NEW Sponge Iron Process opens new economics— new areas of operation for steel making

A steel industry based on iron ore and natural gas or petroleum is economically and operationally practical using a direct reduction process available through The Kellogg organization, exclusive world-wide sales and licensing agent. The process yields a sponge iron which can be substituted for the pig iron or scrap charge to electric or other melting furnace.

The success of the sponge iron process has been firmly established in a 30 ton per day pilot plant and a 200 T/D production plant operated by Fierro Esponja S.A., an affiliate of Hojalata y Lamina S.A.—one of Mexico's principal steel producers. Based on the success of the present plant, HyL has awarded Kellogg a contract to engineer and construct a 500 T/D plant incorporating further improvements in thermal efficiency and materials handling.

Reduction of ore to sponge iron occurs in a controlled-atmosphere reactor. Neither coal nor limestone is required. Small, low-investment plants can be designed to meet practically any need and can be constructed at far below the cost of a blast furnace. The process was developed by Hojalata y Lamina—parent company of Fierro Esponja. The problems of economically obtaining a reducing agent from natural gas or petroleum, and of engineering and constructing the 200 T/D plant, were solved by Kellogg on the basis of its extensive experience in furnace engineering and hydrocarbon processing.

Kellogg International Corporation is a world-wide organization which specializes in engineering and constructing plants involving complex chemical processes. This experience qualifies Kellogg to engineer and construct plants using the sponge iron process. For those desiring further information, a booklet explaining the sponge iron process in more detail is available. Arrangements for screening a motion picture showing the sponge iron process in action may also be made by writing Kellogg International Corporation.

PIA serves the Middle East

DAMASCUS–BAGHDAD and now

Tehran

Two flights weekly each way by PIA Super Constellation

LUXURY PIA Super Constellation airliners fly to Tehran and other oil-important centres of the Middle East! PIA Super Constellations offer comfortable Tourist accommodation and luxurious first-class 'Siesta Cabins' on all flights ... and *personal* service en route second to none. Two eastbound services from London Airport (at 1700 hours, every Wednesday and Sunday) via Geneva and Rome; and onwards to Karachi. And two weekly westbound services from Karachi, calling at all destinations. Convenient onward connections for other key centres all over the Middle East.

From Karachi PIA's domestic and regional network covers the main cities of East and West Pakistan, Afghanistan, India and Burma. Reserved air cargo space available on all flights.

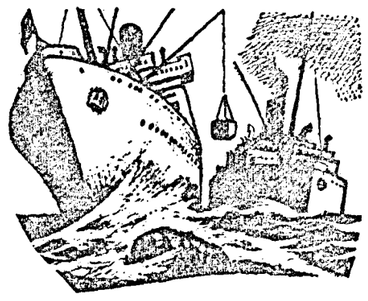
Compressed air
serves the largest electronics firm in Europe



Sixty years ago the Dutch firm of Philips began manufacturing electric light bulbs at Eindhoven. Today they are the largest makers of electronic equipment outside the U.S.A., and the rapid development of electronics in the past 25 years owes a great deal to Philips Research Laboratories.

All Philips components are made in their own factories, which employ 160,000 people all over the world. Every year they produce several million radio sets, whilst their production of TV sets runs into hundreds of thousands.

Besides electronic tubes, X-ray and telecommunication units and other electrical equipment—ranging from tiny miniature lamps to gigantic synchrocyclotrons—Philips and their associated organisations in 60 countries throughout the world also make records, diamond dies and pharmaceutical specialities.

For large numbers of the production machines in their factories (in Holland, England, France, Germany, Brazil and many other countries) Philips use Atlas Copco stationary compressors to supply compressed air.

An airlift for wool

Compressed air is versatile. Atlas Copco provide the means for all its many applications. When the Japanese freighter *Eifuku Maru* ran onto a coral reef in October 1957, the valuable cargo of wool—worth £5,000,000—was salvaged, using winches powered by two Atlas Copco compressors.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

An Act of Bravery?

THE most balanced judgment on sterling's move during the Christmas holidays to convertibility for foreigners is that, given the commitments and conditions which the British Government has accepted in the past six years, and given also last week's peculiar conjuncture in Europe, it was an act of almost obligatory bravery; and the immediate advantages can already be seen. This does not mean that it should be regarded as an occasion simply for hanging out the flags without any misgivings.

In any normal circumstances, in a world where the effects of changes of trade policy are reasonably measurable and those of changes in financial policy much more controversially obscure, the Government would have been wiser to choose a different order of priorities in the pound's advance to greater freedom. It would have been better to give priority to easing or abolishing Britain's remaining restrictions on dollar imports and on general tourist travel, before taking this technical and inevitably highly publicised step in the exchange market. A very special conjuncture of events was required to justify reversing this order of things. It so happens that by last weekend such a special conjuncture had come about.

The de Gaulle government had become convinced, as many other people were convinced long ago, that the only ways to rescue France from its prolonged status as the sick economy of Europe were through a disinflationary budget and devaluation of the franc; whether the steps it has now taken are in fact likely to be enough to do this is discussed in the following article. For political reasons, the French were eager that their devaluation should be accompanied by a declaration of convertibility for the franc, and it is possible that the Germans would have made this a prerequisite to granting the French their financial support.

The chance thus arose of the concerted realignment of European currencies which is described in a leading article on page 55. It was a realignment involving more risks for Britain than anybody else. To give any foreigner who holds francs the right to convert them into dollars means very little, for few hold more francs than they irreducibly need; while sterling is a very widely held banking currency which convertibility could render more naked to future sudden squalls of distrust. But for Britain to have stood aside last week-end would have been to run the risk of plunging all these currencies into disarray and of making the pound look like the least desirable currency in Europe. The grant of convertibility to foreign holders of sterling became a necessary and desirable Christmas contribution to European solidarity. Any misgivings about the eventual implications of the move should be voiced only after giving full recognition to this.

But let it be made clear why there are misgivings. There is no doubt that sterling is at present, and for the short time into the future that it is possible to see, strong enough to sustain the burdens of this sort of convertibility—as well as of the relaxations of some of Britain's own dollar

import controls which the Government has indicated will be allowed to follow it. There is equally no doubt that the proclamation of strength is itself a strengthening factor, just as any confession of weakness (for example, by contracting out of the emerging European monetary accord) would have undermined such strength as there is. It is therefore not at all surprising that sterling rides proudly high on the immediate morrow of the move. But the new currency system, with convertibility at fixed rates of exchange, is not designed for a few months. It is intended to be permanent. It is only prudent to ask how it is likely to work out in circumstances other than the present; it is in the middle distance that the doubts lurk.

THE main meaning of the move is that Britain, as the world's leading short term banker, will now be more formally (and therefore possibly more forcefully) committed to take the strain upon its gold reserves whenever any other currency in the world is regarded as temporarily more desirable to hold than sterling. There are bound, of course, to be occasions when some will be. When different countries have different political systems, different economic ideas, different susceptibilities to dangers in the world market and trade unions of different strength, it is not realistic to suppose that their currencies will always march in exact step with one another in international financial esteem. Admittedly, when a banking currency falls temporarily out of esteem, that is the time when the Government must intervene with all the mechanisms available to it in order to smooth out the divergence. Admittedly, events since September, 1957, have provided an impressive demonstration of the efficacy in this country of one particular smoothing mechanism—high interest rates—which all British Governments in future ought to be ready to use more forcefully and promptly. But nobody can fully weigh the extent to which the British experience of the past fifteen months has been fortified by two elements of quite unusual good luck—namely, the convenient turn in the terms of overseas trade and this past year's unexpected flight from the dollar. Nobody should underestimate the extent to which smoothing out in this country has to be done quickly (or the reserves will run out) and easily (or politicians with their eyes on domestic votes will not stand for it). And even with the promised increase in the quotas of the International Monetary Fund, it is idle to pretend that the level of international reserves which can back up all these banking operations, and meet all the possible swings in confidence, is still anything other than inadequate.

It may be, of course, that to voice these misgivings is just another way of saying that Britain is, for better or worse, in the international banking business. It is a firmly held view in the City that all the new convertibility means is that London has given *de jure* recognition to a *de facto* situation which has existed for a long time, that the country has not increased the vulnerability that comes to it through its international banking trade but has simply at last enabled the balance of payments to get greater advantage from it. For many years foreign holders have been able to convert their sterling into dollars in Zurich and other foreign markets at the so-called (and slightly discounted) "transferable rate." Ever since February, 1955, the British Government has stood ready to intervene with its own dollars on these markets, in order to prevent the discount on this transferable sterling from becoming embarrassingly large. Last week's decision, it can be said, means merely that dealings will be transferred from these foreign markets to London, bringing not inconsiderable profits in foreign exchange to the coffers of the nation and commissions to City firms. But there are three reservations to be made. Nobody can be quite sure how substantial these are; it is nevertheless by their substance that apprehension or satisfaction about last week's move will be justified in the months ahead.

The first reservation is that there may be some foreign holders of sterling who through old-fashioned scruple, simplicity or pure ignorance have never made the effort to convert their sterling through the off-white transferable market at Zurich, but who will be more ready to convert it through the official market at future moments of strain. The most efficient City firms insist that they do not know of any such people; it remains to be seen whether this is because their own customers have included only the sophisticates and none of the simpletons, or because the latter really have never existed. This week's experience is certainly heartening in this respect.

THE second reservation is that dealings in the Zurich markets used to be made at a small and "floating" discount below the official rate. Admittedly, after 1955, the British authorities never allowed the elastic in the old transferable rate to stretch very far; they found that once the discount below the official rate widened beyond about 3 per cent, a bear rush started against sterling. But that may be evidence of the difficulty of maintaining a fixed and a floating rate together, not an argument against the efficacy of floating rates as such.

When convertibility was hotly debated between 1952 and 1955, the formula was to be convertibility plus a floating rate for sterling. Whether the risks inherent in the combination were greater than the benefits was always a matter of doubt. But at least the floating rate would have provided some element of flexibility, something that could bend to any winds of adversity, take the pressure off the reserves and move automatically in the direction of a new equilibrium. Nothing of this sort is provided by last Saturday's resort to the rigid regime of convertibility at fixed rates.

It is, however, the third reservation which could conceivably become most worrying most soon. Last week's move was made on the eve of an election year, when people will soon be talking about the possibility of Britain electing a government that foreign holders of sterling will not like, and one whose leaders have already indicated that they themselves do not like convertibility. Probably Mr Gaitskell erred, even in his own interests, in crying stinking fish so loudly last weekend, and would have been wiser to be more conciliatory to the convertible sterling which he may some day have to manage. But even Labour economists are entitled to say what they think, and Labour politicians have certainly some reason to be apprehensive about finding themselves naked in face of a storm of foreign distrust. The danger that now emerges is that, as polling day approaches, some speculators may think that they had better cash in their sterling at the official rates quickly, for fear of being obliged to accept the old discounted transferable rate if Labour should return and not stand steadfastly behind the new system.

Perhaps all this is too gloomy. The advance to technical convertibility has taken place in concert with Europe and must be regarded as an act of bravery; it cannot reasonably be criticised as merely an act of bravado. Sterling sets sail on a long voyage in a fair weather ship at a moment when the weather forecast is favourable. Let us hope, indeed everybody must hope, that it will remain favourable. But it is rash to bet that it will do so for ever. Beneath the happy increased clamour on London's foreign exchange market, the hostages that have been given to the success of this venture are not only the nation's and the sterling area's precious reserves of gold and dollars, but also the reputation of the Government and the City of London for realism and sagacity.

The General's Gamble

The best service General de Gaulle can do the French economy now is to modify his ideas of national greatness

GENERAL DE GAULLE is basking in unaccustomed foreign praise. France has learned what he means by *vérité et sévérité*: devaluation, stiff taxes, a bonfire of trade quotas, subsidies slashed, the automatic adjustment of wage and salary scales to the cost of living suppressed, rebuffs for the peasants and the alcohol lobby, even a slap at ex-servicemen's pensions. The general has done what no other French prime minister could have done, and what the gaullist National Assembly, if it had been asked, would hardly have dared to approve. It is an impressive performance. Such is the immediate economic advantage of his rule by decree. It is vital, not only for France but for everyone else, that the new budgetary measures should succeed. For General de Gaulle is gambling, and gambling deeply. Just how big the bet is, how much now rests on his own outlook on Europe and the world, still needs to be reckoned.

In France itself the budgetary shock is reasonably astute politics. The electoral series that began with September's referendum is over, at least as far as the general is personally concerned. The senatorial and municipal elections still to come will not directly affect his power, although local discontent will present the communists with their first chance to regain the old protest vote. But France has handed over to the general and cannot retract: psychologically, this is the moment for the price of national recovery to be named. There should be no surprise that it is as steep as it is. The necessity for some action of the kind, irrespective of France's obligations to the common market, has been apparent for months; only the electoral series, and M. Pinay's loan, delayed it. Given the order of political priorities since he came to power, the general's economic timing has been arranged for him. Naturally enough, the opportunity to attribute these hard knocks to British convertibility and to old obligations to France's European partners is not unwelcome. But France's own liabilities remain the nub of the matter. Have the general and M. Pinay done enough to set the country—and particularly the uneconomic second rank of French industry and commerce—to rights? And have they done it in the best way to diminish the social tensions that, with active communist encouragement, could ultimately wreck the whole scheme?

The modern sectors of French industry, which have been heading European production indices for some time, can be reasonably confident of their ability to profit from the new trade outlook. It is also probable that a number of less efficient concerns have been unduly pessimistic about their prospects against German competition in the common market. All this is encouraging. But to establish the prosperous economic base that General de Gaulle needs for all of France's present commitments, something much more positive must be achieved. The big test in the coming months will be whether or not French industry—which must now absorb some stiff increases in fuel and transport costs—can expand into new foreign markets. For on this will depend the repatriation of fugitive capital, and the reappearance of savings from the patriarchal mattress, on which the general is ultimately banking for success. M. Pinay's loan in the summer mopped up a good deal of the gold that was prepared to show itself on the morrow of the general's return. There is certainly more to come. But investment as a whole will probably wait to see if things are going to pan out without renewed inflation; not least, to see how the labour front

is going to behave when the severity of the new measures sinks in.

The initial trade union reaction has been critical, and with some reason. French industrial workers have been increasingly suspicious of M. Pinay's policy since the boom slowed down and short-time working spread this autumn. Communist electoral publicity has been at pains to point out the presence of big industrial and financial interests among the general's own entourage and among the backers of M. Soustelle's victorious UNR party. According to M. Duclos, the common market itself is a deliberate device to bring unemployment to France. New measures to raise rents, announced a week ago, did not bring any comfort. Now the bad news has come from all sides: bread, wine, coffee, electricity, gas, coal, rail fares, post and telephone charges, cigarettes, the buses and the metro will all cost more. Civil Servants are to get a four per cent wage increase next month but the compensatory rise in the minimum wage is confined to the lowest-paid workers; for most of the working class, there is no coating on the pill of austerity. The socialist *Force Ouvrière* has joined voices with the communist-controlled CGT in complaining that the burden of indirect taxation being placed on the working-class family is unduly heavy. M. Mollet and his two Socialist colleagues have not walked out of the present cabinet, but they are not now expected to join the new government when General de Gaulle becomes President of the Republic on January 8th. The MRP is still willing to serve under the new prime minister, but the Catholic unions have been particularly bitter about the evident intention of resisting new wage claims to the limit. Serious industrial unrest is the next major threat that the general may have to face. It is all part of the gamble.

THE strength of General de Gaulle's position now is that only under his personal leadership could such a gamble be expected to come off. It is his great service to the French nation that he alone is able to order it into austerity. But the financial disadvantages of the diplomatic and military cast of thought he embodies are all too plain. The general has summoned France to greatness—his own brand of greatness. The burden he is placing on the country is not the temporary one of discipline to meet an economic difficulty, but the permanent obligation of behaving, and spending, as a great power. It was to keep France's word, its honour, that he seems to have accepted the common market treaty; perhaps, too, for the sake of a western European alliance with France at its head; but certainly not for the political vision of M. Monnet and the European federal cause.

The general has responded to army sentiment in continuing the war in Algeria, and at the same time he has committed France, in his speech at Constantine on October 3rd, to a massive industrial investment in that country in the next five years, building homes for a million Algerians, providing regular work for 400,000 men, and sending two-thirds of Moslem children to school—most of them for the first time. Much of the capital investment is expected to come eventually from French industry itself. Can he continue to employ half a million French soldiers across the Mediterranean while underwriting the price of social integration for the Moslem and European communities? To place France among the great powers the general is now fabricating an atomic weapon. Can he stop there, or must France follow Britain into the expensive profusion of a full nuclear armoury? France has conceived high hopes of the Sahara and the development of its natural resources. But these hopes not only depend on further costly development in wells, pipelines, refineries and communications; they also assume an Algerian peace that will preserve the resources for France while removing the present political obstacles to their full use. Beyond and above are the responsibilities to the new French African community which only substantial economic aid is likely to hold together. Can France really sustain the conspicuous consumption of atom bombs and African development, while at the same time holding its own in Europe and the trading world?

IT is no new charge against the general for him to be accused of *folie de grandeur*. His appeal for Frenchmen, after so many and so great humiliations under the Fourth Republic, is simply that he stands for greatness—against the odds. But this is not the way to run the affairs of a west European country in the year 1959, however proud, however ingenious, however rich in natural resources it may be. The general has come to terms with Dr Adenauer over the common market. But it is not to be disguised that French and German policies already look to different ends in Europe. The general naturally hopes to interest German capital in north Africa. But will the Germans accept his desire to rewrite the North Atlantic treaty or his view of how a west European alliance is to develop under French leadership? They will certainly not permit any notion of a European "third force"—the phrase is already reappearing in Paris— to jeopardise their own relationship with the United States. Unless the dream of French greatness is watered down, or unless German governments even after Dr Adenauer continue to show an entirely improbable degree of self-effacement, a parting of the roads will come.

France has still a great, and important, part to play in the world and in the western alliance. Its own economic strength is necessary now—as it has been in the past decade—for it to fulfil the obligations thrust upon it by its place on the map. But to mistake its part today for that of France in the world of 1919 is to condemn the French economy and people to avoidable perils and unnecessary frustrations. The gamble is great enough already without imperial ambitions. The stroke of retrenchment the French economy needs most is in General de Gaulle's own idea of national ambition.

Disarmament Doors Ajar

Mr Khrushchev seems to have reversed his policy on the question that brought disarmament negotiations to a dead stop in 1957. The West should hasten to find out what this means

IN bedroom farces, pace is kept up by one door opening the moment another shuts. In the sterner drama of the quest for disarmament, an oddly similar pattern now prevails—though, unfortunately, in slow motion. There have been no substantial negotiations for disarmament since August, 1957, when the Russians broke off the Lancaster House talks and went home in a well-timed huff; but they have taken pains, ever since then, to ensure that at any given moment not all the doors should appear to be shut. Various door-stoppers have been shoved one after another into various jambs: a "Bulganin letter" here, a "Rapacki plan" there, a last-minute appearance at Geneva to discuss the control of nuclear test suspension, a grudging agreement at least to go through the motions of discussing precautions against surprise attack. There has always been a chink of light somewhere to suggest that hope is not extinct.

Keen eyesight is needed to spot the latest chink, but that does not make it any less interesting. In the course of the long discussion he had before Christmas with two British MPs, Messrs Philip and Francis Noel-Baker, Mr Khrushchev remarked that it was relatively unimportant at present to agree about destroying existing stocks of nuclear weapons, and that the thing to concentrate on was cutting off all further production of these weapons. No sure means of detecting concealed stocks, he said, has yet been found.

These arguments have been generally accepted in the free world for several years. They will be thoroughly familiar to readers of *The Economist*. They were spelt out at great length by Mr Harold Stassen during the 1957 talks in London; and they were flatly rejected and denounced at that time by the Soviet government. There is more than mere tactical significance in the remarkable sight of Mr Khrushchev now suddenly reopening this door. As Mr Philip Noel-Baker put it in his recent book, "The Arms Race"*:

> It was on this question of nuclear stocks that Russia broke off negotiations, and left the [UN] Sub-Committee and the Disarmament Commission, in 1957. It will remain the crux of all disarmament discussions until it has been solved. . . . It seems likely, therefore, if the western position on nuclear stocks is adhered to, that no disarmament treaty will be made, because Russia will not sign.

Yet now Mr Khrushchev has apparently accepted the western position on stocks, and has jettisoned the insistence on their total abolition which was the core of the Russians' argument when they walked out of Lancaster House in 1957, and which dominated their propaganda for a long time after that. True, he has flown his kite cautiously. Nothing about his talk with the Noel-Bakers seems to have been revealed to the Russian people as yet—a fortnight after it took place, and nearly a fortnight after his *volte-face* was reported in *The Observer*. But this very lapse of time may now make it difficult for him to deny having said anything of the kind. The Noel-Bakers, specialists in the tortuosities of the subject, can scarcely be accused of having misunderstood him. Moscow's official silence to date may simply indicate that, as on many previous occasions, the party stalwarts are having to be discreetly briefed about a sudden shift in policy before it can be revealed to the common *Pravda* reader.

SUCH a shift would have a good deal of logic behind it. Mr Khrushchev himself can never have been too happy about the choice of this issue as a breaking-point in 1957, for he had personally gone on record, not long before, with the admission that hidden stocks could not be traced—an admission that made nonsense of the Soviet case. (The whole episode was a superb illustration of the tactical advantages of the top-secret state; no probing journalist or Opposition MP was able to quiz the Soviet rulers about their two irreconcilable arguments.) Moreover, the Russians' decision in 1957 to boycott further United Nations discussion largely reflected their burst of bumptiousness after getting the world's first inter-continental rocket into the air. It seemed good to them to sit back and wait for a frightened West to accept their terms. But this waiting game in fact yielded few, and diminishing, returns; and now that America has fired its Atlas over an inter-continental range, the Kremlin's tireless chess players may well feel that a new gambit is necessary.

The question of stopping production of nuclear weapons would seem a particularly suitable sector for them to choose for a fresh initiative, for in this sector much has changed since 1957. Mr Noel-Baker, writing after the Lancaster House breakdown, rightly said:

> It seems certain that Russia will not accept the cut-off without the abolition of stocks, so long as the United States, in quality and quantity of nuclear weapons, is as far ahead as President Eisenhower asserts they are.

By now, however, although the American stockpile is doubtless still much larger and more diverse than Russia's, it is unlikely that it is decisively so. Mr Khrushchev himself pointed out to the Noel-Bakers that the stage may be reached quite soon when even a super-power will merely be wasting money by continuing to pile up bombs (delivery mechanisms are, of course, another matter). Russia should now, or very soon, be able to face a cut-off without its former fear of decisive inferiority.

* Reviewed in *The Economist* on June 14, 1958.

A chink of light in a door jamb should not be mistaken for the dawn of a new and glorious day. Russia shows scant sign of giving up its insistence on the dismantling of the whole Atlantic defence system, or its resistance to effective international inspection—and, without inspection, any disarmament plan must work out to the advantage of a top-secret state *vis-à-vis* the relatively "open" democracies. In these respects Mr Khrushchev did not give any ground in his talks with the Noel-Bakers, Mr Walter Lippmann, and others; nor did Marshal Sokolovsky or Mr Gromyko, in their blustering speeches on Christmas Day. But at the Geneva talks on suspending nuclear tests, which are now being resumed after the Christmas break, the western negotiators have been patiently trying to get the reluctant Russians down to brass tacks about the key question of inspection; and that process should be kept up, for this is a door, ever so slightly ajar, the handle of which must be tried again. There is another chink of light visible in Warsaw, where Mr Rapacki ought to be pressed to define his vague references to "appropriate measures of control" over the limitation of armaments in central Europe envisaged in his second "plan."

As to the wider possibilities opened up by Mr Khrushchev's latest remarks, Mr Mikoyan should certainly be buttonholed in Washington and asked for confirmation or denial. (Might not Mr Stassen be diverted from his duties in Ankara to find out whether the Russians have really reopened the door they slammed in his face in 1957?) And, marvel of marvels, there may now actually be something useful for the new 82-member UN disarmament commission to do. It is the only forum at present in which Soviet spokesmen can be publicly challenged to stand up and give public and precise answers to questions about their new terms for disarmament. It is a cumbrous substitute for the parliamentary question, the press conference, the TV interview and the many other means by which democratic governments can be made to clarify their more obscure declarations; but it is the best disarmament commission we have, and if the Russians do not respond to questioning elsewhere, it should be brought into play on this issue without delay.

NOTES OF THE WEEK

UNITED ARAB REPUBLIC

In Praise of Vagueness

MR EUGENE BLACK'S visits to London and Cairo suggest that both the British and the Egyptian governments are seriously trying to come to terms. The president of the World Bank has been quietly involved in the financial side of the Anglo-Egyptian disagreement for some time, but this is his first public appearance as mediator. He would hardly have come so far into the open, risking the bank's prestige, unless he felt reasonably sure of achieving some positive result.

There have of course been false dawns before now. The financial discussions that have been going on intermittently in Rome have occasionally looked like leading to something, but have then petered out. Neither government was really intent on a settlement, and it was always politically inopportune for the one to accept what the other felt bound to insist on. The heads of dispute are now three: whether Egypt should compensate former owners of nationalised property to the extent of £25 million, or £35 million, or something in between; whether doubtful cases should be adjudicated by neutral arbiters or by the Egyptian courts; and whether any compensation at all should be paid by Britain for the damage done at Port Said, and by Egypt for appropriating the installations and stores of the Suez canal base.

The last of these is the most delicate issue; it involves both more money, and more national pride. Negotiation has broken down in the past because the British government, with more logic than finesse, has insisted on setting one claim against the other and suggesting that they cancel each other out. But it is as politically impossible for President Nasser to abandon the Port Said claim as it is for Mr Macmillan to acknowledge it.

The French have another way of doing things. A Franco-Egyptian financial agreement has been signed which satisfies both parties, because the main point is kept beautifully vague. The Egyptians say that they are being paid £20 million compensation for war damage; the French say that they have only advanced the money for economic development; the incident is closed. This is a technique that recalls the diplomatic arts of a more flexible age.

Brotherhood at Aswan?

PRESIDENT NASSER is keeping busy. Two agreements have been concluded with the Russians; negotiations with west Germany for participation in the first stage of the Aswan dam have been brought near the point of consummation; Syrian economic complaints have been given respectful hearing but Syrian communists roundly attacked. A report that the Syrian regional council has closed the Russian cultural offices in several towns may be significant; if this has been done, it is the first time that President Nasser has openly recognised the link between foreign and Arab communists. Some aspects of the apparent shift in his attitude are discussed more fully on page 48.

The first of the two Russian agreements signed during Christmas week is not new, but merely fills in some of the details of last year's general credit arrangement making available £62 million for industrial expansion. The implementation of this has gone very slowly, and so far only a fraction of the promised equipment has materialised. The second agreement sets out the terms of Russian participation in the first stage of building the Aswan dam. The Russians are pledging themselves to contribute up to 400 million roubles (about £36 million) repayable over 12 years from 1964 with interest of 2½ per cent. From the western point of view the important thing about this agreement is the extent to which Russia gains control over the implementation of the scheme. A west German consortium is considering putting about £17 million into the project, and Italian and Japanese industrialists are also interested.

But the text of the agreement, although imprecise, suggests that the employment of foreign contractors requires not only the consent of the Egyptians but also that of the Russians:

> The Soviet government agrees to contract with the UAR government regarding the building of the first stage of the High Dam in Aswan. . . . The implementation of the work will be entrusted to contractors in the manner to be agreed by the two sides, on the basis of the use of Soviet equipment.

The German delegation which is expected in Cairo this weekend will be anxious to discover the Egyptian interpretation of this clause.

GENERAL ELECTION DATE

Convertibility and Two Elections

IT is worth recalling this week one of the most prevalent stories of three and a half years ago: about why the last general election was held in May of 1955 instead of in the autumn. At the beginning of 1955 it was generally presumed that Sir Winston Churchill would not retire until the summer recess, but arrangements had been made that Sir Anthony Eden, as heir apparent, should have the right to call for an earlier retirement and prorogation of Parliament if he judged that Conservative electoral tactics demanded them. In February, just as he was about to board a plane for a Seato meeting in Siam, Sir Anthony was told rather vaguely that certain steps were to be taken against foreign speculators in sterling; according to this report, he was alarmed, while in Bangkok, to find that the steps taken (the decision of the British Government to intervene with its own dollars on the transferable sterling market at Zurich), amounted to what some newspapers called *de facto* convertibility of sterling. He was said to be afraid that any sort of convertibility might lead to an economic crisis in the autumn. On returning from his Asian journey he set in course the train of events which led to Sir Winston's sudden retirement and to the May election.

Perhaps Sir Anthony's coming memoirs will reveal how much of the truth about the date of the last election this story contains; certainly many people believe that it contains at least some elements of it. The point is, of course, that if *de facto* convertibility helped to cause a May election in 1955, *de jure* convertibility could conceivably do the same thing in 1959. Some prominent Conservatives, who took part in the internal party debate last time may even uneasily remember, without suggesting here any relationship of cause and effect, that there in fact was an economic crisis in the autumn of 1955 and again in the autumn of 1956 and again in that of 1957—although there had been no crisis in the three years before 1955. If there is any danger that *de jure* convertibility might increase Britain's vulnerability to a pre-election run against sterling by speculators frightened of a possible Labour government, then national considerations make it desirable that the election should not take place during the autumn months of maximum seasonal strain. This will not necessarily be the deciding factor; Mr Macmillan will no doubt be influenced also by his assessment of his chances of return to office, which the recent by-elections still suggest to be no more than fifty-fifty. But the prospects of a May election seem likely to have been at least slightly increased by the financial events of last weekend.

DEFENCE

Agag in Whitehall

LORD MOUNTBATTEN'S appointment to be designate Chief of the Defence Staff will cause no surprise, although it has aroused the expected criticism from the one newspaper proprietor and the scattered Tory MPs whom he is unfortunate to have as his personal enemies. He has the qualifications and the wide experience both of service organisation and of politics to make him the obvious choice to take over upon Marshal of the Royal Air Force Sir William Dickson's retirement next summer. But he will have to walk like Agag when he gets there. If a Labour government is in power by then, one suspects that Lord Mountbatten will gradually become the main arbiter of Britain's defence policy. If Mr Sandys is still in office, his task will be different, but no less delicate.

Last July the Chief of the Defence Staff was made directly responsible to the Minister of Defence, and became the go-between of the minister on the one hand and the service chiefs on the other. This finally replaced the old system whereby the joint chiefs of the three services had made unanimous recommendations to the Government, after thrashing out their differences among themselves. Naturally many serving officers still hanker after the old system. But at a time when the Minister of Defence was charged with the duty of thinking out a new defence policy as overlord of the service ministries, and when the chiefs of staff found themselves saddled with wide new responsibilities to such international organisations as Nato, the change was in fact both proper and inevitable. The new system was fitted with paper safeguards. The separate service chiefs continue to have direct access to Mr Sandys and remain collectively responsible to the defence committee of the cabinet; they may send in separate memoranda if they cannot reach agreement on what they feel are vital issues. But it was obviously important that personal relations should be happy during the new system's opening months.

Unfortunately, they have not been. There is reason to believe that disagreement among the service chiefs has in fact increased throughout this year, and that as a body of professionals they have also sometimes found themselves opposed to the minister. Such disagreements are inevitable when the cost of all armaments, nuclear and non-nuclear, is growing so fast that compensating cuts in manpower and establishments have to be made. Agonising reappraisals have been the order of every day in all three services. They continue to be. Lord Mountbatten, weighing new ships against enough ships as First Sea Lord has had his share. But there have been whispered allegations that Mr Sandys, who was given the authority to override service decisions and terminate inter-service wrangling, has in fact often found it easiest to rule by

making use of mutual antagonisms. The atmosphere in the service ministries is not happy. It may now be for Lord Mountbatten to exercise his gift of leadership to close these divisions. Mr Sandys is not noted for his mastery of combined operations ; Lord Mountbatten is.

BERLIN

The West Replies

As was to be expected, the western replies sent on Wednesday to Mr Khrushchev's proposals on Berlin show the marks of compromise between the different attitudes that must have confronted each other in last month's Nato discussions. About the rebuttal of the Soviet charges against the West, and the need to put straight the record of the events from which the position in Berlin arose, there were presumably no differences. The difficult part was to frame an answer that would deny the right of the Russians to do whatever they want with Berlin, without slamming the door and making a deadlock—in which the West will not be well placed—inevitable.

The advocates of a blank negative have not had it all their own way, as it seemed at one stage that they might. The western notes properly point out that the Berlin problem can only be solved in the broader context of the German question ; and they have made it clear that the door is open for talks on this. They recall the western notes of September 30th which supported the setting up of a four-power commission to study German unity. Whether the whole tone of the western notes is judicious is another question. On Berlin itself, the three powers rightly point out that their troops are in the city as a result of the agreements of 1944 and 1945, under which more than a third of what is now the German Democratic Republic was handed over to the Russians in exchange for quadripartite occupation of Berlin. Equally, the West is right to maintain that it cannot relinquish its position in Berlin so long as there is no settlement of the German question.

But when the notes come to answer the Russian suggestion that administrative arrangements in Berlin may be handed over to the east Germans, the argument begins to look shakier. The American government admits that it cannot prevent the Russians from giving up their authority in east Berlin if they want to. But in the categorical refusal to entertain the delegation of Russian occupation powers to the east Germans, the notes take up a position that it may be hard either to hold or to retreat from. There is also a rather shrill passage explaining that the western powers cannot negotiate under threat. The statement is, of course, unexceptionable ; what purpose it serves is not so clear. By opening the door to talks upon the German question the western powers have given Mr Khrushchev the chance to talk if he wants to. By taking up a defiant posture they make it easier for him to tease them if he does not.

CYPRUS

Exercise in Semantics

It is obvious that no solution of the Cyprus problem that is imposed by Britain without the acceptance and co-operation of both Greece and Turkey has any chance of being either satisfactory or permanent. The most significant aspect, therefore, of the new diplomatic exchanges in Ankara and Athens is that they are apparently primarily the result of a spontaneous coming together of Greeks and Turks. Perhaps the very blackness of the outlook last month, after the breakdown of Nato's efforts to find a solution, has brought home to both the necessity for compromise.

Of the two, the Turks may find the search for a compromise the more difficult—although in fact it appears to be they who are giving it the more attention just now. The Greek government has already in theory given up enosis, but its intransigent attitude in Paris and at the United Nations has robbed it of much of the goodwill that it might have gained from this gesture, and has earned, instead, isolation and mistrust. This may have made the advantages of a more flexible approach more apparent both to it and to its political opponents. The Turkish government, however, is still in theory committed to partition, though not in any specific form. Indeed, reports from Ankara, which tend to be confirmed by the new-found conciliatory tone of Dr Kutchuk who has just returned to Cyprus after his talks there, suggest that the Turkish government is not set on physical partition after all. It appears to be cautiously manœuvring itself into a position in which it can accept the unity of Cyprus while still presenting its policy to the Turkish electorate as a form of partition. The idea of a "theoretical partition" that is now being seriously talked about in Ankara is not all that far removed from Mr Macmillan's idea of "shared sovereignty," and might prove a stepping stone to independence. It must be hoped, however, that the subtlety of the exercise in semantics which the Turkish government must carry out in order to get off the limb of partition, may not be lost on the ordinary Turk who has got used to shouting "partition or death."

AGRICULTURE

More Food Needed?

The news that Argentine beef shipments are to be cut has been followed by reports of declining milk production in this country. Are these signs that food surpluses are disappearing and that British agriculture should once again be stimulated into expansion ? With the season of the annual price review approaching, farmers are naturally enthusiastically saying that they are.

The world food situation is admittedly uneven. While grain surpluses seem likely to continue, the supply of meat (and of beef in particular) looks like lagging behind the steady growth of world demand. Australia, as well as Argentina, may have less beef to send to Britain unless higher prices are paid, because of the growth of alternative markets. These prospects suggest that the Government has been right to give special encouragement to beef producers in this country. They also suggest that the British may need to divert some of their taste for "roast and Yorkshire" towards a larger consumption of pork and poultry. Already this winter pig prices have been higher (and the pig subsidy consequently less) than the Government had expected. But the Government's pig guarantee is quite high enough to provide good profits for efficient producers, while any chicken farmer emulating the streamlined methods of the American broiler industry can profitably tap a large potential market. British farmers in fact already have adequate incentives to produce more beef, pork and poultry. A fresh price stimulus, by permitting the use of inefficient methods, would only do harm.

In the case of milk, the present decline of production is partly due to the weather. In so far as it is not, it should be considered a thoroughly healthy sign. It means that some farmers have practically switched from milk to meat. A simultaneous increase in liquid consumption has for the time being drastically cut the milk surplus available for manufacturing butter and other milk products—but that surplus has long been completely uneconomic. With milk, as with meat, the opportunities for efficient home producers are quite adequate already, without the Government giving agriculture a fresh shot in the arm.

NEW LAWS

New Year Innovations

As usual, the New Year brings fresh laws, since January 1st is a popular vesting day for recently enacted measures. Since Thursday it has been unnecessary to pay a ten per cent duty on imports of ice and snow ; this is the only substantial change of rates in a vast and most welcome consolidation of numerous and often overlapping schedules of import duties. At the same time the opportunity has been taken to simplify the description of tariffs according to the international classification agreed in the Treaty of Brussels. Hundreds of minor changes in rates are incidental to the central Herculean purpose of clarifying the codes.

From New Year's Day also, the Public Record Office has a ministerial master (the Lord Chancellor), a more severe method of weeding out the junk from the vast effluvium of dead paperwork pouring from the departments, and, for the first time, a general mandate to let the public see everything that is fifty years old (can it be that the papers of Mr Gladstone's last Cabinet are no longer to be held a state secret ?) Defaulting breadwinners, who are failing to pay maintenance to their deserted wives, need no longer, from the same day, be jailed but instead their obligations can be deducted from wages at source. Likewise, the obligation to ensure that the children of a broken-down marriage are properly taken care of before a divorce decree is made absolute has now come into effect. Finally all provisions of the Clean Air Act are for the first time made to apply in Scotland ; opticians have been given professional status by the establishment of their own council ; and the housewife's kind heart is protected against travelling salesmen falsely purporting to sell goods on behalf of the disabled.

EUROPE

France and Free Trade

The French government's plunge towards freer trade has put a new complexion on the trade discrimination in Europe that began with the new year's day. The French, who were so severely reproached in the Organisation for European Economic Co-operation on December 15th for failing to fulfil their trade obligations to the other members, have decided to do so. Side by side with their relaxations of import restrictions within the common market, they have announced a "90 per cent liberalisation" of imports from all the members of OEEC.

In a practical sense the move is obviously welcome. Together with the freeing of 50 per cent of dollar imports, it marks a radical change in French foreign trade policy. The term "90 per cent liberalisation" in the language of OEEC does not mean what it says: to suppose that 90 per cent of France's current imports from the area have been made free of all restrictions would be a mistake. These OEEC percentages exclude state trading, and they are based on the trade of 1948. So in effect France has removed restrictions on goods which formed 90 per cent of private imports ten years ago. It will continue to restrict imports of cars, many types of machine tools, electrical equipment, plastics, and most agricultural products. Still, some important categories—including chemicals, many textiles, many durable consumer goods and much machinery, as well as raw materials—have been freed, subjecting French prices and many French industries to a wholly novel pressure from outside.

The French moves therefore improve the atmosphere, but they do not improve Britain's bargaining position over the free trade area. By concentrating their attack on the failure of the French to fulfil their OEEC obligations, the British hoped to isolate them from their common market partners. The French have now drawn the sting of the British criticism, but they remain determined to discriminate in favour of the common market. They have no intention of extending the full benefits of quota relaxations under the 3 per cent clause to countries outside.

The first step has now been taken in the creation of a single market of the Six, without the accompaniment of a free trade area or of anything like a precedent for it. France's new policies are a political as well as an economic demonstration to its five partners of its loyalty to the community. Whether the policies can succeed is another question. And French views of what the community is for differ from other people's. Nevertheless the common market starts life under a relatively auspicious economic star.

GHANA

Nkrumah and Nehru

To judge by press reports, Mr Nehru has been talking to his guest in Delhi, Dr Nkrumah, with all the uninhibited moral earnestness that is characteristically his. Dr Nkrumah arrived in India as the Nehru of Africa, and let off various harsh remarks about the departed British which he seemed to think would go down well with his hosts. They may have done with the multitude, but not with Mr Nehru, who promptly made a bygones-are-bygones speech in which the brighter side of British imperialism, in Asia as in Africa, was stressed, and the value of Commonwealth ties stressed even more. At his final press conference, Dr Nkrumah took a notably moderate line, although his interviewers were eager to discover when the crusade against colonialism in the rest of Africa would begin its march from Accra. Dr Nkrumah even insisted that he thought British intentions in Kenya were honourable.

The most noticeable indication of Mr Nehru's influence, however, emerged in Dr Nkrumah's remark that the thirty-seven opposition members now in preventive detention in Ghana could have a trial "if they desired it." The Ghana Preventive Detention Act is closely modelled on the Indian legislation, but with the unfortunate omission of the clause that gives the detainee the right to appeal to three High Court judges. It looks as if Mr Nehru may have told Dr

Nkrumah that Indian necessity is not to be made a mask for African tyranny. Dr Nkrumah was on the defensive in India about his interpretation of British parliamentary democracy and the rule of law. Rushing a bill of indemnity through parliament to save a minister from apologising to the courts makes no better impression in Delhi than in Westminster.

Such actions may be signs of arrogance, but they are also symptoms of uncertainty and lack of self-confidence. Perhaps because of this, the Queen seems assured of a genuine welcome from Dr Nkrumah and his colleagues when she visits Ghana in the autumn. Two years of independence have shown the Ghanians that nothing now stands between them and the world's criticisms of any ineptitudes they perpetrate. The Queen's presence will be taken as a blessing on their efforts and on the regime, all the more convincing because the tribal authorities, the chiefs, have now been demoted to lowly estate. Dr Nkrumah may have discussed republicanism with Mr Nehru; but Ghana is likely to hasten slowly in that direction this year.

UGANDA AND RHODESIA

African Nationalists at Odds

SOME of the leaders of the African nationalist parties who subscribed to such a stirring programme in Accra have returned to a peck of trouble. In Uganda, the Uganda National Congress party has split. Mr Musazi, its president-general, has accused members of its central executive of negotiating with Cairo to the detriment of the country's future independence, and has suspended them; they have retorted by suspending him. With the whole Congress party thus in a state of suspense, a new party has suddenly risen with impressive backing among political leaders from the non-Buganda provinces of the country.

This is important because Buganda, the largest and most advanced province in Uganda, continues to exhibit extreme tribal separatism. Its local parliament, the Lukiko, has just passed a resolution to empower its monarch, the Kabaka, to approach the British Government with a view to "negotiations" to make Buganda itself a separate independent country. The Lukiko thinks that the new Buganda should take its "dependencies" (Ankole, Bunyoro, Toro and Busoga) along with it. As a new Lukiko has just been elected, this resolution will have to be confirmed before the Kabaka approaches the Governor. When he does, the Governor seems likely to give him a dusty answer (how does one withdraw protection from *part* of a protectorate?). Meanwhile he is busy trying to get Buganda politicians to play their agreed role in the government of Uganda as a whole. The High Court has just ruled that there is no validity in the Buganda government's objections to the constitutional changes made in Uganda since 1955; the Governor therefore thinks that it is high time that the Buganda government stopped stone-walling, convened its electoral college and sent its five members to fill the vacant seats in Uganda's central legislative council.

Meanwhile, in Central Africa new splits have appeared among African nationalists, comparable to those in Uganda. For some time the Northern Rhodesian African Congress has been divided between extremists and moderates. Now Mr Nkumbula, the leader of the latter (and larger) faction, has parted brass rags with Dr Banda, leader of the passionately militant Nyasaland Congress party. If Dr Banda's outright and violent demands that Nyasaland should leave the Federation ever had any success, they would leave the Rhodesian Africans more deeply in the power of the settlers. These disputes are not unhealthy, for they show Africans that their political problems are not always a pure matter of black and white. But the big question is whether out of them will come any more realistic approach to constitutional advance in East and Central Africa.

LOCAL GOVERNMENT

Conflict in Middlesex

ACROSS the river from London's County Hall stands the headquarters of another local authority which might be described as the LCC's *alter ego*. Although the Middlesex Guildhall (like that better known focus of Middlesex loyalties, Lords) is not itself in Middlesex county, its location emphasises the fact that the 2¼ million inhabitants of Middlesex are essentially Londoners. They live in an ungainly arc of administrative territory, which flanks on two sides the county of London. Middlesex County Council's peculiar domain obscures its importance as the second most populous, wealthy, and powerful local authority in Britain. Politically, too, it now seems disposed to emulate its better known neighbour. Flushed by its success at this year's county elections, the Labour majority which now controls Middlesex is launched on something that looks suspiciously like caucus rule; and its policies (for example, over comprehensive schools) owe something at least to the LCC's example.

There is one important difference. Most of Middlesex's boroughs and urban districts are chafing with resentment at what they regard as the dictatorial attitude of the county council, and they are not being backward in showing it. Education is a particularly sore point, since sixteen of the boroughs and urban districts are "excepted districts," and as such run their own schools subject to general control and co-ordination by the county council. Intrinsically this is a difficult system to operate, since county controls over finance and policy are all too likely to be irksome and time-consuming. But Middlesex's "excepted districts" have recently complained in a strong memorandum that the county council has not even tried to make the system work, but is bent on imposing a uniform educational pattern on the county in matters large and small. To rub salt in the wound, the leader of the Middlesex County Council recently rudely told the boroughs that they were the county's agents and must comply with its comprehensive school plans, whether they like them or not.

The last has not been heard of this quarrel, and it remains to be seen if the educational "discretion" of the Middlesex boroughs is going to fade away into the status of complete illusion. But the conflict demonstrates the erroneousness of the Government's present policy of endorsing more such "delegation schemes" as a way of keeping the smaller local councils happy. Instead, the system seems tailor-made to make them unhappy, to raise every political snag and impede every effective reform. In Middlesex, even more than in London county, the boroughs could function perfectly well as educational, health, and welfare authorities, without any county supervision, if they were amalgamated. Initially, Wembley might not like joining with Willesden, or

'TCA certainly brings home the value of Canadian markets'

It was only yesterday—wasn't it?—that rich Canadian markets seemed just a little distant. Funny how quickly geography dates: because these very same markets are now practically on your doorstep almost begging you to collect your share of new business. This situation is nicely helped along by TCA—Canada's own international airline. TCA's transatlantic services enable you, your executives, and technical men, to make flying visits to anywhere in Canada, *any day of the week*. And TCA Air Freight offers you a direct-delivery service that ties up the whole of Canada into a neat marketing proposition.

For the rest of the story, the people to get in touch with are your Travel Agent and Forwarding Agent.

ONLY TCA OFFERS YOU:

- Club Lounge for De Luxe and First Class passengers
- Through flights to Toronto from the U.K.
- Through flights from London to Winnipeg and Vancouver
- Daily services with convenient same-airline connections to *all* Canada
- To and beyond the Montreal 'gateway' to Ottawa, Toronto, Winnipeg, Edmonton, Vancouver, and to key U.S. cities

TO CANADA—ACROSS CANADA—AND TO KEY U.S. CITIES

Your Travel Agent is the man to see

TCA

SERVING EUROPE, ALL CANADA, THE U.S.A., BERMUDA, NASSAU AND THE CARIBBEAN

Edmonton with Southgate ; but such disparate unions would be a lot healthier and more comfortable for all concerned than administration by remote county control.

BURMA

The New Broom

A LITTLE dose of military efficiency can be a good thing in an Asian country where parliamentary rule had been accompanied by corruption, untidiness and incompetence. For years the potholes in the streets of Rangoon had been growing deeper and the mounds of refuse higher ; bank balances swelled mysteriously and food grains were hoarded in the godowns. Now General Ne Win, the theoretically temporary prime minister, is wielding a spotless broom with military vigour. Shortly after he took over from U Nu in a friendly *coup d'état* three months ago, he sacked the Rangoon municipality for incompetence and put in a colonel with orders to clean up. The drainage system is being restored, the roads are being surfaced, the streets are being cleansed, unauthorised roadside stalls and hutments are being pulled down.

Simultaneously, godowns, sealed on military orders, are being examined for hoarding ; in the banks, under military supervision, accounts and safe deposits are being scrutinised. These direct methods ought to trace a good many illegal currency transactions and black marketeering fortunes.

On the wider economic front, the government is making a clean sweep of foreign experts on "projects yet unimplemented." It is understood that this sweeping decision —again, the military broom—does not apply to United Nations projects or experts. The government has, however, dispensed with the services of two American firms, TAMS and Robert Nathan Associates. The TAMS Overseas Corporation is a successor to another American consultant firm, KTA, whose representatives first arrived in Burma in 1951. The Nu government had adopted an industrial development plan prepared by KTA organisation, which was criticised, however, because it was based on the incorrect assumption that rice exports could continue to earn high prices.

In these circumstances it is of interest that General Ne Win has now appointed a British adviser on mining, Mr Leach, formerly head of the Burma Corporation. This appointment is the first of its kind for some years ; is it one more sign of the nostalgia that Burmese sometimes betray at having opted out of the Commonwealth ?

JAPAN

Mr Kishi Under Fire

FACTION fights are no unexpected peril for Japanese politicians, but the present struggle within the ruling Liberal-Democratic party has moved uncomfortably close to the prime minister, Mr Kishi. Three dissatisfied Cabinet ministers resigned on December 27th, and a group of Liberal-Democrat dissidents has now been formed to try to dislodge Mr Kishi from the leadership at the next party elections—arranged for January 17th, although his term does not end until March. Mr Kishi's chances of emerging unscathed are not good. He has determined to press on with the budget, but already the paralysis of government has stopped effective negotiation on the revised security treaty with the United States. Even if he is able to defeat his rebels, he cannot expect wholehearted support from the ranks when the new treaty terms are eventually placed before the Diet. The government claims that the treaty is being revised to take into account the resumption of Japanese sovereignty, but there is increasing popular opposition—which the Socialist party has taken up—to any Japanese responsibility for the defence of the Bonin and Ryukyu islands, including Okinawa, effective control of which has passed into American hands.

The Liberal-Democrat revolt against Mr Kishi seems to be prompted more by personal rivalries than by any specific differences over policy. But his critics have been at pains to lay the blame for the reverses in the last Diet session at his door, particularly the failure of the bill to increase police powers and the attempt, by what were thought to be unconstitutional means, to prolong the session so that the bill could become law. Mr Kishi's prestige, so high after his electoral success last year, took a bad knock. Complaints that he has favoured his personal followers in appointments, to the exclusion of members of other groups that joined to form the Liberal-Democratic party three years ago, have now set off the quarrel. Perhaps his only consolation is that the Socialist opposition too is still split between right and left. Japan's two-party system, always precarious, is again in danger.

CUBA

A Dictator Departs

GENERAL FULGENCIO BATISTA, the long-established dictator of Cuba, has finally been given the push. Although his country has been in a state of suppressed civil war for two years, he has always insisted that, except for a tiresome band of *maquisards* in the eastern extremity of the island, everything was under control. Now that the revolutionaries under Señor Fidel Castro have begun to look like turning their tenacity into victory and have advanced from the swamps of Sierra Mastra to Santa Clara in central Cuba, the regular army has stepped in to end the war in its own way.

General Batista's downfall means one military dictator the less ; the Afro-Asian trend is in reverse in Latin America. But it is not at all clear what sort of regime will follow. The three-man military junta that has taken over has followed constitutional practice by appointing Señor Carlos Piedro, the oldest member of the Supreme Court, as provisional president. If the army follows the precedent of Venezuela, it will hold the reins only until a new president can be honestly elected. But it is still obscure whether it intends to go on fighting the rebels, or to try to negotiate. Fidel Castro, whose own political evolution has followed a zig-zag path, has apparently refused to recognise the junta's authority and has put forward a provisional president of his own, Dr Manuel Urrutia, a lawyer. But

the rebel camp has been swollen this winter by many liberals who, while they may not much approve of their opportunist leader, like dictatorship even less. Now that the Batista regime has cracked, these men may urge Señor Castro to come to terms so that Cuba can make a fresh start with a degree of unity.

DOCKERS

The Glasgow Ghost Story

In most of industry a strike is a serious and unusual event, but not in the docks. On the dockside unofficial strikes are signs, not necessarily of deep-rooted discontent, but of a momentary huff; and they are frequent. Days lost per worker in the docks since the war have been far higher than in any other industry, including the mines. Moreover, the machinery for settling dock disputes is almost entirely ineffective. Employers are not responsible for labour discipline, which is vested (by a unique arrangement) in the National Dock Labour Board. The board, however, being equally divided between employers and trade unionists, can hardly ever reach important majority decisions; and the union officials on the board are suspect in their members' eyes both because of their managerial position and because they are often divided among themselves in the inter-union strife that still bedevils many ports. All this is highly unfortunate. It is a background that helped to explain both the major London dock strike this summer, and the two-day stoppage over Christmas at the Glasgow docks.

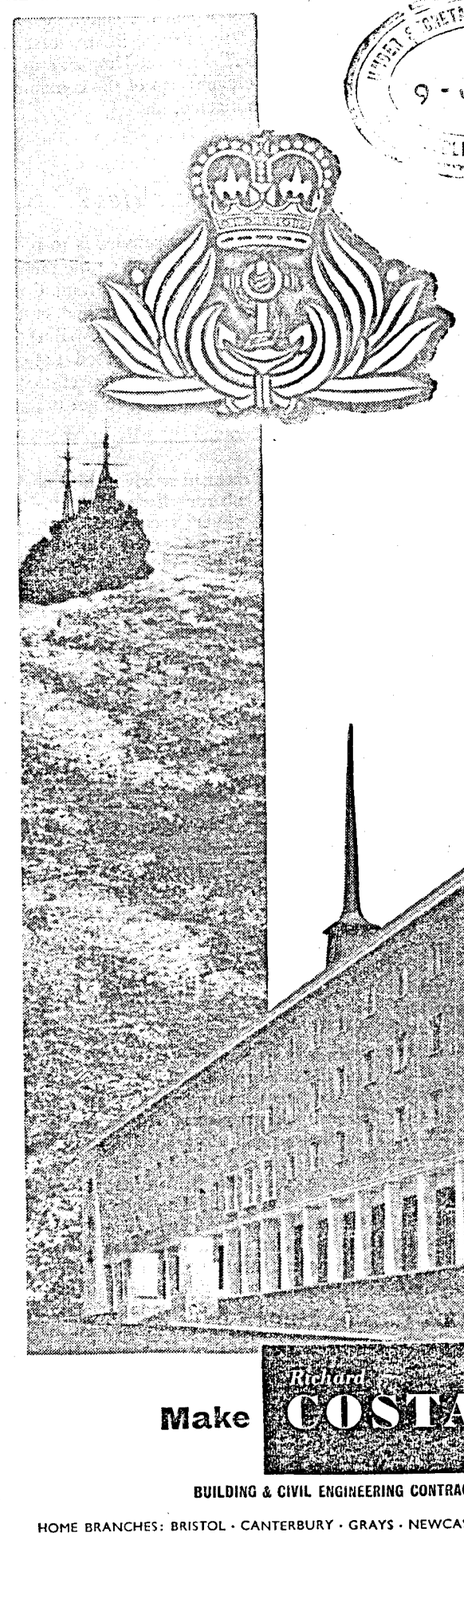
The trouble at Glasgow concerned the employment of a "ghost foreman." This is a member of a dockers' gang, who, if labour on a ship is short, is temporarily appointed to pick up other workers to form the number of gangs required. The men object to ghost foremen on two grounds. The first is that the late arrivals from other ships may be able to pick up the best-paid jobs (like unloading New Zealand butter) while dockers already employed have to carry on less profitable work which they started in the morning. The second reason is that by using ghost foremen, employers are able to draft the men they have hired into a smaller number of full-sized gangs without waiting for others to turn up; if all the gangs have to be made up before work can start, hours are wasted, although they still have to be paid for.

At Glasgow last week a docker refused to act as a "ghost" and to organise a crowd of idle dockers into a gang in this way. On the first day he was paid by the employer even although he thus did no work (a concession which is not unusual). But next day when he again refused to be a ghost (and this was the real cause of the strike) the employer refused to pay him, and said that he could collect only the fall-back pay which is available to all dockers who are officially doing no work. This was against dockland tradition, and 2,800 men struck for two days. The effects were not serious. All that happened was that Glasgow dockers took some extra time off over the un-Scottish holiday of Christmas; all the men returned this week in order to build up their pay packets before the Hogmanay celebrations. But the distrust, indiscipline and inefficiency that underlie all dock problems are serious, and at times crippling. Too little is being done about them.

CHINA

A Partial Climbdown

One of the strangest developments of 1958, the Chinese "communes" movement, seemed by the end of the year to be settling down to a more reasonable pace. The central committee of the Chinese communist party debated the communes at its meeting from November 28th to December 10th; this was the meeting at which Mao Tse-tung's resignation as the chairman of the republic was approved.

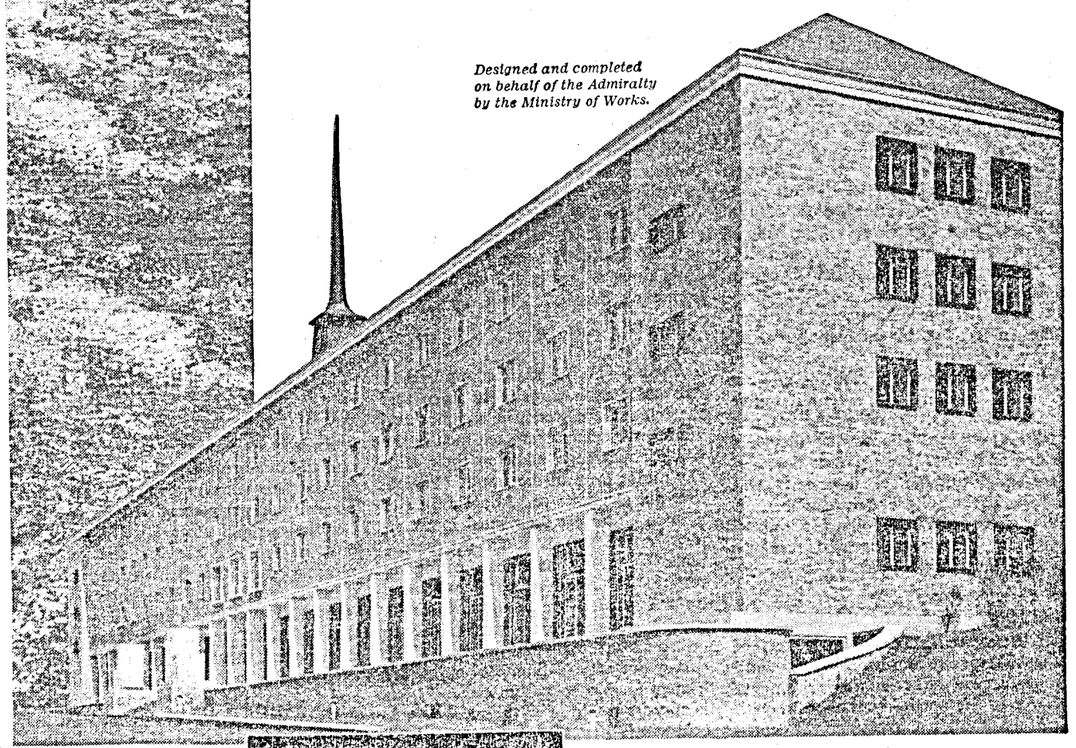


Reviewing what had been done since the spring, the central committee noted that some 740,000 agricultural co-operatives had organised themselves into 26,000 communes. The experiment had been tried in towns, but "especially in large cities, it should not be hurried"; the existence there of many capitalists and intellectuals makes it necessary to go circumspectly.

On the whole, communes do not loom so large as they were made to in the summer; the "leap into communism" has been abandoned. The building of socialism—not communism—is now expected to take between ten and fifteen years: the central committee decided that there was

Binding Cases for The Economist . . .

are available from EASIBIND LTD. The cases are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding and will hold 13 issues of the normal edition together with the quarterly Index, or 26 issues of the air edition with two quarterly Indexes. The year can be stamped on the spine. The cost per case, post free throughout the world, is 12/6. Orders, stating requirements clearly and enclosing a remittance, should be sent, **not** to The Economist, but to EASIBIND LTD. at the address below:



EASIBIND LIMITED (DEPT. E) · 84 NEWMAN STREET · LONDON · W1

This new Royal Naval establishment at Plymouth is COSTAIN built

Here, on the historic Plymouth scene, is an imposing new landmark—the Royal Naval establishment at Manadon, recently completed by Costain's.
A development of the Royal Naval Engineering College, it provides residential quarters for 204 officers undergoing technical training. It is impressively planned and makes every provision for study and recreation.
Costain's, whose South-West Area Organisation carried out the work, are proud to record the completion of yet another major contract.

Designed and completed on behalf of the Admiralty by the Ministry of Works.

no point in being too eager and "over-reaching ourselves." Although the free supply system in the original blueprint for the communes contained an "embryo of the communist principle of distribution according to needs," it was not to be made the general practice. Until the age of plenty arrives, the Chinese communists suspect free supply would undermine labour enthusiasm; in the meantime, caution is enjoined against "petty trends towards egalitarianism." Wages are to be graded into six or eight scales; there is to be no discrimination against those members of the communes who have sources of income outside the commune; members can keep their bank deposits and other property undisturbed, although the commune "may borrow the surplus housing space of members with their consent." The working day in the communes is not to exceed eight hours. Parents can choose whether they want to look after their children themselves or put them into "well-run kindergartens"; the military system, on the basis of which the communes are organised, must not be used "to infringe in the least on democratic life in the commune." Thus the Utopian crudity of the first directives for the organisation of the communes has, to a certain extent, been mitigated.

EDUCATION

How Many Universities?

THE present target for university expansion is to reach 124,000 students in all by the mid-sixties; the present number is about 100,000, and the University Grants Committee in their last review hoped that by the end of the sixties numbers might rise to about 136,000. But the Association of University Teachers has proposed 145,000 by 1965, a figure which is probably much nearer to the number of young people at present wanting to get in; and at the Home Universities Conference last month Dr Robin Pedley, lecturer in education at Leicester University, suggested 170,000, on the assumption that improved secondary education could bring 10 per cent of the appropriate age groups to the universities. (By 1965 there should be in addition 70,000 or so students doing advanced courses at technical colleges, 36,000 at teacher training colleges and thousands of others undergoing further forms of higher education.) The view that universities should be kept for an intellectual and academic élite, rather than opened to all as a step in their vocational or professional training, received commendably short shrift at the conference.

If the dons really desire to open university courses to the maximum number of young people who are both able and willing to undertake them, then Dr Pedley's seems the proper liberal objective. Clearly, however, it cannot be attained simply by the present programme of expanding the smaller universities to the size of the larger, and making some of the larger bigger still—a process which sets grave administrative problems. A really determined plan for university expansion would have to found new universities; Dr Pedley suggested seven more. At present only one, Brighton, is proposed. Some new universities, some of them perhaps as experimental in their own way as North Staffordshire is, could surely be built in conjunction with the new teacher training colleges. But it is also obviously necessary not to waste any available foundation for turning out the required diversity of graduates. On the face of it, it seems extraordinary, for instance, that the University Grants Committee has for so long rejected the claims of St David's College, Lampeter, to a grant, and so allowed it to come almost to the point of extinction, instead of becoming, as it could do, the kind of liberal arts college that the wider spectrum of university provision will require. The UGC, it seems, will only help Lampeter if it becomes part of the University of Wales (which it would be glad to do), but the University of Wales has already turned Lampeter down and remains chilly. Considerations of academic prestige and position look like being allowed to jeopardise some 150 perfectly useful university places. In this apparently minor matter, as in so many major aspects of university development, it is hard to see where the real leadership lies. Britain may be lucky at the present pace to get even 124,000 students by 1965—and perhaps even that increase only at a disproportionate sacrifice of existing university amenities.

Eating Round the Clock

THE levelling up of incomes in the last twenty years—and the spread of industrial canteens—seem to have had a surprisingly small effect on the national diet. In all, food consumption a head is about one-eighth higher than before the war (although the "calorie intake" has risen only 4 per cent). The welfare state has encouraged a considerable increase in the amount of milk drunk. But most of the changes have been moderate: more potatoes replacing some of the bread, meat some of the fish, margarine some of the butter. And, surprisingly, less fruit is eaten and only a few more vegetables. It looks as if traditional British eating habits die hard.

Just what these habits are has been the subject of an interesting special survey* by the market research division of an advertising firm. During one hot August week in 1955, a representative selection of 4,557 men and women were questioned about what they had eaten and drunk the previous day, and an equal number of interviews was made in the following cold February. The survey gives the following impression of British eating and drinking round the clock.

★

Starting with Tea.—Nearly half of the adult population, working class and middle class alike—more in London, fewer in the north—start the day with early morning tea. About 40 per cent—more in the north, fewer in London—also take tea last thing at night. At breakfast-time about 85 per cent of people drink it. Coffee consumption has doubled since before the war, but at no hour of the day is it the Englishman's favourite drink: only on Sunday mid-mornings in the winter is as much coffee drunk as tea.

Breakfast.—In spite of slimming diets, more than half of men and more than a third of women have a cooked breakfast throughout the week; the proportion rises on Sundays, but varies surprisingly little between summer and winter. A cooked breakfast is slightly more usual among the upper class (defined as the 10 per cent of families in the top professional and business occupations) than among the working class (defined as the wage-earning 70 per cent of families). Bacon and eggs is still the traditional dish; it is apparently eaten in nearly a third of British homes on Sunday.

★

Lunch.—To London commuters it will come as a surprise to learn that throughout the week, in summer and winter, six out of every ten men in the whole country go home to their mid-day meal; even in the London region, four out of ten do so. About a quarter of men either eat their meal in a canteen or take it to work and eat there—twice as many as those eating in restaurants. About 15 per cent of men eat a sandwich lunch and a business executive is apparently just as likely to do so as an industrial worker. The survey does not distinguish housewives from women who go out to work, but it appears that during the week 70 per cent of all men and women are eating their mid-day meal in their own homes; public restaurants are catering for only 8 per cent of them. Most people have a cooked mid-day meal and two out of three British homes have potatoes, summer and winter, throughout the week. On any Sunday the traditional roast beef is eaten in nearly a third of all homes; lamb runs it close in summer, but in winter it competes with pork for second place. Poultry or fish is a Sunday lunch for only about 5 per cent of homes; salad, even at the height of summer, features little in the Sunday lunch menu.

★

Dinner for Few.—The peak-time for eating in the evening is between 6 and 6.30 p.m., although a third have already had their meal even earlier. Even in summer, only 12 per cent of men and even fewer women eat after 7.30 p.m. About two-thirds of people (including over half of Londoners) refer to the meal as tea or high tea, although the distinction between the latter and dinner may be somewhat arbitrary. But bread and jam or cakes, with or without a main dish, feature in the evening meals of about half the population.

★

And So to Bed.—Cakes and biscuits and the like are naturally the mainstay of the late supper or bedtime snack taken by 60 per cent of people, mostly between 10 and 10.30 p.m. And it is only in the late evening and in the summer that the British apparently drink beer or spirits with their food—or at least own up to doing so. About 8 per cent of men (10 per cent in the upper class) owned up to taking a late-evening alcoholic drink in the summer and 2 per cent of women did so. During the summer, too, 5 per cent of men in the top class said they drank with their evening meal, but for the population as a whole alcoholic consumption at meal-time is alleged—by the answers to this survey—to be very small indeed.

FINLAND

Under Moscow's Displeasure

FINLAND has been without a government for more than a month: since the withering away of Mr Fagerholm's coalition cabinet, the Helsinki politicians have found it hard to form another. Although the Finns wish to maintain good relations with the Soviet Union, their politicians are reluctant to include the communists in any government. In a broadcast speech on December 10th, President Kekkonen constantly returned to the essential part that foreign relations, and those with Moscow in particular, play in Finnish politics. He said relations with Russia would have to improve, and that the Finns would have to convince Moscow that they really wanted an improvement.

During the initial stages of the crisis, the Russians maintained an ominous silence; later, the Moscow press and radio went into action and accused the Finns—and the Social Democrats in particular—of a variety of crimes, among which wanting to keep the communists out of the government was the main offence. Mr Kleemola, an Agrarian, did his best to appease them. He proposed to give five ministerial posts to the left wing socialists, a small faction represented in parliament by thirteen deputies. He pointed out that if his proposal proved unacceptable the communists would have to be admitted. The conservatives and the Swedish party refused to be impressed, and Mr Kleemola announced his inability to solve the puzzle.

Mr Kekkonen is still apparently toying with various parliamentary combinations that might serve as a basis for a cabinet; the possibility that he will announce a caretaker government cannot be entirely ruled out. So far, he has personally evaded the wrath of Moscow; in fact, he has been singled out for its praise. The crisis, however, has done nothing to enhance his popularity at home, where he is suspected of trying to get one or two communists into the government by the back door.

MIGRATION

Inward Balance

FOR the first peacetime year since 1938, there has probably been a net inward balance of migrants to Britain in 1958. After an exceptionally large outflow in 1957 (230,000 in all), emigration fell off last year, in response, it seems, to the slackening of economic activity in the "old dominions," notably in Canada. But immigration into Britain (160,000 in 1957) kept up, mainly because Irish poverty and economic policy continues to drive Irish youth here; it is often forgotten that the Irish still form a third of the total immigrants, outnumbering the coloured colonial contingent by more than two to one. In their latest report (Cmnd 619) the Overseas Migration Board have repeated their earlier recommendations for the encouragement of emigration, but these are not likely to be heeded. Official policy has settled down comfortably to the belief that it is for the dominions to offer inducements if and when they wish, and for Britain to co-operate modestly if asked to do so. Perhaps this is, after all, the soundest approach.

The board has done some good work in refining the rather crude statistics that are kept of migration movements. It corrects the view that Britain gains unskilled workers, and loses people on whose education and training the country has spent a lot of money. The board thinks that the balance in Britain's disfavour, even in a year when there is a net loss of population, is not great. In boom periods, no doubt, British industry loses scarce craftsmen to the white dominions, and in all periods first-rate scientists to the United States; but it enjoys a sustaining inflow of scientific and technological talent from the dominions and Europe (including, of course, many refugees). In addition, Ireland and the colonies provide some skilled and semi-skilled as well as unskilled workers.

The growth of an Idea

For many years Barclays Bank has been building up a structure unique in world banking, a structure based upon two distinct principles. The private banks which combined to form Barclays have provided the foundation for a system of Local Head Offices which lodges in the hands of local people a broad measure of the day-to-day control of affairs; while, ranged around the English bank, there has been developed a group of associated companies which provide in Scotland, in France, in the Mediterranean, in Africa, in Canada, and in The West Indies, a banking service comparable to that of the parent company. The Englishman doing business overseas may well find invaluable this direct representation in many countries; it is of course supplemented by a network of correspondent banks throughout the world.

The system of decentralisation through Local Head Offices is not confined to this country. Branch managers can deal with practically any banking question you put to them; but if they have to refer to higher authority most of them need go only to their Local Directors in Norwich or Nairobi, in Cardiff or Cape Town, rather than to a remote Head office in London.

ECONOMIC OUTLOOK FOR 1959

A Year for Tax Reliefs

THE main economic question which most Britons are asking at the opening of 1959 is how much money the Chancellor is likely to feel able to give away in his (presumably pre-election) budget in just over three months' time. His beneficence is not likely to be determined mainly by the state simply of his Exchequer accounts, even though the latest indications (see page 64) are that he may just about attain the £364 million surplus above the line for which he budgeted last April. But in these Keynesian days, tax reliefs are decided by other considerations than this.

The first of these other considerations is that the Chancellor must not release sufficient purchasing power to overstrain the internal economy. That particular consideration should not, fortunately for Mr Amory, be very oppressive this year. At the moment Britain is in the middle—or perhaps middle and off—of a stock recession. Arguably, though not certainly (see below), the rate of stock-building may recover later in the new year; while, even without any tax reliefs, consumption would probably be higher in 1959 than 1958, and total fixed investment, Government current expenditure and (questionably) exports might be no lower. At a guess—though a guess carefully hedged—most analysts would probably forecast that even if the Chancellor merely let present policies ride, total demand by the end of 1959 would be running at a rather higher level than now. But current production is, after all, still slightly lower than it was at this season three years ago; while fixed investment has been maintained throughout these three years at or above a rate which was formerly (just before 1955) providing the capacity for Britain's real national income to expand by some £600 to £700 million a year in terms of today's prices. Undoubtedly, Britain now has a considerable reserve of under-utilised capital equipment.

It would be much too simple an exercise in inflationary economics to measure this under-utilised capacity by the sum of three years of industrial expansion foregone, adding in another £700 million-odd for 1959 itself, and saying that Britain could painlessly increase its production by some £2,500 to £3,000 million in 1959 merely by flogging industry at the (too extravagant) rate which the expansionist Mr Butler allowed in 1955. But perhaps this much succour for analysis can fairly be drawn from the arithmetic of past production: even if the Chancellor were to give away in tax reliefs the whole of his prospective budget surplus of £350 million or so (and few people can be expecting him to give away as much, let alone more), the country's internal productive capacity (as pre-1955 Economic Surveys used to measure it) would not seem likely to be as excessively strained at it was in past years of bad inflation. It seems probable that other checks on the Chancellor's beneficence will come into play this year before this particular limiting factor of Britain's theoretical maximum capacity to produce need be taken into account.

AMONG those other traditional checks is the state of the current balance of payments. Fortunately here, too, the Chancellor should not need to be too inhibited this year. Britain has just ended 1958 with a balance of payments surplus which was certainly a record and was probably above £500 million. In the first half of 1958 the surplus amounted to £334 million, and in the next five months the monthly average visible balance was only £8 million worse than in that record first half year. Even allowing for a deterioration in the invisible balance in the second half of the year (caused partly by the interest element in last Wednesday's payments on the North American loans), the second half's surplus should surely have reached or exceeded the £200 million odd necessary to hoist the year's total surplus to well above the £500 million mark.

It would be prudent to expect some deterioration in this record rate of surplus during 1959. Some £280 million of the improvement in the surplus between 1957 and 1958 will have been due to the 8 per cent fall in average import prices. Most people are guessing that import prices will go up again in the new year, although they seem unlikely to go up so fast that the average price level for 1959 will reach the average price level for 1957. Until recently most people had also forecast that the volume of British exports was bound to be considerably lower in the first half of 1959 than it was in the first half of 1958; the remarkable buoyancy of British exports since the end of August has now caused some hopeful second thoughts.

Presumably Britain's volume of imports (which was 2 per cent, or some £70 million a year, lower in the first eleven months of 1958 than in the equivalent period of 1957) must be expected to rise again in 1959, especially if there is an expansionary budget and if re-stocking gets going. But against this one can think of almost as many items of net invisible receipts that should improve in 1959 as one can think of invisible receipts that may deteriorate. In the overseas sterling area, which shares the central gold reserve with Britain, the rate of deficit in the early part of 1959 may well be even larger than in the first half of 1958; on present trends, however, there seem to be grounds for suggesting that it might improve in the second half of the new year.

ALL in all, therefore, although there may be quite a sizeable dent during 1959 in Britain's record 1958 rate of surplus, and although the sterling area as a whole may not be in considerable surplus at all, the state of current external payments will not necessarily be a force that is bound to hold a reasonably expansion-minded Chancellor in check. Indeed, one is beginning to wonder how often it is so vital a restricting force as governments have previously learned to suppose. The balance of payments outturn, cynical experience suggests, is now usually a statistic which is worked out by civil servants some three months after the event, and which nearly always proves to differ in important respects from what everybody had been deducing it to be. Bulls and bears of a currency now pay less attention to this late-coming statistic and look out for other things instead.

One of these other things, which has an important bearing on confidence in sterling, is the course of wage bargaining and of wage inflation in Britain. There is

one blot on the landscape here for 1959, in the shape of the committee which is now inquiring into the state of railway wages: both its terms of reference and the method and membership with which it has been set up suggest that it might recommend a wage increase for railwaymen in spite of British Railways' increased deficit. The effect that any such recommendation could have on foreign confidence in the pound should not be underestimated. But the prospect for reasonable wage stability in 1959 looks less dim than for many years.

This is due in part to the slower recent rate of rise in prices (although that could conceivably be disturbed by developments on the food front), in part to the dampening effect of slightly higher unemployment, but probably in the main to a political factor. The trade union leaders are well aware that the principal primary cause of the electoral swing against Labour last year was the London bus strike, and they are likely to have concluded an unwritten compact with the Labour party to try to avoid bringing it into the pillory again before the expected general election of 1959.

But mention of the election introduces the main shadow over the economics of the new year. In 1959, unfortunately, political economy seems likely to be more important than the science of public finance. As polling day approaches, some flight must be expected from Britain's newly convertible pound, if only because, rightly or wrongly, many foreign holders of sterling are petrified at the thought of what might follow a Labour victory. Indeed, the great paradox of 1959 is that, while the man in the street assumes that the main factor influencing Mr Amory towards a budget of extensive tax reliefs will be his desire to help his party to get back in, the main economic factor in the way of such a budget may be uncertainty in the exchange market caused by the fear of foreign speculators that his party may not be going to do so.

Despite this, and on balance, the best advice to give to Mr Amory at the gate of the new year may be that he should go ahead with preparing a budget of tax reliefs ; and that he should regard the possibility of a higher Bank rate as the main weapon to use if pre-election speculation should set in against the pound. It would be imprudent, a full quarter year in advance, to make any guess at the desirable extent of such reliefs, but there are three points that can already be made about the desirable shape of them. First, there is a better case in Britain at the moment for concentrating most reliefs on income taxes rather than on purchase tax. Secondly, if there are to be any cuts in purchase tax at all, it might be better to announce them this month or next, separately from the rest of the budget, rather than to wait until April ; by April potential buyers of goods in which tax cuts are expected might have held themselves off the market for three unnecessarily depressing months. Thirdly, there are sound arguments for being generous this year in refurbishing allowances designed to stimulate investment. Admittedly experience suggests that these give their main fillip a full year after their introduction ; but it may well be that underutilisation of capacity in the heavy industries that produce capital goods may last through until then. This is a point which emerges from a study of the trends in individual British industries, to which this survey now turns.

Stocks and the Prospect

A STOCK recession reverberates throughout the economy gathering momentum as it goes: every industry down the scale adds its own extra economies until the universal reduction of stocks falls with full weight on basic and heavy industry. In 1958 this meant heavy cuts in production of steel and, one step further back in the least flexible of industries, the piling up of unsold coal at mines and opencast sites. When steel output is down and nobody wants to move the coal, heavy transport slumps: 1958 knocked the railways to their knees.

This tightening of stocks in recent months has far outweighed the small movements in the other elements of final demand. Consumption was never significantly depressed last year, and the demand for consumer durables is now turning up quite sharply. Every physical element in investment demand except vehicles passed its peak by the end of 1957. The motor industry, in the first half of last year, was Atlas carrying two globes: it was sustaining the level of investment as well as the level of total production. But even motor manufacturers, boom or not, were buying more cautiously and thinning their relatively low stocks. Their caution rippled outwards through the engineering trades, where orders for capital goods, the other big factor in demand, had already fallen and were beginning to affect output ; defence demand came down again ; the volume of exports fell, though not as much as was feared ; and forward export orders fell further.

Demand in these early weeks of 1959 depends partly upon the uncertain trend of exports. The November figures looked astonishingly good, but can we really have survived the recession in commodity prices with hardly a ripple on the demand of primary producers for British manufactures ? There is a chance that exports have turned for the better. But demand also depends on industry's guesses about how far the stock recession will go. On the coldest calculation, nobody could call stocks throughout manufacturing, even at the end of 1958, anything but high—relative, say, to the ratio of stocks to output in a boom year such as 1955. On arguments of economic efficiency, industry might justifiably move down to a new, lower level of normal stockholding, since the artificialities of the postwar decade are wholly past.

If industry did so, an upturn in output would certainly be delayed late into the year. On the other hand, easier and rather cheaper credit is making stocks more convenient to finance ; some people may expect commodity prices to go up further ; and when the first venturers begin to rebuild their stocks, psychological pressure is exerted on others. Against this not too conclusive background, let us take a look at some leading industries.

Coal

THE coal industry, right at the bottom of the industrial pyramid, is beset not only with the reduced total demand for fuel, but also with a secular shrinking of its dominant share of the market. Nothing that happens in the economy this year can avert a continuing switch to fuel oil, simply because large-scale conversions are already in train, as at some power stations. Indeed, nothing that is in prospect for the economy seems likely to require any change in the National Coal Board's rather grim plans for 1959. In 1958, it managed to sell only 208 million tons of coal, and it failed to cut its production below about 215-216 million tons ; so its unsold stocks, large at the beginning of 1958, have risen to nearly 20 million tons.

This year the NCB is committed to cut back output from mines and opencast sites to 203 million tons, and it reckons that 3 million tons even of this slashed output may still have to go into stock. It is closing 36 collieries (over and above those that would have gone out through exhaustion) and reducing opencast output by letting fewer new contracts. These cuts are in its most unprofitable and its most profitable coal respectively ; in theory, they should leave the board no worse off, though carrying perhaps £70-£80 million worth more coal in its stocks than it would wish.

These cuts in output, and what it has done already by reducing recruitment, will cut the Coal Board's mining manpower somewhat below the figure which was postulated in its modernisation plan. They have also given it a surer road to high productivity. Whether this is in spite of the board's long-term investment plan and its crash programme of power-loading, or whether these could not make their contribution apparent while so much inefficient production was a national "must," are points for argument ; the fact is that output per manshift is now running at about 26 cwt, 8 per cent better than the best ever before the war.

If the upturn in economic activity comes fairly early this year, it should bring a fairly quick revival in demand for fuel in general. Coal is one of the few industrial materials of which stocks in the hands of consumers have come down fully in line with actual consumption. Use of coal is not likely to recover fully in proportion to any general recovery in the economy, because the switch to oil is continuing (rapidly in electricity, and now more slowly elsewhere in industry and in central heating). It would be pessimistic to think that eventually coal consumption would not feel the benefit of renewed expansion ; but too optimistic to hope that enough recovery could come this year to make the Coal Board revise its production plans.

Steel

CUTS in the steel industry's demand for coking coal were the last straw on the coal industry's back in 1958 ; the closing of 36 collieries, and the need for stringent management of the coal industry's stores and inventories will be one of the minus factors affecting a big slice of demand for steel in 1959. And the railways, which are interlocked with the other two in this depressing pattern of "hurt and be hurt," will be living on their stocks and holding down their current demand for steel ; that may more than outweigh any extra demand for steel arising from the railways' increased rate of investment next year.

Across the economy, stocks still dominate the outlook for steel: opinions in the industry about when the running down of stocks will end differ across a range of about six months, from spring to late summer. A rundown of stocks equivalent to over 750,000 tons of crude steel since March was the main factor bringing steel output last year down by about 10 per cent, to 19.6 million tons ; since the summer, consumption has come down sharply too, and that has further reduced the level of working stocks.

The British Iron and Steel Federation is hoping that demand may turn upward by about the middle of the year ; it is not counting on steel production in 1959 showing any big advance over 1958. Projections of an improving rate of output this year, made by the Iron and Steel Board (which has recently been more optimistic about consumption than the eventual figures proved) suggest a rise from the current rate of, say, 18 million ingot tons a year to 21 million tons by the end of 1959. The Federation might be inclined to put its end-year guess at 22 million tons, which would mean 20 million tons over the year. Beyond 1959, guesses diverge further: some people in the industry doubt if 1960 can show much improvement on the 21.7 million tons of 1957.

Current output, at the rate of 18 million ingot tons a year, is not much better than 75 per cent of capacity, now conservatively rated at 23½-24 million ingot tons. This year capacity will rise by another million so that an unchanged or only slightly increased output for the year would give producers a rather worse rate of capacity utilisation. In 1957-58, a financial year that admittedly started well, British steel companies emulated the American steel companies in weathering the recession fairly well, in terms of profits. By all accounts, the industry has been able to score considerable

The Economist

JANUARY 1, 1859

PAST AND PROSPECT

It would be difficult to conceive a greater contrast than exists between the actual condition and immediate future prospects, of trade at the commencement of 1858, and now, at the commencement of 1859. A year ago, a commercial and financial crisis, of greater intensity than had perhaps ever been experienced, so long as it lasted, was only just subsiding. The Bank discount, which had been for some time at the unprecedented rate of 10 per cent., even then stood at 8 per cent. It is true the reserve of the Bank, which at one moment had fallen to below a million, had so far recovered that it stood at £7,971,000 by the last accounts published in December, and confidence began to be felt that so far as the "money market" was concerned, the country was in a fair way towards a rapid recovery. But the same confidence did not prevail in relation to the trade of the country . . . With these observations upon the past, *we pass to a consideration of the circumstances* which are likely to influence the trade of the year upon which we this day enter. These are of a character peculiarly striking, whether we regard the position of the financial means open to trade, or the great considerations upon which the prosperity and the consuming ability of nations are founded. . . . In the United States, in France, in the chief continental towns, as in the Bank of England, the great distinguishing features of the moment are, large unemployed deposits, a limitation of advances, great bullion reserves, and, as a consequence, a very low rate of interest. And it is important to observe that these remarkable characteristics of the times in monetary matters, are not so, merely as compared with the period of pressure a year ago :—they will bear nearly an equally favourable comparison with the corresponding period of each of the last three years. . . . *As a whole, therefore, the prospects of 1859 bear a most cheerful* comparison with those with which we commenced the past year. *Then*, all was still doubt and apprehension. *Now*, we may fairly say, that a year never commenced with better grounds for hope and confidence. May the same prudence and caution which have marked the commercial public for the last six months, continue to guide them in the very favourable circumstances under which they enter the new year.

improvements in iron and steel making practice which were overlooked or unsought when it was under pressure. The benefit of these and further economies should spread into 1959, but the financial results of the companies reporting to September next will also be limited by the fact that whereas ingot production in 1956-57 was 21.6 million tons and in 1957-58 20.3 million tons, for the twelve months to next September it may be no more than 19 million tons.

Current earnings and the more generous dividends recently paid do not seem significantly to have moderated the companies' readiness to go on investing in new capacity, though their ability to finance investment from internal funds has been affected. The industry's investment planning has indeed been complicated during the last few months by the Government's decision, somewhat mysteriously arrived at, to have two semi-continuous strip mills in the sixties, one at Newport and one at Ravenscraig in Scotland. Investment is now running around £100 million a year.

Engineering

THE first signs of re-stocking among steel's customers in recent weeks have come from certain of the intermediate engineering industries that supply makers of a wide range of finished metal products, from ball-bearings to drop forgings. These intermediate producers have had longer to squeeze their stocks than other users of steel; they felt the motor recession sharply in 1956-57, and never achieved in their own output quite the recovery that motors enjoyed, simply because the demand for some other consumer durables slackened and demand from machinery makers fell away. But these engineering concerns are more dependent upon cars and consumer durables than upon investment goods; and the hire-purchase boom is beginning to quicken their run of orders.

Among the suppliers of plant and machinery, on the other hand, 1958 was a year of steadily shrinking orderbooks, eventually translated into reduced production. Towards the end of last year there were more inquiries for new plant than there had been in earlier months, but precious few were maturing into firm orders. Makers of capital goods, such as machine tools, worked steadily through Britain's private investment boom in the last three or four years, and achieved increases in output that belied the fears of outside observers about the overload then put upon them and their capacity to handle it. But by the middle of 1958 that investment boom was over.

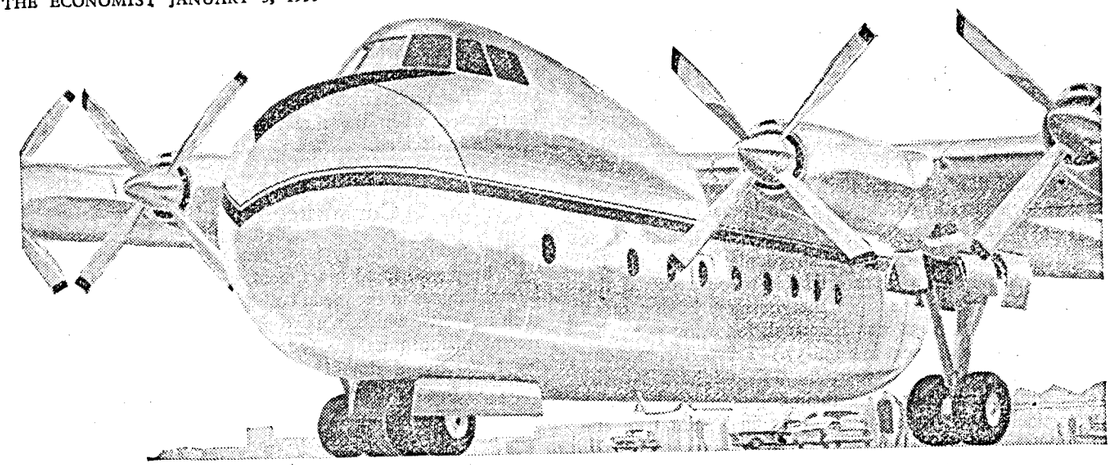
Public investment—primarily electricity—held and is holding up steadily, so that the heavy electrical engineers remain perhaps the most fully-employed of the capital goods industries; since several of the same companies are doing well out of consumer durable goods as well, they are the brightest spots in engineering. The shipbuilding industry has remained busy, though cancellations, considerably exceeding new orders, have been reducing its four-year orderbook; but shipbuilders did not achieve the increase in output that they were promising for last year—nor did they buy all the steel plate for which they had demanded priority in deliveries.

Engineering exports held up fairly well in the first three quarters of 1958, and in some sections where demand had been slack, such as commercial vehicles, rather better orders came in towards the end of the year. Plant and machinery suppliers are hoping for some benefits to flow from the promises made at Montreal; they have also been encouraged by rather easier credit terms for overseas contracts, though there are still complaints that Britain lags behind its competitors in the softer world market.

Building and Construction

IT seems doubtful if the value of new building and construction work declined last year as had been expected. In the first three quarters, in fact, there was a slight increase over the same period of 1957; and since building employment had shown nothing of its usual seasonal fall as late as November, it may be that the output of these industries was maintained in the fourth quarter too. Construction work in the public sector—which covers half of all building expenditure—is practically certain to increase this year; the Government's invitation to public authorities to step up their expenditure in 1959 may mean an increase in their building programmes of as much as £40-£50 million this year. New housebuilding by public authorities fell by about one-sixth last year to around £250 million; but no such decline is likely in 1959, and the increase to be expected in other new work carried out for public authorities may mean that the public sector will increase its building activity by as much as five per cent.

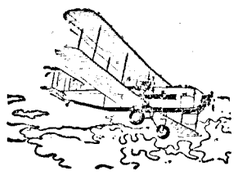
Private investment in building is less easy to forecast. Recent surveys indicate that private industry intends to spend less on new building and plant; professed intentions are commonly more pessimistic than the expenditures that are actually undertaken when the time comes, but it would take a marked recovery in industrial production this year to stimulate new industrial investment. Private housebuilding rose slightly during 1958 and may continue to rise this year; it should be aided by rather easier credit, which —along with the Rent Act—should also stimulate expenditure on maintenance and repairs.



NEW WORK BY CONTRACTORS
(£ million)

	1957		1958
	First three quarters	Total	First three quarters
Housing :—			
Public	234	307	195
Private	184	246	193
Total	418	553	388
Other Work :—			
Public	277	375	308
Private industrial	207	275	204
Private miscellaneous	135	184	147
Total other work	619	834	659
Total, all new work	1,037	1,387	1,047

The most uncertain element at present is new private commercial building, which totalled £184 million in 1957 and may have been as much as seven per cent higher in 1958. But if commercial building merely remains unchanged in 1959, and the result is a slight decline in total private building, this decline should be more than offset by gains in the public sector.



Motors

AMONG metal exports, as among the country's major industries, motors had perhaps the most impressive record in 1958, and the industry remains cheerful

Meet the New ARGOSY!

THE WORLD'S FIRST TURBOPROP FREIGHTERCOACH
TAKES ON A GREAT NAME IN CIVIL AVIATION

In the story of British aeronautical achievement, some great names stand out: aircraft that made their mark in the skies and helped to further aviation progress.

Such a name is the ARGOSY—the first civil aircraft built by Sir W. G. Armstrong Whitworth Aircraft Ltd., back in 1926. It made history as the first commercial aircraft to pay its way for an airline, and inaugurated Imperial Airways' famous Silver Wing lunch-time service between London and Paris. Economic operations were made possible by its trouble-free maintenance, reliability and carrying capacity.

The new turboprop ARGOSY is the jet-age successor of its famous namesake. And like the old ARGOSY, the Freightercoach (designated the AW650) will open a new era in air transportation. It is a most versatile aircraft. Not only can it carry up to 80 passengers in pressurised comfort at a speed of 300 miles an hour, it will also open a vast new market in air freight.

The modern ARGOSY carries over three times the load of a Dakota at twice the speed and half the cost.

PERFORMANCE
POWER: 4 Rolls-Royce Darts
AIRCRAFT CRUISING SPEED: (14,000 r.p.m.) 296 m.p.h.
MAXIMUM PAYLOAD: 27,000 lb.
RANGE WITH 20,000 lb. PAYLOAD: 1,600 st.m.
SIZE OF HOLD: 46 ft. 8 in. (14.23 m.) x 10 ft. (3.05 m.); floor area 426 sq. ft. (39.6 sq. m.).

SIR W. G. ARMSTRONG WHITWORTH AIRCRAFT LTD., Baginton, Coventry, England
Member of Hawker Siddeley Aviation Division

The *Argosy* — BRINGS THE COST OF AIR FREIGHT DOWN TO EARTH

about 1959. But it has some qualms about the early part of this year. The seasonal dip in demand that it expects at this time has already been largely filled up by the freeing of hire purchase in the last quarter of 1958. So it is now a little uncertain whether to make a noise in the next couple of months about a reduction of purchase tax in the Budget—which could easily encourage the postponement of new orders—and dimly hopeful that Mr Heathcoat Amory will resolve the matter by cutting the tax in January or February.

If purchase tax is reduced, it should boost home sales to private consumers and more than counterbalance the fall in business purchases of cars that is to be expected this year. (There are some signs that business buying of all motor vehicles in 1958 was abnormal, following postponement of fleet replacement in 1956-57.) Prosperous as motor manufacturers were last year, they should have capacity for a substantial addition to their output in 1959; Ford, in particular, will be bringing in its final paint trim and assembly building at Dagenham to crown its comprehensive programme of expansion. It seems likely that BMC, and perhaps Ford as well, will be bringing out important new models next year in the small car range, where basic models from British makers have been unchanged for several years.

Nobody is as confident on the commercial vehicle side. These are capital goods and must be expected to suffer if capital investment by business goes down; neither total output nor exports have been particularly lively in recent months. Within this industry there is intense competition at the moment; the heavy vehicle producers have been feeling the draught more than makers of vans and light trucks, and the big car manufacturers have steadily been edging their way upwards through this market with bigger and bigger vehicles and larger production of their own diesel power units. But replacement demand is accumulating and must be released when the threat of renationalisation of road haulage is decided.

The Economist Diary

For the better ordering of the working day, and for the comfort and delectation of secretaries, there is nothing to equal it.

A week's appointments at an opening; a book that lies open flat on the desk	A diary lay-out specially designed to meet the needs of the busy man
Bound throughout in red leather; title blocked in gold. Size: 10" x 8"	All information easily found by means of handy thumb-indexes
A memorandum book, an appointments register, and a complete reference book	Facts and figures covering the world always available when required
43/- Price for U.K. only, including postage and purchase tax	Prices to overseas addresses vary widely; a schedule will be sent on request

ILLUSTRATED PAMPHLET *FROM DIARY DEPT THE ECONOMIST: 22 RYDER ST · LONDON SW1 · WHitehall 1511 (Ext. 30)*

Consumer Durables

THE motor industry is as much or more interested in business capital investment as in consumer durables; its stablemates in the metal consumer goods market have no such interests, which in 1959 means no such worries. The freeing of hire purchase, following the cuts in purchase tax for a variety of durable goods, has given the manufacturers of most of these goods a mighty fillip. They profess the conventional uncertainties about how long this will last, and whether a hire purchase boom merely brings forward purchases rather than initiating them; but, for the moment, they are all set to ride their boom while it lasts.

Less glamorous consumption goods have meanwhile been playing their part as the most stable elements in the economy. The British people eat a little more as their standard of living goes up; the amount that they are prepared to spend on clothing, however, has been declining, and with a considerably increased volume of imported clothing, the textile industries show little signs of recovery.

Chemicals

THOSE parts of the widely-diversified chemical industry whose demand is closely related to that of other basic industries showed a slight decline in 1958 following the drop in industrial output; for the chemical industry as a whole, 1958 brought the first fall in output since 1952. Output of heavy chemicals began to decline late in 1957, and consumption of sulphuric acid may have fallen by as much as ten per cent during 1958. Any recovery in 1959 will thus depend partly on a general economic advance. Paints and solvents are benefiting from the present high level of output in the motor industry and in building; dyestuffs and synthetic fibres have been affected by the general decline of the textile industry, which seems likely to continue.

But a large part of the chemical industry behaves rather independently of industry in general. This is particularly true of petroleum chemicals, and most of all of plastics. Feedstock deliveries to petrochemical plants rose during the first ten months of 1958 to over 725,000 tons, eleven per cent higher than the same period in 1957; while this represents a declining rate of growth in the latter part of the year, output is likely to rise somewhat this year.

Several new chemical plants were opened during 1958, including Britain's first synthetic rubber plant at Fawley. The current high rate of investment in new chemical plant reflects both the industry's ability to ride a general industrial decline, and its confidence in the face of considerable uncertainty about the future. While demand as a whole may not fall very sharply in 1959, margins will be lower and competition keener, both at home and from imports. Profits may be further reduced by increased depreciation charges on new plant. This year may also bring a further decline in exports, which fell from £267 million in 1957 to perhaps £260 million last year.

LETTERS

The Common Market

SIR—Only the last of your three major reservations against joining the common market is a serious obstacle to our membership. I myself would have made different reservations about the Rome Treaty, mainly concerning full employment policy, but for present purposes will confine myself to yours.

Your first reservation is certainly based on a very real problem, one which "Europeans" are indeed all too apt to overlook, but your conclusion is very much open to question.

You argue in terms of "new Japans" within the Commonwealth: but the problem of young industrial countries is only one aspect of a much wider problem—that of underdeveloped countries in general. The recent Haberler report prepared for Gatt gave priority to markets for agricultural exports from such countries, a priority your "Good European" correspondent was evidently allowing for in his suggestions for a relationship between the Commonwealth and Europe.

Further, with regard to "cheap" manufactures, you allow neither for the indirect effects of a dynamic "European" economy, whose development would—most are agreed—be hindered by the restriction of free trade to the Six, nor for the growth of trade in such manufactures between underdeveloped countries themselves, provided "Europe" pursues a favourable investment programme.

It is of course true that one or two Commonwealth countries would be somewhat worse off from losing the privilege of free entry into Britain for their manufactures. But is it not sounder to recognise their problems in the light of the foregoing considerations, and to seek out forms of compensation, than to elevate their difficulties into a principle constituting a major reservation against joining the common market?

Your second reservation takes out of context an admittedly rather rash statement by your correspondent. But his argument about getting "the best terms for Britain and the Commonwealth in Europe" would remain valid even if Commonwealth preferences did not all go by the time the common market reached its final form. It is enough for his case that the system of preferences has been eroded, is being eroded, and is likely to go on being eroded. It is a pity you did not follow up your correspondent's lead concerning possible alternative arrangements involving the Commonwealth.

Your final reservation is by far the most plausible. While a purist would prefer to describe "calling France's bluff" in other terms, e.g. "heeding the French suggestion that Britain should join the common market", it must of course be recognised that France would not take readily even to those reservations which your correspondent has himself made.

It is at this point tempting to cry over spilt milk, to lament our walk-out from the Spaak committee, and to argue that we could have obtained better terms more easily in 1955-56 than now, but is it really too late, as you imply, to break the deadlock by opting for membership of the common market? The only alternative form of possible agreement, to judge from the course of the negotiations, would fall far short of the conception of a free trade area, to which you have given such warm support in the past. Is not the former alternative, for all the political difficulties it raises, very much to be preferred?—Yours faithfully, J. C. HUNT

London, S.W.1

Teachers' Pay

SIR—Given your backwoodsman's view of what happens in the public system of education, I suppose it is something that you should at least recognise, in your editorial comment of December 20th, that teachers are in a "militant mood" following the breakdown in the Burnham Main Committee. That you should take a balanced view of the events leading up to the breakdown is, I realise, too much to hope for. That you should be so ill-informed about the membership of some of the organisations represented on the teachers' panel of the Burnham Committee is regrettable.

You find it difficult to understand what the Minister of Education is supposed to do. May I explain?

By the terms of the 1944 Education Act, no settlement can be made unless the Burnham Committee agrees and the Minister accepts its recommendations. Further, the committee can make recommendations at any time it so decides, and equally the Minister can invite the committee to make recommendations. The Minister has, therefore, some responsibility and we submit he should now intervene.

Only a journal so indifferent as yours is to the provision of adequate educational facilities for the majority of the nation's children, could take such a complacent view of the teacher supply situation, and such a disparaging view of the status the teaching profession should enjoy vis-a-vis others. The facts are that we need at least another 60,000 teachers by 1968 merely to reduce the size of classes to those prescribed by the Ministry regulations. A further 40,000 more would be needed to give real secondary education to all children, to say nothing of the extra numbers needed to replace the many thousands of unqualified teachers at present in the schools.

Whatever you might think about this union's case for a basic scale of £600 to £1,200, the fact is that it was not on the merits of that case that the breakdown in Burnham occurred. The chief reason for the union's rejection of the authorities' offer was that members were not prepared to wait two years for an effective response to an application lodged last April, or to see the present report run for three-and-a-half years.—Yours faithfully, FRED JARVIS

National Union of Teachers

Policy for the Unemployed

SIR—There is one aspect of redundancy to which your references to unemployment do not refer. It is not that of men above 65, by whom you mean industrial workers; it is that of men well below that age, technicians, managers, salesmen and the like, who find themselves out of a job or unable to move to fresh employment. In their case they are hamstrung by the advertisements which ask for men in their thirties or, at best, not more than 45. The reason appears to be the superannuation or pension schemes, largely backed by bulk insurance, which are offered as an inducement in the very jobs from which men still in their prime are debarred as applicants. For those in jobs the retirement schemes become a millstone where they were intended to be a sheet anchor and are likely to remain so till such schemes are transferable.—Yours faithfully, FRANK MACHIN

Sale, Cheshire

Israel

SIR—Your article of December 13th argues that the first move to allay hostility between Israel and the Arab States "must come from Israel or not at all."

In fact, such a move has already been made and I am surprised that you ignore it. It has always been the position of the Israeli Government that the question of reparations for Arab refugees could not be discussed outside the context of a general peace settlement. The Israeli delegate declared at the last session of the UN that Israel was now willing to discuss the reparation issue unconditionally. Does not a concession as considerable as this call for some response from the Arab side? The offer was refused outright.

The only "move" of the kind you ask for that would be acceptable to the Arab countries would be one which implied the liquidation of the Jewish state.

Unhappily, there can be no solution for the Palestine question so long as the Arab states refuse to admit the very existence of Israel, and no "moves" or "concessions" can have any point until this situation is changed.—Yours faithfully, S. SITTON

Paris

BOOKS

Unveiling the Oracle

The Blue and Brown Books

By Ludwig Wittgenstein.
Blackwell. 185 pages. 25s.

The Later Philosophy of Wittgenstein

By David Pole.
University of London: The Athlone Press. 132 pages. 15s.

Ludwig Wittgenstein: *A Memoir*

By Norman Malcolm.
Oxford University Press. 100 pages. 12s. 6d.

To the uninitiated the name of Wittgenstein conjures up a charismatic cult. He was the great philosopher who dominated Cambridge for a decade, who circulated his lecture notes privately among his followers, and who brooked no disagreement or criticism from his friends—with most of whom he eventually quarrelled. His followers inherited his strange sayings about language games, imaginary tribes, and feeling pain; they reduced his pregnant pauses to a kind of gamesmanship in discussion; and they paraded his passionate sincerity and seriousness—often about the most bizarre things. They were also accused by Wittgenstein of either misrepresenting his views if they published them or of making use of them without due acknowledgment. The world, as Whitehead put it, never quite recovers from the shock of a great philosopher. And when the philosopher happens to be a man who combined the dedicated passion for truth of a Socrates with a most eccentric and adolescent character, it is extremely difficult for the world to get clear what is hitting it.

The process of assimilating and getting into perspective Wittgenstein's contribution to philosophy will probably take a generation. But it has been eased and accelerated by the publication, within a short space of time, of three books which in different ways contribute to this end. There is first of all his famous "Blue and Brown Books," which were dictated to his class in Cambridge during 1933-34 and to two of his students in 1934-35, and circulated privately. This makes available to the public part of Wittgenstein's development from the position of the earlier "Tractatus" to the later "Philosophical Investigations," which were also published posthumously.

The "Blue and Brown Books" deal mainly with the question raised at the outset—"What is the meaning of a word?"—a question that produces a sort of mental cramp. Wittgenstein shows how this cramp is induced by our tendency to look for something in common to all the entities which we commonly subsume under a general term and to think of a general term as a kind of picture, and by our preoccupation with the methods of science. He tried to break free from such crude and common misconceptions about language by devising his famous language games. What would a language be like if, as Augustine said, we were taught to speak by learning merely the names of things? We must beware of nourishing ourselves on the meagre diet of a too simple model of meaning. Philosophy, for Wittgenstein, was the fight against the fascination which forms of expression exert upon us.

David Pole, in his "The Later Philosophy of Wittgenstein," makes an admirable attempt to clarify the central points of Wittgenstein's philosophy in a straightforward manner. He approaches it from the outside with sympathy and good sense. And since he combines a clear head with a fluent style of writing—a combination that is rare among the initiated—his book will prove an excellent introduction for those who need a succinct account of Wittgenstein's later philosophy without any mystical overtones. For Mr Pole is not like a man who goes to Delphi and tries to plumb the profundity of every cryptic utterance. He dares to criticise as well as to clarify the "official doctrine" and to develop his own—but too briefly. The appropriate reaction to this brave sortie is therefore not that of the initiated, who will cry "How superficial," or of the ignorant, who may exclaim "How true"; it is that of anyone else who wants to separate the sense of an oracle from its sententiousness—"Tell us more."

A similar feeling of fascination and incompleteness haunts the reader who sees Wittgenstein through the eyes of Von Wright and Norman Malcolm in their Memoir. Was there ever such a mixture of integrity, intensity and perverse puerility? How can one take a man very seriously who made such a strange show of being serious? The spell of the man hangs over his biographers' striving for impersonal and objective recording. Plato suggested that philosophy is a form of madness, and though there have been many great philosophers like Aristotle and Hume who were eminently sane, the mental torment and isolation of Wittgenstein give support to such a story. His life, no doubt, would provide a feast for Freudians and a godsend for anyone wishing to bring up to date the list of the world's great "outsiders" or "noble savages." But such approaches seem beside the point. One simply wants to know more about the man so that one can rethink his thoughts. But the more one reads the more the picture of his personality obtrudes upon the assessment of his thoughts.

Wittgenstein used to compare a person caught in philosophical confusion to a man in a room who wants to get out but does not know how. (A significant metaphor, one reflects, after reading about his life.) If he could only turn round, he used to say, he would see that the door had been open all the time. He himself was like the philosopher in Plato's cave who wrenched the prisoners round. But it takes time and trouble to accustom one's eyes to the new light. These three recent publications meet a real need by refracting its rays.

Placing the Cross

Marginal Seat, 1955

By R. S. Milne and H. C. Mackenzie.
The Hansard Society. 210 pages. 18s.

It is singular how little even professional politicians understand about what moves the ordinary voter. What explains the dramatic swing which—according to the Gallup Poll—has taken place in the last year? Who are the people whose fickleness has so transformed party prospects? No one knows. Ignorance in this field is the less excusable since the means for curing it exist. "Marginal Seat, 1955" is an admirable example of what can be uncovered about voting behaviour by a small team of research workers with very limited resources. Despite its unpretentiousness, it is the best book on the subject that has appeared in England, easily surpassing its own predecessor, "Straight Fight"—the 1951 study of the same constituency, North-East Bristol—and the 1950 Greenwich survey, "How People Vote."

"Marginal Seat" contains a formal description of the constituency, the parties and the campaign, but it is primarily based on the evidence of some 600 electors who were interviewed before and after the poll. The social characteristics of each party's supporters, and particularly of those whose allegiance wavered, are analysed, together with their exposure to the various media of propaganda and their attitudes to the issues and the parties. There are case studies of the conduct and opinions of twenty-five voters as well as an exploration of the part played by family pressure and "opinion-leaders" in the making of decisions. The whole is lucidly and succinctly presented and should be read eagerly by all political practitioners and observers; immediate steps should now be taken to sponsor further studies of this kind at the impending general election.

Many of the findings of "Marginal Seat, 1955" are inevitably familiar: the small part played by meetings and even by issues, the unimportance of the candidate's personality, the fewness of conversions during the campaign. But there are other conclusions that will occasion more surprise. The "floaters" did not come from the least interested or the least informed group of the electorate; they were drawn in very representative proportions from all sections—the old and the young, the rich and the poor, the bored and the eager. The Liberals were not a hard core of ageing free traders dreaming of 1906; they were unusually politically-minded, but many of them had never voted Liberal before, even though they had had the chance, while many who had voted Liberal in recent elections now deserted the party. The abstentions included an appreciable number of ex-Labour voters who said that, if they had voted in 1955, they would have voted Conservative; in other words, while it was in one sense true that Labour lost ground in 1955 because of Labour abstentions, a higher turnout might have helped the Conservatives. The voters were very ignorant about the issues of the campaign, but their attitudes were more Conservative than their votes. Labour supporters, although knowing less about their party's policy than the Conservatives, had a clearer "image" of the party itself—as the party that stood for the working class.

These and many other findings are set out in detail in this enlightening book. Despite their disheartening evidence of public ignorance and apathy, the authors come to a cheerful conclusion about the operation of British democracy. One of the best ways of testing whether their optimism is justified is for more research like theirs to be carried out.

The Age of Charles V

The New Cambridge Modern History. Volume II: *The Reformation*

Edited by G. R. Elton.
Cambridge University Press. 341 pages. 37s. 6d.

It is now generally agreed that the outstanding defect of the New Cambridge Modern History is the absence of bibliographies. The chapters that have been allowed bibliographical footnotes are twice as valuable as the rest. But there have been other failures to consider the needs of what Sir George Clark in the first volume called "those who read or consult a general history." The chapter head on the left-hand page and a paginal headline on the right would have made the volumes easier to use. A full system of cross-references (preferably on the inner margins) would have allowed events mentioned in different chapters to be seen synoptically in different contexts, and supplemented the indexes, which are good though not complete. And why does not each volume have a preface to explain its plan? The cancellation of intended chapters on international law and German constitutional development is too important to be concealed in footnotes. And the omission of any account of the Swedish war of independence and the establishment of the Vasas might have been argued, in relation to the principles of historical validity touched upon in the editor's introduction, against the inclusion of an excellent chapter on Russia under Ivan III and IV.

This volume is much better than "The Renaissance," and shows the advantage of an editor who himself contributes, providing a visible unity of treatment. Dr Elton writes on the Age of the Reformation and the English Reformation as well as on constitutional development in Western Europe and Germany. Professor Bindoff has a splendid chapter on the golden age of Antwerp. But the Reformation is happily treated not as an economic development but as a religious and political revolution, and theologians are given their head. Professor Rupp on Luther and Calvin, and Mr Payne on the Anabaptists, display an exuberance contrasting with Mr Evennett's Roman restraint on the new Orders. Professor Bizer roundly condemns Paul III's procrastination in calling a Council, and when he deals with Philip of Hesse's bigamy is embarrassed into making a personal declaration: "I cannot agree that Luther here stained his good name or acted wrongly as a theologian"—the most remarkable sentence, both in form and content, that has yet been published in the New CMH.

The mood of the volume might be illustrated by reference to two persons, Erasmus and Charles V. Erasmus's intellectual influence is all-pervasive, and gets fullest treatment in two first-class chapters by Professor Hay on literature and education. But the irenic hopes and tragic sadness of which he was the prototype are discounted. Professor Cantimori describes the Catholic reformers in Italy, perhaps justly, as romantic conservatives. The last great effort to conciliate the reformers at Regensburg in 1541 is seen as foredoomed, and Professor Rupp dates the final schism of Europe from Augsburg in 1530. Vittoria Colonna has only passing mention, the Michelangelo of the "Last Judgment" none at all.

If one can detect any such consensus between editor and contributors, it is perhaps the mood of an age that is out of sympathy with the Contarinis and Lord Robert Cecils of politics, and correspondingly attuned to a career, like that of Charles V, which embodies the insolubility of all political conflicts. Dr Elton warns the reader against an easy comparison of the sixteenth and twentieth centuries, but the diplomatic parallels and similarities of political fanaticism are inescapable. And the parochial believer in "the complexity of modern politics" might practise perspective by studying the complexity of Charles V's responsibilities. His slow, sad strength and scepticism are attested in many parts of the book. Mr Koenigsberger has an admirable chapter on the empire of Charles V in Europe; but Mr Spooner's on the Habsburg-Valois struggle, which is of great structural importance to the volume, is written with a wilful obscurity that spoils the good things it contains. It is a pity that when the chapter on international law fell out, Mr Hale remained confined to the art of war, instead of being allowed to cover international relations as he did in the first volume. In consequence both diplo-

Decision-Making and Productivity
By SEYMOUR MELMAN
High productivity and democratic methods in industrial decision-making *can* go together. That is the major finding in this detailed analysis of the so-called 'automation strike' at the Standard Motor Company in 1957. It challenges the conventional view that dictatorial methods are essential for rapid growth in productivity. *Illustrated.* 30s. *net*

Clerical Unions in the Civil Service
By B. V. HUMPHREYS
The first study of the formation and development of Britain's powerful Civil Service Clerical Unions. 'This is a much-needed history and it will become the standard work on the growth and power of trade unionism in the vast field of Government clerking.' (From the Foreword by Douglas Houghton, M.P.) 30s. *net*

Economics of Collective Bargaining
By P. FORD 10s. 6d. *net*
Its purpose is to assist all students of economics to look at the realities of collective bargaining in the light of current economic theory.

The Economic Theory and Policy in Finland 1914-1925
By ERIN JUCKER-FLEETWOOD
These two essays on the Finnish economy examine the country's economic and financial problems and the use made of economic policy in the years 1914—1925. No study of Finnish economic development during this period has ever been made before. 15s. *net*

BASIL BLACKWELL

HMSO

History of the Second World War

Factories and Plant

by WILLIAM HORNBY

The final volume in the War Production series. It deals with the provision of fixed capital for munition production. To obtain a true picture of the massive task of mobilising the industrial resources of the country to meet the demands of the three Services, the author gives a brief account of the development and growth of the munition industry and compares the methods of war production employed in the two World Wars.

37s. 6d. (*post* 1s. 6d.)

From the Government Bookshops or through any bookseller

HMSO

matic organisation and the great debate in Spain on the treatment of the Indians are only perfunctorily covered. And it is an oddity that the coronation of Charles V at Bologna, the last ceremonial meeting in history of a Pope and a Roman Emperor, is mentioned only in a subordinate clause. But such criticisms as these are descriptive, not censorious. This is a good volume, well planned, and with many fresh, valuable and well written chapters.

Unknown Settlers

They Came to New Zealand

By Marjorie Appleton.
Methuen. 318 pages. 30s.

THIS book is not a "blurb" for New Zealand. It says little about the country and its people today. Instead it aims to set the background to the establishment of a dominion which in less than a century and a half has grown from 150 to 2 million people, has converted Britons into New Zealanders with distinctive national and cultural characteristics and has given the world an example of how white and coloured can become part of one social unit.

With a population still only one quarter of Greater London's, New Zealand has pioneered social legislation in important fields, played an influential and generous part in international work (on a per head basis New Zealand is the largest or one of the largest contributors to international appeals for voluntary funds), and has given us such people as Rutherford, Gillies and McIndoe, David Low and Katherine Mansfield, not to mention the soldiers and airmen who fought in two European wars.

In a sense the author sets the scene for those later developments. Skilfully and kaleidoscopically little flints and chunks of history are fitted into a mosaic leading up to the settling of the country. Polynesian explorers, who discovered New Zealand in the tenth century, fixed stars through the half-shell of a coconut and navigated themselves back and forth across that alarmingly wide Pacific while Europeans were still locked inside their concept of a flat earth. Then came the groping fingers of Europe as Tasman and James Cook made their voyages.

In this age of enthusiastic anti-colonialism it is amusing to read how Britain was dragged slowly and unwillingly into taking possession of New Zealand. It was not until fifty years after Cook first visited New Zealand that the first concrete suggestion was made to send settlers there, and in 1831, when there were only 150 British people in the new land, they still had no official protection and feared that it was about to be taken over as a French possession.

There were exceptions to the apathy of politicians. John Lambton, later Lord Durham, is usually associated with Canada. This book refers to his part in promoting the settlement of New Zealand. To some extent, John Stuart Mill also saw the scope and value of a British Commonwealth. Yet for the most part, the story of overseas settlement belongs to the people who went out from the back-streets of Britain, struggled with loneliness, nostalgia, bush fire, drought and flood and did more to lay the foundations of Commonwealth prosperity than the politicians at Westminster. These people were building the foundations for a new power, but for the most part it went unrecognised.

Past, Present and Change

The Passing of Traditional Society
modernising the Middle East

By Daniel Lerner. With the collaboration of Lucille W. Pevsner.
The Free Press. 406 pages. $7.50.

THE role of communications, particularly radio broadcasting, in the Middle East today is so important that any serious study of it is immediately relevant. This study is the product of long and detailed researches by sociologists of Columbia University and Massachusetts Institute of Technology. The basic material is 1,600 interviews done by native scholars in the local language in six Middle Eastern countries, beginning in 1950. Professor Lerner, whose field is international communications, re-analysed these collected interviews for the purpose of presenting in this book his theory of modernisation and the contribution of communication to it.

As a sociologist Dr Lerner is, of course, interested in discovering regularities or trends in institutional or personal behaviour to account for the current social upheavals in the Middle East. As he read the evidence of these initial interviews from the area he discerned a new grouping of the population. Between the traditionals, clinging to the past, and the moderns, rejecting it, he found a large group of transitionals beginning to grasp the possibilities of change and responding in varying degrees to the stimuli now offered by mass media.

The common denominator of response that placed a person interviewed in the transitional group was his expression of opinions on impersonal or political matters. When enough such responses came from illiterates, it was clear that radio and films had served to arouse new interest in hitherto inaccessible ideas. Along with this evidence of the formation of opinion, the interviews brought out a surprisingly extensive capacity for empathy—that is, for *imagining themselves in other than* their present status—among the illiterates expressing positive opinions. This discovery confirmed Dr Lerner's thesis that modernisation requires transformations of character as well as of institutions and that such transformations distinguish a large element among the consumers of mass media in the Middle East today. He writes:

> Our concern is with the large historical movement, now becoming visible in the Middle East, of which an enlarged capacity for empathy is the distinctive psychic component. Our interest is to clarify the process whereby the high empathiser tends to become also the cash customer, the radio listener, the voter.

Unfortunately for the lay reader, much of Professor Lerner's clarification is presented in the technical jargon of the "disciplines" sacred to American social scientists. Since this constitutes a special language, its use in a general book about communications seems unnecessarily awkward. Few area specialists will question the basic assumptions borne out by the tables and graphs here: that a newly awakened and mobile middle group of young men is on the move in the Middle East; that their expectations and attempts to improve the terms of existence constitute both hope and danger in modernising unstable societies. It is useful to have the results of this pioneering effort to analyse the depth of the influence of mass media on this class.

The case studies of Turkey, Lebanon, Egypt, Syria, Jordan and Iran make sense, however, without the elaborate theoretical structure erected around them. The difficulty is, as Dr Lerner himself suggests, that he has two books here. The elaboration of his theory of modernisation would stand by itself as a text for the initiated. The case studies may be, as he says, more useful than "speculations which have not been disciplined by data." But they too suffer from the neutralisation that team production entails.

Lastly, area specialists may seriously question one of Dr Lerner's basic propositions: that Middle Eastern modernisers can usefully study the historical sequence of Western growth. Nothing is less likely or less applicable.

Mr Gadfly

Some Monetary Problems International and National

By Per Jacobsson. Edited by Erin E. Jucker-Fleetwood.
Oxford University Press. 374 pages. 42s.

A COLLECTION of essays and speeches on monetary policy, revolving round the constant theme of the importance of sound money and realistic interest rates, does not promise exciting reading; yet the fact is that Mr Jacobsson's book is hard to put down. It is not so much the lucidity of the style as the alertness of the mind: on paper as in speech, "Mr Gadfly" darts hither and thither, and his excursions into narrative and detail, often far afield but never without their relevance to the central theme, testify to the author's remarkable grasp. History, philosophy, even biology, are invoked in illustration of the lesson that "without stable money neither justice nor progress can be assured . . . that the human spirit cannot give of its best if it is harassed by all the uncertainties to which rapidly changing money values give rise."

Looking back over forty years, as he does in an absorbing 50-page introduction to this collection, Mr Jacobsson could fairly have said outright that he had won. The gyrations in economic thinking that have taken place in this period, the swing to Keynes and then

the reaction from Keynes, have largely passed him by. He was never an outright Keynesian in policy, yet he has a firm grasp of Keynesian principles, and his criticisms of cheap money in the postwar years have never suffered from the intellectual weaknesses of the extremist "anti-Keynesians."

The pendulum has indeed swung full circle for Dr Jacobsson. In 1919, as a young assistant to Eli Heckscher, he spoke fervently at Swedish political meetings to demand higher interest rates to combat inflation. Today, after twenty-five influential years at the Bank for International Settlements, Mr Jacobsson gives the same advice to the world, in his capacity as chief executive of the International Monetary Fund. Because of this single-minded and yet never narrowly based preoccupation, this book has a unity that such collections usually lack; it is a product of a fine mind and a vital man.

A Dickens Companion

Charles Dickens

By K. J. Fielding.
Longmans. 218 pages. 15s.

DICKENS is evidently so great a writer —it would clearly be absurd to regard him as anything else—that every age will probably find it necessary to interpret him, like Shakespeare, in the light of its own persuasions. Much in the attitude of his contemporaries baffles us today: Lord Jeffrey's judgment, for instance, that there was "nothing so good as Nell since Cordelia," or Thackeray's crying out at the death of Paul Dombey, "There's no writing against such power as this!" The sentimental Dickens is at a discount, and about the comic Dickens there is really nothing to be said. (But this was not always so. *The Spectator* protested against the "vulgar good humour" of "Pickwick," and deplored the author's "strong disposition to approve the distribution of punch . . . and kiss pretty women behind doors" as "not really English, and tending to modify English family feeling.") The inclination of modern criticism has been to offer us, instead, what may be called the morbid Dickens—the man fascinated by madness and violence, hallucinated by his own creations, driving his audience to hysteria and himself to the verge of the grave by the insane intensity with which he enacted the murder scene in "Oliver Twist." And along with all this has gone an exposition of an answering intensity, essentially poetic, in the use of imagery and symbolism in Dickens's prose.

Mr Fielding, who approaches his subject with the authority of one of the editors of the forthcoming Pilgrim edition of Dickens's letters, offers a firm and perhaps timely resistance to much of this. About the interpolated stories in "Pickwick" he judges that "little need be said"—except that they are "lamentable" and "unfortunate." Readers who are conscious of usually missing them out, and who have therefore been abashed by the importance attached to them by Mr Edmund Wilson, may now take heart to miss them out once more. And if they have the good habit of going on from "Pickwick" to "Oliver Twist" and then through the whole run of the novels, they will find Mr Fielding an agreeable companion through at least one entire reading. He brings extensive knowledge to bear with great economy, and his narrative is full of fascinating sidelights on the strange personality of the novelist. It is curious to learn that, hard upon the nationwide publicity attending his separation from his wife, Dickens was anxious to call a new periodical publication *Household Harmony.*

Sources of Tension

The Birth of a Plural Society: *The Development of Northern Rhodesia under The British South Africa Company, 1894-1914*

By L. H. Gann.
Manchester University Press. 230 pages. 25s.

THIS book had a curious origin. Mr Gann was commissioned by Professor Gluckman when he was Director of the Rhodes-Livingstone Institute to write a simple historical reference paper for the use of the institute's anthropologists. What Mr Gann produced was a much longer manuscript, designed to combine this piece of history with a more elaborate study of the tribal situation at the time and of the varying streams of immigration which flowed in upon it to form the beginnings of the complex plural society of today. His sponsors "rejoiced in their disappointment" and decided to arrange for the publication of the manuscript as a book.

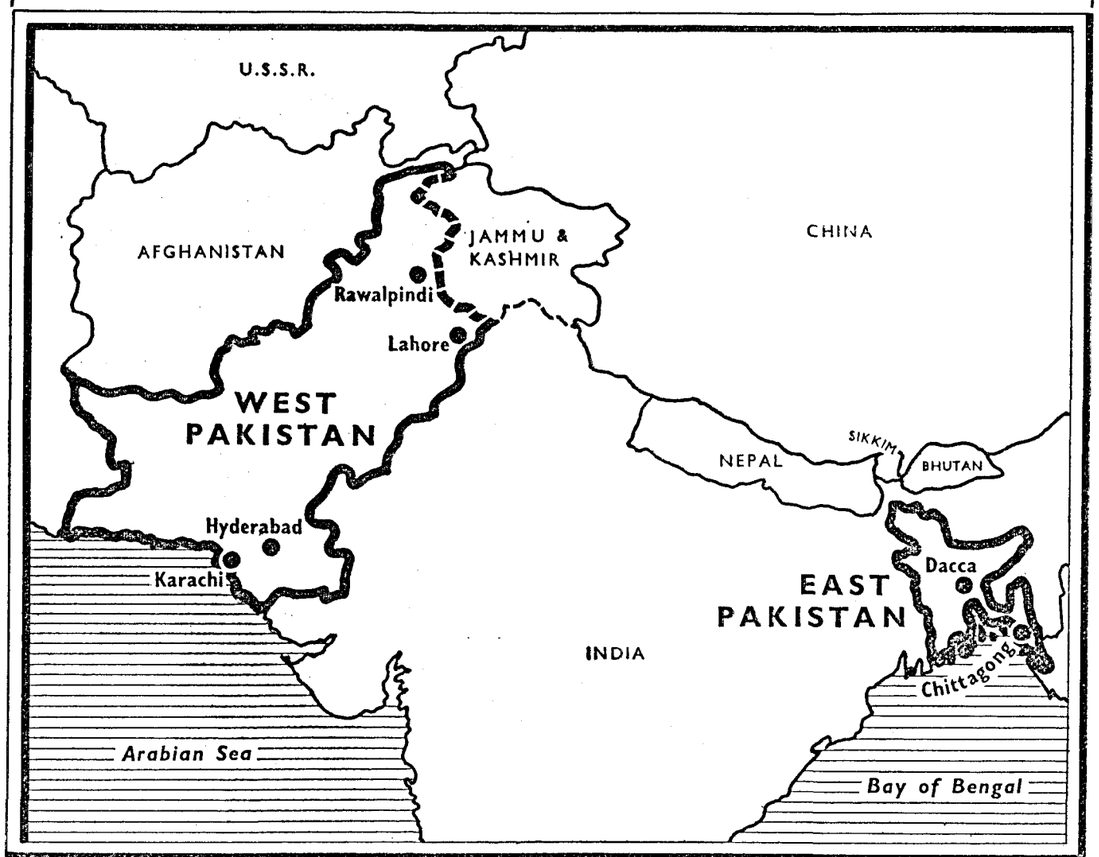
They were certainly justified in doing so because Mr Gann's contribution to the study of the racial and political problems of the Rhodesian Federation is both timely and promising. He uses a great variety of sources, including published works, official archives, newspaper files and the memories of elderly (European) Rhodesians, and his text is well documented. He carefully analyses the many types of immigrants—foreign and British missionaries, British administrators, Afrikaner and Rhodesian settlers, Indians and Jews—and their several attitudes. His treatment of the current tribal situation is thin but also useful, and so, up to a point, is his general historical treatment. His style is clear and workmanlike.

The book has, however, some rather serious limitations. Mr Gann's chief difficulty was that he had to put the cart before the horse. Detailed, limited studies of this kind should come after and not before a full history has been written. Of course Mr Gann sees this basic difficulty; he does try to fill one end of the historical vacuum by sketching in the pre-occupation era, but as it is not his period he fails to see, or at least to impress upon us, some of the very factors that most powerfully influenced race relations in later years. He does not, for instance, sufficiently emphasise that the early treaty-making administrators came as liberators in the truest sense, or the prolonged and lasting effects of the Christian example and evangelism of the missionary pioneers.

In his treatment of the history of his own period he is generally accurate and his judgments of the "Company" and the Colonial Office, though given with the severity of hindsight, may be accepted. There is, unfortunately, one serious omission. No account is given of the important events at the start of his period that led to the establishment of the North Charterland Concession and half a century of trouble.

Parochial Criticism

English Critical Essays: *Twentieth Century: Second Series*
Oxford University Press, the World's Classics series. 363 pages. 7s.



SURELY there is a misnomer here. If the designation "World's Classics" applies at all to literary criticism, it bears on such instances as the "Poetics," on the "Biographia Literaria," or on some of Baudelaire's essays. By no stretch of the imagination can it include a causerie on Leconte de Lisle by Sir Harold Nicolson, an amiable puff by Edmund Blunden or a little memorial for Denton Welch. Little in this odd volume assembled by Mr Derek Hudson is of universal interest; nothing of it is, as of this time, to be pronounced classical. Nor can this present collection be said to represent the obvious best in criticism. Naomi Lewis and Lord David Cecil are included; Helen Gardner is not. A chatty reminiscence by H. J. Massingham is placed near a genuine and powerful exercise in judgment by Dr Leavis.

Yet—and it is this which makes this volume worth looking at—Mr Hudson has succeeded in conveying a rather accurate picture of present-day English criticism. The result is not heartening. We observe the split between scholarship and *belles-lettres* (Sir Maurice Bowra pleads for reconciliation). We observe the parochialism of the English critic to whom foreign tongues, let alone foreign literatures, are all too often closed. Above all, we observe the spirit of clique, the art of criticism diminished to a game with highly determined rules and sides inexorably drawn. We are told of minor English novelists who must be read "with a kind of wistful admiration" albeit their prose is "hopelessly unambitious."

But all this has nothing to do with real literary criticism. And at a time when the language is under constant assault from the new illiteracy of the mass media, it is real criticism that is most urgently required and which most obviously deserves the imprimatur of Oxford's renowned series. Such criticism exists: in the writings of Edmund Wilson, in the subtle humanity of Lionel Trilling, in the essays of R. P. Blackmur. If it is rare in England (Mr Empson and Dr Leavis being noble exceptions), Mr Hudson's anthology tells us the reasons why.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

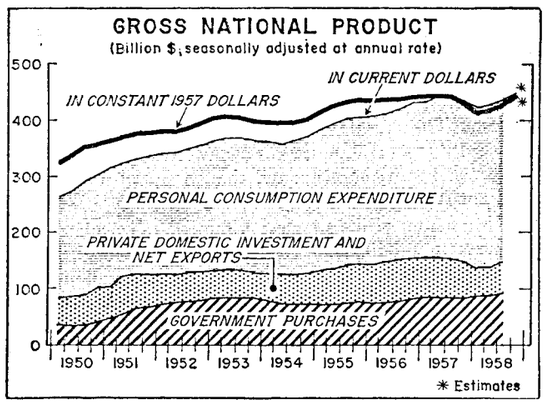
To Grow or Not to Grow?

WASHINGTON, DC

SELDOM, if ever, have men of good sense and good will differed so markedly and so intensely about what would be best for the American economy—while refusing completely to admit that any difference of opinion exists. The dispute between those who advocate more rapid economic growth and those who put the preservation of the value of money first is, of course, an old one, but the intensity of the feeling on both sides is new. Unfortunately, however, the debate is doing little to clarify the argument for the general public. This is because each side professes to accept the desirability of the objective aimed at by the other; some members of either side even go so far as to claim that their prescriptions will best achieve not only their own objective, but that of the other side as well. Thus Mr Martin, the chairman of the Federal Reserve Board, insists that over a period of time the rate of growth will be far greater if inflation is checked decisively, because growth will be interrupted less frequently. On the other side, Mr Leon Keyserling, the favourite economic adviser of the progressive Democrats, insists that the most rapid possible rate of growth is the best cure for the kind of "cost-push" inflation from which the United States has recently suffered.

As a result, even the best-intentioned public comment only serves to confuse the man-in-the-street still more. The *Washington Post*, the *New Republic*, Mr Walter Lippmann, the report sponsored by the Rockefeller Brothers Fund—all agree that more rapid growth is urgently needed; but none allows the readers to be aware that the governmental policies needed to achieve it might bring still more inflation. President Eisenhower, Mr Martin, and Mr Anderson, the Secretary of the Treasury, are thoroughly convinced that a squeeze on public expenditure and on credit is of the greatest urgency if respect for the dollar is to be maintained at home and abroad; but none of them is saying that such restraints may perpetuate the trend of the past few years during which the economy has almost ceased to grow and unemployment has risen uncomfortably. To make matters worse, the "growth" school—with all its near alarmist pressure—is seldom very specific about what should be done. It usually demands larger public expenditure, but more often than not this plea is accompanied by a rugged willingness to exact higher taxes—and the net effect on growth of such a prescription is dubious at best. The President seems convinced that a lower and balanced Budget will, to use his own words, help to promote "expansion" in the economy, though by what magic he does not say.

"You've Got To Stop Being So Inflationary"



It is a matter of the simplest arithmetic to calculate, from increases in productivity and in the labour force, that a rate of growth of 5 per cent a year in the national output is easily achievable and then to show all the resources that would be made available by such expansion. Americans are constantly being told that, in effect, they can have their cake and eat it: that they can have far greater public expenditure of all kinds at home, defend the country against the Soviet Union more adequately than now, and have a higher standard of living as well. Mathematically speaking, this is true. Enormous losses are involved in the slowing-down of the rate of growth during the past five years. The new series on gross national product at constant prices—that is, in real terms—just published by the Commerce Department reveals that the economy was virtually stagnant for a full year before the 1957-58 recession began and that 1955 is the only year since the Korean war in which the economy has shown a really acceptable advance. Then the national product rose by 8 per cent, but since then the annual average has been only a little over 1 per cent; such a slow rate of growth undoubtedly involves a very large waste of resources.

It is also true, however, that during the same period prices were more stable than at any time in the postwar period. The sharp increase in prices from early 1956 to mid-1958 was enough to cause nightmares to Mr Martin and to the President, but it was still much less severe than that which accompanied the steep upward movement in the growth curve from 1945 to 1953. Despite the talk, and the evidence, of "cost-push," it is difficult in the face of the facts to dispute the idea that restraints on demand, chiefly monetary ones, have

moderated both inflation and growth. And yet the overwhelming majority of economists testifying before Congress's Joint Economic Committee in the past year have insisted that a high rate of growth is fully compatible with stable prices. Needless to say, so have government officials and politicians.

In part, the reason why the question is hardly ever posed as a choice is that economists have not reached a decision on the nature of modern creeping inflation. Surely this is why Senator Lyndon Johnson, the Democratic leader, advocates more public spending accompanied by still another enquiry into the causes and cures of inflation. On

the other side, this explains Mr Martin's unequivocally-held belief that even creeping inflation will prove disastrous because it will lead eventually to galloping inflation, speculation and severe depression—all of which is far from certain.

The disagreements among economists on the causes, inevitability and tolerability of creeping inflation account for the self-assurance with which each side maintains that its policies will achieve its objective without undermining the objective of the other. An "expert" can always be found to support this view and thus to avoid the necessity of admitting that any price must be paid. Americans are constantly being told that they can "afford" to do what needs to be done to preserve their safety and to improve public services—and they are just as constantly being told that the one thing they cannot "afford" is a continuance of inflation. The only thing they are not told is that they may have to choose.

Political Arithmetic

AMERICAN Budgets are much less closely wrapped in secrecy than are British but it was unprecedented for a President to announce, as Mr Eisenhower did two days before Christmas, the general outline of his calculations three weeks in advance of their statutory presentation to Congress. Although the announcement was one of good cheer—that the coming Budget would be balanced and that less would be spent than this year—it was hardly in keeping with the season of peace. In effect the Republican President was declaring war on the Democratic majority which will be in control of the new Congress. He was intimating that he would not modify his election charges that the Democrats were extravagant spenders even though he now depended on them to get his programmes through the legislature. By producing his 1960 Budget when he did, and free of confusing details, Mr Eisenhower was trying to convey to the average, deficit-conscious American that it will not be the fault of the Administration but of an irresponsible Congress if in fact the Budget turns out not to balance at all when the figures are finally added up in June, 1960.

In fact to the Democrats in Congress it is the President who looks irresponsible. Practically all of them profess to be as anxious as is Mr Eisenhower to see the Budget balanced but in their view he is over-optimistic in his confidence that prosperity will build up fast enough to bring a rise of $9 billion in tax receipts, chiefly from the existing levy on corporations. On this basis the Administration estimates revenue at $77 billion in the 1960 fiscal year. It expects to bring expenditure down to that level from this year's $80 billion by the automatic ending of various temporary programmes, mainly introduced to counter last year's recession, and by holding other outlays at or below the 1959 levels. Thus it is hoped to eliminate in one year the current deficit of $12 billion which, incidentally, at this stage in 1958 was expected to be a slight surplus.

Defence spending is the exception: it is to be higher than ever before but by how much is not yet known; it is unlikely to be enough to satisfy the many members of Congress who are convinced that it is now dangerously low. And the progressive Democrats who are coming to Washington, many of them for the first time, flushed with their election successes, are pledged to programmes of social welfare, slum clearance, education and so on, which are also supported in theory by the party's leaders and which are bound to mean more spending. It is rumoured that, on the Republican side as well, a group in the Cabinet, perhaps backed by the Vice President and certainly backed by the "modern" Republicans in Congress, has been trying to make the President face the lessons of the election returns but has been defeated by his blind insistence on holding down government spending at whatever ultimate cost to his party. But the advance publicity arranged for his Budget shows that Mr Eisenhower is not entirely unconscious politically.

Mikoyan's Holiday Tasks

OSTENSIBLY Mr Mikoyan, a Soviet Deputy Premier, is coming to the United States for a two weeks' holiday to visit his friend, the present Russian Ambassador in Washington. Officially it is presumed that, since he is a foreign trade expert, he will discuss how to increase commercial exchanges between the United States and Russia. Less officially it is believed that he hopes to arrange a meeting between President Eisenhower and Mr Khrushchev. Unofficially it is guessed that he wants to feel the international temperature of the United States, particularly as it affects Berlin. The State Department has prepared a warm welcome—warmer than on some similar occasions in the past—for a man who is said to be as charming as he is shrewd and who is close to Mr Khrushchev; his visa was granted with extraordinary speed and all doors are apparently to be open to him. But this does not necessarily mean that he will come away with hot news.

After a visit to the United States in 1936 Mr Mikoyan introduced ice cream cones to Russia and this time he is expected to ask for machinery to make other consumer goods so that the Russians may share more of the benefits of the American standard of living. If he is refused he will be able, when he goes home, to tell Russian consumers that it is the fault of the American government that they have to go short. But Washington doubts whether any substantial or durable commercial relations can be established with the Soviet Union; moreover, there are legal barriers against the credit facilities which the Russians have always maintained are essential if they are to increase their trade with the United States. Here Mr Mikoyan will be facing bargainers as tough as himself.

It has been noticed that Mr Mikoyan is taking his holiday just as members of Congress return to Washington from theirs. It is suspected that he may be hoping to embarrass President Eisenhower and Mr Dulles by exploiting his personal contacts with Senator Humphrey, whom he met in Moscow, and with other Democrats who are critical of the Administration's foreign policy. But his chances of success in this, never very great, will be lessened by the President's latest effort to ensure that there shall be co-operation and understanding between Congress and the Administration on international affairs, however lacking it may be on domestic matters. Top officials are to give the Senate Foreign Relations Committee a complete and informative exposition of the present American position in the world as soon as Congress reassembles instead of waiting until the next crisis develops to put Senators in the picture.

Strikes Off and On

NEW YORKERS had one cause to be happy as the New Year approached: the longest and costliest newspaper strike in the city's history was over. For nearly three weeks nine daily newspapers had gone unprinted because a handful of deliverymen refused to accept the recommendation of their negotiators that they approve the same settlement won earlier by the Newspaper Guild, the editorial workers' organisation. For a strike which is estimated to have cost the newspapers, the shops, and laid-off workers somewhere in the region of $50 million, the numbers involved were fantastically small; their financial gains were nil. Some 2,600 men took part in the vote on December 26th to accept the $7 a week rise, spread over two years, which the publishers had offered originally and which was turned down earlier by a vote of 877 to 772—a total of only 1,649. What the rebels in this tiny, ultra-democratic (if not anarchic) father-to-son union may have achieved is to show that they must be consulted when any wage pattern for the industry is being fixed. But they were too well paid already to command sympathy from the eight other newspaper unions, who refused to come to their aid.

New Yorkers can once more retire gratefully behind their newspapers, but like other Americans their freedom to travel, at least by air, is still restricted by other small but vitally important groups of workers. Flying south to the sun in Florida and the Caribbean is difficult because, although Eastern Airlines, the great north-south carrier, has settled with its mechanics, it is still immobilised by a strike of flight engineers. And flying west is hampered because American Airlines, the largest carrier of all, has been paralysed by a pilots' walk-out since just before Christmas. Over a third of the country's domestic air fleet is grounded.

On the surface these are disputes about pay and working conditions, but they are bedevilled by the "third man" issue, which is really an inter-union matter. The question is whether, on the new jet aircraft, the third man in the crew (two are pilots) should be an engineer, as at present, or should have had pilot's training. Both the pilots and engineers fear that the bigger, faster jets will reduce the number of jobs for them. Two government agencies have given directly contradictory rulings. The only solution likely to please everyone—except the accountants of the poorer airlines—is the squeezing of a fourth man into the cockpit, so that a jet would carry three pilots as well as an engineer. American is said to feel that there is technical justification for this flying featherbedding; and if it leads, the other lines will have to follow.

Leading Republicans

THE Eisenhower Republicans who this week chose Senator Cooper of Kentucky as their candidate for Republican leader in the Senate were defying not only the dominant Old Guard of the party, including the redoubtable Mr Styles Bridges, but also the President himself. With the Republicans in the Senate depleted to a threadbare 34, Mr Eisenhower had expressed the hope that the unity of the party would not be shaken by a contest. But the ten "modern" Republican Senators no longer regard the President's word as law; some doubt, on the evidence of the conservative Budget which he has just drawn up, whether he can himself be regarded any longer as an Eisenhower Republican. The President has, in any case, long cold-shouldered his most loyal supporters in the party in order to maintain cordial relations with its powerful conservative leaders. Very clearly he does not read the election returns as the insurgents do: as a mandate to the Republicans to face the future or perish. This handful of progressives argues that if the party is to speak with a modern voice that appeals to the voters, it must choose modern Republicans to lead it.

The conservatives have picked—and the White House has approved— Senator Dirksen, a flexible politician who was once a devotee of Senator Taft, but was painlessly converted to Mr Eisenhower. If he is elected, the conservatives seem prepared to give the liberals the post of assistant leader and a fairer share of the important committee assignments of which they have been starved until now. This is hardly half a loaf and the Republican liberals, who in the past have not been conspicuous, as a group, for back-bone, seem for once determined to demand more. They are unlikely to get it; most observers feel that, with Vice President Nixon standing quietly on the side-lines and with Senator Bridges assiduously pulling every wire, Senator Dirksen will be elected by about 19 votes to 15. The liberals' choice of Senator Cooper—in itself an excellent one—seems designed to retrieve one escaping vote. It is that of Senator Morton of Kentucky, whom the liberals thought of as one of themselves until he disclosed, after a visit to the White House, that he would vote for Senator Dirksen—unless his fellow Kentuckian, Mr Cooper, was a candidate.

Rule to End Minority Rule

FROM A SPECIAL CORRESPONDENT

WHEN the Eighty-sixth Congress convenes on January 7th the Senate will be plunged at once, for the fourth time in recent history, into a struggle to change Rule 22 which governs the shutting off of debate. What is at stake in this highly technical argument is the delicate balance between the rights of the majority and those of the minority. When the Constitution was being drawn up, the small states were concerned lest they be overwhelmed by the large ones. Their qualms were overcome by giving equal representation in the Senate to all states, whatever their population; for example, Delaware, which has only one Representative, has two Senators, just like New York, which has forty-three Representatives.

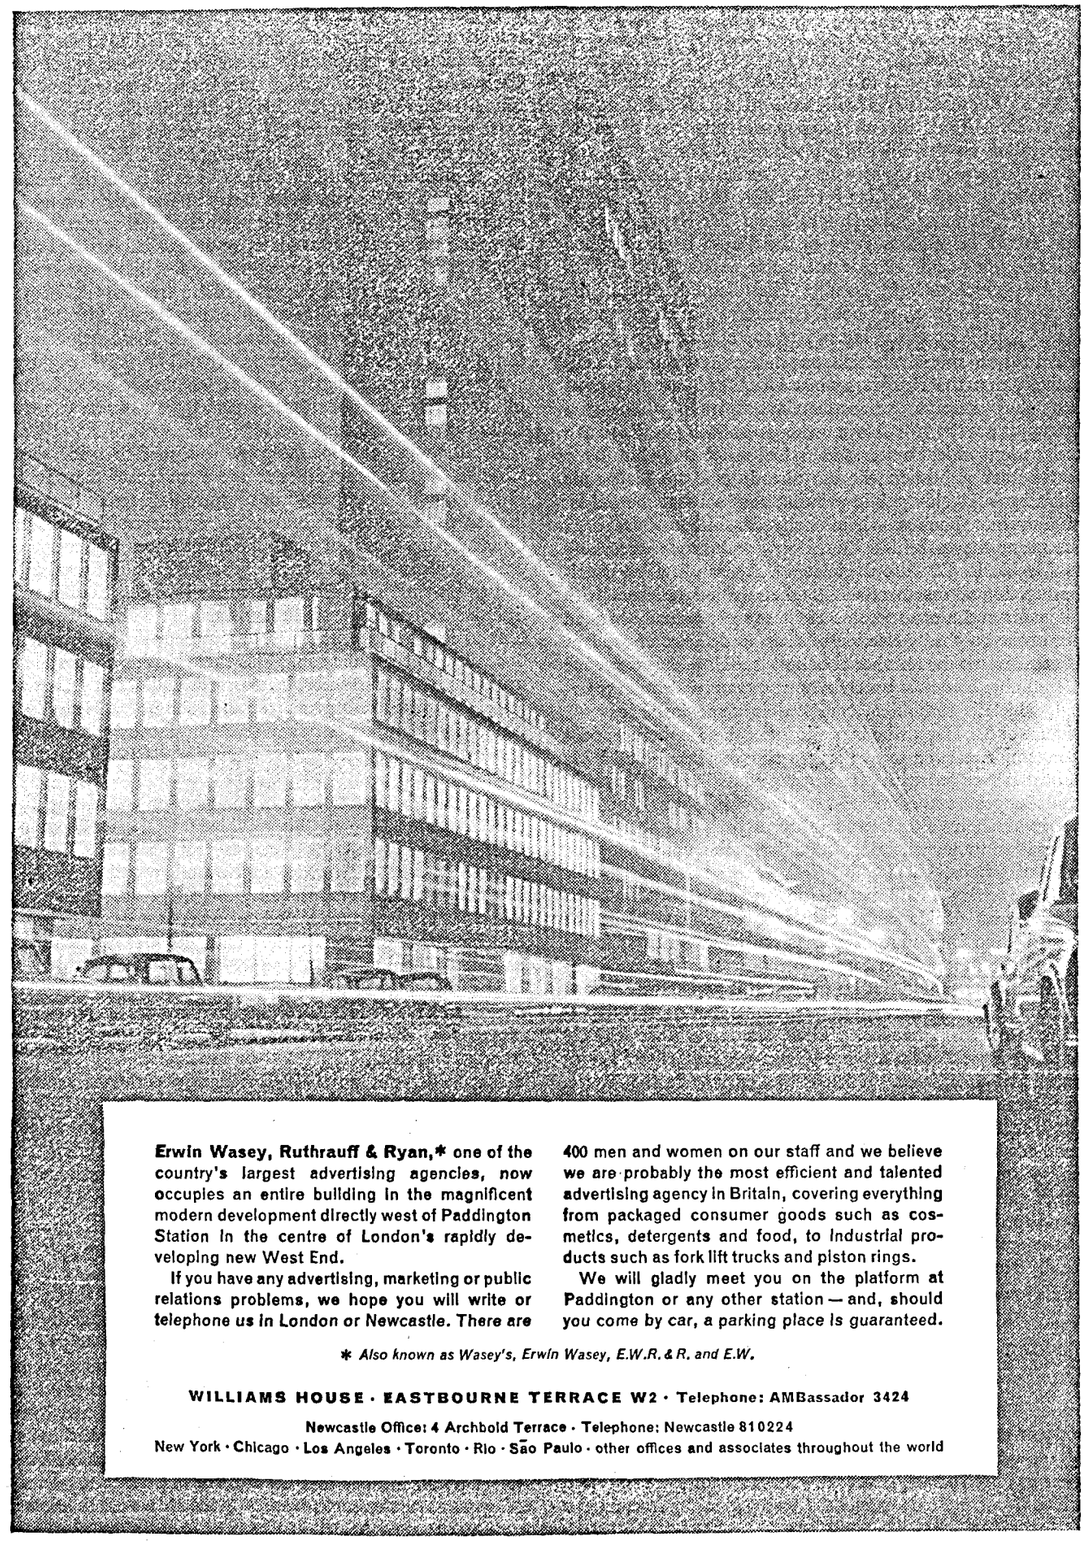
As time passed, the views of the minority gained further weight through the institution of the filibuster, a name borrowed from Caribbean free-booters to describe the process by which one or more strong-lunged members can talk a measure to death by holding up all other business. Next week's debate in the Senate will be over the means by which filibusters might be curbed more effectively.

In the early years of the Republic, debate in the Senate was controlled in two ways. One was the practice, taken over from British parliamentary procedure, of moving the previous question, but this was dropped, for unrecorded reasons, in the general revision of the rules in 1806. The other sobering influence was the power of the Vice President, in his capacity as presiding officer of the Senate; Adams and Jefferson were strict taskmasters, and no appeal from their rulings was possible. But the position of the Vice President was eroded in the course of the nineteenth century and by 1872 Vice President Colfax had ruled that "under the practice of the Senate the presiding officer could not restrain a Senator in remarks which the Senator considers pertinent"; thereafter, the filibuster flowered. (Irish nationalism provided Parliament with a similar problem at about the same time.) As pertinence became irrelevant abuses grew, until in the nineteen-thirties Senator Huey Long indicated his disapproval of the National Recovery Administration by reading to his fellow members good recipes for fried oysters.

YET the technique of prolonged debate has by no means always been misused, nor has it been a monopoly of either liberals or conservatives. Today southern Senators use the threat of a filibuster against Bills to protect Negro rights, but during the first quarter of this century it was frequently employed by Republican progressives such as Senators Borah, Hiram Johnson and LaFollette. Sometimes the filibuster has been used to delay a vote and expound an issue, with a view to gaining time for an informed public opinion to be mustered; sometimes, of course, it has been used to prevent any vote at all, and so to frustrate the will of the majority at a given time.

During this century three efforts have been made to provide a means of closing off debate. In 1917, when the United States was about to enter the first world war, the arming of merchantmen appeared certain to be blocked by a group of anti-war Senators, and there was no way of ending a filibuster. So, at the opening of the new Congress in March, Senator Walsh of Montana proposed the adoption of new rules, and thereby raised the vexed issue of whether the Senate is a "continuing body." Since only one-third of its members are elected every two years, some people hold that its rules carry over from session to session; others resent, quite as strongly, the dead hand of past majorities. Appalled by the prospect of this Pandora's box being opened, the Senate hastily voted, by 76 to 3, to change Rule 22 to permit debate to be ended by a vote of two-thirds of those present.

This change remained in force for 32 years, but in only four cases out of twenty-two was debate successfully shut off. And in 1949 an effort to make it easier to close debate made it, instead, harder, for a vote of two-thirds of the entire membership of the Senate, present or not, was required. It was also stipulated that debate on any motion to change the Senate's standing rules should be completely unlimited—a provision which made change impossible. Two further efforts to raise the question of the rules failed, but in 1957 38 Senators favoured a change as against only 21 in 1953.



NOW that the voters have retired so many reactionaries and returned so many progressives to Congress, the omens look more favourable for another assault on Rule 22, this time by a bipartisan group consisting of Senators Douglas and Humphrey for the Democrats and Senators Javits and Case for the Republicans. Their motion for the adoption of new rules will be based on two arguments: first, that Article 1, Section 5, of the Constitution declares that "each House may determine the rules of its proceedings," and second, that the theory of a "continuing body" is untenable in view of the fact that all Bills and resolutions not acted on by one Congress must be re-introduced in both the new House and the new Senate.

The southern Senators, who possess very considerable parliamentary skill, may respond in several ways. They can seek a ruling on the "continuing body" argument from the Vice President, Mr Nixon. But this would be unlikely to favour their case; in an advisory opinion he gave in 1957, Mr Nixon's view was that rules adopted by the Senate in the past could not prevent a new majority from adopting its own rules. It is more probable that the Southerners will try to table the motion demanding a change in Rule 22; if this move were successful, as it was in 1953 and 1957, it would end the entire proceeding.

If, however, a motion to table is made and lost, and a motion to adopt new rules is carried, the debate will move into uncharted territory without any agreed rules. Much time may therefore be spent in deciding what rules should prevail in this preliminary struggle. Should a two-thirds majority be required to bring the question to a vote, or the simple majority favoured by many Senates of State Legislatures in all sections of the country? (Northern members tease southern Senators with the fact that the Constitution of the Confederacy provided for majority rule, with strict provision for ending debate.)

WHEN and if the debate reaches the stage where substantive proposals to replace Rule 22 are offered, two views are expected to emerge. If any change is made, it may well be a compromise between the two. Mr Johnson, the Democratic leader in the Senate, has hinted that he would not be opposed to a return to the rule that required for closure only two-thirds of those present and voting instead of two-thirds of the entire membership. This is too small a concession for the liberals; they favour a Bill drawn up during the last Congress.

This would make it possible to limit debate by a vote of two-thirds of the Senators present and voting, two days after 16 Senators have filed a petition for this purpose. Fifteen working days later, the Senate, by a majority vote of those "duly chosen and sworn" (50 of 98 Senators after the admission of Alaska) would be enough to choke off a filibuster although, as under the present rule, each Senator would be able to speak for an additional hour before the final vote. Consideration of the Senate's rules would not be exempt from this procedure.

Dr Alford Written Off

As soon as it begins to swear in its members, the House of Representatives will have to decide what to do about Dr Alford, the most outspoken advocate of racial segregation on the old Little Rock school board, who successfully persuaded Arkansans to "write-in" his name on the ballot instead of voting for the duly chosen Democratic candidate, Representative Brooks Hays. Mr Hays is a tragic loss, for in his sixteen years in the House he has applied a healing, moderate and constructive touch to the racial troubles which rack the South. The relative virtues of the candidates, however, are not the point, as Mr Hays himself insists; the issue is the honesty of the election.

Already a special election committee has found, unanimously, that the charges against Dr Alford are so serious that they deserve exhaustive investigation. They are brought, not by Mr Hays, who is showing a Christian resignation which must sadden his supporters, but by a Little Rock publisher who has already paid for his public spirit by losing his public printing contract—at the behest of Governor Faubus, whom many consider to have been the prime mover behind the Alford candidacy. According to Mr Wells, Dr Alford violated Arkansan law by distributing, for voters to attach to their ballots, stickers with his name and a cross; some of these were actually handed out at the booths by election officials, in defiance of the law. In some wards the number of ballots is said to have exceeded the number of voters; moreover, anonymous election material, which is forbidden, consisted in some instances of a picture of Mr Hays, who is president of the Southern Baptist Convention, talking to two Negro churchmen. Finally, Mr Alford is charged with representing himself as a Democrat while opposing the official nominee, Mr Hays, who had been chosen by a 15,000 majority of party members. Dr Alford won the general election by 1,200 votes out of a total of 60,000.

These charges will be thoroughly aired, but first the House must decide whether to seat Dr Alford while the investigation is pending. This is the issue which split the special committee, with three Northerners voting to recommend that he should not be seated until he is given a clean bill of health, and the two Southerners opposing this departure from past practice. The Democrats have already omitted Dr Alford's name and picture from their list of successful candidates. If it comes to a vote in the House, the North would probably prevail; besides, even some Southerners want to stamp out the risk of "write-in" methods spreading to their own constituencies. But an angry quarrel at the start of the session might jeopardise other plans; moreover, any unusual harshness might make Dr Alford a martyr in Little Rock and guarantee his victory if the seat is declared vacant and a new election has to be held. No wonder Mr Hays is not tempted to stand again.

Christmas Blessings

NEW YORK

The hope that Christmas sales would make up for the slackness in retail trade during the earlier part of the year has been largely justified. Department store business, which for the first six months was 3 per cent below the corresponding 1957 figure, is expected to show a small gain, around one per cent, over last year's record total of $200 billion for 1958 as a whole. However, the blessings of the Christmas season—which accounts for some 20 per cent of annual retail sales—were unevenly distributed. On the west coast some shops reported an improvement of 10 per cent or more over 1957. But the persistence of a relatively high rate of unemployment, as well as of strikes in the motor industry, made Christmas less merry in Detroit and sales in Boston were disappointing for no better reason, it seems, than that the weather was either so unseasonably warm that shoppers refrained from buying winter woollies or so unseasonably cold that they preferred to remain at home. Weather, indeed, is a vital consideration during these shopping days; one snow-storm can ruin a cherished annual statistic. In New York the newspaper strike brought a sharp drop in ordering by post or telephone, but this lost business was offset to some extent by a heavier concentration of personal customers.

Retail shops took special pains this year to bring their advance Christmas activities to the attention of the public. Defying daytime temperatures of up to 80 degrees, a group in Tampa, Florida, celebrated the opening of the season by converting a central shopping street into a winter-sports centre, complete with a five-storey ski-jump, a toboggan slide and an ice-rink. Thousands of enthusiasts delighted in this intimate acquaintance with snow, or rather with the 100,000 tons of ice-shavings which were required, in the course of one week, to cheat the sun. Elsewhere skating rinks sprang up in unexpected places—in the main halls of at least two large department stores and in the lobby of a New York bank. In California one shop made an unusually expensive improvement on nature by constructing its Christmas tree of chinchilla fur—at a cost of $125,000.

The calendar makes its own contribution to the statistics of retail trade and in 1958 it provided a vital extra shopping day (compared with the previous year) between Thanksgiving, the fourth Thursday in November, and Christmas, December 25th. Traditionally, the shops accept the fact that even the most foresighted customer is unlikely to relish the thought of a second turkey until the first is eaten; the day after Thanksgiving, therefore, marks the official beginning of a shopping season that can shrink or swell within a margin of six days according to how the dates fall in November. Shopkeepers have always resented this arbitrary and shifting limit to their enterprise, and this year a few boldly put up their Christmas decorations as early as the second week of November—a disconcerting sight in a New York still basking in an Indian summer and an unmerry prospect for the many who feel that the commercial enthusiasm for Christmas should be kept within bounds.

Scientific Co-ordination

President Eisenhower has lost no time in acting on one of the proposals of his advisory committee on strengthening American science, but its other, more fundamental, recommendations may not be implemented so promptly. Mr Eisenhower was anxious to get the new inter-agency council on science and technology established before Congress intervened, as it has been showing signs of doing, to set up an independent department of science to manage all government research work. Since this work is directly related to the separate activities of the individual agencies involved—the Department of Health deals with drugs, the Department of the Interior with fuels and so on—the advisory committee felt that central administration would be disastrous. Nevertheless, the need for co-ordination is obvious—hence the new council. Theoretically research work has been integrated at cabinet level; but it is unlikely that, for example, the Secretary of Health and the Secretary of Agriculture are aware, or bother to tell each other even if they are, that their subordinates are conducting overlapping experiments on food preservation. The new council will have representatives at the research working level from all the agencies involved, including the Atomic Energy Commission and the new Aeronautics and Space Administration. It will be headed by the President's own chief scientific adviser, Dr Killian.

The new council, by ensuring that there is more co-operation and less duplication between government research programmes and between public and private ones, will help the Administration to get better value for the $5 billion it is spending on research each year; as much again is spent by private interests. The advisory committee does not think any more tax money is needed but it does think that private research groups—universities and industrial firms—should be encouraged to widen their projects, mainly by helping them to meet the capital costs of additional research facilities. Workers in government laboratories should be better paid and should be eligible for administrative jobs. Government contracts with private companies should be for three years, instead of the usual one, and the companies should have more freedom to develop new ideas under these contracts, in order that the government programmes should have more continuity and balance and, above all, in order to foster creative research.

The advisory committee's most important criticism was of the over-emphasis which is put on applied research—missiles, satellites, etc. The government spends only 6 per cent of its research money on basic research, which is directed to no immediate end but without which, in the long run, applied research dries up for lack of new ideas. Nevertheless, the advisory committee, after its ten months' study, believes that American science has "a scope and strength unequalled anywhere in the world." Its recommendations are intended to ensure that this advantage is maintained.

Keep Cool on the Road

FROM A CORRESPONDENT IN DALLAS

There is an apocryphal tale of the Texan who arrived home perspiring and limp, to be greeted by his wife with: "Why on earth didn't you open the car windows?" "What!" he replied. "And let the neighbours know it's not air-conditioned?" Not everyone in Texas drives an air-conditioned car to keep up with the Joneses, but more people enjoy this luxury in Texas than anywhere else in America. In fact, Texas—and more specifically, the Dallas-Fort Worth area—is the cradle of the American automobile air-conditioning industry. Of well over a dozen independent manufacturers in a still infant industry, six make their headquarters in the area.

A combination of high temperatures and incomes that permit people to have the latest "extra" on a car as soon as it becomes available—an air-conditioner costs $300-$500—seems to be responsible for this concentration in Texas. Air-conditioning of automobiles in America began in the late nineteen-forties, but until the past few years only the most expensive makes, such as Cadillac and Lincoln, were equipped with it. Even today, sales still are concentrated heavily in the southwest, which is warm all the year round; about 45 per cent of all the air-conditioned cars are to be found in the five states of Texas, Oklahoma, Arizona, Louisiana and Kansas. But their number is growing in other warm areas, such as Florida and California, and the manufacturers in Texas are extending their activities all over the country.

They were able to make progress even last year, when the motor industry was in a severe slump. Although the output of new cars declined over 20 per cent in 1958 compared with 1957 even though sales of air-conditioners for cars were about 18 per cent higher in the first nine months of the 1958 model year (the period ending June 30, 1958) than they were for the same period of 1957. About two-thirds of all such sales are accounted for by the automobile manufacturers themselves, who make or buy air-conditioners, mostly for installation at the factory, but also for sale through dealers. But the independent producers, with their one-third or so share of the total, amounting to 142,330 units in 1957, appear to be gaining ground. In 1957 their sales grew faster than those of the automobile companies, and last year, while the motor companies just about held their ground, the independents forged ahead.

The chief advantage of a small firm based in Texas over a giant corporation in Detroit lies in flexibility. The big manufacturers of automobiles make air-conditioners exclusively for their own products, and the units are not interchangeable among makes, nor, of course, are they sold for installation on the cars of rival companies. By contrast, the Frigikar Corporation, the largest of the independent manufacturers, is prepared to instal any of 156 different air-conditioners on any new or old model in a matter of a few hours. There would be plenty of room for expansion for the Texas independents even if not a single new car came out of Detroit for the next five years. By the end of 1958, there probably were close to 60 million cars on the roads of America, and of these only some 2 million, or 3.3 per cent, were air-conditioned. And when temperatures soar, an air-conditioner is welcome whether it is fitted to an old model or a new one.

Even when Texas and the southwest become saturated—which still is a long way off—there will be untapped opportunities in the rest of the country. The heavily populated northeast, for example, accounted for only about 5 per cent of all sales last year. The manufacturers hope to do better by stressing the value of air-conditioning in eliminating dust, pollen and noise, as well as heat. They also are developing an export business with such natural markets as India, Singapore and the Middle East. They are beginning to air-condition foreign cars; for example, the Clardy Company recently reached an arrangement to air-condition automobiles for the British Rootes group. Finally, they are winning contracts to air-condition lorries. This niche of enterprise which Texans have whittled out for themselves is being broadened to a national business.

THE WORLD OVERSEAS

Nasser's Year of Wonders

BY OUR MIDDLE EAST CORRESPONDENT

THE Arabs seem to reserve many of their surprises for Christmas ; or perhaps it is merely that their surprises are so frequent that some of them are bound to fall within any given season. At the end of 1957 the Christmas holiday saw the beginning of the swift moves that resulted, after years of hollow talk, in the union of Egypt and Syria. In 1958 it was marked by a change in the attitude of President Nasser and his associates towards the Arab Communists in Syria. The communist newspaper, *An-Nur*, has been suppressed. Khalid Bakdash, the outstanding Arab Communist, has been forced for the second time into exile behind the Iron Curtain. A high-powered committee, with two Egyptians and one Syrian, has been formed to enforce compliance with the law in the Syrian region of the United Arab Republic.

In theory these measures mark no radical departure. All party activity in Syria was banned nearly a year ago, when the UAR was formed. Yet for many months the ban was applied with a light hand. Bakdash was allowed to stump the country freely ; while his newspaper conducted a barely concealed campaign against the one-party state, drawing a sharp distinction between the old Egyptian parties (" instruments of imperialism") and the Syrian parties (" foremost in the fight against imperialism "). The significance of the present governmental line is that the ban is now being applied with firmness, and that the new policy was preceded by an important speech by President Nasser, roundly accusing the Arab Communists of treachery to the Arab cause, on the patriotic occasion of " Port Said Day."

The strength of the Communists in Syria was always exaggerated, both before and after the union with Egypt. They could have been suppressed at any time, without fanfare. It was a fair inference from the hubbub that accompanied the measures taken against them that President Nasser was speaking not only to the Syrians, but also to the Iraqis. The inference became inescapable when Cairo newspapers, for the first time, were allowed to print acid comments on the course of events in Iraq.

The first signs of this new approach appeared in November, when President Nasser, in private conversation with his associates, expressed fear and irritation at the growing power of the Iraqi Communists. His fear was that the Iraqi prime minister, Abdul Karim Qasim, was committing himself too far to the Communists and their Kurdish allies ; his anger was directed largely against his own closest followers in Iraq, who had obviously overplayed their hands, just as the Jordanian Nasserists had overplayed theirs in the days that led to King Hussein's coup of April, 1957. For some weeks he hesitated, anxious to avoid a rupture with Qasim and to give his followers no false hopes that might lead to further premature outbreaks. Some time in December, it is now evident enough, he decided that he could hesitate no longer.

The new pattern is not yet clear ; but three questions pose themselves. Was President Nasser's speech on Port Said Day a message of encouragement to his followers in Iraq ? Was it a warning to Brigadier Qasim ? Was it intended to serve notice on the Russians not to press too far the advantage they had obtained in Baghdad ? Or was it a combination of all three ? From the point of view of the cold war, the Russian question is the most important ; and there are signs that the Russians may have gone too far and too fast in Iraq for President Nasser's comfort. Hitherto, he has drawn a sharp distinction between Arab communism and the governments of communist states. He may now be reflecting that, in many circumstances, this distinction is unreal. The next few weeks must surely throw more light on these obscure corners of Arab thinking.

As regards Colonel Nasser's relations with the rest of the Arab world, there is a strong suggestion that the pan-Arab resolution of August 20th at the emergency session of the General Assembly was a turning-point. While his strength in the Arab world gives him room for manœuvre, it also confronts him with some delicate choices. The other Arab states look to Cairo with both fascination and fear. Among the masses, fascination predominates ; among governments, fear often comes first. Thus the attitude of any Arab country as a whole towards Nasser depends largely on Nasser's attitude towards it. His real problem, therefore, is to decide between two possible courses: either to concentrate on the masses at the risk of antagonising governments or to try to conciliate governments without losing his appeal to the masses.

President Nasser has tried both courses in the past. But on the whole his emphasis has been on the masses, and he has not hesitated to quarrel bitterly from time to time with the governments of Iraq, Jordan, Saudi Arabia and Lebanon. Both his recent actions and his latest speech suggest that he has begun to see the disadvantages of these recurrent quarrels with the Arab governments. An obvious exception is President Bourguiba's government in Tunisia ; the cases of Jordan and Iraq, too, are at best obscure.

The reason for the change seems to be twofold. In the first place, the course of events in the Arab world during the past year has immensely strengthened his position. The decisive fact of the year was the revolution in Iraq, which removed his only serious rival for the leadership of the Arab world. Other events tending in the same direction were union with Syria, federation with the Yemen, withdrawal of Saudi support from Jordan and removal of the pro-western regime of Mr Chamoun in Lebanon. In many respects 1958 was his *annus mirabilis*.

In the second place, the old fear of Israel is again rising to the surface. It is reported on reliable authority that Mr Robert Murphy drew President Nasser's attention to the possibility of Israeli movements into Jordan when he saw him in Cairo late last summer. It is also said, wholly plausibly, that President Nasser replied that in such an eventuality he would fight. This would be a gamble on which his prestige among the Arabs might take a severe knock, for the Arabs cannot yet match the Jews in the field. It is unlikely that the knock would be fatal to Nasser, since he could throw much of the blame for any ensuing disaster on the West ; and indeed western acquiescence in Israeli action against Jordan would only confirm in Arab minds the main theme of nationalist propaganda, namely that Israel was created as a " springboard of western imperialism."

Nevertheless, in such a fluid situation, with the real intentions of the great powers (including the Soviet Union) still in doubt, the danger of Israeli action is not one to be courted. What Colonel Nasser needs most is time—time to push through his social reforms and to digest the economic and military aid given and promised from communist sources. His danger is that the revolutionary impetus of the Arab world may push him to new adventures for which he is not yet ready—or that the friendship of the Soviet Union may prove to be less disinterested than most Arabs now think. President Nasser's latest speech shows that this last point is receiving his earnest attention. Thus prospects for the West in the new year are less stygian than they appeared a few weeks ago. Yet if the West is to profit by this new and undeserved opportunity, it must bring to the problem a realism hitherto sadly lacking. The first requirement is a firm grasp of the proposition that in the Arab world you can fight either nationalism or communism, but not both.

France's Christmas Reckoning

FROM OUR PARIS CORRESPONDENT

THE days after Christmas brought, in quick succession, the news of devaluation, drastic cuts in subsidies, higher prices and taxes. The press at first tried to minimise the impact. It laid emphasis on the projected currency reform, on the new " heavy " franc (equal to 100 current units) which is to be introduced progressively over the year, and put the blame for devaluation on the designs of the perfidious English. But the veil was rapidly lifted. General de Gaulle, in probably his last major pronouncement before he leaves the prime minister's office for the presidential palace, whence he will run the government by proxy, exhorted the nation to great efforts, telling it that the heavy sacrifices that were being required were designed to achieve national greatness through financial recovery and price stability.

Many interconnected measures have been introduced at once. The budget, with its cuts in subsidies, would in itself have resulted in price increases and widened the gap between French and European prices on the very eve of the inauguration of the common market. On the other hand, the French government decided to devalue the franc by 17.55 per cent, reducing it to the rate of 494 francs to $1 and 1,382 to £1. It thus went somewhat beyond the prevailing open market rate, making a certain allowance for the expected rise in internal prices. Devaluation, in turn, enabled France to join Britain, Germany and other European countries in their venture towards partial convertibility. It also allowed the French to liberalise their trade with OEEC countries to the stipulated 90 per cent.

It must be remembered that this lifting of quotas refers to *nine*-tenths of trade in 1948. Nevertheless, by fulfilling its commitment to the full, France has deprived the British Government of a powerful argument in the common market controversy. This move is, at least partly, a counter to Britain. But increased foreign competition is also expected to act as a disinflationary brake.

All the changes are linked. The need for change, however, springs from the state of the home economy. France has been living above its means on an increasing scale. Budgetary expenditure simply carried forward would have raised expenditure estimates by about 900 milliard francs between 1958 and 1959. The defence estimates alone, at 1,576 milliard francs, are 250 milliard francs higher than last year (and 130 milliard francs above last year's actual expenditure). The overall deficit (what is now called the *impasse*) was expected to reach nearly 1,200 milliard francs. In France this balance is struck after including the government's outgoings on capital account. Even so, the *impasse* had to be halved to keep it within the limits of borrowing capacity. The government is unwilling to cut its commitments, including those in North Africa, and the country must, therefore, pay the bill through reduced home consumption. Inflation could not veil this fact indefinitely. The institutions of the new Republic have been set up. The elections are over. The government was not hampered by parliamentary control, since, unlike its predecessors, it enjoys the special powers—granted in June—that still allow it to promulgate the budget by decree. General de Gaulle could afford to follow closely the advice of the experts grouped in a committee set up by M. Pinay and presided over by M. Rueff (who had advised Poincaré in the nineteen-twenties and Laval in the nineteen-thirties).

THE experts' search for budgetary savings brought to light a coherent change in the ideas that govern French economic and financial policy. The Fourth Republic was born in a mood favourable to state intervention ; true, its lofty egalitarian aims were quickly distorted by the lobbies into the defence of various privileges. By contrast, the draftsmen of the new budget have been inspired by the gospel of economic liberalism. They have made a bonfire of subsidies, compelled the nationalised industries to bring their prices in line with their costs, and deprived agriculture of some of its special advantages. They have abolished all automatic sliding scales that relate wage levels to the cost of living, and have kept only the basic national minimum wage. The maze of purchase tax is reduced to four rates. State investments are not reduced, but the hope has been expressed that private saving should soon be able to take over. The general argument is that liberalisation of foreign trade cannot be accomplished with a distorted price mechanism at home. Faith is put in market forces. Increased competition is to guide the modernisation of the French economy through the survival of the fittest.

In practice, 255 milliard francs are saved through cuts in subsidies. Some subsidies (for bread and other foodstuffs, agricultural equipment and so on) are cancelled. The nationalised railways, coalmines, gas, electricity and the Post Office are to seek extra revenue by raising their prices. To this should be added a saving of some 60 milliard francs on social security, more than half of it coming from a cut in the national health bill. The net revenue from increased taxation is expected to yield 200 milliard francs, about three-quarters of this from wine and tobacco. Profits tax will

bring an additional 78 milliard francs but this is roughly cancelled by the elimination of some provisional forms of company taxation. Total expenditure is 6,189 milliard francs and revenue 5,602 milliards. The Treasury will thus have to find less than 600 milliard francs and M. Pinay stressed that this is less than the state lending for productive investment. State investments are actually increased, though the figure quoted is somewhat inflated by taking into the budget medium term loans hitherto granted by the Bank of France. Investment in Algeria is also included (as well as atomic energy). It remains to be seen whether the investments will prove enough to stimulate a revival in industrial production, or whether France will be willing, as Britain has been, to pay in stagnation the price of stability.

Financial stability is obviously the aim. The new "heavy" franc is to be the symbol of national confidence in the financial orthodoxy of the new regime. Partial convertibility, it is hoped, will attract foreign capital. The great dream of the experts, however, is to get at the gold and dollar hoardings of the French themselves; these are estimated at the fabulous amount of $10,000 million. In the meantime, it will be quite a job to preserve the integrity of the new structure against human encroachment. One task will be to keep the increase in the home price level within the limits of five to ten per cent. Devaluation will raise the price of imported raw materials. Coal prices are going up by 11 per cent. Transport, gas, electricity will cost more. Will these production costs be translated into higher prices all round? The government relies on the general state of business and the fear of foreign competition to keep profit margins in check.

The other unknown is the price of labour. This austerity budget will hit the lower income groups hardest. The government has taken some measures to prevent social unrest. The wages and salaries of public employees are to be increased by 4 per cent in February. Together with the increase in old age pensions, this will cost 65 milliard francs. The increase of 4½ per cent in the guaranteed minimum wage should cost somewhat less. Even those who get the benefit of this improvement will argue that it barely compensates for existing postponed claims. All the trade unions have expressed their misgivings. (The Socialist ministers have opposed the whole operation, and M. Mollet will now hardly be able to stay in the next government.) The government has to rely on the general's prestige, the absence of parliamentary pressure, the fear of recession, and the undecided mood of organised labour in the new political climate.

Thrice in succession the French have voted for General de Gaulle. They have made their choice; the referendum is over. Internationally, France begins its new operation with a certain cushion. Its own gold and dollar reserves are low, but its European neighbours, led by Germany and Britain, have promised their backing. At home, Frenchman are told to tighten their belts and wait for the benefits of stability. Since production is expected to remain stable this year, the cut in home consumption foreshadowed by the new measures is substantial. Having willed the man, and presumably his ends, will the French people accept the means? The answer will not be found in parliamentary debate. Not only the fate of the new franc, but the political future of the new regime, may hang on a forthcoming trial of strength between the general's government and the unions.

Tariff Cuts in Europe

The first tariff cuts in the European Common Market take place this week. This is the first stage of the long and complex process of establishing the Common Market. Through its European services The Economist Intelligence Unit can keep you abreast of these events and show how they are likely to affect your interests. Full particulars from:

The Economist Intelligence Unit Ltd.

Puzzled Ottawa

FROM OUR CORRESPONDENT

BEHIND the Canadian government's official welcome for the currency moves taken last weekend lie two bothersome questions to which officials and businessmen would dearly like answers. One of them may have to wait until it is answered by events. The other is a question of past motives and calculations to which an answer should be possible now. It can be put like this: what prompted the timing of the British move to formal external convertibility of the pound? Does it represent a conscious new orientation of Britain's external economic policy? Is it the end of Mr Macmillan's "European dream" and the start of a new emphasis on trade ties with the Commonwealth and with North America?

This puzzle obviously arises from the almost simultaneous manifestations of British policy which appear here to be essentially contradictory. It should be stated that Canadians with access to all the official information believe that Britain took the decisive initiative in persuading the Scandinavian countries and all six common market countries to act simultaneously on external convertibility. They give the British Government the fullest credit for pushing through the concerted action which was much less acceptable in some capitals than in others. They recognise that it may have seemed politically advantageous to act early, leaving time to overcome all possible dislocations and uncertainties well before the British elections. But all this must have been under discussion at the same time as the preparations for the OEEC talks in the middle of December about the common market and the free trade area. Was convertibility originally conceived as an alternative to the successful solution of those difficulties before December 31st? Was it only after the failure of the crucial OEEC meeting that the British Government decided to go ahead with this currency move, or would it have done the same even if the free trade area had been adopted?

Looking in on Europe from outside, even those Canadians who are usually best informed about European affairs find it very difficult to make sense of this. As they see it, all

arguments for preferring European regional development of trade—all the economic and financial arguments anyway—must be weakened if not destroyed by the ending of the European Payments Union and by the requirement that all transactions between European countries shall be settled in currency just as "hard" as in transactions with North America. Logic, they think, now can find no advantage or peculiar charm in exclusive European arrangements and can provide no excuse for a liberalisation programme confined to the OEEC countries. Nor do the present currency changes appear to affect the French refusal to extend the "hard core" quotas to other countries besides the six members of the common market. Where does the British Government now stand on the free trade area?

At this point Canada's uncertainty about Britain's intentions towards Europe begins to overlap with a second question, which concerns the abolition of discriminatory restrictions on trade. It is accepted that the British programme announced by Sir David Eccles at the Montreal conference in September remains the effective guide rule. This indicated, with all safeguards, that quotas on foodstuffs and consumer goods which still discriminate against Canada and the United States would be tackled this year. Canada will be satisfied provided a start is made soon and progress is not unduly delayed. Mr Fleming, the finance minister, cannot be accused of holding out any false hopes here about the speed of advance to non-discrimination. In his official statement welcoming the moves toward convertibility, he said that Canadians could look forward to "more rapid elimination of trade discrimination against our exports in the United Kingdom." But he did not expect the end of the European Payments Union to have "any immediate influence" on Canadian exports, and he referred to the whole series of weekend moves only as "broad and constructive movements" which must eventually increase the opportunities for Canadian exporters.

The Canadian question about the relationship between trade and the new currency arrangements is this: "Will Britain and other newly convertible countries accept the interlocking obligations of the International Monetary Fund and Gatt?" According to the Canadian interpretation, all of them should start at once to bring themselves into line with article eight of the IMF articles of agreement which forbids "discriminatory currency practices" and instructs members to maintain the "convertibility of foreign held balances." So far all the countries concerned are still sheltering under article 14 which tolerates restrictions necessary to maintain balance of payments. Section four of this article, however, requires every member country to consult with the fund annually about its restrictions, and it envisages representations by other members urging the withdrawal of restrictions. The sort of progressive pressure envisaged in this article (culminating in the possibility of expulsion) is seen here as being completely appropriate to the present situation. It is also thought that it ought to be fully acceptable to the British Government because it would only involve a progressive abolition of restrictions such as is already promised. As Canada sees it, once the International Monetary Fund finds no further balance of payments reasons for restricting trade relations, the provisions of Gatt should be brought into full play. It is believed that for most this would mean the early end to all quota restrictions. The so-called "hard core waiver" as extended to Belgium might be used to provide a five-year period for gradual adaptation to a quotaless regime but in any case discrimination would have to stop.

If this sort of development of trade policy is agreed to be the logical result of the new external convertibility, then it is foreseen that France may now adopt an attitude of pious multilateralism in all dealings except only in the common market where it can make the fullest use of all restrictive provisions in the Rome Treaty. Such a result would be deeply deplored and the rest of the world acting through Gatt might have to take a much firmer stand about the common market arrangements. But the important thing in all this business is the intentions of the countries concerned rather than the speculations of a remote observer. Early and definite clarification would be most welcome here.

A Reforming Soviet

IN the Soviet Union the Supreme Soviet, or parliament, rang out the old year with a particularly busy session. It opened on December 22nd, shortly after a plenary meeting of the central committee, during which approval of Mr Khrushchev's agricultural programme was combined with attacks on the "anti-party group." It closed on Christmas day, having witnessed not only the traditional budgetary debate and review of foreign policy but also the passing of two important reforms: one overhauls the educational system; the other lays down the principles of law on which the various republics should base their legal codes. The purpose of the following notes is to outline the main features of the session in home policy.

The Budget.—Gross industrial output in the current year is planned to be 7.7 per cent higher than last year. Since national income is expected to rise by about eight per cent, the planners must be relying on a substantial increase in agricultural production. Budgetary revenue is to be increased by over nine per cent and the contribution provided by the profits tax continues to rise steadily. The planned return from the turnover tax, levied mainly on consumer goods, implies an expected rise in the sale of consumer goods by more than a tenth. Expenditure shows a further growth in grants to the national economy, which is supplemented by greatly increased investments from non-budgetary sources. Capital investment in the chemical industry is increased by three-quarters; in ferrous metals and engineering by a third. In social spending the biggest jump is made by education, which now absorbs nearly as much as the direct outlay on defence. The defence estimates are

SOVIET BUDGET
(billion roubles)

	1958 (estimates)	Per cent	1959 (estimates)	Per cent
Revenue :—				
Turnover tax	300·5	46·8	333·0	46·0
Profits tax	130·3	20·3	154·9	21·4
Direct tax	49·8	7·8	56·0	7·7
Other*	161·3	25·1	179·4	24·8
Total	641·9‡		723·4	
Expenditure :—				
Grant to national economy	257·2	41·0	308·9	43·7
Social and cultural services	212·8	33·9	232·2	32·8
Defence	96·3	15·3	96·1	13·6
Administration	12·0	1·9	11·5	1·6
Other†	49·4	7·9	58·9	8·1
Total	627·7‡		707·6	

* Including collective farm and co-operative taxes; insurance funds; foreign trade profits, etc. † Includes advances to banks. ‡ Actual revenue in 1958 was 661·2 billion roubles and expenditure 638·3 billion roubles.

almost unchanged, but as total expenditure grows their proportion of the budget is further reduced to 13.6 per cent.

Work and Study.—The educational reforms are based on Mr Khrushchev's theses on the need for closer links between study and production. His proposals, which are aimed partly at closing the social gap between manual and intellectual labour, have been subjected to the usual debate throughout the country. Some account seems to have been taken of criticisms; for instance education has been made compulsory for eight years (between the ages of seven and fifteen). Answering charges that general culture will be neglected, Mr Kairov, the rapporteur, replied that there will be 45 million pupils receiving general school education in 1965, compared with 31.6 million last year. But the comparison omits the fact that "matric. for all" (or ten years' compulsory education) was until recently the goal to be achieved in the near future. Moreover, Mr Kairov's figure covers all sorts of courses, including adult education.

In the future, a Soviet 16-year-old will have a choice between several methods of further education, though all will be combined with some form of practical work. He will be able, while working in a factory or on a farm, to attend an evening or part-time school and get his matriculation within three years. He may also, presumably after passing some sort of "15-plus," complete his secondary education in a polytechnical school, but this, too, must be coupled with productive labour. The so-called specialised secondary schools differ only in the length of study, which varies from branch to branch; it is in these schools that the bulk of the skilled cadres will still be trained. Provision is also made for vocational training ranging from one to three years. The proportion of young people following these various streams is not yet known.

Mr Khrushchev's suggestion that admission to universities should be partly determined by reports from youth organisations, trade unions or factory managements has been included in the bill. So has the idea of outside work for university students. Technical students will not attend a university full-time until their third year; an exception will be made for courses requiring prolonged laboratory work. Medical students are to be recruited chiefly among medical orderlies and other auxiliary staff in hospitals. Arts students will be no exception to the rule of study while you work.

It is claimed that the number of graduates will soon be raised to between 300,000 and 350,000 a year, compared with instead of between 250,000 and 290,000. The engineering graduates should exceed 120,000 a year. But soon more than half the students will attend evening institutes or follow correspondence courses. The whole overhaul implies a tremendous amount of co-ordination and co-operation between industry and agriculture and the schools and universities. It is scheduled to take three to five years. Only time can show the worth of this gigantic venture.

Legal Codes.—The draft principles of law and procedure defined by the Supreme Soviet are to serve as basis for revising the legal codes of the republics. Such a revision has been mooted ever since Stalin's death. The main reason has been the rejection of Stalin's assertion that, as the Soviet Union grows, the class war gains in intensity and repression must therefore be strengthened. In rejecting this, the new principles contain certain important improvements. All criminal cases are to be submitted to the same jurisdiction (military tribunals will deal only with military matters). Special courts and all forms of summary jurisdiction are abolished. Arrests can be ordered only by the court or the prosecutor's office. All trials must be open and the prerogatives of defence counsel have been increased. The indictment must be based on a specific provision of the code (the principle of analogy is dismissed). The concept of "enemy of the people," permitting expulsion from the country, disappears.

The death sentence is preserved for high treason, spying, subversive and terrorist acts and premeditated murder. The highest sentence of imprisonment is reduced from 25 to 10 years (in exceptional cases, 15 years). On the other hand, there is to be less scope for remitting sentences and some penalties, particularly those for drunkenness, have been increased.

Justice is what justice does. The new laws and procedures will still leave plenty of scope for abuses. And open trials could still be faked. The speech to the Supreme Soviet by Mr Rudenko, Vyshinsky's successor as public prosecutor, with its attacks on the "anti-party group," might even have been a hint that a political trial is being prepared. But the general trend of the contemplated legal reform is relatively liberal and it coincides with a further reduction in the powers of the security police. Party control over the security police was strikingly illustrated last week by the appointment of Mr Shelepin to succeed Mr Serov as chairman of the Committee of State Security. Mr Shelepin is a product of the party and was until fairly recently head of the Komsomol. Mr Khrushchev's extension of party authority, in this sphere at least, looks like an advance on the past.

Bulgarian Leap in the Dark

THE Bulgarian Communists, borrowing a favourite phrase of the Chinese, have embarked on a "great leap forward" in their economic development. The proposed leap was described by Mr Zhivkov, the first party secretary, to the Bulgarian central committee in November. It involves upsetting the economic plans approved by the seventh party congress only last June; completing the five year plan (1958 to 1962) in three to four years; doubling agricultural production next year, and trebling it in 1960.

This looks wildly utopian; and Mr Zhivkov did not satisfactorily explain either what it meant or why it should be attempted. He openly admitted that some groups in the party had grave doubts, and that if the party was content to plod on at the present rate of development, it would avoid tensions and difficulties. But he insisted that the time was ripe for a series of leaps to "bring us as near as possible to the threshold of the construction of communism." More prosaic needs may have dictated the resolve to make a herculean effort. Mr Zhivkov's harping on the need to economise, and on the shortage of investment funds, tends to bear this out; so does his constant emphasis on the need for the men on the spot to seek out and exploit all possible local resources without waiting to be prompted from Sofia.

Labour is the main resource to be exploited. Mr Zhivkov maintained that "several hundred million workdays" could be extracted from the peasants in autumn, winter and early spring for, among other things, irrigation and reclamation works. White-collar workers are to do thirty or forty days of manual labour a year. The use of students and school children is being considered. The amalgamation of the collective farms along Russian lines (from 3,200 to 800) will no doubt help the regime to control and mobilise the peasants' labour. Perhaps, too, the extraordinary speed with which this amalgamation has recently been completed (in two or three months instead of years) has encouraged the Bulgarian planners in bold designs.

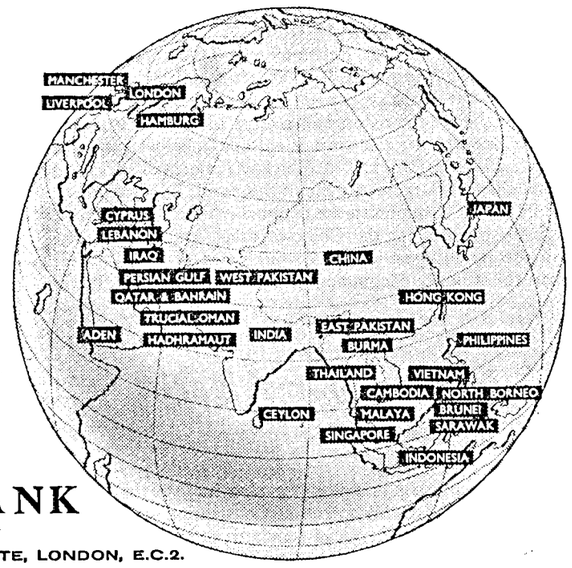
The Sofia newspaper *Rabotnichesko Delo* reported the formation of a "commune" of 35,000 members at Botevgrad, near the Jugoslav border, on December 7th; on the 8th, it withdrew the report as "a gross mistake." It is too soon to say whether this curious episode, together with the proposed leap forward and Mr Zhivkov's vague talk of "profound changes in the entire life of the people," indicate that the Bulgarian Communists are tempted to desert the Russian path to socialism for the Chinese path. And if they are, will the recently-announced slowing-down of the Chinese plans to introduce communes, give them second thoughts?

Industry for Algeria

FROM A CORRESPONDENT

GENERAL DE GAULLE'S five-year plan for Algeria, which he outlined in his speech at Constantine on October 3rd, aims at raising the social standards of the largest and poorest part of the Algerian population. The planned increase in industrial and agricultural wealth has to be obtained in a way which serves this primarily social purpose. These promises, moreover, must be fulfilled while a huge programme of elementary education is being carried out. The general said at Constantine that by 1963 two-thirds of Algeria's children would be at school. At present 12 per cent from all communities is the official and probably exaggerated figure; as Mlle. Germaine Tillon pointed out in her book on Algeria, in many parts of the country barely one child in 70 goes to school. The priority given to education is essential politically. But, because of the age structure of the Algerian population, it will not be until 1975 at the earliest that education could begin to pay real economic dividends. Today, half Algeria's 10 million Moslems are under 20.

By far the most direct way to increase the economic wealth of Algeria would be to concentrate development in the three established industrial zones—Algiers, Oran and Bône—where railway and port facilities are available. But this would not help the country districts where work is most needed and would still further accentuate the dangers of concentration in Algiers itself. In 1957 half the registered profits of industry and commerce were earned in Algiers and a quarter in Oran; almost half the building permits in the same year were issued in Algiers. The areas where industrial employment is most needed are totally non-urban but do not necessarily have a low population density. For example, the mountainous department of Tizi Ouzou in eastern Algeria has no large town but has a population density of 150 per square kilometre, which is rather higher than that of the Seine Maritime department in France which contains Rouen and Le Havre.



Another serious difficulty is that many industries which have to be developed in Algeria as a basis for reconstruction —such as chemicals, gas and electricity—give comparatively little employment. Nor will the exploitation of Saharan oil and natural gas need much man-power. It is clearly desirable that, together with public works (which has the highest employment coefficient of all), the industries to be encouraged should include leather and shoes, soap, pharmaceutical products and all those based on the skill of the artisan. These industries could be placed in the countryside and, supplying the home market, should eventually become well established.

BUT here, as M. Jean-Louis Fyot has pointed out in the *Revue de l'Action Populaire*, there is one great obstacle. French industry has always regarded Algeria as its private preserve and at a moment when sacrifices are being asked from consumers and producers in metropolitan France, there will be a strong feeling in favour of preserving the present form of economic "integration." There will certainly be opposition to any tariff-barriers that would save, for example, an Algerian boot and shoe industry from being swamped by French competition. The problem is greater because Algerian development cannot be carried out without financial and technical aid from French industry. It will need great resolution by the general's government to follow an economic policy for Algeria that is the reverse of "integration," but Algerian industry will have to be protected from competitors from metropolitan France.

General de Gaulle's figure of 400,000 new jobs for Algeria in five years was based on *Perspectives Décennales*, a report drawn up by a committee of civil servants and economists and published last year which spoke of 875,000 non-agricultural jobs in 10 years. It will be more difficult to achieve half the target in five years, since it should be in the last three or four years of the ten-year period that increased prosperity will have the most marked effect on employment. *Perspectives Décennales* also allowed ten years for providing 351,000 hectares of land for Muslim farmers, whereas the Constantine speech promises 250,000 in five years. It is hard to see how General de Gaulle's figure can be obtained without the expropriation of large estates and buying land from the poorer European farmers. Interference beyond a limited extent with Algerian agriculture would upset a whole nexus of trade relations that contribute to the national revenue, and would create as many problems as it would solve. However, failure to reach the target of 250,000 hectares will be less serious if there is a sufficient increase in employment in the over-populated rural areas. M. Jean Vibert, Director of the Plan for Algeria, believes that it should be possible to increase the number of Algerian workers in France by 20,000 per year, thus bringing the number of new jobs per year to 100,000.

Perspectives Décennales put the investment effort for the strictly economic aspects of the plan at 350 milliard francs per year from metropolitan France, over half coming from public sources. This excludes the cost of developing Saharan oil resources. On the other hand, the prospects of revenue from oil (and it is now clear that, for once, official figures for oil output in 1960-62 have erred on the prudent side) imply that France will not have shouldered an endlessly growing financial burden. There are plans for exporting natural gas to Italy, Spain and even Germany. It seems plain that even after 10 years' industrialisation, Algeria itself could only account for a fraction of the natural gas which will have to flow through the pipe lines to make the Saharan exploitation economically possible. Of course, there will be no satisfactory oil or gas revenue from the Sahara unless there is peace in Algeria. The future is at the mercy of political uncertainty.

British Banking in Asia

These are the territories served by THE CHARTERED BANK and its wholly-owned subsidiary, The Eastern Bank Limited, through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by expert knowledge and long experience of Eastern trade, finance and industry. In London an effective credit information service and skilled assistance and advice are available to merchants and manufacturers seeking new business connexions in Asian markets.

THE CHARTERED BANK

(Incorporated by Royal Charter 1853)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2.

Branches in the United Kingdom at Manchester and Liverpool. Agencies at New York and Hamburg.

THE BUSINESS WORLD

Convertibility at Work

STERLING earned by residents outside the sterling area, and sterling balances held by them in bank deposits or Treasury bills, are now freely convertible in London into gold, dollars or any other currency for the first time since 1939. This move, long planned and long awaited, was made last week-end as part of an international operation, involving parallel moves to external convertibility by all the other West European currencies including the French franc—which is devalued by 17½ per cent, supported by Draconian measures of fiscal retrenchment, and transformed to a more respectable unit (the " heavy " franc) by dropping two noughts. These concerted currency moves, the most important since the devaluations of 1949, coincide with recommendations by the executive directors of the International Monetary Fund and the World Bank of increases in member countries' quotas in their institutions (which are discussed in a later note) ; and the exchange measures also coincide with the opening of the European Common Market. This conjuncture, together with the helpful weakness of the dollar, has provided the favourable opportunity for moving to external convertibility for which the British authorities had been waiting.

Europe's currency arrangements of recent years have been of a transitional character, and it was doubtful how much longer the transitional could last. The European Payments Union, designed to operate for two years, went halfway through its ninth ; and for almost the last four of them, sterling and major continental currencies have been convertible *de facto* in unofficial but broad and well organised markets. Effective convertibility of currencies made the EPU arrangements, with their settlements at mid-point parities and automatic grants of 25 per cent credits, increasingly anomalous. The most important of the original credit lines in EPU had long been exhausted ; the temporary renewals of the Union were achieved only by Germany agreeing to extend more and more credit, so that recurrent help could be given to France. Germany made no secret of its reluctance to go on pouring credit into a system that it considered outdated and, in the circumstances, unsound. Accordingly, Germany has led the Continental cry for formal convertibility and the replacing of EPU by the European Monetary Agreement, negotiated in 1955.

The move has now been made. On the face of it, formal external convertibility could involve certain additional risks for Britain. Against these risks (assessed at the end of this article) must be set the great improvement that has been achieved in the European climate —in finance, in trade and in politics. The possibility of a divided Europe has by no means disappeared, but the dangerous atmosphere of a fortnight ago has been transformed by the realignment of last weekend.

External Convertibility

The establishment of external convertibility is a major milestone ; but it stops well short of restoring full currency freedom, especially for residents of their own currency areas. What has been done, by Britain and by all other OEEC countries except Greece, Turkey and Iceland, is to unify all current external accounts. Thus the old transferable sterling accounts, the American and Canadian accounts and registered accounts are merged into a single " external account," which can be used for transfers anywhere throughout the world, and for the purchase in the London market or elsewhere of any currency and of gold. No country except France has changed its dollar parity ; but, as is explained below, the introduction of arbitrage in the official markets between the dollar and the European currencies necessitates a widening of the permitted margins within which European currencies can move in terms of each other. The margins of these currencies against the dollar are mostly unchanged.

The formal unification of external dealings in official and transferable sterling (they had been assimilated for nearly four years) has brought back to London exchange

business that hitherto was transacted in markets in transferable sterling in Zurich and New York; and other City markets are benefiting too. It is impossible to judge yet how much additional exchange business London will attract but in the first few days the rise has been most marked. London dealers have always worked on fine margins (cynics among international operators have hitherto been in a quandary about where to lose their money, in gilt-edged in London, or in commissions in Zurich) and in the new free market the narrow spread of quotations has been a powerful attracting force. Secondly, the London gold market has been broadened. Gold may now be bought from any non-resident account, instead of only against gold or dollar accounts; and the disappearance of "cheap" transferable sterling has removed the main reason why the Russians, in particular, have sold gold in Zurich rather than London. Thirdly, full trading freedom returns to all London's international commodity markets. All commodities can now be bought for external sterling or specified currencies (broadly, all currencies in which international trade is financed).

The Remaining Controls

There remain in Europe two major types of exchange control. The first is on liquidation by foreigners of capital assets. In Belgium, Switzerland and Germany, the minor restrictions on inward and outward movements of capital that remain are now expected to disappear. In Britain, however, the proceeds of non-residents' sales of capital assets may still not be paid into the convertible external accounts; security sterling remains as a separate category, which can be used only for buying sterling securities. But this week the discount on security sterling has all but vanished; on Tuesday the rate touched the parity of $2.80 for the first time. The same has happened in France and Holland. Effectively, therefore, non-residents at this moment enjoy full convertibility in most European countries—though the restriction on repatriation of capital could become important if confidence fell away and the unofficial discount widened.

Much more significant are the controls over external payments by residents. Residents of Britain and the overseas countries of the sterling area enjoy no relaxation at all in the writ of exchange control as a result of the present currency moves. People wanting to buy foreign currency for trade or travel must still apply to the exchange control to get it, and people earning foreign currency must still surrender it for sterling.

Trade Restrictions Now

The Government has reaffirmed its policy, announced at Montreal, of relaxing the remaining restrictions on dollar imports as soon as possible; and although the authorities consider that they are not obliged under IMF articles to remove all discrimination and all restrictions on current payments now that sterling is externally convertible, the logic behind such restrictions is greatly weakened, while the logic of discrimination entirely disappears. Britain has for some time lagged behind the Continent in the degree of convertibility it has granted to residents. In Germany and Switzerland almost all restrictions on foreign payments have been removed, and in Belgium a free market is openly available. The stronger continental countries have also freed a larger proportion of their dollar trade than Britain has done, even after the Montreal contribution. There must be no going back on promises to allow more dollar imports into Britain.

The biggest move to open the domestic market comes from France, which suspended all liberalisation in 1957. About one half its dollar trade is now being freed from quotas, and quotas for OEEC countries are raised to 90 per cent of the volume of private imports in 1948. The unliberalised 10 per cent still bars from the French market many items of great importance to overseas exporters. But in some measure the same distortion applies to the liberalisation percentages of other OEEC countries. That is shown by the significance that has been placed on the increase of quotas to cover at least 3 per cent of domestic production, which has now come into effect between the common market countries and which Sir David Eccles is proposing should be extended throughout OEEC.

France's Measures

THE ultimate success of this bid to continue the removal of trade barriers throughout Western Europe, and the viability of the new European payments system itself, will depend in large measure on the outcome of France's bold bid for financial reform. At last, France has taken the full range of corrective measures—devaluation, cuts in public spending and public subsidies, abolition of the dangerous practice of "indexing" wages and other benefits to prices, and the opening of trade to foreign competition—as recorded in earlier articles. Taken as a whole these measures make economic sense. The franc is also being supported by short-term swap facilities provided by the central banks of Britain, Germany, Holland and Belgium, together with the Bank for International Settlements. It is reported from Paris that these facilities amount in total to $250 million.

If this formidable combination of defences for the new franc attracts public confidence—and the first auguries have been good—then the French situation could quickly be transformed. The committee under the venerable M. Jacques Rueff, whose reports formed the basis of the reforms, put the total holdings of gold and foreign exchange in French ownership at the staggering figure of $10,000 million; the reserves in official hands are around $1,000 million. If a significant part of the vast private hoards ever did begin to flow back, some uncomfortable disturbances might be felt in the centres that now hold them.

The European Monetary Agreement

When Britain and other countries representing more than 50 per cent of the quotas in the European Payments Union notified the Secretary General of OEEC that external convertibility had been introduced, the EPU automatically ceased to operate and the European Monetary Agreement came into force. Under the new regime, payments between European countries will be settled 100 per cent in gold or dollars, in contrast with the EPU procedure, whereby 25 per cent of each balance to be settled ranked automatically for credit, received or given. New arrangements for European credit facilities will be made, but the credit granting function is now separated from the clearing function. Provision is made for multilateral (100 per cent) settlement through a monthly clearing; and a close limit is put on the maximum amount of "interim finance" that central banks are obliged to extend to other central banks between settlements (the Bank of England is obliged to provide sterling up to a total of $64 million). Settlements at the clearing, moreover, are to be made not at the middle parity rates, as under EPU, but at the extreme of the official dealing limits that is most unfavourable to the country, creditor or debtor, that takes the initiative in using the clearing.

The deterrent effect of this rule will presumably mean that very little is put through the clearing at all; throughout the 1955 negotiations, Britain was in favour of leaving the task of clearing to the market. It is difficult to see how it could be otherwise, given the greater permissible margin of fluctuation in rates. The margins for European currencies quoted against each other were previously at ¾ per cent either side of parity (giving a total spread of 1½ per cent), or roughly the same margins as were quoted for them against the US dollar. Most margins in terms of the dollar remain unchanged. Hence, now that arbitrage between the dollar and European currencies is permitted, the effective range of fluctuation of the rate between one European currency standing at its upper dollar limit and another standing at its lower dollar limit is 3 per cent. If this doubled range had not been recognised in the official margins for European currencies against each other, and central banks had intervened at an earlier stage, the effect, through arbitrage, would have been to prevent fluctuation against the dollar within the full 1½ per cent swing. For these reasons, the IMF in 1955 made no objection to the 3 per cent swing of European currencies in terms of one another, although this exceeds the 2 per cent maximum (1 per cent either side of parity) stipulated in the Fund agreement. As may be seen from the table, all the European margins except two now allow a total swing of 3 per cent. The exceptions are the Swiss franc, whose limits against the dollar are still wide, despite a small adjustment, and produce a swing against sterling of 5 per cent, and the Swedish kroner, which now has a very small range of fluctuation against the dollar and therefore needed very little adjustment against sterling.

The main credit facilities under the European Monetary Agreement, besides the interim finance and additional bilateral facilities such as the central bank "swap" credit granted to France, are to be through a new European Fund. This will provide the float that the Bank for International Settlements, the Agent, will need to run the monthly clearing, but its main purpose will be to provide short-term credits, up to two years, to OEEC members in financial need. Although the European Fund will be run by the same international managing board that has run the EPU, decisions on the granting of credits, their terms and on any conditions to be imposed will be taken by the OEEC. As has become the tendency in IMF, credits will probably be granted on merit rather than as of right. But this change does not curtail the amount of credit in European finance. The EPU system has in recent years provided very little new credit; and Germany is much more likely to open its coffers under the new arrangements.

As originally devised, the European Fund was to have resources totalling $600 million, some $328 million to come from new contributions from the European members, and the balance from the residual assets of the EPU and from the United States contribution. The amount was to be called only as required. The intention now seems to be to take as a working fund the $113 million that comes automatically from EPU, and to reconsider the basis of contributions in the light of changes since the original negotiations. There are obvious anomalies: for example, Britain's total contribution, at $86½ million, is more than twice as high as Germany's.

After the final settlement date in the European Payments Union in mid-January, work can begin on the winding up of the Union. The big creditor is Germany, with a claim of $994 million up to end-November, and the main debtors are France ($476 million) and Britain ($353 million). But arrangements to amortise most of these debts bilaterally have already been made. Britain is paying off about £20 million a year; and because the funding arrangements hitherto have provided only for repayments to net creditors, and not for individual repayments due to countries like Britain that are net debtors, the final settlement now due may actually reduce Britain's net annual commitment.

THE NEW RATES

Sterling exchange rates	Former official spread	New spread	Closing rates, December 31
USA	2·78–2·82	2·78–2·82	2·80 3/16–5/16
France	1167·18–1194·82	13·6220–14·0265	13·75–75 1/2

Overseas Sterling Area

THE move to external convertibility has no direct effect on countries in the overseas sterling area; but it may indirectly hasten the move towards non-discrimination in trade and freedom of current payments in these countries. The Bank of England has long granted effective convertibility to governments of overseas sterling territories, and the foreign payments that may be made by individuals in these countries are decided by their own exchange controls. Thus the formal granting of convertibility to residents outside the sterling area gives no incentive to any sterling country to weaken ties with the sterling area. The countries that have lately been restless, such as Iraq, have been prompted by political considerations.

How Much Extra Risk?

IN the first three days of freedom in London's greatly expanded market, sterling has held up well. Some recent buyers of transferable sterling (and some recent sellers of francs) have taken their profit, and at times the authorities seem to have given some support against the dollar. But the profit-taking has been smaller than might have been expected, and sterling has been in keen demand from many quarters. Wednesday's rate on New York was $2.80\frac{3}{8}$-$\frac{1}{4}$, compared with $2.80\frac{1}{2}$ in the official market and $2.796 in the transferable market just before Christmas.

What of the longer run effect of the merging of the official and transferable rates? At times when confidence is firm, the right of formal convertibility is likely to provide an additional reason for transferring money to London, and for abstaining from withdrawal of existing balances. In addition, the return of a large volume of exchange business to London, besides adding to the City's earnings, must give the authorities a surer hold than they could have when dealing in Zurich. On the other side of the equation, some sterling may now be converted into dollars that otherwise would not have been. Just as discriminatory restrictions on trade now appear anomalous, the special limitations on the use of sterling that the Treasury has agreed with the big oil companies and others now become more difficult to justify.

On balance, one would guess that the strain from these sources would not be substantial, while confidence holds. What if it weakens? Then it might be argued that the advertisement and the official blessing given to the route into dollars will throw some sterling into the pool in London that would not have found its way into Zurich. But the overriding lesson of the two last sterling crises, that of 1957 and that of Suez, has been the speed with which speculators, traders and the ordinary public can and do unload when confidence fails—even when some of the sales, such as those on behalf of residents, have to take devious routes. In the worst phases of those crises, the outflow reached $300 million a month, or more. The only thing that can check flights of that magnitude is decisive corrective action to restore confidence. Formal convertibility is not likely to make much difference to Britain's leeway in a future crisis; it might help to build up the reserves in the good times.

Room for Private Fliers

Small airports and small aircraft have given the Ministry of Transport a New Year hangover

CROYDON AIRPORT was due to close down for good last Wednesday. The axe did not fall on the appointed day—this was not a reprieve so much as a stay of execution until the dispossessed tenants have found somewhere to go. It could be said that they have taken a long time to find other accommodation, for the government announced its intention of closing Croydon long ago in 1953 and it has never wavered. Croydon is a grass airfield; it costs the taxpayer £80,000 a year in direct running costs, and £150,000 a year with capital charges. It straddles awkwardly across the main air traffic control zone for Southern England. So the decision to shut it, sell the land and disperse the flying operations conducted from Croydon to newer airfields, such as Gatwick, was always reasonable. But it still leaves a real dilemma for the Croydon tenants, and indirectly for the Ministry of Transport. Small aircraft operate economically only from small airfields and there is no other Croydon-type airfield for them in the London region. The Ministry does not want to drive such aircraft out of business. Nor does it want to subsidise them at the taxpayer's expense. So the Ministry's file on Croydon airport has grown out of all proportion to the number of people affected by the decision to close it.

Croydon is in this one respect unique; it is the only airport near London that caters for small aircraft of all kinds. The plans for London's air traffic have concentrated on meeting the needs of international airlines using aircraft weighing 50 tons while the needs of smaller machines have been either overlooked or forgotten. A small aircraft need not be barred from using a big airport provided that it carries radio. But many of the smallest runabouts have no radio and the scale of charges at international airports is decidedly putting-off for an aircraft carrying half a dozen passengers—even if the airport will let it in, which London airport rarely will, and then only after much fuss. When the

tenants of Croydon airport were told four years ago that they would have to move to rebuilt Gatwick, they assumed that they would enjoy the same facilities as at Croydon and at roughly the same charges. Instead they are invited to become tenants of an airport built and equipped to handle the biggest transatlantic airliners, with rents and other airport charges to match. They asked for bed-and-breakfast, and are offered accommodation at the Ritz.

The Ministry of Transport has no wish to be charged with driving small airlines and private fliers out of the sky, but its policy has been moving towards that result for several years. Tenant airlines at new airports have to provide their own hangars and concrete aprons on land rented from the airport. At Gatwick, the annual rent is £500 an acre, and a modest three-acre hangar and apron will cost £200,000 to build. This puts it beyond the purse of the typical small airline that was able to work profitably from Croydon, paying an annual rental for old, but weatherproof, hangars. These small airlines, in their turn, have provided garaging and maintenance for the private owners and flying clubs that have been based on Croydon.

One proposal to satisfy the three types of flying at Croydon airport was to move them all to a far corner of Biggin Hill airfield. The Air Ministry's first offer of full repairing leases of buildings in varying states of repair for only four years was immediately turned down. Biggin Hill is unattractive to the small airlines that operate from Croydon; it would cost them a good deal to put the buildings in reasonable order for passengers and there are no Customs. Croydon flying clubs will almost certainly go to Biggin Hill if they can negotiate better terms with the Air Ministry, which owns it. The Ministry of Transport feels that in their case it has fulfilled its obligations to find them an alternative home and neither clubs nor flying schools will be allowed to use Croydon after January 31st. But it has not been able to satisfy the small airlines that fly scheduled and charter services out of Croydon and the airport will remain open for them and for business fliers until the airlines and the Ministry agree on a compromise. These small airlines, mainly Morton Air Services and Air Couriers, are not prepared to build hangars at Gatwick as another Croydon tenant, Transair, has done. Several plans have been suggested, including one by which the government would build hangars at Gatwick for rent to small operators. But the rents of the new hangars struck the companies as too high. Since then, Morton Air Services has been bought by Airwork, one of the largest of the independent airlines. The Airwork management seems no more anxious to shoulder the cost of transferring Morton's operations to Gatwick than Captain Morton himself.

THERE will certainly be disappointment if all small airlines boycott Gatwick. This airport, built at a cost of £7 million, was intended for a double purpose—to serve as a bad-weather diversion for London Airport and also as a centre of all charter, private flying and small-scale scheduled operations in and out of the London area. Its charges have been too high for this class of customer. Besides building hangars, the Ministry may now cut some charges at Gatwick for small aircraft and with them many of the expensive formalities about porters and baggage.

In these circumstances, the amount of private flying to and from the London region might grow. Of the private aircraft registered in this country, perhaps 300 belong to flying clubs, and another 300 to 350 to private owners, many of them companies with fleets running up to five aircraft. Freedom from the commercial airlines' schedules is a convenience and brings some saving of the tycoon's time. But the savings in costs, as distinct from the convenience, are harder to establish.

The standard business aircraft is the de Havilland Dove, capable of carrying six passengers. It is not an outstandingly cheap aircraft, either to buy or to run, but given a sufficiently high utilisation, its costs can be kept fairly close to those of a commercial airline. Ind Coope, the brewers, have calculated that the company's Dove may be used for as much as 800 hours a year, which could put it among the highest figures for any business aircraft in this country. On the basis of 800 hours, the cost per passenger is likely to average less than 11d. per mile. But to get utilisation up and costs down to this level the aircraft is fitted with a range of radio, navigation aids and de-icing equipment that will allow it to fly in all weathers; employing a pilot with full instrument rating; leasing an airfield to save landing charges; employing full-time aircraft maintenance engineers; and co-ordinating the aircraft's journeys through a central traffic department.

Most parts of Britain are now within 30 minutes of an airfield capable of handling small aircraft of this type. Besides the airports run by the Ministry of Transport there are two dozen private airfields, some owned by municipalities, some by companies, some by clubs, all of which are open in daylight. There are another 40 or so, not all of them open in winter, where permission to land can be arranged in advance. In addition, about 50 RAF stations allow private aircraft to call. Ind Coope's experience suggests that even in a country as small as Britain, private business flying might pay.

In this case, there is probably some reason for expecting the Ministry of Transport to provide airport facilities for private fliers of this calibre at Gatwick, if not at Croydon, just as it provides them for commercial airliners. It might be more convenient, but certainly more difficult, to open a private airfield for this purpose as Silver City opened theirs at Ferryfield. The next few years will show whether business flying in this country will develop as it has in other countries—with the helicopter too, using the Battersea helicopter station, where Westland Aircraft are now driving the first piles.

BUSINESS NOTES

CONVERTIBILITY MARKETS

Confidence in Pounds

THE stock markets as well as the exchange markets saw the Christmas moves to external convertibility as a sign of the British authorities' confidence in the viability of sterling and the economy. In line with the firmness of sterling this week, both gilt-edged and industrial stocks have gone ahead. Some observers had thought that the gilt-edged market was due for a rally in the new year in any event, after the dubiously founded setback in confidence in the late autumn. The currency moves have given added reason to the recovery. Few people in the City think that the commitment need involve, over the course of time, any noticeable toughening in monetary policy or hardening of interest rates. It is likely to induce still greater flexibility in Bank rate policy, but that need not be a bad thing for gilt-edged. The present level of prices is low in relation to 4 per cent Bank rate; now the display of official confidence implicit in the currency moves has had a significant impact on investors' confidence.

This week's buying of gilt-edged has been fairly well spread through the range of stocks, and the market has been an active one. Prices have risen only modestly, partly because the government broker has taken the opportunity to supply some stocks and partly because at least one big sale was made from private quarters. The fact that this was well absorbed reflects the firmness of the undertone. In the middle of the month the government will be paying out the unconverted portion of the £592 million maturing Conversion 2 per cents. This will help to offset the new year drain of funds to the Inland Revenue.

Through the Barrier

THE move towards sterling convertibility came as another pep pill for an equity market that was already full of pep. Before Christmas ordinary share prices were striding ahead confidently, just as they had been doing for most of the year, and they marched into the new year at an even brisker pace. One barrier was passed on the last day of the old year when the *Financial Times* ordinary index touched 225.5, going beyond the previous peak of 223.9 reached on July 21, 1955, and nearly 50 per cent above the February low point. *The Economist* indicator, which is based on a wider range of stocks, had risen beyond its 1955 peak in the first week of November and on December 31st it climbed to 255.6, a gain of 8.9 points within a week and of more than 50 per cent on the February 26th low of 166.1.

Partial convertibility has no direct effect on the stock market, for British shares can still be sold by foreign investors only for security sterling, which can be used only for new security purchases or sold in unofficial markets. But the discount has now almost run off. If sterling remains strong, overseas investors may find the earnings and dividend yields on British industrial equities—high by American and Continental standards—even more attractive. Indeed, such buying has already had a marginal effect on prices of steel shares and such stocks as EMI.

But basically the equity market will continue to depend upon domestic factors. Last year's boom in equities with a consumption goods flavour left many shares in the capital goods industries, oil, commodities and shipping lagging behind. Easier credit, Government measures aimed at expansion, small signs of economic recovery, hopes that the budget will bring further tax reliefs and a wider belief that the Conservatives will win the next election have all contributed to the markets' exuberance. Much has already been discounted and the approach of an election will presumably check the advance.

Current prices ignore the patchy profit and dividends record of British industry in 1958 and anticipate better earnings and dividends this year. That optimism has at least one justification: the credit squeeze forced many concerns to find permanent savings in costs. The recession made many of them more efficient. But, though economic recovery is on the way, there is still plenty of surplus industrial capacity and commodity prices have failed to advance very strongly. Orders in light engineering have begun to pick up, but by only a little; steel production this year may not be much, if anything, above its 1958 level; and another record breaking run by the motor industry has to be set down as a hope, not as an accomplished fact. Hence, to buy shares at values that look beyond recovery to a roaring industrial boom is to take a gamble. Yet, for many investors in this country and the United States, it is a gamble that has to be taken, for savings continue to pile up in the pensions and other institutional funds. They must find a home and increasingly that is in the equity market.

First of the Few

THERE seems to be little immediate prospect of another flood of new issues to mop up the flow of savings. British industry is not likely to embark on a fresh round of capital spending until its present capacity is more fully utilised. The new issues that will come forward early this year will be funding operations, to provide permanent finance for additions to capacity or capital developments already made and temporarily paid for by bank overdrafts. The banks, moreover, are not likely to press borrowers to pay off.

The first funding issue is by English Electric, to raise just over £10 million through Lazard Brothers. Ordinary, preference and debenture stockholders are offered £6 million of a 5½ per cent debenture (1979-84) at 97 and ordinary stockholders a one-for-ten rights issue of £1 ordinary units at 50s. Both issues should command a ready success. The debenture offers £5 13s. 5d. per cent flat and £5 14s. 6d. per cent to redemption and is covered 3½ times by assets and about 7½ times by earnings. The market gaily passed the test of a 5½ per cent debenture in December when Ind Coope made its £2 million placing at 96½; it now stands at 99¼ and a sizeable premium on the English Electric debenture is in prospect. When English Electric raised £16 million in May, 1957, it was exactly on the same terms for both debenture and ordinary stocks. The ordinary units stand at 61s. 6d. so that the value of the rights is only about 1s., but as the directors expect to maintain the dividend at 14 per cent on the increased capital the new shares at 50s. are offered at a yield £5 12s. per cent—about £1 higher than that offered at the market price on the old.

Heavy electrical engineering concerns have a voracious appetite for new money and even with this issue English Electric will still have about £10 million outstanding on bank overdraft. The new money is needed to finance a growth in production and orders, for since May, 1957, turnover has risen by about 13 per cent and the order book has expanded from £180 million to £238 million (of which about one sixth is for military orders). Yet despite this growth, costs continue to rise and profit margins to fall and for 1958 the directors' estimate of profits (before British tax and interest charges) is "not less than" the £8.3 million earned in 1957.

New York and Paris

WALL STREET ended the old year in much the same frame of mind as Throgmorton Street. Common stocks advanced to an all time peak on the last day of the year, carrying the *Dow Jones* average up to 583.65, a gain of 147.96 points over the whole year. Dealers on Wall Street, as in London, are optimistic though they recognise that if the advance in prices persists it will probably be at a slower pace. Economic recovery and higher earnings this year are being generously discounted, but Wall Street is continually subject to the buying pressure of the mutual funds (which in 1958 again scored a phenomenal success) and other institutional investors. Good equities are scarce on both sides of the Atlantic.

Continental bourses gave a more guarded welcome than did London to the moves towards convertibility. Prices were generally marked higher and Continental investors were buyers of German loans as well as a few selected British equities. In Paris, prices of gold shares and other international stocks had to be adjusted to the devaluation of the franc. For the first time for many years the premium on gold in the French market ran off, and the premiums on security dollars, security sterling and the like also disappeared. These premiums had been running at about 17 per cent, thus anticipating almost exactly the extent of the devaluation. Having guessed right, the professional dealers were quick to take their devaluation profits on the international stocks and this shaded their prices. But there was no heavy bout of selling, for any expectation of measurable repatriation of French funds from their foreign refuges would at this stage be premature. The political reaction to the policy of retrenchment has to be measured and the lasting efficacy of the economic reforms has to be proved before funds can be expected to flow back to Paris. The Bourse, having given a nominal vote of confidence by marking up French domestic issues, has to wait upon proof.

Freedom for Commodities

ALL the British commodity markets can now transact international business with equal freedom. Hitherto freedom was limited to the schemes for non-ferrous metals, rubber and copra. Those commodities, irrespective of the country of origin, could be bought from owners in the dollar area and re-sold for sterling or other major currencies. Chilean copper, for example, could be bought from an American owner, in Chile or the United States, and re-sold for sterling (but not if bought from a Chilean owner). A second group of commodities had a slightly more limited freedom. If coffee, cocoa, and raw sugar were bought for dollars and sold for sterling, they had to be bought in the country of origin. Cuban raw sugar, for example, could not be bought for dollars from a third country and sold for sterling. A third group of commodities was still more restricted. Because the main source of supply of raw cotton and grains is the dollar area, these important commodities had to be sold for dollars if bought from the dollar area. This restriction also applied to refined sugar. From last Monday, all commodities in the schemes can be bought for external sterling or any other currency, and sold for external sterling or other specified currency—which mainly excludes soft currencies of Latin America.

In the grain and cotton markets, particularly, British traders have an opportunity to increase their international business if they can offer a better standard of service than other centres. The scope for an increase should not be exaggerated. The role of the merchant is more limited than before the war. Prices of grain and cotton are largely controlled by governments; the usefulness of the futures markets is thereby curtailed and the scope for speculative merchanting business is that much narrower. Though London has succeeded in establishing an active market in barley futures, the wheat futures market in Liverpool is dead, and the cotton futures market in Liverpool is only just alive. Many consumers, indeed, are no longer interested in using the futures markets. No tears were shed by the millers when the Liverpool market died.

IMF AND WORLD BANK

Quota Increases Recommended

THE executive directors of the International Monetary Fund and the World Bank have recommended the increases in the capital of their institutions that were generally advocated at the New Delhi meetings. A standard increase of 50 per cent is recommended in quotas in the Fund, with substantially larger increases for three countries. It is suggested that Germany should more than double its quota, from $330 million to $787½ million. Germany would thus become one of the "big five" and would have a firm claim to a permanent seat on the board. The smallest of the five permanent members in terms of present quotas is India; the third largest is Nationalist China, but as this administration has paid up virtually none of its present quota it is difficult to see how it can be given an additional quota—and if it is not, it will rank behind the United States, Britain, Germany, France and India, and it might be possible to withdraw its permanent seat on the board. The other special increases proposed are for Canada (from $300 to $550 million) and Japan (from $250 to $500 million).

Together with the general increases of 50 per cent, these would add $5,100 million to the resources of the fund, of which a bit more than half would be in gold and dollars. At end-November the fund's uncommitted holdings of gold and dollars amounted to only $1,500 million. Together with some big repayments (including Britain's) now falling due, the quota increases would add very substantially to the

fund's lending capacity. Another help here should be the establishment of European convertibility; hitherto, drawings of sterling, D-marks and other currencies have been discouraged by the obligation that all drawings must be repaid in convertible currencies.

Only one quarter of the increases in quotas are payable in gold, and there are provisions for payments being spread over a period of years. Britain's gold commitment on its own account will be $162½ million, and overseas sterling countries will have to find $114 million in all, some of which may come from their own reserves rather than from the central pool. The next stage is that the governors of the Fund (the world finance ministers) will vote by post on the proposals early in February. The increases will take effect only if countries having 75 per cent of the quotas actually take up their increases before September 15th.

The World Bank proposal is to increase all subscriptions by 100 per cent, but to leave the whole of the increase uncalled (together with 80 per cent of the existing subscriptions). In practice this general increase is needed simply to increase the $2,500 million guarantee of the United States. The great bulk of the bank's new funds are raised in bonds denominated in US dollars, though often sold in foreign centres (this week, however, the Bank has issued a medium term loan for 100 million Swiss francs, and an issue in Germany may be seen this year). The executive directors express their regret that importance should be placed on the guarantee of one particular member—and they add with prescience that "the readier transferability of currencies will undoubtedly be of great help in this respect." But they consider that an increase in America's guarantee is desirable if the rapidly expanding volume of business is to be financed, and that once an increase is asked for there is no reason why it should not be large enough to cover the needs of the next decade. There should be no difficulty in getting members to agree. The Bank also is asking special increases from Germany, Canada and Japan, and to put them in line with other members, it will ask that on one half of these special increases, 2 per cent should be paid in gold and 18 per cent in local currencies, as was the practice with the original contributions.

BRITISH ALUMINIUM

Long Knives Out

EMOTIONS are never far from the surface of any take-over struggle and they are now running high in the battle for British Aluminium. The battle has become bitter, with the merchant banks and finance houses openly taking sides. A syndicate of City houses, many of them long established and many of them with a reputation for conservatism, has now entered the fight on the side of British Aluminium and its proposed deal with Alcoa. This group, listed in the accompanying table, is headed by Lazard Brothers and Hambros Bank, the financial advisers to British Aluminium.

The syndicate recommends stockholders to retain their shares in British Aluminium and not to accept the bid made by Tube Investments and Reynolds Metals on these grounds:

> . . . the maintenance of British Aluminium as a separate British company in partnership with Alcoa is in the national interest and affords the best and indeed the only opportunity for investors to hold a direct interest in a British company engaged in the production, fabrication and sale of aluminium on an international scale.

It is true that acceptance of the TI-Reynolds bid would leave the stockholders with only an indirect and diluted interest in aluminium. But this explicit appeal to patriotic interest sits oddly with the fact that British Aluminium has embarked on large-scale developments outside this country, that it is intent on further developments in Canada and elsewhere in the Commonwealth, and that it has itself sought the help of an American company, Alcoa, in financing these developments, in a manner that cannot but give Alcoa a dominant interest in its affairs.

Counter Bidding

THE syndicate has already approached a number of important stockholders in British Aluminium and some of them have indicated that they do not intend to accept the TI-Reynolds offer. Those stockholders and those within the syndicate are stated to hold more than £2 million of the £9 million ordinary capital of British Aluminium. The syndicate, however, recognises that the cash portion of the TI-Reynolds bid is attractive to some investors and its own scheme is designed to cap it. It offers to buy half of any holdings in British Aluminium (other than those of the TI and Reynolds interests) at 82s. per share on condition that accepting stockholders agree not to sell or transfer the remaining half before March 31, 1959. That period goes beyond the date to which the TI-Reynolds offer could be extended. Tenders for sale will not be considered by the syndicate before January 9th, the date on which the original TI-Reynolds offer closes. The syndicate reserves the right to refuse tenders when acceptances exceed £7 million in cash. It thus seems to be aiming at the acquisition of about 1,700,000 shares and the "sterilisation" of another 1,700,000 and it seems to be directing its appeal deliberately to the institutional investors. The sale of stock to the syndicate is a course of action that the syndicate explicitly does not recommend the stockholder to take. The syndicate evidently would prefer to see stockholders retaining the whole of their stake in British Aluminium—and therefore refusing the Reynolds-TI offer. In effect they would thus give their vote to the British Aluminium board and the Alcoa deal, but they would then be exposing themselves to the full risks of stock market fluctuations. Even the stockholder who accepts 82s. for half his holding is taking a risk, for there is no certainty what price the rest of the stock would fetch in the market when he is free to sell after the end of March.

The syndicate has some parallels with that formed to purchase Mr Samuel's holding in the Savoy Hotel shares so as to leave the management of that company in the hands of the sitting board of directors, though in that instance Mr Samuel was a willing seller. But its offer has a twist

THE SYNDICATE

Robert Benson, Lonsdale	Lazard Brothers
British South Africa Company	Locana Corporation
Brown, Shipley	Samuel Montagu
Cables Investment Trust	Morgan Grenfell
Robert Fleming	M. Samuel
Guinness, Mahon	Edward de Stein
Hambros Bank	The Whitehall Trust

THE ORDER OF BATTLE

	£
Issued ordinary capital of British Aluminium	9,000,000
Tube Investments Holdings and Reynolds Metals	say 1,900,000
American Metal Climax	650,000
Holders not accepting the T.I.-Reynolds offer	above 2,030,000
Obtainable by syndicate at 82s. out of fund of £7,000,000	1,700,000
Corresponding number "sterilised" until March 31, 1959	1,700,000
Remainder, assuming American Metal Climax holding is uncommitted	below 1,150,000

Vote of CONFIDENCE

Some 600,000 men and women are today investors in Abbey National. This great vote of confidence comes from thoughtful, sensible people all over the country. They have not chosen Abbey National lightly; they have chosen *rightly*. You would have to look far to find an investment that combines such a high level of security with such a satisfactory yield. The current return is 3½% per annum with income tax paid by the Society. This represents £6.1.9. per cent when income tax is payable at the standard rate.

REGULAR SAVERS!

Why not enquire about BUILD-UP Shares—the simple, profitable Abbey National plan for those who can save between £1 and £10 per month?

all of its own. The syndicate, which includes some public companies, is willing to buy the stock on an indicated dividend of 17½ per cent (not generously covered by earnings) and on a yield of only 4¼ per cent. Yet while its members are willing to pay 82s. per share, they are also prepared to countenance the agreement with Alcoa which gives that company the right to buy up to 4½ million new units at only 60s. each (with a limited dividend of 12 per cent for three years). Neither British Aluminium nor Alcoa suggested or were consulted about the formation of the syndicate; nor has Alcoa contributed to the syndicate's fund and none of the stock the syndicate secures will be sold to Alcoa.

The syndicate's offer is a last minute attempt, backed with power and prestige, to keep TI and Reynolds Metals out of British Aluminium. The reasons as set down by the syndicate for doing so are not strong; in themselves they do not explain why the battle is being fought with such intensity. It is now for TI and Reynolds, if they wish, to outbid the syndicate by improving on their original offer of one TI ordinary share plus 78s. for every £2 of British Aluminium stock. They can afford to wait for a time—just as stockholders can—for the market price of the British Aluminium has now risen to 84s. 6d., above the syndicate's bid price. TI-Reynolds Metals and their associates are fighting back and they are now believed to control about 20 per cent of British Aluminium's ordinary capital, compared with about 13 per cent when they posted their offer to stockholders just before Christmas.

EXCHEQUER ACCOUNTS

On Course

THE budget accounts at the end of the third quarter of the Government's fiscal year are running roughly according to plan, but there have been some large, though compensatory, deviations from the estimates made last April. For the full year the Chancellor expected total ordinary revenue to expand by £97 million; now, with two-fifths of the total still to be collected, the expansion amounts to £82 million. Receipts from Customs already show the whole £49 million growth expected in the full year; profits tax has provided an additional £25½ million, compared with £20 million expected for the full year; income tax an additional £69 million, compared with £104 million. Excise receipts, on the other hand, have already fallen by almost as much as, and miscellaneous receipts by rather more than, their estimated change in the year. Ordinary expenditure appears to have been running slightly—but only slightly—above estimate. The budget provided for an increase of £156 million (of which £32 million was for debt service) while up to date the increase has been £133½ million (£25½ million for debt service).

The "above-line" deficit for the nine months has thus expanded by £51 million to £495 million, but this increase is £8 million smaller than was originally envisaged for the full year. Net expenditure "below-line" has contracted, but rather less markedly than the estimates had suggested it would do. Any contraction at all, however, is somewhat remarkable, given the massive growth of the requirements of the nationalised industries. Net borrowings by these industries had been expected to rise by £49 million over the year; up to date they have risen by £103 million, to £422 million; of this deterioration, £76 million is attributable to transport and £20 million to coal. A large part of the strain from these sources has, however, been offset by a further pronounced change in local authority finance. New advances by the Exchequer to the Public Works Loan Board have amounted over the nine months to a mere £3.7 million (compared with the year's forecast of £65 million), or £37½ million less than the amounts repaid by the Board to the Exchequer. Thanks very largely to this relief, the Exchequer account as a whole shows only a tiny shortfall from estimate. The "overall deficit" of £927 million is nearly £30 million larger than that for the similar period of 1957-58—but the budget forecasts had envisaged a worsening by £24 million (to an overall deficit for the year of £236 million).

VENEZUELAN OIL

Breaking the Missing Principle

THE change in Venezuela's tax law announced by the Junta last week is clearly regarded by the oil companies as a more offensive act than throwing stones at Mr Nixon: they think that a breach of a fifty-fifty principle—retroactive and without any by your leave—is bad enough, and they fear that it will be worse if certain Arabs find out about it. Venezuelan law originally provided for a basic income tax of 2½ per cent, and a graduated surtax ranging from two to 28 per cent; in addition, the oil companies paid royalties to the government amounting to 16⅔ per cent of their output. The implicit intention in this arrangement was that Venezuela should receive one-half of the companies' profits. But in later years as the price of oil rose and costs fell, the government's proportion worked out at less than half, and in 1956 it was agreed that if royalty income plus taxes did not produce 50 per cent, a supplementary payment would be made to bring Venezuela's share up to one-half. In principle, the oil companies surrendered 50 per cent of their profits; in practice the government sometimes got more. Creole Petroleum, a subsidiary of Standard Oil of New Jersey, claims to have paid 56 per cent last year. Now the maximum tax rate is to be raised to 45 per cent, and certain reinvestment allowances formerly granted are to be revoked. This will mean that, since the oil companies pay the top rate, they will be giving something over 60 per cent of their profits to the Government if production remains at its average for the past few years.

But contrary to agreements now in force in the Middle East—where the fifty-fifty principle is generally explicit—there has never been a provision limiting the Venezuelan Government's share to 50 per cent. The Venezuelan move violates no contract, even though its arbitrary character certainly violates all past intentions. But a sovereign government is entitled to impose taxes, and if by doing so Venezuela makes its oil less attractive to produce, it must accept the consequences. It is possible that Venezuela's revenue from oil would ultimately have been greater had it lowered taxes, thus making its oil more competitive with Middle Eastern supplies.

The position of President-elect Betancourt remains unclear; he had announced that he intended to negotiate with the oil companies to raise the Government's share of oil revenues, and the lame-duck Junta may simply have tried to steal his thunder. He will certainly be able, after his inauguration this month, to modify the law if he wishes. Promise of more reasonable tax treatment for oil companies might well help him in the pending discussions on setting mandatory quotas on oil imports into the United States instead of the present voluntary ones.

ATOMIC ENERGY

Agreement with Euratom

THE text of an agreement between Britain and Euratom was finally approved by both sides before Christmas and will be signed later this month. It is likely to disappoint those who had hoped that the agreement might follow the same pattern as an earlier treaty signed last summer between Euratom and the US government which provides for American help on a fairly lavish scale in the development of atomic energy in Europe. The Anglo-Euratom treaty follows the same formal lines as earlier bilateral agreements concluded between this country and the governments of potential customers for atomic power stations in Italy and Japan; it promises Euratom no more aid, and no less, than was offered to them.

This is a less ungracious gesture than it seems. The goods that Britain has to sell are not of much interest to the research scientist in Europe in 1959. This country cannot hope to match the United States in breadth of experience with reactor design; only two basic types have been developed here, one at Calder Hall and one at Dounreay. It is still, however, the only country in the world that has tackled the difficult task of scaling up prototype reactors like Calder Hall for the bulk generation of electricity under commercial conditions. The commercial reactors being built in this country now bear the same relationship to Calder Hall as the engines in the Comet to Sir Frank Whittle's early jets. The engineering refinements that distinguish these reactors from Calder Hall are not important to scientists, but they are to electrical engineers. The Americans lack this experience; by working with Euratom, they may well acquire it. Meanwhile British scientists and British companies remain convinced that the way to develop nuclear power—and British trade—is by winning the confidence of public utilities and their engineers and keeping it as far removed from politics as possible. They have had one success in Italy; whether they can repeat it in other countries of Western Europe, without paying the attention that the Americans have paid to the political relationship with Euratom, remains to be seen.

AEA and Hot Water

SOME time this month a committee will decide whether or not to advise the Atomic Energy Authority to experiment with a boiling water reactor of the type developed in the United States. It seems almost certain that the committee will recommend that such a reactor should be built. It is a design that has been ignored in this country except by companies that have taken licences on American designs; its main advantage is that it is much better suited to provide electricity in small quantities as distinct from the bulk supplies from the Calder Hall system, which does not take kindly to being scaled down in size. Its disadvantage up till now has been the fact that it requires enriched uranium fuel. Enriched uranium is now, however, freely available from the United States and the International Atomic Energy Agency in Vienna, and the boiling water reactor has become the serious competitor to the Calder Hall type of reactor sold by British firms.

It is by far the most promising of the many different types of reactor tested in the United States; prototype reactors are already giving three times more heat than was originally expected, and the fact that there are no heat exchangers—water simply boils around the fuel and the steam goes direct to the turbines—makes for exceptionally low capital cost. It is perhaps a compliment to both British and American scientists that Britain should be considering adopting an American reactor design just at the time when the Americans are considering adopting the British Calder Hall type.

FOREIGN EXCHANGE

Money Out of Spain

DRAMATIC stories have been coming from Spain in the last few weeks about the interception of officials of Swiss banks by government agents tracking down the ownership and the location of expatriated Spanish money. This cloak and dagger activity reflects the growing concern of the Spanish authorities over the scale that the flight of capital has recently assumed. This is the more alarming as the people concerned are the natural supporters of the regime: this could be a *crise de confiance* in more than a financial sense.

The recent excitement follows a minor exchange reform. Spain has added another variant to its already diverse system of variable exchange rates. By clamping a levy of 25 per cent on the fob value of the great majority of its imports, it has, in effect, devalued the peseta for these imports from 117.60 to around 145 to the pound. The goods affected can best be described by specifying the exceptions; these are heavy equipment for power plants, mining machinery, railway equipment, newsprint and lubricants. Certain luxury imports already bore this surcharge,

or even higher ones. The higher rates remain in force—for example surcharges of 200 per cent are applied on imported motor cars and 50 per cent on whisky.

In April, 1957, Spain announced the abolition of the system of multiple rates that had previously been in force, and established uniform rates, of 42 pesetas to the dollar and 117.60 to the pound, for all transactions. This search for orthodoxy proved short lived. The uniform rate was soon overtaken by the inflationary rise in costs and prices and exporters of olive oil and canned fish among others soon had to be given subsidies through premiums on their foreign exchange earnings. The levy on imports is now being extended to finance these payments. The whole gamut of differential rates has thus been restored ; these have included for some time the special tourist rate of 52 pesetas to the dollar and 145.60 to the pound.

AIRCRAFT INDUSTRY

Orders in the Offing

THE Minister of Supply has never wavered from his statement last summer that the aircraft industry would have to shed about 120,000 of its workers by 1960 and stabilise at an employment level of 150,000. After the end of October employment was still as high as 247,000 though men were leaving the industry at the rate of about 1,000 a month. Mr Aubrey Jones's estimate was based on the assumption that the Ministry would not be placing orders for new military aircraft except in limited numbers to carry out functions that could not be given to missiles. These included a replacement for the Canberra bomber, a heavy freighter, a long distance troop transport and a small, strong fighter. Each of these new aircraft was included in the defence programme but it has proved difficult to get approval for ordering any one of them from all the government departments that have a say in aircraft procurement. This delay has threatened the aircraft industry with the danger of contracting even below the level set for it.

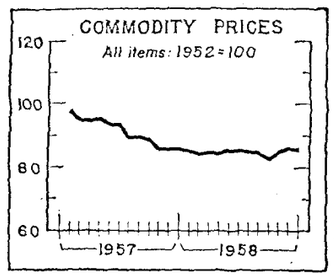
Now, presumably, that the outlines of this year's Defence White Paper have been agreed, the Ministry is belatedly getting the decisions for which it has asked. Orders are being placed for the Air Ministry's Canberra replacement, with Vickers-Armstrongs, and English Electric developing the "weapon system" aspect of the aircraft and the newly-merged Bristol-Armstrong Siddeley company providing the engine. The army appears satisfied with the short-range load-carrying and parachute-dropping characteristics of the Argosy freighter, a private venture of Armstrong Whitworth, and orders for a longer range transport are held up on the question whether it should be a jet or turbo-prop.

The interests of the service ministries concerned with getting the right aircraft, and of the Ministry of Supply, which would wish to spread production orders as widely as possible over the industry, may be divergent. The Air Ministry would presumably wish to place orders both for the Canberra replacement and for a trooping version of the VC 10 jet airliner with Vickers-Armstrongs. But this would concentrate two-thirds of all new military work in the factories of Vickers and of Rolls-Royce, which would be building engines for Vickers and for the Argosy. It would therefore tend to aggravate the unemployment that is already threatened in other factories, especially those of Bristol and of Shorts in Belfast, that are laid out to manufacture turbo-prop aircraft and their engines. The Ministry of Supply is, however, free to place research contracts where it chooses. It is awaiting an expert report—expected to be favourable—on the technical and commercial feasibility of a civil supersonic airliner. If the Ministry decides to sponsor the development of a prototype, it will represent the biggest act of government assistance that the civil aircraft industry has ever obtained.

THE PESO

Argentina's Exchange Reform

SIMULTANEOUSLY with the establishment of external convertibility of European currencies, Argentina this week announced the replacement of its system of multiple rates by a convertible peso at a single rate fluctuating in a free market, backed by big dollar credits. The concurrence was quite fortuitous ; Argentina's reform is on the pattern that has been under discussion for some months. Following recent precedents in smaller Latin American countries, proposals for credits from private American banks and US government agencies were linked to a credit from the International Monetary Fund ; and as Argentina had already drawn one half its quota of $150 million, the IMF was able to lay down important conditions on further support. It has now made available the remaining $75 million as a stand-by credit ; the US Treasury is providing $50 million, leading private banks $54 million, the Export-Import Bank $125 million (a loan for development of electric power), and the Development Loan Fund $25 million. The total dollar assistance amounts to $329 million.



Argentina will be able to use the IMF credit for a stabilisation fund that is to check excessive fluctuations in the free peso. Dealings in the new peso have not yet begun ; some observers in the City guess that the new rate may be at around 120 pesos to the pound, compared with 50 pesos at the old official rate and up to 200 pesos in the limited free market. Although Argentina is now removing all direct controls on imports and is thus putting its trade on a non-discriminatory basis, the authorities are for the time being imposing important surcharges on imports, as well as retaining a part of export proceeds. Effectively, therefore, multiple rates have not been abolished. The real worth of this exchange reform depends largely on how long the temporary provisions are kept in being. That in turn depends on the government's ability to check inflation. It has now announced rigorous budget economies and new taxes, and proclaims a tough line on bank credit, wages and prices.

COMMODITIES

Past and Prospect

COMMODITIES had a mixed year in 1958. American industry did not start to recover until May, and then commodities were affected by the pause in industrial production in Europe. So commodity prices as a whole finished last year no higher than they began it. *The Economist* indicator, which averages the prices of seventeen items, opened at 85.6 (1952 = 100) ; it started to sag in the summer, reaching 82.8 in the first week of October, its lowest level for nine years. The subsequent recovery did not go far ; after rising to 87.9 in November the indicator slipped back again

to finish the year at 85.8, barely above its opening level. Movements of individual commodities have equally been mixed. Non-ferrous metals and copra finished appreciably higher. Over the year copper rose by £45 to £224 a ton and tin rose by £20 to £750 a ton. Zinc, which started at £62 a ton, £10 below lead, has recently overtaken its sister commodity, closing at £76 a ton, £3 dearer than lead. Supplies of copra were short, and prices rose by $56 to $245 a ton over the year ; cocoa, regularly afflicted by fears of shortage, finished 30s. higher at 334s. a cwt. Prices of coarse grains, especially barley, were helped by the late harvest in Europe, which led to hasty buying of imported grain. The weakest commodities were coffee and fibres. Brazilian coffee dropped by over one quarter ; United States cotton dropped by one-eighth and the long staple cottons by much more ; wool prices fell by over one-quarter.

While commodities as a whole should fare better in 1959, the improvement may be slight. Most items are in ample supply, and industrial prospects in Europe are hardly likely to set off a bout of re-stocking for some time. Supplies of copper are being augmented by the ending of the strike at the International Nickel Company's mines, and by the Board of Trade's decision to sell the whole of the copper remaining in the stockpile, amounting to 30,000 tons. The quantity is tiny in relation to world consumption, but its disposal will act as a brake on prices all the same. Presumably the remaining quantities of lead zinc and other metals in the stockpile will also be sold. And the time is bound to come when the United States will begin to run down its vast strategic stock.

GAINS AND LOSSES IN 1958

GEOPHYSICS

End of a Long Year

THE International Geophysical Year, born in high summer eighteen months ago, ended on Wednesday night. Its main purpose was to make a detailed study of the earth's atmosphere, reaching upwards and outwards towards the sun. The dates were chosen to span a peak time for sun-spots which disturb the atmosphere in a way that interests scientists as much as it infuriates radio engineers. Polar regions are the best places to study these phenomena—hence the migration of scientists to the Antarctic. The work involved detailed readings taken round the clock by chains of stations running around the world. Standardised, 24-hour measurements of different phenomena from different points of the globe were the main object of the biggest scheme of scientific co-operation ever launched.

Sputniks undermined this scheme of co-operation before the IGY was more than a few months old. The eight earth satellites than went into orbit (including the 4-ton Atlas, which is not an IGY project) and the two moon rockets that did not were able to collect in hours more data than stations on the ground could have acquired in years. The scientist who controls a sputnik does not depend on the goodwill of colleagues overseas to fill gaps in his data. But scientists without sputniks are still in the dark about what the American and Russian satellites found in outer space, beyond their one or two well publicised discoveries.

Sputnik data, as well as the information thrown up by the IGY as a whole, may take a long time to analyse, so that the aircraft, missile and radio engineers who need more basic data on the earth's atmosphere will still have to wait. There are plans to carry some IGY projects into this year. Most of them depend on international co-operation in routine investigations but some of them are quite different. Countries that set up special IGY bases in the Antarctic, nominally to study sunspots, are showing no inclination to pack up and go home now that the "year" is over. Indeed sometimes they are digging in, as the Russians are, on slabs of ice over which other countries claim sovereignty.

BUTTER AND MEAT

A Mixed Business

THE British housewife has recently been told that imports of butter have been freed, and that imports of beef from Argentina will fall. She would be wrong to suppose from this news that supplies of butter will become much more plentiful, and supplies of beef much less. The restrictions on imports of butter from several European

MOTOR BUSINESS

Whitehall 1511, Ext. 140

countries were introduced in May, in response to New Zealand's complaints about dumping and the depressing effect on prices. The aim was to reduce total imports over a full year by roughly 10 per cent, or 40,000 tons, below the level of 1957. Now that prices have recovered sharply there is no reason to continue the restrictions. The steps taken by the exporting countries to reduce their surplus have proved too effective from the housewives' point of view, and thus there is no likelihood of an increase in shipments big enough to harm New Zealand's farmers. The actual rate of increase may be no more than 20,000 tons a year. The size of the exportable surplus will not be the only factor. Most of the countries accused of dumping may decide that it is better to restrain their shipments than risk the renewal of restrictions in Britain.

Argentina, Britain's main source of chilled beef, has decided to restrict shipments to this country in order to conserve domestic supplies. Prices have soared, and that is politically embarrassing in the largest meat-eating country in the world. It is intended to ship less than 50,000 tons to Britain in the first quarter of this year, compared with arrivals of over 74,000 tons in the first quarter of 1958. The actual rate of shipments in the first quarter and beyond may not suffer quite so severely. Beef is an important sourse of export income for Argentina, and the authorities may try to cut down domestic consumption a little further. Britain should also get some relief from Commonwealth supplies. Shipments of beef from Australia should be larger this year than last, and shipments of lamb from both Australia and New Zealand should improve.

BUDGET HOPES

Postwar Credits

A PERENNIAL budget favourite is being tipped more strongly than usual this year: quicker release of postwar credits. Certainly, if the Government wanted to find a way of injecting purchasing power into the economy with equity, postwar credits are an obvious choice. They date from the budget of 1941, in which steep increases in income tax were sweetened by "offsetting" them against a credit to be payable "after the war." Some £765 million of credits piled up in this way ; and postwar governments, confronted with too much existing purchasing power, have been reluctant to create more by honouring the wartime pledge. The credits have been released only to women when they reach 60 and to men at 65 ; since 1954, they have been payable in the event of death or bankruptcy to the person having title to the credit, the timing of the payment being subject to the same conditions. Some £440 million of postwar credits have still to be paid off, and about 8½ million people are waiting for them ; the maximum held by any one person is £325. Apart from the special provision in the 1954 relaxation, the credits are not negotiable ; the Government has hitherto resisted (for no very clear reason) suggestions that people should be able to discount these claims with banks or any other institutions willing to take them.

SHORTER NOTES

Agreement on a three-year limitation of exports from Hongkong to Britain—for home consumption only—has been reached by the cotton textile industries of the two countries. It now remains for the cotton textile industries of India and Pakistan, who accepted restrictions on their own exports on condition that Hongkong did the same, to approve the level of restriction that Britain has agreed with Hongkong.

* * *

Mr Ian W. Macdonald, at present director and general manager of the Commercial Bank of Scotland, will be the full-time chairman of the merged National Commercial Bank of Scotland ; Mr David Alexander, at present director and general manager of the National Bank, will be director and general manager of the combined bank.

* * *

A new yard and a new pound weight for use by scientists and engineers have been defined by the Department of Scientific and Industrial Research. The English yard is fractionally shorter than the American yard and the scientists say that it is shrinking at the rate of more than one millionth of an inch each year, which is inconvenient for precision engineers. The standard yard and pound must still be used for trade.

* * *

Following negotiations between representatives of the British and Polish governments, quota lists have been drawn up covering mutual trade during 1959 under the 3-year trade arrangement signed at the end of 1956. These provide for British exports to Poland of machinery, machine tools, instruments and consumer goods at approximately the same level as in 1958 and for increased exports of chemicals, manufactures of rubber, and electrical equipment. Poland will be able to increase its exports of chemicals, canned meat, and toys, and to send 47,000 tons of bacon.

COMPANY MEETINGS

TURNER & NEWALL LIMITED

TRADING PROFITS SLIGHTLY LOWER

OUTLOOK CAUTIOUSLY OPTIMISTIC

The Annual General Meeting of Turner & Newall Limited will be held on January 20, 1959, at the Chartered Accountants' Hall, Manchester, when it is expected that Sir Walker Shepherd, the Chairman of the Company, will preside.

Sir Walker Shepherd's Statement to the Stockholders has been circulated to them with the Report and Accounts, and, after dealing with the accounts of the Company, it contains a detailed review of the Company's operations during the year to September 30, 1958, both at home and abroad.

The following are extracts from the Statement:

Before I deal with the Directors' Report and the Accounts for the year I wish to report, with great regret, a very sad loss to the Company in the death of Mr H. Hanson, who was our Deputy Chairman and a Joint Managing Director until his retirement, on grounds of ill-health, in January, 1958, which, unhappily, was followed by his death on February 5, 1958. This terminated an association with the business of this Company and its predecessors which had lasted for more than half a century, and removed from our Board an extremely able and experienced Director, and a man of whom, I feel it is literally truthful to say, that he had not an enemy in the world. Your Directors will long miss a valued colleague and a close personal friend of all of them. It is also my sad duty to report that in January last Mr George Wilson, whose resignation from our Board was reported a year ago, died within a few months of his retirement from the Board. Mr Wilson, too, had a long record of valued service to our Organisation, and your Directors regret exceedingly that it was not possible for him to have a reasonable period of full health and vigour in which to enjoy the retirement he had so well earned.

ASBESTOS TEXTILES

Demand for the general range of asbestos textile products of Turner Brothers Asbestos Company Limited was progressively affected during the greater part of the year by the general decline in trading activity but showed signs of some recovery by the end of the period. Export turnover again broke the record established in the previous year, partly owing to substantial and unusual orders from Russia for rubber transmission belting. Requirements of conveyor belting from the National Coal Board and other large users were appreciably reduced, but the Company strengthened its position in this highly competitive field and secured further substantial contracts for its Hindley Green factory. The production of automotive and industrial "V" belts has been considerably expanded to keep pace with sales, in face, once again, of strong competition. In both these directions, the keen attention that has been given to cost reduction is yielding increasing benefits. Progress in the modernisation and extension of the Rochdale factory has continued, but has been delayed by unexpected difficulties arising from the geological conformation of the site. These have now been overcome.

The transfer of certain important textile and plastics processes from Rochdale and Leeds to the new factory at Hindley Green has been brought close to completion. Asbestos textile manufacture at the Leeds factory of J. W. Roberts Limited has now ceased. Beneficial effects on costs are beginning to appear, as production becomes established in the new location. Construction of the new premises for J. W. Roberts Limited at Horwich, near Bolton has been recently completed, enabling the Company's commercial, research and development activities to be moved from Leeds to more suitable accommodation there. Despite adverse trading conditions, turnover in Sprayed "Limpet" Asbestos has been increased substantially, particularly in export markets, while encouraging progress has also been made in "Ferobestos" technical plastics.

BRAKE AND CLUTCH LININGS

In spite of more intensive competition the turnover of Ferodo Ltd. attained a new high level, with both home and export markets showing an increase on last year's figures. The motor trade has been enjoying a period of prosperity, and, since Ferodo brake and clutch linings are used by practically all vehicle manufacturers for original equipment, the Company's business has expanded accordingly. This does not mean that the continued development of markets outside the motor industry has been neglected ; for instance, following the trend of recent years, sales of non-slip stair treads have expanded still further to a new record figure. Costs, however, have continued to rise, but the effect of this has been cushioned by increased volume. Present indications are that this trend will continue in the immediate future and that it may be possible to avoid any significant fall in profits.

The extension of research facilities, to which I referred last year, has proceeded satisfactorily, and HRH Prince Philip, Duke of Edinburgh, honoured the Company by opening the new building last month.

In recent years one of the most important developments in braking has been the increasing use of disc brakes, and it is pleasing to be able to report that Ferodo Ltd. is the leading supplier of friction material for such brakes. Motor racing has always been regarded as one of the proving grounds for the Company's products, and the fact that this year eight out of ten Grand Prix races have been won by cars fitted with Ferodo brake linings provides an encouraging demonstration of the quality of the Company's products in the face of worldwide competition.

ASBESTOS CEMENT

During the past year the steps taken by the Government to control inflation had their inevitable damping effect on the activities of the construction and civil engineering industries ; under these circumstances it is very pleasing to be able to report that Turners Asbestos Cement Co. Ltd., which supplies these industries with a wide range of asbestos cement materials, has had a most successful year despite the fact that export markets have been in a very depressed state. Various new products have been developed in the past few years, and in particular "Turnall" "Colourglaze" Finish has been very well received by architects and is being specified by them on a substantial scale.

Demand for "Everite" asbestos cement pressure pipes for water mains has been lower both at home and overseas and price competition is acute ; there are, however, grounds for hoping that demand will improve, but it is not likely to return quickly to the very high level reached in the past few years. The amount of industrial and commercial building which is being planned has fallen substantially, with the result that the Company may experience in the early part of 1959 an appreciable fall in demand for its building products ; however, the financial year opened with the order book in a very healthy state and there appears to be no reason why the results for the whole year should not be satisfactory.

CHEMICAL AND INSULATION

The level of activity at the factories of The Washington Chemical Company Limited was somewhat less than that of last year. This was due principally to the effect of a general diminution in industrial demand throughout the country and increased competition in export business. The tendency towards reduced profit margins, mentioned last year, continued. The turnover of Newalls Insulation Company Limited did not quite reach the very high level of last year, as the completion dates of substantial contracts were not reached by the end of the accounting period. The volume of work on hand is, however, substantial, although in common with industry generally, profit margins are falling.

DIVIDEND ON ORDINARY STOCK

This year your Board recommend, as foreshadowed in their interim statement, a final dividend on the Ordinary Stock of 10 per cent, making, with the interim already paid, a total distribution of 15 per cent for the year. This figure corresponds to last year's total distribution and is, in view of the fact that our experience during the past year has not been quite as good as during the previous year, an appropriate rate of dividend in the circumstances.

FUTURE PROSPECTS

Last year I informed you that as far as could then be seen it was likely that conditions obtaining during the financial year ending September 30, 1958, would result in a rather lower profit for that year. In essence this forecast was repeated in the interim statement of the Board, and it has now been demonstrated to be broadly accurate. As regards the future, forecasting is even more difficult than is normally the case, but we do expect to remain prosperous on a somewhat lower level than that of the boom years, and, while a downward trend still continues in some sections of our activities, there is, here and there, an indication that bottom may have been reached and that some improvement of a modest character may not be far ahead. This is a movement which appears to have some significance in the United States of

America and Canada, but it does not show at present in relation to our operations within the United Kingdom, while our sales of raw asbestos, both from Africa and from Canada show a diminishing trend which, while not of a serious character, is disappointing. The current year, therefore, may not show figures as good as those in the Accounts now before you, although it is not anticipated that any reduction will be of a serious character, and the broad geographical spread of our Group activities tends to have a cushioning effect against extreme fluctuations, whether up or down. Our outlook, therefore, remains optimistic, but cautiously so in view of world-wide problems in both the political and economic fields, none of which, of course, is within our control.

OK BAZAARS (1929) LIMITED

(Incorporated in the Union of South Africa)

INCREASED VOLUME OF SALES

PROFIT AFFECTED BY PRICE REDUCTIONS

The twenty-ninth annual general meeting of OK Bazaars (1929) Limited was held on December 15th in Johannesburg, Mr M. Miller, chairman, presiding.

The following is the directors' report circulated with the accounts:

The Directors have pleasure in presenting the twenty-ninth Annual Report and Statement of Accounts for the year ended June 30, 1958.

The Profit and Loss Account of the Holding Company has this year been presented in narrative form. The figures quoted below have been taken from the Consolidated Accounts which show the state of the affairs of the Company and its Subsidiaries. The Company's Accounts are attached, and do not call for special comment.

PROFIT AND APPROPRIATION

The Group trading profit for the year is £2,156,563 compared with £2,129,059 for the previous year, from which charges and appropriations have been made as shown below:

1957		1958
£		£
2,129,059	Consolidated Trading Profit	2,156,563
216,745	*Deduct:* Interest paid less received	308,165
1,912,314		1,848,398
24,000	*Add:* Income from Trade Investments	24,000
1,936,314		1,872,398
680,907	*Deduct:* Taxation	695,146
1,255,407		1,177,252
1,503	*Deduct:* Minority Interests	6,082
1,253,904		1,171,170
4,531 (loss)	*Add:* Surplus on sale of Properties	34,502
£1,249,373	Net Revenue for the year	£1,205,672

	£	£	£
Dealt with as follows:—			
Dividends of Holding Company—			
On Preference Shares		75,400	
On Ordinary Shares—			
Interim of 20 per cent paid on 31st July, 1958	168,870		
Proposed Final Dividend of 42½ per cent	358,850		
		527,720	
603,120			603,120
Retained in the business of which £537,800 (£536,500 in 1957) has been transferred to Capital and General Reserves			
646,253			602,552
£1,249,373			£1,205,672

DIVIDENDS

In addition to the Interim Dividend of 20 per cent paid on July 31, 1958, the Directors now recommend a Final Dividend of 42½ per cent on the Ordinary, "A" Ordinary and "B" Ordinary Shares, making a total distribution for the year of 62½ per cent, which is the same as last year.

Directors.—It is with regret that we record the death of Mr I. Hayman, who was a Director of the Company for many years. The vacancy was filled by the appointment of Mr B. A. Ettlinger, QC, who retires from office at the forthcoming Annual General Meeting, but offers himself for re-election. Messrs A. Schwartz and L. M. Miller, who retire by rotation, being eligible also offer themselves for re-election.

Auditors.—Under the provision of the Companies Act of 1926, as amended, Messrs Peat, Marwick, Mitchell & Company, continue in office and a resolution fixing their remuneration will be submitted to the Annual General Meeting.

GENERAL

Whilst the Company increased its volume of sales over the previous year, it did not show a corresponding increase in trading profit by reason of the maintenance of competitive values and the reduction of prices to the public. Administrative costs continue to rise but an improved merchandise control has resulted in a better stock turn rate. Stocks show a slight increase, due to the opening of new branches. Throughout the year, the South African manufacturers who supply over 85 per cent of our total requirements have given us good service, and have improved the standard of their products, and it is gratifying to know that we, as large purchasers of locally made goods, have assisted them in achieving this position. Provision for the replacement, renewals and modernisation of shop fittings and equipment has this year been increased by an amount of £125,155. We have deemed it prudent to make this provision to enable us to continue our policy of modernising our shop layout and sales presentation wherever necessary.

The following statistics are given for the information of shareholders:

	1954	1955	1956	1957	1958
	£	£	£	£	£
Preference Capital	1,040,000	1,040,000	1,340,000	1,340,000	1,340,000
Ordinary capital	651,000	651,000	844,000	844,000	844,000
Reserves and Unappropriated Profits	6,271,000	6,953,000	8,703,000	9,347,000	9,950,000
	£7,962,000	£8,644,000	£10,887,000	£11,531,000	£12,134,000
	£	£	£	£	£
Profits after Tax	853,000	966,000	1,153,000	1,254,000	1,171,000
Percentage of profits of above totals	10·71	11·17	10·59	10·83	9·65
Preference Dividends paid	57,000	57,000	57,000	75,000	75,000
Profits attributable to Ordinary Shareholders	796,000	909,000	1,096,000	1,179,000	1,096,000
Dividends to Ordinary Shareholders:					
Amount	390,000	390,000	507,000	528,000	528,000
Per share	3s. 0d.	3s. 0d.	3s. 0d.	3s. 1½d.	3s. 1½d.
Profits retained	406,000	519,000	589,000	651,000	568,000*

* This figure does not include the surplus of £34,500 on sale of properties.

DEVELOPMENT

New branches were opened at Orange Grove (Johannesburg), at Kitwe (Northern Rhodesia) and at Florida (West Rand) in April, June and November, 1958, respectively. In August, 1958, we transferred our Randfontein (West Rand) branch business to new premises; portion of the extension presently being effected at Klerksdorp (Western Transvaal) was made available for trading in October, 1958. It was not possible to commence building operations at Rosebank (Johannesburg) as anticipated, but it is expected that a start will be made in January, 1959. The Company is busy on plans for the erection of new branches on sites which have already been purchased. Good progress is being made with the extension to Port Elizabeth and last month we commenced the extensions to Salisbury (Southern Rhodesia) and Wynberg (Cape). As stated in last year's report, capital outlays will be required for the extension of these three branches, as well as for alterations to certain other stores on long-term leases, the major portion of which will be recovered from Federated Stores Limited, over a period of years. At June 30, 1958, the amount of such recoverable outlays was £409,328 as reflected in the accounts.

During the year under review, the Company sold at a profit properties which were no longer required. Warehouse sites at Durban, Bloemfontein and Salisbury were purchased and work has already started on the Bloemfontein and Salisbury projects.

Staff: We extend to all members of the staff our thanks and appreciation for their continued loyal co-operation and efficient services. This year, as in previous years, bonuses were paid to the staff.

The report and accounts were adopted.

ARTHUR GUINNESS SON AND COMPANY LIMITED

STATEMENT BY THE EARL OF IVEAGH, KG, CB, CMG

The Annual General Meeting of Arthur Guinness Son and Company Limited will be held on January 14, 1959, at Park Royal Brewery, London, N.W.10.

The following is an extract from the statement by the Chairman, the Earl of Iveagh, KG, CB, CMG, which has been circulated with the Report and Accounts:

TRADING DIFFICULTIES AND PROFITS

The year had been a difficult trading period: increased unemployment and a decrease in overtime, together with competition of other consumer goods had combined with high taxation and poor summer weather to depress beer sales. For the first time for some years the upward growth of Guinness home sales had been temporarily halted, but exports had continued to expand.

Nevertheless it was satisfactory that an increase in profits could be shown. Total group profits before taxation were £8,154,000 compared with £7,461,000 in the previous year, an increase of £693,000.

CONFECTIONERY GROUP

The William Nuttall Group had now been a wholly-owned subsidiary for over a year. Over the years the bulk of the considerable profits had been ploughed back, but it was now felt the time had come for the shareholders to receive some tangible benefit; William Nuttall had accordingly declared a substantial dividend to the Parent Company.

INCREASE IN ORDINARY STOCK DIVIDEND

It had been decided to recommend an increase of 3 per cent in the Final Dividend on the Ordinary Stock, making the total 28 per cent for the year. The policy of building up reserves would continue.

RESEARCH

The emphasis on research and modernisation had been continued and intensified. An experimental section at Park Royal was trying out new brewing techniques, and unending attention was being devoted to the perfecting of the Guinness product, in which the Company had the fullest co-operation of the very many firms and individuals in Great Britain and in Ireland who bottle and serve Guinness. On such co-operation the Company was dependent, for Guinness was by a long way the greatest of malt liquors still sold naturally conditioned in bottle.

PENSIONS

This year would see the completion of the 10th year of the Pension Scheme under which part of existing and future pensions were payable from a separate Trust Fund. The Actuarial valuation showed a satisfactory surplus which would be used for the greater security of all pensioners. In addition the further strengthening of the Pension Fund was being considered.

BICENTENARY

In the last days of December the Company entered into the 200th year of its existence, having been founded in 1759. It was an indication of the Company's vitality that this year the Chairman had been joined on the Board by his grandson.

It is proposed to recommend the payment of final dividends on January 15, 1959, of 3 per cent on the Preference Stock and 18 per cent on the Ordinary Stock, both less Income Tax.

Staff and Employees are receiving a bonus of one month's pay.

KENDALL & GENT LIMITED

(Machine Tool Engineers)

A FAVOURABLE YEAR'S WORKING

The one hundred and twelfth Annual General Meeting of Kendall & Gent Limited was held on December 18th in Manchester. Mr F. C. Mosley (Chairman and Managing Director) presided, and in his speech, said: The net profit for the year is £88,494 against £82,601, and as usual we are making full provision for taxation by reserving £43,000 which covers all taxation liabilities. This year, your Directors recommend placing £10,000 (£5,000 last year) to General Reserve Fund, and to increase the carry forward to £59,670 against £58,909. Capital Reserves remain at £20,000, and the General Reserve is thus increased to £135,000. Dividend Equalisation Reserve remains at £20,000. The total of these three reserves is now £175,000 and with the carry forward of Profit and Loss Account balance (£760 better) at £59,670, there is a grand total of £234,670 against an issued Capital of £200,000. It is recommended that the final dividend of 10 per cent be maintained with a bonus of 5 per cent making a total of 20 per cent less tax for the year.

Having regard to all the circumstances, your Board reports a favourable year's working. Output has been at a high level, but demands for machine tools have fallen, due to the recession felt in many engineering industries. Although the rate of incoming orders is below that of deliveries, a satisfactory level has been maintained.

The subsidiary Company has maintained the high quality of its products and various structural improvements have been carried out.

Regarding the Balance Sheet, Current Liabilities and Provisions are some £39,000 less; Current Assets £18,000 less, and the surplus of current assets over liabilities has again shown an improvement.

Our investment in The Associated British Machine Tool Makers Limited remains the same, and is shown in the Balance Sheet at a very low figure indeed. Although as members of this organisation we are well represented throughout the world by reputable Agents, we have arranged for our own specialists to assist the selling organisation.

We have been very conservative in dealing with our profits for a long number of years, and have built up very good reserves. All necessary repairs have been carried out and new machinery installed, so that now our Works is amongst the most modern in the engineering world.

In thanking the workmen, officials and Directors for their support, Mr Mosley paid a tribute to Mr Foley who retires from executive duty after 54 years with the Company, but retains his seat on the Board.

The report and accounts were adopted.

ANGLO-ECUADORIAN OILFIELDS LIMITED

The fortieth Annual General Meeting of Anglo-Ecuadorian Oilfields Limited was held on December 30th, in London, Mr F. C. Bowring presiding. The following are extracts from his circulated Statement for the year ended March 31, 1958:

I regret to have to report that, as intimated in your Board's circular letter of April 1st, owing to the uneconomic trading conditions in Ecuador the profits for the year to March 31, 1958, were substantially reduced, though due to exports of crude oil the Company was able to show a consolidated profit of £235,880 compared with £773,347 (which includes a profit on the sale of investments of £171,112) for the previous year.

PRODUCTION

Crude oil production for the financial year ended March 31, 1958, amounted to 2,490,849 barrels compared with 2,453,423 barrels for the previous year, an increase of 1.5 per cent.

As Stockholders will be aware from my circular letter of April 1st, owing to the serious financial position resulting from the uneconomic refined products price basis in Ecuador and the increased costs of labour and materials, your Board decided the scale of your Company's operations must be reduced until such time as adequate prices for refined products were authorised by the Government of Ecuador. In consequence since April the Field has been operating on a substantially curtailed drilling programme, designed to give the maximum production for a minimum expenditure. It will be appreciated that this reduced programme is such that production must steadily decline. Moreover, serious long-term effects must arise from the inability to carry out a full programme of exploration and exploitation.

REFINERY

The new Refinery was originally planned to come into operation in July, 1958. During the year under review preparatory work on the site was completed and good progress made with the erection of the plant which would have been on stream as scheduled. Unfortunately, however, on March 15th last, lack of funds and no certainty of refined products prices being increased in the near future compelled your Board to cease construction of the new Refinery until products prices were adequately increased in accordance with the Company's contract with the Government of Ecuador and the terms of the Petroleum Law.

ACCOUNTS

The very serious decline in profits is principally due to the losses that have been incurred on Refined Products Trading in Ecuador, amounting to £387,790 as against £78,743 in the previous year.

You will observe that due to a change in Ecuadorian Social Legislation your Company has a substantial contingent liability for pensions, for which no provision has been made in the Accounts under review. Your Board has commissioned a legal and actuarial study of the position and should receive the results in time for consideration before next year's accounts.

The future trading conditions of your Company are uncertain as no price increases have yet been obtained and this, coupled with the unfavourable liquid position, does not justify your Board in declaring a dividend.

The report and accounts were adopted.

MITCHELLS AND BUTLERS LIMITED

MR ROBERT H. BUTLER'S STATEMENT

The Seventy-first Annual General Meeting of Mitchells and Butlers Limited will be held at The White Horse, Birmingham, on January 15, 1959. The following is an extract from the circulated statement of the Chairman.

RECORD PROFIT

I am happy to report that the trading profit for the year is once again a record. This is due partly to the strenuous efforts which have been made in all sections of the business to keep down production and selling costs, and partly to the fact that we have had the benefit for a full year of the price increase we had to make during 1957.

Although trading profits for the year are a record it has not been necessary to provide for taxation as much as last year. The policy of re-equipment of the Brewery has resulted in higher capital allowances, but more important than this has been the abolition in the last Budget of the two-tiered system of Profits Tax in favour of a flat rate of 10 per cent. Although this change has been operative only since April, it has been of considerable benefit to your Company and will be of additional benefit next year.

In addition to the re-equipment of the Brewery we have continued to spend large sums on the erection of new licensed properties and the improvement of existing ones; the total figure expended in the last year has been £332,000. We have been successful in selling a number of surplus properties and land at very good figures and, in fact, have financed a large proportion of the expenditure on licensed houses during the year in this way so that the Accounts only show an increase in the value of Fixed Assets of about £143,000.

FIRST CLASS PRODUCTS

Beer output of the Country has shown a considerable decrease over the previous year, due mainly to yet another poor summer, but I am happy to say that the output figures of this Company tell a better story.

Our beers have withstood all competition during the year under review, and the goodwill of customers has been firmly held and consolidated.

The reconstruction which has been completed during the year, mainly in the Power Station and Fermenting House, is already yielding excellent results. Further progress in modernisation in the Bottlery has been made, economies achieved and working conditions improved by mechanisation of the handling of both full goods and empty cases and cartons.

REPLANNING BIRMINGHAM—COMPANY'S PROBLEMS

The inhabitants of Birmingham will have noted the rapidly changing face of the City. Demolition and rebuilding now appear to be proceeding at an accelerated pace. All too often licensed houses disappear in the process and the sum total trade passing from these houses is considerable.

Three famous catering houses belonging to the Company are among the many houses affected, and in the all too near future a large and important section of the community will require to be provided with alternative accommodation at mid-day or in the evening where they may enjoy a meal in or near the City centre.

Your Board are devoting a great deal of thought to this problem with the object of providing the necessary accommodation in other houses as near the centre of the City as possible.

This is only a part of the vast rehabilitation problem with which the Company is faced, calling for a tremendous amount of capital to enable us to continue to provide the services which we have always done in the past.

It has always been our policy to plough back out of our profits adequate sums to meet this type of expenditure, and in order that stockholders may appreciate the full extent of the task I would say that over the past three years we have expended a sum in excess of £1½ million on new and improved licensed houses.

At the present time we have on hand major projects at about sixty existing licensed houses, and a further eight new fully licensed premises now in course of erection. These and other schemes which have been approved by the Board amount to nearly £1 million, and in addition to this we have further schemes under discussion amounting to another £500,000.

WEAR AND TEAR ALLOWANCE ON BUILDINGS

This brings me to a taxation point to which I have referred previously. While industrial undertakings receive certain taxation allowances in respect of industrial buildings, licensed houses are not included, although tied houses are necessary to a brewery business to enable it to earn profits. If assistance by means of capital allowances for the purpose of the financing of new or improved houses—providing greater amenities to the public—should lead to improved trade, and, therefore, to greater profits, more than 50 per cent will return to the Chancellor by way of taxation. Such allowances would therefore not be an entirely one-way affair.

Further, alterations to houses such as the improvement of domestic quarters or general betterment of premises to conform with high modern standards of hygiene, do not lead to additional trade and it is unfair that brewery companies should have to find the money out of taxed profits. This policy of regarding as capital each and every alteration to a licensed house, whether or not there is any increase in profit-earning capacity resulting therefrom, is liable to act as a deterrent to improving the standard of licensed premises generally.

In 1951 the Millard Tucker Committee on the Taxation of Trading Profits went so far as to recommend that a depreciation allowance should be given for all commercial buildings, and this was endorsed in 1955 by the Royal Commission on the Taxation of Profits and Income under the Chairmanship of Lord Cohen (as he now is), who stated: "We could find no fiscal justification for distinguishing between commercial and industrial buildings and we think both should get the allowance. Accordingly we endorse the recommendation of the first Tucker Committee."

ATTRACTIVE NEW LICENSED HOUSES

Building of the three Planning Removals in the suburbs of Birmingham to which I referred last year has been duly completed during the year, and the brisk trade they are doing provides ample evidence of the need they are filling. Five more have received all the necessary consents and building of these is just commencing. The Company is thus actively engaged in endeavouring to replace with all possible speed the trade lost through closings in the Redevelopment Areas of Birmingham.

The three new houses we have opened outside Birmingham since the date of our last meeting have delighted a large number of people and have received most enthusiastic references in the Press. Two of these houses are in towns where we have not previously built, Swindon and Cardiff, and trading results are most satisfactory, thus more than justifying our new ventures. The third is at West Bromwich and is also doing a very good trade.

The recently introduced Bill to improve the basis of compensation to be paid when land or property is compulsorily acquired by public or local authorities is a timely act by the Government to put right a situation which has borne unjustly and heavily not only on your Company but on other property owners.

An appeal lodged with the Lands Tribunal by the Birmingham & Midland Counties Wholesale Brewers' Association in respect of one of the Company's houses known as the "Edgbaston Hotel," Lee Bank Road, Birmingham, was taken in consequence of the disquiet caused to brewers by local authorities adopting a basis of compensation which was considered to be quite inadequate. The result was that the Lands Tribunal awarded a figure considerably in excess of that offered by the Corporation, and it is felt that this decision will provide a reasonable basis for the future compensation to be paid in respect of a large number of licensed houses.

ASSOCIATED MIDLAND BREWERS LIMITED

I informed Stockholders last year that a Company had been formed to deal with certain properties belonging to Messrs Ansells and ourselves, to enable a saving of expense to be made wherever it was thought possible and, as I pointed out, the idea being that in certain instances, one house only would have to be built instead of two. During the year we have dealt with two properties in Coventry which will be jointly owned, and in which the products of both Companies will be on sale. We are hoping to make arrangements with the Local Authority for the building of two jointly owned new houses on the Shard End Estate, both of the "community type" and selling the products of Ansells and ourselves.

In furtherance of the policy of making special contributions to the Pension Fund Trustees for the funding of liabilities which we have undertaken for augmenting the pensions which we are able to provide for our older employees through the contributory schemes, we have paid over a total of £25,000 to the Trustees out of the profits of the year. This is in addition to the Company's normal contribution to the contributory schemes and non-contributory fund for licensed house managers and manageresses.

CONFIDENCE IN THE FUTURE

Changes in social habits and the pattern of consumer spending have created greater competition than we have ever before experienced. I am confident, however, that this competition can be met—and met successfully—by the Trade pursuing a progressive policy of improvement such as we have undertaken.

THE INDUSTRIAL CREDIT COMPANY LIMITED

At the twenty-fifth Ordinary General Meeting of the shareholders in Dublin on December 17th, the chairman, Dr J. P. Beddy, in the course of his statement, said:

In round figures, total assets increased during the year by £940,000 because of increases of £302,000 in cash, £354,000 in investments and £300,000 in loans and advances, less a reduction of £16,000 in other assets. On the liabilities side of the balance sheet there is no change in the paid-up capital and only a slight change in reserves and profit and loss account; hence the increased assets were financed by additional bank accommodation which increased total creditors by £940,000. During the year we negotiated a loan of £1,800,000 from the Irish banks, which is repayable between 1970 and 1990.

There has been a further depreciation of £32,000 in the market value of our quoted investments during the year. This is entirely attributable to the further decline in the value of preference shares predicted at last year's general meeting; the market value of our quoted ordinary shares in fact increased during the year.

Principally because of increased income from dividends and interest, gross profit increased by £5,200 as compared with the previous year, despite a reduction of £5,300 in underwriting commission. Expenses were up by £7,800 mainly because of bank interest which increased during the year to £50,300 and represented 64 per cent of total expenses. Though net profits declined slightly (by £2,500), profits before charging bank interest increased by £3,900. Deducting provision for income tax there remains £50,442 and adding the balance brought forward from the previous year the amount available for allocation is £71,177. Your directors recommend the payment of a dividend of 4 per cent less income tax, which will absorb £50,000. There remains £21,177, out of which it is recommended that £10,000 be transferred to Reserves, leaving the Carry Forward at £11,177.

The Minister for Finance has intimated to your board that the provision of adequate funds for your company's business is assured. From the recently-published White Paper on economic expansion it is clear that the Industrial Credit Company is on the threshold of an era of major expansion of resources and activity. With resources available to us of the order mentioned in the White Paper we can embark with confidence on the work of assisting in and bringing about accelerated large-scale industrial expansion and, in particular, expansion directed towards the creation and development of export trade which is so vital a consideration to our economy. We are desirous of enlarging the facilities we offer to industry as we are aware of difficulties which have prevented industrial concerns from availing of our services.

We have decided to finance, by way of hire-purchase, the acquisition of plant and machinery by manufacturing industries. We consider that an organisation such as ours has a special function in bringing about the more widespread extension of hire-purchase to industrial plant and machinery. We believe, furthermore, that the terms on which hire-purchase finance is made available by us should recognise the fundamental difference between consumers' and producers' goods and that industry should be able to obtain hire-purchase facilities at rates substantially lower than those which apply to consumers' goods.

To meet the initial difficulties experienced by new industries, or by existing industries undertaking major expansion, we are prepared in suitable cases to grant loans on the basis that repayments will not begin for a period of up to five years. In cases in which we consider it appropriate—for example, where sizeable expansion is contemplated for export—we are prepared in addition to defer payments of interest for a period of three years or to charge specially reduced interest rates for limited periods.

We have noted with satisfaction the announcement that the Government intends to introduce legislation entitling companies to issue redeemable preference shares. Subject to the enactment of the proposed legislation, we are prepared to provide finance for both public and private companies through the medium of such shares and thereby enable them to meet their capital requirements in circumstances where the issue of other forms of share capital or where further borrowing would create problems for them and for those from whom they seek capital.

The report and accounts were adopted.

THE STRAND HOTEL LIMITED

The fifty-first Annual General Meeting of The Strand Hotel Limited was held on December 29th in London, Mr S. I. Salmon, the chairman, presiding.

The following are extracts from his statement which had been circulated with the report and accounts for the year ended September 30, 1958:

The accounts show that the profit for the year after taxation amounts to £88,336 compared with £100,639 last year. The Board again recommends a dividend of 16 per cent for the year on the Participating Preferred Ordinary shares.

The Provision for Repairs and Renewals is the same as last year, namely £20,000; and Profits tax shows a reduction mainly due to the change in the rate of this tax since April 1958. A trade investment has been written down by £6,566 and £20,000 has been transferred to General and Contingencies Reserve.

The trading balance of £273,033 is some £29,000 less than that of last year, and the decrease is accounted for by higher costs, especially wages, and a slightly lower volume of business, which have more than offset such increases in our charges as we have been obliged to make.

During the year under review further progress has been made in our programme of redecorating our bedrooms at both the hotels to conform with modern trends in design, and our guests have expressed appreciation of the changes. At the Strand Palace Hotel the facilities offered for banqueting, conferences and exhibitions are proving popular.

The report and accounts were adopted.

REGIS PROPERTY COMPANY LIMITED

A SCRIP ISSUE

The twentieth annual general meeting of the Regis Property Company Limited, was held on December 31st in London. The Right Honourable Lord Kennet of the Dene, PC, GBE, DSO, chairman, presiding.

The following are extracts from his circulated statement for the year to June 30, 1958:

Although the excess of rents over outgoings has risen from £474,881 to £518,710—a gain of £43,829—all this surplus has been absorbed by increased mortgage and bank interest. Profits subject to taxation are £177,256 against £177,312. However, taxation has increased from £80,336 to £91,535, which gives a net profit after taxation of £85,721 against £96,976, a fall of £11,255.

Increases in rents included only a portion of the allowable increases under the 1957 Rent Act. In the current year the income from flats and offices should again rise substantially. In the following year owing to termination of leases based on 1939 rents a further substantial amount should be available. The board recommend a final dividend of 11 per cent less tax, an increase of 1 per per cent, making 14 per cent for the year.

An item in the Appropriation Account of £8,780 includes legal costs in a friendly action between the company and a tenant for the purpose of obtaining a clear direction from the Courts as to the meaning of the new Rent Act in practice. By this means we have avoided almost completely any complaints that our new rents are excessive. The number of tenants who have not agreed to our new rental proposals represents only about 3 per cent of our lessees of residential flats.

CAPITAL PROPOSALS

The £500,000 4½ per cent Unsecured Loan Stock falls to be satisfied and redeemed on June 30, 1959, by the allotment to stockholders of a total of 200,000 5½ per cent Cumulative Preference shares of £1 each and 175,000 Ordinary shares of £1 each credited as fully paid. Your board are convening a meeting of the stockholders to approve proposals for satisfaction and redemption of their stock on the same terms but at an earlier date, January 1, 1959.

Subject to these proposals being carried into effect, your board recommend the capitalisation of £975,000 of the Capital Reserve and the distribution of 975,000 new Ordinary shares to Ordinary shareholders after redemption of the Unsecured Loan Stock in the proportion of one new Ordinary share for every Ordinary share held.

After allowing for this the Capital Reserve will still stand at the large figure of £2,450,259. In order to provide for the scrip issue an increase in the authorised share capital will be required and it is proposed to create an additional 1 million new Ordinary shares of £1 each, the excess, after providing for the bonus shares, being available for future issue as and when required.

It is also proposed to make an issue of Ordinary shares for the purpose of increasing the cash resources. Application is being made for Treasury consent to an issue for subscription by Ordinary shareholders in cash on a "rights" basis of 250,000 new Ordinary shares of £1 each. Unless any unforeseen circumstances arise the directors expect to be able to recommend a dividend in a full year on the increased capital at the rate of 8 per cent per annum.

The report and accounts were adopted.

FAIRBAIRN LAWSON COMBE BARBOUR LTD.

The fifty-ninth Annual General Meeting of the Company was held in Leeds on December 30, 1958. The following are extracts from the Statement circulated by the Chairman, Mr W. Walker, with the report and accounts for the year:

The Accounts and the directors' report thereon are substantially in accordance with the detailed statement issued on July 19th; they confirm the intimations then given and there would seem to be little point in repeating again the problems of the Company.

Much has been done in the way of diversification, particularly in general engineering, so that, in future, the company will not be so dependent upon the boom and slump conditions of textile machinery manufacture.

Unfortunately, the concentration from Dundee into Leeds did not go smoothly and there was considerable feeling aroused in Dundee regarding the closing of the works. Every consideration was given to our former workpeople, the Board delayed the closing as long as it was practical and gave all our workpeople a minimum of four weeks' notice, making eight to ten weeks in all. Preparations went ahead in Leeds on a considerable scale. During this period, the Board assisted the Dundee workpeople by releasing them immediately as they found other work but there was no similar co-operation in assisting the removal of the machines to Leeds so that, in effect, some plant was out of action for several weeks. Early in September the works were closed and, at this stage, the Unions "blacked" the removal but, after approximately two and a half weeks of total stoppage, this embargo was removed. I think I ought to say that the action was entirely of a political nature as a demonstration regarding unemployment in Scotland.

All the required plant and machinery is now in Leeds and, by the time of the Annual General Meeting, should all be working.

This delay has set back the directors' programme and although it is not possible to assess it in terms of cash, there is no doubt that this demonstration has cost the company and its shareholders a considerable sum of money. I should like, on behalf of the Board, to express the company's thanks to our customers who have been so very forbearing in the difficulties in which the company was placed.

Our small works at Townshend were sold at a reasonable price before the auction sale and an offer has been accepted for the sports ground. The main works at Blackness and the Wallace and Bellfield works are not sold. An auction was held on November 11th and 12th of the remaining plant, machinery and fixtures, etc., not moved to Leeds and was very successful.

There is no doubt that, with the installation of the machinery from Dundee, there will be an excellent balanced plant in Leeds. All production is now concentrated in the one works in Leeds under the direct control of the executive management.

There is nothing yet to alter my views that this concentration scheme should put the company back to profit making by the end of the current financial year, but the demonstration previously mentioned has added to the difficulties.

Finally, I must pay tribute to a number of our senior staff for the excellent work and very long hours in which they have been engaged in this major operation.

The report and accounts were adopted and the re-election of Mr W. Walker and Sir Digby Lawson, Bart, was unanimously agreed by the meeting.

THE PLESSEY COMPANY LIMITED

(Manufacturers of Components and Equipment for the Radio, Electrical, Aircraft, Nucleonic and Precision Engineering Industries)

LARGE-SCALE DEVELOPMENT PLANS

INCREASED PRODUCTION COSTS ABSORBED

MR A. G. CLARK REVIEWS EXPANSION AT HOME AND OVERSEAS

The thirty-fourth Annual General Meeting of The Plessey Company Limited was held on December 30th in London. Mr A. G. Clark (Chairman and Managing Director) presided.

The Secretary (Mr W. F. Cross BA) read the report of the auditors.

The following is the statement by the Chairman which had been circulated with the report and accounts.

You have received the Accounts for the year to the 30th June, 1958, from which you will see that the Consolidated Profit for the year amounts to £1,391,636, which is below that achieved in the previous year.

The general conditions which affect our business have been difficult both in respect of national policies and, I am sorry to say, continued increase in production cost. In this latter connection it has been our policy to absorb, in whole or in part, increases resulting from wage awards and this, together with a very considerable development programme to which I shall refer, accounts for the discrepancy between the profits of the past two years. To counter this we have devoted intensive effort towards improvement in productivity and the streamlining of our organisation and the result is encouraging.

In regard to the large-scale development programme, I told you last year of the work which we are undertaking with a view to adding continuously to our overall product range. This is now bearing fruit and in a number of cases completely new products are in production and other development work proceeds. It is unnecessary for me to tell you that such a programme is expensive but that in the long term it makes our position firmer and firmer.

As you know, the Company is organised into a series of Groups and Subsidiaries and under these headings I will give you a brief report of our achievement and problems during the period under review.

ELECTRONICS AND EQUIPMENT GROUP

There are three Divisions in this Group and they are concerned with Telecommunications, Military and Industrial Electronics and Radio and Television.

The Domestic Equipment business made a poor start because of national policy but the position is now considerably improved. It may be said that each Division has made material progress during the year and that continuous effort both in design and production technique is achieving the desired end.

AIRCRAFT EQUIPMENT DIVISIONS

In spite of the reduction in orders for equipment for piloted aircraft it is satisfactory to record that the total volume of orders for our Mechanical and Electrical Aircraft Equipment has been maintained. This is due to the development work which we have carried out over the years with a corresponding increase in our product range. I find it very difficult in this field to forecast the future, which is so closely bound up with national policy; suffice to say that intensive development work will continue and that additional fields of endeavour are being continuously surveyed.

COMPONENTS GROUP

In this Group, which manufactures components for the electronic and electrical industries, we suffered to some considerable extent earlier in the year from credit restriction, purchase tax and the rising cost factor to which I referred earlier.

At present, because of changed Government policy and manufacturing economies, the future appears brighter. This Group has a large development programme whose work is aimed at systematic and continuous increase of product range.

SWINDON GROUP

I should remind you that The Plessey Development Company was formed some years ago to introduce into our Company certain types of business with the idea that at a later stage and when ready therefore they would be integrated into our pattern as separate divisions within one or other Group.

This policy has been successful and in fact several of these new divisions, together with those which already existed, are now formed together into a fourth Plessey Group which is known as the Swindon Group and it is doing well.

Last year I told you of the formation of Semiconductors Limited, a joint company with Philco of America and you will be interested to know that this is now a going concern, manufacturing transistors to a very high standard.

ATOMIC ENERGY

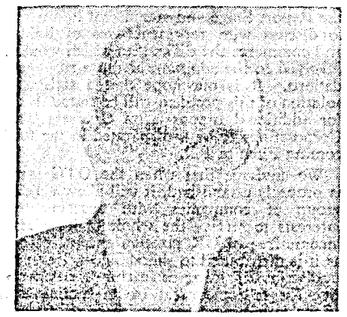
Plessey Nucleonics Limited is now firmly established in the atomic field and they have substantial orders both from home and overseas markets. In common with other parts of the organisation they have a big research and development programme aimed at enlarging the field in which they operate and the results are most encouraging.

EXPORT AND INTERNATIONAL COMPANY

In export markets our operations are expanding profitably and progressively with the full support of our home divisions. We look to the export markets in these days to provide a considerable contribution to our business and planned action is taking place to fit our products for the requirements of the European Free Trade Area.

This then gives you a general picture of the Company's operations at the present time and you will expect from me some indication of our prospects for the coming year and in this connection I would say that the state of the business is fundamentally satisfactory. Our products are broadly based of high technical standard and sound, and our economic position is a satisfactory one.

As a result of recent Government policy the commercial outlook is expansive and we shall undoubtedly obtain our share of the resulting increased activity. Defence policy clouds the issue as do certain aspects of European trade tendencies but I look forward to progress in most of our operations and I hope my opinion will prove to be well founded.



We again place on record our appreciation of the continued high degree of understanding and co-operation of Government establishments in particular the Admiralty and Ministry of Supply.

I thank my colleagues, managers and staff and all our workpeople for the hard and successful effort which they have made in a difficult year.

The report and accounts were adopted; the retiring Directors, Mr J. F. Mallabar and Mr A. E. Underwood were re-elected, and the remuneration of the Auditors, Messrs Deloitte, Plender, Griffiths & Co., having been fixed, the proceeding terminated.

THE WELLCOME FOUNDATION LIMITED

CHAIRMAN'S REFERENCE TO POLIOMYELITIS VACCINE

Mr Michael W. Perrin, CBE, FRIC, Chairman of the Wellcome Foundation Limited

The Annual Report and Accounts of The Wellcome Foundation Limited, a private company, are not normally published. But because of the general interest in poliomyelitis vaccine in the United Kingdom, the relevant portion of the Review by the Chairman, Mr Michael W. Perrin, CBE, to the shareholders, the Wellcome Trust, is quoted below. This was presented at the Annual General Meeting of The Wellcome Foundation Limited for the year ended August 31, 1958, and held in the Wellcome Building, Euston Road, on Monday, December 15, 1958.

'POLIMYLEX'

"As I was able to report in my previous Review the special building for the production of 'Polimylex' was taken into use in January, 1957. The cost of this building and its equipment was about £320,000, but this does not represent more than 50 per cent of the money which has now been invested in this project by The Foundation. Your Directors took the view in 1954, following the early development of Salk vaccine in the USA, that it was in the national interest that a comparable product should be manufactured in this country and that the experience of The Foundation in the field of biological products made it imperative that we should take a share in this. It was also decided that this work should be based on the Company's own high standard of research and technological development and that it must not be allowed to jeopardise the production of other biological products of equal, or even greater, importance. This polio vaccine project was, therefore, fitted in with the larger scheme of re-building and re-housing at Beckenham, planning of which was already under way, and at no stage was there any question that The Foundation would undertake this project under any special contract from the Ministry of Health.

CLOSE CO-OPERATION WITH MEDICAL RESEARCH COUNCIL

"From the start there has been close and mutually valuable co-operation with the Medical Research Council who have had the responsibility for independent testing and the passing of every batch of British vaccine.

"The Ministry of Health has stated its willingness to take any output during the coming year, less a very small percentage for the export market, at a price to be mutually agreed in contracts to cover successive periods of six months or a year. The Ministry has been informed of production plans at Beckenham and of the actual achievement but it has not always been easy to get acceptance of the fact that, in the kind of process involved in the preparation of a killed virus vaccine with a delicate balance between safety and potency, there will inevitably be unpredictable difficulties from time to time either in production or in the complex steps of testing.

LONG-TERM PROGRAMME BEING FOLLOWED

"During the year under review 'Polimylex' has been successfully launched by The Foundation with the issue of about 1 million doses and, in the latter half of the year, production has been running at the rate of about 4 million doses per annum. The long-term programme which was given to the Ministry of Health is being followed quite closely though difficult problems in the testing of the vaccine have slowed down the rate of issue of the batches.

"The Government decision to import large amounts of American and Canadian vaccine during the year has in no way interfered with the demand for 'Polimylex.'"

ALLIED LEATHER INDUSTRIES

At the annual meeting held on December 19th in London, Mr H. G. Barlow (Chairman and Joint Managing Director) presided. The following is an extract from his circulated statement:

Income Tax and Profits Tax on undistributed profit take £30,250, leaving a Group net profit of £21,296.

Sole leather has gone through an increasingly difficult year during which several more sole leather tanneries have gone out of business and we ourselves have suffered considerably. Although we have succeeded in maintaining and selling our normal production, shoe manufacturers have demanded the flexible leather in which we specialise, in lighter and still lighter substances, without any compensation in the price paid. It is quite impossible to buy hides that give these substances without paying the premium applicable to light hides normally used for upper leather. This considerable extra cost cannot be borne indefinitely by the tanner alone but must eventually be shared by the shoe manufacturer.

As our repairing business is in the main retail, the continued increase in rents and rates applicable to our premises makes this type of business more and more expensive to operate but we have nevertheless made progress during the year.

We have expanded our range of leather goods by taking over a firm of leather goods manufacturers whose business was complementary to our own and less subject to seasonal fluctuation. We are hoping to derive considerable benefit from this consolidation.

The report was adopted and the total dividend of 10 per cent approved.

MERLIMAU PEGOH

The forty-ninth annual general meeting of Merlimau Pegoh Limited, was held on December 30th in London, Sir Eric MacFadyen presiding in the absence in the East of the Chairman, Sir Harry Townend.

The following is the extract from the Chairman's circulated statement:

Although the Parent Company's crop for the year ended March 31, 1958, was 14 per cent higher, the working profit (including dividends from Subsidiary Companies) was down from £132,996 to £98,256.

The reason for this drop in profit was the lower price which we received for our product. The average Spot London price for No. 1 Quality Ribbed Smoked Sheet for the year was 25d. which was fully 2½d. per lb. lower than the previous year's average. A total of 7½ per cent was paid by way of two interim dividends of 2½ per cent on August 8, 1958, and 5 per cent on November 14, 1958.

The drop in the price of natural rubber also affected the results of our Subsidiary Companies and the Group working profits fell to £101,952.

The total crop for the Group showed an increase of 687,900 lbs. compared with the previous year. Higher yields from mature postwar replantings and further replanted areas reaching maturity and being brought in the tapping round helped in increasing the Parent Company's crop.

The increase in the Parent Company's crop has been fully maintained in the current financial year and at the end of September the crop for the six months was ahead of the corresponding figure for 1957 by 320,100 lbs.

BRITISH OVERSEAS MINING ASSOCIATION

The thirteenth ordinary general meeting of British Overseas Mining Association was held on December 29th in London.

Mr Clifford Waite, *President of the Council*, in the course of his speech, said: Mr Alfred Baer, your President last year, referred to the introduction of legislation in the Finance Act, 1957, creating a new class of company under the style of "Overseas Trade Corporations," which would be exempt from UK income tax on undistributed trading profits and from UK profits tax on all trading profits. The Association has been able during 1958 to play some part in the development of the idea underlying that new departure in UK tax law.

The OTC legislation had to be applied to a wide variety of companies. It was only rarely that individual companies found that their course of trading was precisely tailored to the statutory requirements and many companies of the type which the Royal Commission on the Taxation of Profits and Income had in mind when recommending the creation of this new class of companies had to make new arrangements to enable them to conform with the strict letter of the Act.

The Inland Revenue gave much helpful advice to such companies but, in the Association's view, might well have interpreted the escape clauses in the statute more liberally than they did. This would have relieved some members of the Association of the disadvantage which they suffered, in our opinion inequitably, during the transitional period until they were able to put into effect the changes in company administration and trading methods which the Inland Revenue required before granting them OTC status. There has been a measure of dissatisfaction among those members with the decisions of the Inland Revenue which may lead to appeals before the Courts.

One of the features of the OTC legislation was an improvement in the UK tax position of the non-resident shareholder in many overseas trade corporations. As he is now entitled to exemption from any UK tax applicable to dividends paid out of exempt trading income, it was the Association's hope that the administration of this matter could be simplified and that the troublesome and complicated procedure for claiming back UK tax by repayment could be avoided. An arrangement to allow non-residents to secure their tax repayment simultaneously with the dividend itself was under discussion with the Inland Revenue over a period of several months. Unfortunately the Association has not been able to agree with the form of arrangement proposed by the Revenue.

The Association believes that the OTC system, as advocated by the Royal Commission, could be of great value to British interests overseas. Unfortunately the legislation adopted in 1957 is only an instalment of the Royal Commission's recommendations, which referred not only to UK companies but also to their overseas subsidiaries. An attempt was made during the debate on the Finance Bill, 1958, to implement the Royal Commission's recommendations in relation to overseas subsidiaries. It did not succeed, but the Chancellor referred to this matter on the Report Stage and stated that he intended to discuss with representatives of industry and commerce the difficulties which would be involved in the adoption of those recommendations. It is our hope that a satisfactory solution of this problem will be found in time for additional proposals on Overseas Trade Corporations to be incorporated in the forthcoming Finance Bill.

We envisage that when the OTC system is properly established, it will allow a British group of companies with overseas trade interests to receive the whole of its overseas income free of UK taxation except in so far as it is distributed to shareholders, leaving its undistributed overseas earnings intact and free for re-deployment in its trading operations in any overseas territory.

ALLIED BAKERIES

A PROGRESSIVE AND VIRILE ORGANISATION
RECORD SALES AND PROFITS

The twenty-third annual general meeting of Allied Bakeries Limited was held on December 19th in London.

Mr W. Garfield Weston (the Chairman) presided and, in the course of his speech, said: It has not, I am sure, escaped your notice that the spirit of competition is daily being intensified in every trade and industry in this country. For many years now, I have been telling you that we have been preparing for and, I may say, looking forward to this challenge to our abilities in the fields of management, production and selling and it is a great achievement on the part of our executives, throughout this country and overseas, that we are able to present a report of record sales and profits.

We are spending millions of pounds every year in installing modern equipment in our factories up and down the country, as well as abroad.

We employ in our bakeries the finest craftsmen in the trade today and they are only too anxious to meet the demands of our customers whether it be for sliced and wrapped bread or for speciality bread.

The grocery side of our activities is playing an increasingly important part in the overall pattern of our organisation.

In Australasia, our bakery and biscuit activities are continually expanding both in production and sales capacity.

In South Africa, too, our companies are in good shape.

Our profit of £6,062,000 is almost £1 million more than a year ago, after all charges other than taxation. After taking into account taxation and the interests of minority shareholders, the net profit applicable to the Company is £781,000 higher at £2,843,000. In an organisation such as ours, it is always necessary to retain a large part of the profits in the business and in this year our retentions amount to £1,795,000, but the dividends to our ordinary shareholders were raised to take a total of £965,000, as against £723,000 in the previous year.

The retention of profits, however, is not sufficient to provide all the capital that is required in an expanding organisation such as ours, and there comes a time when it is desirable to seek permanent capital to reduce bank and other borrowings.

PROPOSED SCRIP AND RIGHTS ISSUES

It is our intention that an issue of new ordinary capital will be offered to shareholders in proportion to their holdings and at a price which will be favourable as compared to the market price at the time of issue.

At the same time as this new issue is made, we propose to capitalise approximately £5,600,000 of our reserves and to make a free scrip issue to the ordinary shareholders of one new "A" and one new "B" Ordinary Share for every two "A" or "B" Ordinary Shares already held.

The scrip issue which we are proposing to make will raise our issued total ordinary capital to £11,200,000, and a cash issue will raise this total even further.

You will not expect me to be too detailed in my comments on the financial results of the current year, but I can tell you that we are not dissatisfied with the profits which have been earned so far. In the absence of any unexpected difficulties in the next three months, I can reasonably forecast an increase in our figures as compared with last year.

We have already declared a first interim dividend of 10 per cent, as against 9 per cent last year. We hope to be able to pay two further dividends at the equivalent rate of 5 per cent on the capital as doubled by the free scrip issue, and further increased by the amount which we hope to issue for cash. Our new and enlarged capital will, therefore, receive the equivalent of 15 per cent.

In conclusion, Mr Garfield Weston, on behalf of the Board and the Shareholders, paid a tribute to all the Company's employees for their loyalty and hard work.

The report and accounts were adopted.

RIM (MALACCA) RUBBER ESTATES

INCREASE OF CAPITAL APPROVED

The forty-eighth annual general meeting of Rim (Malacca) Rubber Estates Limited was held on December 31st in London, Mr H. A. Kinney, FCA (the chairman) presiding.

The following is an extract from his circulated Review: The accounts for the year ended June 30, 1958, show a profit of £23,645. We have no hesitation or fear for the future in again recommending a dividend of 15 per cent.

A resolution is being submitted to increase the authorised capital to £250,000, which, if approved, will give us in hand nearly £60,000 of authorised but unissued capital. At the moment we have no plans for this capital, but it is felt that opportunity may readily occur for acquisitions by share issue to the benefit of your company, and we want to be ready if and when the opportunity comes.

Addressing the meeting the Chairman said: For the five months ended November we harvested 1,105,500 lb, which is almost exactly 50 per cent of the estimated total for the year, and if the weather holds there will certainly be record crops this month. What the ultimate result will be in a full twelve months I will not attempt to forecast, though I remain optimistic that the price for the remainder of the trading year will not fall off to the same extent as last year.

The report and accounts were adopted, and at a subsequent extraordinary general meeting the increase of capital was approved.

COMPANY AFFAIRS

TURNER AND NEWALL

THE £1 ordinary shares of Turner and Newall, now 76s. 4½d. and yielding 3.9 per cent, have always been popular with investors, both institutional and private. The dividend for the year to September 30th, maintained at 15 per cent, is covered nearly three times by earnings and backed by a strong balance sheet, with conservatively valued assets and ample liquid resources. Turner and Newall is the giant of asbestos; it ranges from mining the raw material to the sale of fabricated products, and it supplies many industries, of which the most important are building and construction, engineering and motor manufacture. Vertical integration is allied with industrial and geographical spread, and though Turner and Newall cannot opt out of a recession, as last year's fall in trading profits from £16.3 million to £15.1 million shows, it would take a world wide slump to topple it from its pedestal of security.

The group had in fact to cut back mining production in Africa and may have to do so in Canada. Sales of asbestos textiles were affected by the general decline in economic activity, though there are now some signs of recovery. Exports ran at a new record level; the chairman, Sir Walker Shepherd, discloses that this was partly because of "substantial and unusual orders from Russia for rubber transmission belting." The Ferodo brake linings business has expanded with the motor boom, and though competition has increased and costs have risen Sir Walker says that the increased volume of sales has offset the fall in margins; he believes that this will continue and that "it may be possible to avoid any significant fall in profits." Despite the contraction in the building and construction trades, asbestos cement enjoyed a "most successful year," and though Sir Walker expects sales to contract further early this year, the order book is "very healthy" and results for the whole year should be satisfactory.

In all, this is an encouraging report from a board that has always been noted for its caution. This same impression is left by the chairman's summing up of the immediate prospect. He notes that a downward trend still continues in some sections of the business; but he adds: "There is, here and there, an indication that bottom may have been reached and that some improvement of a modest character may not be far ahead." There may be a further decline in profits in the current year, but not of a "serious character."

LANCASHIRE STEEL

PROFIT margins of Lancashire Steel were adversely affected in 1956-57 by an unsatisfactory price award late in 1956 on billets, wire rods, bars and light sections (which make up about 90 per cent of the group's output) and by a lightning strike of maintenance men. But another—and to the company a more satisfactory—adjustment in prices was made in July, 1957. This pointed to some improvement in earnings, but the jump of over £1 million in gross profits from £1,901,826 to £2,985,989 was surprising. Yet there had been straws in the wind. In January, the directors reported that higher output and the new price award had lifted earnings at least to the level of the previous year, and in February the chairman, Sir John James, said that the group was beginning to benefit from its development schemes.

Now the directors have again loosened the purse strings by adding a "profits tax" interim dividend of 2 per cent to the maintained ordinary dividend of 12 per cent. They say that this special interim "will not be taken into account when consideration is given to the payment of further dividends for 1958-59." Thus the ordinary dividend has effectively been raised from 9 per cent to 14 per cent in four years, within which equity earnings have risen from just over 37 per cent to nearly 51 per cent. Lancashire Steel cannot but be affected by the current slackening in production, but in a strong market for steel equities its £1 shares put on 4s. 6d. to 31s. 9d., to yield just over 8¾ per cent.

FINE SPINNERS

THE directors of Fine Spinners & Doublers say that the half year ended September 30th was one of the most difficult since the war for the UK cotton industry. They attribute this not simply to the recession in the textile trades throughout the world but more specifically to the continued flow of free imports of cotton goods from Commonwealth countries into Britain, to doubts about spinners' margins in view of the investigations of the Restrictive Practices Court, and to "weak and capricious marketing by raw cotton producing countries." They add that the breakdown in July of the voluntary scheme for spun rayon yarns brought prices down to unrewarding levels. The result has been "hand to mouth trading in reduced volume, severely curtailed production and intense competition for the few orders that were available."

Nevertheless, Fine Spinners earned a profit on the half year's working. What this profit was the directors do not indicate beyond saying that it was considerably less than in the corresponding period in 1957. But they have left the interim ordinary dividend unchanged at 5 per cent. The directors explain their decision on the dividend by referring to their confidence in the future prospects of the company with its widespread interests. They are streamlining and slimming the group's operations: closing down uneconomic mills and purchasing a 90 per cent interest in Lilac Mill Ltd., which the directors describe as being one of the most up to date and successful firms in Lancashire. They say that they are confident that capital is being better used in this way than in the mills that have been closed. The pact limiting exports of cloth from Hong Kong to this country has now been signed and that may remove some of "the doubts which have affected the industry adversely in recent months" to which the directors refer. But this is not a signal for confidence in textile shares, in which the £1 ordinary units of Fine Spinners, now standing at 20s. 6d. have an important ranking.

H. AND G. SIMONDS

H. AND G. SIMONDS, the brewery centred on Reading, has a wide spread of interests, including hotels and restaurants, wine stores, and associated brewing companies in Malta, Gibraltar, and East Africa. Its earnings mainly depend on the 1,300 licensed houses it owns in the South and South-West of England and in South Wales, but the chairman, General Sir Miles Dempsey, in his statement covering the year to September 30th, states that the wine stores are now contributing worthwhile profits, having achieved a marked increase in turnover. Sales of beer were close to the previous year's record, despite the cold wet summer and the trade recession (which led to the 3 per cent drop in beer consumption for the country as a whole). Higher sales to clubs balanced a small drop in sales to tied houses and increased sales of draught beer offset a fall in those of bottled beers.

The rise of 9 per cent in net profits from £351,238 to £384,818 compares with one of just under 3 per cent in gross profits from £828,001 to £850,799

425 Industrials:—1958: High, 58·65 (Dec. 30); Low, 48·20 (Jan. 10).

and this was due largely to the reduced burden of profits tax. The dividend is effectively maintained at 12 per cent for the seventh year running and it is paid from earnings of 23.5 per cent. The prospects of a thaw in the eighth year seem to turn not only on a full year's savings in profits tax but also on the increased charge in depreciation that follows in the train of the group's rebuilding and development programme. Such programmes make calls upon liquid resources but like other breweries pursuing these policies H. and G. Simonds is selling off unremunerative public houses and modernising out-of-date brewing and bottling plant. Sales in the current year are described by Sir Miles Dempsey as "satisfactory," but he adds that the rate of increase in sales of wines and spirits, "representing a most important fraction of total turnover" is slackening. At 10s. 6d. the 5s. shares yield 5.6 per cent—a yield which discounts the gains that may be expected from the rationalisation and development of the industry.

MITCHELLS & BUTLERS

ANOTHER brewery to benefit from the new flat rate of profits tax is Mitchells & Butlers, whose trade is centred upon the Midlands and South Wales. In the year ended September 30th, gross profits rose only fractionally from £2,114,519 to £2,164,496. But the group's net income was about 10 per cent higher, advancing from £900,242 to £995,162, as tax fell by £44,943 to £1,169,334. The directors have again left the ordinary dividend unchanged at 13½ per cent but this year it is accompanied by a 1½ per cent tax free capital distribution from the surplus arising from the disposal of land and properties. Although the chairman, Mr Robert H. Butler, says that earnings in the current year will benefit from a full twelve months of the new profits tax he again emphasises that the company must build many new houses in Birmingham to replace those affected by the City's rebuilding programme. He warns shareholders that this "vast rehabilitation problem" calls for "a tremendous amount of capital," for major projects already on hand will cost in all nearly £1 million and further schemes now under discussion would require another £500,000. But Mitchells & Butlers is not short of cash and at the end of September the group held £2,865,582 in liquid resources.

Competition is said by Mr Butler to be "greater than ever before," but like other brewers Mitchells & Butlers has been able to push up its "free trade" sales to privately licensed public houses and clubs. Looking further ahead Mr Butler is confident that the breweries can meet the challenge of changing social habits by a progressive policy of improvement. That policy has involved Mitchells & Butlers, as it has the other big breweries, in large expenditures on building new properties, rebuilding and refurbishing old ones, and installing up-to-date brewing and bottling plants. Such expenditure has enabled the progressive breweries to retain their hold on the market and has given their profits some impetus. But the gains that can be secured are likely to be limited in such a competitive trade and in the strong advance in brewing shares in 1958 they seem to have been well discounted. The £1 ordinary units of Mitchells & Butlers, for instance, now stand at 48s. 9d.xd. and they yield 5.5 per cent.

FRIARY MEUX AND PETERS

FRIARY MEUX, like other breweries, has made reciprocal trading agreements and has modernised its public houses and is building new ones. Now it has made an offer in shares and cash worth about £1¼ million for the ordinary and preference capital of George Peters and Co. of Portsmouth. On a conservative valuation Peters' net assets were worth over £750,000 at the end of March, and in that year it earned a profit before tax of nearly £120,000. The cash element in the bid is only £387,830 but the directors say that this sum will be provided from temporary bank loans and will be funded later from the proceeds of sales of licensed houses. The share exchange will require the issue by Friary Meux of 175,750 £1 5½ per cent preference shares (now quoted at 17s. 6d.) and 397,499 £1 ordinary shares (quoted at 48s.xd. The preference and ordinary shares in Peters are largely held by the Young and Peters family interests and the directors of Peters recommend acceptance.

The directors say that Friary's beer sales were adversely affected by the bad summer weather and although the group's profits before tax may not be maintained at the 1957-58 level (when they totalled £891,963) they anticipate satisfactory results for the current year. They expect future earnings to be progressively enhanced by the integration and expansion policies, of which the bid for Peters is the latest example, that they are now pursuing.

ASSOCIATED MOTOR CYCLES

THE financial year of Associated Motor Cycles ended on August 31st—before the government freed hire purchase. But its consolidated gross profits more than doubled, from £125,277 to £299,081, and net profits more than trebled, from £43,910 to £154,296. After two depressing years for the motor cycle industry, 1958 showed a big recovery in sales. Since August, sales have continued to run at a higher level and AMC, which supplies components to other firms as well as manufacturing the "Matchless," "AJS" and "Norton" machines, should easily hold its own. Net equity earnings are nearly 20 per cent and the ordinary dividend, effectively raised from 5 to 7½ per cent by the declaration of a "profits tax" interim of 2½ per cent, is well covered. The 5s. ordinary shares at 6s. 4½d. yield 5.9 per cent.

London Stock Exchange

FIRST DEALINGS:	Dec. 10	Dec. 31	Jan. 14
LAST DEALINGS:	Dec. 30	Jan. 13	Jan. 27
ACCOUNT DAY:	Jan. 6	Jan. 20	Feb. 3

THE funds, having been firm before Christmas, made widespread and immediate gains on the announcement of the moves towards sterling convertibility. The *Financial Times* index of Government Securities rose by 0.52 to 84.74 by Wednesday's close Among short dated stocks, Funding 2½ per cent 1956/1961 rose ⅝ to 96⅝ and in the medium dated stocks Savings 3 per cent 1960-70 jumped by ¾ to 80¾. In the long dated issues Funding 5½ per cent (1982-84) rose from 100⅛ to 101⅛ and in the irredeemables War Loan 3½ per cent gained ⅝ to 66½.

Industrials were strong on Christmas Eve, and markings at 6,716 were the highest recorded for the day since 1946. Prices went ahead again even more strongly at the end of the old account and the beginning of the new although some profits were taken on Wednesday afternoon. On December 31st the *Financial Times* ordinary index touched an all time peak of 225.5 and *The Economist* indicator rose in the week to December 31st by 8.9 points to 255.6. British Timken were quoted at 57s. 3d. on Christmas Eve, and later rose to 66s., having touched 69s. Dunlop gained 2s. to 25s. 4½d. and Metal Industries at 43s. were 2s. 6d. higher. Tobaccos were firm, BATS rising 1s. 9d. to 59s. 6d., Gallaher 2s. 1½d. to 38s. 9d. and "Imps" 2s. 9d. to 56s. 6d. Breweries maintained their earlier strength; Hewitt Brothers were outstanding with a gain of 6s. 6d. to 87s. 6d. and Strong deferred rose by 2s. 6d. to 114s. Textile shares responded to the news of the Hong Kong pact, Calico Printers jumping from 34s. 9d. to 38s. 9d. Oldham Twist on the results and capital proposals gained 4s. 3d. to 22s. 9d. Among stores, Drages in a narrow market rose by 4s. 3d. to 42s. 9d. Gamage at 63s. 6d., and Currys at 25s. rose by 4s. 9d. and 2s. 9d. respectively. Montague Burton ordinary on renewed rumours of the possibility of a take-over bid went up by 4s. 10½d. to 33s. 3d., having touched 35s.

British Bank of the Middle East on rumours of a take-over bid gained 11s. 6d. at 57s. 9d. Insurance shares were again active, Legal and General jumping by 6s. 3d. to 195s. and Equity and Law by 10s. to 186s. 3d. Among property shares, Grand Junction in a narrow market rose 7s. 6d. to 61s. In Oils, Anglo-Egyptian oilfields rose by 7s. 6d. to 37s. 6d., Burmah gained 2s. 9d. to 80s. 3d., BP the same amount to 53s. 3d., and Shell 5s. 3d. to 148s. 3d.

Among Kaffirs, Loraine fell from 29s. 3d. to 28s. 4½d. on Johannesburg selling, and "Buffels" lost some of its earlier gains to close on Wednesday at 46s. 3d. In diamonds, De Beers rose by 1s. 3d. to 121s. 3d. Bancroft among coppers reached a 1958 peak of 31s. 9d. before reacting to 31s. 6d., still showing a gain of 1s. 4½d. over the week. Rhodesia-Katanga rose 2s. 6d. to 17s. Consolidated Zinc gained 5s. 6d. to 64s. 3d. Rubbers were quiet.

Money and Exchanges

EXCHEQUER RETURNS

For the 11 days ended December 31, 1958, there was an "above-line" deficit (after allowing for Sinking Funds) of £69,037,000 compared with a deficit of £76,121,000 in the previous week and a deficit of £13,527,000 in the corresponding period of last year. There was a net expenditure "below-line" of £76,730,000 leaving a total deficit of £527,278,000 compared with £897,788,000 in 1957–58.

THE MONEY MARKET

THE money market withstood the seasonal pressures of the year-end with unaccustomed ease. Market supplies of credit were adequate, and more than adequate, not only on December 31 itself but also on preceding days. There was actually a surplus of funds and the Bank made some special sales. Some banks were calling funds but the clearing banks as a whole were well placed and money came out easily. The market was also helped by a big official disbursement.

The Treasury bill rate was steady at the tender on Christmas Eve, having reversed its decline at the preceding tender, with a rise of 8d. per cent to around £3 3s. per cent. The discount market's allotment rate fell a little last week, from about 73 to 61 per cent on the whole allotment of £280 million (which included, besides £50 million of 63-day bills, some 92-day maturities to straddle Easter Monday). At yesterday's tender, the authorities offered only £260 million of three months' bills, leaving £50 million of maturing 63-day bills to help smooth the flow of tax transfers.

The Bank return shows a reflux of £38 million of notes in the first week after Christmas.

The Treasury bill rate in New York has declined for the second week, from 2.74 to 2.69 per cent for 90-day bills.

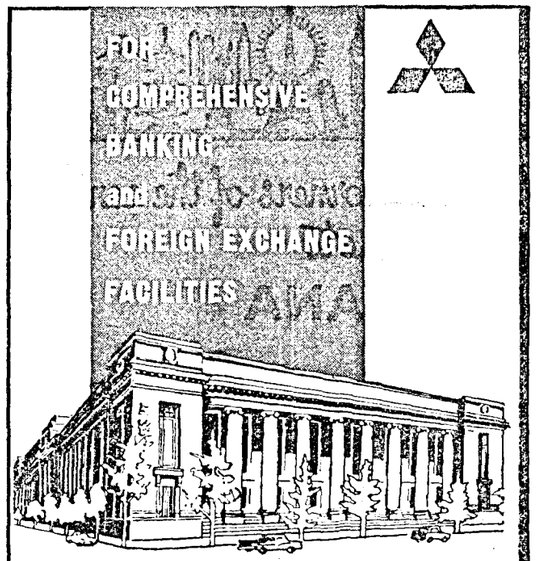
From all corners of the earth people come to
MONTANA



the popular health and sports resort situated on a lovely plateau, perched on mountain slopes facing the Valaisian Alps.
With its pure and bracing air, and its remarkable record of sunshine (averaging 8 hours 14 minutes daily in January alone), Montana is an ideal spot to enjoy happy holidays at any time of the year. Winter sport enthusiasts in particular, appreciate the advantages of two cable cars and five ski lifts.
All visitors are glad to know that they can cash their Travellers' Cheques or Letters of Credit at the Montana Branch of the
Union Bank of Switzerland.

Employers requiring the services of Chartered Secretaries to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute (Dept. E), 14 New Bridge Street, London, E.C.4.

APPOINTMENTS

GENERAL SECRETARY required by The National Union of Bank Employees. With 50,000 members among all grades of staff in banks throughout the country, the Union's further development offers a challenge to one having good personality, considerable ability and appropriate experience. Commencing total emoluments by arrangement but not less than £1,500 per annum. Pension Scheme. Application forms from "G.S.", 28 Old Queen Street, Westminster, SW1.

GRANADA TV NETWORK

Require . . .

SALES EXECUTIVES

Experienced, especially in buying or selling television time.

RESEARCHERS

To find, analyse, condense and present facts.

VISUALISERS

To work in our Advertising Department on all sorts of advertisements. An opportunity for young people to show their talents in a field where frustration will often be their reward.

WRITERS

With a deep regard for the English language. This is not a routine job; it is a chance to make a mark as an Advertising Writer.

Our own staff know about this advertisement. Applicants should write, giving full details of qualifications and experience, to:

ALEX ANSON,
Director of Sales & Advertising,
Granada TV Network Limited,
187/193 Oxford Street, London, W.1.

LEADING MARKET RESEARCH FIRM REQUIRES A QUALIFIED

STATISTICIAN

in its Statistical Development section. The successful candidate must be able and willing to work independently and be capable of following a job through to its end. The pressure of work is high but there are ample opportunities for advancement.

Experience in Market Research would be an advantage, but not essential and recently qualified graduates with Statistics as special subject will also be considered.

Salary according to experience. Good pension scheme. Apply to Box 813, R. Anderson & Co., 14 William IV Street, Strand, W.C.2.

STATISTICIAN/ECONOMIST with some experience required by Birmingham stockbrokers. Preference given to actuarial, accountancy or legal training, or financial newspaper experience. Replies treated in strict confidence. Applicants asked to state salary required.—Box 1096.

AUSTRALIA
UNIVERSITY OF SYDNEY

Applications are invited for a LECTURESHIP IN ECONOMICS within the University of Sydney.

Salary for a Lecturer is within the range £A1,500-90-£A2,100 per annum, plus cost of living adjustment and will be subject to deductions under the State Superannuation Act. The commencing salary will be fixed according to the qualifications and experience of the successful applicant.

Under the Staff Members' Housing Scheme in cases approved by the University and its Bankers, married men may be assisted by loans to purchase a house.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

The closing date for the receipt of applications, in Australia and London, is February 6, 1959.

UNION CARBIDE LIMITED · CHEMICALS DIVISION

MARKET SURVEY

UNIVERSITY GRADUATE, aged 30 to 35 and qualified in the field of ECONOMICS OR SCIENCE, is required to fill a position in a newly established MARKET SURVEY GROUP. Applicants should preferably possess considerable previous experience in market survey work, or have a thorough basic knowledge of the chemical industry with experience in related statistical job responsibilities. There is considerable scope for a young, energetic and intelligent man to progress rapidly in this sphere.

Please write in the first instance giving full details in strict confidence to:

S. H. CONWAY,
Union Carbide Limited,
103, Mount Street, London, W.1
quoting reference number NI.

The Financial Accounts Department of

MULLARD LIMITED

requires a young man, aged about 22-24, preferably with a degree in Economics, for reporting and analytical work mainly on stocks. Some knowledge of statistical methods is desirable and candidates should be able to mix at all levels.

Written applications should be sent to the Personnel Officer, Mullard House, Torrington Place, London, W.C.1.

THE GHANA SCHOOL OF LAW: LECTURESHIPS

Applications are invited from barristers and solicitors for appointment to lectureships on the teaching staff of the Ghana School of Law. The Ghana School of Law has recently been established by the Government of Ghana to provide training for students who intend to qualify as practising lawyers in Ghana.

It is desirable that applicants should either hold a good law degree or have had experience in teaching law.

The salary scales are as follows:

For Senior Lecturers	—	£1,700 to £2,150 a year;
For Lecturers	—	£1,000 to £1,850 a year;
For Assistant Lecturers	—	£900 a year

In addition a yearly car allowance will be paid and accommodation will be provided at a small rent (7½ per cent of salary). Two months' leave each year will be allowed and first class air passages paid to the United Kingdom for the lecturer and his wife.

These posts offer an exceptionally interesting opportunity to anyone interested in developing new ideas and methods of legal education. The Ghana School of Law is an entirely new institution and anyone joining the staff now will be at the beginning of what is intended to become a new and important school for training lawyers in Africa. There will be ample opportunities for research and writing of text books.

Applications should be sent to The Director of Recruitment, Ghana High Commissioner's Office, 13 Belgrave Square, London, SW1, from whom further information regarding the posts can be obtained.

THE BRITISH OXYGEN CO., LTD.

HEAD OF ECONOMICS AND STATISTICS SECTION

Applications are invited for the above post at the Company's Head Office in the West End. It is a senior position; applicants should have had industrial experience preferably on the finance side, together with a practical knowledge of statistical methods and a flair for carrying out investigations and writing lucid Reports. The post has been advertised before, but has not yet been filled; previous applicants should therefore not re-apply. Apply in writing to:

THE STAFF OFFICER,
THE BRITISH OXYGEN COMPANY LIMITED
BRIDGEWATER HOUSE, CLEVELAND ROW, ST. JAMES'S, S.W.1.

AUSTRALIA
UNIVERSITY OF QUEENSLAND

SENIOR LECTURER IN ECONOMICS (STATISTICS)

Applications are invited for the above position. Applicants should have an honours degree in Economics, Statistics or Mathematics, with knowledge and experience in economics and in social statistics.

Salary £A2,160/£A2,510 per annum.

Further particulars and application forms are obtainable from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on February 16, 1959.

EAST AFRICA HIGH COMMISSION

STATISTICIANS, EAST AFRICAN STATISTICAL DEPARTMENT

Candidates should have a good Honours degree preferably in Economics with Statistics as a main subject. The latter is not essential provided that Statistics has been included in the degree course and the candidate has a good knowledge of statistical methods and the handling of statistical data. Experience desirable of work in a government or commercial statistical organisation or post graduate research in economic analyses or statistical surveys. Age limit 40. Appointment may be pensionable or on contract terms. Inclusive salary scale £939 - £1,864, point of entry determined by experience. Gratuity of 13⅓ per cent of salary if appointment is on contract. Income tax at local rates. Free passages on first appointment and on leave for officer and family. Liberal home leave on full salary. Government quarters, when available, at moderate rental. Application forms and further particulars from Director of Recruitment, Colonial Office, Great Smith Street, London, S.W.1, reference BCD 59/88/02.

HOOVER

OPERATIONAL RESEARCH

The Company is enlarging its Operational Research Section *and invites applications for* the undermentioned position.

STATISTICIAN

Applicants between the ages of 23-30, should be experienced in the practical application of statistical techniques in industry. A knowledge of operational research would be an advantage.

Qualifications required: Degree in Statistics or Mathematics with Statistics as a special subject.

Salary according to age and experience, but commencing at a minimum of £1,000 a year at the age of 25.

The successful applicant will become a member of a team and must be prepared to travel both on the Continent and in the U.K.

The Company offers generous Sickness, Superannuation and Holiday Schemes.

Applications, in writing, stating age, qualifications and experience to the

EMPLOYMENT OFFICER,
HOOVER LIMITED,
PERIVALE, GREENFORD, MIDDLESEX.

APPOINTMENTS

Vacant 9/- a line; Required 6/- a line.

MSL have been retained to advise on the appointment of a

GROUP PERSONNEL CONTROLLER

for an important department store organisation operating in the home counties. The holder of this office would be responsible to the board for the general personnel policy of the group; for advising on wages policy, joint consultation and industrial relations; and for the recruitment, training, promotion and general welfare of a staff numbering nearly 3,000.

Candidates should be between the ages of 40 and 45 and of sufficient experience and ability to be able to command a salary of between £3,000 and £5,000 a year (plus a contributory superannuation scheme); and, looking to the future, must be of director calibre. They must either be graduates of a university or have had training in personnel management, social studies or economics. They must have had several years' experience in personnel work at a senior level.

No information will be disclosed to our clients until candidates know their identity and have given permission after personal discussion. Please send brief details in confidence, quoting reference S.1292 to P. J. H. Fryer.

MANAGEMENT SELECTION LIMITED
17, Stratton Street, London, W.1.

COUNTY COUNCIL OF ESSEX
COUNTY PLANNING DEPARTMENT

Applications invited for post of Senior Planning Assistant, Special Grade (£750—£1,030) at Wanstead. Applicants must have had practical experience in the preparation of development plans in urban areas and be able to take charge of a small section of staff. Experience in, and a flair for, statistical and research work related to planning regarding population, industry, employment, education, etc., will be an advantage. Applicants should be Corporate Members of the Town Planning Institute or other comparable professional institute, or possess a University Degree in Economics or Geography.

Five-day week; medical examination; superannuation. Application form from County Planning Adviser, Broomfield Place, Broomfield, Chelmsford, returnable by January 12, 1959.

RICHARDSONS WESTGARTH & CO., LIMITED
GROUP SECRETARY'S DEPARTMENT

There is a vacancy in the Head Office of the Richardsons Westgarth Group of Companies for a Qualified Accountant, or an applicant possessing equivalent commercial degree, to act as Assistant in the office of the Group Secretary.

This is an important appointment and the salary will be commensurate with the responsibilities involved.

Experience with a large industrial Organisation with export or overseas interests will be an advantage and the preferred age group is 27 to 35.

Generous contributory Pension and Life Assurance Schemes are in operation.

Applications, which will be treated in confidence, should be addressed to the Group Personnel Officer, Richardsons Westgarth & Co. Ltd., P.O. Box No. 2 Wallsend, Northumberland, quoting reference number G.-14 C.

ROAD RESEARCH LABORATORY (DEPARTMENT OF SCIENTIFIC AND INDUSTRIAL RESEARCH) requires civil engineers, physicists, mathematician or statisticians in Senior Scientific/Scientific Officer grades in overseas section of Laboratory, to work on road problems in overseas territories. Based at Harmondsworth, Middlesex with opportunities of visits overseas. Engineering posts provide facilities for obtaining wide knowledge and experience of road engineering at home and abroad, and opportunities for qualifying for Part C of Institution of Civil Engineers examination. Work concerns construction and maintenance of low cost roads, soil stabilisation, bituminous surfacing materials, and traffic engineering with special reference to overseas problems. Qualifications: 1st or 2nd class Hons. degree or equivalent. At least 3 years' appropriate post-graduate experience in addition for SSO jobs. Starting salaries within ranges: SSO £1,190 - £1,410 (or SO £685 - £1,110 (men). Slightly less for women. Good prospects of promotion to Principal Scientific Officer in mid-thirties (range up to £2,050) with possibilities of higher posts. 5 day week. Closing date February 14, 1959. Applications from candidates overseas will not be considered after this date. Forms from MINS. Technical & Scientific Register (R), 26 King Street, London, SW1. Quote S.L42/28A.

THE UNIVERSITY OF LEEDS
DEPARTMENT OF SOCIAL STUDIES

Applications are invited for appointment as Research Assistant to the Granada Television Research Fellow who is undertaking a study on the public impact of television. Salary will be within range £700 - £900 a year. Appointment will be for one year in the first instance, renewable for a total period probably not exceeding five years. The successful applicant will be expected to collaborate in every part of the work including interviewing, assessment of programme material, the analysis of statistical and qualitative data, and the interpretation of results. Applications (two copies), stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds 2 (from whom further particulars may be obtained) not later than January 24, 1959.

STATISTICIANS

Experienced Statisticians are required in our Operational Research Department. One of the first of its kind in the Steel Industry, this department contributed among other things to decisions which led to the £50 million expansion scheme now in progress, a major development in Britain's productivity.

A number of scientists, including a team of computer programmers, are engaged in a wide variety of research projects covering all aspects of Company operations. Successful applicants will carry increasing responsibilities in a friendly department where personal merit is recognised.

The successful applicants will be responsible for the design and conduct of industrial experiments with whatever assistance may be necessary and will have every opportunity of making major contributions to statistical discipline in Operational Research studies.

Please write, giving full details of age, experience, qualifications and any further information considered relevant, to :—

Superintendent, Personnel Services,
THE STEEL COMPANY OF WALES LIMITED,
(Steel Division),
Abbey Works, Port Talbot, Glam.

LEADING firm of Stockbrokers requires experienced INVESTMENT STATISTICIAN preferably, but not necessarily, with professional or academic qualifications. Appropriate salary and excellent prospects for suitable candidate. Write Box TE.992, c/o 191 Gresham House, E.C.2.

THE UNIVERSITY OF MANCHESTER SIMON FELLOWSHIPS

The University offers a number of Simon Fellowships for advanced study or research in the social sciences. This term is used in a wide sense to include not only Economics, Government, etc., but equally, fields such as Education, Jurisprudence and Social Medicine. Values within the range of £1,000—£1,800 per annum (Simon Research Fellowships) or within the range of £1,850—£2,250 per annum (Simon Senior Research Fellowships), according to qualifications and experience. They are open to members of the public services as well as to persons with academic experience.—Applications should be sent by January 15, 1959, to the Registrar, the University, Manchester 13, from whom further particulars may be obtained, and who will be pleased to answer any enquiries regarding the scope of the Fellowships.

UNIVERSITY OF BELFAST

Applications are invited for two assistant lectureships in Economics from October 1, 1959. Salary will be on the scale £700 x £50 to £850. For one of these posts preference will be given to applicants with qualifications in Mathematical Economics or Econometrics, or with qualifications in Pure Mathematics in addition to Economics. Applications should be received by January 31, 1959. Further particulars may be obtained from G. R. Cowie, MA, LL.B, JP, Secretary to the University.

EDUCATION

9/- a line.

THE RAPID RESULTS COLLEGE

Complete inexpensive tuition for G.C.E., Accountancy, Secretaryship, Law, Civil Service, Local Government, Banking, Insurance, etc.—NO PASS—NO FEE guarantee. Over 50,000 successes. For FREE 100-page book write to-day to the Principal. The Rapid Results College, Dept. E.13, Tuition House, London, S.W.19, or call at 235 Grand Buildings, Trafalgar Square, W.C.2 (WHI. 8877). Open week-days incl. Sat. mornings.

HOW MUCH DO YOU KNOW?

—ABOUT Inflation, Imports, Exports, Taxation, Wages and the fascinating background to political problems of today? Ten-week study courses in Basic Economics and Social Philosophy begin January 13th and 15th at Victoria. Nominal charge for the course 5s. including text book. Attend on either Tuesday or Thursday evening, 7 p.m. Write: Henry George School of Social Science, 177 Vauxhall Bridge Road, SW1, for prospectus or telephone VICtoria 4266. (Or enrol on the opening night). Courses as outlined above are also being held at branches in the Greater London area, Glasgow, Dundee, Cardiff, Birmingham and the Isle of Wight. Send for full particulars stating area.

UNIVERSITY OF LONDON: A course of three lectures entitled "On Politics and Culture": (i) 'Characteristics of our Time'; (ii) 'The Role of the Intellectuals. I'; (iii) 'The Role of the Intellectuals. II' will be delivered by Professor C. Wright Mills (Columbia) at 5 p.m. on January 12th, 13th and 15th at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. Admission free, without ticket.

JAMES HENDERSON,
Academic Registrar

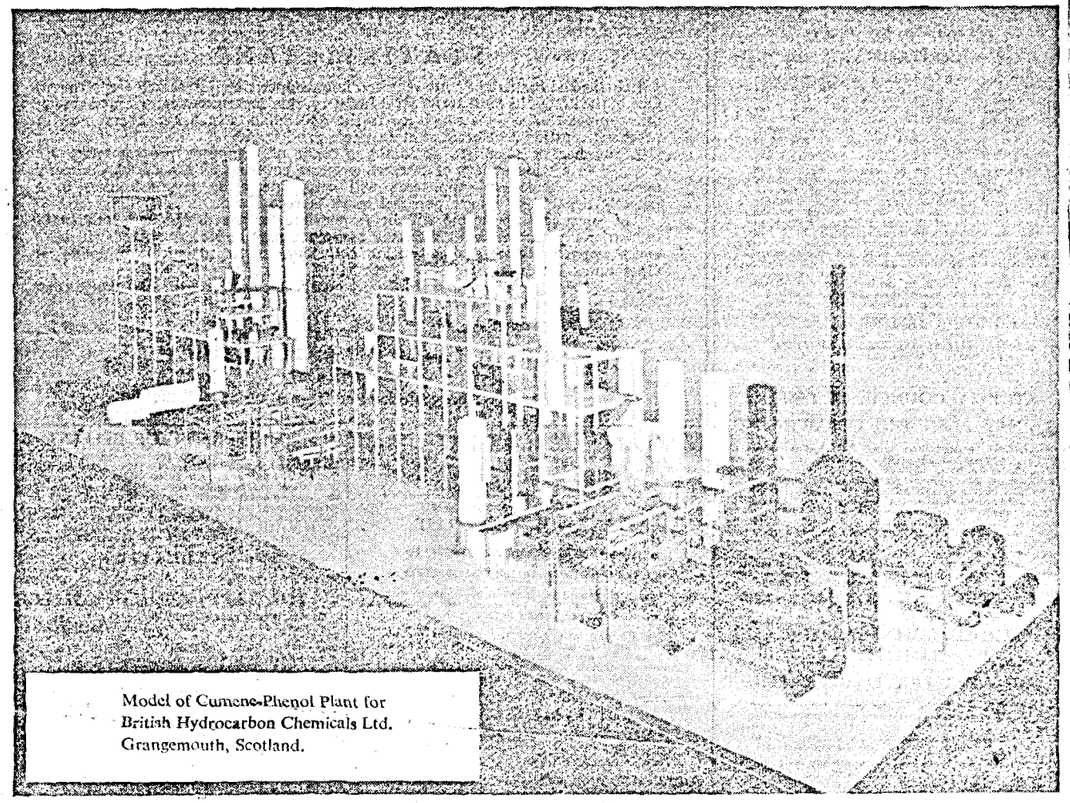
B.SC.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees; instalments.—Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. Law, free from the Registrar, 60 Burlington House, Cambridge.

SUCCESSFUL TUITION FOR THE B.SC.ECON DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.Econ., three if Entrance is included). Moderate fees, instalments. 1,147 W. H. students passed Lond. Univ. B.Sc.Econ. exams, 1950-58. Tuition also for G.C.E., Law, Statistical, other exams.—Prospectus from E. W. Shaw Fletcher, C.B.E., LL.B., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

SECRETARIAL TRAINING, especially for university graduates and older students. Six-month and intensive 14-week courses—Write, Organising Secretary, DAVIES'S, 2 Addison Road, W.14. PARK 8392.



EXPERT POSTAL TUITION

for Examinations—University, Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus, and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Street, London, E.C.4.

PROFESSIONAL TRAINING SCHEMES FOR SCHOOL LEAVERS

The G.E.C. offers a variety of training schemes for boys who wish to make industrial careers in such developing technological activities as

NUCLEAR ENGINEERING
ELECTRONICS
TELECOMMUNICATIONS
HEAVY & LIGHT MECHANICAL ENGINEERING
TRACTION
ELECTRICAL ENGINEERING
APPLIED PHYSICS

These courses lead to appointments in

DESIGN
DEVELOPMENT
RESEARCH
PRODUCTION
COMMERCIAL ENGINEERING

and also to responsible posts in

MANAGEMENT

UNIVERSITY SANDWICH SCHEME. For the boy who has obtained a University place to read Science or Engineering, the Company offers a two-year course of industrial experience blending academic study with practical training. The first year's training is given between leaving school and entering the University ; the second after completing the University course.

Remuneration is paid during industrial periods—according to age in the first year, and between £550 and £625 in the post-graduate year.

UNIVERSITY SCHOLARSHIP SCHEME. A limited number of scholarships will be awarded to boys who are accepted for training under the University Sandwich Scheme. The award will cover tuition fees and a maintenance allowance for a three-year full-time University course in addition to remuneration during the industrial periods.

STUDENT SANDWICH SCHEME. For the boy of Advanced level G.C.E. standard, who wishes to follow his higher education alongside his industrial training, there are five-year student training schemes organised on a sandwich basis—six-monthly periods of full-time study at a College of Technology alternating with similar periods in Industry. Successful students qualify for the Diploma in Technology (Engineering) awarded by the National Council for Technological Awards.

Remuneration is on a rising scale according to age (£335 per annum at 19 to £440 per annum at 22 years) and continues during attendance at the college.

Company halls of residence available. Good facilities for sport.

MAN MEETS GOOD JOB: JOB MEETS GOOD MAN

Every year a number of the country's leading industrial and commercial companies take full pages in the Manchester Guardian to speak about themselves: to announce what they are looking for in the way of executive personnel and what prospects they offer for the right man with the right ambitions.

This year, starting on January 19, the sixth 'Careers' series begins in the Guardian. To Employers, to Careers Masters and others who work with the young, to graduates and school-leavers, these announcements give a valuable picture of the current employment situation. Past years have shown that they serve as an excellent introduction between men-in-search-of-jobs and jobs-in-search-of-men. Here is an interesting and imaginative approach to the problem of executive recruitment which you may well find worth considering.

The ancients—and the great 18th century craftsmen, too—knew the advantages of layered wood. But until recently, plywood was suspect because of the inadequacy of the glues used. New adhesives were developed for aircraft manufacture during the war, so that today the glue line becomes the strongest part of the structures.

Line of Life

Aero Research Ltd., now CIBA (A.R.L.) Ltd., made the first urea-formaldehyde and resorcinol-formaldehyde glues produced in Great Britain. Aerolite is the most widely used synthetic resin adhesive in this country, and is employed for purposes ranging from the construction of heavy timber roof members (as in the photo of a lattice truss by Rainham Timber Engineering Co. Ltd.) to miscellaneous repairs in the home.

AUTOMATIC AIDS TO CONTROL,
ADMINISTRATION AND ROUTINE WORK
IN OFFICE AND FACTORY
CAN BRING RICH REWARDS TO THOSE
WHO FIRST APPLY THEM

Commercial and industrial concerns everywhere have warmly welcomed this authoritative guide to the choice of equipment and its correct application

Every day, more and more progressive organizations—at home and abroad—are subscribing to DATA PROCESSING, the new Iliffe quarterly devoted to fresh methods of business and industrial control. With these methods, important decisions can be based on a complete and accurate assessment of all relevant data ; routine administrative efficiency can be raised and its cost substantially reduced.

DATA PROCESSING describes the means by which this can be achieved, surveying the whole range of automatic aids to good management, commercial and industrial, Computers, punched-card machinery and allied equipment are examined and the best of current operational practices presented in a form readily applicable to particular problems. Completion of the order below is the first move in ensuring that your organization is early among those who benefit from these new methods.

FIRST ISSUE *just published!*

Is Plenty Enough?

THE annual defence white paper is due next month; there has obviously been the usual round of argument about it. Questions are again being widely, and rightly, asked about the cost of the home-made as well as the imported British nuclear deterrent and the dent it makes in resources for other forces. For the past year Mr Sandys's argument has run like this :

> The nuclear deterrent—bombs and delivery—costs only 20 per cent of the defence budget; but half of this is for aircraft, radar, runways and suchlike which we must have anyway. The remaining 10 per cent would not buy us any *significant increase in non-nuclear strength*; *it does buy us a real deterrent.*

Will Mr Sandys repeat this argument in next month's white paper? If he does, he will have to prove it in more detail than he has provided hitherto. For the economics of defence have changed almost out of recognition since Britain first decided that it should produce its own H-bombs and rockets.

For some years there have been two schools of thought about the deterrent. One school, holding that "enough will be plenty," assumed that all one needed to do with nuclear weapons was to make them and then stockpile them. Once a country had made and stocked enough nuclear explosive to blast any potential enemy, resources could then be switched to helping to make good the West's inferiority to Russia and its satellites in other arms. This was the dominant feeling when Britain first began making nuclear warheads and missiles.

Unfortunately, it is now clear that the other school, which held that there was no foreseeable limit to expenditure on nuclear arms, is more likely to be right. This school points out that to possess enough warheads to destroy the enemy will be no deterrent at all if they can be blown up on the ground or intercepted in the air; with technological change so rapid, it will be imperative for any thermonuclear power to keep ahead in the race to build better missiles, space satellites and the other requisites of prompt and accurate delivery. To maintain the deterrent you must, like the Red Queen, run ever faster to keep in the same place.

The forward prospect, as these experts see it, is :

(i) Foreseeable developments in atomic anti-aircraft missiles will presently make it impossible for any manned bombers, or even missiles of the air-breathing type, such as Snark or Matador, to pierce the defences.

(ii) When this happens, the land-based deterrent will depend wholly on Thors (intermediate range ballistic missiles, based in Britain) and Atlases (intercontinental ballistic missiles, based in America). The problem of intercepting these is much harder, but it is necessary to pour out money and effort to try and solve it, because whoever solved it first would have the world at his mercy.

(iii) Just because this is a hard problem, it will put a premium on "Pearl Harbour" tactics to knock out opposing missiles before they leave the

ground. To counter this it is necessary to have in quantity missiles which can be fired from underground or undersea.

To accept this last argument is to open up a vista of massively expensive new weapons. An Atlas costs £5 million per missile. Atomic submarines capable of carrying Polaris missiles are likely to cost at least £25 million or £30 million each. They are not likely to be ready in quantity before 1970. When they are ready, each of them (on present specifications) will fire only sixteen missiles ; the West would need a large fleet all round Russia before naval nuclear warfare became more than a small auxiliary to the land-based deterrent.

To keep up with the nuclear Joneses on the scale thus envisaged would plainly beggar any middle-sized power ; indeed it may end by beggaring the Joneses themselves. But is it possible, or sensible, to be a "nuclear power" without going in for everything? The familiar argument against Mr Sandys's policy of making Britain an H-bomb and rocket-producing (as distinct from merely an American rocket base) power has been that it may compel Britain so to economise on its brush-fire forces that it cannot play an effectual and independent part in a world of peripheral skirmishes and cold war. Is this argument now reinforced by a new argument : that any such bargain-basement nuclear deterrent as we could hope to produce and mount in this country will be minimally effective for only a very short period anyway ?

THAT is the main new problem to be faced in considering this year's defence white paper. One should begin by leaning over backwards to be fair to Mr Sandys. Some day the prospect of any Armageddon being fought between missiles and anti-missiles somewhere in inner space may make sixty Thor IRBMs along the Norfolk coast like scrap. But for the time being the Thors, of which a squadron will be deployed in Britain this year, cannot be intercepted—once they are off the ground ; and their successors, the British modification of the Thors, to be called the Blue Streaks, will also come into operational use long before interception is likely to be practicable. (In addition, they will be less vulnerable to surprise attack.) Whatever the inner diplomacy behind Britain's original decision to produce its own H-bomb, the Government's promise to go ahead with developing Blue Streak is now formally an eagerly accepted British obligation under the Anglo-American alliance. It was a guarantee against the possible failure of the American programme to develop the Atlas, or against delays in that programme. The effectiveness of Blue Streak as a weapon will probably last to the early 1970s. Up to then, it looks as if Britain will be making a tangible contribution to the West's deterrent, costly as it may be.

So much for one argument about the "ineffectiveness" of Britain's own production of H-bombs and rockets. But the second argument which thoughtful critics deploy against Mr Sandys surely has much greater force. It is really very doubtful whether Britain's own H-bombs and rockets will ever constitute an "independent deterrent" of our own. It is only possible to conceive of them having to be used "independently" in circumstances in which the United States had decided to leave Britain to its fate, and Russia was making demands which Britain felt it necessary to resist even to the extent of threatening a third world war. It might be wrong to suggest that in no circumstances would the British—or any other minor nuclear power—stage an atomic Thermopylae ; but it would be hard to convince the Russians that they would do so without American support, and on that degree of credibility much of the deterrent depends. The first and last line of Britain's defence, in fact, is the trans-atlantic alliance. In this as in so much else, the American partnership has to be axiomatic.

If a military argument is to be found for Britain undertaking independent production of rockets, the best one is that the arms race threatens to go to such lengths that the entire scientific resources of the West will be needed to sustain it, not just the American. America needs Europe, just as Europe needs America. It can be argued that recognition of this was implicit in the "open door" agreement reached between Britain and America last year. On that argument, surely, a formula for Britain's proper level of nuclear spending emerges for this year's white paper. Logic suggests that this expenditure should be kept to (or cut to) the level at which it is agreed with the Americans that it does contribute usefully to (or fill gaps in) the deterrent mounted by them.

IT is hard to believe that this cost ought now to be allowed to rise much above the £150 million or so in this year's defence budget. At some stage it ought to be possible to say thus far and no further. For example, if Britain mounts an underground Blue Streak it would probably be wrong to go on to the further immense cost of submarine Polaris missiles ; it would probably also be wrong to try for an independent anti-missile missile as well. At a certain stage, the British nuclear budget should flatten out, even though (failing general disarmament) the American may still ascend.

As a direct corollary, the current level of British spending on non-nuclear forces and their equipment would have to be maintained, indeed probably increased. This equipment is bound to be costly. Non-nuclear musketry does not stay still. Large bills impend for air transport to make small forces mobile, for the new Canberra replacement, and probably for some nuclear submarines to handle the anti-submarine role. Even a minor bad investment in the nuclear field reacts disproportionately on these cold war and limited war forces. They can never have plenty. The first requirement of British defence policy, much more important than dreams of being an independent nuclear power, is that they should have enough.

17259

Generals Sink in the West

While in some Asian and African states "strong men" are setting aside the constitution, in Latin America the military caudillos have been discarded one by one

THE new temper of Latin American politics has received miserly notice in other countries. The swing against parliaments and personal liberties in half a dozen newly independent nations of Asia and Africa has inspired much gloomy comment, but the broadly heartening contrary movement in the New World has gone largely unobserved. The rebel victory in Cuba that filled the newspapers last week was only the latest Latin American manifestation of an explosive pressure for more political freedom. Since General Perón was thrown out of Argentina in September, 1955, all but three of the dictators who once bestraddled the continent have been swept away—and the three survivors rule only in poor and petty fiefs. And, whatever the immediate personal motives of some of the new victors, at the back of many of their minds is the same reforming zeal that inspired Bolívar, Santander, San Martín, and other founding fathers of the Latin-American republics.

The political leaders of the 20 Asian and African states now freed from foreign tutelage have usually chosen, in the first instance, to maintain the parliamentary forms they already knew. But this transplantation of western methods has not always been successful—forms have been too far removed from realities. In Pakistan and the Sudan (as, earlier, in Egypt), military strong men have now displaced constitutional government ; parliamentary methods have been threatened in Ceylon, Lebanon and Ghana, overridden, at least for a time, in Burma, and reduced to something like irrelevance in Indonesia ; and in the Indo-Chinese states and Korea the primacy of parliament has never really taken hold. But while the generals' stars have been rising in the East, the Latin Americans have been rapidly discarding their "strong men."

THERE is no stereotype for the now vanishing Latin American caudillo of the early twentieth century —except that he has nearly always been a self-appointed general. He has been ultra-conservative, demagogically radical, or firmly middle-of-the-road. Sometimes he has been warmly welcomed as the saviour with the sword ; General Rojas Pinilla, for instance, was thus hailed in 1953 when he first took control of a Colombia then being torn in half by battling political factions. Often he has manipulated the constitution instead of discarding it ; General Pérez Jiménez in 1952 held elections in Venezuela, though without any intention of paying heed to the result if it went against him (as it did). In some cases, like General Batista, he has been content to operate much of the time through hand-picked nominees while refreshing himself in the background.

General Batista's career is an epitome of the whole period. As leader of the Cuban "sergeants' revolt," he ousted a corrupt and unpopular regime in 1933, ruled throughout the next decade either as president or as the real power behind the throne, and then withdrew, between 1944 and 1952, into voluntary but threatening exile. In the unrigged 1952 elections, he stood for president (inspired, perhaps, by the successes of the "strong men" of Chile and Brazil, Ibáñez and Vargas, in returning to office by the constitutional methods they had formerly scorned) ; but when he saw that the vote would go against him, he at once seized power by a military coup. Before his downfall last week, he was once again preparing to withdraw behind the limelight. Like General Perón, he began his career as the working man's champion ; but while Perón kept most of the workers on his side to the end—nearly ruining Argentina's economy in the process—Batista eventually became more concerned to maintain himself in power and his associates in luxury than to retain popular support, and it was a popular movement that brought him down.

NOW only three dictators of the diehard type are left in obscure corners of Latin America: General Trujillo of the Dominican Republic ; General Stroessner of Paraguay ; and Luis Somoza of Nicaragua (technically not a member of the generals' club, since his brother, and not he, is in command of the armed forces). Generals Perón, Pérez Jiménez and Batista have piled up as refugees in Trujillo's tight little island haven ; Rojas Pinilla, too, has been swept away, and has failed in an attempted come-back ; the Peruvian dictator, General Odría, and General Ibáñez, former president of Chile, have read the signs and quietly allowed themselves to be constitutionally succeeded. Even in countries that were doing well economically, the dictators could not prevail against the pent-up anger of their restive peoples ; even in republics hard hit by recent falls in exports of primary products, there has been no revival of rule by "strong men" such as occurred in the slump of the 1930s.

In most cases this general revulsion against the caudillos could not have got far without backing from the armed forces. True, there are still many officers who distrust not only leftists but all civilian

politicians, and are ready to pounce at the first sign of disorder. But the army, which used to supply most of the dictators, is now producing a new kind of officer attuned to the more liberal impulses of the time, and seemingly as determined as the politicians—sometimes even more so—to make parliamentary methods succeed.

In Brazil the armed forces eased out Vargas at the end of the world war. In Colombia, they backed Rojas when he was putting an end to civil strife, but fell away from him when he sought to perpetuate his power. General Aramburu, who was head of state for most of the transitional period between Perón's departure and Señor Frondizi's election last spring, guided Argentina back to parliamentary ways on a tight and sometimes almost cruel rein. In Venezuela, Admiral Larrazábal put down three army diehards' revolts against his caretaker government last year, and, having nursed the country along to its first free elections in eleven years, accepted his own defeat at the polls with good grace. Not all Latin American officers by any means are so loyal to liberal forms of government; but today it is certainly misleading to regard the military and the civilian as two opposite camps.

The church has also veered in its loyalties. Until its quarrel with General Perón, the Catholic hierarchy had usually put its weight behind the "strong man," mainly on the pretext that Rome's worst enemy, communism, must be suppressed at all costs. But whether from change of heart or from political prescience, the church has now come down on the side of the democratic counter-revolutions. In Colombia, where the church has particular influence, Cardinal Luque's decision to back the civilian parties played a decisive part in the overthrow of General Rojas. In Venezuela, the public criticism by the Archbishop of Caracas of General Pérez Jiménez for misspending public money helped to galvanise the rebels' "patriotic junta" into action; and in the last year, the Cuban church has supported Señor Castro's now victorious uprising.

So popular opinion, backed by the church and by elements in the armed forces, has overturned the dictators. But, once in power, the new revolutionary or elected governments inherit both the troubles of the old regimes and troubles of their own. It is not easy to reconstruct the whole life of a country which, like Argentina, had been pressed into a totalitarian mould for a full decade; no European nation has had to tackle such a job unaided. And Latin American political "parties" have too often been no more than personal followings of rival groups of landowners or industrialists.

Now the younger, and more genuinely representative, parties are only with difficulty finding their way through the post-revolutionary maze. In particular, the Intransigent Radical party is finding it hard to get Argentina out of its economic tangle. And the new regimes are too inclined to lay all their troubles at the door of the old dictatorships, much as the dictators blamed communism. In fact, communism has never yet been a really serious danger in Latin America. Recent elections, indeed, have mostly shown a marked swing towards the right; the electorate in Brazil, Chile, Costa Rica and most notably in Uruguay—apparently disillusioned with left-wing experiments, promises, and extravagances—has tended to favour the right-of-centre parties.

In the past the bogey of communism often brought the dictators the support not only of the less authoritarian Right and of the church but also, at certain times and places, of the United States. The conviction, held by most Latin American students, that the United States had been invariably sympathetic to the dictators, was forcibly demonstrated by the abuse and vegetables hurled at the unfortunate Mr Nixon in Caracas and elsewhere last spring. However naive their belief—and it is far from clear what exactly they thought Washington should have done, given the basic Pan-American code of non-intervention—it is obvious that foreign business interests, whether American or European, find it easier to deal with a stable regime; and for a time the old order undoubtedly gave the appearance of stability in many of the republics. But both in the United States and in Britain, there has been a reluctance to recognise the changing trends that have recently made these regimes the least stable of all. The show of ignorance about the Cuban revolution displayed by British ministers emphasises how slowly, if at all, London has learnt the lesson that Latin American dictators have apparently had their day.

Informal and Compelled

The new Mental Health Bill deserves a general welcome, but some details need scrutiny

THE main and welcome purpose of the new Mental Health Bill, although no-one would think so merely from reading it, is to assimilate the care and treatment of the mentally ill with the other health and welfare services. At present, by law and by administration, the mentally ill and defective are in a class apart. They cannot, most of them, obtain treatment without going through a formal legal procedure. The hospitals they enter are "designated" by law to receive them and still carry some of the stigma associated with the word asylum. Some patients—though, for newly admitted ones, a small and decreasing minority—have to bear the additional stigma of certification, with all the loss of liberty and rights that it entails. It is the same sort of stigma as was formerly associated with the poor law; indeed, one of the original objects of the certification of the insane was to establish their eligibility to enter publicly provided institutions.

For some years, it is true, this legal and administrative system has been breaking up. With the big advances that have been made in methods of treatment, more patients have been able to get it informally in general hospitals. Moreover, as a result of the royal commission's report, published in May, 1957, mental defectives can enter institutions informally (without being certified) and some mental hospitals have been "dedesignating" parts of themselves so that they, too, can receive patients without the usual legal procedure.

Now, by the new bill, there is to be one code for the mentally ill and the mentally defective. More important, all legal distinctions between mental hospitals and institutions and general hospitals are to be swept away; and the mentally ill who seek treatment will be able to have it on the same terms as the physically ill—not by any positive assertion in the bill itself, but simply (clause 1) by virtue of the repeal of the Lunacy and Mental Treatment Acts and of the Mental Deficiency Acts, and through a funnily negative little clause, which begins

> Nothing in this Act shall be construed as precluding the reception or treatment in any hospital or mental nursing home, without power of detention, of any person for whose reception arrangements are made otherwise than . . .

Clearly, the sheer pressure of numbers will prevent most of the mentally ill from entering general hospitals for treatment. Gradually, these hospitals can be expected to add psychiatric wards to their existing facilities. But most mental hospitals were built with the Victorian determination that they should last, and it will be many years before their accommodation can be dispensed with in favour of less grim and remote buildings. In the meantime, the symbolic unlocking of the gates provided by this bill, together with the actual unlocking of wards that has already taken place on a large scale, should help to dispel some of the reluctance to enter. It is, however, a pity that the dissolution of the Board of Control will put an end to the statutory visits of its inspectors, who are often the means of spreading new ideas from one hospital to another.

At the moment, mental hospitals provide almost the sole accommodation for patients that have ceased to need treatment but are not well enough to live independently outside and have no families who are able, or willing, to take them. The second main positive purpose of the Mental Health Bill is to encourage patients back into the community by enabling them to live in hostels and residential homes provided by the local authority. Some of these hostels will be specially provided under the national health service. In other cases, the mentally disordered can be housed in an authority's welfare home for the physically infirm and disabled; and some of the mentally disordered children can be placed in homes set up under the Children Act. Few of these powers will be new, and—a big obstacle—their use will depend on the money being available; but the bill makes it clear that the provision of community care for the mentally disordered is to be integrated with the ordinary social services. Further, it lays down a more humane and considerate procedure for giving care and training to mentally defective children.

THE bill recognises, as did the royal commission before it, that however good the facilities for care and treatment are, there will still be some patients who will refuse it and who should be compelled to undergo it in their own interests or for the protection of others. Their numbers, when the bill becomes law, should be fewer than the present number of certified patients, because under the existing procedure a person has to be certified if he is unable to express his willingness to enter hospital voluntarily—unless he can be brought within the limited category of a "temporary" patient. Under the new bill the only people who will be compelled will be those who positively object to receiving treatment. Of about 90,000 admissions to mental hospitals each year, probably not more than 2 to 3 per cent will now be subject to compulsion.

Yet the procedure for compulsory treatment laid down in the bill makes up its biggest single part, and is likely to provoke most discussion in and out of Parliament—rightly so, since the issue of individual liberty is involved. The bill's proposals broadly follow the recommendations of the royal commission. They lay down the classes of people that can be compelled and the reasons; abolish the judicial order that is the essence of certification and substitute for it the recommendation of two doctors; and (in the place of the Board of Control) establish independent mental health review tribunals, with legal, medical and lay members,

to whom the compelled can apply periodically to have their case reconsidered.

Some objection will probably be expressed to the removal of the lay opinion that now exists in the magistrate's agreement to certification ; but it can be argued that he usually accepts the medical opinion in any case and that a better safeguard is provided by the need for two independent medical opinions, one of which is to be given, where practicable, by a patient's family doctor. What can be much more reasonably objected to is the provision in the bill that one of the doctors can be on the staff of the hospital to which the patient will ordinarily be admitted ; many doctors will prefer not to compel patients into their own hospitals.

Not that it will be certain, in every case, to which hospital a compelled patient will go. For, in accordance with another of the royal commission's recommendations, a hospital will be authorised to admit and detain a compelled patient but will not be obliged to do so, whereas at present a hospital serving the area in which a certified patient lives has to take him. The motive behind the removal of this obligation is the laudable one of making the mental hospitals more like general hospitals. The danger is that there will arise a class of unpopular patients whom hospitals will find good reason not to accept. If the bill goes through as it stands, there will have to be an administrative refereeing system such as exists for finding beds for the chronic sick in general hospitals.

The royal commission proposed that there should be three groups to whom compulsion should be applied : the mentally ill, now covered by the Lunacy Acts ; the severely sub-normal, classified as idiots and imbeciles under the Mental Deficiency Acts ; and psychopaths, with whom it included higher-grade defectives. The bill distinguishes the latter (whom it calls the "subnormal") from the psychopaths, and, as the commission suggested, allows compulsion to be applied to both groups only if the patients concerned are under 21—and therefore supposedly more treatable. The question is whether psychopaths should be made into a special group at all for compulsory treatment, or whether, as at present, they should be compulsorily detained in hospital, whatever their age, if their behaviour is such as to enable them to be brought somehow within the category of the mentally ill.

The question is likely to be exhaustively debated before the bill becomes law. Psychopaths are few in number—there are perhaps half a dozen among every thousand patients in a mental hospital. But with their frequent suicidal gestures and their violence, they have a nuisance value out of all proportion to their numbers. They are certified now as a last resort—to save them from themselves and to protect others from them. By restricting the use of compulsion to adolescent psychopaths, the new bill should reduce the numbers that are medically compelled. But this may merely mean that more of the older ones will find their way into hospital by another door—by direct committal from a court or by transfer from prison.

No answer has yet been found to the problem of how to treat people who are not mentally ill but whose behaviour is completely anti-social and irresponsible without necessarily—or as yet—being criminal. Probably it will have to await the setting up of more special institutions for them. In the meantime, it is to be hoped that the nuisance value of these people will not spill over into all the discussions on this bill and obscure the very real progress it marks in the treatment of the mentally disordered. One royal commission at least has seen its labours come to fruit in good time.

Set the People Free

There is need for a mid-twentieth century manifesto to free Britons from governessy legislation

EVEN the outside possibility of Sir Alan Herbert winning Harrow East, so that once more there would be an Independent in the House of Commons, is enough to make the New Year imagination leap to (doubtless excessively euphoric) thoughts of turning Britain into a freer and more mature society. While the political parties enforce discipline, fight elections and consume much of Parliament's time over minor questions of who should own the steel industry and how many subsidies there should be in an omelette, the problems of manners and morals, by which a society's degree of civilisation can be assessed, are "issues of conscience" which embarrassed parties are reluctant to see treated as issues at all.

Attitudes to these two types of issues are often wildly incongruous. A left-wing politician like Mr Sydney Silverman fights uncompromisingly for personal freedom of choice on moral issues and advanced humanitarianism on penological ones, while as a member of the "Victory for Socialism" group he endorses the aggrandisement of the state on the industrial and economic fronts. The bulk of the Tories, favouring a "dash for freedom" in economic affairs, cling to governessy statutes when it comes to regulation of personal conduct.

Sir Alan's own political commitments are contained in the boisterous manifesto which he has put on sale in order to finance his campaign. In true independent spirit it follows no party line—not even a liberal line since it favours the return of the birch. But while a few of his individual proposals can and will be challenged on liberal grounds, the fact that, for the most part, he is bringing issues that really matter into the political arena by presuming to fight an election about them in a reforming spirit is deserving of the warmest support. Now is the time for all good East Harrovians to come to the aid of no party.

Meanwhile Sir Alan's public spirited effort should be an inspiration to other nonconformists to produce their own suggestions for a mid-twentieth century manifesto that would help set Britain free from its archaic inheritances from medieval theology and from succeeding centuries of fussy English men and women who "thought there ought to be a law" against this or that contemporary scandal—and had their way.

FOR a start any society which considers itself liberal must face up to two fundamental decisions about the purpose of Parliament and the proper function of politicians. The relevance of both was suggested by the recent debate on the Wolfenden report. First, granted that political leaders cannot afford to be so far ahead of their troops that they vanish entirely out of sight, it is also profoundly true, as the Rev. Llywelyn Williams pleaded most movingly towards the end of that debate, that "We who legislate in this House should not be too timorous . . . because public opinion may be lagging behind. In a sense we are the creators of public opinion. Certainly someone must give a lead in these matters." The second argument that must be outfaced is that in taking a step such as the repeal of the Labouchere amendment (which made homosexual offences in private between consenting adults a crime), the House of Commons is in the public eye condoning an undesirable practice by the act of ceasing to make it illegal. In using this argument as the principal one which weighed with him against the compelling practical and humanitarian case for accepting the Wolfenden proposals on homosexuality, Mr Butler was travelling along the Home Office's deepest worn groove. But in doing so he was raising questions that have to be answered. Are we living in an adult society or are we not ? Have political leaders got tongues in their heads with which they can explain what they are doing to their constituents or have they not ? Does Mr Butler really want us to accept the profoundly despairing view of our society which replying No to these questions would confess ?

The usual reaction to any proposal to liberalise long-existing law is the listing of a great many hypothetical dangers. The main test of whether one is a conservative or a liberal, at the right or left of the freedom spectrum, is how one reacts to such arguments. In general the right liberal approach (except in a rigorously reduced minority of cases where disastrous consequences seem virtually certain) is to make the maximum concession to freedom, and then simply sit back and see if any of the snags turn out to be real. Then specific legislation, involving the minimum interference, should be directed at eliminating these and these alone.

With these principles in mind the following is a first short-list of desirable reforms which is offered for inclusion in any independent candidate's manifesto:

1. **Lord's Day Observance.** This should be left to the churches and the efforts of private societies. The whole absurd legal structure (which for instance permits a live television play but not a live theatre performance on Sundays) should be brought tumbling down. In most occupations the unions are strong enough to protect any workers who might otherwise be exploited. If there prove to be in practice some exceptional cases which require special provision, a very limited law (of limited duration) should be passed.

2. **Drink Licensing.** The elaborate restrictions on the licensing of pubs should be abandoned to enable them to compete on even terms with the clubs that are proliferating in the big cities. There should still be a few limitations, probably in the total number of opening hours and perhaps on a closing time, though this should certainly be at least an hour later than at present.

3. **Homosexuals.** The Labouchere amendment should be repealed, as the Wolfenden Committee proposed, and the other changes in laws affecting homosexuality which it suggested should be enacted.

4. **Gambling Laws.** Betting shops should be licensed, so as to do away with the anomaly (which is almost a form of class distinction) by which anyone with a credit account with a bookmaker can place a bet legally over a telephone, while the law is broken every time anyone places an off-course bet by cash.

5. **Literature.** The Obscene Publications bill should be enacted in the form that the Select Committee of the House suggested (and which largely originated with Sir Alan Herbert) and the Lord Chamberlain's control over the theatre abolished (which Sir Alan might oppose).

6. **Aliens Laws.** These should be drastically liberalised.

The Economist

JANUARY 8, 1859

LET THE PEOPLE STALK

"No one who knows Mr Bright, or who has watched his public career, can doubt either his honesty of purpose or the earnestness of his convictions. . . . In the early part of the Corn Law struggle . . . Mr Bright was an earnest defender of the rights of the people—an efficient denouncer of a selfish and mistaken policy ; but he was a bad political economist. In his reform movement he is falling into exactly the same errors, and with much less excuse. . . . Mr Bright calls it a *sinful* application of Highland moors to devote them to grouse and deer. So long as the Legislature confined this country by statute to our own soil for the supply of food, there was a fair pretence for requiring that no portion of it should be applied to any objects of secondary importance. But now that we have free access to the soil of the world, every sound principle dictates that land at home should be turned to that purpose for which it is best adapted, for which the greatest demand will give the highest profit. It is the whole case of the Free-traders. They said truly, do not compel us by restrictive laws to cultivate wild wastes, suited only for hunting-grounds, while we can bring grain at half the cost from Ohio or Chicago. Well, if the Highland estates are more than ever turned into grouse preserves and deer forests, is not the reason plain to Mr Bright as it is to others ? Does Mr Bright believe that Highland proprietors would let their estates for those purposes, if they could derive more profit in any other way ? By free trade we can bring wool and cattle and corn from any part of the world. We cannot bring game preserves. But there is a demand for grouse moors and deer forests. It may be that it is a mere fashion, but even if so, there is no reason why it should not, like a fashion for claret, or old port, or madeira, be supplied.

In this age of diminishing sovereignty, it should be made clear that foreigners are welcome to learn what they may of the British way of life at first hand and as nearly as possible under the same conditions as the British. This implies abandonment by the Ministry of Labour of the regulations preventing most foreign visitors from taking a job. It should be accepted that there is a positive public advantage to be gained in accommodating foreigners, particularly young people without full means of support but who are willing to turn their hand to whatever is available to gain some knowledge of Britain.

If this results in a flood of immigrants whom it is impossible to absorb the Government should intervene only as a last resort and then if possible by diplomatic arrangement with the countries from whom the excessive immigrants are coming. Real undesirables should, of course, still be deportable, but subject to proper appeals.

7. **Abortion.** At present this is illegal except where doctors can show that failure to carry out an operation would endanger a mother's life or health. The legal barrier should be removed and the matter left absolutely at the doctor's discretion, although, except where there are strong therapeutic reasons for the operation, efforts should be made by welfare workers to dissuade the mother from it.

These are a few candidates for the list. Other suggestions should be pressed on the Government. One whole field that deserves separate examination is that of the royal prerogative. There is, in fact, far too much prerogative still with us, but since the discretion of princes has under the modern constitutional dispensation become the convenience of politicians and civil servants, spasmodic attempts to re-open sectors of the uncompleted battle between Commons and Crown have usually been successfully ruled out of order in the House. (The recent *Auten* case, involving the claim of "Crown Privilege" to enable the Government to withhold documents that are important to a private litigant, uncovered one example of still untamed prerogative. There are many others.) In addition, although the British police are (quite genuinely) the best in the world, there is a case for a new enquiry into their powers over the ordinary public—and the powers sometimes assumed by people outside the police force who think they are entitled to enforce by-laws.

In a rather different category are two reforms, previously advocated by *The Economist*, which would fortify the civic freedom of voter and worker. These are (a) the electoral system of the "alternative vote," which would give the voter a better chance, though admittedly not as good a chance as under full proportional representation, to see that his vote counts in keeping out the candidate he most dislikes; and (b) a Companies Act for trade unions, which would confine the special legal exemptions of unions to those which satisfied the Registrar of Friendly Societies that they possessed and were practising proper arrangements to ensure fair internal elections, and a full procedure of appeal, before a member could be expelled and thus put in peril of losing his livelihood.

Let the list lengthen. Britons are not as free as they think.

NOTES OF THE WEEK

FRANCE

Paper Revolution

GENERAL DE GAULLE'S rule by decree has made France's *Journal Officiel* a bulky publication for some weeks past. As cabinet meeting followed cabinet meeting—and the general kept up the pace to the end before moving into the Elysée palace on Thursday—Frenchmen have turned with trepidation or anticipation, or merely a sigh at the mass of material to be digested, to the announcements and regulations that have changed institutions, policies, even a whole way of bureaucratic life, at one reforming stroke. Education, justice, social services, defence, a new penal code, administrative reorganisation, and the full impact of the general's financial and economic gospel of austerity all appear in bulging issues of the *Journal*.

The overhaul of French institutions is drastic, and has been badly needed. It is too early even to guess at how some of the changes will work out. The school-leaving age is to be raised to 16 from 1967. Criminal juries will have nine members instead of seven. The succession of political authority in a nuclear war is arranged. The idea of an urban district is introduced to local government. Social security payments are regulated, labour's share in management encouraged, and the decentralisation of Les Halles—Paris's antiquated food market—approved in principle. Changes that the deputies would have debated interminably have been put through without drawing breath.

This reforming spirit was not enough to persuade M. Mollet to remain in the government after the general handed over the reins to M. Debré (the new premier's personality and prospects are described on page 134). M. Mollet's resignation and that of a second socialist minister, M. Thomas (who had actually refused to sign the order raising charges in his own Post Office department), are now known to have been submitted on December 27th, after the budget decisions. Thus the party that, on its electoral posters in November, called itself "the advance-guard of the Fifth Republic" now goes into opposition.

UNITED ARAB REPUBLIC

Black to Mate

WINTER visitors are no novelty in Cairo. In the past, thousands of tourists seeking refuge from less amiable climates found the winter sun and a bit of antique culture along the banks of the Nile. This season the Egyptians are entertaining an array of visitors as varied, if not quite so numerous, as the tourists once were. In one day this week there was a round of talks between United Arab Republic officials and the prime minister of Italy, the prime minister of east Germany, the secretary-general of the United Nations, the UN truce supervisor, and Mr Eugene Black, president of the World Bank.

While Mr Black discussed with Dr Abdul Moneim el-Kaisouni, the UAR minister of economics, the settlement of outstanding Anglo-Egyptian financial disagreements, the most encouraging feature of a week of feverish activity and cautious public statements was the optimism of the controlled Cairo press. Never before during the seemingly endless Anglo-Egyptian financial negotiations had the Cairo newspapers regarded settlement as possible or even desirable. Perhaps the change in attitude is a result of communist scares in Iraq and Syria—but these same newspapers now claim to have discovered that the friendly Soviet Union is embarrassed by the activities of Arab communists against Arab unity and nationalism. Perhaps the Egyptians have discovered that in dealing with the neutral Mr Black they cannot hope, once they have agreed on everything else, to draw forth from their dispatch cases some claim unrelated to the general settlement.

On Thursday afternoon the Egyptians were apparently counting on the early arrival of British representations for direct talks. This implied that a settlement was already at hand. If it is reached, the Egyptians will doubtless claim that they have won a great victory. That will not necessarily mean that Britain has suffered a defeat.

ELECTION DATE

Riddle of the Sphinx

IT is generally assumed that the Prime Minister will have had one main political thing on his mind during his short and interrupted rest at his Sussex home: when to call the next general election. There are at present five by-elections outstanding, and it seems probable that the Conservatives will call three of them before February 15th. If these show a definite swing to the Government compared with the (for the Government) rather disappointing by-elections just before the Christmas recess, then almost all Tories will expect a general election in May. But if they do not show such a definite trend (and the appearance of a Liberal at Southend and of Sir Alan Herbert at Harrow is going to complicate reading of the omens), then heart-searchings at all levels of the Tory hierarchy are to be expected.

Many Government supporters probably agree that the convertibility of sterling now makes it rather less desirable to hold an election in the autumn, at the period of sterling's normal seasonal strain. It has only recently been generally realised that the schedule for the Queen's visit to Ghana may make the previous favourite date for an autumn election—in the second half of October or the first half of November—unfeasible anyway. On to these considerations, however, there has now been imposed the major additional factor (discussed on page 150) that Britain's small recession may be ending earlier than expected, that the economy may be already on the turn. Previously it had been supposed that an early turn in the economy might lead to an early election. Instead, it could be an influence the other way. The Tories are already rather more happily convinced than they were even three weeks ago that 1959 should be the year of the harvest after Mr Thorneycroft's and Mr Amory's hard ploughing; if the by-elections in the next few weeks do not show a swing in their favour, they may be more inclined than ever to want to delay the general election until after that economic harvest has been collected. Nor are the Conservatives unduly impressed by the argument that an election could not be held after mid-November, because of the risk of voters being fogbound on election day. In the present state of party organisations, bad weather on polling day would probably hurt Labour more than the Tories.

Some excitement has been caused this week by Sir Winston Churchill's remarks to members of his constituency association at Woodford; he told them that they must organise themselves for a general election "some time this year or next," but that he was personally "rather doubtful whether it is going to be so swift and sudden as is made out." But a local factor may have played a larger part than foreknowledge in this Churchillian utterance. Some of that audience at Woodford, worried at the rush to which they would be put if they had to find a new candidate in time for a May election, may have wanted Sir Winston to indicate to them for certain whether he is going to stand as their MP again. Sir Winston, it appears, was gently telling them that they must wait and see.

PAST THE MOON

"Planet Ten"

THE world heard of Russia's "cosmic rocket . . . launched toward the moon" early on the morning of January 3rd. By then the Soviet scientists already knew that it would escape the earth's pull, but they remained cagey about what exactly it was meant to do. "Shoot first and answer questions afterwards" is still the custom in Moscow. The rocket settled the issue by skirting the moon at a close distance of 4,600 miles and going into orbit round the sun. It thus becomes, its admirers say, "Planet Ten" although, with its sodium flare exhausted and its radio batteries dead, it is now as useless to man as any other asteroid. The Soviet rocketeers have proved their ability to send up a final stage missile of a weight and speed well above anything the Americans have achieved, and with a disturbing accuracy of aim (an engineering success that is examined on page 159). Had they been thinking seriously of orbiting round the sun, however, they would presumably have equipped the rocket with solar batteries.

In propaganda terms the launching was acutely timed. "Planet Ten" has been dedicated to the twenty-first party congress that opens later this month, and represented as a symbolic triumph of "the creative toil of the whole Soviet people." But seemingly most important of all in the Russians' eyes is the fact that they are still keeping in front in the space race. The gap that the Americans narrowed by launching their heavy Atlas satellite in December yawns widely again. But American reaction has been calmer, and more sporting, this time than when Sputnik I appeared in October, 1957. There were, of course, congressional calls for two more shots at the moon right away. But until the Russians show that they have solved the very different problem of re-entry, the Pentagon can still claim to be close to parity in the development of intercontinental missiles.

By avoiding a direct hit—as American rocketeers mean to do until more is known about the moon's dust—the Russians spared everyone a tricky problem in space law. The Lunik apparently carried pennants with the Soviet coat of arms and a suitable inscription. Had it landed, would it—by planting, or at least embedding, the flag—have constituted a claim to possession? It seems unlikely; Amundsen did not claim the South Pole for Norway—though how else did Britain take over Rockall in 1955? A United Nations committee on the uses of outer space was formed in November to look into this sort of question. But its batteries, too, seem to have gone dead.

CUBA

Hindsight Wisdom

WHATEVER comes next, this week has been Señor Fidel Castro's triumph. For twenty-four hours Cuba had two provisional presidents; then the revolutionary forces and their nominee, Dr Urrutia, took over. The youthful Señor Castro has marched across the island in a blaze of glory; he now has the chance of using his personal popularity to impose some kind of unity on his distracted country.

Wise after the event, the British Government must be regretting the aircraft and tanks it allowed General Batista to buy; it has hurried to try to make things up by quickly recognising the new government in Havana. But the problem is not quite as simply black and white as, say, Mr Graham Greene makes it. Britain is an arms exporting country. There are two possible criteria for forbidding the sale of arms to another state: either moral disapproval of the way in which they are likely to be used, or a shrewd calculation that the customer is riding a losing horse. The moral argument can be disputed to and fro: apart from the Nato allies, how many countries can be safely assumed to use any weapons sold to them only in ways acceptable to British opinion? And as for the practical argument, it would have needed considerable acumen to have foreseen the rebel victory at the time when the orders were placed in the early summer.

After that point, however, there was a sad miscalculation both about the situation in Cuba and about the likely indignation there and in this country. Mr Delargy first raised a question about the arms in the Commons on November 19th, and Mr Selwyn Lloyd then admitted that "the situation has rather changed since these orders were given"; but nothing was done to stop the arms going until Mr Delargy spoke out again on December 15th, when it was already much too late for the subsequent ban to be of any political use. It has all made Whitehall look pretty silly, and it will scarcely help to get Britain's relations with the victorious regime in Havana off to a good start.

TEACHERS' PAY

Out in the Cold

THE refusal of the Minister of Education to intervene in the deadlock over the teachers' pay demands puts the National Union of Teachers in so difficult a position that it is almost impossible not to feel sorry for them—or at least for the moderates among their leaders. Mr. Lloyd has in effect told the NUT to go back to the main Burnham committee and restart talks with the local authorities. The difficulty here is that Sir Ronald Gould, after his union had declared that the recommendation of the main committee for a 5 per cent increase was not enough, exerted all his very considerable negotiating talents to induce the authorities' side to reopen discussions on the two issues in which he is most interested, and the authorities flatly refused to do so. Although the authorities agree that the 5 per cent increase should be regarded as only an interim one, they declined to bind themselves in advance to a further pay increase when negotiations for a new salary scale start, and also refused to advance to an earlier date than April, 1960, the time when the new scale, if agreed, will start.

All the NUT can think of now is to beg the minister to have second thoughts about not intervening. Would not the teachers be wise to have second thoughts of their own? The union's narrow card vote for rejection of the 5 per cent increase probably exaggerated the extent to which teachers as a whole opposed the recommendation; the people who turn up to cast card votes naturally include a more than average proportion of keenly militant types. The union is not, one suspects, in a really strong position to push matters to extremes. It might, for example, organise a teachers' boycott of the schools meals service, which would put the local authorities to some expense and annoy parents. But the local authorities would dislike negotiating under duress even more, especially as they have to consider the many other organised blackcoat professions whose members they employ, some of whom are at least as discontented with their pay as the teachers (and possibly with more reason). It is extremely doubtful whether such action would win public support for the teachers' claims for a quicker salary review (let alone a demand for a 25 per cent rise). And would the boycott—or any similar direct action—really be complete? The moderate teachers might well object to such action, and, if they refused to be carried along by the militants, would reveal disunity in the NUT. It is difficult to think that the position is worth such risks, when a 5 per cent increase can be had now and some well-publicised responsible leadership would almost certainly win another advance by April, 1960.

MALTA

Mr Mintoff's Dream Island

BOTH Mr Lennox-Boyd and Mr Mintoff have now put forward their plans for Malta's future. Mr Mintoff got in ahead, probably because he knew that the Colonial Office was about to announce its intentions, and he has done his best to make those intentions non-starters in competition with his own. These latter are imaginative—in most senses of that term, especially the pejorative one, Mr Mintoff has shrewdly accepted the point that an independent Malta would have to be neutralised and demilitarised, so that it would be unable to sell its naval nuisance value to anti-western powers. But he has put a price on this—an outright gift of £100 million to make Malta the Switzerland of the Mediterranean. Instead of exporting watches, it would export ship repairs, and tourists would flock to it because of its scenic attractions and (Mr Mintoff pretends to believe) because of its atmosphere of dedicated peace. In the same breath Mr Mintoff has done his best to frighten off the one firm that showed willingness to risk

Mosquitoes Traced by Radioactive Nectar

RITCHIE CALDER, the science writer, explains how atomic power is helping to open up the frozen wastes of the Arctic...

PEOPLE do not usually associate mosquitoes with the Frozen North, but Arctic Old Hands will tell a tenderfoot: 'Mosquitoes! They are so big we skewer them on spigots and roast them!'

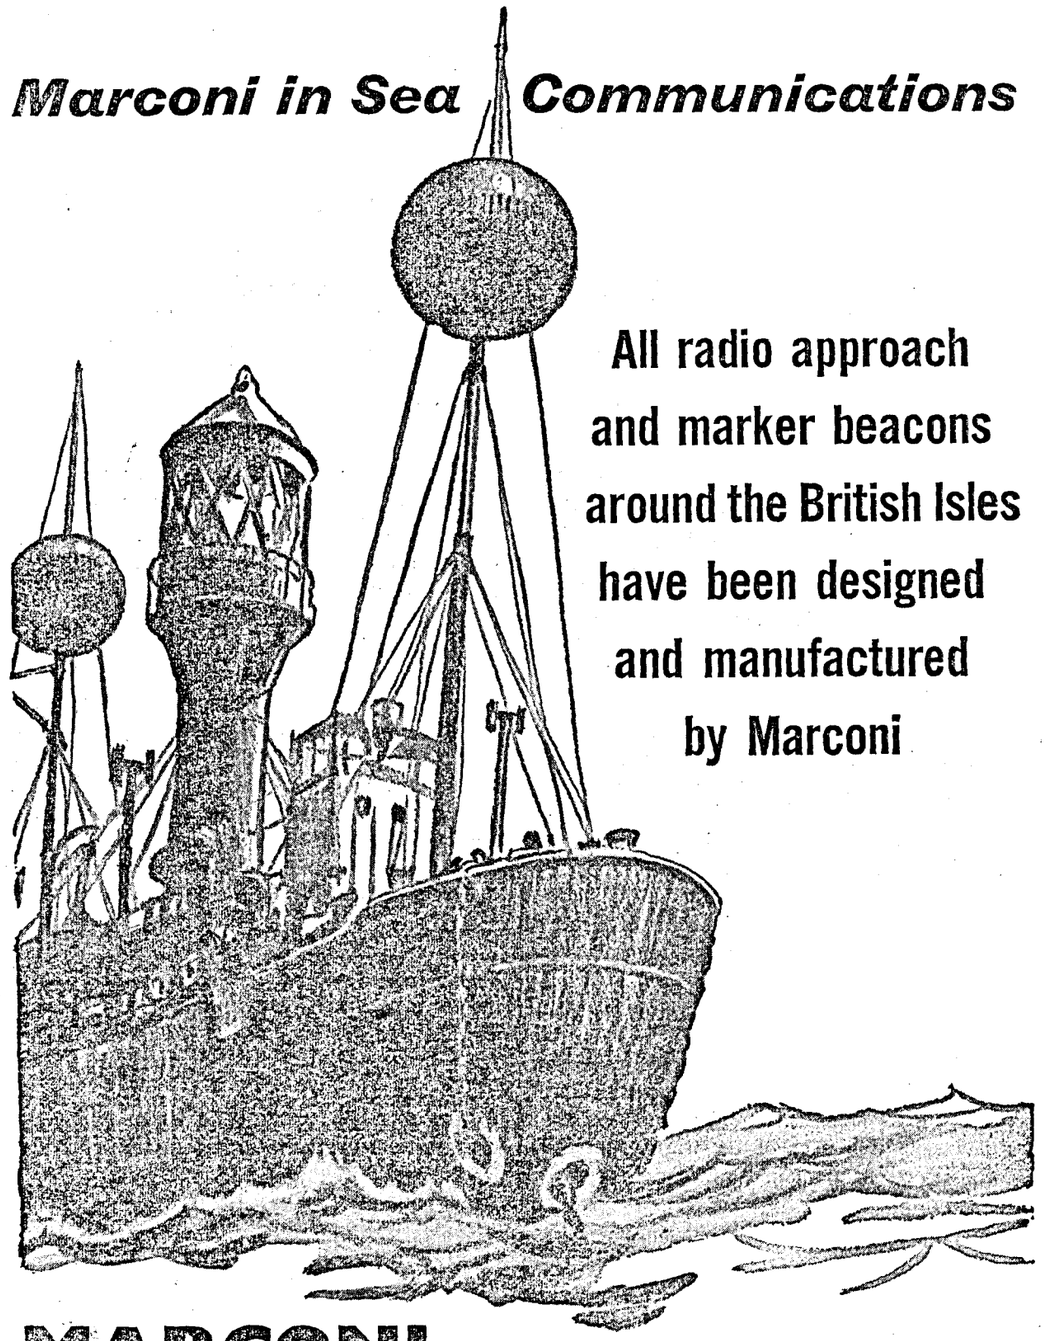
That is an exaggeration, but they are certainly 'man-eaters'. Fortunately they do not, like the anopheles of the tropics, transmit malaria; but when the icebound swamps unfreeze in the Arctic summer they swarm in such vast numbers, and bite with such blood-thirsty persistence, that the settlers' lives become unbearable. Indeed, it can be said that the mosquitoes are a bigger obstacle to settlement and development of Arctic regions than the cold or the six-month long night.

RADIOACTIVE ISOTOPES

Something will have to be done about these hostile and voracious insects. Already scientists are hard at work studying their habits. Ingenious methods are being devised to keep track of the swarms, not the least of which enlists the help of nuclear energy.

It is known that the mosquitoes drink the nectar of the Arctic poppies (again, people do not usually associate flowers with the Frozen North) and the experts are feeding the poppies with an artificial fertiliser containing radioactive isotopes, which are, of course, by-products of the release of atomic energy.

In the Arctic poppy then, this radioactive fertiliser finds its way into the nectar. The mosquitoes sipping the nectar, pick up the radioactive elements. And from there on, they are marked. They carry in their bodies a 'radio transmitter' and the scientists can follow them wherever they go and so find out vital information concerning their habits — information that will lead to their effective control.



The end result of using this by-product of nuclear energy to plot the mosquitoes' activities will help to make the Frozen North a more comfortable place in which to live and work. And this, in turn, is an important factor in preparing the way for the time when atomic power itself releases the immense industrial resources of the Far North.

capital in converting the dockyard for ship repair work, by telling it that if its operations failed to ensure full employment he would nationalise it without compensation.

This is not of course a plan: it is politics. Mr Mintoff wants to frighten off British private enterprise because he wants Malta's bread-and-butter to remain the moral responsibility of the Admiralty and the Colonial Office. He may be expected to say "boo" to every industrialist whom Lord Hives inveigles to the island on promise of Northern Ireland-type inducements. Mr Mintoff does not want any incoming industrialists—or the tourists either; he wants to keep the produce of the milch cows he knows. But he thinks that by flogging these bitterly he can eventually persuade them not only to move out, but also to send back much more money for him to spend as he pleases as boss ruler of Malta. His aim is a sort of large Danegeld in reverse, a new sort of economics based on absentee tenants.

Subvention without Representation

THE danger—for Malta as well as Britain—is that the British Government may be being manœuvred into a position where it may eventually seem least uncomfortable to accept some variant of Mr Mintoff's plan, and after causing a lot of bad blood. This week Britain has pledged itself to spend £29 million on Malta over 5 years. This is no more than the current annual budget subvention (equal to the island's regular capital expenditure) plus the outlay on dockyard conversion—and is thus the scale of aid which Mr Mintoff rejected. But it leaves the British Admiralty (unwillingly) paying considerable sums for the upkeep of the naval base indefinitely. On the constitutional side, a bill is to be rushed through the British Parliament this spring to confirm governor's rule in Malta, with a small nominated council. This reversion to old-fashioned colonial patterns is described as being only an interim measure, designed to tide over the period of dockyard conversion and to give Malta's solider citizens a chance to think again. (The first fruits of their rethinking will appear in the names of those who prove ready to serve on the council.) This is a miserable pass to have come to, after the high hopes of the Round Table conference.

Is the Government going down the wrong road and ignoring Britain's real interests in Malta? Briefly, Britain needs safeguards that the base does not fall into anti-western hands, it should give the island a limited and proper subvention for past services rendered, otherwise the Maltese should choose what government and which form of constitution they like. If they choose Mr Mintoff in his present mood, so much the worse for them. If, during the Colonial Office's attempted "breathing space," Maltese public opinion deserts Mr Mintoff, then this week's decision will prove to have been a brave and humane move. But if, as seems at least equally likely, that opinion now rallies to Mr Mintoff more excitedly than ever, then Mr Lennox-Boyd's policy will have been a mistake.

SOVIET UNION

The Double Crosser

ALTHOUGH Marshal Bulganin had already twice described his "anti-party" activities in abject terms, he again came under heavy fire at last month's plenary meeting of the Soviet Communist central committee, and his previous self-denunciations were rejected as "feeble, insincere, unprincipled and false." The full record of the meeting on December 15th was published in Moscow on Tuesday. The attacks made on Bulganin by his colleagues (he has apparently remained a member of the committee so far) were ruthless; since they were all made by good Khrushchev men, their original source is easy to trace. Mr Ignatiev, former minister of state security said that "Bulganin ran after a piece of gingerbread the anti-party group offered him, although the gingerbread was poisonous." Mr Matskevich, the minister of agriculture, accused the marshal of pretending to have joined the group of rebels only at the last moment, and exhorted him to "tell honestly about his subversive work and about the roots which have remained." At the end of the day the genial letter-writer and participant in the 1955 "summit" conference was roundly condemned as a double-crosser and traitor.

It seems unlikely, now that political trials have fallen into discredit, that Mr Krushchev will revive them. The men now under attack are carefully described, not as "enemies of the people," but as an "anti-party group." But more will certainly be heard about them and their vile activities. Further members of the group are likely to be made to confess, and Marshal Bulganin, a pliable man, will have to do so more fully. So far there has been an air of unreality, reminiscent of Stalin's and Kafka's trials, about both the accusations and the confessions—though that does not mean that opposition to Mr Khrushchev's policies, and mainly in the agricultural field, never existed, or that it does not now exist. For the time being, however, Mr Khrushchev does not need scapegoats for the failures of his policy; the "anti-party" men may be put in pickle for future use.

JUGOSLAVIA

Marshal Tito in Asia

MARSHAL TITO'S partiality for foreign travel is well known. On New Year's Day, after an all-night party in Bali, he sailed away to Rangoon for the next stage of his Asian tour. But his ten-day visit to Indonesia (his second) was not all the Indonesian equivalent of gas, gaiters and delight. It was also an opportunity, which he did not miss, for putting to the Indonesians and other uncommitted peoples of Asia the Jugoslav side in the running controversy with China and the Soviet block, and for demonstrating to them that it is both possible and desirable to keep clear of both the great power groups. Without naming any names, he made in public some palpable hits at communist interference in the internal affairs of other countries, and emphasised the importance of letting each country develop along its own chosen path. In private, no doubt, he was even more explicit.

Marshal Tito's words will not have fallen on unwilling ears. President Sukarno has in his time been deeply attracted by Chinese developments, but he appears lately to have become more aware that the attraction could be fatal. (In any case, much of the communist economic aid that has been arriving in Indonesia has been pretty shoddy stuff.) This no doubt largely accounts for the apparent success of the visit. And this success, in turn, helps to account for the way in which Chinese and east European propaganda is now stepping up its efforts to discredit the

Jugoslavs in Asian and African eyes. The gist of these diatribes is that the Jugoslavs are in reality zealously serving the "imperialist block" as its Trojan horse among the neutral countries of Asia and Africa. The aid which Jugoslavia is receiving from the West—a new agreement for nearly $95 million of farm surpluses has recently been signed with the United States and agreement in principle reached on a £3 million credit from Britain—is represented as payment received for past and future services.

The Jugoslavs, who have heard all this before, are not taking it lying down. They appear anxious, however, to keep on good terms with Moscow itself, and this may be easier for them if they feel—as they may—that the bitterness of the attacks now being made on them is a sure sign that Marshal Tito's Asian travels are well worth while.

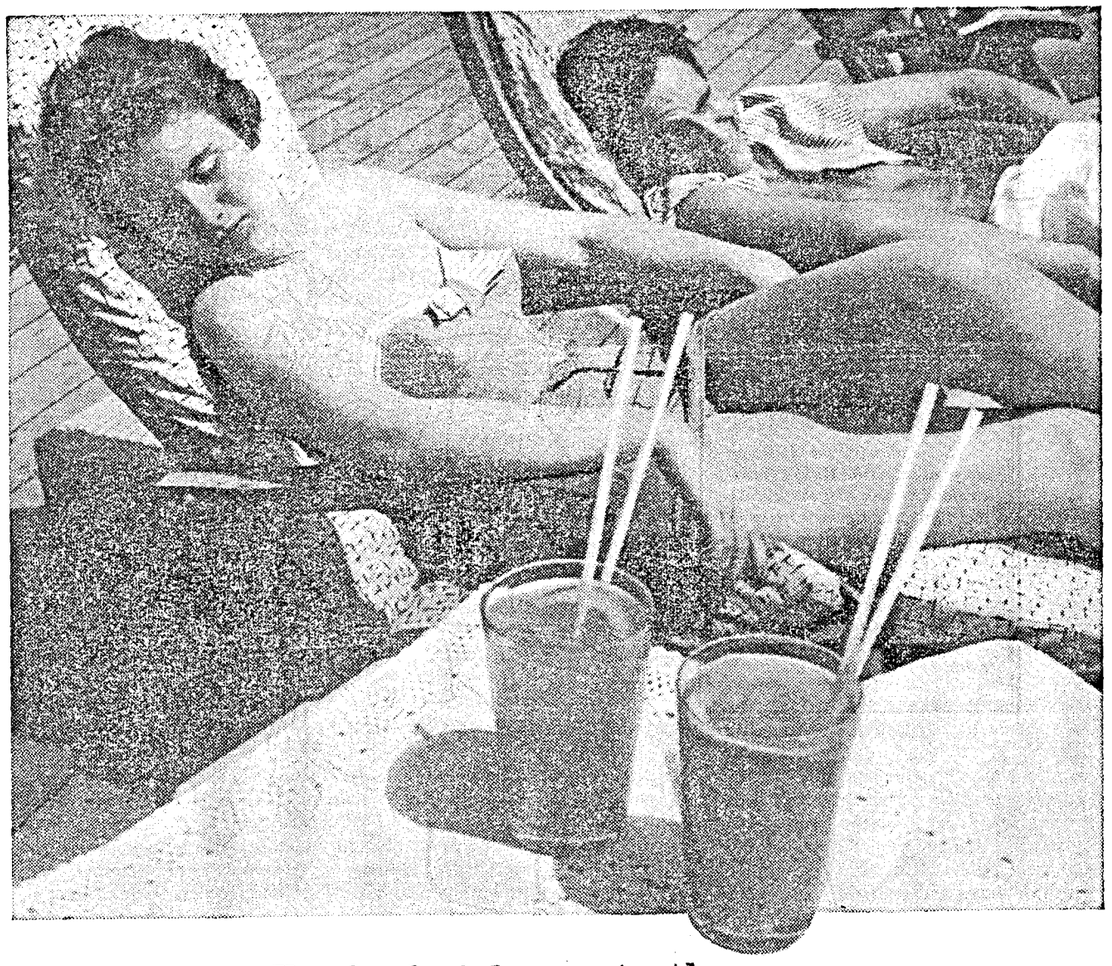
LOCAL GOVERNMENT

How to Govern the Midlands

THE new Local Government Commission has picked as its first review area a section of the Midlands, covering 13 counties and extending across England from Herefordshire to Cambridgeshire. The area has been chosen because it contains a good sample of the thornier problems which the commission must tackle. It includes two towns seeking county borough status (Luton and Cambridge) and four counties (or five if Cambridgeshire loses control over Cambridge) which, with less than 100,000 population each, are very weak administrative units. It also includes the "special review area" of the West Midland conurbation, within which the commission has discretion to make whatever proposals it likes.

The commission will obviously find its course easier, however, if it sticks to the present types of local authority even within the conurbation. Once that is conceded, a possible line of reform can be suggested to it. The West Midland conurbation contains one giant county borough (Birmingham), five other county boroughs, and another 700,000 people served by 20 minor local authorities and three counties. The simplest course would be to absorb all these minor authorities into the existing county boroughs, possibly adding one or two new ones. Staffordshire and Warwickshire would survive as more compact but perfectly sound units, while Worcestershire might be joined to Herefordshire. In the eastern part of the commission's area, a number of counties could profitably be united. If (as would not be unreasonable) Cambridge becomes a county borough, Cambridgeshire could be joined with both Huntingdonshire and the Isle of Ely, while Rutland and the Soke of Peterborough could conveniently be merged with Leicestershire and Northamptonshire respectively. On the other hand, the futures of Luton and Bedfordshire are difficult to resolve in isolation from the adjacent home counties; it is a pity that they have been included in this first review area at all.

The net effect of these changes would be to reduce the number of counties from 13 to 8, to create one or two new county boroughs, and to unravel the tangled web of councils operating in the Black Country. This would be a workmanlike if unspectacular improvement, the maximum that can perhaps be expected within the commission's remit, and one that would do little real violence to the traditional administrative map. No doubt the affected county councils would still protest hotly, while the small councils of the Black Country would object that they were being partitioned in a Polish manner by their powerful neighbours. The commission will need to probe carefully into the real, as opposed to the aldermanic, weight of this type of objection. If it decides to be more ambitious than is suggested here, it should be congratulated; but it will deserve to be castigated if it is less so.



LORD ATTLEE

Look Back Inclemently

LORD ATTLEE'S lengthy recorded television interview with Mr Francis Williams last Saturday followed the lines which Mr Morrow had pioneered in his famous similar interviews with ex-President Truman in America. Never before has so large a proportion of the British people had so intimate an opportunity of assessing just what had made so recent a Prime Minister tick. The fact that Lord Attlee pulled no personal punches makes it morally permissible (as well as journalistically quite irresistible) to comment in similar personal vein on his own performance.

To judge from this interview, the main things that made Lord Attlee tick, by the time he reached the Premiership, were a belief in the innate "decency" of the ordinary Briton, which was so fervent that he still does not realise that he had a few extraordinary Britons even in his own cabinets; a love of administrative efficiency, which was sometimes sorely tested both by his own party and by some of his leading opponents (and which abetted his human unwillingness to admit easily to the occasions when his own policies proved wrong); together with some surprising tinges of jealousy which were just (but only just) sufficiently contained not to be absurd in an ex-Prime Minister nor unengaging in so outwardly unassuming and benign a *savant*. Two of these qualities were evident in Lord Attlee's impish denigration of Sir Winston Churchill; although he never quoted it, he obviously still gets immense enjoyment out of the famous judgment attributed to an ex-Cabinet official ("When we came out of Winston's cabinets, we always said 'what a great man'; when we came out of Attlee's, we always said 'what a lot of work we've done'"). Others of these qualities, one may guess, were evident in his antipathy to Mr Jinnah, but it is ridiculous that Pakistanis should be so cross that this has now been openly expressed. The antipathy to the founder of their dominion from this great socialist imperialist among British Prime Ministers was an important fact of history, and it is to everybody's interest that it should now have been revealed.

Some surprise has been caused by the tribute which Lord Attlee paid to Stanley Baldwin, a tribute which, by coincidence, has been repeated in not wholly dissimilar terms by Mr Macmillan in an interview published in the *Daily Mail* this week. There is room for an article-full of comment here. The emollient, unflappable, one-nation father figure of Stanley Baldwin was the sort of Prime Minister whom the British people often like, and whom other Prime Ministers, in their dreamier moments, often think they would like to emulate. And one of the abiding dangers of British politics is that they should think any such thing. For the personally popular Mr Baldwin, by leading Britain too slothfully through depression and too calmly down the road that eventually led to war, was in fact an unmitigated disaster for this country.

Deck-chairborne to the sun

Your luggage . . . piles of it . . . is safely below. But the bags containing your summer cottons, your bathing costumes, shorts, sun-suits, sun-tan lotion and sun-glasses are marked WANTED ON VOYAGE. You'll be out of the Channel and headed South at 19 knots by breakfast on Friday. Hot sun, smooth seas: you'll be bathing on deck by Monday. A trip ashore at Madeira or Las Palmas, and then a long and blissful week of the South Atlantic, the albatrosses above you, the porpoises and flying fish astern, deepening suntans, flaming sunsets, warm nights, dancing under the stars, cinema shows, games, good companionship. And those Union-Castle meals . . . heaven for the hungry, gargantuan for the greedy, gorgeous for the gourmet! Drinks and cigarettes are all you'll want to buy—and they are at duty-free prices that look like pre-war misprints! Such service, such freedom, such warmth, such a five-star holiday—all for the price of the travel tickets!

Every Thursday at 4 p.m. from Southampton to South Africa. About twice a month from London to East Africa and Round Africa.

TO SOUTH AFRICA, TO EAST AFRICA AND ROUND AFRICA

THE LABOURS OF HERCULES

THE THIRD LABOUR

THE ARCADIAN STAG

Some dismiss the Hercules story as a myth. Others, more cautiously, think that the legends that surround his name have some basis in fact. It could have been the exploit of some early Greek hunter, for example, which gave rise to the story of Hercules' capture of the Arcadian Stag. It makes a lot of sense to trap a stag too swift to catch, by driving it into a net!

To-day the tradition is maintained. Hercules—a chemical company now—takes pride in doing things which make sense. It makes sense to re-plan many operations in chemical technology—to mention three, using Dresinol emulsified resins to improve leatherboard binding at lower cost; to enhance quality of rosin products by using Polypale polymerised rosin; to size paper with *fortified* Pexol Size. Suppose you are a paper man. If Hercules has not told you yet about Pexol Size you should be asking some pointed questions!

UNIVERSITY FEES

The Unexpected Champion

MIDDLE-CLASS parents with children who will soon be going up to a university should take note of a significant political development last week. The general council of the Trades Union Congress has declared itself in favour of freeing all university tuition fees and other strictly academic expenses from the parental means test on scholarships and other university awards. Were this particular policy adopted, the relief to parents would not be enormous. Even at non-residential universities, and *a fortiori* elsewhere, it is maintenance rather than tuition that constitutes the main load. In terms of £ s. d., a further approach to greater liberality in the income scale to which parental contributions are related, and in the allowances for dependants other than the award-winner, would make much more difference.

But the TUC proposal marks, as a revision of scales and allowances would not do, a change of principle. It would assimilate higher education, at least as regards its direct cost, to ordinary state schooling whose benefits are available without question of means to every citizen. Whether those who agree with means tests in some other things should applaud the abolition of a means test on university awards is a nicely controversial question. But comment this week need be concerned only with effect. What the TUC recommends by halves today, the Parliamentary Labour party (some of whose leading lights are likely to be affected by university means tests themselves) may well be inclined to do by more than halves tomorrow; and the way has surely been made clear for the Conservatives, who are even more strongly subjected to middle-class pressure, to go the whole hog. To free university allowances from means tests altogether would not cost a great deal of public money. One suspects that the day when they will be so freed may have been brought significantly nearer by last week's announcement from the TUC.

GERMANY

Bonn Keeps the Door Open

FOLLOWING in the footsteps of its allies, the West German government has answered the Russian proposals on Berlin in terms whose moderation is in contrast with the intransigent noises which came from Bonn when the Russian proposals were first made. The note rightly rejects the Russian suggestion for a separate "demilitarised" Berlin; it takes the view that any separate Berlin settlement risks freezing the division of Germany. But it also suggests that broader talks on the German question are the proper context for solving Berlin's problems. And it reminds Russia that the door opened in the West German note of November 17th is still ajar.

That note, inspired by a resolution of the Bundestag, proposed the setting up of a four-power commission to discuss the German question. It also suggested, in contrast to earlier attitudes in Bonn, that talks need not be confined to German unity. The new note confirms this. The federal government apparently holds that if the East, for example, wishes to discuss the Rapacki plan in the commission, the West is willing to oblige. Disarmament, European security and German unity are, in Bonn's view, linked aspects of one problem. And Germany, the note says, has no political aims in the east beyond "a just and reasonable settlement of the German eastern frontier."

The note's explicit rejection of the idea of "confederation" between the two German states seems, however, to conflict with the declared willingness to discuss anything and everything. Bonn's fear that Herr Ulbricht's highly dubious version of "confederation" is merely a device for giving permanence to the division of Germany, and to his own regime, is understandable. But though the West cannot give up its advocacy of self-determination for the East Germans, many aspects of their status will have to be agreed between the four former occupying powers before Germany is reunited. This negative form of approach offers the Russians an excuse if they do not want to talk.

The question whether they do may be answered in Washington this week. There Mr Mikoyan has made it plain that Russia has not given up the idea of handing over the regulation of access to Berlin to the East Germans. But, unless and until this change comes to mean a clear threat to isolate Berlin, it is not the heart of the matter. What matters is to get talking on the German and European questions as a whole.

Drang nach Osten

HERR GROTEWOHL, the East German prime minister, is making a pilgrimage to Cairo, Baghdad, Delhi, and finally to North Vietnam and China. His large retinue includes his foreign minister, his deputy trade minister, and an atomic physicist. The East German government has for some years been doing its best to oblige Arab and Asian countries. Establishment of trade missions with a semi-diplomatic status has followed the conclusion of trade treaties; and there are many students from these countries at East German universities. The new mission is expected to propagate the idea that East Germany really exists as a separate state, that it is a peace-loving country and worthy of diplomatic support. And Herr Ulbricht and Herr Grotewohl have indicated that they regard their journey as a part of the diplomatic struggle for Berlin; they will present the Russian proposals as a step towards decreasing tension in Europe; they are clearly hoping to put Bonn on the defensive. They are reported to be doing their best to get Mao Tse-tung to repay their visit to Peking. Such an exchange would not only demonstrate the unity of the Soviet block; the East German and the Chinese leaders are faced with similar problems on the international scene, and they might find some striking similarities between the position of the offshore islands and Berlin.

The German visitors may, however, get a fairly cool reception in Delhi. The Indian government does not much like the way Russia has brought up the Berlin problem. And Mr Nehru has just made it pretty plain that he has no intention of recognising the East German regime in the near future. His example may well be followed by other "uncommitted" states.

EUROPEAN TRADE

Back to Paris

NEXT Thursday the council of ministers of the Organisation for European Economic Co-operation will try once more to agree on provisional arrangements to alleviate the

effect on outsiders of the tariff and quota changes which the six-nation common market made on January 1st. The chronology of the European trade controversy on page 133 records how Britain and other countries outside the common market have vainly sought, in the free trade area plan, a means of averting discrimination by reducing trade barriers throughout western Europe in step with the programme of the Six. In the absence of a long-term agreement, discrimination against countries outside the common market automatically began on New Year's Day. To mitigate this, the British have made the reasonable interim proposal that the new quota relaxations between the Six should be extended to all OEEC countries on a reciprocal basis.

France's five partners seem ready to accept this proposal. The French, however, are not. Some of them do not want anything like a free trade area at all ; others will not concede the principle of non-discrimination unless the scheme is radically changed ; some even seem to feel—quite wrongly—that the common market will actually be stronger if it discriminates against outsiders. On January 1st, however, France improved the situation when it agreed on a "90 per cent liberalisation" of import quotas within OEEC ; what this means in practice was explained on page 19 of *The Economist* last week (the Six had already agreed on certain other tariff and quota concessions to the countries outside). But the French still insist that some discrimination in favour of the Six follows from the principle of the common market.

Unfortunate though any discrimination in European trade will be, it would be wrong to allow whatever precedent is set next week to deepen the breach between Britain and the Six, for the need for the resumption of long-term talks must not be forgotten. In a press interview in Rome, Sir David Eccles has suggested that the European Monetary Agreement (EMA), the new successor to the European Payments Union, may prove unworkable if there is trade discrimination between its members. This was a telling point ; but past experience suggests that it is Britain's interest to strengthen and play a leading role in such organs of "big Europe" as survive, rather than to break them up.

TOWN PLANNING

Not even Hook

THE London County Council is having a frustrating time trying to find a site on which to build a new town for 60,000 Londoners. Ever since the Government prohibited it from building more satellites in the London green belt, the LCC has searched diligently for more distant sites on which some of its vast surplus population can be housed. Some small schemes have been started, but every proposal for a major project has so far fallen foul of local opposition. To minimise objections the LCC has excluded from its search all areas of high agricultural value or of distinction, charm or beauty, as well as sites close to existing towns. From the few possibilities thus left it recently picked a site near Hook in Hampshire, 40 miles from London. Now it has found that the National Farmers' Union is objecting after all, and that the Hampshire County Council, which previously flirted with the LCC over an alternative plan for a project near Ringwood, has decided that it does not want a new town anywhere in its area.

Whether or not Hook is in fact a good site for the purpose, it is impossible on this occasion not to feel sympathy for the LCC. As a colonial power, so to speak, it is not unenlightened. It is willing to build a complete new town, and not just a housing estate. It is ready to abrogate its own control over the colony to a more local body in due course. Its standards of building and design are higher than those of most local councils, and there are many worse vandals than it scouring the countryside. It is willing to take a poor site and spend money on its rehabilitation, to the advantage of local inhabitants and local rates. All in all, its reputation as a ruthless and insensitive public authority is hardly deserved in this case. Yet the reputation is there all the same, and seems to be blocking one of the LCC's last hopes for advance. This story furnishes yet another reason for entrusting London's next new town, like the previous ones, to a public corporation rather than to a big, unpopular city 40 miles off.

BELGIAN CONGO

Congo Drumbeat

THE Belgian authorities have been quick to attribute the rioting in Leopoldville, capital of the Belgian Congo, to unrest produced by unemployment and not to political feelings. It is certainly true that the Congo has been very severely hit by the world recession, and this was bound to cause hardship, given the Belgian policy of divorcing Africans completely from the land and urbanising them when they take up industrial and commercial jobs. Industrial unemployment is a new experience there, and bitterly resented. But that hardly explains the attacks made so persistently on Europeans and European quarters, or the fact that it was at a political meeting, held in defiance of a ban, that the affray started.

It looks as if the Belgians must learn to accept such outbreaks as the normal "ingratitude" which is shown when representative political institutions are introduced. It is only a short time since the first municipal elections were held in the Congo, and since then there has been a steady growth of political parties and political discussion. Congolese Africans are now discussing what is happening in the surrounding territories, and particularly the new autonomy granted to their neighbours in French Equatorial Africa. Some Congolese leaders went to the Accra conference last month. A mission sent from Brussels to consider future relations between the Congo and Belgium has recently visited the territory. All this is bound to lead to a mental ferment.

The question is whether the Belgians are wise to try to confine a normal political expression of this ferment to municipal and tribal institutions only. It looks very much as if a much more rapid advance to self-government will have to be considered, whatever additional social services are decided on. In any case the Congo can no longer be regarded as a solid dyke between emergent African nationalism to the north and the Rhodesias and the Union to the south.

Appointments, Business and Personal notices, and other Classified Advertisements pages 182 and 183

ADEN

Limited Democracy

ON January 4th, about a third of Aden Colony's qualified voters chose twelve "moderate" members for the Aden legislative council from among over thirty "moderate" candidates. The other two-thirds were presumably frightened away from the polls by local "extremists" and Cairo broadcasts. In Aden a moderate is anyone willing, for the present, to accept the *status quo ;* an extremist is an ardent Arab nationalist, probably under the influence of Cairo and a member of the Aden Trade Union Council. The extremists presented no candidates and urged a boycott of the elections. This was surely a mistake. How much worse it would have been for the British authorities if they had had to control the actions of a majority of extremists legally elected to the council. How simple it would have been for the extremists to call out their two-thirds of the voters and get themselves elected.

Before the council starts doing business, the governor of Aden is to appoint five more members. In view of the rather one-sided election results, which have already given him a loyal majority, he might consider offering these places to a few extremists in order to broaden the representation. But if he did, would the extremists' Arab consciences allow them to accept places on the council from the governor after they had refused to accept them from the people ? It is not likely that they would, but it is unfortunate that a majority of the colony's electorate will remain unrepresented.

Among the unrepresented are the Yemenis, who were not allowed to vote at all. Indians, Pakistanis and Somalis, being British protected persons, may vote after two years' residence in the colony, but Yemenis are considered too foreign. Many Yemenis have lived in the colony for years and are model citizens and good workers. It seems a pity that they are not allowed to take part in the kind of democratic experiment that the elections offer ; nothing of the sort is tolerated in the Yemen. If they had a vote there is no fear that the Yemenis in Aden would ever cast it for the extension of the Imam's oppression to Aden or the protectorate. The seeds of democracy that are being planted on the colony's barren soil will have more chance of survival if they are cultivated by all the people living there. Representative government there may succeed as an Arab institution, but the chances of success are small if it comes to be regarded merely as a British imposition.

LETTERS

Controlled Expansion

SIR—Sir Robert Renwick and Mr Green ask in your columns what the Labour party means by "controlled expansion" of the economy, and how it could be achieved. By controlled expansion we mean full employment without inflation.

If Sir Robert and Mr Green want to know the means by which a Labour government would set about this, they only have to read the policy pamphlet "Plan for Progress", where the programme is explained with much greater precision than is usual in policy statements by political parties. (Compare some of Sir Winston Churchill's post-war efforts.)

But the methods of achieving controlled expansion have, after all, been exhaustively discussed in written and spoken economic debates throughout the past 25 years (your columns included), and should be clearly known by now to Sir Robert and Mr Green. They include budget policy, credit policy, interest rates, distribution of industry, investment policy, key controls, the development programmes of public enterprises, etc. Your correspondent, however, must not expect to be told the full details of future budgets now. The present Chancellor would hesitate to announce the contents of the next budget until April; and I fear Sir Robert and Mr Green must wait a little longer to know the details of the one after that.

It is not the means to expansion which are lacking. It is the will to use them—and it is this which distinguishes the Labour party from the present Government. Sir Robert says we almost all desire expansion. But we are not getting it. National output is dropping drearily downwards.

Meanwhile I can set one of Sir Robert's persistent nightmares happily at rest. There is no intention whatever (as you rightly point out in your article that started this correspondence) that the next Labour government should embark on the "nationalisation of the greater part of British industry".

And anyway, if Sir Robert and Mr Green don't want controlled expansion, what do they want? More stagnation? Or uncontrolled expansion, i.e. inflation?
—Yours faithfully, DOUGLAS JAY
House of Commons

Teachers' Pay

SIR—Mr Jarvis's abuse were best ignored were it not for the fact that he is wrong on every issue that he takes with you. As a dispassionate scholar I must say how unfortunate it is that the National Union of Teachers has chosen to fight its pay claim on a series of demonstrably erroneous propositions. There is no shortage of recruits; teachers by and large are better off than they have ever been; they are not worse off than similar groups ; women teachers are not hard up—and so on.

The real problems are two: merit awards, and the position of the family man. I suspect that in an expanding service the prospects of promotion for the able man are so good that the first issue is a little exaggerated ; nevertheless, pay at the top is not as high as it might be. The problem of the family, however, is really serious. It is a general one. Is it too much to hope for an impartial investigation of the best means of helping the family ? Is it by additions to pay, tax allowances or bigger state payments ?

Mr Jarvis could use his union's time and money more profitably in furthering such an investigation than in writing silly things to you.—Yours faithfully,
Oxford JOHN VAIZEY

Rhodesia's Future

SIR—Mr Howard of Umtali appears to have a very inadequate knowledge of Central African constitutional history. It was, for example, Southern Rhodesia, not Rhodesia, which was granted self-government in 1923 and it is therefore Southern Rhodesia only that is at liberty to incorporate itself in the Union of South Africa (if the Union will accept so many citizens of British stock). No British political party thinks that it has the right to stop incorporation, if that is the future desired by Southern Rhodesians.

Northern Rhodesia however is in a very different position. Mr Howard may threaten as much as he likes, but he cannot escape the fact that federation is not amalgamation, that the northern territory has never been self-governing and that it remains under the Colonial Office except for the functions taken over by the Federal Government. Any decisions therefore concerning the future of Northern Rhodesia will be made ultimately by the British Government and Parliament after appropriate consultation with the inhabitants of the territory.—Yours faithfully,
Oxford JOHN TODD

The African Revolution

Education

SIR—From your excellent survey of the political economy of Africa I miss any reference to the extent of secondary education, which is one of the keys to economic development. There is a whole range of jobs for which the qualification is a secondary education, with or without one or two years of specialised training to follow—secretaries, nurses, laboratory assistants, junior technicians, agricultural assistants, bookkeepers, printers, elementary school teachers and the like. The middle and upper ranks of business consist almost entirely of secondary school products, and they are also the backbone of public administration. If the country does not produce enough secondary school people, we have to import from abroad, paying twice the normal salary, plus about £1,000 a year in housing allowances, car allowances, leave passages to Europe every fourteen months, and so on; and this is one reason why our costs of production are so high. Alternatively we have to abandon desirable schemes. For example, to have a proper agricultural credit system we must have small credit societies all over the country. These can work satisfactorily only if there are enough people living in the village with a secondary education to keep the books and records and to check that the secretary is not falsifying the accounts. Local government also breaks down unless there are plenty of secondary educated people around to act as clerks, committee members, and watchdogs.

By back-of-the-envelope methods I have reached the conclusion that countries in our state of economic development are not self-sufficient in secondary school products until about 4 per cent of each generation is entering secondary schools. This is about the figure in Jamaica, which is just about self-sufficient. The figure for India is about 10 per cent, which is more than economies at our stage can use, and the plight of unemployed Indian secondary school products is notorious. One of the most striking differences between Africa on the one hand and Asia and the West Indies on the other hand is that while the latter are nearly self-sufficient in administrators, African administrations and firms depend on white imports even at clerical and junior technical levels. In Ghana, which is better off than most, less than 2 per cent of the generation enters secondary schools, a deficiency which we are determined to remedy at full speed. When imperial governments speak of preparing their colonies for self-government, they usually think in terms of votes and Ministers; an equally important aid would be to ensure that there are enough secondary schools to take 4 per cent of each generation, since without this the country will still be almost entirely dominated by foreigners, both in business and in government, even after it becomes independent—or else will not have much administration or business worth mentioning.

It is also a fault of new self-governing cabinets to spend excessively on primary education, while neglecting secondary education. Most African politicians try to achieve universal primary education within five years, even when they start from a base of only 20 per cent in primary schools. Apart from what this does to the budget, it plays havoc with the economy, since the finished primary school products make a bee line for the towns, and the countryside tends to be starved of labour while the towns swell with unemployed juvenile delinquents. In Africa at present we need to keep 50 per cent of the children in agriculture, but educated children will not stay in agriculture as it now is, scratching three acres with a hoe; and revolutionising agriculture to make it more attractive and more productive cannot be done in five years. Neither can we in that time provide enough jobs in the towns for the other 50 per cent who will come streaming in. The expansion of primary education should be matched to the speed at which one can create the new economy into which these educated products are to fit.

If 4 per cent are to enter secondary schools, about 50 per cent should enter primary schools, so that, allowing for wastage, one can cream off the top ten per cent from the primary schools. Another proof of the fact that India's secondary school population is at present too large is the fact that its 10 per cent in secondary schools are drawn from only 45 per cent in primary schools; so it is not surprising that every year half the candidates for the matriculation examination fail. It seems to me that the right way for education to advance in Africa—where in most territories 20 per cent or less of children are in school—is to aim first to raise primary education to 50 per cent and secondary education to 4 per cent in the first five-year programme; and then to move to 100 per cent primary education and 10 per cent secondary education over the next ten years, by which time our absorptive capacity will, we hope, be very much greater.—Yours faithfully,

Accra, Ghana W. ARTHUR LEWIS

Capital

SIR—Your survey of Africa makes two priorities clear, the continuing need of outside capital and technicians if higher standards of living are to be attained, and the great importance of acceptable political conditions. Together these add a third priority. Through what medium are outside capital and technicians best mobilised in the aftermath of colonialism? *Laisser faire* and leave each country to find them where and how it can? The Commonwealth for those in it, the common market for those in that? The western world on the one hand, the communists on the other? Or the UN? Why not the UN? The jet age in ideas forces these alternatives before us however difficult and indiscreet. Can they be harmonised or must we choose? There is no real analogy in the past for, before our age, no higher material culture dealt with a lower by negotiation.

May I suggest another priority for future study—the problem of participation and time? Not time before a country gets independence or an adult is told he is competent to vote, but time before 99 per cent of people emerging from a subsistence economy can really feel a desire and a competence to participate in the modern world. Is it lack of attention to inexorable time which has turned so many hopes of democracy to dictatorship? If so, beyond the right medium lies also the right psychological technique for participation. Can you help to elucidate that?—Yours faithfully,

Taunton ARTHUR GAITSKELL

Nationalism

SIR—I read your survey of Africa with great interest. There was one thing, however, that I found rather misleading. You commented that the first consequence of any attempt by Egypt to rally Muslim sentiment in black Africa would be to alarm and alert all non-Muslim leaders. And then presumably to illustrate the point you go on to add: "When pan-Arab, pan-Muslim feeling was tested at the polls in Zanzibar . . . the Arab party was trounced by the African nationalists."

I suppose what you meant by "the Arab party" was the Nationalist Party, of which Sheikh Ali Muhsin Barwanix was (and remains) a leader. Of what use to Sheikh Ali a pan-Arab slogan could possibly have been in an election in which he was courting African votes you did not make clear. Nor did you elucidate what reasoning could ever make an experienced politician ask the electors to "vote Muslim"—when the Opposition belonged to the same religion. I do wish journals of the calibre of *The Economist* would be more careful what they serve their readers as illustrations for some pet theory. Mr Abeid Karume (the leader of the party that won) is hardly the best example of a non-Muslim leader being "alarmed". He is himself a Muslim.

What, in fact, was tested at the Zanzibar election and failed was neither pan-Arab nor pan-Muslim feeling. It was nationalism as distinct from racialism. That was what the nationalist party stood for. It failed because the electorate was not ready for it—thanks to many years of *communal* representation in the political system. It takes time to stop thinking in terms of racial groups if for ages the people have known nothing else. An encouraging sign, however, is that in the Nationalist Party today there are more Africans than Arabs, which is as it should be since Africans predominate in the country as a whole.—Yours faithfully,

ALI AL'AMIN MAZRUI

Manchester

BOOKS

Inside Industry

Business Enterprise: *Its Growth and Organisation*

By R. S. Edwards and H. Townsend.

Macmillan. 607 pages. 60s.

No academic economist in Britain has so close yet wide-ranging an acquaintanceship among British businessmen as Professor Edwards. This has come in part from his direct experience in various industries, such as the watch industry and, more recently, the electricity supply industry, but also from the continuing series of evening seminars that, with Mr Townsend's assistance, he has run at the London School of Economics during the last ten years. At each of these an industrialist or sometimes a civil servant has presented a paper on the development and organisation of the industry or business with which he is concerned, and discussed it with an expert and critical group. More than 200 of these "case studies" are now on file at the school; the present book is partly though not wholly a systematic review of some of the lessons to be drawn from this battery of business experience.

This rich bank of data has enabled the authors to produce something rather exceptional among British studies of business, and for that matter unusual, at this level, among American. The first half of the book, concerned with the variety of firms, of their growth, and of their patterns of integration, is illustrated with a wider range of comparative examples, quoting the unpublished experience of many of Britain's best-known firms, than any recent work of comparable scholarship: for a similar wealth of industrial anecdotage one would have to go to the far slighter books of management writers such as Drucker. These "illustrations" are inherently interesting in themselves, and it would be a remarkably well-informed businessman who could say he was already familiar with them all. But here they illumine a modest but penetrating analysis of such topics as industrial location, economies of scale, and the various forms of business integration.

The second half of the book, leaning less upon the case studies (and more upon one of the authors' experience?) sets the business they have been describing within the frame of the mixed economy in which it has today to operate, considering the relations of Government with industry. It moves from governmental regulation (development area policy, price control and the like) to more direct governmental supervision or ownership (as in supervision of the steel industry, and in the nationalised industries). Its discussion in some 60 pages of policy towards the nationalised industries, which might be described as going on where the Herbert Committee left off (Professor Edwards, as present deputy chairman of the Electricity Council, has included a disclaimer dissociating his new colleagues from his previously-formed views) is perhaps the best single thing in the book. In a fourth section, looking at the future of British industry, the authors are astringent but on the whole cheerful.

The quality of this book lies essentially in its easy, good-humoured familiarity with what really goes on in business (which is not as common among applied economists as it should be). There is not the air of surprised, condescending, and rather acid discovery that sometimes mars the descriptive analysis of an economist who within a few thousand words will be advising experts how they ought to be doing their jobs. The more dogmatic among industrial economists, indeed, may complain that the authors prefer to linger among their well-laden trees instead of mapping out the wood; and certainly they lean over backwards from almost any generalisation: "We know of no principles of organisation that are both right and useful. . . ." To the impatient seeker after some "secret" of industrial organisation such relaxed eclecticism may be provoking; but this study may go a long way towards promoting good relations between businessmen and the other economists nowadays appearing in droves, with their questionnaires (and sometimes their conclusions) already prepared, on industry's doorsteps.

The Larger Lunacy

The Lunatic Republic

By Compton Mackenzie.

Chatto and Windus. 223 pages. 15s.

THE publication of "The Lunatic Republic" is timed with an appositeness suggesting that Sir Compton Mackenzie's private intelligence service (or perhaps that of the firm of Chatto and Windus) is vastly more efficient than the official organisation; a superiority at which, on past evidence, he should feel little surprise. The republic in question lies (a point which Tass may shortly verify) on the far side of the Moon; it was established by the few survivors of that Abominable War which, waged with nuclear weapons between Lunaria and Lunatia some 3,000 years ago, reduced the Moon's visible side (including all of Lunaria) to the familiar rubble of craters. Its first human visitors arrived in 1997, in a rocket launched by the now all-powerful Celestial Chinese Republic. A conscripted English fellow-traveller of the Chinese scientist Tin Pan sets down his impressions of the Lunatic Way of Life and what he understands of Lunatic history.

The formula is, in fact, a familiar one: a Utopia or anti-Utopia, discovered by whatever device, preferably topical, may tickle the author's fancy, and presented, in any medium from the solemn to the farcical, as a mirror for social criticism or social ideals. Here its use falls a longish way short of complete success. This is partly because the author has not done his homework. There should be some logic, even a lunatic logic, in science fiction. If the amiable blue-coloured Lunamanians (all identically resembling Tweedledum and Tweedledee) have managed the technical miracles ascribed to them—an artificial atmosphere and climate, an artificial alternation of day and night, controlled gravity, and the even unlikelier biological achievements of abolishing excretion and entirely dispensing with water—then they should not be baffled by a shortage of raw material for clothes or books, or cultivate their single food crop by ordinary manual labour. Nor, for that matter, should they have progressed so ineffectively towards the Brave New World method of reproduction as to need specially bred and segregated "*drunes*" to perpetuate, albeit without personal contact, the Lunamanian race. The know-nothing attitude of the untechnically minded narrator serves as a colourable excuse for glossing over details; but a minimum of coherence, a minimum of continuity with existing scientific trends, is wanted if the supposed social results are themselves to seem convincing projections.

There is failure, too, on Sir Compton's own ground, that of human psychology. The narrator is not an observer of today, drawing on an immediately recognisable set of tastes, values and experiences; he is a product of the European welfare state of 1997, itself a barely adumbrated, greyish anti-Utopia in its own right. As such, he makes an unsatisfactory mouthpiece; he lacks a voice of his own, and he takes most of the resonance out of that of his creator. One wishes, vainly, that Tin Pan's fellow-traveller had been Ben Nevis or even Paul Waggett.

But there are delights as well as disappointments. "The Lunatic Republic" is extremely funny. (Only wide quotation would show how skilfully its author uses the elementary device of a not-quite-basic English dialogue—with such variants as "mug" and "wug" for "man" and "woman"—for the hilarious deflation of human solemnities.) And at the level of serious intention something at least is achieved. The Lunamanians are in many ways most admirable creatures. They are perfectly public-spirited and honest; cheating, lying and shirking are inconceivable to them. They are incapable of unkindness, meanness or spite. They have scrupulously good manners. They are hospitable, considerate and benevolent. And Sir Compton Mackenzie makes it perfectly credible that with all these good qualities they should have created a quite appalling society, in which joy is as absent as pain, love as

alien as hate, without creation, imagination, adventure or variety; a voluntarily regimented ant-hill whose motto is "Sameness is Strength." It is not quite clear whether the warning is chiefly against the consequences of "Abominable War"—there is an attempt, weakened by that lack of homework, to show that only thus could society reconstitute itself and survive—or against those of secular utilitarianism, the exclusive pursuit of the Greatest Happiness of the Greatest Number. Peace; social justice; freedom from want, hunger and disease; total solidarity; here they are, at a price. The price is not even paid in terms of tyranny or hypocritical submission; conformity is built in or rather bred in. Not very profound, not at all scientific, a squib rather than a rocket, "The Lunatic Republic" is still a salutary tract for the times.

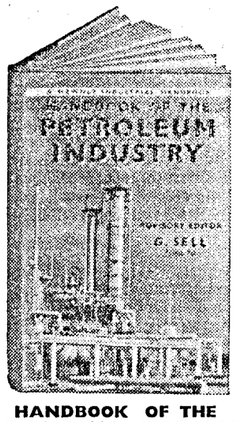
My Great and Good Friend

Samuel Johnson: *Diaries, Prayers and Annals*

Edited by E. L. McAdam, with Donald and Mary Hyde. The Yale Edition of the Works of Samuel Johnson, Vol. I: *Yale University Press.* London: *Oxford University Press.* 461 pages. 80s.

BIOGRAPHERS can fare better than their subjects: Boswell's "Life" has been splendidly edited and a whole factory of scholars has been at work on his journals for twenty-five years, but there is no complete edition of Johnson. Now the gap is to be filled, and the Yale tradition of eighteenth century studies gives promise that the edition will be definitive.

To this, Volume I is in effect a prologue, for it includes all Johnson's fragments of personal record still extant (many of them new) intermingled in chronological order, since the manuscripts are incomplete yet overlapping. The system produces maximum readability; but much of the text is evidently scholar's meat. Details of purges are not manna to the part-time Johnsonian, nor are the telegraphic entries comprehensible even to the initiate; the text is thus underpinned by a consecutive narrative, deftly weaving the usual plethora of notes and translations into a painless pattern.



Some of the diary material is of course trivial; but it cannot be read without a profound impression of Johnson's strength of character: this, one says, is a big man, though in his jottings he hardly ever says big things. Only the Prayers are in themselves great literature; yet the diaries, too, show a man of extraordinary fortitude of spirit, infinitely troubled by malaise of body and scruple of conscience, a man whose piety and native courage fought a constant and eventually winning battle with his questioning mind and fear of death. There are moving passages: "Perhaps Tetty is now praying for me. God, help me. We were married almost seventeen years, and have now been parted thirty." And many items reveal how hard, and often organisedly, Johnson could work.

The picture is personal and intimate; Johnson's recreation for passing a tedious night, we learn, was to translate Boethius into Greek and the Greek Anthology into Latin. He was a generous man, whose frequent charities fill a full column of the excellent index, and had an inquiring mind and an interest in scientific fact that led him to remark after seeing wire drawn "I have enlarged my notions." And he was well travelled. The tour in the Hebrides has been recognised as a feat for a man of 64 at a time when very few Scotsmen had ever been there; but he had also toured in Wales and France and had seen all the English cathedrals except Carlisle, which few of the petrol-borne can boast.

Of the growth and design of Johnson's output, there is less record. Writing was his work, to be done "doggedly" and with effort, and when the work grew hardest his pen was least likely to stray into the penniless paths of his diary: the gruelling labours on the Dictionary, for example, are scarcely mentioned. Sayings in the great tradition are also few; never much given to monologue, he required a conversational cut-and-thrust to produce the profoundly sensible observations, the great hammer strokes, which Boswell recorded. Wrote up too, perhaps: certainly it is Johnson's kindness and strong piety rather than his ruthless destruction of fools that emerge here—and entitle him to Boswell's epitaph: "My great and good friend."

The third volume in this valuable new series—

NEWNES
INDUSTRIAL HANDBOOKS

HANDBOOK OF THE PETROLEUM INDUSTRY
Edited by G. Sell, F.Inst.Pet. & H. A. Dossett
A comprehensive survey either from the commercial or technical aspect. The historical development of the industry and geology of oil fields is covered as well as exploration methods; drilling; uses and prospects, resources and locations; distribution; chemicals from petroleum; its uses as a fuel and a lubricant; careers, etc.
A glossary of trade and technical terms. Illustrated in line and half-tone with charts showing world sources and companies.
25s. net.

The Executive Council

The Cabinet in the Commonwealth: *Post-War Developments in Africa, the West Indies and South-East Asia*

By H. V. Wiseman.
Stevens. 364 pages. £2 10s.

LIKE too many books nowadays, this one has a misleading title redeemed by a long accurate sub-title. The publisher may have thought the book would sell better if its title suggested a broader scope than it actually had. At all events, Dr Wiseman's book is not about the Cabinet in the Commonwealth. If it were, it would be concerned with the differences in Cabinet structure and procedures between the United Kingdom and the other member-nations of the Commonwealth; it would show how the Cabinet system has been adapted to the conditions of countries such as Canada, Australia, India and South Africa. In fact, however, it is about recent colonial developments, none of which, except in the Gold Coast and Malaya, has led to a full-blooded Cabinet system. It might justly have been called "The Movement Towards Responsible Government in British Colonies, 1946-1956." This might not have caught so many eyes, but it would certainly have caused less trouble in booklists and libraries.

Dr Wiseman has, as he says, tried to do for the colonial Executive Council what Mr Martin Wight did for the Legislative Council; but the result is not the same. Mr Wight's book was magisterial in its execution and bold in its generalisations. This is fussy and diffuse. The evidence is so dispersed as to make it hard for the reader to know what happened in which colony: such complicated stories as those of British Guiana and Nigeria are told in four or five separate sections, and some stories (for instance, Jamaica) are not told at all, only hinted at. The author has taken his examples from so many separate territories that only a reader already familiar with postwar colonial changes could be expected to follow him. Also, there is far too much quotation. Dr Wiseman quotes for facts (which is legitimate), but also for opinions (which soon becomes tiresome). We do not want to know what everyone else who has written about the subject thinks about it; we want to know what Dr Wiseman thinks about it. It is hard to censure a man who quotes so often and with such approval from *The Economist;* but less from the commonplace book, and more from his own reflections, would have served him better.

Nevertheless, the book is timely. It shows what special difficulties stand in the way of turning a crown colony constitution into one embodying responsible government. The difficult people may include the politicians, the officials, the journalists, the public and the Governor. It is likely that none of these will be accustomed to the restraints and understandings of responsible government, and that all will make mistakes in the awkward transitional stage before self-government. The politicians are inexperienced and suspicious; the officials are doubtful and sensitive; the press does not know what is going on; the administrative structure may have to be reshaped if the new "Ministers" are to have anything to do; and the Governor has to turn himself from a near-despot (who is also the Speaker of a near-Parliament) into a constitutional monarch. All these processes can be seen in operation in "The Cabinet in the Commonwealth," if the reader keeps his wits about him.

Rural Economics

The Country Craftsman: *A Study of Some Rural Crafts and the Rural Industries Organisation in England*

By W. M. Williams.
Routledge and Kegan Paul. 214 pages. 25s.

THIS is a book for the specialist, who will be fascinated by the array of facts that the author has amassed from normally inaccessible sources, but who will also be irritated by minor misstatements and imprecise conclusions.

Mr Williams explains the organisation set up to assist rural industries in England and Wales and describes in detail the role of the Development Commission, the Rural Industries Bureau, the National Council of Social Service, the Rural Community Councils and the all-important County Organisers.

On the basis of field work in Devon, Cheshire, Shropshire and Staffordshire, he describes saddlery, thatching, farriery, blacksmithing and agricultural engineering, and, more briefly, pottery, weaving and furniture making. All this is interspersed with rustic quotations from conversations with craftsmen. The reader may wonder why brick-making and boat-building, also on the list of crafts to be assisted by the rural industries organisation, are omitted, and may also inquire why Mr Williams does not ask why Devon is supposed to have 1,500 workshops, while Staffordshire, Cheshire and Shropshire have only 400. There is a very good chapter on "The Craftsman in Business."

The last two chapters are a critical analysis of the activities of the rural industries organisation and suggestions for the future. Perhaps one sentence sums up Mr Williams's criticism: "Ambiguity and vagueness are the lubricants that make the rural industries organisation run smoothly." This in fact sounds wholly admirable and very English and is the case wherever a central policy is administered by independent local bodies, in education and town and country planning as much as in rural industries. One is left wondering whether the author would prefer to go back to conditions of fifty or one hundred years ago or whether he approves of modernisation; he blames the Rural Industries Bureau for pulling both ways. One would also like to know how many of Mr Williams's policy proposals were in fact in the minds of the officials he talked to and may since have been carried out; he describes the situation only up to the end of 1955. This book should be followed (as is strongly suggested by the author) by a great deal of further research and investigation.

Antiquarian History

Medieval England: *A New Edition rewritten and revised, two volumes*

Edited by A. L. Poole.
Oxford University Press. 601 pages in all. 70s.

THIS book has a curious history. It first appeared in 1902 as Barnard's "Companion to English History," edited by an antiquary whose tastes were reflected in the large amount of space devoted to architecture, costume and heraldry. It was designed to satisfy a popular interest in these and other manifestations of medieval life and it was advertised as being suitable for school certificate candidates, university extension lectures, "the National Home Reading Union, forms in the First-grade Public Schools and many University and College courses in Great Britain, the Colonies and the United States of America." It was one of many co-operative works of historical popularisation at that time, of which the best (though now almost forgotten) was Traill's "Social England."

Like Traill's more ambitious work it also would doubtless have been forgotten if it had not been issued by a powerful university press, which could enlist the services of editors like H. W. C. Davis and Dr Poole, with their band of distinguished contributors, for later editions. The work was reissued with very many improvements in 1922, and now it appears once more greatly enlarged: the 372 pages of the original edition have nearly doubled their number, and instead of 97 plates there are now 140 plates with over a hundred illustrations in the text. The reader is at once struck by the extreme handsomeness of the production. The paper and print are of outstanding quality. The same may be said of the illustrations, with the single unlucky exception of the fourteenth century Gough map which looks like the photograph of a diseased organism. The only substantial cause for regret is that these improvements have entailed a huge increase in price from the original 8s. 6d., which will put the work out of the reach of those for whom it was originally intended: a cheap edition of a work with so wide an appeal is greatly to be desired.

Although the whole work has been rewritten by leading medieval scholars, the plan is still that of the original editor. The main emphasis is antiquarian rather than strictly historical: the chapters are chiefly concerned with the visual surface of things rather than the development of society or institutions. There are, however, some changes that have the effect of making the work more of a "history" and less of a "companion to history." Dr Hoskins's chapter on the English landscape, Professor Knowles's sketch of the development of the church, and Dr Crombie's account of medieval science are more systematic in their approach than anything in the earlier editions. But in general the reader is likely to continue to go to this work as a mine of information on armour, architecture, heraldry and other physical objects distinctively medieval. To anyone who is interested in these things, without being expert, it is full of absorbing reading.

These subjects have indeed not the hold on the attention of historically minded people which they once had: to this extent the work, though meticulously brought up to date, is itself a period piece. It is hard to think that, as it now appears, it can ever be greatly improved. Already the antiquarian framework is strained to bursting point. Subjects such as heraldry are now so thoroughly integrated with social and political history, largely through the efforts of Dr A. R. Wagner who contributes here a new and authoritative account of the subject, that it can no longer be confined within the few pages that once sufficed to explain the main points of emblazonry. Even with the greatly extended length it has been impossible to preserve everything of value in the old edition, and one must regret the disappearance of A. G. Little's masterly account of the Friars. On balance, however, the advantage is heavily on the side of the new edition, and it may well be that this will be the last, as it is also the best, edition of an old favourite.

University Dilemma

Technology and the Academics: *An Essay on Universities and the Scientific Revolution*

By Eric Ashby.
Macmillan. 118 pages. 15s.

SIR ERIC ASHBY'S Ballard-Mathews lectures, developed and deepened in book form, make a trenchant and constructive contribution to the dilemma facing the universities, which are under pressure to turn out more technologists as the crying need—the *sine qua non* of survival—of the country that pays for them. Sir Eric reviews the strange history of the universities in Britain, their decay from the sixteenth century to the mid-nineteenth, their sudden renaissance after science had largely passed them by, their rapid adaptation soon after the appearance of Charles Darwin's "Origin of Species," and their present state, which, Sir Eric concludes, is truer to the medieval idea of a university than at any time since the Middle Ages. But his main parallel is between the universities in the days when they were trying to swallow science without losing independence, culture and the education of gentlemen to be statesmen, and the present time when they are trying to swallow technology without losing their power to transmit a liberal education and keep alive non-practical ends.

It is a suggestive parallel, and Sir Eric makes it a hopeful one. His solution is

the well-worn one of making specialised studies into a vehicle of liberal education; and he does not hesitate to show how the curriculum for a degree in brewing could successfully lead a man to consider life steadily, as well as whole, through the contacts of his utilitarian course with basic science, social science, economics, ethics, philosophy and religion. Whether in practice the student to whom the course is a passport to a managership at £1,250 a year, and with not a spark of curiosity or speculation in his turgid make-up, will be prepared to be so diverted is another matter—certainly one which brings in question the quality of teachers as well as that of students. But the direction is the right and natural one, and Sir Eric does not fail to make the point against the classical men that the classics and even the "arts" man is really the specialist; it is the technologist (even more than the pure scientist) who can be shown to have been "exposed" to the whole range of humane studies. Of course, this is not quite fair; the good arts man, knowing, admittedly, little about science, is yet usually widely informed over a far wider range of humanistic and aesthetic studies than is the average technologist, who forgets his school history and school musical appreciation as quickly as he can and embraces his ideal of himself as a no-nonsense "practical" man. But the big-minded scientist, however rare, is a far more rounded character, and far less a specialist, than even the first rate arts man.

But all this leaves unresolved the university dilemma: how to civilise the technologist, and how to give the arts student some science. Sir Eric's views on both problems are well worth considering—and are, indeed, being considered in most universities in the little time left to professors to consider anything except administration and new building. This point was left out by Sir Eric; but an essay cannot be a book on university problems, draft syllabuses and all, and busy academics—and others—should be grateful to him for so skilfully bringing the subject down to bedrock in an eminently readable presentation.

Colonial Anachronism

Under Chartered Company Rule:
North Borneo, 1881-1946

By K. G. Tregonning.
Oxford University Press. 250 pages. 30s.

In these days, when colonialism in its non-pejorative sense continues to be misunderstood west of the Atlantic and is distorted and traduced behind the Iron Curtain and south-east of the Mediterranean, it is useful for an example of so beneficent a colonial administration as that of British North Borneo under its Chartered Company to be presented to the general reader in an objective and documented study. It is particularly so where the administration in question was conducted by a form of government even then held by some to be an anachronism. The British North Borneo (Chartered) Company exercised sovereignty over the north-east corner of the world's third largest island effectively for sixty, in theory for sixty-five, years from 1881 to 1946, and laid good, solid foundations for the happiness and prosperity of the new colony's native peoples.

Not that the company's early policy was uniformly sound. Founded largely through the vision and persistence of an enterprising young London business man who was to become Sir Alfred Dent, it began wisely by borrowing from the British colonial administrations in the Far East experienced civil servants as governors and administrators of the new territory. Then W. C. Cowie, an ambitious, obstinate and autocratic man, who had been the local Borneo manager of a small Singapore firm, nearly ruined the infant state, when he became managing director and ultimately chairman of the Chartered Company, by insisting on governing it himself from London. In pursuit of this determination he replaced the trained and independent-minded seconded civil servants by servile creatures of his own with neither administrative nor local experience. The great Sir Hugh Clifford, perforce called in from Malaya in 1900 to clean up the resultant mess, resigned in disgust at Cowie's refusal to listen to him. The territory's progress was blocked until Cowie's death in 1910.

This past history has been painstakingly gathered together by the author from company minute books, Colonial Office despatches and other original records not easily accessible, as an enlightening prelude to the story of later development. After the first world war the company made repeated efforts to induce successive British administrations to assume political control of the territory by annexation. These proposals were consistently declined until the Japanese devastation of the country during the second world war made its postwar rehabilitation a task beyond the power of the company to undertake. The Chartered Company never returned to North Borneo after 1941 although the legal transfer of sovereignty to the British crown was not effected until 1946.

Mr Tregonning has also some good specialised chapters on native administration, labour, health, education, economics and the abolition of slavery. He shows clearly that the company's local administration, after it was helped and no longer fettered by London, built well for the future. This book is a valuable contribution to British colonial history in the Far East.

Called to the Bar

Brief to Counsel

By Henry Cecil.
Michael Joseph. 190 pages. 12s. 6d.

All barristers know that a brief to counsel does not necessarily contain all the information he needs. Mr Cecil has produced one that most certainly does. In a comparatively short space he provides for the young man contemplating the Bar as a profession (or for his parents) a complete, if succinct, account of how to get there and how to get on when he does. This book gives a shrewd and witty explanation of what Mr Justice Devlin in a foreword describes as "the mechanics of a great profession."

By what was, no doubt, a coincidence, one of Mr Cecil's most important suggestions was put into effect within a fortnight of the publication of his book. He points out that the Bar is the only profession in which a person is treated as qualified to carry on business without having seen it conducted or knowing, from a practical point of view, how it is done. He, therefore, suggests that it should be made compulsory, before a new barrister be allowed to appear in court, that he should have read for a year as a pupil in the chambers of a practising barrister. At the beginning of October the Inns of Court issued regulations laying down this very condition for those seeking in future to practise in the English courts.

A danger Mr Cecil does not mention is that of excessive specialisation. Work in such fields as income tax, rating and Town and Country Planning tends to be concentrated in very few hands. This may be the inevitable result of the volume and complexity of modern legislation; but it means that the practitioner with a wide and general knowledge of the law as a whole, whose training and career Mr Cecil describes so admirably, is in some danger of disappearing. If this process continues, it may eventually affect the quality of the Bench, since the man who has been a specialist practitioner will be ill-fitted to cope with the diversity of work, civil and criminal, which the High Court Judge, particularly in the Queen's Bench Division, has to try.

In his description of the life of the barrister Mr Cecil employs an obviously wide experience and a humour which readers of his legal novels have learned to expect and appreciate. Some of the imaginary dialogues between the white-wigged junior and the wily solicitor's clerk or the testy judge are highly instructive. The book is generously illustrated with drawings by Mr Edward Ardizzone, whose wonderful sense of line and character captures the true atmosphere of the Temple and the courts.

Sleep your way to Paris

You'll arrive early next morning when you travel by the through sleeping car train from Victoria Station, London. Remember there's a similar service to Brussels.

NIGHT FERRY

THE REGULAR SERVICE YOU CAN RELY ON

SOUTHERN RAILWAYS

For further information please apply to principal travel agents or the Continental Enquiry Office, Victoria Station, London, S.W.1.

What will you drink?

The answer to that question can be embarrassing when you are entertaining. It is not easy to select wines, spirits and liqueurs that you know will please the man you have not met before.

The anticipation of the awkward choice is part of our work, for we help a large number of City firms to choose, that trying entertainment *contretemps* may be avoided and that guests of all types may be pleased.

At our cellars you can choose and taste, with an expert in City entertainment at your elbow to suggest and advise, if you wish. Alternatively, he can visit you. Either way, he can be very helpful.

AMERICAN SURVEY

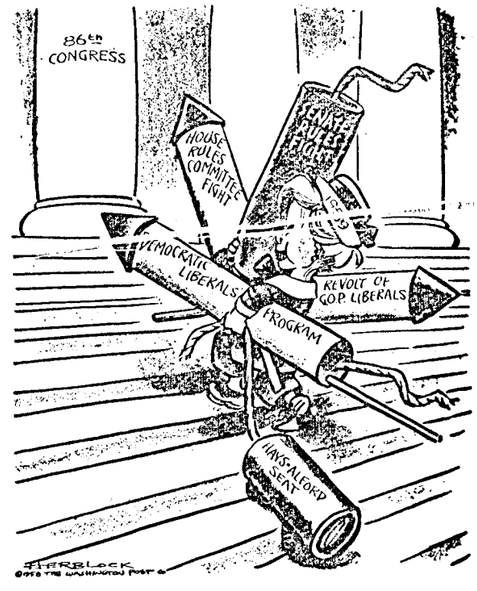
AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Liberal Fireworks Fizzle Out

WASHINGTON, DC

DURING the next two years, in the Eighty-sixth Congress which began its first session this week, the power of Mr Rayburn, the venerable Speaker of the House and of Senator Lyndon Johnson, his *protégé* and fellow Texan who leads the majority in the Senate, is likely to reach its highest point. In the past four years the two Democratic leaders, by their superior capacity for legislative manœuvre, have controlled much of the work of Congress although they had only thin, almost nominal majorities at their disposal. Now they have ample elbow-room in which to operate; their party holds nearly two-thirds of the seats in each House, the largest partisan majority in twenty years. After 1960, however, the congressional leaders are unlikely to be given as free a hand as they enjoy at present. Although Mr Eisenhower is not without political resource, as the early skirmishing over the new Budget has already made clear, his successor, whichever party he belongs to, will hardly exercise the powers of the Presidency with the same self-effacing restraint.

The objective of Mr Rayburn and Senator Johnson in their new political affluence remains the same as it was in the relative austerity of the past two Congresses. That aim is to keep the Democrats on a centre course: maintaining bipartisanship in foreign policy; carrying forward the party's tradition of liberalism on questions involving social welfare and natural resources; easing the devisive issue of civil rights for Negroes; and, above all, proving to the "swing voters" that the Democrats can provide moderate, responsible government. The congressional leaders contend that their middle of the road policy is responsible for the party's successes in the congressional elections.



The liberals in the party have long disputed this. They attribute the Democrats' successes in November primarily to the aggressiveness of men like Senator Douglas of Illinois and Senator Humphrey of Minnesota who developed clear-cut challenges to the Eisenhower Administration on economic issues. More aggressiveness and not more moderation, the progressives assert, is the way to a presidential victory in 1960. This divergence also extends to foreign policy, or rather to the Democratic party's relations with the Administration's foreign policy makers, chiefly Mr Dulles. It was notable, for example, that last month while Senator Johnson was amicably serving as the Administration's spokesman at the United Nations on the problems of outer space, Senator Clark of Pennsylvania, one of the leaders of the liberal block, was angrily urging that Mr Dulles should be ousted.

Although the outcome of the election served to increase substantially the strength of the northern liberals, they are not strong enough to sustain any determined challenge to the party's entrenched congressional leaders. Mr Rayburn made that unmistakably clear on the House side before the session even began when he snuffed out an attempt to reduce the power of the House Rules Committee. This committee, under the leadership of Representative Howard Smith of Virginia, an arch-conservative, and under the control of a bipartisan conservative coalition, has often been the graveyard of progressive legislation. This is because no measure can be moved to the floor for action until it has been given a legislative "rule" by the Rules Committee.

The liberals first favoured the restoration of the so-called "21-day rule" which provides that a Bill can be called up for action if the Rules Committee has not acted on it after twenty-one days. This rule was adopted in the Eighty-first Congress of 1949-50 with strong backing from President Truman, but the bipartisan conservative coalition was able to repeal it in 1951. The alternative proposal favoured by the liberals was simply to add one northern Democrat to the Rules Committee, widening its Democratic majority from 8 to 4 to 9 to 3. This change would have ensured a liberal majority for all domestic legislation except civil rights measures, on which even progressives from the South defect.

Mr Rayburn rejected both changes, explaining that he disliked the 21-day rule because it interfered with the orderly routine of the House and that he could not change the parties' balance on the committee because he had a gentleman's agreement with Mr Martin of Massachusetts, then still the Republican leader, not to do so. After Mr Rayburn laid down this line, the liberals abandoned

"Might As Well Start Things Off With A Bang"

the struggle. In effect they accepted Mr Rayburn's contention that it would be more effective to rely upon his personal influence with the often difficult Mr Smith than to alter the rules or routines of the House.

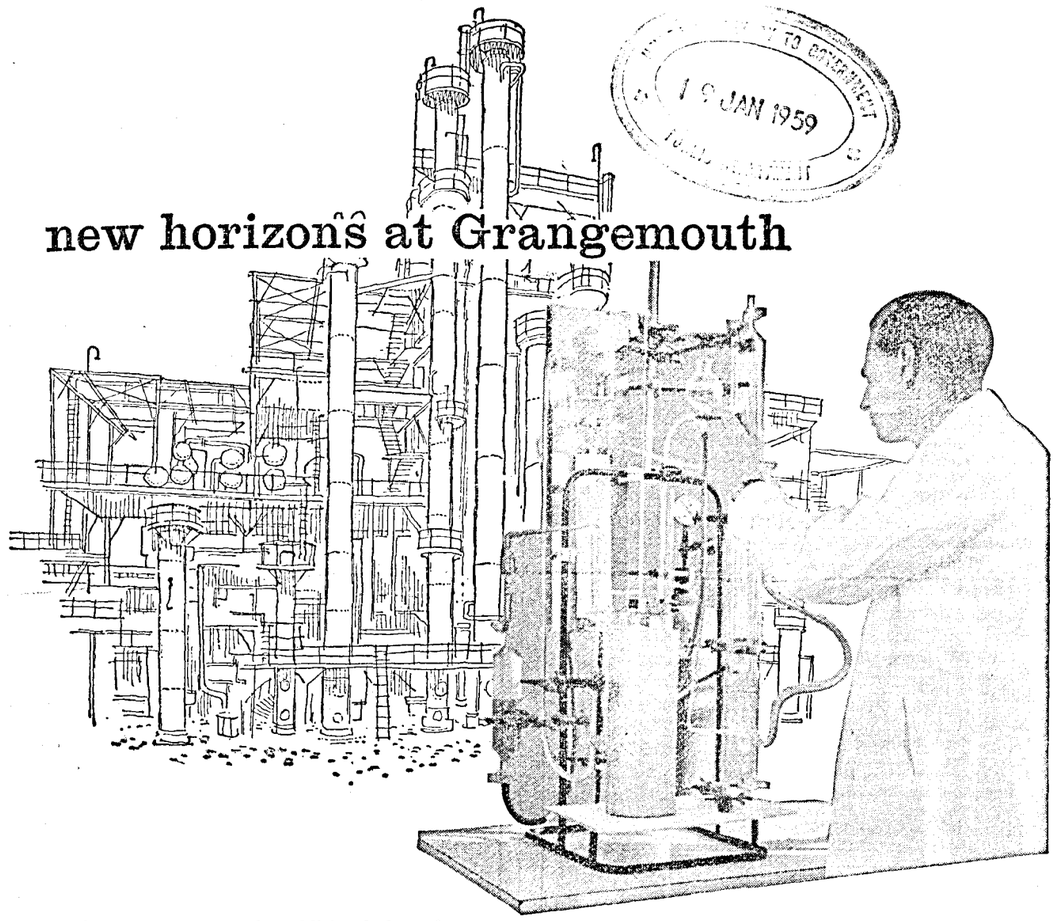
By sheer weight of numbers, however, the newly elected Democrats, most of whom are of the liberal persuasion, are sure to have a leavening influence within the committees of the House. They will strengthen the existing progressive majorities on the committees dealing with labour and education, banking and currency, and taxes and reciprocal trade. The addition of some individuals of exceptional experience and ability will also make a difference. Mr Chester Bowles, for example, a former Ambassador to India, who is a new member from Connecticut, is expected to brighten up the House Foreign Affairs Committee.

The gain of thirteen seats by the Democrats in the Senate, plus the two Democrats from newly admitted Alaska, will have a less pronounced effect on the temper of the upper House. Only about half of the newcomers are aggressive liberals of the Douglas-Humphrey-Clark school ; the other half consists of middle-of-the-roaders whom Senator Johnson will have no difficulty in fitting into his highly personal system of political power.

The changes in the Republican leaders of the House and the Senate suggest that there will be a sharper partisan tone to debates during the next two years. In place of Representative Martin of Massachusetts, the amiable stalwart who had reigned over them for twenty years, the House Republicans in a surprise move elected Representative Halleck of Indiana, a younger, more ambitious and more aggressive figure, by a margin of 74 to 70 on a secret ballot. The change had no ideological significance, both men being routine conservatives ; it reflected instead the restlessness of the minority after its repeated defeats and a desire for a leader who would develop a more clear-cut partisan record. Mr Martin's personal friendship with Mr Rayburn and his predilection for settling controversies by private arrangement had aroused the resentment of many members of his party.

In the Senate the election of Mr Dirksen of Illinois by a vote of 20 to 14 over Mr Cooper of Kentucky was an anticipated victory for the old guard. Senator Dirksen, who has shown himself to be politically flexible, may well prove a more responsive agent of the Administration than his predecessor, stubborn Mr Knowland, but he is certain, in any event, to put on more impressive—if unavailing—forensic displays of indignation and partisan outrage.

THE big imponderables of the new Congress are the foreign situation and the problem of racial segregation. Any major crisis with the Russians or any prolonged deterioration in world affairs which increased the likelihood of war would transform the congressional scene and push all normal political calculations to one side. The racial issue arouses profound emotions ; and, once the unavoidable opening day clash in the Senate over the filibuster is past, all the artfulness of the Democratic leaders in Congress will be directed toward mollifying feelings on this subject and keeping it in the background. If racial problems should nevertheless cause an explosion of rancorous public dispute, there always exists the possibility that the thinly concealed antagonisms between North and South within the Democratic party will bring about sharp political changes that cannot now be foreseen.



Leaving aside these two contingencies, the liberal revolution of last November is probably going to have its biggest impact on the new Congress through its effect on the attitudes of the Democratic party's congressional leaders. Mr Rayburn was, after all, one of the legislative architects of Franklin Roosevelt's New Deal and Senator Johnson was one of that President's most ardent supporters. While both have grown more conservative with the passage of the years, they are by no means insensible to pressures from the left. Legislative measures brought forth with their official blessing are likely to be more ambitious in scope and more progressive in spirit than those introduced in the Congresses of the recent past. This will not wholly satisfy the liberal block, but most of its members most of the time are likely to act in accord with Speaker Rayburn's perennial advice to new members : " The way to get along is to go along."

Urgency in the Hemisphere

IT was only chance that the successful revolt against General Batista coincided with Dr Milton Eisenhower's latest report to his brother on Latin America, but the Cuban sensation dramatises Dr Eisenhower's contention that the whole continent is in a state of ferment and that his proposals, first made in 1953, have now become urgent. It also underlines his endorsement of Vice President Nixon's suggestion that the United States should offer a hearty embrace to democratic leaders in the hemisphere and only a formal handshake to dictators. Dr Eisenhower recommends various other steps for fostering better understanding of the United States in Latin America, mainly by making more information available, and the creation of a high-level governmental council in Washington which would demonstrate the importance which the United States attaches to co-operation among the American republics.

On the economic side progress is already being made towards setting up the inter-American financial institutions which Dr Eisenhower believes should advise on development plans as well as provide credit for them. Moreover, the American government has itself stepped up its lending to Latin America substantially during the past year. Practically half the credits authorised by the Export-Import Bank in 1958 were to Latin American countries, which received $477 million. And the year closed with a spectacular combined loan by international, governmental and private agencies, $329 million, the largest amount of aid ever provided for a single Latin American country, to reward Argentina for its sincere efforts to put its economy in order. This, it is hoped, will spur other countries to similar austerity in the hope of similar assistance ; economic reform would also make them more attractive to the private interests which have already provided 80 per cent of the United States capital invested in Latin America.

Dr Eisenhower is prepared for the United States to co-operate with groups studying the problems of surplus commodities, is it has already done in the case of coffee, but he does not believe it should enter into any agreements on price stabilisation. He recognises, with some understandable embarrassment, that the United States, in disposing of its own agricultural surpluses—wheat and cotton, for example—and in protecting its own producers

During the next twelve months, additional plants for the production of petroleum chemicals will add their dramatic silhouettes to the changing Grangemouth skyline. The rapidly expanding demands of British industry for the growing range of petroleum chemicals produced by British Hydrocarbon Chemicals have amply justified all the heavy investments in new processes and plant. By 1959, over £30m. will have been spent at the 400-acre Grangemouth site, where the production of chemicals from oil has already become one of Scotland's leading industries. With the continued technical backing of its two parent companies —The British Petroleum Company and The Distillers Company—and the increasing use of petroleum chemicals throughout industry as a whole, British Hydrocarbon Chemicals is playing its part in the ever widening horizons of this new Elizabethan age.

B.H.C. Products.....and some of their end uses

Ethylene	Styrene monomer and Polystyrene (Synthetic rubbers and rubber-like plastics; electrical equipment; toys; piping). Polyethylene.
Ethyl Alcohol	Raw materials for textiles; synthetic fibres; plastics; paper; leather and food processing industries; pharmaceuticals and fine chemicals. Solvent for industrial finishes. Methylated spirits.
Diethyl Ether	Solvent for extraction of oils and alkaloids in the pharmaceutical industry. Anaesthetics.
Isopropyl Alcohol	Acetone (solvent for rayon, explosives, lacquers, aircraft dopes, and adhesives). Intermediate for pharmaceuticals and other fine chemicals.
Tetrapropylene	Household and industrial synthetic detergents.
Butadiene	Synthetic rubbers and rubber-like plastics. Boot and shoe soles.
***Polyethylene**	Sheet, film and monofilaments; household, medical and laboratory articles.
***Cumene/Phenol**	Phenol (resins; insecticides; herbicides; synthetic fibres; lubricating oil additives). Intermediate for dye-stuffs, pharmaceuticals and other fine chemicals.

of oil and metals, has not always acted in full accordance with its declared trade policy. Developments of this type have perhaps had a more destructive effect on American relations with the northern part of the hemisphere than with the southern and have been, as so often before, one of the main topics of this week's economic discussions in Ottawa between Canadian and United States cabinet ministers. While some progress is said to have been made in dealing with these and other difficulties no final solutions seem to have been reached. It would be surprising if they had.

Rockefeller's Taxing Role

MR NELSON ROCKEFELLER, who proved in November, by a margin of 570,000 votes, that he was an energetic and most attractive Republican candidate, was sworn in as Governor of New York State last week and now has his chance to display more solid merits. As the only prominent member of his party to win a great victory in a Democratic year, he will necessarily—and cheerfully—be measured against the responsibilities of an even more exalted office. For Mr Rockefeller now governs a state which has provided four of the country's Presidents and nine of its presidential candidates; moreover, although he insists tactfully on wearing all three political labels—conservative, liberal and progressive—he stands with the modern wing of his party, not with the old guard which was so decisively repudiated in November. The new Governor devoted the lion's share of his inaugural address to an enlightened, if very general, discussion of international and national issues. Clearly Mr Rockefeller does not want to be confined to the housekeeping problems of any state—even if it is the Empire State and the wealthiest of all.

Yet New York presents a real challenge to any Republican who hopes to combine progressive social policies with financial responsibility, as Mr Rockefeller does and as President Eisenhower once set out to do. The state faces a $220 million deficit in the financial year, which begins in April, because of falling revenues during the recession and because increases in certain state programmes are mandatory. It is too late now to put up the taxes on income earned in 1958, which fall due in April. But Mr Rockefeller has gone to great pains to make it quite clear that more money must be found, not just by raising the taxes on petrol and cigarettes, which would bring in about $100 million in a full year, but possibly also by raising taxes on income and instituting a "pay-as-you-earn" system.

Even if the budget can be balanced, on paper, by February 1st, the economic growth which the Governor wants will have to be swift to provide the revenues to support the better education, more social welfare, and greater cultural opportunities which he has promised New Yorkers. The state educational authorities already are asking for an additional $123 million for next year. Some economies have already been put into effect; Mr Rockefeller's first appointments have been promising; and he plans a study of the executive organisation of the state to achieve greater efficiency. These steps are unlikely to bear a great harvest in the year and a half before the Republican presidential convention. But the energy and resolution with which Mr Rockefeller tackles his first elective job may be great enough to impress the delegates.

Institutions Go to Market

FROM A CORRESPONDENT IN NEW YORK

INSTITUTIONAL investors—mutual funds, life insurance companies, savings banks and pension funds and individual trusts managed by banks—have always been a significant influence in the American stock market, but in 1958 they were clearly a dominant one. The share of the issues listed on the New York Stock Exchange which is held by institutions has risen from a value of $9.5 billion—or 12.4 per cent of the total outstanding—in 1949 to an estimated $40 billion—over 16 per cent of the total—at the end of 1958. These figures do not include equities in those individual trusts which are institutional in character; if these are added, the 1958 total comes to over $80 billion, or about 30 per cent, of the value of all issues on the New York Exchange.

Most of the growth in institutional portfolios is due to the steady and often spectacular rise in the values of securities over the past ten years, but the annual accumulation of funds available for investment is also growing larger. Pension funds, for example, which owned $500 million worth of equities in 1949, made net purchases of $1 billion last year. Other institutions were big buyers in 1958, particularly in the second half of the year, and this helped to accelerate the rise in share prices. The enormous purchasing power of the institutions can be exaggerated, for they do not always operate in the same way. A mutual fund looking for capital appreciation will not pursue the same investment policy as a savings bank seeking safe yields; and frequently one institution will sell a big block of an issue at the precise moment when others are buying. But even when their policies differ, the institutions, with their staffs of technicians and analysts, form the single most important pool of professional opinion, and are largely responsible for the prestige and respectability now associated with investment in equities.

In spite of the countless tales about barbers, secretaries and bootblacks playing the stock market, it was only in the upper-income groups that ownership of equities was common before the last world war. Since then much wider distribution has become possible as a result of the huge rise in personal incomes at all levels, but much of the credit for the actual increase belongs to the open-ended mutual funds, whose energetic sales campaigns have stressed the safety—and the profitability—of investment in equities. The satisfactory performance of these funds, which owes as much to inflation as to professional management, has expanded the demand for equities in general, not just for shares in mutual funds. Moreover, great publicity has been given to the concept of "growth stocks." and "dollar averaging" by the institutions and these have helped to overcome the small investor's fear of losing his shirt.

THE performance of the stock market in 1958 demonstrated the respect in which the public holds institutional dogma. Last winter, when business activity was declining rapidly, spokesmen for the mutual funds were publicly expressing their faith in common stocks, while privately they were expressing their concern over the possibility of a prolonged recession which would bring with it the threat of large redemptions of mutual fund shares. Other institutions were similarly cautious; while they did little

outright selling, there was some switching to defensive issues and a good deal of hesitancy about making new commitments. But the public did not lose confidence. In fact, there was a marked increase in purchases of mutual fund shares which forced the funds to expand their investment programmes. And as soon as the down-turn showed signs of levelling out, other institutions began practising what they had been preaching. Their buying, combined with that of individuals, resulted in the return of the bull market.

Whatever motivates the general public, the institutional demand for equities is based largely on the increasing stability of the national economy. In the highly cyclical period between the world wars institutional investors avoided equities which fluctuated with rises and falls in corporate earnings, and gave priority to the safety provided by fixed income obligations. But the economy's ability to resist downward pressures, which has now been tested on three separate occasions in the post-war period, changed this. The institutional preference for equities was already well established before last year's decline, but there is no doubt that the relative shortness of the decline hardened and confirmed the trend. The bond market's fall from grace, the result of speculative excess on one hand and psychotic fears of inflation on the other, served to exalt the status of equities and hastened the conversion of the remaining sceptics. Fear of inflation was also a recognised factor in the decision of the American Telephone & Telegraph Company and its subsidiaries, which together hold $2.6 billion in pension funds, to put 10 per cent of these assets into common stocks. AT & T's action was followed by other conservative pension funds and stirred up the savings banks and insurance companies to ask for increases in the present legal limits on equity holdings in their portfolios.

This cult of equities has led to a severe shortage of these shares. The amount available for purchase is limited largely by the tax laws which, by making interest payments on bonds—but not on dividends—tax deductible, restricts the supply of new equity issues and, by assessing a capital gains levy, tends to freeze outstanding shares in the portfolios of permanent investors. Because institutional investors buy in volume, they usually deal in actively-traded issues with a large number of shares outstanding. Of the 1,500 companies whose shares are listed on the New York Stock Exchange, the institutions have big holdings in about 200 " investment grade " issues which, not surprisingly, are also the public's favourites. These are the issues that, by and large, show the biggest gains, mainly because too much money is chasing too few shares.

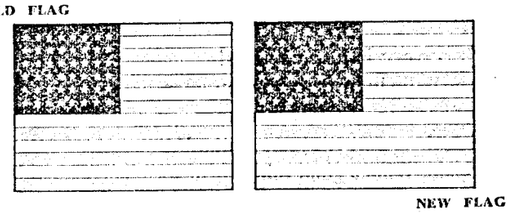
THE managers of institutional money are becoming more and more apprehensive at the public's persistence in following their lead. But there is nothing they can do about it The portfolios of the open-end and closed-end funds are published quarterly and are closely followed as buying guides. The portfolios of other institutional investors are not exposed to such consistent scrutiny, but brokers can count on increasing their trade with individual customers by airing rumours of institutional transactions.

The enhanced value of equities, especially of issues formerly regarded as cyclical—steels, machine tools, electrical equipment, paper, metals—has a permanent look. Institutional analysts are in fact upgrading many issues that were once termed semi-speculative to the ranks of stable investments, while an ever-widening search is on for speculative situations which give promise of providing big gains. But there is growing concern that some of the groups—like drugs and electronics—which the institutions have made popular are being bought too liberally by individual investors who lack the balance of more stable holdings.

The public's tendency to follow the dollar averaging system—to invest a fixed sum in the same issue over a long period—is also questioned by the institutions. The success of the system depends on undeviating adherence to it, a test of discipline that an institution, which can count on a constant accumulation of funds, can meet more readily than an individual who depends on what may turn out to be a fluctuating personal income. Yet individual investors and investment clubs are now resorting to dollar averaging, particularly by means of the monthly share purchase plan that bears the New York Exchange's stamp of approval.

It is obvious that the institution and the individual share the same desire for increased profits and dividends, but professional fund managers, who are themselves executives in large enterprises, are likely to support the policies of the large enterprises whose shares they hold, including proposals for higher pay and bonuses for executives and, of course, more liberal pension plans, all of which are of dubious benefit to the small shareholder. The institutions rarely seek to improve the management of a company in which they hold shares ; if they dislike a company or fear unwanted changes, then they sell out as advantageously as possible. Some critics claim that this hurts the individual investor but the institutions, anxious to avoid the more serious charge that they are dictating to a company's managers, take the position that their responsibility is limited to their own shareholders.

No matter how far the trend towards domination of the equity market by the institutions goes, and the peak has probably not yet been reached, it is no insurance against a decline in stock market prices. This could come without any wholesale liquidation by the institutions ; a definite slowdown in their buying of equities is all that would be needed, so great is their power today.



Now There are Forty-Nine

DURING the nineteenth century Americans made a habit of admitting new states to the Union, but last Saturday's proclamation of statehood for Alaska, the first addition for nearly fifty years, brought with it a number of technical questions with which people nowadays are not accustomed to dealing. The founding fathers had answered the first with their provisions for ensuring staggered terms in the Senate: the two new Senators each drew a slip of paper from a box to settle the length of each man's service. Neither drew six years ; Senator Gruening has a four-year term, Senator Bartlett only two. By proclaiming statehood on January 3rd, the day the new Congress officially took over from the old, President Eisenhower ensured that the Senators from Alaska would have exactly the same status as the other newly-elected members.

The President also made the final decision on the new flag, the twenty-sixth design the United States has had, after a special cabinet commission had reviewed nearly 2,000 suggestions. The pattern chosen does not come into use officially until July 4th and may well be superseded after only a year, since before Independence Day comes in 1960 Congress seems likely to have given Hawaii statehood as well. One advantage of the new design—the now traditional thirteen stripes for the original states and forty-nine stars for the number of states today—is supposed to be that a fiftieth star can be fitted in easily ; but it is difficult to see how this can be done satisfactorily without some fairly drastic revision.

An official abbreviation for the name of the new state is also wanted, although it is so long and its name is so short that the map makers at least ought to be able to write the word in full. " Ala." has been pre-empted by Alabama ; " Aaa.," which may in the end be chosen, seems

nearly as unwelcoming as " Alas." No one seems to have proposed " Ask.," although this is what many people believe Alaska will be forced to do—ask for federal funds to help it to carry the new burdens of statehood and to make up for the neglect from which, according to its new officials, it suffered during its ninety years of inferior status. Certainly the Governor, Mr Egan, and the majority in the Legislature, which meets towards the end of January, will not find it easy to make ends meet, particularly since they are Democrats who put social welfare before economy. And the burden of maintaining the biggest state in the Union will fall on only 215,000 residents, fewer than in any other state.

Bank Hold-up

FORTIFIED by its sweeping victory in the Bethlehem Steel case, the anti-trust division of the Department of Justice is taking more interest in business mergers which are likely to lead to greater concentration and to reduce competition. Banks, which are subject to state banking authorities and in most cases to the supervision of the Federal Reserve Board as well, have so far been able to combine without being held to account under the anti-merger provisions of the Clayton Act. But the Department of Justice, which three years ago raised no objection when the Chase National Bank and the Bank of the Manhattan Company joined forces to become the third largest bank in the country, has announced that it is examining the proposed merger of J. P. Morgan and Company with the Guaranty Trust Company to see if it violates the anti-trust laws. Those laws, it is interesting to recall, were in considerable part a response to the industrial giants such as the US Steel Corporation which the first J. P. Morgan created by a series of mergers at the turn of the century.

Section 7 of the Clayton Act, which covers bank amalgamations brought about by an exchange of shares, the method apparently chosen in this case, forbids mergers which tend to restrict competition in any line of commerce in any part of the country, or which tend to create a monopoly. The Guaranty Trust Company and J. P. Morgan are both " wholesale " banks, which deal primarily with other banks and large business concerns ; merged, they would have total resources of $4 billion and would become the third largest bank in New York City and the fourth largest in the country. Although Morgan's, with deposits of $791 million, compared with $2.5 billion for the Guaranty Trust, is much the smaller, the officers of this historic and still most influential bank are to have many of the plums in the new concern ; and the chairman of Morgan's foresees " intensified competition " with the other big banks. In the Bethlehem case, however, an exactly similar contention by the defendants was judged irrelevant.

The inquiries of the Department of Justice do not necessarily mean that it will intervene, or that the amalgamation will not take place. But there are other hurdles to be surmounted. The Federal Reserve authorities have power to bar the operation of branches by a bank, though this would not necessarily be fatal to a bank dealing with great corporations rather than with small depositors. Permission must also be sought from the New York State Superintendent of Banks, who has already said that the burden of proof is on the two banks to prove that their merger will not harm existing competition.

SHORTER NOTES

The controlling interest in the *Chicago Daily News*, which has belonged since 1944 to Mr John S. Knight, who also owns a number of other important newspapers, has been sold to Mr Marshall Field who founded the *Chicago Sun-Times* during the war. While the afternoon *News* has in the past been by no means as liberal as the morning *Sun-Times*, it has been much more so than its only direct competitor, the *Chicago American*, originally a Hearst paper, which was taken over in 1956 by the reactionary *Chicago Tribune*. The *Tribune* is the only morning paper in the city, apart from the *Sun-Times* and the two will therefore now be in continuous rivalry throughout the day.

* * *

The strike which had held down Eastern Air Lines for over five weeks was settled on New Year's Day when the company agreed not to require the engineer who is the third member of the flight crew on a jet airliner to qualify as a pilot for the present ; to stifle the pilots' objection to this settlement, the company then agreed to increase the flight crew to four by adding a third pilot. American Airlines is still grounded, however, and on Monday the company laid off nearly all of its 20,000 other employees.

* * *

In 1958, for the first time since 1950, fewer babies were born than in the previous year—4,248,000, 53,000 less than 1957's record. In 1957 the marriage rate had declined by 4 per cent.

Manufacturer's exports multiply 26 times in 10 years!*

From an export turnover of £81,000 to over £2,000,000 in just ten years! That's the success story of a manufacturer in the radio industry who went after the world markets in 1948 with the right sort of backing—ECGD insurance. In fact, had it not been for ECGD cover during these past ten years, a number of unforeseen losses might have cost him £236,000. What a good thing he was insured! For although £82,000 of this money has since been recovered, these are the sort of losses that no exporter, however big, can afford to face alone. There's money, big money, to be made in the export markets. But a few bad debts or a suddenly blocked currency could bring serious financial loss. If you're all set to launch out overseas, *first have a talk with your ECGD man.* With ECGD behind you, you get your money whatever happens. For consumer goods the cost averages less than 10/- for every £100 insured.

* This is a true story, but because business between ECGD and exporters is strictly confidential any details which could identify the exporter have been left out.

THE WORLD OVERSEAS

The European Rift

A diary of the events which led up to the split between Britain and the six countries of the European Economic Community.

1940 is the year Europeans look back to when they talk of Britain's relationship with the Continent. In that catastrophic year Mr Churchill breached a barrier of prejudices by proposing a union of the British and French nations. His offer reflected a profound historical truth, for 1940 was the end of the era when individual European nations could queen it in the world alone. And in that hour of physical isolation Britain came in a sense nearer than ever before to many European hearts.

In **1946** it therefore seemed natural that Mr Churchill, speaking at Zürich, should give the first resounding expression to the ideal of European unity. All over western Europe men were looking for a new ideal that would restore their self-respect, for a new system suited to a dangerous world in which their individual countries could not stand alone. Gradually there appeared a band of political leaders —Spaak, De Gasperi, Schuman, Adenauer, Monnet—dedicated to the idea of European unity, not just in the form of "membership of a club" or a "good neighbour policy," but in the form of a new federation, a United States of Europe.

The **1945-1951** Labour government, preoccupied with social transformation at home and political transformation in the postwar Commonwealth, did not share these ideas. In **1949** Britain backed the creation of the Council of Europe at Strasbourg, but was opposed to letting it acquire any powers. Many of the "Europeans" on the Continent were becoming suspicious of British motives.

In **1950** the first rift opened between Britain and the six countries that have now formed the European Economic Community. In **May, 1950,** M. Robert Schuman, then French foreign minister, proposed the establishment of a high authority to control west European production of coal and steel. This was presented as the first step in a *rapprochement* between France and Germany which was to lead to European federation. The French invited Britain to join in the talks on the "Schuman plan," but made it clear that they regarded acceptance of the goals of a supranational authority and ultimate political unity as a precondition of attendance. The British government disliked this prior commitment and in **June, 1950,** declined the invitation. The six-nation Coal and Steel Community began operations in **1953**; Britain has remained outside, linked with it only by a tenuous association.

Until **1951,** many "Europeans" hoped that a Conservative government would prove less aloof than Labour. It was Mr Churchill who had first publicly called for a joint European army in the Assembly of the Council of Europe in **August, 1950**; and his son-in-law, Mr Sandys, drafted the first plan for it. During the winter of **1950-51** the French and their five partners developed the concept of a European Defence Community (EDC). In **October, 1951,** Mr Churchill's government took office; but within a few months it made it clear that Britain could not join the EDC. When, in **August, 1954,** the plan for a European army—and with it the project for a political union—was finally killed, it was the French Assembly that struck the fatal blow. But Britain's aloofness was not forgotten by the "Europeans."

Late in **1954,** as the dust settled over the corpse of the EDC, and the Paris Agreements for the seven-nation Western European Union (WEU) were hastily concluded, on the initiative of Mr Eden, as an alternative means of bridling West Germany's new armed forces, these men began to seek a way of "relaunching" the European idea. They turned to economics. Since **1948,** some of the best practical teamwork in Europe had been achieved through the 17-nation Organisation for European Economic Co-operation (OEEC); and Britain had played an active part in its successful efforts to liberalise trade.

During **1955** the low tariff countries, led by Benelux, who were irked by the restriction of OEEC's work to the easing of quotas, urged that it should also tackle the lowering of tariffs. But once again Britain held back; and meanwhile the Six began to move on by themselves. In **June, 1955,** their ministers met at Messina, and set up the "Spaak committees" to work out plans for a customs union and an atomic community (Euratom).

There still seemed, even **late in 1955,** to be a chance that Britain might join in. At France's suggestion, British experts were invited to sit with the Spaak committees in Brussels; this invitation was accepted.

November, 1955, may prove to have been a decisive date. The work of M. Spaak's committee on the common market had gone so far that he asked for some commitment from the British on the long-term purpose of the talks, if they wished to extend their stay in Brussels. Britain's response was to withdraw its experts.

In **April, 1956,** the Spaak team reported to the six governments; in May they instructed it to go ahead with the negotiation of treaties setting up the two new communities—economic and atomic.

Meanwhile, partly in reaction to the work of the Six, partly under a liberal impulse of its own, the British government was changing its mind about freer trade in Europe. The ideas of enlightened officials were given political drive by Mr Thorneycroft, then President of the Board of Trade, who sensed the invigorating value of

free trade, and by Mr Macmillan, then Chancellor of the Exchequer and long a close follower of Mr Churchill, who clearly saw Britain's political need to find new strength in closer association with Europe.

So, in **July, 1956,** Britain proposed in the OEEC the creation of a European free trade area. At the end of **September, 1956,** it put the idea to a meeting of Commonwealth finance ministers and a few days later explained it to the public. The lack of rules and institutions in the free trade area plan, as compared to the common market plan, and its pragmatic spirit, had many economic virtues ; and it was well designed for British political conditions. Latent in the free trade area—in the merging of national economies which it implied—were many of the political and social implications of the common market ; but Britain was to be guided gently into the European family, without sudden shocks, and care was taken of particular British interests—the Commonwealth, the farmer.

At the end of **1956** an OEEC working party, in which all the member countries were represented agreed that a free trade area was possible. In **January, 1957,** when M. Spaak visited London on the morrow of Mr Macmillan's becoming prime minister, Mr Thorneycroft proposed immediate negotiations between the Six and the "other six" countries most interested in the free trade area (Britain, Austria, Switzerland and the Scandinavians). At M. Spaak's request, however, Britain agreed to wait until after the common market treaty was signed. But, meanwhile, the solidarity of the Six had grown enormously since Messina ; and to the devoted band in the country house outside Brussels, where their negotiations had reached a decisive stage, the outside world, Britain, the free trade area, seemed far away.

On **March 25, 1957,** the treaties to set up a European Economic Community and an atomic community were signed in Rome. In **February** the OEEC council had agreed to carry on technical discussions on the free trade area so that major decisions could be taken by July, but these talks proved desultory. In **May** the British government, still determined to show that there were no destructive motives in its European plans, again agreed not to press the free trade area project until the Rome treaty had been ratified in France and Germany—which was done in **July, 1957.**

Soon after that the British cabinet, disconcerted by the delays, undertook something of a reappraisal. It considered, but rejected, the idea of joining Euratom and the Coal and Steel Community, and instead appointed Mr Maudling, the Paymaster-General, to drive the free trade area plan home. In **October,** the OEEC council approved the creation of a free trade area in parallel with the common market, set up a ministerial committee to negotiate it, and put Mr Maudling in the chair. It was only when he took up his task that it became clear just how difficult it was.

ON **January 1, 1958,** the twin treaties of the Six came into force. The new European institutions, which already have some powers to overrule the member governments and will acquire more, were set up. The Six began to send their best men to Brussels to work their new creation. It became clear that they were prepared to give it high political priority and to adapt their national policies considerably to that end. Whatever its commercial advantages, the free trade area offered them no political alternative to the Treaty of Rome.

During **1958** French opposition to the free trade area plan changed from a combination of lip-service with reservations and delaying tactics into a much more explicit resistance. Although much of this opposition arises from sheer protectionism, the painful medicine of the common market, which is already laying France open to foreign competition, has nevertheless been accepted—on political grounds. France's young "Europeans" see European institutions as a means of regenerating both their country's economy and its political life ; and the common market has also appealed to them—like the EDC and the Coal and Steel Community—as a means of harnessing German energies to European ends. The free trade area, in contrast, has seemed to them to jeopardise these political aims.

Thus, behind the French case against the free trade area, which was first expressed in a memorandum to the other members of the Six in **March, 1958,** there has lain a strange alliance between destructive nationalist protectionism and the forward-looking idea of European unity.

In **October** the Six took up a common position in Mr Maudling's committee. In six months of negotiation between themselves they had got rid of a lot of the protectionist French demands ; but they kept most of the others—the demand for a different balance of economic interests (here the Commonwealth comes in), the demand for some tariff harmonisation, and for other commitments on broad policy akin to those in the Treaty of Rome.

During the **summer of 1958** the British made it clear that they were ready to leave out some sectors of French industry altogether, to accept subsidies to others, to give France a special position—in other words to go a long way to appease French protectionism. But they never succeeded in starting a real dialogue with the French. **On November 15th** Mr Maudling broke off the talks in his committee after a French spokesman had appeared to go back even on the position the Six had just taken up.

On **January 1, 1959,** the process of tariff and quota disarmament began in the common market. Unless some new provisional arrangements can stave off or modify the discrimination against non-members which this means, a precedent will be set which runs counter to the basic purpose of the free trade area. Meanwhile the Six have given the European Commission (the executive of their economic community) the task of elaborating their long-term position ; and, as is noted on page 115, the Council of Ministers of OEEC is to tackle the problem once again.

France's Princeling

FROM OUR PARIS CORRESPONDENT

"CES Princes Qui Nous Gouvernent" was the contemptuous title of the last book published by the man who this week became the first prime minister of the Fifth Republic. On Thursday a salvo of twenty-one guns in Paris proclaimed that the last official touches had been put to the country's new institutions. M. Coty, having helped in the transfer of power, has gone. General de Gaulle has taken over as president, giving up the leadership of the government. It has been known for some time that this job, which now bears the British title of prime minister in place of the Third and Fourth Republics' "president of the council," would go to the general's faithful lieutenant, M. Michel Debré.

Michel Debré was born 47 years ago in Paris of a professional, upper middle class family. His father's is a highly esteemed name in the French medical profession. (Biographers are reluctant to probe deeper into his ancestry since diehard nationalists might object to the Jewish blood that apparently flows in the veins of this new champion of French nationalism.) After showing brilliant promise in his studies in law and politics, the young Debré passed into the higher civil service. In 1938 his distaste for the political "system" was not yet sufficiently pronounced to prevent him from joining the staff of M. Paul Reynaud, then a minister in the Daladier government.

When the war came, he was called up as a cavalry officer. He was taken prisoner, escaped, and served for a time in the French administration in Morocco. In 1942 he went back to France and joined the resistance movement. The French authorities in London must have had confidence in him despite his youth, since he was entrusted, soon after, with the preparations for setting up the postwar administration (the job was partly concerned with efforts to minimise communist influence).

After General de Gaulle's return, he worked for a time in the general's cabinet. In 1946 he tried, unsuccessfully, to get elected to parliament. After that he served on the French commissariat for German and Austrian affairs, but two years later he finally entered parliament through the back door—the upper chamber. Once in the Council of the Republic, he rapidly became the chief gaullist spokesman. He used the rostrum and his prolific pen to attack successive governments for their weakness (to which his party greatly contributed) and for the decadence of France. He was the champion of nationalism, the arch-enemy of the European Defence Community and the common market. He described the "European" ideology as an anti-nationalist heresy, and European integration as an obstacle to the French mission in North Africa.

TOWARDS the end of 1957, sensing that the hour had nearly struck, M. Debré started a weekly called *Courrier de la Colère*. There, and elsewhere, he vituperated against the government, particularly for its pliability when faced with the alleged pressure of the Anglo-American good offices mission after the Sakiet affair. On April 15, 1958, M. Debré delivered his indictment against the government in the Council of the Republic, and M. Gaillard's cabinet was defeated in the Assembly on the same day. M. Debré, one of the few gaullists who had not been tempted by office under the Fourth Republic, received his reward for faithfulness. General de Gaulle made him minister of justice and, as such, he played a key part in drafting the new constitution. He also carried out a reform of the judiciary. He joined the directing committee of the neo-gaullist UNR party at its creation. And when the UNR scored its electoral success, he became the obvious choice for prime minister since he was both more reliable and more obedient to the general than, say, M. Soustelle.

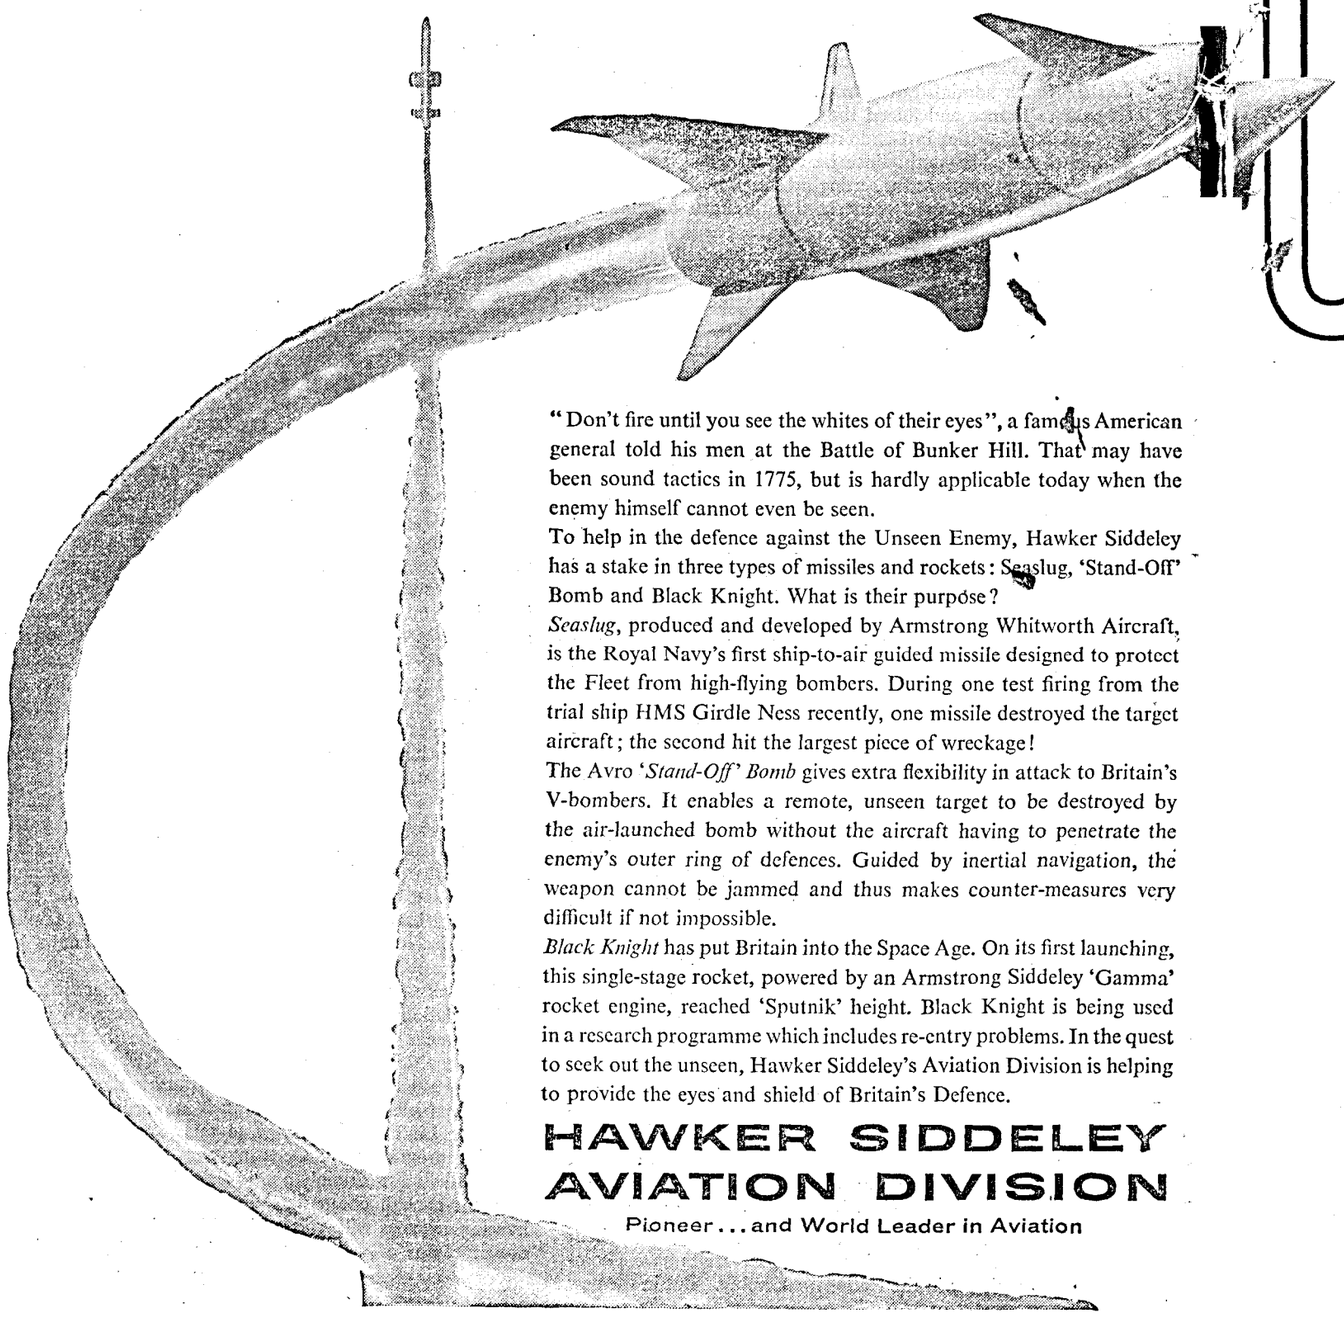
M. Debré's past jingoistic outbursts, his attacks against "Europe" and Anglo-Saxon interference, are a source of worry in certain quarters. But it should be remembered that the new head of government, though he may interfere with the execution of policy, is no longer the real policy maker. True, he can be sure of a greater stability than his predecessors. The powers of parliament have been curbed; in any case, the neo-gaullists and conservatives have a comfortable majority in the National Assembly. But in the new structure the prime minister is overshadowed by the president of the republic. It is the president who nominates the prime minister and other members of the government, and who appoints to all the important jobs, civil as well as military. It is the president who commands the armed forces, who negotiates treaties, and who can dissolve the assembly or assume all powers in a national emergency.

In constitutional terms it is possible to imagine a situation in which a prime minister, tired of his hybrid position and backed by parliament, might defy the president. But such a trial of strength is most unlikely with this president and this parliament. General de Gaulle dotted the "i's" in his last message: "Guide of France and head of the republican state, I shall exercise supreme power in its full scope and according to the new spirit which brought it to me." The seat of political power in France has been moved to the Elysée Palace, where General de Gaulle has taken up residence. It may be unfair to M. Debré, chosen for his faithfulness rather than his ideas, to rank him among *ces princes qui gouvernent*. The new princes, it seems, are not called to govern but to carry out orders.

REFUGEES IN CENTRAL EUROPE—I

Somewhere Cheap to Live

BY OUR SPECIAL CORRESPONDENT



SOMETIMES by design, sometimes because there is no room anywhere else, refugees from east Germany share the same west German camps as foreign refugees who may have been drifting from one camp to another since the end of the war. The rooms where the Germans are living are often the more squalid. The force of their numbers piles them into tiered bunks, and since they have only been in camp a few months—and have every hope and intention of moving on directly—they have not bothered to paint the packing-case furniture, or to stick photographs on the walls. But the squalor is superficial ; there is no doubt where the atmosphere is bleaker. The Germans still have confidence that eventually things will turn out all right ; the non-Germans have often waited too long.

A lot is talked about "camp psychosis"—that failure of spirit which makes a refugee frightened of leaving the security of camp life. More often than not this neurosis is a straightforward fear of the expense of life outside the camp. But now that the reborn German army wants to take back most of its barracks, the refugees who have been camping in them are having to move out. Nobody yet knows for sure where they will all go.

Since very few of them have a chance of emigrating, the United Nations High Commissioner for Refugees, Dr Lindt, plans to move them into housing schemes on the fringes of large towns. In Germany, those refugees who are able to work can usually find jobs, and once outside the camps the children, at least, will be able to melt into ordinary German life. Dr Lindt is now trying to raise $6 million for his building programme in Germany and Austria. But since there will almost certainly not be enough money, and therefore not enough cheap flats, the refugees left out of the housing schemes will have to be shifted into the prisoner-of-war camps of wood hutments that the war left dotted

In Search of the UNSEEN

"Don't fire until you see the whites of their eyes", a famous American general told his men at the Battle of Bunker Hill. That may have been sound tactics in 1775, but is hardly applicable today when the enemy himself cannot even be seen.

To help in the defence against the Unseen Enemy, Hawker Siddeley has a stake in three types of missiles and rockets: Seaslug, 'Stand-Off' Bomb and Black Knight. What is their purpose?

Seaslug, produced and developed by Armstrong Whitworth Aircraft, is the Royal Navy's first ship-to-air guided missile designed to protect the Fleet from high-flying bombers. During one test firing from the trial ship HMS Girdle Ness recently, one missile destroyed the target aircraft; the second hit the largest piece of wreckage!

The Avro *'Stand-Off' Bomb* gives extra flexibility in attack to Britain's V-bombers. It enables a remote, unseen target to be destroyed by the air-launched bomb without the aircraft having to penetrate the enemy's outer ring of defences. Guided by inertial navigation, the weapon cannot be jammed and thus makes counter-measures very difficult if not impossible.

Black Knight has put Britain into the Space Age. On its first launching, this single-stage rocket, powered by an Armstrong Siddeley 'Gamma' rocket engine, reached 'Sputnik' height. Black Knight is being used in a research programme which includes re-entry problems. In the quest to seek out the unseen, Hawker Siddeley's Aviation Division is helping to provide the eyes and shield of Britain's Defence.

about the country, or into barracks so dreary and so inconvenient that even the army does not want them.

The High Commissioner's " non-operational " mandate is interpreted strictly in Germany. So far all he has been able to do is to use his emergency fund (Unref) money to buy a very small share in German housing projects. These houses, put up by building societies as good investments, are admirably suited for a family of average size and moderate means. But about half the refugees still living in camps are on public assistance, and few of them are average ; some have a great many children, others are just single men or women. Dr Lindt has now appointed the Danish architect, who designed most of the much simpler refugee houses in Austria, to try his hand in Germany. This is a step forward ; but it is still doubtful whether the Federal and Land authorities will accept the UN plans. The High Commissioner's officers, who fall over their own feet to be tactful to a dozen masters, can do no more than urge their schemes.

Cheap flats are badly wanted for the 3,000 or so " difficult cases." It is rather easy to be called difficult in refugee language: the disabled, petty criminals, drunks, sluts and old people who refuse to go into homes are all lumped together into this class. Nobody quite knows what to do about them. Although there is a federal German law laying down minimum housing standards, the Land government of Lower Saxony is thinking of defying this and—with the support of the High Commissioner's representative—building some very rudimentary flats for the type of tenant who would never be accepted by a building society. The danger here, as the government is well aware, is that these low-class houses could develop into a sort of ghetto.

In North Rhine-Westphalia the government has decided to pack all its difficult cases into a single camp. In that way the authorities can at least keep an eye on the children and run adequate schools and kindergartens on the premises. But the camp, in a Münster barracks that the army rejected, has a nightmare Hogarthian quality, and nobody living in it can forget the failing or disability that has singled him out. In a long, cheerless corridor, a prostitute's five children, the eldest nine, live next door to the stable-like room where six middle-aged men lie on their beds drinking themselves to slow death. However well-intentioned, this is surely not the solution.

The Second Series of Reports in our New Subscription Service

DURABLE CONSUMER GOODS

will be available at the end of January

This regular, comprehensive service combines economic forecasting with consumer research. Each report contains the results of a survey based on a random sample of 3,000 households in Great Britain ; these results are combined with an assessment of trends in the economy as a whole and in each particular industry to give an estimate of the scale and quality of demand for the following goods during the next six months.

Electric washing machines and spin driers
Refrigerators
Vacuum cleaners
Electric fires and convector heaters
Gas and electric cookers
Sewing machines
Passenger cars
Radios, radiograms and record-players
Television sets

This service is provided jointly by

THE ECONOMIST INTELLIGENCE UNIT LIMITED

and

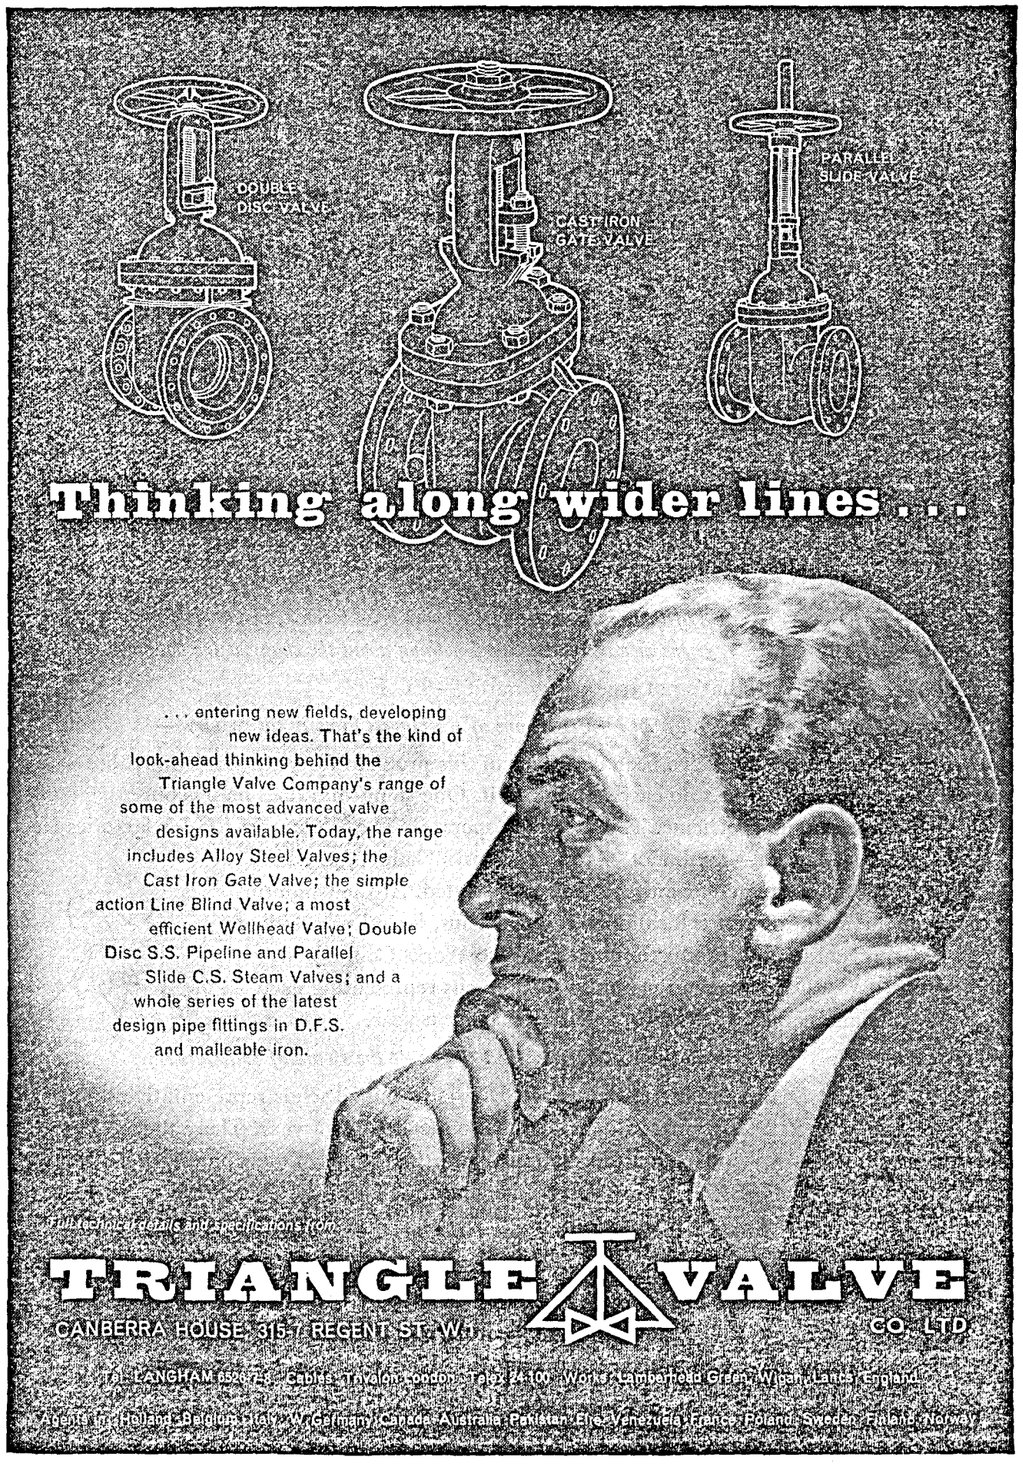
THE BRITISH MARKET RESEARCH BUREAU LIMITED

Further information from the E.I.U. at 22 Ryder Street, London, S.W.1. Whitehall 1511, ext. 13

For each difficult refugee whose problem defies solution, however, there are many more who only need somewhere cheap to live and a little money to get them going. Since west Germany has shown that it has the will and the power to absorb an immense number of newcomers, including some 3 million east Germans, it is all the more irrational that the settlement of the residue of a few thousand non-Germans should be so painfully drawn out.

(To be concluded)

Mr Kadar's Safety First



BY A CORRESPONDENT

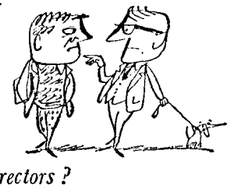
THE Humpty Dumpty of Hungarian communism almost had a great fall in 1956. In any case it certainly had a good fright ; and this in many ways is still exerting its salutary influence on Mr Kadar's governing apparatus. The party's many wings are flapping less and less, reason is no longer taken for proof of treason, nor is zeal sufficient evidence of trustworthiness. Safety first is the guiding principle. However, even such unambitious rules of conduct as reason and safety first can clash. It is about their inconsistency that a fascinating internal debate seems to be going on within the party.

There is a broad group of middle and lower functionaries, frustrated and depressed by unrewarding daily contact with " the masses," who are for a policy of resigned frankness. " It is worse than useless (they argue) to go on telling the people that *they* like the way things are ; perhaps it is also a mistake to tell them that we in the party do. Certainly one should not irritate them with elections such as the last one with its ludicrous 99-plus per cent majority. All this merely makes them think that we Communists are responsible for the unrelenting march on the one and only road to socialism. Let us instead remind them that what we do is not a matter of choice, but of geography ; that we should have to act the way we do even if we personally preferred some Polish or Titoist way to socialism or, like the unfortunate Imre Nagy, an 'Austrian solution.' Thus we could make a reasonable bid for popular understanding and co-operation ; otherwise we must remain despised outcasts."

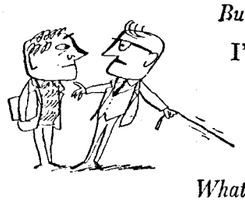
One of the cleverest exponents of this line is the writer Mesterhazi, whose daring between-the-lines hints in a pre-election article in *Nepszabadsag* are still the talk of the town. He has all but said that it may well be nicer to be independent than a colony, nicer to live in a bourgeois than in a proletarian democracy, " but "—so ended each paragraph—" we cannot freely elect " the time and place of our national existence.

AMONG the higher party leaders, perhaps the only practitioner of this frank line is Mr Marosan, nicknamed Georgie the Bun. An impatient and arrogant man, he is annoyed with the attempts of Mr Kadar and others to justify the party's rule. Why should power, backed by Soviet strategic interest, have to justify itself? For Mr Kadar and the other leaders, however, this line, no matter how likely to disarm popular resentment by pointing to a *force majeure*, is nevertheless unsafe. By confessing to their own subjects that Hungary is and must remain communist primarily by

the things they say!



Most of the troubles in industry today arise because, in the big firms, the men at the top know nothing about the chaps at the bottom.



Well, that's not true of my outfit — I.C.I.

Why not? I.C.I. is one of the biggest firms in the country —

Yes but we've been conscious of this problem for years, and we realise there's no easy solution to it. One thing that does help is our Works Council Scheme. This is how it operates. The workers in I.C.I.'s factories elect their representatives — by ballot — to their Works Council, to which members of the management are also appointed. At their monthly meetings the main interest is local domestic problems, including accident prevention and production matters. The Works Councils in their turn send members to Councils representing each manufacturing Division, which meet twice a year.

But how do the workers meet the top men — the Board of Directors?

I'm coming to that. Each Division Council sends representatives to a Central Council that also meets twice a year. There the men from the shop floor put their point of view on all sorts of topics before the Chairman himself and the Directors.

What sort of topics — rates of pay, perhaps?

No, those matters we negotiate with the Trade Unions. These Councils deal with other features of the Company's labour policy.

The interest they showed in the idea of Profit-Sharing for example, helped to bring our I.C.I. scheme into being. I.C.I.'s 1,300 Works Councillors are an important link between top management and workers, because they do a lot to ensure that the Company's policies are understood by everybody.

ICI

E

force of geographical circumstance, they would implicitly charge Russia with "colonialism," and this would be a much graver risk to take than any that is involved in accepting responsibility for the status quo.

The status quo, safe as it may be for Mr Kadar, is cheerless and uninspiring for his cadres, and this is worrying the brainier of his lieutenants. The Kadar policy is one of *immobilisme,* of an obsession with security and caution which the more sanguine regard as cowardly. In particular, his go-slow approach to collectivisation is resented as appeasement of the peasants, and his reluctance to break the writers' strike by force is thought to yield nothing but humiliation to the party. Economically, matters are kept on a fairly even keel only by accepting a rate of growth which is far too low by communist standards; the "raised" plan provides for a 4.7 per cent increase in manufacturing production and a 2.8 per cent rise in real wages for next year, with the share of accumulation in the national income rising slightly to 16.5 per cent. There is little in these relatively unamibitious figures to fire the imagination of the faithful. Not surprisingly, they are getting bored and stale.

The old magic is gone, and some of the party's ablest brains feel an urgent need to recapture it. China is the one obvious source of fresh magic; and while the Sino-mania of the old stalinist firebrand, Jozsef Revai, is making scant impact, more important people are also smoothing the path of intangible imports from the Far East. General Revesz, the cool-headed and polished defence minister who, more than anyone else, is steering the course of the regime from the background, is on a protracted visit to China, having conversations with Chinese leaders including Mao himself, while a Chinese delegation led by the deputy head of the Chinese planning board is staying in Budapest. Contemptuous of their familiar Russians, Hungarians are wondering what the emerging Chinese connection has in store for them.

Black Outlook for Swedish Liberals

FROM A CORRESPONDENT IN STOCKHOLM

AT international liberal meetings Sweden's Liberal party (*Folkpartiet* or the Peoples' party) has long been hailed as the most successful in Europe. This will not happen again for some time. In last year's elections—the "pensions" elections in June, and the ordinary elections in September—the party was cut back from 24 per cent of the votes to less than 16 per cent. It no longer forms the leading opposition to the Social Democrats, who have now been in power for over a quarter of a century.

The main cause of the catastrophe was the party's difficult middle position on the pensions issue, which has dominated Swedish politics for several years. The question is whether there should be additional pensions, graded according to income, for all employees, on top of the existing uniform national pensions. The Social Democrats have proposed a compulsory system for these new pensions; the Conservatives and the Centre (formerly Farmers') party are against any new law; and the Liberals, seeking a compromise, proposed a permissive law, involving "a legal right but not a legal obligation." And this proposal has not found favour.

There is not even much prospect that the Liberals will regain their losses once the pensions issue has been settled, for this issue is only one illustration of the problems of a middle party. The political situation has changed enough in the last two years to depress the Liberal strategists. The Conservatives have found "reactionary" platforms politically profitable, and will consequently maintain them, especially as there is now far less prospect of a non-socialist government than even a year ago. They are now challenging important parts of the postwar welfare system. This policy has had a great appeal among upper and middle class groups, who are less interested in children's allowances, national health insurance, and similar recent reforms than in the promises of lower taxes which are the mainstay of the Conservative programme. It is, generally speaking, these same groups that do not want any new pensions law, as they already enjoy quite good private or public pensions. The Liberals' dilemma is simple. If they join the Conservatives in demanding a more restrictive social policy, they will lose votes to the Social Democrat party, thereby perpetuating its majority or at last stopping the electoral trend away from it; if they adopt a radical policy, they will continue to lose votes to the Conservatives and the Centre party.

Before the June elections, they stood a good chance of leading a Liberal-Centre-Conservative coalition. This possibility is now very remote. In their own words, the Liberals have now gone out into the political "wilderness," to wait for the other parties to come to their senses about pensions—that is, to accept the Liberal idea of combining statutory security with some freedom of choice. There is little likelihood of this happening, as the voters have twice rejected the Liberal compromise.

With no non-socialist coalition government in prospect, the three opposition parties now seem bent on competing even harder for the non-socialist half of the electorate. The Conservatives can show off their "new" conservatism much more boldly, as they are no longer afraid either of having to accept a common programme for a three-party coalition, or of having to fulfil their promises; and they can make more trouble for the Liberal party, not so much by attacking it directly as by carrying on a policy that will intensify its dilemma.

A SPECIAL Liberal problem is the weak party organisation. Only about 10 per cent of Liberal voters are party members. Moreover, the actual members are generally less radical than the leading Liberal papers and the party leadership, even in its present cautious mood. The membership has traditionally been based on groups of small traders and businessmen, farmers, free church members, temperance reformers, and so on. The pensions fiasco has only served to demonstrate once again, and even to widen, the divergence between this cautious party body and the "culturally radical" or "social-liberal" attitudes of the Liberal press and the party leadership under Professor Ohlin. The party's official ideology, the so-called "social liberalism," of the last ten years has undoubtedly been too radical for these groups. Now that the party has been defeated, their influence is increasing. At the party congress in Uppsala, held after the electoral set-back in June, conservative tendencies became obvious. There is probably a wider split between the old main body of the party and the "radicals" of the big Liberal papers than there is either between the party's right wing and the Conservatives, or between the

more radical Liberals and the Social-Democratic right wing.

The staunch supporters, moreover, are not the most important party subscribers. Much of the money needed for the party work comes from big business men. These financial supporters, who often themselves belong to the Conservative party, have naturally become less willing to subscribe now that the Liberal party's chances of effectively challenging the Social-Democrats seem to be vanishing. If the party should move to the left and join the Social-Democrats in a coalition—it is forty years since that happened, except during the all-party government of the last war—or make an agreement with them on pensions and other important issues, these industrial subscribers would of course close their wallets.

Priorities for Irish Investment

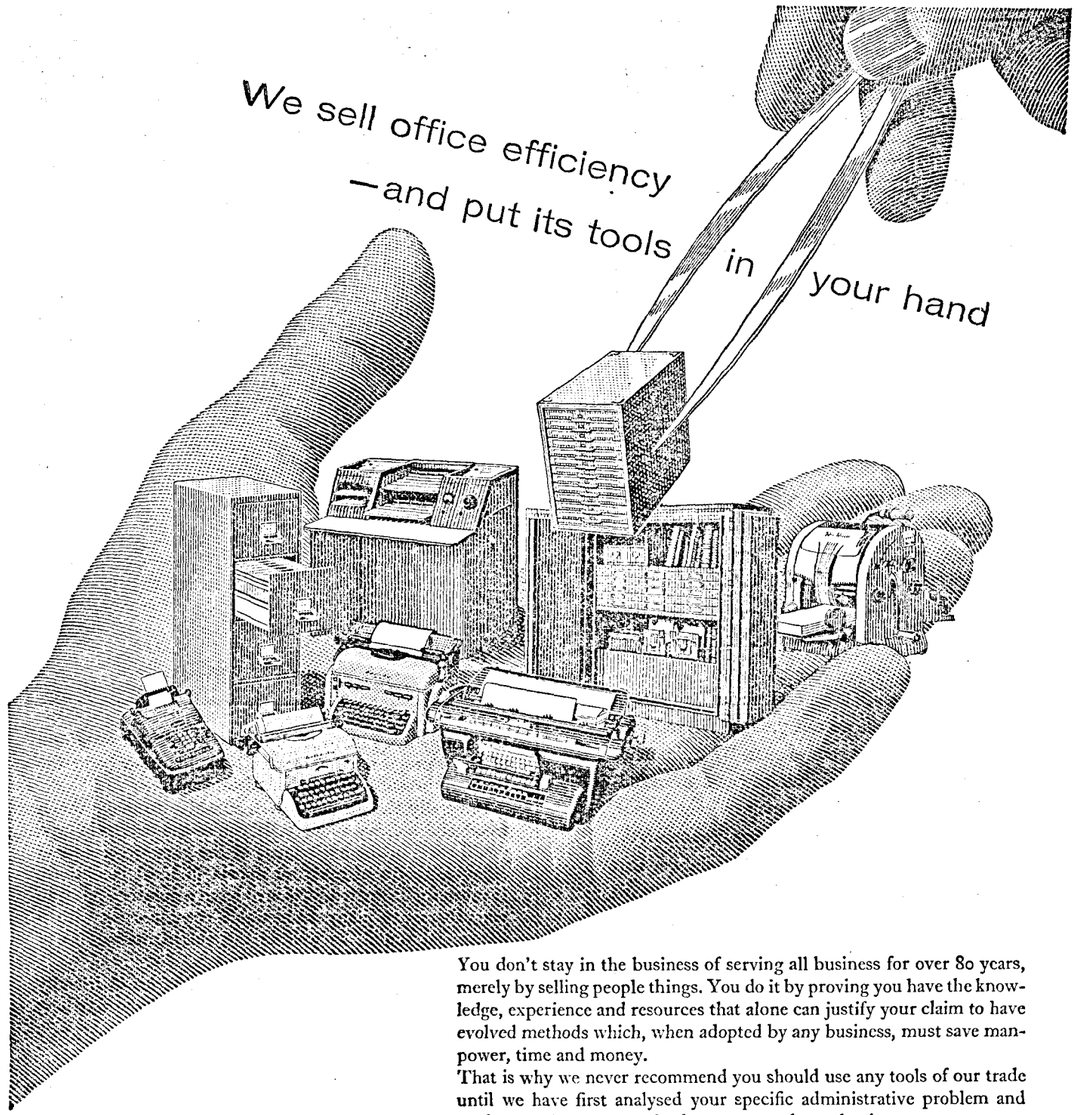
FROM OUR DUBLIN CORRESPONDENT

ALL Irish governments since the war have been great believers in public capital investment. The fashion began in the days of Marshall aid ; it has been retained and financed out of external assets (i.e. out of the sterling balances) since the flow of dollars ended. The ultimate objects of public investment have been clear enough, though their relative priorities have never been clearly stated—to make good the arrears of housing and other social amenities such as hospitals and electrification, and in general to create circumstances in which an expanding economy might absorb a greater part of the natural increase of population, so reducing emigration.

In the nine years 1949-50 to 1957-58, the State spent £278 million on capital investment. It is a sizeable sum for a population that numbers less than 3 million and has a national income of a shade under £500 million. This expenditure has undoubtedly secured a great improvement in housing and a considerable expansion in the production of fuel and power and in the provision of public services such as telephones. But its effect in bringing about an expansion of national income has been negligible. In these nine years, the real national income is estimated to have increased by only 8 per cent, compared with increases of 21 per cent in Great Britain and of over 40 per cent in western Europe as a whole. Worse still, this period has also witnessed a heavy fall in population ; the increase in emigration persists.

It is no wonder, therefore, that reviews of investment policies have lately become as fashionable as the investment programmes themselves. The last government began the process by appointing an advisory committee of Irish economists which has presented three reports on various aspects of investment. The present government has issued two further publications. One is a white paper which sets out programmes of investment from now until 1963-64. The other, perhaps even more interesting, is a detailed review of the possibilities of economic development which was drawn up by the secretary of the Department of Finance. It is an engaging exercise to compare what the secretary thinks with what the government proposes, but it has certainly been an enlightened decision to make his review available.

The white paper proposes to continue investment on a relatively large scale. It contemplates capital expenditure totalling £220 million over the next five years. This is to be found from current savings and drafts on the sterling balances ; to expedite the latter, it is said that a decision may be taken that future issues of legal tender notes will no longer need to be backed 100 per cent by external assets. This last suggestion is not as portentous as it may seem : the increase in the currency has been very small in the last three years. Savings have been volatile, but the external assets of the commercial banks have nearly regained the level of about £120 million at which they stood nearly five years ago. It looks as if the financing of the programme is possible.



THE encouraging aspect of the programme lies in its priorities. First place is given to agricultural production for export—and, consequently, to the improvement of grasslands and the increase of stock. This is only common sense ; but Mr de Valera's governments, since he first came to office more than 25 years ago, have always paid more attention to tillage than to livestock and have paid more attention to cutting imports by home production of wheat and feeds than to the more easily realisable possibilities of increasing exports. In its aim of obtaining better pasture and more livestock, the government will receive useful aid from the Irish banks, who have lately become interested in the provision of loans to increase herds and to hasten the eradication of bovine tuberculosis.

All this is a considerable change for the better. Some doubts must remain. The provision of capital for these purposes still seems less than it should be. More widely, it seems that an expansion of agricultural production demands consultation with the British Government. The existing trade agreement has worked well but present British policies (and, no doubt, Irish shortcomings) have increased the importance of the cattle trade at the expense of the traditional products, bacon, eggs and butter, on which the smaller farmers depend. And it is difficult to repress a suspicion that money would be better spent on the provision of marketing facilities, research and instruction of producers than in the usual channels of capital expenditure. The Irish government may be using a hammer where a screwdriver is needed. But at least it is trying to use it in the right section of the economy.

AIR SUBSCRIPTION RATES

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

	Airmail	Air Freight
Australia	£10 6s.	—
Canada	—	$25 or £9
Ceylon	£9 0s.	—
China	£10 6s.	—

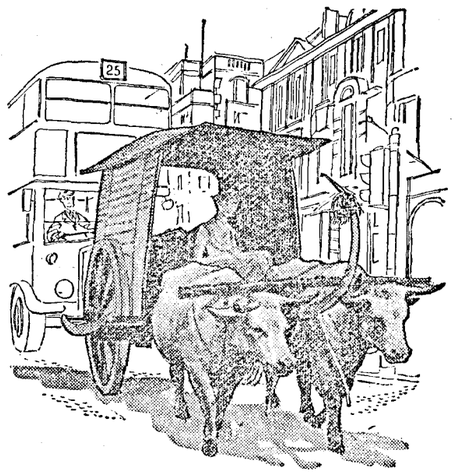
West Indies	£9 0s.	—

You don't stay in the business of serving all business for over 80 years, merely by selling people things. You do it by proving you have the knowledge, experience and resources that alone can justify your claim to have evolved methods which, when adopted by any business, must save manpower, time and money.

That is why we never recommend you should use any tools of our trade until we have first analysed your specific administrative problem and made sure they are exactly those you need to solve it.

And since we make the world's most comprehensive range of office equipment, once we have pin-pointed the problem, we can provide the right machine or system to cope with it.



Furthermore, because an office machine is no better than the service that goes with it, every one we install is backed by a service organisation—staffed by highly skilled mechanics—that keeps it functioning profitably, year after year.

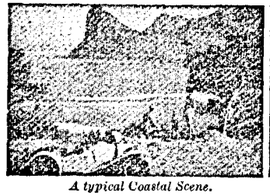
"South Africa for a glorious holiday!"



SAYS THE WIDELY TRAVELLED WOMAN

It's simply marvellous to slip away from the discomforts of the European climate and bask luxuriously in the heavenly warmth of South African sunshine.

Naturally there's more than sunshine to make this a wonderful holiday country. If you're the energetic type you'll revel in the excitement of the game reserves and enjoy all sorts of open air sports in ideal conditions. If more sophisticated pleasures have a greater appeal to you, there are many fashionable coast resorts with a gay social round, as well as the varied attractions of modern cities like Johannesburg.

You can't possibly be dull in South Africa. A friendly welcome greets you wherever you go and the day-long sunshine gives zest to everything you do.

A typical Coastal Scene.

A tall member of the Game Reserve.

THE BUSINESS WORLD

War to What Purpose?

On Wednesday, victory in the battle over British Aluminium was conceded. By then Reynolds-TI interests controlled over 50 per cent of the ordinary stock of British Aluminium. By 3 p.m. yesterday there had been a flood of acceptances of their offer, making the triumph complete. A lot of dust now has to settle. Tube Investments and Reynolds Metals will have to sort out their holdings so that the intended 51-49 per cent division of interests in their joint company is secured, leaving nominal control in this country. The Treasury still has to give its consent, though it had made it pretty clear that this would go according to the majority decision of British Aluminium's stockholders. A great battle has been won and lost. The destiny of British Aluminium is irrevocably altered and its present directorate cannot conceivably reach any *modus vivendi* with the new controlling interest. The balance of power between the successful American bidder, Reynolds Metals, and the BA board's chosen instrument, Aluminum Corporation of America, has been radically changed. And the struggle has left permanent scars on the City. Bitterness of an unprecedented kind has been provoked. The prestige of some of the City's oldest houses has been put into the hazard and has been weakened. Qualities of foresight and rational calculation on which the expertise of the City has for centuries been based seem suddenly to have taken flight; in the last crunch, some of the proud establishment sought to teach some of the newcomers a lesson—and defeat has done them and the City no good.

At an early stage, before the battle developed with such intensity and bitterness, the directors of British Aluminium lost sight of a cardinal principle in the administration of company affairs in this country. They failed to take their shareholders into their confidence and to convince them that the courses on which they were set were inevitably the right ones. Having made this irretrievable mistake, they were always on the defensive, making their counter-blows too obviously, and in their promise to raise the dividend, too dubiously. The bidders, TI and Reynolds, dictated the battle and imposed their initiative throughout.

There is plenty of room for differing views about the best arrangements for the future of British Aluminium. It remains to be proved that the Reynolds Metals interest will be the best for the company—just as it would have remained to be proved that the Alcoa participation was best, if the BA board had won the day. No point of British national prestige or interest made the one unequivocally preferable to the other. Arguments in terms of "national interest" have to be proved. In this case they were merely asserted and they were quite irrelevant. British Aluminium needed help in its development and it sought an American partner. With the same object, Reynolds Metals and TI were distinctly aggressive. But battles are won by aggression. Defeat teaches not that aggression is wrong, but that only a sound policy fully supported by shareholders provides a sufficient defence against it.

As a case study of what went wrong, the British Aluminium episode will long be worth study. Here was a company with an important foothold in British and European markets; with important developments afoot in Canada; and potentially even bigger things in prospect in Australia. It had to transform itself from an important but still modest company in this country, largely dependent upon outside sources for aluminium, into an international concern, exploiting bauxite deposits and producing its own ingots. For this, it required enormous capital; it had gone to North America for capital to bring the first two stages of the Baie Comeau project in Canada into production and a modest estimate of the capital needed to set up production in Australia was £100 million. One could be bullish about aluminium, but British Aluminium's share in the potentialities were inescapably linked with the raising of big international capital—which in

practical terms, meant linking itself with one of the established American producers. The two questions were when it should do so and with whom.

The board of British Aluminium and its financial advisers were certainly aware of these problems. But they do not seem to have addressed them with a sufficient sense of urgency. Early in 1957, they knew that American Metal Climax had acquired about 650,000 units in British Aluminium and had stopped buying. They must also have become aware that another group was seeking a link with British Aluminium—which was not identified as Reynolds Metals until a year later. The directors of British Aluminium and their advisers concentrated on raising new capital in the British market to finance the participation in the first stages of the Baie Comeau development and the exploratory stages of the other developments. There was an ill-fated rights issue, but after the preliminary moves to broaden the capital base, British Aluminium seemed disposed to wait until Baie Comeau began to make profits before deciding to proceed more vigorously there or in Australia.

THIS apparent lack of purposiveness in 1957 gave Reynolds Metals and Tube Investments the chance to make the running in 1958. Not until British Aluminium became aware of a buyer of its stock early in 1958 did it begin to seek seriously a marriage of its own choosing rather than one forced upon it. Its relations with Alcoa were already close and in June it began negotiations with that company. There were exchanges of information and a general acceptance of the idea of some kind of link between the two companies—though without firm obligations on either side. By September British Aluminium must have had a shrewd idea who the buyer was, but he was not formally identified until November 3rd, when British Aluminium, TI and Reynolds met together. The directors of British Aluminium then declined to hear the detailed proposals of TI and Reynolds on the ground that they could not negotiate with two rivals at the same time. Two days later TI sent their letter, saying that, in association with Reynolds, they would make a bid on terms favourable to BA's stockholders.

That letter precipitated action by British Aluminium. On November 14th, they signed the contract with Alcoa; it was not, apparently, until this meeting with Alcoa that the final terms of the deal were fixed. The price of 60s. per unit for the purchase of 4½ million BA shares by Alcoa was then fixed in relation to the current market price of British Aluminium stock and to the fact that the rights issue in August, 1957, had been at 58s. per share. The desire by British Aluminium directors to avoid an unwelcome union with TI and Reynolds may explain their haste. But they then committed another and more damaging error of judgment; they did not disclose to their stockholders the terms of the contract they had signed to sell a one-third interest in the equity to a newcomer.

This mistake gave TI and Reynolds, who must have got wind of the terms, the chance to turn on the pressure with a bid of 78s. in cash plus one TI ordinary share for every £2 of British Aluminium stock. The board of British Aluminium, saddled with the Alcoa deal, had then to reconcile the argument that the stock was worth a good deal more than 78s. with the fact that they had agreed to give Alcoa a dominant stockholding, and an important say in the management, at 60s. Lord Portal argued that to accept the TI-Reynolds bid was to sell "a powerful empire for the price of a small kingdom." He did not explain why Alcoa had been let in for the price of a minor principality.

This dilemma forced the board of British Aluminium and its advisers into further error. They honestly believed that the link with Alcoa was in the best interests of the company and its stockholders. Some of the institutions taking the long view were at that stage prepared to agree with them. But the better income and the cash advantage offered by the TI bid were attractive present facts, and in an attempt to counter them British Aluminium responded with a two tier dividend proposal to pay 17½ per cent to all ordinary stockholders, except Alcoa which for three years would receive only 12 per cent. Immediately, the dilemma was made worse, for this increased dividend was palpably not satisfactorily covered by earnings. The way was always open for TI to improve its own dividend—which by contrast was well covered; to that company's credit it refused any such temptation.

At this stage the issues had become clear for stockholders. They could choose a diluted and indirect interest in aluminium production and fabrication by accepting the TI-Reynolds bid. Or, by refusing to accept it, they could give their vote to the directors of British Aluminium and the Alcoa deal. At that moment the balance of decision was a fine one, but it was up to the stockholders to make up their minds about the merits of the management of British Aluminium, weighing the maladroit defensiveness of the board against the purposeful aggression of Reynolds and TI.

IF matters had been left there, the story of British Aluminium would have remained one of hard battle and nothing more. But then another and extraneous element entered the fight. A group of fourteen merchant bankers and City houses, consisting of the joint financial advisers of British Aluminium and their friends, and claiming themselves to speak for £2 million of BA's ordinary stock, offered to buy half of any holdings in British Aluminium (other than those of TI and Reynolds) at 82s. a share, subject to the questionable condition that the rest of the holdings should be held intact until the end of March. They appealed to stockholders either to retain their holdings or to accept the syndicate's offer on grounds of the "national interest." They were prepared to convince stockholders that British Aluminium was really worth more than 78s. by putting their own resources (and in some cases, those of public companies for which they are responsible) at risk and for a very lean return. All they succeeded in doing was to focus attention on the adequacy of what Alcoa had agreed to pay. Some important institutions and merchant banks in the City who were not already committed in the BA battle were noticeably absent from this group, whose action went beyond the role of stockholders and advisers. As stockholders, they had a perfect right to band together and to say in concert that they would refuse the TI-Reynolds bid. Instead, they entered the battle themselves.

THEIR action will be a matter of argument for a long time to come. If it was not likely to succeed brilliantly, it could only have been inadvisable. In fact, it failed totally and was withdrawn two days before the TI offer closed on Friday afternoon. Stockholders not committed one way or the other were unimpressed with the partial and conditional nature of the group's offer. The ordinary investor was well aware that City tempers were frayed (beyond remedy even by the Governor of the Bank of England who made an unavailing attempt to bring the two sides together nine days ago). There is no doubt at all that the operations on behalf of Reynolds Metals and TI had been resented, and this emotion may have been sufficient to explain why the affair turned into a very rough fight indeed. In the end, the less powerful but shrewder opponents have come out easily on top.

The syndicate, in fact, sealed the issue against themselves. Once the gloves were off, the Reynolds-TI group and their advisers, already ahead on points, traded blow for blow, and ended with the most telling punches of all. Reynolds Metals came into the market, prepared to buy any British Aluminium stock that was offered. Institutional holders and private investors sold enormous quantities of stock and in a matter of days the Reynolds-TI interest in BA was raised from 13 per cent to 45 per cent by the purchase of three million shares costing £12½ million. Anyone who chooses to remain with British Aluminium as a minority holder (which may include some recent sellers who decide to get in again much lower down when the dust has settled) knows what he faces. Sir Ivan Stedeford has given the clear warning that "future dividends paid on BA ordinary stock will be consistent with a prudent financial policy determined by ascertained results."

It now remains for tempers to cool and for the obvious lessons of the BA affair to sink deeply into the minds of company directors and the City. Lack of information cannot be made good by irreconcilable arguments. The City is a market where dealings should be governed by facts, convincing reasons, and proper prices. It is competitive, but its actions should not be tinged with prejudice or allowed to degenerate into feuds. And it needs always to keep pace with modern ideas of how business should be done and how investment is best conducted.

Mr Jones Gives His Orders

Two new orders for military aircraft do not spell a new defence policy; but they may spell more businesslike buying for defence

THE leader of the Opposition sent a telegram from Belfast to the Minister of Supply early this week urging him to place aircraft contracts with the local Short Brothers factory to prevent "an already serious unemployment problem becoming greatly aggravated." Such a move may be good politicking; it is not calculated to improve Short's chances of getting work. The Ministry of Supply is anxious not to lay itself open to the charge of channelling work for political reasons to a company—any company—badly hit by Mr Aubrey Jones's plan to rationalise the aircraft industry. Shorts will not necessarily lose the order for which it is now competing, that for an intercontinental troop transport. But should the company get it, this will be because the aircraft, a modified Britannia, comes closest of the four competing designs to the Army's requirements, not because of the efforts of any Ulster lobby.

The tide has recently been turning in Mr Jones's favour and the five, or at most six, strong production units into which he hopes to concentrate the sprawling aircraft industry are begining to emerge. The recent award of the engine contract for the RAF's Canberra replacement to the newly merged Bristol and Hawker-Siddeley engine divisions ensures the future of a second engine manufacturer to compete with Rolls-Royce. Although British European Airways' decision to buy a new jet from de Havilland rather than from one of the bigger airframe manufacturers was in some ways a setback to the Ministry, it did wring from de Havilland an undertaking of sorts to group with several other smaller manufacturers; and out of the nebulous Airco company they formed may come one of the three or four airframe manufacturing units in a rationalised industry. Last week's shot-gun wedding between Vicker-Armstrongs and English Electric forms the obvious basis of a second group; even if the marriage fails, Vickers alone is big enough to be considered as an independent production unit. So is the Hawker-Siddeley group, although it has the least new work in hand of any.

Whichever way the country's defence policy goes, the forces are expected to want sufficient number and

variety of weapons of some kind to keep this number of separate manufacturing and design teams in existence, although this demand will certainly not keep them fat. For anything above subsistence diet they must look to the civil market. Whether there is a marginal living to be found for yet a fourth airframe manufacturer depends on the size of the civil market and on the inconvenient manner in which the brightest ideas repeatedly turn up on the drawing boards of companies not among the Ministry's chosen few. What happens when the views of the Ministry on what is right, economically, for the industry diverge from the views of the services on what is right, technically, for the forces?

EVENTS in the past week or so provide some interesting answers. During this time new orders have been placed for a Canberra replacement, for a new Army freighter for parachute drops and a technical assessment (not yet finished) has been undertaken of designs for an intercontinental freighter. The Fairey company has been offered both more Government help for the Rotodyne and a letter of intent from British European Airways to buy six of these vertical take-off airliners, provided Fairey can arrange for the supply of engines. There has not been so much activity in the industry's contract departments for years; indeed, it is twelve months since any new aircraft—civil or military—was ordered for this country.

A note in *The Economist* last week explained that this was no sudden departure from the defence policy for the RAF laid down by Mr Sandys two years ago, but the result of a number of belated decisions foreshadowed in that defence policy and brought to a head by the sudden and apparently dramatic intervention of the Minister of Supply who saw the aircraft industry running down to a level where it would soon become incapable of handling even the essential minimum of military construction. Closer examination of these orders shows that they all favour aircraft that are either fully developed, under development or relatively easy to develop from existing types, and that the main contractor for the only radically new aircraft, the Canberra replacement, has been chosen on the company's production record more than the technical brilliance of the design. This time, the Air Staff is taking no chances. It cannot afford to back aircraft that might not arrive on time or up to specification. And this makes the Air Ministry as anxious as the Ministry of Supply to foster the formation of strong production units with the emphasis on production rather than on inventive brilliance.

The Armstrong Whitworth freighter, for example, uses Rolls-Royce Dart engines identical with those on the Viscounts; the first civil prototype is already built and made its first flight at Coventry on Thursday afternoon. The freighter was developed privately by Hawker-Siddeley, and the Air Ministry will get delivery of the first military version in the next two to three years. Although four companies are competing for the order for an intercontinental freighter, Handley Page, Blackburn, Vickers-Armstrongs and Shorts, only the last two have any real chance of the contract because they are offering modified versions of existing civil aircraft, while the others propose new machines. The Air Ministry's natural leaning is for a freight version of the Vickers VC-10 jet airliner. But a jet, and particularly one operating in hot and humid weather to Africa and the Far East, suffers from certain runway limitations.

Both the Air Ministry and the Australian Air Force decided against buying American-built military jet transports because there were so few airfields that these could use. The VC-10 may be turned down for much the same reason, namely that it might take less time to fly troops direct from A to B in a slower Britannia than it does to fly them seven-eighths of the way by faster VC-10 and then tranship them into an Armstrong Whitworth short-range freighter for the last leg of their journey. If the present technical examination of the two designs shows that the Britannia can get in and out of airfields closed to the VC-10, then this coveted and contested order will go to Shorts; the same company will also win if the rear mounted engines of the VC-10 prevent Vickers from being able to build a loading door into the tail of the aircraft of the size that the Army has specified. In either case, the Air Ministry will be buying an aircraft that is merely a variant of an existing design, with engines already fully proved.

THE same cannot be said of the "Canberra replacement," a dual purpose aircraft in which the most important single consideration is structural strength and the second most important, immense engine power. Choice of engines lay between the Rolls-Royce jet being built for the new de Havilland airliner (a new engine evolved from the Conway) and a modification of the existing Bristol Olympus. There is not much doubt that Vickers-Armstrongs would have preferred to go on working with Rolls-Royce as the company has always done, and the Rolls-Royce engine would have given the new aircraft greater range. But the Olympus gave it the shortest, quickest take-off, and so the order went to Bristol. This fitted admirably into the Ministry's plan for fostering a second big engine company, conveniently avoiding the intriguing question of what might have happened if the technical assessment had gone the other way.

The most interesting example of the change in the Ministry's and the Air Staff's attitude to the aircraft industry lies in the order for this bomber's airframe. This must be capable of high altitude flying for photo reconnaissance, which can only be done by manned aircraft, and of supersonic attack at tree-top level on bases immediately behind the front line. It is probably the RAF's last combat aircraft. These are difficult

requirements to reconcile in the same structure and English Electric began investigating them probably a year earlier than any other British company. But when the designs of English Electric came to be weighed against those of Vickers-Armstrongs, the delivery record of the two companies was also taken into account. Vickers' Valiant bomber is one of the few postwar aircraft delivered to the RAF on schedule and to the specification laid down. It is probably as much a result of this as of anything else that Vickers has become the main contractor for the new aircraft, with English Electric sending a design team to work at Weybridge under Vickers' managing director.

A decision of this type is something new in Government-industry relations. In the past, Government support of the aircraft industry has put a premium on novelty in design and a discount on conservative engineering. The emphasis in these recent orders seems to be on predictable performance and delivery. It does not follow that the Ministry of Supply has withdrawn all support from the new and untried; it is free, within the limits of research spending as a whole, to finance the type of project that no company could undertake on its own. The Rotodyne is one example. Its present troubles arise not from lack of Government support but from the fact that Fairey (along with British European Airways) wants to change the engine from Napier's Eland to Roll-Royce's Tyne, but needs the goodwill of Napier to carry on trials until Rolls-Royce can supply an engine. Research projects still under discussion include other developments in vertical take-off and in Dr Barnes Wallis's flapping aircraft wing.

IT is sometimes overlooked, however, that the Ministry of Supply is also responsible for the production of atomic weapons and that it pays for these out of its nominal research and development vote of £200 million. Production of nuclear weapons is running at a higher rate than some recent discussion might suggest. Hydrogen bombs will never be stock-piled in large quantities, even in the United States, but statements that there are no more than five in this country are certainly without foundation. The precise number is known to be less than a dozen people in this country, and these do not include the Chiefs of Staff. The switch to hydrogen warheads, and the work going on to scale these down in size so that they will replace the old A-bomb to an increasing extent has relieved some of the pressure on the supply of military plutonium in this country. The reason for the change is partly a practical, partly a political one; a hydrogen explosion produces only a fraction of the radioactive contamination of one based on the fission of uranium or plutonium. One practical consequence of the switch is that the 300 to 400 kilograms of plutonium that will be produced yearly by the Calder Hall and Chapel Cross power stations of the Atomic Energy Authority—Chapel Cross begins working this year—should, together with the diffusion plant at Capenhurst, be able to satisfy the country's military requirements without requiring the Central Electricity Generating Board to arrange for their new civil power stations to produce plutonium in case of need.

Meanwhile, there are other defence projects outside the aircraft industry making calls on the Ministry's research budget. A new armoured vehicle is under development for the Army and more may be heard in the future of anti-tank guided weapons for use by the infantry. The country's one big rocket, the Blue Streak 2,500-mile range missile, is a project that fits fairly closely into the Air Ministry's new buying policy in the sense that it is evolved from existing American rockets and should more properly be considered as a Mark II Thor built to British engineering standards and tolerances than as a completely new design. But the use to which Blue Streak is put is another matter. Pressure for a British satellite programme with Blue Streak as launching vehicle is beginning to build up among scientists in the same way that pressure is building up among aircraft designers for a Government-sponsored supersonic civil airliner programme. But these pressures are nothing compared to those applied to the Minister of Supply to find work for the idle draughtsmen of aircraft companies left out of the recent round of defence orders. This is the pressure that it is most important for him to resist—if the British aircraft industry is ever to group itself into units big enough to handle the few vital defence projects built here and efficient enough to hold their own in the civil and export markets from which most of its future livelihood must come.

BUSINESS NOTES

THE ECONOMY

The Turn Already?

BY revising upward their first estimate of industrial output in October and reckoning on a further improvement in their similar first estimate for November, the statisticians of the Treasury are now suggesting that a turn may have taken place in the economy much earlier than anybody except Mr Ian Macleod had been prepared to forecast. And a more than seasonal reduction in unemployment with a small increase in vacant jobs on offer between mid-November and early December is now on record further to justify Mr Macleod's optimism.

It is true that the revision for October should re-emphasise the need for caution in accepting these early estimates of industrial production (the Central Statistical Office reckoned that the index would be 103-104 seasonally adjusted (1954=100) and now think it was 105). The new index seems no better in this respect than the old, and as a matter of statistical nicety perhaps the CSO should think of giving a range of four points rather than two (baffling as in present circumstances this would be). Nevertheless, the profile of the recession that is now drawn by the index suggests a low point in September, with output just on 5 per cent lower than a year before, and a slight improvement since then to only 1-2 per cent below 1957 levels.

And in this apparent improvement manufacturing output, after so many months, would seem to have shared: allowing for seasonal influences, it is shown as turning a point upward between September and October.

Obviously, one cannot place too much confidence on provisional figures for a couple of months (there was an apparent upturn in July both in output and employment, which proved a false dawn). But this timetable for the turning point would accord fairly logically with the easing of credit in the middle of the year, and with the rapid response of sales of durable consumer goods to freer hire purchase terms (followed later by full freedom for everything on HP, the effects of which have still to show in these output figures). Moreover, they accord with the greater confidence expressed already in October in the FBI's sampling of business trends and attitudes. It would be early to think of any immediate improvement in the general outlook for heavy industry: the encouraging export figures for October-November seem to have been influenced partly by bunching of deliveries of certain ships and aircraft, and in the same way heavier investment spending by the iron and steel industry in the third quarter may have reflected accelerated deliveries of certain plant—from abroad as well as from Britain's own capital goods producers. But the hire purchase boom is roaring along merrily still, that predicted drop in exports looks to have been shallow and shortlived, and across a wide range of intermediate and miscellaneous industries—which the last few years have shown are more responsive to motors and consumption than to fixed investment demand—there is a smell of better business in the air.

COAL

Trimming the Plans

IF one accepts the National Coal Board's estimates of how much oil, as well as how much coal, was used in Britain last year, the total for both fuels comes out roughly the same in 1958 as in 1957, which was a year of rather higher economic activity. A crude allowance for changes in stocks and exports of coke and manufactured fuels, indeed, suggests that the country may have used in all about 1-1½ per cent more fuel—presumably as a result of much more motoring as well as colder weather. What matters to the Coal Board, however, is the market where coal could have been sold, which covers a little more than 90 per cent of total fuel consumption. Here, it reckons, total consumption was fractionally lower than in 1957, but consumption of coal was more than 10 million tons lower—because oil increased its share from 7.9 per cent to 11.3 per cent of the available market. There can be various quibbles about these calculations (was 1958 a 53-week year or not?) but their import is plain. Oil statisticians, incidentally, will be intrigued to see that the Coal Board gives every ton of oil used in competition with it a conversion factor of nearly 2 tons of coal equivalent, against the customary factor of 1.7 tons.

Sir James Bowman talked with some bravado this week about future competition from oil—"I do not ask my experts for estimates of how much more we are going to lose from coal. What I want from them is plans about how much we are going to win back." He may have taken some comfort from the increase of 5s. a ton on fuel oil announced this week (the kind of thing that nearly causes a riot if it happens to coal, which is unlucky enough not to be sold by the gallon). But the trend to oil is part of the writing on the wall that made him admit in another passage:

> I doubt very much indeed whether the future levels of demand we envisaged in our 1956 revision of the National Plan will now be realised, owing to this competition, to improved fuel efficiency, and to the Clean Air Act.

The NCB is at present reviewing its long-term plans for output—though it is hampered in this, as other people in similar boats are, by lack of guidance from the Government, which still purports to hold to estimates of expansion that have never been significantly hedged since the brave days of Mr Butler. A touch of Sir James's same bravado was evident, when asked whether if he was not hoping to sell as much coal he still needed to invest £100 million a year in creating capacity to produce it; "More vital than ever! This industry can only live on its efficiency." The mere decision to accept a lower output, in this industry with so long a tail of mines, must reduce inefficiency; why should the board's capital investment necessarily be sacrosanct?

Sacrificing the Mines

SIR JAMES BOWMAN obviously feels deeply about the decision, forced upon him by events after a year of expedients, to close 36 short-life collieries that would mostly have gone out of production in the next three or four years anyway.

> I do not have to tell my friends and colleagues how I feel about this. It is a bitter pill to swallow. But let us have it on a basis of planning. If it is to protect the great body of men employed in the industry we can only do it according to our lights and our convictions.

About 13,000 miners, he said, were involved; 9,000 of them could be found jobs elsewhere in the industry without difficulty, though this proportion would be lower in Wales and Scotland.

COAL OUTPUT & SUPPLIES
(Million tons)

	1956	1957	1958
Coal Production :—			
Deep-mined	209·9	210·1	201·5
Opencast	12·1	13·6	14·3
Total	222·0	223·6	215·8
Net exports	5·3	5·0	4·1
Increase in total stocks	1·1	6·4	10·1
Inland consumption			
Coal	218·4	213·2	202·9
Oil in same markets.....	9·5	9·9	14·4
as coal equivalent	19·0	19·6	28·3
Total oil	22·3	21·8	27·8

It is impossible not to appreciate this involvement with the men of the industry in which Sir James has spent his life—or to ignore his priorities in coal:

> It is true that 1958 has cost us money, but sometimes we can be penny wise and pound foolish. What we are spending on those stocks may be on the debit side of our achievements. It's a very little debit side. We have maintained a full working week for the British miner throughout 1958, a year in which we have not created a single unemployed miner despite the position we have faced, and we have not jeopardised our long-term capacity.

There is nothing cold-blooded about Sir James Bowman, as his former comrades ought to remember. And the detached observer must feel something of a Gradgrind in questioning whether this mood, at this moment, is quite the wisest one for the chairman of the National Coal Board, facing the continuing problems of this industry.

AFTER THE PARTY

Equities or Gilt-edged?

INVESTORS have begun the New Year by taking a cold look at what they have been doing, and a number of them have decided that they have overdone it. The psychological mood of the last two months of 1958 has been almost exactly reversed this week: gilt-edged are strongly in favour and eyes have been looking more critically at equities. Selling has not been large, and it has included some profit-taking following the big rise; but investors are now making a more careful scrutiny of earnings and immediate prospects, rather than buying all and sundry because "equities are the thing." In the week to Wednesday, *The Economist* indicator fell from its peak of 255.6 to 249.3; notable exceptions to the falling trend were Gallaher, P & O and the Midland Bank. Wall Street followed London after a lag; the Dow Jones index was still climbing until Tuesday, but on the following day it dropped 8 points to 593.

The transformation in the atmosphere of the gilt-edged market owes something to the act of convertibility, but probably more to a natural reaction from the unfounded fears of the autumn. There was also a renewal of Bank rate talk, but Thursday's silence suggests that the authorities have other priorities. The November reduction, they knew, was a calculated risk; to its credit, the Bank of England judged the forces in the market to a nicety, and the reduction has not renewed the market's fears of inflation. But it might be imprudent to take the same risk again—especially as a rate of 3½ per cent might put London bill rates below New York, and thus encourage an outflow of funds.

This week's buying of gilt-edged has included significant orders from abroad, including the United States. War Loan 3½ per cent and 3 per cent Savings 1965-75, on which interest is not deducted at source, have risen by about 1¼ points since December 31st. Most gilt-edged prices are now above their previous peak in mid-October; and the authorities, quick to take advantage of the favourable turn in mood, have brought forward a medium sized local authority issue, £5 million for Fife County Council. The coupon is still 5½ per cent; the price of 99½ and life of 1974-76 give a gross redemption yield to latest date of £5 10s. 11d. per cent. This is only 4d. below the yield that was offered in October on the Lanarkshire issue, the last local authority to get under the wire before the gilt-edged market turned sour. The run of corporation issues before then was an unhappy one, remembered by the underwriters for many weeks. Fife may give something to the stags, but by making the terms attractive the City sponsors have improved the prospect for further small trustee issues.

FOREIGN EXCHANGE

Convertible Pounds In Demand

TURNOVER in the London exchange market this week has continued to be larger than before the establishment of official convertibility for transferable accounts. The market has settled down following the first rush of profit-taking sales of sterling previously bought in the transferable market, and of covering of bear positions in French francs. Sterling had to be momentarily supported by the Exchange Account early last week, but since then the tide has turned and this week the authorities are believed to have gained considerable

amounts of dollars and Continental currencies. Foreign balances have been returning to London and for the most part are not being covered by forward sales of sterling.

The exchange markets shrugged off the big deficit in the European Payments Union in the last settlement period, up to December 27th, as a consequence of special operations in anticipation of convertibility. Sterling has risen against the dollar this week to $2.80\frac{1}{2}/\frac{5}{8}$, fully up to the level of the previously restricted category of convertible sterling. It would have risen appreciably beyond this figure had it not been for considerable purchases of dollars by the Exchange Equalisation Account. The market reports steady selling of dollars from the Continent. In the now fully integrated market, arbitrage quickly spreads the impact of any one influence over the whole range of rates. Sterling has risen significantly against the D-mark (to over 11.72, above the pre-convertibility level) and has recovered against the Swiss franc, to around 12.10 (following the drop from 12.18 to $12.04\frac{1}{2}$ after the widening of official margins).

London's great attraction is the closeness of its dealing margins, and the modesty of its commissions. On January 3rd the pound was quoted in Zurich at 12.08-12.14; in London the quotation against Swiss francs was $12.11\frac{1}{2}$-$12.12\frac{1}{2}$. The sterling-dollar rate was quoted in Zurich at $2.80\frac{1}{8}$-$\frac{5}{8}$, in London at $2.80\frac{3}{8}$-$\frac{1}{2}$. A similar contrast exists in the gold markets. As a result, now that London has full freedom of international dealing, it is attracting the lion's share of it.

Another Credit for the Franc

THE French franc this week has remained fairly steady at 13.76 against the pound. Some confusion has arisen in this market from mistakes about which francs, heavy or light, the dealers were quoting, with a result that one or two operators have found themselves long or short by a hundred-fold in the position they had intended to establish. In the forward market, the franc is quoted at a small discount and there is still a small premium on the gold bar in Paris. But the French authorities now have available substantial reinforcements of their own $1 billion of dollar,

The Business of Retailing

THE welcome speed of publication of the initial findings of the 1957 Census of Distribution shows how justified was the installation of an electronic computer in the census office. Unlike the first picture of Britain's shops and shopkeepers taken in 1950, this second census was a sample inquiry only; information was obtained from all the largest retailers but from only 10 per cent of the small traders.

When these sample figures have been rated up, it seems that there were fewer shops in 1957 than in 1950, although the apparent reduction of 1 per cent in numbers is little more than the possible error introduced by sampling. However, there is no doubt that in these seven years both the multiple retailers with 10 or more branches and the co-operative societies have ousted some of the "independents"—defined as those retailers with fewer than 10 branches. Yet these independent shopkeepers still account for over three-fifths of Britain's retail trade.

TURNOVER OF SHOPS, 1957

	No. of establishments	Turnover £ mn.	Turnover per shop £
Grocers and provision dealers	148,988	2,040	13,690
Other food retailers	126,689	1,560	12,310
Confectioners, tobacconists, newsagents	77,429	706	9,120
Clothing and footwear	93,347	1,150	12,320
Household goods	64,787	884	13,640
Other non-food retailers	58,488	579	9,900
General stores	3,715	872	234,720
Total retail trade	**573,443**	**7,790**	**13,580**

The total turnover of all the 573,443 shops was £7,790 million. This was 53 per cent higher than the turnover recorded in the 1950 census—a result which blessedly agrees exactly with that obtained from the retail trade figures collected monthly by the Board of Trade. Since the prices of goods sold over the counter probably increased in this period by just over a third, the volume of retail business rose by around 14 per cent.

The multiple chains have taken the lion's share of new business in both food and non-food shops—but only by taking on the biggest increase in staff; in 1957 they employed 30 per cent more people than in 1950 to give them their additional 72 per cent in cash turnover. Total turnover per employee appears indeed to have risen less for the multiples than for other retail organisations. But the implications of this will not be clear until fuller details of the census are available; comparisons must be affected by differences in the composition of trade and by the larger proportion of part-time workers employed by the multiples, who rank equally with whole-timers in the count.

The census reflects the striking changes in food retailing between 1950 and 1957—the movement towards ever larger food shops and more general ones. While grocers and provision dealers increased in number, there was a reduction of 9,000 in all kinds of food retailers. In particular, the small bakeries are disappearing, their numbers having dropped precipitously from nearly 20,000 to 13,400. Altogether, the share of the small shops in the food trade has fallen from 62 per cent to 59 per cent.

Rather strangely, the census did not collect information about the method of trading, but the official report has drawn on other sources to conclude that there were in 1957 nearly 2,000 co-operative food shops and some 850 multiple food shops run on self-service lines with a combined turnover of more than £150 million, over £100 million of which was in the co-operative shops. In 1950 the comparable figure had been £17 million. Adding in the self-service food departments of department stores and the independents, self-service food turnover in 1957 was put at "probably well over £160 million."

Another striking increase between 1950 and 1957 was in mail order sales which had risen from less than £50 million in 1950 to some £130 million in 1957. Fuller information about mail order trading will be published later as will information on wages, stocks, gross margins, credit trading, all of which should add up to a fairly full picture of the retail business.

"Help—let me out!"

Many motorists may have wondered, seeing the rather technical look of some petrol advertisements, just what it's all about. Perhaps, blinded by science, they may even wonder whether there is very much in it after all!

This is a pity, for big things have been happening to petrol. It is better – and *different*. A first-class high-octane petrol such as Super Shell can be produced only by the most advanced refinery processes which lead to better fuels at economic cost.

But refining is only half the story. Additives play an increasing part in giving motorists the higher performance they need. You may remember the first important additive – tetraethyl lead – which in 1922 sensationally reduced petrol "knock". Today, a premium petrol may contain as many as ten additives, most of which never reach the headlines, but each with a special function.

The latest, and most important since tetraethyl lead, is I.C.A. – the Ignition Control Additive based on tricresyl phosphate – which was developed by Shell Research to overcome serious problems of power loss and rough running due to engine deposits. These deposits upset the smooth rhythm of ignition and are particularly troublesome in today's high-compression engines. I.C.A. has proved the answer. It was a triumph of fundamental research, far removed from an advertising "stunt". It is vital in modern cars, and it is exclusive to Shell.

Super Shell with I.C.A. gives you modern petrol at its powerful best, with the added pleasure of a really smooth engine. It is a striking example of how Shell, through the quality of its products, is contributing to better and more economical motoring everywhere.

YOU CAN BE SURE OF SHELL

As I see TI... "The home is where all things start, and that is where I see TI", says Heinz Kurth, the German designer, asked to give his impressions of Tube Investments Limited.

Where the heart is...

Many housewives will agree with Heinz Kurth. Electric cookers with the fastest boiling plates, spin driers, water and space heaters—all under the familiar name of "Creda"—come from one TI company, as do switchgear. From others come Pel taper tube furniture ; Phillips, Hercules, Norman and other bicycles and mopeds for the family ; Drynamels decorative paints ; vitreous enamel ovenware ; Mersey electric cables ; roller skates, Apollo sports goods ; and parts for refrigerators, vacuum cleaners, pressure cookers, venetian blinds, roofing ... Soon perhaps there may be a TI home : Metal Sections already designs and erects prefabricated buildings.

gold and foreign exchange reserves. In addition to the central bank facilities of $250 million reported last week, leading US commercial banks are making available a standby credit of $200 million to be used when necessary to help maintain the franc parity. Morocco and Tunisia have decided not to follow the franc in its devaluation and the new rate of 1,000 Moroccan or Tunisian francs to 1,175 French francs has now been established.

THE RESERVES

Gold and Convertible Currencies

THE statement of the reserves for December bears a significant difference from the previous series. As a result of the unification of non-resident sterling from December 29th, the Treasury points out, and of the announcement of convertibility of the main European currencies, the statement now embraces official holdings not only of gold and dollars but of all convertible currencies. The Treasury has therefore decided to express the reserve figures in pounds sterling rather than in dollars. This may be a justifiable touch of panache, but so many people are used to looking at the reserves in terms of dollars, to which gold is still keyed at $35 an ounce, that it may be helpful to express the reserves in both pounds and dollars, as we do below. The inclusion of convertible currencies other than US and Canadian dollars does not involve "more than an insignificant amount"; presumably there has been some fall in holdings of OEEC currencies from the level of £8 million in mid-June, the latest published figure. The overwhelming proportion of the total, consisting either of balances in US dollars or gold earmarked for Britain in the vaults of the Federal Reserve, will in any case have been converted by the Treasury from dollars to sterling in the first place.

Unfortunately the figures themselves in the December statement were rather poor, though in all the excitement this did not attract much attention. The reserves had been expected to fall, and the loss of $146 million was more than accounted for by the payment of $196 million on North American debts, and of $11 million to the European Payments Union in gold settlement of the November deficit. But in the last settlement period before the replacement of EPU, from December 1st to December 27th, Britain incurred a deficit in the Union of £40 million—easily the biggest since the crisis months of 1957. It involves a gold payment this month of $84 million. Thus on a current basis, there was a net dollar deficit in December even after allowing for the special debt payments ; and this was the first such deficit since September, 1957.

RESERVES BEFORE CONVERTIBILITY

December .....£ mn.	− 8	− 52	1,096

* Adjusting for one month lag in EPU settlements, for $250 million drawn from Export-Import Bank in October, 1957, for small receipts of US aid and for special payments, including $196 million last month on North American debt. December figures slightly distorted by inclusion for first time of non-dollar currencies now convertible.

A substantial part of the EPU deficit is ascribed to further *ratissage* by the Bank of France ; though some of the sterling thus clawed back by the French authorities must surely have been offset by sales of francs for sterling by private French speculators. Another big influence in Britain's EPU deficit was the heavy selling of sterling against Swiss francs, in anticipation of the widening of the official margin of fluctuation in this market following the establishment of convertibility. German banks among others were selling sterling against Swiss francs as well as withdrawing some funds from London for their own seasonal needs. Germany's surplus in EPU in December rose to £53 million, and Switzerland had a surplus of £13 million. Germany has this week foreshadowed full formal convertibility for the mark, for residents as well as non-residents.

AIRLINE FARES

Stalemate on Jets

THE conference on the fares to be charged by airlines for jet services was to have been resumed in ten days' time in Paris ; it has been postponed, apparently indefinitely, while the three airlines in the thick of the fight meet privately in New York to attempt their own compromise, having tried unsuccessfully to find one in London last week. This is an issue on which it is not easy for either side to make concessions. Two of the three airlines, Pan American and BOAC, have jet aircraft in regular daily service between Europe and North America—the only international airlines to do so. The third, Alitalia, emerged during stormy discussions last autumn as spokesman for the majority of airlines, which will not have jets in service for another year or so. Fearful of the effect of jet competition on their own traffic, they have demanded a surcharge on all jet fares. The Italian government refused at one point to allow Pan American to fly its jets into Rome without such a surcharge ; under an uneasy truce, Pan American has since been operating jet services to Rome at normal fares.

The International Air Transport Association, through which the airlines have successfully fixed world air fares every year since the war, dare not risk another breakdown. According to the rules, air fares must be agreed unanimously at IATA meetings and must then be referred to governments, which hitherto have given virtually automatic approval. Every new tariff has a time limit, and the present arrangements expire on March 31st. If the airlines have not then reached agreement about new fares, the cartel agreement automatically lapses and operators would be theoretically free to charge whatever they like. No airline believes that anarchy in fares is workable or tolerable to governments. But until the issue about jet fares is settled, a new tariff cannot be extracted from the IATA rate-fixing machine. Hence the importance of getting the three airlines to agree privately on a common policy so that this can be put to a full meeting of all the airlines, who will be

greatly relieved to rubber-stamp it. Neither BOAC nor PAA have changed their attitude to a jet surcharge, which they feel with some reason would drive passengers off their aircraft into the arms of competitors. What they need is a formula to allow Alitalia to climb down without too great loss of face. Pooling may offer a way out. But the ordinary air traveller will think that a better policy would be to aim at reducing fares on other services. Let the airlines show, if they can, that there are no commercial arguments for lower fares on turbo-prop and other non-jet services. There are none for a surcharge on jet services.

HONGKONG COTTON

Better than Nothing

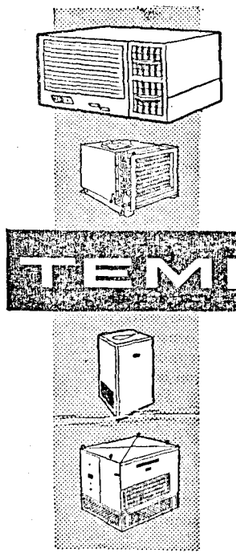
THE undertaking announced this week by the Hongkong textile industry to limit its exports of cotton piece goods for home consumption in the United Kingdom brings to an end—if not to an entirely happy end—the negotiations that have been in more or less constant progress since Lord Rochdale's mission to Hongkong last September. The undertaking limits exports (but not re-exports) to the United Kingdom of cotton piece goods to 115 million square yards annually for a period of three years; the limitation will be put into effect some time this year. It also provides that exports of yarn-dyed cloth and towelling in excess of four million square yards a year will be subject to a limit of three million square yards; and whereas a shortfall in the overall quota may be carried forward for the first half of the succeeding year, any shortfall in finished goods will lapse. No explicit limit has been placed on exports of made-up goods, much to Lancashire's dismay. However, there is an overall ceiling of 161 million square yards, so that if exports of made-up goods exceed the equivalent of 46 million yards in any year, exports of piece goods will be correspondingly decreased. Cotton yarns and threads and a number of made-up goods are entirely exempted from the undertaking.

The initial reaction in Lancashire to the announcement has been—as could be expected—that the limits are not sufficiently severe. Imports from Hongkong during the first eleven months of last year were running at the rate of 135 million square yards, of which 94 million were grey cloth, three million finished cloth, and 38 million made-up goods; to Lancashire, the present undertaking therefore sounds like no limit at all. But imports from Hongkong had been steadily increasing in recent years; and the present figure is considerably lower than the one previously proposed by the Hongkong industry, although much higher from the Cotton Board's original request. Though yarn is not included in the undertaking, the amount of yarn imported from Hongkong is a negligible part of British production.

Thus the badly-winded Lancashire cotton industry has been given a breathing space. It will not be a very deep breath; nor will it be a long-lasting one, since the undertaking has been made for three years only and there is no reason to count on its being renewed. Furthermore, should economic conditions deteriorate badly during the life of the undertaking, the Hongkong government—which will administer the undertaking—may have it withdrawn. Thus the modernisation and re-equipment of the industry, so long overdue, will have to come in a hurry. As India and Pakistan have been kept in touch with the Hongkong negotiations, Lord Rochdale's expressed hope that they will observe the agreements reached last year in principle presumably has a firm foundation.

BUILDING SOCIETIES

Bids for Sheerness



AT the moment when the City of London was profoundly disturbed by the battle for British Aluminium, three building societies put in rival bids to absorb the Sheerness and Gillingham Building Society. This is an unfamiliar sight in a non-profit making movement but it is not a matter for surprise or for criticism. The Sheerness and Gillingham society has about £3 million of assets and its reserve ratio is particularly strong—much stronger indeed than that shown by some bigger societies intent on expansion. That is the major attraction to the rival bidders. Its mortgages are well spread throughout the country, but the directors seem to have been disturbed by the rate of withdrawals by local shareholders and depositors. They were thus disposed to consider the possibility of merging with another society. Other societies facing similar problems have gone out to seek the best possible terms for their shareholders; one such case was Newcastle-under-Lyme which considered competitive offers and which finally agreed to a merger with Leek and Moorlands because that society offered the best terms to shareholders. The directors of Sheerness and Gillingham, however, do not appear to have shopped around in this way and they accepted the terms of a merger, including a bonus of 5s. per cent to shareholders, proposed by the neighbouring society Hastings and Thanet. But that proposal did not receive the necessary majority at a meeting of shareholders and Hastings and Thanet then raised its offer to 25s. per cent. Before the meeting to consider this improved offer, the Co-operative Permanent, which last year took over the Scottish Amicable and seems to have digested this not too palatable meal fairly well, stepped in with a bonus offer of 40s. per cent. And then Leek and Moorlands, which is also intent on expansion and is not so well represented in Kent as the Co-operative Permanent, went one better by offering 70s. per cent. No one seems likely to improve on that, and it is now up to the shareholders of Sheerness and Gillingham to decide. The directors of Sheerness and Gillingham do not care for these outside and unsolicited offers and they may prefer the proposals put to them by the Hastings and Thanet, which are accompanied by security of office or compensation. But in a friendly society as much as in a public company, shareholders should look to their own interests and Co-operative and Leek and Moorlands have done them a service.

Abbey National's Expansion

PRELIMINARY figures of the Abbey National for its year to December 31st show a growth in total assets from £278 million to £304 million: previously only the Halifax had passed the £300 million mark. The Abbey National improved its ratio of liquid assets from 14.4 to 15.6 per cent in 1958; but its reserve ratio is down a little, from 3.80 to 3.79 per cent, still comfortably above the 2½ per cent stipulated for societies eligible for the new government facilities, but equally below the traditional recommendation of the Building Societies Association of 5 per cent. New receipts from shareholders and depositors during 1958 rose to £57 million, compared with £48 million in 1957; the preliminary figures do not show withdrawals, but these are unlikely to have risen much. Accordingly, the society was able to grant new advances of £41 million, compared with

Extremes of heat, dust and humidity need not affect health or efficiency. Temkon air conditioning units make normal living possible in some of the worst climates in the world. LORD BIRKETT'S BROADCAST TO BRITAIN NEEDS YOUR RESPONSE

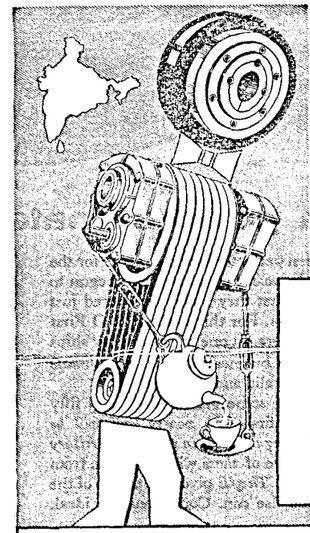
Week's Good Cause, broadcast all Home Services, December 21st.

"If you have been blessed with home and friends, think for a moment of those for whom *every* day means misery and hunger, and perhaps illness, in some cheerless refugee camp. . . . A Korean orphan boy who has lost an arm or a leg can be kept and trained in a special home for six months at a cost of £5; 10/- will feed a hungry boy in Jordan for a whole month.

"I hope there will be many large and substantial gifts, but there is no gift, believe me, so small that it will not relieve somebody's suffering."



Please send a generous donation to:-

Lord Birkett, 17 Broad Street, Oxford.

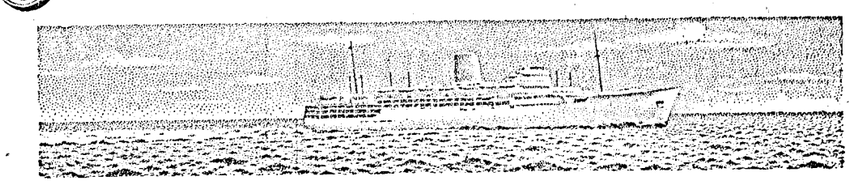
Such a good climate - for business



These men would have been perfectly happy to settle for the sun, the sea and the sky. It wasn't until they had begun to pool information and ideas that they really discovered just how favourable this climate is. For this is the P & O First Class Service to Australia. Here, in one of the mighty ships of the P & O fleet the British businessman gets an *intimate* line on the prospects in Australia and the East.

You can see why. Out of some six hundred and fifty fellow passengers travelling first-class *nearly half will be people with similar or connecting interests in the same territory as yourself.* A high percentage of *those* will be people from the very area you are visiting. *They'll* give you the lie of the land you're visiting as none else can. Conditions are ideal.

On P & O both the sun and the service wear a smile. You have time to know people, to pursue ideas without interruption, to rest properly. You do more constructive work in four weeks at sea than you do in four months at home. Yet you arrive back fresher than when you left!

If you have interests in Aden, India, Pakistan, Ceylon, Malaya, the Pacific or 'Down Under'—it *pays* to travel *all or part way* by P & O First Class Service to Australia (or the Far East). Special seasonal terms and Executive Tickets are available. Ask someone to check *now* with your Travel Agent or with P & O direct. 14/16 Cockspur St., S.W.1. Tel: WHI 4444 or 122 Leadenhall St., E.C.3. Tel: AVE 8000.

P&O *First Class to Australia is an investment*

£38 million in 1957. Money seems to have been coming in to most of the bigger building societies fairly well in recent months, enabling them to lend a bit more freely. But some of the smaller and medium sized societies are still feeling the pinch. The prospect of trustee status, for some, is making its mark.

SALES ON HIRE PURCHASE

Record Month, Record Year

THE boom in sales of motor vehicles on hire purchase continued during December; 102,530 contracts—nearly eighty per cent more than a year before—were concluded during the month. Although this was fewer than in November, when the highest total for any month was recorded, it represented a new peak for credit sales of vehicles during the month of December, and brought to a close a record year of hire-purchase dealings. Figures released by Hire Purchase Information show that sales of new cars on hire purchase totalled 10,630 during December, compared with 13,399 in November and 5,621 in December, 1957; used-car contracts were 54,413, against 71,718 in November and 39,808 a year before. HP sales of both new and used commercial vehicles were higher than a year earlier at 4,051 and 9,139, although both were lower than in November. Sales of motor cycles, on which hire purchase controls were removed in mid-September, fell during

The High and the Low Road

THE gondola of the balloon that had drifted across the Atlantic on the trade winds reached land at approximately the same time as Soviet engineers lost contact with their moon rocket nearly 400,000 miles out in space. The two voyages have much in common. They are practical demonstrations of what has been known for a long time to be theoretically possible. They prove that those theoretical predictions have been remarkably accurate. And there is an engaging futility about both enterprises that sounds echoes of science's lost age of innocence.

The technical effort required to send the Russian rocket to the moon is roughly equal to that required to despatch a warhead of several megatons, weighing perhaps two tons in all, from Soviet Russia to the heart of the United States. These big ballistic weapons have a certain flexibility and a rocket vehicle with a sufficiently big motor to enable it to carry death and destruction across those distances will also be able to put a fairly sizeable satellite into orbit or, if necessary, to shoot a smaller package one quarter that size out of the earth's orbit altogether to the moon and beyond.

Where the package goes depends on the speed it is given. Less than 18,000 miles an hour, and it will fall back to earth. At 18,000 miles and above it will begin to orbit the earth as an artificial satellite. At 25,000 miles an hour, it breaks away from the earth's gravitational pull and travels into space. The speed reached by the package depends on the power of the engine behind it, and it is calculated that motors of 600,000 pounds thrust were required to lift the 200 ton rocket vehicle that propelled Planet X past the moon.

The scientific results sent back by the four transmitters of this rocket are completely dwarfed by the immense effort that went into its launching. There is intense interest among scientists of certain disciplines to get first hand, factual information about the composition of outer space and what nuclear particles drift about it. They are interested in cosmic rays and the existence or otherwise of a magnetic field on the moon. But not even the Russians would build and develop a moon rocket just to discover this or even to see, by television and other means, whether the moon is really made of green cheese.

But once big ballistic rockets have been developed and have to be tested, there is more sense in harnessing them to shoot sputniks into orbit and baby planets out into space than there is in idly banging them from one end of a test range to another. The Russians have a bigger incentive. They possess no range long enough to test their biggest 8,000 mile range ballistic missiles and perhaps the only means of proving these is to fire them into space and check from their velocity and the direction in which they travel whether their motors, instruments and guidance systems are working properly.

The extreme accuracy of the Russian moon-shot is one of its most alarming implications. Earlier American attempts have failed for a variety of reasons, because the rocket tilted more than it should at launching or because motors failed to light; the one American rocket that did travel some way into space had faults in its scientific instruments. The Americans were attempting the more difficult task of orbiting round the moon, which involves the use of forward-firing rockets to brake speed of the package of instruments as it approaches the moon. Yet they never expected to be able to launch a missile with such precision that it would almost graze the moon's surface as it passed by.

The other disturbing aspect of the Russian experiment is the indication it gives of Soviet progress in rocket motors. The biggest rocket built in America, the Atlas, uses a total of nearly 400,000 pounds of thrust to lift it off the ground where the Russian moon rocket probably has 50 per cent more power behind it. As with aircraft, the heart of a rocket is its engine, and American missile designers have been handicapped, as it now seems, by the constant need to scale down the size and weight of the skin, the instruments and the payload carried by their rockets to fit the size of engine available to power them—all of which makes for a cheaper rocket.

The Vanguard satellite programme almost certainly failed through an attempt to scale down the rocket to a point where it was impossible to get reliable engineering. The Russians almost certainly succeeded in all their experiments in space because their engineers and instruments designers were given plenty of room and plenty of spare power for rugged equipment not built to over-fine tolerances. Even if American reports are correct that the Russians have been trying on and off to reach the moon even since Sputnik 1 was launched in 1957, they are still the first to have succeeded.

The future of space exploration seems closely tied up with military rocket developments. At this moment, military interest in outer space and the moon is an academic one, but there is considerable research into the development of sizeable reconnaissance satellites that would transmit back to earth pictures of the territories over which they passed. Thanks to the tilt of the earth, a satellite launched in the right direction will gradually cover every corner of the globe. The rockets that will ultimately launch these satellites will give scientists the chance to send bigger payloads out into space; when the military begin to put men in satellites, scientists will have the beginnings of their first moon ship.

The satellites and the moon rockets have proved that scientific calculations about the requirements for space travel, by man or by geiger counter, have been gratifyingly accurate. They have also demonstrated the difficulty of translating these calculations into practical engineering. These difficulties have led the Americans to experiment along bizarre lines with winged rockets that would borrow some of the properties of the aeroplane and send a crew skimming along the outer fringes of the atmosphere, but most British engineers are sceptical about their chances of success. This country incidentally will have no stake in outer space until the Blue Streak rocket—which could serve as a small satellite launcher—is built and working.

December in line with their normal seasonal pattern but were nonetheless nearly twice as high as in December, 1957. The total number of vehicles sold on hire purchase in 1958 was 1,289,014, an increase of 18 per cent over 1957.

The record activity in credit sales of motor vehicles during November was reflected in a rise of £40 million in outstanding hire-purchase debt to a total of £567 million, according to provisional estimates released this week by the Board of Trade. This was an increase of 7-8 per cent, compared with an increase of two per cent (£12 million) in October, when restrictions on HP sales of vehicles were still in effect. But the Board of Trade states that rather more than half of the increase in total debt during November was accounted for by household goods. Restrictions were removed on some of these goods—notably furniture—in September, and relaxed on most others; vehicle sales thus responded more rapidly to freedom from control than did household goods. These goods account for less than half of the total hire-purchase debt, and thus accounted for a more than proportionate share of the rise during November; Christmas shopping and a seasonal fall in vehicle sales make it likely that this was repeated in December.

LIFE ASSURANCE

Another Bumper Year

ORDINARY life assurance and annuities business shows no sign of slackening; 64 offices whose 1958 figures have been announced reached a record of £1,593 million for new sums assured, compared with £1,335 million in 1957. This shows an increase of 15 per cent compared with 11 per cent in 1957 and 13 per cent in 1956. Industrial life assurance, though expanding less rapidly, also seems to have had a record year in 1958.

Sales of individual policies seem to have been buoyant, and new life assurance and pension benefits under employees' schemes also reached new records. The prospective widening of the scope of state pensions will presumably have reduced the number of brand-new schemes arranged with the life offices. New business from recruits entering existing schemes and from higher pay levels continues to mount. Only one office specifically mentions Millard Tucker annuities for the self-employed, but these are bringing in a useful, if unspectacular, flow of new money. There is no indication about the volume of overseas new business, which has accounted in recent years for about 15 per cent of the total new sums assured. The life offices have, however, at last taken the point that premium income is a better measure of saving than new sums assured; nowadays a £10 premium may assure as little as £100 or as much as £5,000 according to the nature of the cover. This year the majority of offices give details of new premiums, which show an increase of 8 per cent, half the rate of increase in sums assured. Total premiums paid in 1958 for life assurance must have approached £300 million (including about £30 million overseas), and for annuities (mainly insured pensions) at least £120 million.

Last year's growth of ordinary life and annuity funds must have been fully £275 million; and in addition, industrial life funds are expanding by about £50 million a year. The boom in equities and the useful recovery in fixed interest stocks brought welcome replenishment to inner reserves that had been sharply reduced. An average life office portfolio will have shown an appreciation over end-1957 values of over 9 per cent of total assets; offices with an above-average stake in equities should have done even better. The bumper bonuses now being declared on participating policies reflect in the main the benefits of high interest rates.

MONEY

Not So Suspect

THE average level of bank deposits in England probably rose in 1958 by more than in any year since 1954; yet the economy was less inflationary. The explanation lies largely in the changes in money velocity. In the years when they were trying to check the boom, the monetary authorities found that it was not sufficient to check the rise in total deposits, if the general economic climate encouraged

To any town thinking of drinking sea water—

Mad idea? Not a bit of it. Go mad if you drink it? Nonsense. Not today; not with modern evaporators; certainly not with the newly developed Richardsons Westgarth evaporator. This tidy and compact piece of plant will distill for you—from sea water—anything up to 250 tons of fresh water every hour. And by fresh we mean crystal clear, far purer and softer than good drinking water supplies. Of course, large sea water evaporators are not, in themselves, anything new; Richardsons Westgarth and many other people have been building them for years. But this latest R.W. evaporator is the result of a radically different approach in design. It is indeed something quite new in its simplicity of operation, relatively low first cost, and ability to go on delivering full output—without having to be shut down for cleaning—for months or years on end and with almost negligible attention and maintenance. Fresh water from sea water now becomes feasible economically where cost had hitherto put it out of court.

people to turn over those deposits more quickly. Correspondingly, in the past year, part of the impact of monetary expansion has been offset by the greater caution that has been induced in spending habits. Turnover through the London Clearing House (which excludes internal clearings through branches of the same bank and also local clearings) rose by less than 5 per cent, compared with 8 per cent in 1957; excluding the Town clearing, which is heavily weighted by stock exchange transactions, the rise was 3.5 per cent, compared with 6.3 per cent in 1957. Turnover through the much smaller provincial clearings actually fell, by 1 per cent; the fall was wholly in the three big centres of Liverpool, Manchester and Bradford. Crudely measured by expressing the figures of cheque clearings as a multiple of total deposits, money velocity was virtually unchanged in 1958, following a long run of increases.

A similar tendency has been apparent in the course of the note circulation. A rise in the note issue is much less a cause of inflation than a reflection of it. In 1958, notes held outside the Bank of England, including the commercial banks' till money, rose by £42 million, or 2 per cent; this followed increases of £110-£120 million in each of the four preceding years. Circulation of notes among the public is estimated to have risen by about 3½ per cent in the first ten months of 1958, but the rate of increase was slackening markedly towards the end of that period.

Another manifestation of the more chastened financial mood of 1958 can be seen in the rise in "small" savings. The national savings movement reports an excess of new savings over withdrawals of £216 million in the calendar year, compared with £76 million in 1957. In the first nine months of the fiscal year from the beginning of April, new savings reached £149 million, whereas in the same period of 1957 there was net dissaving of £29 million. Savings certificates and defence bonds have done well; their unchanged terms are markedly attractive against a background of lower rates. Many surtax payers have switched into them up to the permissible limits. And a good number of small savers, as in the past, must have been adding to their savings certificates at the same time that they have increased their hire purchase debt. But total personal savings have probably gone on rising.

SOUTH AFRICA

Cheaper Money

THE South African Bank rate has this week been cut by ½ per cent to 4 per cent. Bank rate is changed rarely in South Africa—it had stood at 4½ per cent since 1955—and moves in recent years to set up a money market have not led to any greater flexibility. In particular, the South African authorities have been reluctant to raise interest rates to the levels dictated by London. Instead, they have imposed restrictions on the outflow of funds to other parts of the sterling area. Those restrictions are still in force; but the Reserve Bank feels that the reductions in the London rate to 4 per cent now justify a reduction in South Africa, which will presumably be followed by corresponding adjustment of money market rates. The Reserve Bank had no wish for hot money from London to take advantage of higher rates in South Africa; and it is anxious to give a stimulus to industry, after the recent interruption of its postwar expansion. Yields on medium dated and long dated government stocks, however, are not being changed—in South Africa these rates are pegged by the government. Nor has there been any marked response so far in the equity markets.

SUDAN AND JUGOSLAVIA

Political Loans

THE British Government has agreed to make a credit of £5 million available to the Sudan for up to five years. The credit will be arranged under section III of the Export Guarantees Act, and administered by the Export Credits Guarantee Department. The rate of interest has yet to be decided; the interesting point here is whether Sudan is given the benefit of the "Montreal policy" of charging Commonwealth borrowers only ¼ per cent over the rate at which the British Government itself borrows in the London market. Certainly, political considerations have ranked high in assisting Sudan out of its financial difficulties in this way. In another "Foreign Office" credit, to Jugoslavia, Britain has undertaken to provide £3 million; presumably this also will be arranged through the ECGD machinery.

TANKERS

New Tonnage for BP and Esso

BRITISH PETROLEUM has announced this week that a new company, Warwick Tanker Company, has been formed jointly with Houlder Brothers to take over contracts for the construction of two tankers of 35,000 deadweight tons each, previously on order in British shipyards. Warwick Tanker has an issued fully paid-up capital of £500,000; the two tankers will be financed partly through these resources and partly through a combination of bank loans and an issue of 6¼ per cent first mortgage debenture stock believed to total around £5 million. One of the vessels will be delivered by Hawthorn Leslie to BP Tanker Company in March, 1960, and the other by Cammell Laird in July, 1960. As with the £52 million worth of new tanker capacity for which BP has similarly raised outside capital this year, these two vessels constitute a part of BP's tanker building programme through 1960; 26 vessels, stated to cost over £80 million, will be built between 1960 and 1963.

It has also been announced this week that negotiations are in progress to increase the size of two tankers being built for Esso Petroleum from 47,000 to 70,000 deadweight tons each. If completed, these vessels would rank among the largest in the world, and would be the largest ever built in Britain; they would also be too large to be used at Esso's refinery at Fawley, and would thus be confined to operating at the company's refinery at Milford Haven—at present under construction and due to be completed late in 1960—which will be able to accommodate vessels up to 100,000 tons. But the final decision to build these giants has not yet been taken, and officials of the Walker yard of Vickers-Armstrongs at Newcastle-on-Tyne, where the two ships are to be built, this week announced that up to 60 redundant welders are being paid off; the remaining welding force are reported to have decided on a self-imposed shorter working week.

COMPANY MEETINGS

THE STEEL COMPANY OF WALES LIMITED

THE CHAIRMAN'S STATEMENT

MR HARALD PEAKE ANNOUNCES ANOTHER SUCCESSFUL YEAR

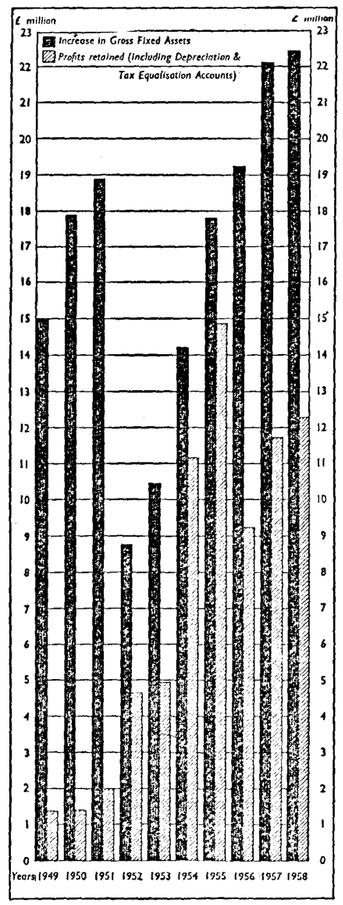
EXCELLENT PROGRESS BRINGS THIRD DEVELOPMENT PLAN NEAR COMPLETION

In a year during which the iron and steel industries of both the United States of America and of the United Kingdom have experienced a marked depression, the Company has been successful in attaining a modest increase in turnover from £109,488,348 to £113,329,707. This has been made possible by a very active selling organisation and by the outstanding achievements in the export market of our many customers in the motor, engineering, electrical and packaging industries. These achievements place upon us a great obligation to make available to them in increasing quantities materials of the highest quality as and when they are required. In spite of lower prices in the export market, the total value of our direct exports was £27,407,000 compared with £29,543,000 in the previous year. If the value of the indirect exports of our customers' goods is added, the total value of our products sold in the export market during the past year has increased considerably.

Expenditure on Capital Account during the year amounted to £22,473,818, most of which was in connection with our third development plan.

The average earnings of our workpeople continued to rise during the year. A small part of the increase is due to the operation of the cost of living clause in the wages agreements. The greater part is due to the continuing expenditure on new plant and machinery and to improved production methods.

The number of shareholders on the register is now 31,500. Approximately 40 per cent of the ordinary shares are held by insurance companies and trustees of pension funds representing many hundreds of thousands of policy holders and pensioners.



The Directors feel amply justified in recommending a final dividend and a special interim dividend which will bring the return to the holders of the risk capital to 9 per cent, less Income Tax, during a period of twelve months. If the recommendation relating to final dividend is approved, the average rate of interest on the ordinary share, Debenture and Loan Capital for a period of twelve months is 6.7 per cent. The rates of interest on the Debentures and on the Loans were fixed on a commercial basis in March, 1957.

Conditions during the past year have not been easy and the staff and workpeople have every reason to be proud of the results achieved.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The Sales and Other Income together with the Costs of Production and Other Charges have been included in the Consolidated Profit and Loss Account for the first time to give shareholders a clearer view of trading conditions.

Trading surplus before depreciation amounts to £22,181,916 compared with £18,980,450 in the previous year. In the prospectus issued in connection with the offer for sale of the Company's shares in March, 1957, it was stated that by January, 1958, the trading profit should be running at the rate of £20 million per annum. The Directors are pleased that, in spite of more difficult trading conditions, their forecast has been justified by results.

Provision for depreciation is higher than last year by £448,659 at £6,108,228 as a result of bringing additional plant into use.

Interest on Debentures and Loans is higher than last year by £370,624 at £4,534,841, due partly to heavier borrowing and partly to higher rates of interest on Loans.

Taxation on profit for the year at £6 million is £1,500,000 greater than last year, due partly to higher profits.

Dividends, less Income Tax, totalling 6 per cent for the year, of which 3 per cent was paid on July 31, 1958, and 3 per cent is recommended to be paid on February 4, 1959, take the some amount as in the previous year. A full explanation regarding dividend policy is given later in this statement.

If the recommendation as to final dividend is approved, the balance of profit carried forward to the next account is £7,725,334 compared with £6,006,487 brought in.

BALANCE SHEET

Whilst it is obligatory to publish a Consolidated Balance Sheet in addition to the Company's Balance Sheet, the two are so nearly the same that I shall comment only on the former.

The issued capital remains the same. Borrowing on Debentures and Loans has increased by £8,500,000 to meet in part the cost of the third development plan.

Fixed Assets Replacement Reserve is increased by £2,500,000 to £8,800,000 by a transfer from the year's profit. The amount set aside for future taxation is higher by £4,350,000 at the formidable figure of £23,900,000.

Current liabilities and provisions total £23,209,357, being £1,431,739 higher than a year ago. The increase calls for no special comment other than to say that the total is affected by expenditure on development, and by taxation resulting from higher profits.

Under Fixed Assets the only significant change is under development schemes, where the expenditure to date on plant not yet in operation has increased by £18,270,515 during the year to a total of £31,117,286. This reflects the good progress which has been made with the third development plan.

Current assets call for no special comment other than to note a welcome reduction of £1,192,001 to £16,760,013 in the value of stocks, including stores.

DIVIDEND POLICY

In the prospectus issued at the time of the offer for sale of the Company's shares by the Iron and Steel Holding and Realisation Agency in March, 1957, it was stated to be

the intention of the Directors to pay an interim dividend of 2½ per cent (less Income Tax) on the ordinary capital in September, 1957, and to recommend a final dividend of *3½ per cent in January, 1958*. Also that the aggregate of these dividends which total 6 per cent would represent a rate of approximately 8 per cent on the average of the paid up capital during the year to September, 1957. Later in the prospectus the Directors stated that by January, 1958, in the absence of unforeseen circumstances, the trading surplus should be running at the rate of £20 million and that they would expect to be able to recommend dividends totalling 8 per cent for the year ending in September, 1958.

In the event the results for the past year have come out substantially better than the Directors' forecast. Having regard, however, to the incidence of Profits Tax, the Directors are recommending a final ordinary dividend of 3 per cent for the year to September, 1958, making with the interim of 3 per cent a total of 6 per cent—the same as for the previous year.

In addition, the Directors are declaring a special interim ordinary dividend of 3 per cent in respect of the year ending September, 1959, payable at the same time as the final dividend for last year. This special dividend will not be taken into account when consideration is given to the payment of further dividends for the year to September, 1959.

In the absence of unforeseen circumstances, the Directors will declare a further interim dividend of 3 per cent in July, 1959. The amount of the final dividend must, of course, depend on the results of trading during the current financial year.

THIRD DEVELOPMENT PLAN

By the end of the year payments to meet expenditure on this plan amounted to £30,938,956 out of the estimated total cost of *£52,500,000. Excellent progress has been* made during the year and the main producing units are expected to be in operation between now and the end of June, 1959. It is hoped that an ingot production rate of 3 million tons per annum will be attained early in 1960.

STEEL DIVISION

In spite of the inevitable interference with normal working which results from the constructional works relating to the third development plan, the division has done well to increase annual ingot production from *2,095,000 tons in* 1957 to 2,178,000 tons in 1958.

Profit has been substantially higher due, for the most part, to the completion of the second development plan.

Among the records set up during the year was the discharge of 83,350 tons of imported iron ore at Port Talbot in a week in June, 1958. The previous record was 73,600 tons.

In September, 1958, *the melting* shops beat all previous records by the production of 48,295 tons of steel ingots in a week.

The blast furnaces have operated very well during the year. Coke ovens production has been slightly in excess of requirements and repair work on the older ovens has been *completed.*

Since the end of the financial year, after many months of preparation, a task of the greatest difficulty has been completed satisfactorily in a period of twelve and a half days with the minimum interference with normal production. The original slabbing mill was dismantled, before being despatched to a purchaser in Canada, and an entirely new mill of much larger capacity, built by Davy and United Engineering Company of Sheffield, was installed in its place. Part of *the normal production of steel ingots* which would have passed through the old mill during this period were put into stock for use at a later date. Steel slabs which should have been produced by the old mill during this period were purchased from other steel works at home and abroad in order to maintain production of steel sheets, plates and tinplate. A thousand men working in continuous shifts by day and night completed this unprecedented changeover thirty-six *hours ahead of scheduled time. The tech*nicians and men who planned and carried out the work in conjunction with the makers of the new mill deserve the highest praise for their enthusiasm, skill and endurance.

TINPLATE DIVISION

The financial year started *in October, 1957,* with a serious shortage of orders which, in spite of the closing of the remaining old type hand mills, necessitated some short time working at both Trostre and Velindre during the first six months. In the early summer demand for tinplate both at home and abroad increased above the normal seasonal variation and full time has been worked regularly. Over the year the output of the division was 670,000 tons compared with 703,000 tons last year.

In September, 1958, the mill at Trostre achieved a record output of 11,304 tons in a week. In July, 1958, Velindre had a similar record week of 9,604 tons.

Profit for the year was rather lower than in the previous year owing to the reduced output and to lower prices all round, *especially in the export market. During the* year 240,168 tons of tinplate were exported compared with 248,375 tons a year ago. Export sales of tinplate represented 36 per cent of our total sales of tinplate in the year. The whole of the Company's production of tinplate now comes from the new Works at Trostre and Velindre. It is believed that there are no more up to date or efficient works in the world. They are set in the Welsh countryside and the working conditions and amenities are second to none.

NEWPORT DIVISION

A development scheme costing approximately £2 million was completed and has operated fully since early in 1958.

The division was working to capacity early in the year but during the middle months it was affected adversely by a world-wide recession in the electrical sheet trade.

A further development plan estimated to cost £2,250,000 is now proceeding and should be in partial operation late in 1959. The purpose of this expenditure is to expand the production of electrical steel in sheet and *coil form.* The most highly specialised type is known as UNISIL, deliveries of which have nearly trebled during the year.

A new and improved canteen for staff and workpeople is being built.

The profit for the year was substantially higher than a year ago due to an improved demand for high grade electrical steels and to new plant coming into operation.

SALES ORGANISATION

Since 1956 special attention has been paid *to setting up an efficient and world-wide* selling organisation to meet the more competitive conditions which were foreseen. The Managing Director, Mr Julian Pode, has during the period visited Australia, New Zealand, East and South Africa, South America, France, Italy and Germany, in all of which areas our sales agents are active. These top-level meetings with agents and customers are of the greatest possible value. The Sales Controller, the Honourable Michael Layton, and members of his staff, have also visited regularly many overseas markets. At the present time the Company is actively represented in thirty Commonwealth and foreign countries.

Great improvements have been made in the packing of our various products. The distinctive containers and the quality of their *contents are becoming more and more* recognised.

On March 31, 1958, the Iron and Steel Board announced a general reduction in steel prices for the home market, the first to be announced since 1938. At the same time the Tinplate division introduced a new price structure designed to give additional advantages to the users of light-weight tinplate, thus enabling our customers to compete more effectively with other packaging materials.

DIRECTORATE

Mr S. E. Graeff, who joined the Board when the Company was formed in 1947, is an American citizen and has recently taken up residence in America. Consequently he has decided not to offer himself for re-election.

An acknowledged authority on continuous wide strip mills since their earliest days, Mr Graeff has been the Company's principal technical adviser on the rolling mill side. The results attained by the hot strip mill at the integrated works at Margam and by the cold strip mills at Trostre and Velindre provide proof of his skill and experience. The Directors will miss the presence of a greatly respected colleague at their meetings.

PERSONNEL

At the end of the year the Company was employing 20,053 men and 1,502 women, a total of 21,555 staff and workpeople. In addition, 4,947 men were employed on development work.

In January, 1958, the Directors announced that the Company had reached a state of development which enabled them to introduce a non-contributory pension and life assurance scheme for works employees. Embodied in the scheme were provisions to enable an employee to contribute either to secure an additional pension or to secure a lump sum payment at retiring age. At the present time all of the eligible works employees, numbering 14,091, are enrolled in the scheme and of this total 4,338 members are contributing towards additional pensions and 6,135 towards securing a lump sum payment at retirement age. The voluntary contributions for additional benefits are now running at a rate of £101,000 a year.

The Company is very proud of the work of its National Savings Committees and it is good to be able to report that the rate of saving has not been adversely affected by the contributory element of the works employees pension scheme already referred to. During the year National Savings within the Company amounted to £853,300 and no less than 79.5 per cent of employees were regular savers.

Recruitment for all branches of our work continues to be good and a large number of our staff and workpeople have undergone specialist courses of training at home and abroad.

During the year 77 members of the technical staff visited the USA, Germany, Russia and other countries to investigate and discuss a wide range of technical subjects.

Prizes to the value of £3,000 have been paid to 438 members of the staff and workpeople for suggestions which have, in many cases, led to useful results in operating technique.

FUTURE DEVELOPMENTS

The original development plan for the Company cost approximately £73 million and was in operation by the end of 1952. The *second development plan cost* £54 million and came into complete operation during the summer of 1958. The third plan estimated to cost £52,500,000 is expected to be completed towards the end of 1959. Shareholders may wish to know what further developments, if any, are contemplated.

In general, it is satisfactory to be able to report that production estimates have been exceeded in nearly every case. Our object now is to utilise to the full the surplus production capacity of certain units. The Directors have under consideration certain projects which, if carried out, would have the effect of further increasing the production of tinplate at a fairly early date and at a comparatively low cost. A scheme on these lines might cost approximately £5 million and this expenditure could be met from the Company's internal resources.

PROSPECTS

The current year has opened with full time working in all divisions and the order book for the first quarter of 1959 promises well. In the second and third quarters production capacity is expected to increase as a result of additional units coming into operation. A greater trading surplus is essential to enable the Company to meet the interest on the heavy capital cost of *the third development* plan. The task ahead of us is to sell in the more competitive markets at home and abroad the increasing production of our steel and tinplate Works. A thriving national export trade is the key to our future prosperity.

In my statement a year ago I appealed for a standstill policy in regard to nationalisation in order to allow the industry time to complete its developments and to increase its exports. I make the same appeal today.

There is abundant evidence that the British public is becoming increasingly critical of the disappointing service given by nearly all of the nationalised industries. The threat of re-nationalisation of the iron and steel industry, however, still exists. Under these circumstances, I should be evading my responsibility if I did not express the view that re-nationalisation would be disastrous to the Company and to our staff and workpeople. I am convinced that under nationalisation rigidity and frustration are inevitable. It would be difficult to maintain, much less to expand, sales in the export market in competition with countries whose iron and steel industries are not nationalised.

In the interest of our country, our staff and workpeople, and our customers, re-nationalisation must be avoided.

STERLING ESTATES

The thirty-first annual general meeting of Sterling Estates Limited, was held on December 30th in London, Mr Douglas Overall, JP, FAI, chairman, presiding.

The following are extracts from his circulated statement for the year to September 30, 1958:

The Group's Gross Rental Income of £259,857 shows an increase of £15,917 over that of the previous year; increased revenue from the Associated Company and the surplus of £26,694 arising from the sale of property brings the total income for the year to £295,451.

Your Directors recommend a final dividend of 7 per cent, making 11 per cent for the year.

In view of the changes in the rates of Profits Tax your Directors decided not to recommend an increase in the dividend for the year under review, but since the close of the year they have declared a special interim *dividend of 3 per cent for the current* year, which will be paid with the final dividend of 7 per cent.

Your Directors recommend that £64,287 of the Capital Reserve be capitalised and applied in issuing fully paid shares in the proportion of 1 Share for every 10 held. It is anticipated that in addition to the special interim dividend declared for the current year on the existing capital, the Directors will, in the absence of unforeseen circumstances, be able to recommend interim and final dividends totalling 14 per cent on the enlarged capital for the year ending September 30, 1959.

The report and accounts were adopted.

BRITISH TABULATING MACHINE

PROPOSED MERGER WITH POWERS-SAMAS

The fifty-second annual general meeting of The British Tabulating Machine Company Limited will be held on January 29th in London.

The following is an extract from the circulated statement of the chairman, Sir Cecil M. Weir, KCMG, KBE, MC:

The business transacted in our Company's Golden Jubilee Year which has now come to an end fittingly constitutes a *record in our* history.

On July 4, 1958, it was announced that we were *proposing to enter into a merger with* another important British Company in the same general field of business machines, Powers-Samas Accounting Machines Limited. Between the two Companies we shall offer users a greater choice of punched card equipment than has yet been available from any one source and in addition our electronic developments will provide a wide range of calculators and computers of varied and diverse capacities.

The statement then outlined the progress that had been made in the production and use of the Company's electronic machines and continued: I mentioned last year that the introduction of electronic equipment had not reduced the market for punched card machines. This, we believe, will continue to be the case for a long time to come.

In the overseas areas in which we have for long been established the number of Hollerith users has continued to grow.

BARCLAYS BANK DCO

ANNUAL GENERAL MEETING

The thirty-third Ordinary General Meeting of *Barclays Bank DCO was held on* January 2nd, at 29 Gracechurch Street, London, E.C.3.

Mr Julian Stanley Crossley (the Chairman) presided.

The Secretary, Mr C. F. S. Pringle, read the notice convening the meeting and the auditors' report to the stockholders.

With the concurrence of the stockholders present, the Report and Accounts and Statement by the Chairman, which had been previously circulated, were taken as read.

The Chairman spoke of the change in the financial climate during the year covered by the accounts. At the time of the last meeting, Bank Rate had been 7 per cent, sterling was under pressure and the credit squeeze at its tightest. In the USA, on the other hand, the authorities had adopted a cheap money policy to counteract a depression. Now within one year the position had been almost reversed. This background had called for unusual vigilance on the part of the Bank's staff and particularly from the General Managers and others in the most responsible posts. *The rapidly changing economic* and social pattern, particularly in Africa and many of the new countries the Bank served, called for qualities of a high order, not only in the technical field, and the Chairman said he knew stockholders were grateful to the staff for the way they measured up to their very considerable responsibilities.

The Chairman referred to the appointment of Mr H. S. Morony and Mr J. P. van Heyningen as Assistant General Managers in South Africa and wished them well in their new posts.

THE DIVIDEND

Finally the Chairman spoke of the increase in the dividend from 8 per cent to 9 per cent, and said that though small, this was the most that the Directors felt able to recommend under present conditions, with the economic outlook still so uncertain.

The Chairman then moved the adoption of the Report of the Directors and the Statement of Accounts and the payment of a final dividend of 5 per cent actual on £12,932,250 Ordinary Stock, making 9 per cent for the year, less income tax at the standard rate of 8s. 6d. in the £.

The motion was seconded by Mr A. C. Barnes, Deputy Chairman, and carried.

The retiring Directors, Mr Anthony Charles Barnes, DSO, OBE, The Honourable Sir Geoffrey Cokayne Gibbs, KCMG, and Mr Cuthbert Fitzherbert, were re-elected.

On the motion of Mr J. D. Cowen, seconded by Brigadier E. C. Pepper, the auditors, Messrs Deloitte, Plender, Griffiths and Company, Price Waterhouse and Company, Peat, Marwick, Mitchell and Company and Cooper Brothers and Company, were reappointed.

A vote of thanks to the staff, proposed by Mr P. V. Emrys-Evans (a Director) and seconded by Sir Frank Newson-Smith, Bart, was carried unanimously and was responded to by Mr J. F. Cade (a General Manager).

A vote of thanks to the Chairman was proposed by The Right Honourable The Lord Mancroft, KBE, and was unanimously accorded.

SOUTH DURHAM STEEL AND IRON COMPANY

SATISFACTORY RESULTS DESPITE SOME ADVERSE CONDITIONS

RECORD PROFIT EXCEEDING £7 MILLION

DIVIDEND INCREASED TO 12 PER CENT

MR B. CHETWYND TALBOT ON BENEFITS FROM CAPITAL EXPENDITURE

The sixtieth annual general meeting of South Durham Steel and Iron Company Limited, will be held on January 28th at Caxton Hall, Westminster, London, S.W.

The following is the statement by Mr B. Chetwynd Talbot TD, chairman and managing director, circulated with the report and accounts for the year ended September 27, 1958.

The financial results for your Company's past year show the gross profit, including £13,721 income from investments, amounting to a total for the year of £7,106,417, which is a record, compared with £5,131,207 for the year 1956-1957, equivalent to an increase of 38 per cent over the profits earned in the previous financial year. It will be noted that the profits after deducting Directors' Fees, Pensions, Depreciation and Interest Charges amounted to £5,141,117, compared with £3,760,360 in 1956-1957, or an increase of 37 per cent over the previous year. I particularly draw your attention to the fact that we introduced Workmen's Pensions and Life Assurance Schemes from January 1, 1958, to which I referred in my remarks last year. The cost for the nine months amounted to £81,371 and has been given effect to in the above results.

CAPITAL COMMITMENTS

In commenting on the Balance Sheet figures as at September 27, 1958, you will note the capital expenditure, including routine capital expenditure, incurred during the year amounted to £8,502,601. Of this total, approximately 43 per cent was secured from your Company's resources by way of sums set aside for depreciation and transfers to reserves. The capital commitments as at September 27th still to be expended on Stage Two Development amounted to £2,585,526. The principal items of plant on which this money will be expended comprise the completion of (i) boiler plant and turbo alternators and (ii) a large diameter blast furnace and ancillary equipment, both at West Hartlepool Works. Benefits will be secured from these items of plant as and when they come into operation towards the end of the present financial year, and also from the improved ore discharging facilities on the River Tees which are in the final stage of completion at Cargo Fleet Works.

The balance of capital expenditure outstanding at September 27, 1958, as authorised by the Directors on the Stage Three Development amounts to £43,450,362, in addition to which there is, of course, the anticipated working capital which will be required.

STOCKS AND WORK IN PROGRESS

You will note that the value of stocks and work in progress has increased by only £137,000, whereas debtors have decreased by £500,000 compared with values at September 28, 1957. This decrease in debtors is chiefly due to the fall in demand towards the end of the financial year for the products of the Cargo Fleet Works.

The temporary investment in Government Security of £1,489,447 and the cash at Bankers and in hand of £1,305,450, compared with the Bank overdraft last year of £2,701,149, was the surplus from the issue of £8 million 6 per cent Convertible Second Debentures in March of this year. It is anticipated with capital expenditure progressing according to schedule and production remaining at its present level that these amounts will be absorbed in the early part of 1959, following which the loan arrangements with Barclays Bank and Finance Corporation for Industry to which I refer later will come into effect.

During the financial year under review the investment allowances reserve has been increased by £250,000 to an amount of £1,630,000, and the replacement of fixed assets reserve by £300,000 to an amount of £1,250,000. These appropriations, together with the sum of £1,750,000 transferred to general reserve, amount in total to £2,300,000 for the year.

A GRATIFYING RESULT

There was a falling off in the demand for the home and export markets for the products of your Cargo Fleet Works and I am, therefore, gratified to report to you the substantial increase in the Company's profits during the financial year under review. This was mainly due to certain units of plant of the Second Development Scheme coming into production during the year. The steel outputs of your West Hartlepool Works were increased and substantial benefits accrued from the boiler plant, the turbo alternators and sinter plant at Cargo Fleet. In addition there was increased benefit from the extensions at the Pipe Works at Stockton resulting from additional outputs.

I think you will consider the results for the year satisfactory, especially in view of the adverse conditions prevailing during the last few months of the year. Despite the falling off in orders from the shipbuilding and engineering industries, production at the West Hartlepool Works and the Pipe Department at Stockton-on-Tees has been fully maintained. Your Company is actively engaged in efforts to obtain further orders in world markets for the rolled steel products of your West Hartlepool and Cargo Fleet Works and also for the specialised products manufactured in the finishing departments at the Stockton-on-Tees Works. While the level of production of heavy sections and rails at your Cargo Fleet Works is being adversely affected by the recession in the heavy steel trade the demand for pipes at your Stockton Works continues; consequently the Stockton Works and your West Hartlepool Works, which supplies the plates for the Stockton Works, should not be substantially affected and the total profits for the year ending September 26, 1959, should not show a drastic curtailment.

NEW INTEGRATED STEELWORKS

In my Statement last year I referred to the financing of the new integrated steelworks on the site of approximately 530 acres of land—known as the South Works—which links up as regards rail connection and inter-works services with the existing North Works at West Hartlepool. Your Directors decided to proceed with the full scheme, as the necessary finance has been made available from the issue of the £8 million 6 per cent Convertible Second Debentures made during the year, from the loans arranged from the Finance Corporation for Industry Limited and our Bankers, and anticipated retentions from future earnings.

The capital expenditure and working capital of £66 million mentioned in the Prospectus dated March 14, 1958, comprised:

	£
Second Development Scheme and Working Capital ...	7,500,000
Routine Capital Expenditure ...	3,500,000
Third Development Scheme and Working Capital ...	55,000,000
Making the total	£66,000,000

It is with great pleasure that we congratulate the United Engineering & Foundry Company of Pittsburgh, USA, on their execution and prompt delivery of the slabbing mill for the South Works.

Work is proceeding on our developments according to plan and all departments should come into operation in accordance with our estimates provided there is no interruption by events outside our control.

I must place on record my view that in order to keep prices competitive with those of other countries and to encourage capital investment, the question of the restoration of the Investment Allowances should receive the very serious consideration of the Government.

TRANS-CANADA PIPELINE COMPLETED

During the year the Trans-Canada Pipeline was completed and your Company was congratulated on the quality of the pipes which it supplied and the deliveries thereof. The official opening of the pipeline has not yet been arranged, but it is my intention to endeavour to attend this function as I did the opening of the Westcoast Transmission Pipeline in October 1957. On the successful completion of the welding of the final joint on the Trans-Canada Pipeline, which incidentally comprised two South Durham steel pipes, I received an appreciative letter from the President of the Bechtel Corporation praising South Durham for the outstanding part the Company had played and the great contribution it had made to the Western Hemisphere and Canada in particular by supplying several hundreds of thousands of tons of large diameter steel pipes. These have aided materially in the early and successful completion of the Westcoast Transmission Pipeline and the Trans-Canada Pipeline projects.

During the course of my travels and those of Mr R. W. Baillie and other Pipe Works executives to ensure site requirements were being met and in search of contracts, it has become obvious to us that there will be an increase in the use of pipes for the transportation of natural gas and oil. It is, therefore, the policy of your Board to keep in touch with the large developments at present subject to investigations and negotiations. These projects are in Western and Eastern Canada and at many other different points on the American Continent, including Latin-America.

OTHER IMPORTANT CONTRACTS

In addition to the deliveries to the Trans-Canada project we have executed during the year contracts for the supply of pipes for Iraq and the Middle East to the value of over £4½ million in connection with the vast developments in those areas as well as deliveries to the Latin-American countries.

We have been successful in obtaining contracts for over £2,800,000 for the supply of 22 in and 24 in pipes to the Argentine. Future prospects so far as the demand for the supply of the products of the Pipe Works are concerned appear to be very encouraging.

Deliveries of substantial value were made during the year of other specialised products, particularly Rendhex Foundation Columns for oil companies in the Middle East, and we have been successful in obtaining the order for the supply of Rendhex Columns and Decking for the harbour at Malta. The value of these contracts exceeds £2 million.

PROPRIETORSHIP OF EQUITY AND DEBENTURES

I take this opportunity of referring to the proprietorship of the Equity capital and Debentures of your Company in view of the issue at £95 per cent of £8 million 6 per cent Convertible Second Debenture Stock 1978/83 which was made in March, 1958. The number of holders of the 8 million Ordinary Shares as at December 1, 1958, was 16,000 and represented an average holding of 500 shares. The holders of the £3 million 5¼ per cent Debenture Stock 1976/81 at the same date amounted to 1,800 and represented an average holding of £1,666 Debenture Stock. The holders of the £8 million 6 per cent Convertible Second Debenture Stock amounted to 2,500 and represented an average holding of £3,200 Debenture Stock. Many of these Shares and Debentures are held by Insurance Companies and Pension Funds, so that the ownership is in fact even more widely spread than these figures indicate.

I mentioned last year that it would be the policy of your Directors to maintain the rate of dividend on the Equity capital of your Company at a level in relation to annual profits and your Directors have pleasure in recommending an increase in the final dividend this year to 8 per cent, making 12 per cent for the year compared with a total of 10 per cent last year.

RENATIONALISATION

You will no doubt expect me to say a few words on Renationalisation. In my opinion Nationalisation of Steel should not continue to be a political issue when the Steel Industry is already effectively supervised by the Iron and Steel Board and the Ministry of Power on behalf of the Government. It has been admitted by a member of the Shadow Cabinet that Renationalisation of Steel has nothing whatever to do with its present efficiency. It is entirely a political issue.

The Iron and Steel Act, 1953, empowers the Iron and Steel Board, consisting of consumers, producers and trade union representatives, to exercise a general supervision over the Iron and Steel Industry which includes the fixing of maximum home prices and the power to recommend the Minister to undertake any development project which may be thought necessary.

Your Company, like others in the Industry, is taking steps to see that the real facts on the matter are put before the public.

THE DIRECTORATE

Mr Astley Barton tendered his resignation from the Board on November 30, 1958, and we express our appreciation of the valuable services rendered by him. Mr Barton joined the Company in 1920.

You will have noted from the Directors' Report that the Secretary, Mr W. A. Metcalfe, was elected a Director of your Company in November last. Mr Metcalfe has been employed at the Company's Head Office for the past 35 years and your Board have every confidence in his abilities on the Accountancy and Secretarial sides of your Company. I am sure you would wish me to express to Mr Metcalfe every success on his appointment.

In concluding my remarks I would like to place on record my tribute and that of the Directors to the services of our staff and workpeople during the year and I am confident we can look forward to their continued co-operation in the future.

J. H. FENNER & COMPANY (HOLDINGS) LIMITED

The twenty-second ordinary general meeting of this Company and subsidiary companies was held on January 7, 1959, at the Queen's Hotel, Leeds. The following extracts are taken from a Joint Statement by Mr C. Bradshaw, FCA, the Chairman, and Mr S. B. Hainsworth, FTI, the Managing Director and Deputy Chairman.

Comments on Financial Position: The consolidated net profit of the Group is £486,118, compared with £449,593 for the year ended August 31, 1957. After adding the balance brought forward from the last Account of £384,588, and the amount of £3,763 being a reserve for taxation no longer required, the sum of £874,469 has been appropriated as shown below:

	£
Provision for Taxation	260,063
Transfer to Mortgage Debenture Sinking Fund	9,705
Dividend on Preference Shares	3,953
Dividend on Ordinary Shares	43,125

leaving a balance to carry forward to next year of £557,623.

The Reserves of the Company are considerable and for a number of years it has been possible for the Company to finance its growth and the increase in its facilities out of its own resources. Consequently, the Reserves are, in the main, permanently employed in the business. The Board have therefore, decided to recommend the capitalisation of part of the Reserves by the free issue of Ordinary Shares to the Ordinary stockholders at the rate of one fully paid Ordinary Share of 5s. for each two Ordinary Shares held and the issue of one fully paid Preference Share of £1 for each 16 Ordinary Shares held. The necessary Extraordinary General Meeting of the Company to deal with this matter took place immediately after the Annual General Meeting.

J. H. Fenner and Company Limited: This has been a difficult year for trading. There has been a lessened demand for mechanical power transmission drives to be fitted to new machinery in this country and we find that shrinking overseas markets close up faster than growing ones develop. Under these circumstances, we are happy about the results that have been achieved, and they represent an enormous amount of hard work on the part of your Executives and staff. We do not expect a quick improvement in the general economic climate and we anticipate less satisfactory results in the future than those we are now able to report.

And in connection with the economic climate, we believe that in an industrial country such as ours, which has to rely upon its capacity to export for the maintenance of its high living standards, there is something to be said for the creation of economic conditions which force manufacturing companies to be efficient if they are to survive. We ourselves have seen industries abroad which, by means of quotas and tariffs, have so protected themselves that genuine competition from makers in other countries is ruled out. In such countries the high protective fence which is built round manufacturing industries makes for a soft and easy life inside. We do not think that in the long run a soft and easy life for UK manufacturing industry would be helpful. It would be very nice in the short run, but it weakens instead of toughening. We ourselves have had some hardening over the year and have come out of it at the end in pretty good shape. Never before have we done so much in the way of improving our products and developing new ones, and we plan to do even more in this direction during the coming year. We are not deceived by the prosperity which arises out of an inflation which has not yet, in our opinion, been checked.

Taper-Lock.—The application of this device, the quickest and easiest method of fixing to shafts, has been further widened by its use in the "Fenaflex" rubber tyre couplings which we began to make and sell this year. Something like 85 per cent of all the pulleys we make are now fitted by the Taper-Lock method and already there are more than a million of them in use. During the year we completed the transfer of our pulley manufacturing operations to the new factory in Hull with consequent benefit both in administration and production.

Premium V-Belts.—Our leadership in the field of V-Belt design, manufacture and application continues, and the Premium V-Belts we were the first to make in this country—they employ Terylene for the load-bearing cords—have now proved our claims to three times normal life, thus bringing greater economies to many industries.

GENERAL MATTERS

We are engaged in a competitive industry, a very competitive industry, with all the hazards and the opportunities that are in the way of such industries. No one makes claims for special treatment, or subsidies, or the injection of new capital into our sort of business on the grounds that we are a strategic industry, or that if we are not supported in some way from outside our own resources, business and employment would be lost to this country. We have to stand on our own, and we do not even hope for, or think of, help from outside. Perhaps it is as well. We have to look carefully at the items of expense we incur, we have to examine projects in detail to see whether they are likely to develop and pay off within a reasonable time, we have to employ and encourage only those who come into our organisation prepared to work hard and to be rewarded only if the business is prosperous. All this makes for a tough, hard organisation, as being the only type that can live in the world competitive field in which we operate.

BANK OF CEYLON

YEAR OF SATISFACTORY PROGRESS

REVIEW OF POLITICAL AND ECONOMIC CONDITIONS

MR H. V. PERERA'S STATEMENT

The Annual General Meeting of the Bank of Ceylon was held on December 20th at Colombo.

The following is an extract from the statement of the Chairman, Mr H. V. Perera, QC, on the report and accounts for the year ended September 30, 1958:

The political and economic storms which have blown over Ceylon during this year have been some of the worst in recent history. Some of these misfortunes were caused by factors beyond our control, but others are to a large extent attributable to our own folly and short-sightedness.

Prices of some of our export commodities have been the lowest on record in recent years and our external trade has been in the doldrums from time to time. In the early days of the year, unprecedented floods ravaged a large part of the countryside and also some townships, but the misfortunes of our distressed people were alleviated to some extent by foreign aid, given promptly and spontaneously.

During the early months of the year strikes were a common feature and labour discontent continued to grow throughout the year. In May, civil strife spread far and wide and the Government was compelled to impose a state of emergency which still continues in a modified form. The repercussions of some of these events on the social, political and economic life of our country and on its people have been widespread. The immediate cause of the civil strife may appear to be communal or political differences, but in the last analysis these differences are due to social discontent arising from the economic disease of inadequate employment opportunities against the background of a fast growing population in a virtually stagnant economy.

ECONOMIC ACHIEVEMENTS—AGRICULTURE

Looking at the other side of the picture we may reflect awhile on a few of our achievements in the economic sphere. In the field of agriculture, the rehabilitation of rubber and coconut is a significant development, and credit is due to the Government and the planting interests for the systematic manner in which lands have been manured and replanted so as to obtain increased yields at lower costs, thus helping us to meet our competitors on more favourable terms. The rehabilitation of tea lands is also receiving the attention of the Government and we may expect the benefits of this undertaking to accrue in full measure in the course of the coming years.

The Honourable the Minister of Agriculture has put forward a comprehensive plan for agricultural development which involves, among other schemes, the nationalisation of foreign-owned tea estates by payment of compensation based on stock exchange prices. Provision is made in the plan for the replanting of uneconomic land now in cultivation and for the opening up of lands for new crops. Other needs such as easy credit, insurance and marketing facilities are to be met by provisions such as multi-purpose co-operatives, crop insurance and price support schemes. The views expressed in the plan particularly on nationalisation of foreign-owned estates and State-monopolised Boards for supply and distribution, may not be acceptable to the Government, but certain other parts of the plan would probably be adopted by the Government in due course.

On the subject of the nationalisation of foreign-owned estates I would do no more than make the general observation that we should consider the State-ownership of any instrument of production not as an end in itself but as a possible means to an end, and have due regard not only to other relevant factors, such as increased costs of production, which bear on the achievement of the end in view but also to possible repercussions of such a step on our economy in general, as for example the discouragement of desirable foreign investment and the reduction of the earning capacity of our exports.

INDUSTRY

No overall plan for industry has yet been formulated, but some industrial development has nevertheless been undertaken by Government, and plans for further development are encouraging. In this connection we must not fail to acknowledge our indebtedness to Governments abroad for financial assistance in promoting our industrial projects.

What I would like to see however, is a greater participation of the private sector in industry. We need more private effort in economic activity because, in my opinion, healthy private enterprise is a pre-requisite of democracy. Any undue growth of State intervention in the industrial, agricultural and commercial life of the country constitutes a threat to true democracy.

We welcome the long-awaited statement by the Government of its policy on foreign private investment in Ceylon. With the adequate safeguards which have been proposed, we have nothing to lose and much to gain from foreign private investment in this country. Of special significance is the assurance by the Government that it will not consider for the next ten years the question of nationalising any new private foreign investment.

While these inducements are encouraging, they are not enough. The period of guarantee may be too short for some investors, but what is more pertinent to the encouragement of foreign investment is not so much the assurance of freedom from nationalisation over a period of time, although this in itself is important, as the business and investment climate in the country, and the certainty that adequate compensation will be provided in the event of nationalisation. In the unsettled conditions prevailing in Ceylon today I do not think that the Government's statement of policy in this connection will evoke much foreign interest in investment here, though it is a step in the right direction; and I hope that with the passage of time, more stable conditions and the right investment climate will be created for foreign private capital, which may then be expected to come in appreciable quantities and partake in joint ventures with Ceylonese entrepreneurs.

BANK OF CEYLON

The Assets of your Bank as at September 30, 1958, amounted to Rs 777 million, representing an increase of Rs 35 million over the assets as at the end of the previous financial year.

The Bank's advances reached an aggregate of Rs 179 million, an increase of Rs 19 million over the figure of the previous year. These advances were granted in the form of Commercial Advances, Personal Loans, Medium Term Loans backed by Medium Term Deposits, and the discounting of bills for exports and imports. In view of certain recent developments in banking in the UK, it is worthy of note that the Bank of Ceylon has over the past twenty years been engaged in the Personal Loan business where modest advances are granted to customers without tangible security. About one year ago the Bank also introduced the equated instalment personal loan.

Total deposits of all commercial banks were Rs 981.7 million as at September 30, 1958, as against Rs 997.6 million as at September 30, 1957, a fall of 1.6 per cent. In the face of this general decline in the volume of deposits, the total deposits with your bank increased from Rs 433 million to Rs 454 million, an advance of 4.85 per cent over the previous year.

Your Bank was privileged as at September 30, 1958, to hold 46.1 per cent of the total deposits within the commercial banking system. It must be said, however, that on account of the operations of Government during September, which is the closing month of the Government's financial year, certain "hot deposits" are made by the Government with the commercial banks. For the purpose of illustrating, however, the position of leadership which your Bank holds, I may say that the Bank of Ceylon now controls 38.5 per cent of total non-government deposits. This is indeed gratifying proof of the confidence reposed in the Bank by the people no less than by the Government.

It is interesting to note, in the light of very recent developments in British banking, that your Bank introduced two systems of commission-free, no-minimum-balance current accounts known as Safety Checking and Security Checking Accounts as far back as 1954.

Cash, Bullion, Loans at Call, Money at Short Notice and Treasury Bills aggregated to Rs 150.6 million. Our total liquid assets including Bills Discounted amounted to Rs 197 million. The percentage of liquid assets to total deposits is 43; the percentage to demand deposits is 58.

Your Directors recommend the transfer of Rs 350,000 out of current net profits to "Other Free General Reserves." Together with the transfer of Rs 1,550,000 authorised during the year, this transfer will result in "Other Free General Reserves" standing at Rs 6,750,000. The capital and published free reserves of your Bank will then amount to Rs 17.25 million.

I am sure that you will agree with me that your Bank has made satisfactory progress in the year under review.

The report and accounts were adopted.

ENI

ENTE NAZIONALE IDROCARBURI, ROME, ITALY

RECORD NATURAL GAS PRODUCTION — SYNTHETIC RUBBER PLANT IN OPERATION

The ENI Balance Sheet and Report for the year ending April 30, 1958, were published recently, the main features of which are set out below:

EXPLORATION AND PRODUCTION

Exploration activities were extended and intensified during the year. New exploration permits were secured on the Italian mainland, outside the Po Valley area where the Group has exclusive rights, and in Sicily. Outside Italy AGIP MINERARIA set up a new company in 1957, jointly with the National Iranian Oil Company, the Società Irano-Italiana dei Petroli (SIRIP). This new company has been granted concessions in three areas covering altogether 8,842 sq. miles. A similar agreement was concluded with Morocco giving AGIP MINERARIA a concession of some 11,600 sq. miles in the province of Tarfaya.

Geological exploration work was carried out in Italy, Iran and Morocco.

The total of Geophysical surveys effected in Italy during 1957 amounted to 210.5 crew-months while during the first four months of 1958 it amounted to 54.5 crew-months.

Geophysical surveys of the Persian offshore concession were started early in 1958 under the control of AGIP MINERARIA.

During 1957 AGIP MINERARIA and its associated companies sank 156 oil wells, 49 of which were exploration wells and 107 production wells. Outstanding among discoveries of hydrocarbon deposits were the natural gas deposits of San Pietro in Casale (Bologna) and of Casteggio (Pavia).

NATURAL GAS PRODUCTION

Natural gas production in 1957 amounted to 163,975m. cu. ft., equivalent in calorific value to app. 7m. tons of coal, and representing an increase of 12.7 per cent compared with the previous year. Output of liquid and liquefiable hydrocarbons rose from 134,828 tons in 1956 to 216,706 tons last year, thus showing a rise of 61 per cent. During the first four months of 1958, output included 60,480m. cu. ft. of natural gas and 78,747 tons of crude oil, including 48,173 tons from the first four productive wells of the Gela deposit where output for 1959 is expected to reach 1m. tons.

In the course of 1957 and during the first few months of 1958, the first equipment stage of the Gela field was brought to a conclusion.

The network of gas pipelines installed by SNAM and its associated companies had reached a length of 2,447 miles by the end of 1957. The urban distribution networks run by constituent companies of the ENI Group had covered 448 miles by the same date.

In 1957 the ENI Group distributed a total of 168,910m. cu. ft. of natural gas—a figure equivalent to 97 per cent of Italian consumption as a whole.

OIL REFINING AND PETROCHEMICALS

New installations were built during the year in some of the refineries in which the ENI Group holds an interest. During 1957 the refineries connected with the Group processed 5,475,000 tons of raw material and have made it possible to improve and strengthen productive capacity in this sector. The big ANIC petrochemical plant at Ravenna was inaugurated in April, 1958. In the field of nitrogenous products, production of ammonia, nitric acid, ammonium nitrate and ammonium sulphate began between the end of 1957 and April 1958. The installations for the production of synthetic rubber came into service in April of this year when the unit for the production of styrene was still in course of erection and preparations were being made to build a second plant for the production of butadiene. This plant will begin working in the course of 1959 and use butane produced by the Group's refineries. Once all the installations planned have been completed, the plant will have an annual output capacity of 60,000 tons of synthetic rubber and 750,000 tons of fertilisers.

DISTRIBUTION OF PETROLEUM PRODUCTS

In the course of 1957 AGIP's distribution network was further extended and complemented by new motels. Considerable increases over the 1956 figures were achieved in sales of petrol (12.5 per cent) and gas oil (21 per cent). Sales of liquid gas (AGIPGAS), which is being used in 2,700,000 households, increased by 13 per cent compared with the previous year.

AGIP also resumed the distribution of its products in Italian Somaliland, Eritrea and Ethiopia and established a company (ASSEIL) in Libya, on an equal basis with a Libyan group, for distribution in that country.

TANKER TRANSPORT

The Group's tanker fleet, which was 118,000 tons at the end of 1957, was increased in March, 1958, by AGIP RAVENNA, the first of two 36,000 dwt turbine tankers launched during the current year. The tonnage carried during 1957 showed an increase of 37.6 per cent and reached a total of 2,196,740 tons of crude oil and petroleum products.

NUCLEAR ENERGY

In 1957 AGIP NUCLEARE concluded a consultative agreement with the United Kingdom Atomic Energy Authority (UKAEA) and a special agreement with the Nuclear Power Plant Company which will help AGIP NUCLEARE in its research and in the erection of nuclear power stations of the natural uranium developed from the original British Calder Hall type. An agreement for the delivery of a power station project of the slightly enriched uranium type was also concluded with the American Vitro Engineering Company.

SIMEA, in which AGIP NUCLEARE holds 75 per cent of the shares and IRI the remaining 25 per cent, has begun on the construction of a first natural uranium power station with a capacity of 200 MW in the neighbourhood of Latina. The SOMIREN Company has intensified prospecting work for radioactive materials in Northern Italy as well as in Calabria and Sardinia, and has confirmed, particularly in Piedmont, the existence of mineralised structures with mineable contents of such materials.

ENGINEERING

In this sector considerable progress was made by NUOVO PIGNONE by expanding its technical equipment.

Total turnover during 1957 rose by 60 per cent over 1956. Machinery and equipment for the oil and chemical industries delivered during the year represented an increase of 20 per cent in weight over the figure achieved during the preceding year.

E N I
(Ente Nazionale Idrocarburi)
Rome, Italy

BALANCE SHEET AT APRIL 30, 1958

LIABILITIES	Lit.	Lit.	ASSETS	Lit.	Lit.
Medium and Short-Term Loans	11,835,513,273		Cash in Hand and at Bank, Securities and Allied Items	660,743,283

DORMAN LONG AND COMPANY LIMITED

SIR ELLIS HUNTER'S REVIEW

STEEL DEMAND FALLS BUT STRUCTURAL ENGINEERING OUTPUT MAINTAINED

NATIONALISATION POLICY OBSOLETE

The Sixty-ninth Annual General Meeting of Dorman Long and Company Limited, will be held in London on Wednesday, February 4, 1959. The following extracts are from the statement by the Chairman and Managing Director, Sir Ellis Hunter, circulated with the Report and Accounts:

TRADING RESULTS

After charging depreciation based on historical cost and transferring £1,500,000 to Fixed Assets Replacement Reserve of Dorman Long (Steel) Limited (same as last year) the group profits before taxation amounted to £6,104,807. After deducting the profits of subsidiary companies applicable to outside shareholders at approximately £39,000 before taxation, there is left approximately £6,066,000 which arose broadly as follows:

	1958		1957	
	Amount £	%	Amount £	%
Bridge building, Engineering and Chemicals	2,915,000	48	3 086 000	41
Iron and Steel..	3,151,000	52	4,365.000	59
	6,066,000	100	7,451.000	100

When a similar analysis was given last year, the Bridge building, Engineering and Chemicals item included the profits of Dorman Long (Africa) Limited attributable to the holding of Dorman Long and Co., Limited. Since the African Company is no longer a subsidiary company the above figures for both years include only the dividends receivable by Dorman Long and Co., Limited.

The reduction in the ordinary dividend from Dorman Long (Africa) Limited due to the lower shareholding is the main reason for the lower amount of profits from Bridge building, Engineering and Chemical activities in 1958.

More than £900,000 of the reduction of approximately £1,200,000 in the Iron and Steel profits is due to increased depreciation. The charge for depreciation will be higher in the current year. It follows the Inland Revenue allowances for profits tax purposes, except for initial allowances.

Interest on loan capital has increased substantially, owing to variations in Bank Rate and to further calls on the loan from Finance Corporation for Industry Limited, of which £1,500,000 still remains available.

DORMAN LONG (STEEL) LIMITED

The falling off in world trade and the consequent reduction in the demand for steel has inevitably affected the Company's production for the past year. In the aggregate both ingot and rolled steel outputs were lower. Ingot production at 1,927,005 tons compares with 2,118,715 tons in 1957. Rolled steel production at 1,454,163 tons showed a reduction of 44,601 tons on 1957.

The Universal Beam Mill at Lackenby has been operating since February, 1958, when the first beam was rolled. Since July the mill has been rolling first class beams and columns, on a commercial basis, six shifts per week. Experience to date shows that the mill will do efficiently all we expected.

Trial operations have begun at the new rod mill at Lackenby, the semi-finished steel requirements of which will be provided by the new billet mill recently installed at that works.

HOME AND EXPORT DEMAND REDUCED

The decline in orders for rolled steel began early in 1958, and the downward tendency increased as the year went on. The works have been operating at much below capacity since June. At home, consumers and merchants have been reducing their stocks and this was accentuated by the financial restrictions on the nationalised industries which have only recently been lifted.

The reduction in demand also affected export markets. After a long period of severe restriction of British steel exports during which the limited tonnages released earned substantial premiums in prices, we are now being urged by the Government to export all we can. Competition is keen, but we are making determined efforts to expand our old markets and develop new ones.

The marketing of our new product, universal beams from Lackenby mill, is beginning to show encouraging results. Orders for the home market are building up. Structures are now generally being designed with universal beams specified and the beams are also being used in the highway programme. A ready outlet has been found in Canada, and we hope to do business in the United States. Orders for small tonnages have been received from other overseas markets.

RENATIONALISATION

The Labour Party is still committed to renationalise the steel industry and this threat cannot be ignored. The Party does not seem anxious that re-nationalisation should become a major issue at the polls. The reason for their attitude is readily understandable.

The great majority of the people in this country have no desire for any further extension of State ownership of industry. What they have seen of the results of nationalisation has killed any enthusiasm for it. They do not regard further nationalisation in any form as likely to contribute to their own well-being or to the economic progress of their country.

If the general election, whenever it comes, were to be fought on the question of renationalising steel it is certain the country would reject it. The hope of the Labour Party is that steel re-nationalisation will be obscured by other issues. It is, therefore, of the utmost importance that there should be a lively recognition in the country at large of the harm that would be done to the steel industry whose efficient operation is essential to virtually every form of industrial activity.

The arguments against nationalisation are well known, generally accepted, and to those capable of objective consideration can lead to only one conclusion. The urge to renationalise steel is based on the Labour Party's political thinking of forty years ago. In view of the experiences of the past decade, the Labour Party should have the courage to admit that this policy is obsolete, and scrap it.

EFFICIENCY NOT THE ISSUE

We know, on the authority of Mr Alfred Robens, MP, that "the nationalisation of the iron and steel industry has nothing whatever to do with its present efficiency," and that "no one is making a case for public ownership on the basis of an inefficient industry." The Labour Party's recent policy statement ignores Mr Robens's declaration. After stating that it is essential in the national interest to restore steel to full public ownership, it remarks in a subsequent paragraph "if after careful enquiry other industries are found to be failing the nation, we shall not hesitate to use whatever remedies, including further public ownership, are shown to be most effective." The purpose of this carefully worded sentence must be to create the impression that the steel industry is failing the nation and should therefore be nationalised. This is serious misrepresentation. The steel industry is one of the most efficient of the nation's industries. Moreover in twelve years it has raised its capacity by about 65 per cent and in the early 1960's capacity will be double that of 1946.

The Labour Party's policy statement tries to justify renationalisation of steel on the grounds that "Only the State can be relied upon to supply the large capital funds and to carry through the great expansion programme that will be required when Labour's production drive gets going." This also is misleading. It is the Labour Party's threat of nationalisation which makes the public reluctant to risk their capital in the industry at the present time. Remove this threat and steel will attract the capital required.

GRAVE RISK TO STANDARD OF LIVING

Steel and the great industries it serves are carrying the main burden of the battle for overseas trade. As the people of this country have good reason to know, the decline and fall of the steel industry would be inevitable under nationalisation. Economic disaster for Great Britain would result and no reasonable hope of a rising standard of living would remain.

Under nationalisation steel would soon become a rigid monopoly. The engineering industry of this country comprises thousands of concerns both large and small responsible in the aggregate for a substantial part of the country's home and export trade. How would they be likely to fare if they found their interests and needs at variance with such a vast state monopoly?

GROUP ENGINEERING ACTIVITIES

Activity at a high level was maintained at the fabricating shops of Dorman Long, Redpath Brown and Tees Side Bridge and Engineering Works. A large tonnage of steelwork has been exported and new bridge contracts secured. Both at home and abroad financial difficulties have restricted the placing of work in recent months, while disturbed conditions in the Middle East caused a number of projects to be held back.

Outputs from the Chemical Works have increased and would have been still higher but for the slowing down of operations at the iron and steel works. At Clarence Chemical Works we have first-class units which in efficiency compare favourably with anything in this field in the United Kingdom.

MERCANTILE CREDIT COMPANY

ADDED FINANCIAL STRENGTH

The twenty-fifth annual general meeting of Mercantile Credit Company Limited was held on January 7th in London, Sir Mark Turner, chairman of the company, presiding.

The following are extracts from his statement circulated with the report and accounts for the year to September 30, 1958:

It is, I think, significant that the twenty-fifth annual general meeting of your company which this is, should coincide with the emergence of the hire purchase business from a modest and much criticised youth into the maturity of a recognised part of the banking and monetary system of the country. At the extraordinary general meeting which was held on September 15, 1958, you sanctioned an increase in the authorised capital and Martins Bank and Westminster Bank are between them subscribing in instalments for a 40 per cent interest in the company at a price closely approximating £4 million.

This is not only important for the added financial strength and stature which it brings to your company, but also for the potential growth in business which must inevitably result from an association between Mercantile Credit and two joint stock banks together having over 1,800 branches in the United Kingdom.

EXPANSION

Although both banks have agreed to pay for their shares in full earlier if required, the present arrangement is that the £4 million will be paid in four equal half-yearly instalments, the first instalment having been paid on October 1st last. We are hopeful that the natural growth of business will be such as to match each instalment of capital provided by the banks with an appropriate amount of new business.

When I speak of new business, this can be by means of serving new customers, entering new trades, the increase of business from existing connections or, alternatively, the acquisition of other companies such, for example, as Mutual Finance, which we agreed to purchase on January 1, 1959. Our experience since the relaxation of credit restrictions leads us to believe that our target, to match new business with instalments of new capital and borrowings based thereon, is capable of achievement.

Since its inception Mercantile Credit has enjoyed the support of the acceptance houses and the joint stock banks, a support which it hopes it will continue to enjoy in the future. Some four years ago the natural growth in the company's business made it necessary to look for other sources of borrowing and we started to take deposits. At first these deposits represented only a small proportion of the company's borrowings. More recently they have grown considerably and represented as at September 30th last about 57 per cent of the total group borrowings. We are happy to see that some of our shareholders, both private and corporate, are on our list of depositors and look forward to being of service to many more in this way.

ACQUISITION OF MUTUAL FINANCE

The acquisition of Mutual Finance as from January 1, 1959, is another important step in the policy—United Motor Finance Corporation, which we acquired a year ago, being the first—which your company has been adopting for some time in the expansion of its activities by the acquisition of suitable companies, particularly those operating in fields and areas where they can make a positive and rapid contribution to the group's activities.

During the last eighteen months or so your company is so changing its shape that our consolidated balance sheet is becoming a document of much greater relative importance than that of the parent company alone. The best illustration of this feature is that there is now a difference of no less than £10,800,000 in hire purchase agreements, etc., on hand between the one balance sheet and the other. The growing importance of the contribution made by subsidiaries is illustrated by the addition of another £6 million in agreements outstanding brought to us by the group's most recent acquisitions, Mutual Finance and Dunelm Trust of Darlington.

LOSS RATIO

This year I wish to devote a little time to general matters associated with hire purchase financing. The first concerns losses.

All sorts of figures, percentages and so on are published from time to time, and whilst I do not question their accuracy, I think some tend to show [illegible] and sometimes misleading picture. To begin with, fraud excepted, a loss is incurred at the particular point in the history of a transaction at which it is not considered possible to reduce it further. The assessed loss therefore understates the true amount lost by the additional cost incurred in reducing it to that point. The ultimate figure of true loss is therefore often unrealistic. However, there is no other way of expressing loss without complicated and expensive analysis.

Subject to these remarks shareholders might like to know how we ourselves have fared and I will give you figures relating to our entire motor business. Comparing average losses with average balances financed over the last ten years, the figure is 0.064 per cent. But, of course, losses incurred in one year seldom apply to transactions entered into during that year, and one must remember that turnover has been rising. Therefore I will give you another and perhaps more accurate assessment by comparing losses incurred during the period 1949-1958 with turnover during 1947-1956. This percentage is 0.108. May I suggest that both percentages are equally striking and reflect the common sense and integrity of the hire purchaser and the care with which the business of your company is conducted.

Now for a word about unearned finance charges. Many will have noticed that the proportion of these to agreements outstanding varies somewhat from year to year and perhaps wonder why this should be so. Let me say that the amount decided upon at the end of each financial year is based upon as accurate an assessment of the requirements as we can make. We were perhaps, a little more ponderous years ago but this figure used to be called "Reserve for Interest, Collection and Unearned Finance Charges." Certainly that description indicated exactly the purpose for which the amount was set aside. Therefore we carefully review our companies' portfolios at the end of the period to ascertain the required cover for these items on a factual basis according to the period of agreements outstanding and according to the known costs of money and operating and our assessment of the trends thereof.

At the end of the year under review, in the parent company for example, we decided to reduce the reserve in question from 8.72 per cent of outstandings in 1957 to 8.24 per cent for 1958, because of the present lower cost of money and by reason of our portfolio having an average shorter date than in the preceding year.

United Motor Finance which joined our group just prior to the close of our financial year ended September, 1957, has in every way fulfilled all and more than we expected of it. Again it is my pleasure to express thanks to the company's board and its management.

In Ireland, Mercantile Credit Company of Ireland, and in the Union of South Africa, National Industrial Credit Corporation, have had record years.

Our associated company in Canada, Interprovincial Building Credits, continues to grow in importance.

In conclusion, I would like to emphasise on this occasion that you, as shareholders, owe a real debt of gratitude to the executive Directors and the staff of your company.

The report and accounts were adopted.

WEBSTERS PUBLICATIONS LIMITED

EMINENTLY SATISFACTORY RESULTS

The fourth annual general meeting of Websters Publications Limited was held on January 5th, in London, Lieutenant Colonel W. D. Gibbs (the chairman) presiding.

The following is his circulated statement:

I am pleased to report that the profits of the Group for the period under review amounted to £124,723 compared with £133,894 for the previous year. Your Board regard this as eminently satisfactory, having regard to the particularly inclement weather during the Flat-racing Season.

It will be recalled that during the year the sum of 6d. per share was returned to shareholders, being money surplus to the normal trading requirements of the Company. This repayment was effected by the liquidation of the principal Operating Company, and a reduction of Capital. The reduced shares were subsequently consolidated back into units of 1s. each, and the Holding Company assumed the name of the former principal Operating Company.

It will be observed that the Authorised Capital is shown as slightly reduced. This arose from a technicality and a resolution will be proposed to restore the Capital to its original £250,000. There is no present intention of increasing the Issued Capital of the Company.

As regards dividends, last year an interim of 10 per cent followed by a final of 30 per cent, making 40 per cent in all, was paid. This year your Directors have ensured that Shareholders will receive the same amount in dividend as last year—viz., an interim of 20 per cent, which has already been paid, and a final of 60 per cent which is now recommended, making 80 per cent in all. This is as I forecast at the last Annual General Meeting.

In conclusion, I am glad to report that the business of your Company continues on the same sound basis.

The report and accounts were adopted and the ordinary resolution increasing the capital to £250,000 by the creation of a further 47,010 Ordinary Shares of 1s. each was approved.

COMPANY AFFAIRS

Record Bank Profits

THE banks have enjoyed a bumper year. Every one of the "Big Seven" has announced a substantial increase in profits for 1958 and every one has raised its effective distribution. Four of these increased distributions are in accordance with forecasts made at the time of announcement of capitalisations of reserves—which in the case of the Midland Bank provided for only a fractional increase in the distribution for 1958 but an increase by a further one-ninth for 1959. The newly disclosed increases are those of the National Provincial (18 to 20 per cent), Westminster (11¼ to 12½ per cent) and the District (15 to 17 per cent). Increases in published profits range from 16.9 per cent for Barclays to just over 3 per cent for the Midland and the aggregate profits of the seven banks examined by us by £1.4 million, or 10.2 per cent, to the new peak of £15.1 million.

A notable expansion of bank earnings had been generally expected; but it has been attributable much more to the credit trends of the year—the reaction from a phase of abnormally high interest rates—than to the banking innovations that have attracted so much public interest. It seems probable, too, that the expansion of true current earnings may not have been quite so pronounced as that in published earnings. On the one hand there is no longer need to make special provision for investment depreciation; on the other hand there have been the important series of capital increases, and associated increases in effective distributions, by capitalising reserves. The first of these considerations makes it feasible, and the second makes it desirable, for the banks to bring a larger proportion of their earnings into the published account.

In true earnings the gain is the resultant of several conflicting forces. The banks in 1958 had the benefit of a further increase in their resources; net deposits through the first eleven months averaged some £187 million, or 3 per cent, more than in the similar period of 1957. But all this increase, and more, went into deposit accounts on which interest is allowed at 2 per cent below Bank rate; these accounts showed on the average an expansion of no less than £353 million—and the year's average deposit rate, like the average Bank rate, declined by less than ¼ per cent. Average bill rates fell by a little more and average short money rates by considerably less than this; but on the bills the banks were benefiting from the fact that the fall in their earnings consequent on each new drop in market rates did not begin until their existing holdings matured, whereas each drop in deposit allowances became effective immediately. This lag effect working in the banks' favour as rates were falling was also important in relation to investment portfolios. The greater part of the addition to the banks' average resources available for employment went into gilt-edged investment (these averaged £148 million more over the eleven months for which figures are available), and the purchases were mostly made early in the year. In spite of the freer lending policies pursued in the second half year, the average level of advances over the eleven months was only £27 million higher than in 1957. The recent rise should help to swell profits in 1959. Adverse influences were a continuing rise in salaries and pension provisions and the incidence of the equalisation of the two rates of profits tax—a change that generally increased the tax on the banks' substantial undistributed (disclosed and undisclosed) profits.

Barclays Bank

Barclays' net profits, shown as in all banks after tax and internal transfers, showed the biggest increase, of £484,004, to £3,345,411. This was a greater proportionate rise than the increase from 9.6 to 10.8 per cent in ordinary dividend being made effectively this year. But the maintained final dividend of 6 per cent on a capital increased by a one for four scrip issue is to be followed by two payments of 6 per cent this year. Despite the rise in dividend disbursements, it has been possible to add £1,561,914 to published reserves; together with a transfer of £5 million from contingencies, this raises total reserves to £21 million, up £1 million despite the capitalisation of £5.6 million.

Lloyds Bank

Lloyds, as forecast, is paying its final dividend on its increased capital, at 5⅔ per cent, raising the total dividend from the equivalent of 8⅔ per cent to 10 per cent. Net profits rose by £225,144 to £2,727,535; the larger dividend absorbs £1,601,237 against £1,387,739. The transfer of £1,250,000 to general reserve, added to a transfer of £8,032,535 from inner reserves, restores the published reserve to £18 million. A further transfer of £500,000 has been made from profits to contingencies reserve.

Midland Bank

The Midland, as forecast, is making only a tiny increase in dividend this year, from 17.6 to 18.0 per cent; it forecasts an effective increase for 1959 to 20 per cent on the present capital. Following a one for three capitalisation published reserves will be restored to the present level of £16.2 million by a transfer from inner reserves. Disclosed profits rose only modestly in 1958, from £2,846,687 to £2,934,039. The distribution policy of the Midland also seems the most modest in the longer run comparison with dividends in the long phase of stabilisation before 1953.

National Provincial

The National Provincial announces a rise in its final payment from 9 to 11 per cent, making 20 per cent for the year. Net disclosed profits rose from £2,061,966 to £2,236,426. The rise in dividend was less than the market hoped and the £1 shares fell 9d. to 89s. 9d. on the results. An allocation of £1 million has been made to *contingencies reserve*; in 1957 a similar sum was allocated to reserve funds.

* On present capital. † On 12 per cent as forecast for 1959. ‡ On 20 per cent. Dividend of 15 per cent for 1959 is forecast on capital to be increased by 33⅓ per cent scrip issue. § On the "B" shares.

Westminster Bank

In reporting the substantial increase in profits, the directors of the Westminster Bank have had regard "not only to the satisfactory trading results of the year but also to the continued increase in the strength of the bank's internal position." The rise in disclosed profit is among the best—£217,266 to £2,069,747. The dividend paid on the £1 "B" shares is 12¼ per cent compared with the equivalent of 11¼ per cent forecast at the time of the capital re-organisation in 1957. But here too market hopes were not realised in full; the "B" shares eased to 54s. 6d. on the announcement. The appropriation to published reserves has been raised by £100,000 to £900,000.

Martins Bank

When Martins Bank anticipated its final results early in December by the announcement of a one for four scrip issue and an increase in the ordinary dividend from 15 per cent to 20 per cent, the warning was given that this did not imply that substantially higher profits were earned in 1958. The profits now announced show a rise of £149,403 to £1,050,805, second only to Barclays in proportionate advance. The directors explain that this arises from "some easement in the necessity of allocations to reserves," and not from substantially higher profits.

District Bank

The District shows a rise of £65,237 to £738,197 in net profits and has raised its dividend from 15 per cent to 17 per cent. An interim dividend of 8½ per cent is forecast for 1959, so that it can be assumed that the bank intends to maintain the total of 17 per cent in the full year.

STEEL COMPANY OF WALES

BY the end of June the main producing units in Steel Company of Wales' third development plan are expected to be in operation. The first stage costing £73 million was completed in 1952, the second costing £54 million was completed last summer and now a third stage amounting to £52½ million is nearing completion. During the year £22 million was spent on capital account and capital commitments at the end of last September came to £24 million; the figure for plant not then in operation carried in the balance sheet rose from £12.8 million to £31 million. Ingot production is expected to rise to an annual rate of 3 million tons early in 1960. Further development plans are on a smaller scale; the chairman, Mr Harald Peake, mentions a £5 million tinplate project; the objective now is "to utilise to the full the surplus productive capacity of certain units."

Steel of Wales' loan capital has risen by £8½ million to £81½ million, while the credit extended by ISRHA has expanded from £8½ million to £16½ million. A limit of £40 million has been set on loans from this source, and these loans are repayable by the end of 1964. Despite the rise in the cost of servicing the outstanding debt as well as higher depreciation and taxes, net profits have risen from £5,528,000 with a rise from £19,217,481 to £22,527,147 in gross trading profit. The completion of the second development plan was mainly responsible for this improvement. The true cost of an ordinary dividend of 9 per cent, including the special interim dividend of 3 per cent, is £207,000 net.

In the early stages of the financial year a fall in orders for tinplate led to the final shutting down of all hand mills; all tinplate produced by Steel of Wales now comes from the new mills at Trostre and Velindre. The current year has opened with full time working in all divisions. Mr Harald Peake expects good results from the first six months of this calendar year, but he points out that a greater profit is essential to service comfortably the capital borrowed to finance the third development plan. At 22s. 6d. the £1 ordinary shares of Steel Company of Wales yield 8 per cent on a 9 per cent dividend.

DORMAN LONG

BRIDGE building, engineering and chemicals supported Dorman Long's profits last year, when the heavy burden of interest charges and depreciation stemming from the company's expansion programme bit into its steel profits. The group's trading profit declined slightly from £10,472,166 to £10,151,465. Further calls were made on the loan facilities from FCI, raising Dorman Long's indebtedness to FCI from £9¾ million to £13½ million and leaving only £1½ million still uncalled. Increased depreciation accounted for £900,000 of the fall of £1,200,000 in the profits before tax of the iron and steel section, but a charge of £675,183 for repairs made last year before striking gross profits has not been repeated. The final stages of the expansion programme were only starting to earn their keep in the latter part of the financial year. A universal beam mill at Lackenby started on commercial production in July. Trial operations have also begun on the new rod mill. It was a misfortune that just when increased capacity and new products had become available orders began to contract sharply and after June the works as a whole were operating much below capacity. Rolled steel output fell by 44,601 tons to 1,454,163 tons over the year.

Profits from the engineering and chemical side of the group's business were virtually unchanged; the sale of part of the shareholding in Dorman Long (Africa), reducing Dorman Long's interest from a majority to minority holding, is the principal cause of the reduction in profits before tax of £171,000 to £2,915,000 shown by this division. Dorman Long therefore earned almost

* Excluding special interim dividend of 3 per cent. Yield calculated on 9 per cent. † Before exceptional appropriations relating to denationalisation. ‡ Adjusted for scrip issue.

two-fifths of its profits before tax and replacement reserve appropriations in activities other than the furnaces and steel mills. But that proportion is an index of how badly steel fared last year, and already Throgmorton Street is discounting higher earnings from steel. On the full report Dorman Long's £1 ordinary shares strengthened to 28s. 9d., to yield 8.4 per cent on the 12 per cent dividend.

SOUTH DURHAM

MR B. CHETWYND TALBOT, the chairman of South Durham, does not expect total profits for 1958-59 to be drastically curtailed. Since profits in the year to September 27th were much better than expected, rising from £5,117,815 to a record level of £7,092,696, this is fairly encouraging. Hopes are pinned on the performance of the steel pipe division in offsetting any drop in production of heavy sections and rails. The necessary finance has recently been secured for the third big stage of the group's development programme. Authorised capital expenditure on September 27th was £46 million, compared with a mere £5.7 value of fixed assets "at end, a book million. Barclays Bank is prepared to lend £10 million and FCI £22½ million. A 6 per cent convertible debenture issued last March brought in £8 million; the bank overdraft of £2¾ million has thus been repaid, leaving a balance of liquid assets in hand of about the same amount. The face of the company will be unrecognisable after such massive changes and the ordinary capital will eventually have to reflect these changes. FCI has the opportunity to subscribe for 2 million £1 ordinary at par next October, and £4 million of debenture stock can be converted to ordinary at par after March 1960. The options are attractive at the current market price of 28s. 1½d., at which the £1 units yield 8½ per cent.

THOMAS FIRTH AND JOHN BROWN

FOR the greater part of the financial year to September 30th, the plants of Thomas Firth and John Brown were fully employed but the order book was being thinned out. Record profits were achieved, with earnings before tax advancing from £4,563,265 to £5,537,764, but by the end of the financial year deliveries were falling. Debtors contracted from £4.6 million to £4.2 million and stock and work-in-progress fell from £8.7 million to £7.6 million. "If the present rate of order intake does not improve," says the chairman, Sir John Green, "the company's plant will have to operate at two-thirds of capacity." In that event, the fall in profits might be even greater, for the proportionate cost of overhead expenses would rise. The installation of a new rolling mill by the associated company, Firth-Vickers Stainless Steels, and a contraction in orders led to a substantial fall in its profits last year but these profits are likely to improve. At the current price of 22s. 3d. the £1 ordinary shares yield 9 per cent.

UNITED STEEL

THE directors of United Steel report that the group's works operated at a high level of capacity during the first half of the financial year, but that production slackened later. Stocks dropped by £1.6 million to £24 million and debtors declined by £3.2 million to £16.7 million.

GALLAHER

ONCE again Gallaher is coming to the market. Sir Edward de Stein and his co-directors have announced an impending "rights" issue in the ratio of one new share for every four held by holders of the existing £11 million of ordinary capital. Treasury consent for this issue has been obtained. The price of the issue has not yet been fixed, but it is hoped to publish the terms and post allotment letters within the next three weeks. The directors say that funds are needed to finance the continued expansion of the group's business. That growth, on any reckoning, has been [illegible] has so has Gallaher's appe- new money in every year since 1954 except 1957. But even then there was only a short respite for last year, to fund its short term debts, Gallaher raised £9,325,000 on a loan stock. In the prospectus this loan was said to be sufficient "for the purpose of the present business." Clearly, then, the proposed rights issue indicates another increase in turnover, requiring a bigger investment in tobacco stock (on which the company has to bear the burden of duty). The issue seems to be assured of a good welcome in a market that is short of new capital issues of first-class ordinary shares. The preliminary results for 1958 now announced nearly three months ahead of their normal date provide the right background for a successful issue. Last year gross profits of no less than £7.5 million were earned, compared with £6.6 million in 1957, £5 million in 1956 and £4 million in 1955, and the ordinary dividend, which is well covered by earnings, has been raised from 20 to 25 per cent. Barring "unforeseen circumstances" the directors expect to be able to maintain that rate on the increased capital this year. Investors were obviously happy about the prospect for Gallaher, for on this announcement its 10s. ordinary units, which enjoyed a strong rise last year, were marked up another 4s. 3d. They now stand at 42s. 3d. and yield just under 6 per cent.

CARRERAS

THE financial year of Carreras ended on October 31st—just before the announcement on November 4th of Rembrandt's bid for the 240,000 £1 voting ordinary shares. The Baron family controlled most of that stock and the bid, which left the "B" non-voting stockholders out in the cold, went through. The directors now announce that trading profits in that year rose by only £11,136 to £1,455,347 and that net profits actually fell from £726,554 to £700,148. Clearly, though other tobacco and cigarette manufacturers were growing, Carreras was not. Moreover, the ordinary dividend is left unchanged at 6 per cent, and this may disappoint those investors who were hoping that the payment would be restored to the rate of 8¾ per cent paid in 1955 and 1956. At the time of the Rembrandt bid the Carreras directors spoke of some improvement in profits—as might well have been expected in a year that benefited fully from an increase in cigarette prices. These results and the directors' statement that the dividend is held at 6 per cent "in order to conserve resources" to meet "the considerable expenditure" soon to be incurred on "reorganisation, re-equipment, and promotional activities" cannot but add to the anxieties of shareholders. What does the future under a new regime hold for them? These stockholders, who contribute £7,200,600 of Carreras' £7,440,600 equity, will be eager to hear what the new chairman, Mr A. E. Rupert, has to say. Not least they will want to know what benefits the merger will bring to them. Their 2s. 6d. shares now stand at [illegible] and yield 3¾ per cent.

NATIONAL DISCOUNT

A YEAR in which Bank rate fell from 7 to 4 per cent gave the discount houses the opportunity of making good their previous knocks, and particularly those suffered under the impact of 7 per cent. The National Discount, the first of the houses to report, shows a very marked recovery and is raising its dividend from 10 to 12 per cent. In its accounts for end-1957 it was obliged not only to value its bonds above market value, as other banks and discount houses did in the years of sagging gilt-edged prices, but also to write up the book value in anticipation of redemption profits, and include that writing up in the "balance of profit." This year the profits figure is on an orthodox basis, after making transfers to contingencies. Thus the disclosed increase from £208,117 to £284,275 after tax must understate the true improvement. The bond portfolio is shown at less than market value, for the first time since end-1954. Despite the bigger dividend, the "B" shares fell 1s. 6d. to 46s. 9d.

THE GRANADA GROUP

THE Granada Group is tightly controlled by the Bernstein family, but there are a few voting ordinary shares and some non-voting "A" shares in the market. Official dealings in these shares have been suspended since August because the company has no present intention of seeking an official quotation, but unofficial dealings have taken place in them outside the stock exchange, at booming prices, with buyers anxious to gobble up the few shares available in the hope that the group's commercial [illegible] television interests would immediately produce the boom in profits already enjoyed by other commercial television concerns. From 40s. in August the price of the voting shares has risen as high as 80s. and the non-voting "A" units are now around 52s. 6d.

Granada's profits have indeed risen, but not nearly to the same level as the profits of Associated Rediffusion and ATV; in the year to September 27th, the trading surplus of the Granada Group was £1,109,694 (against £332,278) and the net profit £257,129 (against £34,971). Effectively, by the payment of a special interim of 10 per cent for 1958-59, the dividend has been raised from 5 to 15 per cent. But the speculators were looking for something much better, and they will search carefully through Mr Sidney Bernstein's statement to see why they did not get it. There they will find some crumbs of comfort. The cinema side of the business found the going hard. But that was to be expected, and Mr Bernstein's references to commercial television have much greater significance. Commercial television will be the main source of profits in the future and a further improvement in television profits has taken place in the current year. Mr Bernstein adds that: "Arrangements for programming made in the early days protected the television subsidiary from heavy losses. These arrangements are terminable by the television subsidiary in 1960 when increasing profits may reasonably be expected." But Mr Bernstein has not revealed with whom these arrangements were made nor given any indication of their actual impact on earnings. The bonanza is, in fact, further off than the speculators thought it was, for if these arrangements protected the Granada group from incurring heavy losses in the early days, they also prevent the group, for the moment, from sharing in the boom that other commercial television companies are now enjoying. Investors also have to measure the implications of the directors' decision to re-submit the proposals, first made last August, that would have the effect of authorising the issue at par of "A" shares and of deferred shares in the subsidiary, Granada TV Network, to executive directors and officers. There would be a big paper profit on the "A" shares accruing to the directors and officers if this issue went through and clearly, though no price can be fixed for the TV deferred shares, these on the basis of current profits—which in the seven months to end-November came to £900,000—these shares would be worth more than their par value of 1s.

WESTERN DEEP LEVELS

THE prospectus of the deepest and most expensive gold mine in the world, Western Deep Levels, has now been published. The issue in February of 4,750,000 "A" shares of £1 each at par in addition to the £850,000 already in issue plus the loan facilities provided by Anglo American amount in all to £10.6 million. This will cover expenditure up to the end of October this year. To bring the mine to initial production in 1962 will require another £10½ million and the further stages to bring output up to 120,000 tons a month, by tapping the Carbon Leader Reef, will require at least another £7½ million. Thus a sum of the order of £28 million is to be spent and if production is to be stepped up even further sums will be required. Even with the special tax concession, this is a tremendous act of faith that gold will be found in sufficiently payable qualities at a great depth to justify this enormous expenditure, for even the most careful sampling does not guarantee that a mining venture is bound to be a paying proposition. Sampling and borehole results make the risks seem worth taking. But the risks are big and it is not until the shafts are sunk and development has proceeded a good way that the venture is proved. Yet investors in Kaffir shares are prepared to support this venture; in unofficial dealings in Johannesburg the new shares are quoted at 25s. (nil paid). Thus for those investors who are offered the right to take up the new shares there is already an incentive to do so.

RANKS

L[illegible] competitors, Ranks, the flour miller, baker, and manufacturer of animal feeding stuffs, has been growing fast. Now Lord Rank, the chairman, says the bakery side of the business is broadly based, and it now includes bakeries, biscuit factories and retail shops as well as flour mills. This has, of course, led to a big increase in investment in fixed assets and in the year to August 30th the net book vale of these assets (including goodwill) rose by £5,593,636 to £48,871,010. And at the end of the year outstanding capital commitments came to over £2½ million. Over the year, the group drew down its liquid assets from £3 million to £1½ million and its bank overdraft rose from just over £600,000 to nearly £2.7 million. Lord Rank says rather mildly that "the question of finance is constantly under review." Ranks, in fact, is faced with a problem similar to that facing Allied Bakeries.

A rights issue of ordinary stock from that group is impending and investors must wonder if a capital issue from Ranks can be long delayed. The advance in trading profits (from £4,330,733 to £7,250,873) and in net profits (from £1,546,024 to £3,259,670) is a good augur for any issue that may be decided upon. But this is a highly competitive trade and profits are vulnerable to swings in wheat prices; in 1956-57, for instance, profits were sharply cut when the group had to sustain heavy losses on flour stocks. The big capital investments are now producing their returns, but the directors, though they look forward to "the maintenance of satisfactory results," still remain cautious in their dividend policy. At 10 per cent the ordinary dividend was effectively left unchanged; in that dividend the 10s. units at 18s. 10½d.xd yield 5.3 per cent.

London Stock Exchange

FIRST DEALINGS:	Dec. 31	Jan. 14	Jan. 28
LAST DEALINGS:	Jan. 13	Jan. 27	Feb. 10
ACCOUNT DAY:	Jan. 20	Feb. 3	Feb. 13

GOVERNMENT bonds advanced strongly this week. There was some switching from industrial equities into bonds on yield considerations and institutional buying was heavy. The *Financial Times* Index of Government Securities rose from 84.46 to 86.52 at Wednesday's close. Among the shorts, Funding 2½ per cent 1956-61 gained ⅞ to 96⅝, and in medium dated stocks Funding 3 per cent 1959-61 jumped two points to 85½. Consols 2½ per cent gained 1⅛ to 53 and War Loan 3½ per cent, which was particularly active on Monday, rose 1¾ points to 67⅞.

Widespread selling led to points falls in industrial equities as investors took their profits, and over the week *The Economist* Indicator fell by 6.3 points to 249.3. On the full report and dividend forecast British Tabulating dropped by 5s. 9d. to 58s. 3d. Guest Keen after touching 60s. closed at 54s., a drop on the week of 4s. 3d. [illegible] Box fell 6s. 3s. 6d. In the engineering section, Murex lost 1s. 6d. at 44s. 3d. but Birmid jumped by 2s. to 76s. 6d. Among textiles, Calico Printers fell by 9d. to 38s. on disappointment with the progress of the "Terylene" patent case. In electrical issues Philips Lamp fell by 2s. to 91s., Chloride "A" 3s. 3d. to 66s. 3d. and Plessey 1s. 3d. to 71s. But Enfield Cable rose by 2s. 9d. to 19s. and E. K. Cole by 1s. 9d. to 19s. 9d. Teachers (Distillers) fell by 3s. to 33s. on the dividend disappointment and in brewing shares Whitbread "A" lost 8s. 10½d. to 100s. 6½d.

Among Insurance shares, Atlas gained 1s. 6d. to 77s., Equity and Law 1s. to 187s. 3d. and Legal and General 5s. to 200s. In the property field, Metropolitan Estates rose by 3s. 6d. to 43s. 6d., and Regis Property by 2s. 6d. to 67s.

Kaffirs were hardly affected by either the December output returns or the cut in the South African discount rate. In the OFS group Loraine fell by 3s. 3d. to 25s. 1½d., Welkom shed 1s. 9d. at 19s and President Brand dropped 9d. at 68s. 3d. But Cape bidding for Merriespruit in a narrow market lifted the shares 1s. 4½d. to 7s. 1½d. Coppers fell on selling from Paris, Bancroft losing 2s. to 29s. 6d. Teas were quiet but rubbers were firm.

***The Economist* Ordinary Share Indicator was re-based on December 31, 1958, and linked back to the original base (Average 1953=100). British Aluminium £1 stock units, Monsanto Chemicals 5s. shares and Ranks 10s. stock units have been replaced by Daily Mirror Newspapers 5s. stock units, Gallaher 10s. stock units and Midland Bank £1 shares in the 50 ordinary shares used.**

THE MONEY MARKET

THE unaccustomed ease that the money market enjoyed up to the close of December proved short-lived; on New Year's Day, the usual heavy turnover of credit was accompanied by heavy and widespread calling by the main clearing banks. The authorities gave no assistance and several houses borrowed moderate amounts from the Bank. The authorities gave a fairly large amount of special aid on Friday, and intervened again on Saturday morning. This week, official intervention enabled books to be balanced without recourse to the Bank until Wednesday, when no help was forthcoming and three or four houses borrowed small amounts at Bank rate. Night balances have been taken at up to 3½ per cent.

At yesterday's tender for Treasury bills the offer remained at £260 million of three months' bills, £10 million more than maturities. No 63-day bills mature next week, but on Thursday the Government will pay out the unconverted portion of the Conversion 1958-59s.

At last week's Treasury bill tender, the discount market kept its bid unchanged at £99 4s. 3d. and secured an allotment of about 52 per cent. April maturities changed hands in the market during the week at 3⅜ per cent.

Estate Duties Investment Trust Limited

is an investment trust whose business it is to purchase and to hold minority shareholdings in family businesses, and small public companies, whose shareholders have to meet Estate Duty liabilities.

Executors and trustees holding shares in such companies and faced with Estate Duty liabilities will wish to avoid selling out or losing control. They will find Estate Duties Investment Trust Limited—known as EDITH—ready to help in this problem.

Our booklet, M6, 'The Death Duty Problem', will be sent on request.

DORSETSHIRE *for 'Dumbledore' but* YORKSHIRE *for Insurance*

In Dorset dialect bumble-bees are known as "Dumbledores." Their drowsy murmuring is an essential part of those peaceful summer days of happy contentment we all like to remember.
Peace of mind and a feeling of well-being can easily be yours in the more everyday world. Let "Yorkshire Insurance" take care of your worries and set your mind at rest. This old-established Company progressing with new ideas will be to your advantage to see our local branch manager right away.

★*Most people realise the need for Fire Insurance, but these days it is essential that your insurance is comprehensive and for the full value. The business man must consider his loss of profits, the householder the furnishing as well as the provision of a new home.*

EDUCATION

9/- a line.

UNIVERSITY OF EDINBURGH

RESIDENTIAL COURSE FOR BUSINESS MANAGERS

The Fifth RESIDENTIAL COURSE FOR BUSINESS MANAGERS will be held in the University from July 4 to 25, 1959. The aim is to encourage the development of a broader understanding of business problems and of the environment in which business operates, and thus to assist in the transition from specialised to general management.

PROGRAMME OF STUDY

There will be three principal fields of study—(i) Business in a Changing World; (ii) Problems of Business Policy; (iii) Aspects of Internal Administration. In addition to syndicate work and case-studies, seminars will be led by practising business and professional men as well as University teachers drawn from several departments, including Commerce, Political Economy, Accounting and Psychology.

ADMISSION

To encourage the exchange of knowledge and experience among members of the course, the number admitted will be strictly limited. There are no formal educational requirements. The fee for the course, including residence, is 90 guineas. Further particulars and nomination forms may be obtained from Professor N. C. Hunt, 29 George Square, Edinburgh, 8. Early application should be made: the closing date is March 14, 1959.

HOW MUCH DO YOU KNOW?

—ABOUT Inflation, Imports, Exports, Taxation, Wages and the fascinating background to political problems of today? 10-week study courses in Basic Economics and Social Philosophy begin January 13th and 15th at Victoria. Nominal charge: course 5s, including text book. Attend on either Tuesday or Thursday evening, 7 p.m. Write: Henry George School of Social Science, 177 Vauxhall Bridge Road, SW1, for prospectus or telephone VICtoria 4266. (Or enrol on the opening night.) Courses ... are also being held at branches in the ... ham and the Isle of Thanet, Dundee, Cardiff, Birmingstating area. ... for particulars

MATHEMATICIANS

LAPORTE INDUSTRIES LIMITED invite applications from Mathematicians for new posts to deal with a range of problems of great variety and interest arising throughout the diverse *operations of a progressive industrial group.*

Candidates will need real mathematical capacity *over a wide range, with good physical appreciation* and an equal interest for problems both academic and practical. They must have direct *experience* and provide evidence of achievement in operational research or the application of statistics to industrial and scientific problems or in the application of non-statistical mathematics (any "applied" branch) to such problems. Some successful leadership of a team, even if a small one, would be an advantage. Age should be in the range of 25 to 35. The salary offered will be *in accordance with qualifications and experience.*

Candidates who have already replied to an advertisement in more general terms in this connection will be considered for the post and need not apply again if they have already supplied adequate details.

Replies should be addressed to the Group *Personnel Manager, Laporte Industries Limited,* Hanover House, 14, Hanover Square, W.1, and quote the Reference LIL/E1/33.

AMERICAN daily newspaper wants well-educated man, preferably early 20s, for news desk in London office. Some sub-editing and re-writing experience desirable, good general knowledge equally important.—Box 1099.

CHIEF ACCOUNTANT

Production-Engineering Ltd., have been asked to advise on the selection of a Chief Accountant with wide industrial experience in modern Management Accounting practice and control techniques *for a large Irish undertaking based in Dublin.* The post, *which will command a salary* of about £3,000 per annum, is pensionable and is one which involves a high degree of responsibility.

Applications giving full particulars, which will be treated in confidence and not disclosed to the Company until applicant's approval has been given, should be sent within ten days to:

Production-Engineering Ltd. (*ref. JB/WM*)
11, Ely Place,
Dublin.

ASSISTANT WOMAN PERSONNEL OFFICER. A vacancy exists in the Personnel Department of The Mullard Radio Valve Co., Ltd., for an Assistant Woman Personnel Officer who will be required to work under the guidance of the Senior Women's Personnel Officer, and who will be expected to take responsibility for the recruitment, placing and follow-up of female employees. The work is in a large personnel department which is capable of giving the necessary training to help the successful applicant to broaden her experience so that she may eventually take an active part in all aspects of the personnel function. Applications are invited from young women up to the age of 25, preferably with a university degree and some industrial experience.—Apply, in writing, to Mr. J. C. Ross, Plant Personnel Officer, The Mullard Radio Valve Co., Ltd., New Road, Mitcham Junction, Surrey.

FORD MOTOR COMPANY LIMITED require young men aged 24-27 as Analysts to work on *financial and commercial problems. The work is interesting and exacting, covering all aspects of* the Company's activities. It requires a high standard of intelligence and imagination with the ability to think and write clearly. Applicants must have the broad background necessary to appreciate management, as opposed to *accounting*, problems, and should be Graduates, professionally qualified men, or have had suitable experience in industry, commerce or public service.

Please send full particulars to Training and Recruitment Department (012A), Ford Motor Company Limited, Dagenham, Essex, quoting reference CFA.

ASSISTANT Economist. The person appointed to this *position will be engaged in obtaining information* and presenting reports on trends in economic conditions in the United Kingdom and overseas, and their possible influence on activity in the constructional industry. Apart from publications it will be necessary to obtain data by means of surveys and personal interviews, which could involve a certain amount of travelling in the United Kingdom. Applications for this post are invited from women aged 22-30, with at least a second-class honours degree in economics and preferably two years' experience since graduating. The commencing salary will be in the range £650-£800 per annum. Letters should be addressed to Assistant Personnel Officer, Richard Costain Ltd., 111 Westminster Bridge Road, London, S.E.1.

CHIEF ARCHITECT IN THE MINISTRIES OF HOUSING AND LOCAL GOVERNMENT AND HEALTH

The Civil Service Commissioners invite applications for two pensionable posts of Chief Architect.

Ministry of Housing and Local Government (one post)

Applicants must be registered Architects and hold professional qualifications in architecture, and have had a wide experience of housing and other building development. Experience in the field of public authority housing would be an advantage.

The person appointed will be responsible for the organisation, direction and supervision of the Ministry's architectural advisory service on housing and local government building generally. The work of this service is being reviewed and extended and will afford increased scope for the study of design problems and constructional techniques. There will also be opportunity for carrying out selected demonstration schemes in the housing field.

Salary (London) £3,750.

Ministry of Health (one post)

Candidates must be registered Architects and hold professional qualifications in architecture. Experience of hospital building an advantage. All-round experience and organising ability essential.

The Chief Architect will be in charge of the Ministry's Architectural Staff. He will be responsible for organising the examination of building schemes of Hospital Boards engaged in an expanding programme, as well as of schemes for other health and welfare services, and for a design group which it is intended shall undertake development work. His duties will include collaboration with professional staff of Hospital Boards and Local Authorities.

Salary (London) £3,400.

Application forms and further particulars from Civil Service Commission, Scientific Branch, 17 North Audley Street, London, W.1, quoting S 4925/59. Closing date January 30, 1959. Applicants should state the post for which they are applying and if they wish to be considered for both appointments this must be indicated.

TUBE INVESTMENTS LIMITED

COMPUTER PROGRAMMER

A vacancy exists for a Computer Programmer at the Computer Unit at Walsall, Staffs.

The work involves the preparation of commercial programmes and preference will be given to candidates having a background of accountancy or production control and possessing the appropriate professional qualifications. Previous experience essential. Applicants ... between 25 and 35 years of age.

Reply giving details of age, experience, qualifications and present salary to Computer Unit, T.I. (Group Services) Ltd., The Airport, Walsall, Staffs.

CENTRAL ELECTRICITY GENERATING BOARD

Applications are invited for the following appointments in the Commercial Branch of the Commercial and Operations Department at Headquarters, London, E.C.2.

A. Economist

The duties will include the provision of an economic intelligence service to all Departments; the formulation of long and short term estimates of the future maximum demand and the consumption of electrical energy; the assessment of production trends affecting the consumption of electricity; and appraisals of the probable effect of changes in policy of the Government and of other bodies.

Candidates for the post should have an Honours Degree in Economics, a sound knowledge of modern statistical techniques and practical experience in a large organisation.

Salary within provisional range £2,160—£2,360 per annum.

B. Assistant Economist

To assist in the above duties.

Candidates should have a good Degree in Economics or Statistics.

Salary within scale £1,375—£1,495 per annum.

Applications, stating age, qualifications, experience, present position and salary, should be forwarded to S. S. Scott, Chief Personnel Officer, 24/30 Holborn, London, E.C.1, by January 23rd. Please mark envelopes "Confidential Ref. E/4."

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships and grants, for research in Economics, Economic Statistics, Government, Social Administration, Social Anthropology or Sociology, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £400 per annum. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University.—Applications should be sent not later than February 15, 1959, to the Registrar, The University, Manchester, 13, from whom further particulars and forms of application may be obtained.

APPOINTMENTS

MSL have been retained to advise on the appointment of a

GENERAL SALES MANAGER

for Sanderson Brothers and Newbould—founded in 1776 and still a leader in its field with an extensive export business. The General Sales Manager will co-ordinate and manage the sales departments dealing with the company's five main groups of products—special steels, saws of all types, machine knives, engineering small tools and reduction gears and will be responsible for developing both the home and overseas markets.

This is an important appointment as the company wishes to find a man to whom a seat on the board may soon be offered.

Candidates must have had a public school and university education, preferably with a degree in *engineering, and have had selling experience* at senior level in the steel, toolmaking or similar industries. A knowledge of languages and *experience in more than one company and country* would be assets. Age range 36-45. Salary will depend on experience and age and there is a *contributory pension scheme and a car.*

No information will be disclosed to our clients until candidates have given permission after personal discussion. Please send brief details in confidence, quoting reference S.1472, to P. J. H. Fryer.

MANAGEMENT SELECTION LIMITED
17, Stratton Street, London, W.1.

SENIOR Research Executive required by Associated Television Limited. Age 25-30. Good appearance. University degree. Ability to prepare and present sales research propositions and act as Assistant to Research Manager. Minimum of four years' experience all aspects consumer research. Full details, in writing, including salary required, to Personnel Manager, Associated Television Limited, Television House, Kingsway, London, W.C.2.

THE BRITISH OXYGEN CO., LTD.

HEAD OF ECONOMICS AND STATISTICS SECTION

Applications are invited for the above post at the Company's Head Office in the West End. It is a senior position; applicants should have had industrial experience preferably on the finance side, together with a practical knowledge of statistical methods and a flair for carrying out investigations and writing lucid Reports. The post has been advertised before, but has not yet been filled; previous applicants should therefore not re-apply. Apply in writing to:

THE STAFF OFFICER,
THE BRITISH OXYGEN COMPANY LIMITED
BRIDGEWATER HOUSE, CLEVELAND ROW, ST. JAMES'S, S.W.1.

SOUTH-WEST ESSEX TECHNICAL COLLEGE AND SCHOOL OF ART

FOREST ROAD, WALTHAMSTOW, E.17.

APPOINTMENT OF HEAD OF DEPARTMENT OF COMMERCE AND MANAGEMENT

Applications are invited for appointment as Head of the Commerce and Management Department. The post will be vacant from September 1, 1959, on the retirement of the present Head.

Candidates should possess a degree and have had some teaching experience. Experience in research, industry, or commerce would be an added qualification.

The Department is at present in the III Department under the Burnham Further Education Report, 1956, the salary scales being £1,600 x £50 to £1,750 (men) and £1,280 x £40 to £1,400 plus equal pay increments (women), plus London Allowance and the 5 per cent addition.

Details and forms from the Chief Education Officer, County Offices, Chelmsford. Closing date February 7, 1959.

STATISTICIAN/ECONOMIST with some experience required by Birmingham stockbrokers. Reference given to personal accountancy or head teaching, or financial newspaper experience. Particulars treated in strict confidence. Applicants asked to state salary required.—Box 1096.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for TWO LEVERHULME POSTGRADUATE FELLOWSHIPS, one in the School of Architecture or the Department of Civic Design, and one in any Department of the Faculty of Arts. The Fellowships will be tenable for one year at a value of £600, but may be renewed for a second year. Applications, three copies, stating age, qualifications and experience, proposed field of research, the names of two referees and in the case of the Fellowship in Architecture or Civic Design, enclosing copies or photographs of work, should be received not later than March 1, 1959, by the Registrar, from whom further particulars may be obtained.

STATISTICIANS

Experienced Statisticians are required in our Operational Research Department. One of the first of its kind in the Steel Industry, this department contributed among other things to decisions which led to the £50 million expansion scheme now in progress, a major development in Britain's productivity.

A number of scientists, including a team of computer programmers, are engaged in a wide variety of research projects covering all aspects of Company operations. Successful applicants will carry increasing responsibilities in a friendly department where personal merit is recognised.

The successful applicants will be responsible for the design and conduct of industrial experiments with whatever assistance may be necessary and will have every opportunity of making major contributions to statistical discipline in Operational Research studies.

Please write, giving full details of age, experience, qualifications and any further information considered relevant, to:—

Superintendent, Personnel Services,
THE STEEL COMPANY OF WALES LIMITED
(Steel Division),
Abbey Works, Port Talbot, Glam.

AN FORAS TALUNTAIS

(THE AGRICULTURAL INSTITUTE, DUBLIN, IRELAND)

CHIEF OF THE RURAL ECONOMY DIVISION

... invited for the above position are invited from suitably qualified persons. In addition to possessing a recognised University Degree, or equivalent, in Agricultural Science and/or Economics, candidates must have at least 10 years' post graduate specialist and/or research experience in farm management and/or agricultural economics and marketing and/or rural sociology, or in allied subjects.

Further particulars and application forms may be obtained from The Director, An Foras Taluntais, 21, Earlsfort Terrace, Dublin. Latest date for receipt of completed application forms is January 30, 1959.

SALES OPENINGS

with

CALTEX

in

EAST AFRICA

University Graduates in Economics, or Business Administration, aged 24 to 30, and preferably single, are required to train and thereafter control a Sales Zone in the marketing of Caltex Petroleum products in East Africa. Some previous selling experience is desirable, not a necessity, the commencing salary being £115-£130 per month, plus a cost-of-living allowance, at present 11 per cent, of salary.

Home leave is granted after the first three years of service and thereafter at intervals of two years and local leaves are also given.

Candidates should apply in writing, giving full particulars of experience, etc., and quoting "FAF," to CALTEX SERVICES Ltd., Caltex House, Knightsbridge Green, London, S.W.1.

BOARD OF TRADE: ASSISTANT RESEARCH OFFICER required in Cardiff; RESEARCH ASSISTANTS in Cardiff, London and Manchester. Duties include collection and presentation of data, assistance in preparation of regional surveys of population, distribution, trade, industry, communications, services and natural resources. Qualifications: at least 2nd Class Honours degree, or equivalent in Economics, Statistics or kindred subjects. Background knowledge and experience essential. Assistant Research Officer post and advantageous Research Assistant posts. Temporary appointments but with F.S.S.U. benefits. Men's salary ranges: Assistant Research Officer, £1,160-£1,370; Research Assistant, £605-£1,080; slightly more for service in London. Starting pay according to age and experience. Write, giving age, qualifications and experience, to Ministry of Labour and National Service, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4, quoting reference PE 2437/8. Closing date January 30, 1959. Only those persons selected for interview will be advised of result.

LARGE Industrial Group with Headquarters Manchester (not Cotton Textiles) requires two or three young executives, each initially as personal assistant to Chairman of an operating company, but with definite prospect of appointment to subsidiary company directorial status within two or three years. Age 35-45 (no higher). ... ore

Qualifications required ... ... of industry, and (irrespectively) ... to carry responsibility for the work of others. *Capacity for team-work imperative.*

These are exceptional opportunities of a career in top-level management, and applicants should give full *particulars of education, training and experience* to date, and also indicate present earnings level.

Absence of a University degree does not disqualify, but *graduate applications welcome.*

Please do not apply unless willing to give full details first letter, and unless prepared to risk being found unsuitable within twelve months. We are interested only in men of sterling character and unusual talent, and are well able to remunerate these qualities appropriately.

Apply to Box 1100.

LONDON COUNTY COUNCIL

Applications are invited for the position of Principal of the London County Council College for the Distributive Trades, Charing Cross Road, W.C.2, to commence duties in September, 1959.

The activities of the College include day and evening classes for men and women engaged in or preparing to enter the distributive trades.

The College is equipped with a textile laboratory and display studio as well as commodity rooms and model shops.

Experience in retail distribution and ability to command the confidence of employers' and employees' organisations are necessary and it is desirable that applicants should possess graduate or equivalent professional qualifications, organisation and teaching experience.

The salary scale is £1,732 10s. x £52 10s. to £1,890 plus London Allowance under the Burnham (Further Education) Report 1956.

Further particulars and application forms (stamped addressed foolscap envelope) from the Education Officer (F.E.4), County Hall, London, S.E.1, returnable by January 31, 1959.

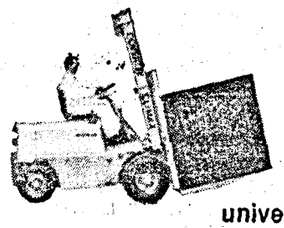
2471

BRITISH TRANSPORT COMMISSION require Economist/Statistician. Candidates should have some years' experience as an economist in the business world and understanding of the problems of high level management in a large organisation, ability to write briefly and clearly in non-economic language, and a good knowledge of the structure of the economy and of sources of statistical information. Direct experience in inland transport is desirable, but not essential; good academic or professional qualification required. Salary range £1,315-£1,590 per annum. Starting salary within this range according to qualifications and experience. Superannuation scheme. Certain free travel facilities. Medical examination. Write, giving age and details of education and career, to Principal Establishment and Staff Officer, British Transport Commission, 222 Marylebone Road, London, N.W.1, within 14 days. S.A.E. for acknowledgement.

DUNDEE TECHNICAL COLLEGE

DEPARTMENT OF MANAGEMENT AND HIGHER COMMERCIAL STUDIES

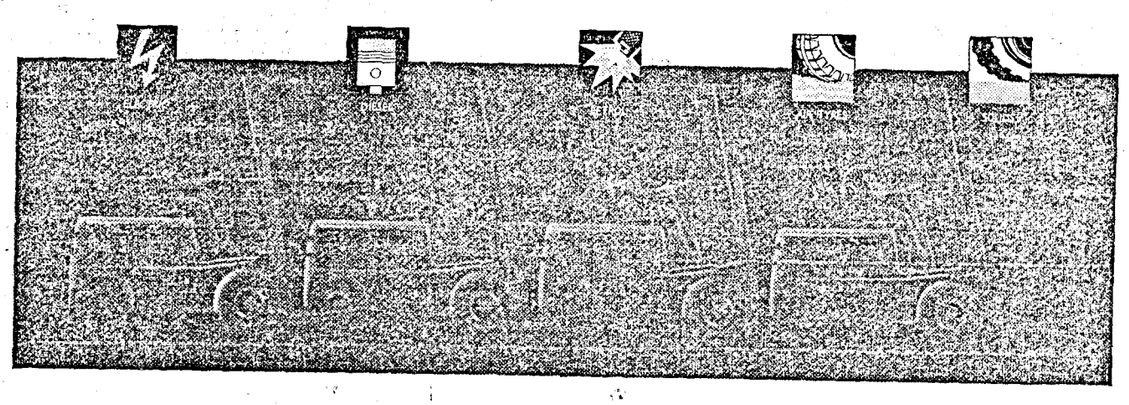
Applications are invited for the newly-created post of LECTURER in Industrial Administration. Candidates should possess an honours degree, or an equivalent professional qualification. Experience in industry in a responsible position is essential.



Salary—

Honours graduate, or equivalent—
Grade II (a) £785 x £35—£890 x £40—£1,250 x £50—£1,350.
Other Qualifications—
Grade II (b) £700 x £35—£805 x £40—£1,005 x £40—£1,125.

Note.—An increase of 5 per cent on the above-named scales is presently under consideration.



The full particulars and application form may be obtained from the Clerk and Treasurer, Dundee Institute of Art and Technology, 40, Bell Street, Dundee, to whom the *completed* form should be returned not later than two weeks after the appearance of this advertisement.

HEAVY castings

Well, heavier than we have previously supplied. We have increased our capacity in the floor moulding department and can now supply castings up to 5 tons weight in grey iron, and up to 2 tons weight in aluminium alloy.

Intricate castings

These have been our speciality for many years. Let us examine your casting problems. We supply grey iron castings made in green sand, dry sand, and by the shell moulding process.
Our aluminium foundries use the green sand, gravity die, pressure die and plaster processes.

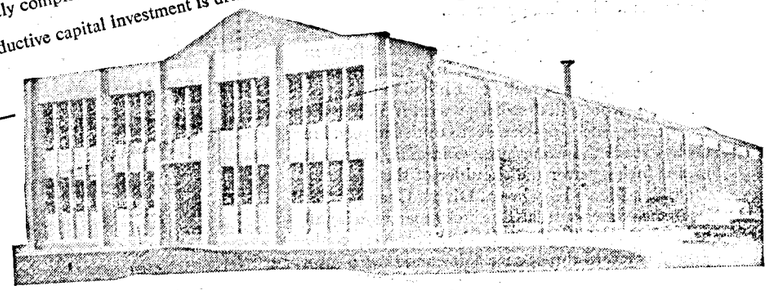
These buildings went up faster –

and cost less



This announcement is of vital interest to you. It's news—news of price reductions in a period of rising costs.

It can make the building project you may have scheduled for the future an economic proposition *NOW!*

HERE'S WHY

- Advanced techniques eliminate all waste and delay.
- Firm quotations are given at design stage.
- Work commences on site months earlier.
- Construction frequently completed in half the average time.
- The period of unproductive capital investment is drastically reduced.

And you get a building of better quality at a lower cost!

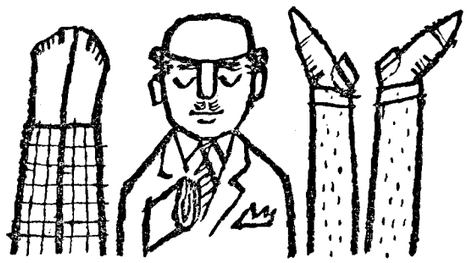
MAN MEETS GOOD JOB: JOB MEETS GOOD MAN

Every year a number of the country's leading industrial and commercial companies take full pages in the Manchester Guardian to speak about themselves: to announce what they are looking for in the way of executive personnel and what prospects they offer for the right man with the right ambitions.

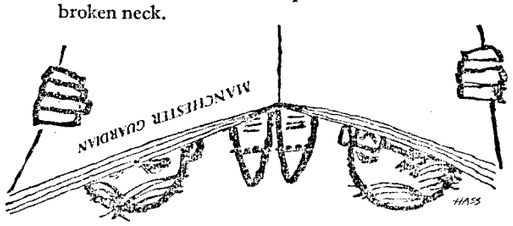


This year, starting on January 19, the sixth 'Careers' series begins in the Guardian. To Employers, to Careers Masters and others who work with the young, to graduates and school-leavers, these announcements give a valuable picture of the current employment situation. Past years have shown that they serve as an excellent introduction between men-in-search-of-jobs and jobs-in-search-of-men. Here is an interesting and imaginative approach to the problem of executive recruitment which you may well find worth considering.

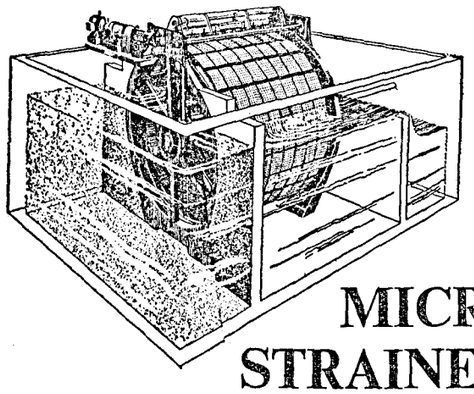
... in the

MANCHESTER GUARDIAN

Who are the men behind the



MANCHESTER GUARDIAN?



The man on the left, as our illustration shows, is going downhill fast. He is in fact accelerating at 32 feet per second per second, on the short way down from the ten-metre diving-board. This seems an odd moment for the Hackney Dolphins Men's Highboard Diving Champion (for that's who it is) to be reading the *Manchester Guardian*. He must be very absorbed in the paper indeed. The sharp-eyed observer will notice that he has also forgotten to take his trousers off.

The man in the centre is the right way up because he is a Top Person. He has his chin in, his chest out, and is keeping a stiff upper lip. If this text were not in the way, you would be able to see that he is keeping a straight bat, too. He keeps it on a sticky wicket, where he uses it to explore every avenue and leave no stone unturned. That neatly rolled newspaper under his arm is not the *Manchester Guardian*, which he never reads. You can see his point, poor chap.

The man on the right is by no means a Bottom Person, in spite of his position in the illustration. He has eight pints of really blue blood in his veins, ancestors who sailed steerage with William the Conqueror, and king-size death duties to pay. He always reads the *Manchester Guardian*, even if it means looking over the shoulder of the Hackney Dolphins Men's Highboard Diving Champion as he rushes water-wards. The lucky man who is still unencumbered by death duties, however, could probably afford threepence a day and have a copy all to himself. It's a cheap way of avoiding a broken neck.

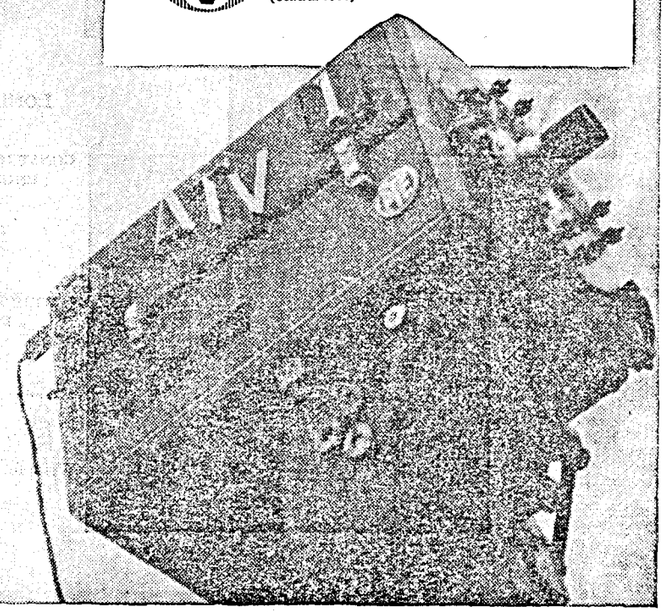
The changing face of advertising

THE NEXT STAGE IN ATV's TELEVISION PLANS

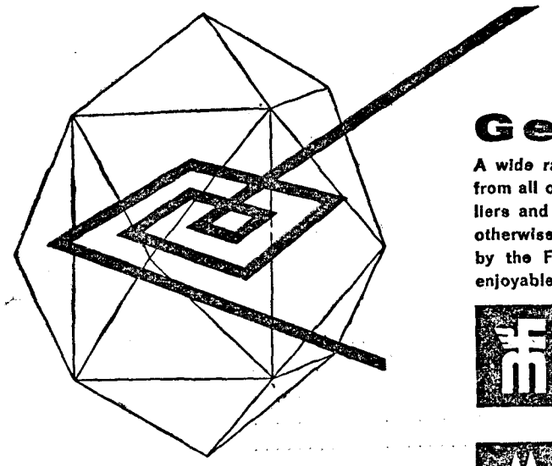
ATV have been running a television service for just over three years. We have learned our television know-how the hard way.

When our first programmes went out we had, to our credit, unlimited enthusiasm, some fresh ideas, and a bare minimum of improvised studio space and equipment. To our debit, we had a capital commitment of staggering proportions. But we knew where we were going.

At first, the commitments only got bigger. But the public were with us, and so were more and more advertisers. They gave us the confidence to keep to our original plan, which envisaged building up the equipment and staff to give a steadily improving service, and even better programmes. We hoped to make good our initial losses in three or four years.



We did it in three, and the first stage in our plan is complete. Now that our pioneering faith has been justified, we have big plans for the future. We have, at last, the resources to finance some of the essential developments we have all been wanting for so long: new, properly designed studios, more ambitious programmes.



The result, of course, will be an even better service to the public, and even more value for advertisers.

We have already changed the face of advertising considerably. We aim to change it even more.

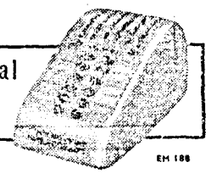
What are these men doing?

They are having a telephone conversation...



With the new Ring-Master intercom there's no dialling or lifting of receivers—no need to stop what you're doing, in fact. The caller just presses the numbered buttons for the extension required. Conversation can be held quite normally at either end—even when the speaker is some way from the desk unit! And with the crystal-clear sound reproduction, voices can be recognised immediately.

The revolutionary Ring-Master system can bring *instant push-button contact* to *your* organisation, however small or large—from 2 to 999 extensions!

Ask for further details of the Ring-Master—telephone or write to one of the addresses below.

Extra facilities for visual paging, calling preference, public address and secretary interception can easily be added.

The Way to Reflate

THE parliamentary term which starts on Tuesday will be an occasion for major economic decisions. This is not because anything has happened in the recess which suggests that reflationary measures are now going to be more urgently needed in order to save people's jobs. Indeed, rather the reverse. The signs are that Britain may already have begun to pull out of its small recession, somewhat earlier than anybody except the optimists had expected; both the index of industrial production for November and the unemployment figures for December give indications to that effect. Even some normally gloomy prognosticators of the new year's economic prospect are now guessing that, even without any further reflationary measures by the Government, production should rise slightly in 1959—perhaps to, say, 2 or 3 per cent above 1958 levels. The big question, however, is whether the Government is now ready to make the psychological break away from assessing how much reflation is needed to assessing how much reflation can be afforded.

The orthodox economic arguments why quite a lot might be afforded have just been set out in the debutant issue of the *Review* of the National Institute of Economic and Social Research (see page 245). "There is now," says this new and closely reasoning addition to the academic economic establishment, "a considerable margin of excess capacity in industry which, with present reserves of labour, should readily permit a rise in industrial production of 10 to 15 per cent in about two years." To bring this capacity into use would plainly necessitate the release of several hundred million pounds' worth of additional purchasing power.

If there is such a release soon, it is probable that Britain's present considerable balance of payments surplus will be reduced; but the institute's argument is that this will happen anyway when expansion gets going again, and that the period ahead is one in which it can be afforded more easily than usual. Perhaps re-expansion would also bring with it a risk of rising prices, but the institute believes that "there is now substantial scope for increases in productivity," which should help to keep costs stable. To these arguments the outside observer should add two points. First—and this can reinforce the economists' optimism—the trade unions seem less likely, even in a re-expanding economy, to press exorbitant wage demands to the point of strike threats this year; they feel that this would cause political damage to the Labour party just before a general election. Secondly, however—and this is the real rub—the external barrier to re-expansion in recent years has not been the exact statistical state of the current balance of payments, but the largely psychological state of foreign confidence in the pound.

One can agree with the economists that, if ever a substantial measure of re-expansion can be afforded, the strictly economic conditions are never likely to look more ripe for it than now. But they looked nearly as ripe in early 1957, and look what happened then. All experience since the war has shown that neat arithmetical calculations of a Chancellor's elbow

room can be constantly upset by the fourth dimension of economics: by the degree of confidence, buoyancy, *incentive and initiative in* and about an economy. The task this year should be to recapture that confidence trick in a re-expanding economy. If any re-expansionary measures which Mr Amory takes look like give-away gestures made under pressure, then his scope for reliefs without misfortune is likely to be much less than hopeful economists at present calculate. But if his policies can be made to look like a determined advance towards a new order of Conservative society, particularly in a year when foreign holders of sterling are likely to cheer on any increased prospect of Tory electoral victory, reflation this year might be able to go even further than prosaic economists at present presume. What measure would best fill the bill?

Would the right recipe be special steps to encourage investment? That would please many economists, but it seems very unlikely that a great new economic dynamic could be found by laying too much emphasis on subsidised inducements to add to an industrial capacity which is being under-utilised already. Would the right crock be found at the end of the rainbow by an extensive reduction in purchase tax, either this month (to avoid depression in the shops while awaiting such tax cuts in April) or in the ordinary budget? The consequent reduction in the cost of living would placate the trade unions, but the unions are not the people who most need placating this year. The spectacle of British consumers being encouraged by sizeable cuts in purchase tax to go on a sudden spending spree would not be likely to impress foreign bankers, many of whom think that popular spending on frivolities in Britain is quite high enough already.

Is it not much more likely that the right policy would be for Mr Amory to concentrate his efforts on the most ambitious possible assault on Britain's astronomical rate of income tax? Many foreigners (and some shrewd natives of this country) envisage the English as a people whose sense of initiative and responsibility is hopelessly downtrodden by some of the highest marginal rates of income tax in the world; they also believe that if a substantial reduction in income tax rates were made now, any incoming Labour government would find it politically difficult to raise rates quite back to their old level, so that this would remove one of the main weapons through which a Labour government might carry on a form of administration which foreign holders of our currency particularly dislike. Moreover, there is at least a possibility that they are right in both conclusions.

Each shilling cut off the standard rate of income tax, with a proportional reduction in the reduced income tax rates, would now cost a Chancellor some £280 million of revenue a year, of which over £100 million would go to business enterprises rather than to consumers. No doubt many stern realists will say that to mention even a shilling is wildly inflationary. No doubt many economists will propound that other tax reliefs would do more direct good to particularly deserving or depressed sections of the economy. No doubt departmental ministers will be pressing for increases in their own public investment programmes (for which they can make a reasonable case); and there are arguments about timing, about vote-getting (income tax cuts naturally favour those with the biggest incomes), and about debt management that will be heard as well. But the task of a statesman is to listen to his professional advisers on economics, political machinery and finance, and then to add his own touch of instinctive flair. The instinct one would like to inculcate into Mr Amory for the next three months can be expressed in a single sentence. There are largely uneconomic, wholly unstatistical, partly illogical but nevertheless plausible reasons for suggesting that every pound's worth of income tax relief this year would bring less risk to sterling than every ten shillings' worth of reflation made in any other way.

A Chance to Talk

Russia's aims remain obscure, but the shift from Berlin to the broader German question makes useful talks possible

To any sanguine souls who imagined that Mr Mikoyan's remarks in America augured a hopeful change in Soviet policy, the Russian proposals on Germany have been a disappointment. The Russians have proposed a conference to discuss a peace treaty. But the timing is impracticable—within two months; the attendance—31 countries—too cumbrous; and the substance of the proposed treaty contradicts what has been a basic postulate of western policy—that a peace treaty can only be signed with a freely elected all-German government. The treaty, says Moscow, must be signed by the two existing German governments. Progress towards unity is also left to them. *En passant*, the note suggests confederation between the two. That, as the communists interpret it, appears to mean the maintenance of a communist regime in the existing German Democratic Republic. It means, as it stands, perpetuating the present partition.

Mr Dulles has dubbed the Soviet scheme "stupid" and Mr Eisenhower terms it an "exercise in futility." It has caused general dismay among the Germans. Yet it would be a serious mistake to regard the Russians' proposals as merely offering no change. On November 27th they demanded the end of the occupation regime in Berlin and said they would hand over their own occupation powers to the Democratic Republic in six months' time. On New Year's Eve the western powers refused to give up their position in Berlin, but called for broader talks on Germany. Now the Russians have inched forward from their first position. They are not, it seems, delivering an ultimatum. They are, after all, *offering to talk, in their fashion*, on Germany as a whole. They still intend to hand over east Berlin, and their functions in regard to the western approaches to Berlin, to the Democratic Republic. But even on Berlin they leave room for counter-proposals; and if the western powers want "preliminary exchanges on the contents of a peace treaty" before the proposed conference, Russia will agree—given the participation of both German states. The rub is that, both in the transfer of functions in Germany and in the proposed talks, the West is asked to give recognition, *de facto* or *de jure*, to the existing East German regime.

It is this requirement that sticks, inevitably, in the gullet of Dr Adenauer and, to a lesser extent perhaps, of Mr Dulles. Yet the western response to the Russian proposals themselves cannot simply be negative. Many people in the West, as well as in, say, Poland or Czechoslovakia, may agree that some of the points in the Russian draft treaty are fair starting-points, at any rate, for discussing the place of a united Germany in Europe. Certainly there can be no agreement on German unity without agreement first on the frontiers and military status of the new united state.

The western obligation is to discuss, if there is the chance of progress, not simply to accede to the Russian bid. The West cannot sign a peace treaty unless German unity is at least on the way. But even this must be approached with an open mind. On Tuesday Mr Dulles himself conceded that free elections are not the only way to unity. Eventually, of course, the Germans must —indeed they will—decide their own destiny themselves. But the process of unification must start from the situation as it is. It has to be accepted to start with that the Democratic Republic does exist; but it is equally a fact, of which the West must make properly intelligent use in any discussions, that the great majority of its subjects would pitch it overboard the moment they felt it safe to do so. This is the great change in the balance of bargaining since the years just after the war. Then the fear was that, if the barriers in central Europe came down, communism might spread westward. Now the fear, Russia's fear, is the other way; given the choice, and uncowed by the presence of Soviet arms, the east Germans (and others) would choose a freer system.

Precisely because of this fact it is very much in the western interest to develop early contacts between east and west Germany. A closer economic relationship, for example, by *bringing* large-scale capital *from* western firms into east Germany's enterprises and freeing it from its economic bondage within the Soviet block, might be a valuable prelude to reunion. Once Russian troops withdrew—if ever that is likely to happen—the Democratic Republic could not last long, and German unity would be on the way. It is well worth while, in hard bargaining, to explore the chances—*without being deceived* by any false hopes.

It is, of course, the political importance of any conceivable withdrawal of Russian troops that makes *military disengagement in central Europe* so much in the interest of the West. Disengagement is plainly the only context in which German reunification could take place. The difficulties are obviously formidable. Russia's offer to withdraw its troops only from Germany, leaving them in Poland and Hungary, is clearly not enough, if a safe military balance in Europe is to be preserved, as *it must be*. But the important thing, when the prospect of piling up more atomic arms in western Germany has so alarmed not only the Russians but also Germany's other neighbours, is to see, in open-eyed negotiation, what, if anything, can be done to turn back the tide. The second Rapacki plan for a nuclear-free zone in central Europe offers some basis for a start to discussion. A scheme which brought international inspectors into the satellites would have real significance.

In this context what the West has to say about Berlin is important. The West cannot place the two million people of west Berlin at the communists' mercy—which is what the Russian proposal for a "demilitarised" west Berlin means. The idea, set out in *The Economist* of December 6th, that the West might propose the demilitarising of the whole city provides no sort of solution, by itself, for the Berlin problem. As was then said, it is realistic only in the setting of a wider accord, with guarantees, for Germany at large. But, if foreign troops in Germany were actually being gradually withdrawn, if atomic arms were under ban on both sides, and if the two states were coming practically together in their daily life, then the demilitarisation of all Berlin might help to speed reunion.

There is no possible way of knowing whether the Russians would in any circumstances be prepared to do any of these things. They will follow their own interests; and, plainly, even if they do want a settlement, they are going to try to get the best terms they can. Obviously, if they can persuade the West to keep its nuclear armaments out of western Germany, to recognise the Democratic Republic, and to give way in Berlin, without themselves conceding anything in return, they would be delighted. And the West must firmly and unequivocally refuse any such one-sided claim. But the one way for the West to test the Russians' intentions is to talk to them—confidently, and with its own counter-proposals.

How Green Are Our Diplomats?

Caught with their striped pants down in Baghdad, in Paris and now in Havana, Britain's diplomatic representatives need a closer examination than they themselves are evidently able to give to their surroundings

THE Fleet may be shrinking, but Nelson could still take pride in the doughty defence of his tradition by Britain's Foreign Service. It has formed a habit of clapping the glass to its sightless eye right up to the moment when some new catastrophe hits it, custard pie like, slap in the other one. Last year Her Majesty's envoys were taken completely by surprise by the military eruptions in both Baghdad and Algiers. More recently—if ministers are to be believed, and Commander Noble is, after all, an honourable as well as a gallant member—our men in Havana failed to notice that a civil war was going on until the fighting was pretty well all over bar the shooting of the losers.

In each case—and there have been others—advance warning could have been got without any need to coax cloaks and daggers from Ministry of Works storekeepers. Our diplomats did not have to slink in Haroun al Rashid's tracks through the bazaars, or steal the saddlebags containing The Papers, or smuggle beautiful temptresses, disguised as bagwash, into the bedrooms of the chief conspirators. They had only to read reports published in papers as reliable as (and including) the *New York Times*, and to keep in touch with equally respectable, though admittedly unofficial, persons who were fully alive to the way things were going. In the three cases cited they could have got their information without even having to wrestle with such notoriously exotic languages as French, Spanish or Arabic.

The indictment must be tempered. Its purpose is certainly not to torment a diplomatic service which cannot itself answer back (though it has some formidable champions who are free to joust on its behalf). It is rather to initiate a search for remedies. To begin with, one knows no more than Edmund Burke the method of drawing up an indictment against a whole service. Exceptions abound, many of them admirable ones. There is brilliance as well as ballast among British diplomats; and there is a wealth of solid ability. Diplomatic readers of *The Economist* may recall that it has on various occasions—notably, perhaps, in the issue of August 3rd, 1957—taken their part against their sillier critics. And the service has a proud record of loyalty—loyalty both to fellow officials and to even the dimmest of its ministerial masters. This seals its lips when it is unjustly blamed for what is really a politician's bloomer. It is a valuable quality; the example set by American and French (pre-de Gaulle) officials in vocally canvassing umpteen different policies at the same time is not an encouraging one.

Yet that same loyalty may contribute to the present alarming epidemic of myopia. This is not to accuse the Foreign Service of being exceptionally prone to "cover up" for its less competent members; nor is it to suggest that British diplomats are deferentially apt to report only what they think their superiors want to hear. (This last nightmareishly dangerous failing certainly besets the Soviet and other fear-ridden systems, and after McCarthy's evil hour it has had some noticeable effects on American diplomacy too.) But the corporate sense of the Foreign Service embodies some of the vices as well as the virtues of the British "public" school system. Conformity in thinking may not be as over-stressed as critics sometimes suspect; but conformity in conduct is. And some of the things which are "simply not done" need to be done.

IS it over-fanciful to detect in this at least one root of the trouble? Good manners are admittedly one of civilisation's essentials, but too much anxiety about them can have an inhibiting effect. Many British diplomats have the art of mixing easily in any society; but many others, aloof either because of their training or in an attempt to conceal awkwardness, leave a questionable impression both on foreigners and on their fellow countrymen. Some scarcely bother to conceal their boredom or unease in the company with which it is their duty to mix. Far from complaining about the over-frequent and often fantastic transfers that keep them scudding about the globe, they seem quite content with the excuse this system provides for their not troubling to master languages or probe beneath local superficialities. They may not be instinctively either snobbish or race prejudiced; but they are apt to arouse suspicions that they are, because they conform to a pattern of reserve, muscular Trappism, and revulsion from the least hint of alien fulsomeness, that was laid down by Dr Arnold at Rugby a century ago. And while their colleagues and superiors doubtless criticise frankly enough any technical inefficiency they show, even their best friends may well hesitate to tell them that this impeccable Rugby form is out of date and liable to keep them sadly out of touch.

Example from above is the only means of curing this malady. Happy is the junior diplomat who works under a master of the art of making contact (which does not call for a more than Rotarian heartiness, but for an approachable warmth and a genuine interest in other people's affairs). Unfortunately there are still to be found among the top ranks of the Foreign Service some practitioners of the lack of personality cult, some west-of-Suez, suburbia-minded innocents whose attitude towards non-pinko-grey people combines courtesy with total inability to regard such people as real, and some embusqué survivals who seem to feel that prewar Geneva was really quite as far as one could decently go in mixing with the mass of mankind.

The public has no chance to judge these men until, safely retired, they ventilate their terrifying ignorance of our changing world in memoirs, the posh papers, or Another Place; but their subordinates know their deep-frozen preconceptions all too well. Malleable subordinates may know better than to keep drawing H.E.'s attention to discrepant facts which disturb his liver as well as his Panglossian conviction that everything is under control. Less malleable diplomats may, like honest doctors, speak as they find—and later learn with horror that somewhere along the proper channels their timely warnings had been pigeonholed by an official determined not to let the Foreign Secretary be bothered by panicky nonsense. And, of course, the minister himself (and even his prime minister, as has been known) may suddenly embark on an adventurous policy against which the diplomats deployed in the area affected would have warned him practically with one voice—if only they had been given some inkling of what he was about to do.

Either way, British diplomacy is liable to end up looking myopic rather than Machiavellian, and its best men get tarred with the same brush as its boobies. One cannot hope for a clean sweep of its defects; but a start might be made by unfreezing some upper lips, taking the plums out of some mouths, and adopting the friendly grins commonly found on the faces of, say, the Canadians upon whom British diplomacy now often depends to help it to its feet after its pratfalls. To be warm and approachable does not, admittedly, ensure that one will always win friends and influence people; but when combined with a shrewd good sense, it does make it rather easier to find out what is going on in the world.

HMG Requests the Pleasure

The Government has an official organisation for throwing cocktail parties. But does it throw too few?

THE great gilt-encrusted mirrors of Lancaster House have reflected the glitter of state conviviality for over a century. "I come from my house to your palace," said Queen Victoria, when visiting the Duchess of Sutherland there. But today the uniforms and *tenues* which emerge from the equipages that deliver guests to the entrance are less obviously up to the standard of the decor. Gatherings of aviation officials, world zoologists, trade delegates and even diplomats tend to be subfusc under such regency opulence, although African or Eastern robes may sometimes conjure the sense of the past.

Lancaster House at least imparts an impressive air of occasion to government dinners and cocktail parties. It is an air cheaply bought at the price of the house's maintenance (borne by the Ministry of Works vote), and it does something to plump out the modest sociabilities made possible by the annual grant in aid of the government hospitality fund (Class 1, Vote 13 in the annual civil estimates). The great hostesses and princely establishments have vanished; the state can no longer count on private enterprise to receive its guests fittingly. What must be done must be done by the taxpayer, and he is lucky to have had Lancaster House presented to him by Lord Leverhulme to do it in. For the Treasury has no intention of competing with the past in any other direction. The policy is one of providing an irreducible minimum of hospitality done in decent order by a small and efficient unit within the Treasury establishment.

The unit organises government hospitality—which of course extends far beyond the functions held at Lancaster House. For instance, official lunches and dinners often have to be laid on at No. 10. Receptions may occasionally be more appropriately held at Hampton Court or even the Science Museum, depending on the provenance of the guests. Then there are hotel and other bills to be paid. Eminent state guests (if not staying at their embassies or at Buckingham Palace) are put up at Claridges and the Dorchester—others at more modest places suited to their station. The bills go to the debit of the government hospitality fund.

There are also the bills of the private contractors who tender for the dinners, lunches, cocktails or evening receptions wherever held. A bare half dozen firms come

up to the exacting standards of price, provisioning and security that are required of those who wish to be caterers to HMG. They have to look on the business as good public relations (which it is), and as splendid training in what is *comme il faut* (it is all that); there are no fortunes in it. The government insists on good fare, and first class but not frenchified cooking. The contractor has the onerous task of taking charge of the Government's own stocks of glassware, china, silver and cutlery; and his waiters must be beyond suspicion. He must serve, under the Government's butler's severe eye, the Government's own wines. Lancaster House is fully equipped with these; a voluntary committee of experts (on which it is an exacting but interesting honour to serve) purchases wines and spirits for the cellars at the rate of some £3,000 a year. On these unusual Treasury liquid assets the taxpayer makes a handsome, but rarely enjoyed, capital appreciation. There is no nonsense, of course, about insisting on Empire wines (although they may be stocked); but one residue of the dollar problem is to be found in continued investment in Jamaican cigars. Some nervousness was felt about this, but complaints have been gratifyingly few. Whether a detente with the new Cuban regime will require partial return to the Havana standard remains to be seen.

THE taxpayer's guests are thus fittingly received. Yet the total annual outlay under vote 13 is notably small. In 1956-57 it was only £67,501 10s. 3d.; in 1953-54 only £37,536 19s. 9d. In 1948-49, when Labour was throwing the parties, it was £110,628 16s. 4d. The latter figure seems more commensurate with the scale of entertaining before the war when (as we all know) the cost of a "do" was much less than half what it is now. For in 1937-38 the government spent £46,734 on state guests, and even as long ago as 1922-23 it spent £14,829. Expenditure has risen unevenly from the initial grant of £6,000 instituted in 1908 (by Lloyd George, just before his squeeze-the-rich budgets). But the number of guests to be entertained is hardly declining. (Consider the Commonwealth alone.) The conclusion must be that in recent years the Treasury has been economising. It has been permitting fewer parties or insisting that parties shall be smaller.

The rule is that a request to entertain Somebody or some Body must come from a minister (obviously the greatest number come from the Foreign Office). Provided that the guests rate for ministerial importance—to ensure which, the minister or his deputy must in person be their host at the party—the Treasury contends that such requests are never turned down. But its rules keep down the parties; and there is always liable to be a delicate *pourparler* about just how big or lavish a party is called for. Lunches may be substituted for dinners. It is rare for all the rooms of Lancaster House to be filled (they will hold over 1,000), rarer still for larger premises to be taken for a still greater number.

Thus the taxpayer may be assured that no great hordes of nobodies are now being dined and wined at his expense. In fact, the number of functions, large and small, averages 350-400 annually, many of them small cocktail parties at £50 a time. The accounts give details only of a score of major affairs; these, too, vary so much that no very significant conclusions can be reached. At first sight, the expansion of the Commonwealth would seem to be revealed in the fact that the cost of the 1957 prime ministers' meeting was £14,994 against only £7,143 in 1953. But the Labour government spent £11,420 on no more prime ministers in 1948; while the cost of the Imperial Conference in 1922 was £23,000. Length of sojourn and size of staffs are variable factors as well as consumption of champagne. The visit of Messrs Khrushchev and Bulganin cost £11,231 in 1957, King Feisal only £714. (Labour spent £1,655 on the Shah of Iran). The Soviet parliamentary delegation was also the most expensively entertained of any in recent years at £4,355; the Jugoslav MPs cost only £1,215, the American Congressmen only £1,211 and the Danish parliamentarians only £971. Naturally there are several degrees of state visit; but it is to be hoped that guests do not look up the accounts and make invidious comparisons.

At bottom, the Treasury's view of a really fitting entertainment policy is probably that it should be mainly concentrated on heads of state, brass-hats, parliamentarians and colonial leaders demanding independence. The entertainment of a conference of the top men in air safety or geology is rare; to bang £520 on the London Fashion Fortnight was exceptional. Parties thrown for such people as athletes (e.g., Empire Games) are modest. Parties given to meetings of learned and scientific societies average hardly one a year.

ECONOMY is gratifying. But an international reputation for stinginess would not befit or profit a trading nation in a competitive world. The blunt fact is that the British Government spends less on hospitality than the government of almost any other major western country. It is true, of course, that much more hospitality is given than is covered by vote 13; each department has, under its "travelling and miscellaneous" subheads, the wherewithal for an occasional sedate binge. But HMG appears to some of the rest of the world to be a rather reluctant host, very selective in its guests. In particular it shows none of the eagerness to attract, by a round of official receptions and so on, the conventions and conferences of learned men and women which are such a feature of state entertainment in other lands, even those that do not have a Ministry of Culture to insist on its importance.

The hospitality vote has been debated in Parliament only once—on Conservative allegations of waste in the administration of the government hostel at No. 2 Park Street ("The Cripps Arms"). This was proper; but perhaps the very success of recent economies ought now to stimulate MPs to take another look at this question, and consider just what sort of a figure Britain ought to cut as a host among the nations.

NOTES OF THE WEEK

THE ECONOMY

Particular or General Remedies?

SHORTLY before he left on his meet-the-people tour of North East England this week, Mr Macmillan held a special meeting at Downing Street of those ministers who are primarily concerned with the economic situation. There is nothing surprising in this. Such an assembly was to be expected towards the end of the recess, to decide whether or not to take early steps to re-expand production and employment. Subsequent speculation in the newspapers —about the possible appointment of a big industrialist as "Lord Job-Finder" for the development areas and so forth —probably flowed from intelligent assessment of what was likely to be discussed rather than from any precise knowledge of what was decided.

Broadly speaking, there are two alternative decisions which the Government could take in order to help re-expansion along. The first of these would be to intensify the policy of trying to poke new production discriminatingly *into particularly depressed areas of the country.* There is no doubt that the Government is disappointed at the comparative lack of response to its offer, under the Distribution of Industry Act last summer, that industrialists who directed their new enterprises to areas with above-average *unemployment could secure advantageous finance from the* Treasury. For some time, therefore, the idea has been mooted that this programme might be made to look more attractive if an industrialist or committee of industrialists were recruited to manage it rather than the Board of Trade, and if some of its provisions were extended. But the more logical conclusion to draw from the relative failure of the Act is surely that cost accountants seem to agree that there are bigger disadvantages involved in moving jobs to the workers than the politicians had hoped. Instead of recruiting some super-industrialist to bully or cajole other industrialists to go against their better judgment, it would be wiser to switch policy back towards helping unemployed workers to move to more extensive opportunities for jobs.

As is argued in the leading article in this issue, the best medium of general expansion this year, for a Chancellor who keeps his eye on long term objectives as well as short term ones, would be the biggest practicable reduction in income tax rates. If that decision were taken, the question of timing would be comparatively unimportant—although to advance the budget to some date before April, as was done in 1952, would not do any obvious harm. If the less enterprising alternative of concentrating on purchase tax reductions were adopted, then there would be a stronger case for advancing the announcement of them to before April, rather than allow a depression caused by anticipation of them to hang over the shops for another three months. But here again arguments about timing are arguments only of degree. To spur forward general re-expansion by means other than tax cuts, because of a political desire to do something early and because of the presumed administrative inconvenience of advancing the budget's date, would probably be the least satisfactory decision of all.

MIKOYAN IN AMERICA

Kind Words for "Traitors"

MR EISENHOWER very sensibly remarked on Wednesday that he did not yet know just what Mr Mikoyan's "holiday" in America was meant to achieve, and, equally sensibly, he invited the newspapermen with whom he was lunching to give him their opinions. The one thing he was quite firm about was that he did not want his Armenian visitor's informal call this week-end to develop into negotiations about definite proposals. Moscow's spokesmen have been even more discreet about the coincidence between Mr Mikoyan's holiday and the publication of Russia's latest terms for Germany; according to the Soviet press, the deputy premier's journey reflects his government's wish to find a "common peaceful language" with the West.

Mr Mikoyan has certainly been smoking the pipe of peace with the ogres of Wall Street, the monopolists of the Middle West and the decadent anti-social elements of Hollywood. He has been particularly smooth-spoken about his own former colleagues now in disgrace. While the Soviet press has kept up its onslaught on the "traitors" and "double-crossers" of the "anti-party" group, Mr Mikoyan has been reassuring his American audiences that they are still honourably employed and regarded as valuable assets. He expressed his "respect and admiration" for Mr Molotov, criticising him and Mr Kaganovich only for a tendency to conservatism.

These remarks, astonishingly in conflict with the line taken up by Mr Mikoyan's colleagues in his tactful absence, may amount to no more than a desire to please American listeners. Yet it is possible that Moscow's latest witch hunt is meeting resistance, and that Mr Mikoyan is among those who do not want to press it too hard. The persistent rumours that Mr Molotov is to be transferred from the distant oasis of Ulan Bator to the post of ambassador at The Hague lend some weight to these speculations, and at least make it seem less likely that the fallen titans are about to be brought to trial.

BAGHDAD PACT

Friend and Allies

THE last session of the Baghdad Pact council, in London last July, was in the form of a wake at which the United States tried to cheer up the surviving members of the family. Iraq was gone, Nuri es-Said, the architect of the pact, was dead. The future of Iraq was uncertain, but there was little prospect that it would retain any effective links with the pact.

Already a member of the military, counter-subversion, and economic committees of the pact, the United States pledged itself to become even more closely associated with the members, without becoming a full member itself. At an earlier stage it may have remained outside in deference to the feelings of King Saud, but now it could not easily or

quickly join because of constitutional limitations on treaty-making. During the past six months, however, it has been preparing bilateral agreements with Iran, Pakistan and Turkey. These efforts to patch up the pact have not gone unnoticed in Moscow. In October, Iran was warned that the Soviet Union could not "remain indifferent" to a treaty that subjected its southern border to immediate danger; the Pakistan foreign ministry has had to reply to a similar protest this week, Iran got another long-range missive from Moscow.

Meanwhile, the Iraqi government has opened its doors to the Russian influences the pact was partly designed to stop, its ambassador in Cairo has pronounced the pact dead, and demonstrations in Baghdad make it clear that the government in power now could not, even if it had any wish to, take an active part as a member of the pact. Iraq has in practice defected, but it need not, according to the terms of the pact, tell the other members until September.

The pact organisation has been given a new start in Ankara, but its files and its headquarters building remain sealed up on the outskirts of Baghdad. The pact council meets again in Karachi on January 26th. The proceedings should be a bit less funereal than those in July, but the problems are, if anything, trickier than six months ago.

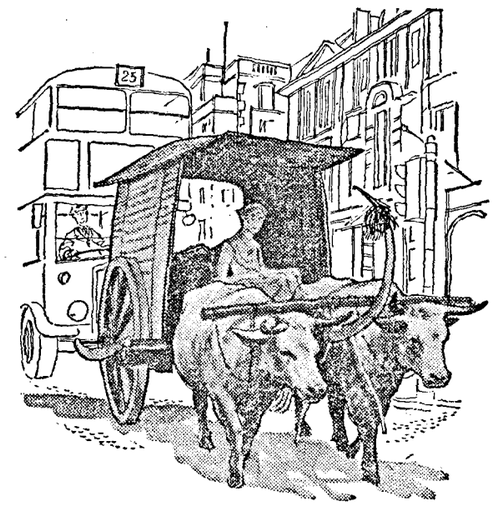
LONDON UNDERGROUND

The Turning Worm

THE London Underground's sit-down strikers have won a certain moral victory. It is now admitted that passengers differ from "luggage with legs" (to use the horribly revealing phrase of a London Airport spokesman) to the extent of requiring an explanation when something goes very wrong with their journey. More loudspeakers, better briefing of station staff, and more consideration all round, are promised. High time, too. But this does not—and should not—mean that there will never again be any of that infuriating (but sometimes sensible) decanting of eight-carriage trainloads to await, for seemingly interminable periods, the arrival of six-carriage trains already crammed to bursting point.

Behind the squabble lies the fearfully complex question of costs and price policy in a highly capitalised public transport monopoly. London Transport cannot fairly be accused of giving inadequate service for the passengers' money; indeed, since it is in deficit, the main trouble is really that it gives too many services for too little money. There are three ways out of this dilemma. One way is to raise fares; on the whole (though it and the public rarely dare to admit this) London Transport has not raised fares enough. A second tempting expedient for an organisation in deficit is to rely too long on making do with decrepit equipment, instead of spending money on replacing it. On the whole, London Transport has relied on this way too much. Many of the (on average) eighteen instances a day of passengers being turned off London Underground trains are due to faulty equipment. The third way out of a deficit is to make economies in running costs. Asking passengers to change trains is sometimes a way of achieving them. London Transport's main organisational problem is to be able to meet demand at the rush-hour without carrying too much uneconomic idle capacity outside it. To turn a proportion of trains round at an intermediate point on their run and send them back into the thickest of the fray, leaving a thinner service to carry the thinner traffic seeking the extremities of the system, is sometimes a sensible means of doing this.

Suspicion remains, however, both that other ways of economising may remain neglected (such as skimming some surplus labour off pay rolls) and that the system of turning round trains has often been dictated more by the convenience of the railway staff than by constructive economy. The convenience of staff (mainly crews accustomed to joining their trains at a particular station) is certainly to be considered when organising turn-rounds; but the fact that staff can unitedly protest about inconvenience while the monopoly's passengers have hitherto suffered in silence makes it humanly certain that the path of least resistance, the first resort rather than the last, has been to load inconveniences on to the passengers. The sit-down strikers have at least made this policy less attractively trouble-free and stimulated second thoughts. Those fellow-worms who have never been exasperated quite to turning point owe them—along with the advice not to make a habit of obstruction—a couple of rousing cheers.



MPS' WELFARE WORK

No Complaints?

LORD ATTLEE and Sir Alan Herbert have been giving fresh currency to a complaint that is more often muttered to each other by backbenchers in private—that MPs are much put upon by the welfare work they are expected to do by their constituents. They both take exception to the weekly or fortnightly "surgeries" which many members hold so that constituents can drop in with their problems. Sir Alan Herbert admonishes the voters of East Harrow that if they elect him as their member: "One thing, I tell you frankly, I shall not do. I shall not act as a kind of glorified welfare agent or poor man's lawyer. . . . A member must have time to think." Lord Attlee suggests that by a "gentleman's agreement" the parties should gang up on the public by agreeing not to compete in providing such personal service.

Nothing in fact could be worse for the malaise that affects Parliament—the people's lack of interest in politics and politicians, and the sense of futility of too many members. It is not the pressure of constituency problems that is preventing backbenchers from being more effective than they are, but the archaic conditions and procedures under which they work. Politicians may well feel that when they have arrived in Westminster they ought to be doing something grander than wrestling with parochial and ill-expressed grievances. So they should, part of the time; and any reform which, within the general framework of the British system, gave them a greater chance of participating in the work of the House should be welcomed. But on the other hand any member who feels no sense of purpose in being a mediatory force between "us" and "them" (as so many people think of their relationship to those in authority) is simply in the wrong vocation.

The argument, often resorted to by MPs who feel themselves ill-used, that a high proportion of their letters ought to be addressed to someone else, usually the local council, is no argument at all. It simply shows that many ordinary people cannot distinguish between the different layers of authority, and need guidance from some identifiable individual on how a problem which is important

Bullock Cart in Bond Street

Delivering goods to somewhere out East? Right here in London we can produce for you facts and figures about your market. We can provide you with up-to-date credit information, and advise you on currencies and monetary regulations, for any part of South or East Asia. For ours is the largest British bank established by the Far East for the Far East. We are intimately connected with the life and commerce of thirteen Far Eastern countries. We have offices in most of the main trading centres. Our knowledge and services are available to you whenever you need them.

Branches throughout the Far East; also in New York, Hamburg and Paris. Offices of our Subsidiary in San Francisco and Los Angeles.

"Yes, Gentlemen, each one gets special attention . . ."

. . . a precept countless craftsmen and Swissair have in common. For it is precisely special attention and service-plus that each passenger enjoys on every Swissair flight.
And whatever *your* destination, Swissair offer every week twelve flights to the Middle East . . . nine to North America . . . services to South America every Sunday and Thursday . . . to the Far East every Tuesday and Friday. Luxurious First or unrivalled Tourist Class, each flight is swift and smooth with weather-radar . . . each meal brings a well-dined, well-wined satisfaction.

The men who come to Unilever under our management development scheme do not always have a clear picture of what they want to do. Provided that this indecision is based on breadth rather than woolliness of mind, we welcome it. For we recognise that, as a man grows in experience, so his ambitions develop and may change course several times.

We have the rarely-found facilities to allow for this. In the first place, the interests of Unilever are far wider than most people imagine. And, secondly, the organisation is made up of over 400 separate companies, no two having quite the same personality. This means that each move a man makes will aim to bring out whatever talent is in him; not to bend him to fit a particular groove or to work in an atmosphere that is unsuited to his personality.

We have room for both arts men and scientists. In both we look for the same thing—the ability, however latent at first, to develop as managers. In developing, a man will at times feel the need to change direction. The diversity of Unilever and its own ability to develop will generally satisfy that need.

If you would like to know more about opportunities in Unilever, write to the address below for a copy of "Six Men on Business".
Or ask your Appointments Board or Committee, if you are at a university.

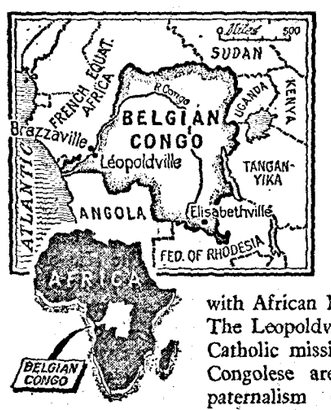
enough to the person involved is to receive proper attention. A member who deserves his seat should welcome regular contact with real people (instead of merely with other politicians and journalists).



Of course much routine letter-writing is an imposition on a member who cannot afford a secretary and has no office space of his own. The solution is not to deprive the constituents of his services, but to provide all MPs with a decent minimum of facilities. Britain is far behind other parliamentary democracies in providing these.

BELGIAN CONGO

One More 1960 Deadline

After a "soul-searching" parliamentary debate, an openly penitent Belgian government has announced its plan for dealing with the suddenly agitated Congo. The first part is an undated cheque for independence, backed up by a timetable of elections for local bodies which are in turn to elect next year—the year of independence for Nigeria, Somalia and Cameroons—a "skeleton" assembly to which responsibility will be transferred in unspecified stages. The second part involves the suppression of the nationalist Abako party, and the jailing of, among others, three of the elected African burgomasters who represented the first fruits of last year's limited political reforms. The third part is fair play for Africans in the civil service, and other measures to end race discrimination and alleviate unemployment. The fourth is a strengthening of the Belgian armed forces in the Congo.

The Belgians may cling for some time to the idea that the disaster which has overtaken their colonial policy is mainly the work of agitators influenced by the nationalism "irresponsibly" unleashed by French and British policies in Africa. But the inconsistency of promising political advance while suppressing political organisation cannot last. The genie will not go back into the bottle, and the Belgians, like the British and French before them, now have to learn to live with African Nationalist politicians. The Leopoldville rioters' attacks on Catholic missions indicate that the Congolese are tired of the joint paternalism of enlightened big business and a ubiquitous church. This paternalism has threatened to leave the Congo as ill-prepared for statehood as the Dutch left Indonesia; and even if combined with repression, it will no longer hold up the march of change.

The Belgians' wisest course would be to grasp the nettle, while the "soul-searching" mood prevails, and get down to discussions with African leaders about developing in the Congo the representative institutions which the Belgians have long condemned as premature in British and French Africa. If, instead, they concentrate on finding new devices for maintaining their authority, they will be ignoring the lesson of their neighbours' experience—and drifting towards violence on a scale alien to their own inclinations. They would do better to leave that to the Portuguese—and even Portugal's African deadlines will now evidently arrive sooner than has been generally expected.

FRANCE

The Price of Pinay

The first French reactions to General de Gaulle's financial policy of *vérité et sévérité* have been, as expected, not less than anguished. Now the critical time for the government's gamble on prices begins. The socialists' feeling that the new budget weighs too heavily on the poorer classes has already driven M. Mollet out of the government. Although he reaffirmed, in his letter of resignation, that he still supports the general's policy on other issues, including Algeria, the full effect of socialist opposition in the country, as well as in the Assembly, will be increasingly felt. Above all, the government cannot afford a year of industrial unrest.

M. Pinay is banking on the overall price rise caused by his budget not going above 8 per cent. If it does, his advisers believe, the benefit of the latest devaluation will—as in the past—be lost and, with it, the best stimulus to French industry's competitiveness in the common market. Some increases which have been published in the past week show how strong the pressure may become in some sectors. Steel prices will rise by 8-10 per cent, railway transport by 10 per cent, and gas and electricity by 4.5 and 6.5 per cent (more to domestic consumers). A man's haircut will cost 15 per cent more and cigarettes and tobacco 15-20 per cent. The present increase in meat prices, although partly seasonal, fits into the pattern of budget reactions. If this trend becomes widespread M. Pinay's bet will be lost at the outset. But for the moment at least the government does not intend to intervene. It is relying on the psychological effect of the new regime and its reforms, as well as on a continued fall in demand. But a clear sign of popular nervousness about prices has been the spurt in purchasing domestic appliances and similar items since the budget.

The position on the labour front is also in the balance. Union feelings have been critical and watchful, and the Catholic unions have again appealed to the government (which still includes MRP ministers) to modify its economic policy. Gas and electricity workers in Paris have already held a mass demonstration of protest. It may be that the government is depending on the continuance of the present recession to hold the general wages line. But such a policy must eventually increase the Communists' political strength in the country and spur the communist-led CGT to direct economic action.

GERMANY

The Krupp Merger

Last week's merger between the Rheinhausen steel group and the Bochumer Verein carries on the process of reconcentration that has been going forward in the Ruhr for several years. The main medium-sized Ruhr firms—Mannesmann, Hoesch, Klöckner—have long since recombined coal with steel and steel with engineering. The

Vereinigte (united) group, biggest of all before the war, has not regained its former size. But out of it have emerged three major groups, two owned by separate branches of the Thyssen family ; each of the three produces 2 to 3 million tons of steel. Now the main steelworks in the Krupp group has merged with another descendant of Vereinigte. Under the allied deconcentration laws Herr Alfried Krupp was obliged to sell his holdings in coal and steel. As a result he sold his "Constantin der Grosse" coalmines to his Swedish friend, Hr Axel Wenner-Gren, who had already acquired control of the Bochumer Verein. Now both firms have been bought by the Krupp group and merged with the Rheinhausen steelworks, which Herr Krupp never sold. The combined group produces some four million tons of steel a year. The 3.8 million tons of coal it produces, mainly from the Constantin der Grosse mines, should cover 75 per cent of its coke needs. A large proportion of its steel output will go to the engineering industries to which Herr Krupp has devoted his energies since the allies sought to keep him out of coal and steel.

The move has the consent of the High Authority of the European Coal and Steel Community. There is no political provision in the treaty which could justify rejection, and since other French and German firms in the community are already larger, there could not very well be a refusal on economic grounds. But a special and somewhat controversial order has been imposed on the new group: all investment must have the blessing of the High Authority.

The merger still offends the allied deconcentration order, which the west German government took over when it attained sovereignty and which is supposed to be in full effect by 1960. But Bonn is hardly likely to enforce it. Hitherto, Herr Krupp's main argument against carrying out the order has been that there was no one who could afford to buy. The new repurchase suggests that he is reasonably confident that it will lapse altogether. Whether he will succeed in getting a waiver on his personal commitment to the allies to give up the management, as well as the ownership, of his coal and steel works, remains to be seen. Hitherto Herr Krupp has kept his obligation on management, but he is not the only German to regard both provisions as economically unjustifiable, and imposed under duress.

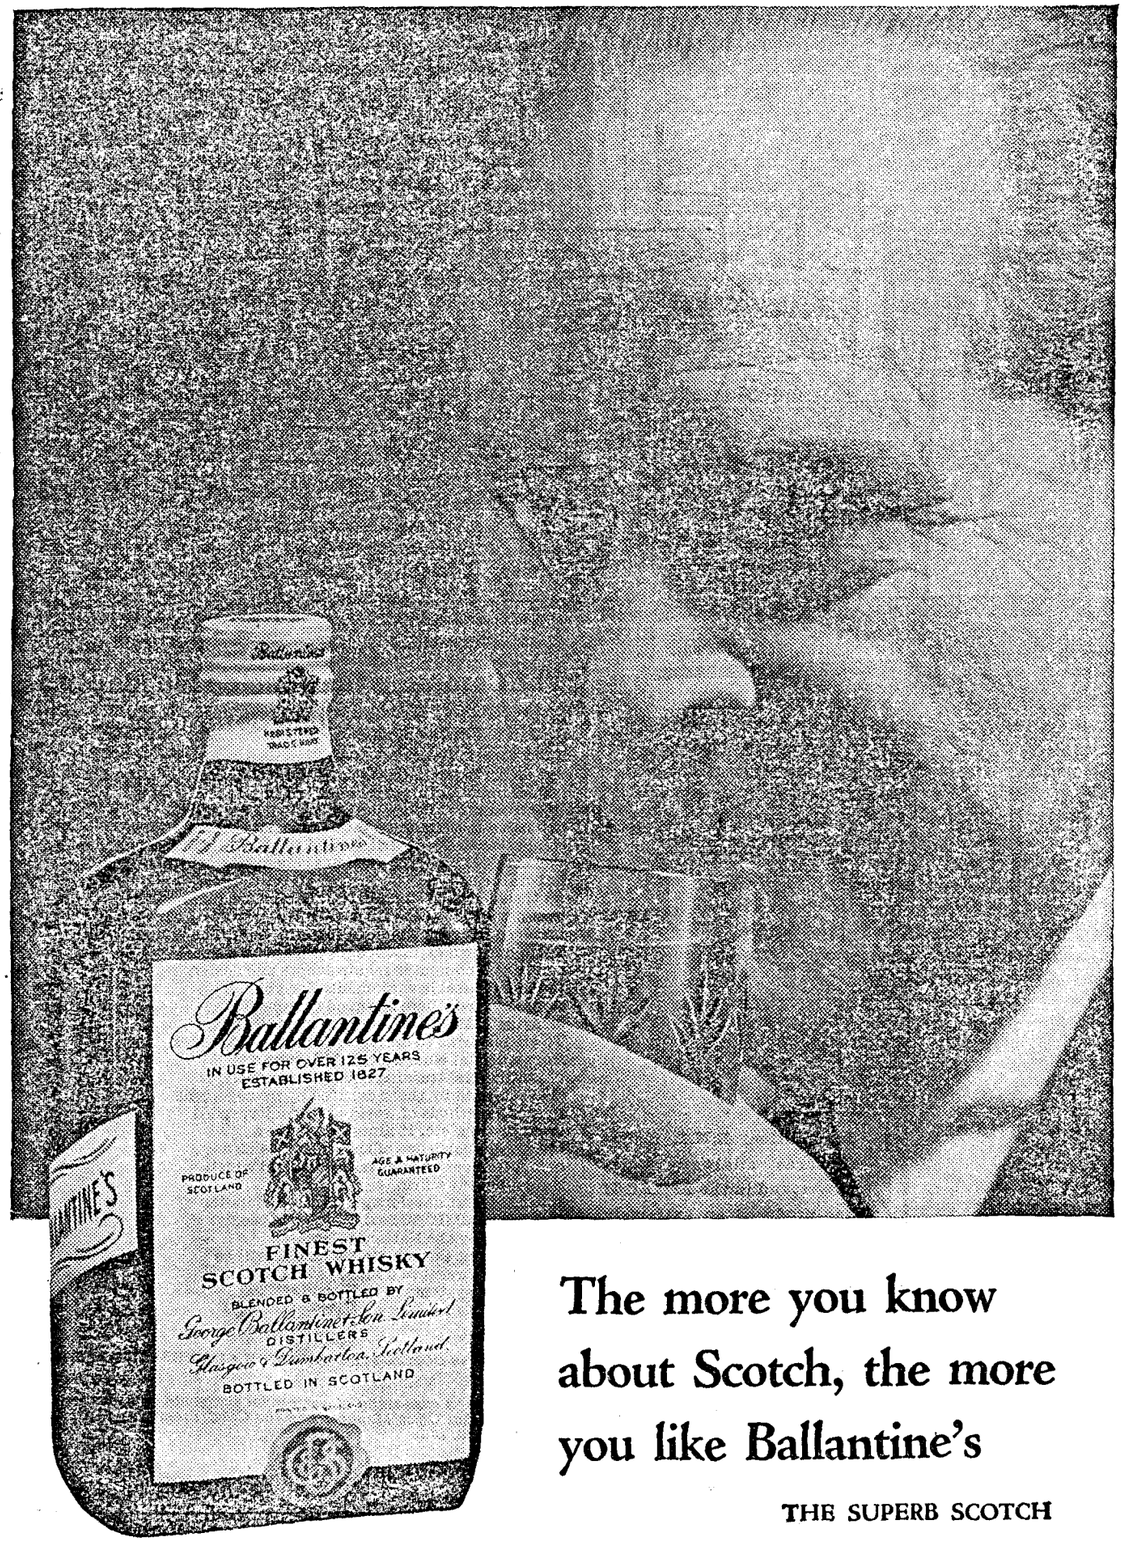
LIBERALS

Third Party Prospects

THE return of Mr Frank Byers, the former Liberal Chief Whip, to the political active list as chairman of the Liberal Party's pre-election campaign committee should give his party the first-rate organiser it urgently needs. But his desperate appeal for a beggarly £50,000 fund, half of which is simply to meet the normal bills of party headquarters, contrasts starkly with the revelation from Transport House that it is thinking up fancy ways to blue £750,000 on its campaign. The Liberals' danger is that in contrast they too may be driven to gimmickry because of the sheer lack of resources for a fully sustained effort. It sounds ominous that Chorley Liberal Association, for instance, which has not yet got a candidate, already has a publicity firm that is advising it to "forget about the Commonwealth and the Colonies and concentrate on what you can do for Chorleyans—after all, they are your prospective customers."

The Liberals have already adopted 186 candidates, compared with 110 who stood in 1955. Of these all except forty-five are fighting Tory incumbents. Save in a very few instances, such as North Cornwall, North Dorset, Carmarthen, Merioneth and Roxburgh, where the Liberals used to hold the seat and have managed to stay second, their main hope lies in the handful of seats where there may be the prospect of a two-stage recovery—first pushing Labour down to third place, and then becoming the main beneficiary of any anti-Tory swing as well as stealing extra votes from Labour on the deliciously ironic grounds that they would otherwise be wasted.

The next election will be a harsh test of the theory that second place is halfway to first. Rochdale, where Mr Ludovic Kennedy will be attempting to better his spectacular performance in a by-election, is probably the constituency where the theory is least likely to work. There are four other constituencies—North Devon, Inverness, Denbigh and Hereford—in which the Liberal candidate forced his way up into second place in 1955 (and in Hereford the same candidate came only 2,000 votes short of victory in a by-election in 1956). In the first three the candidates who did well last time have been hard at work, although in Hereford, oddly enough, there is still no one in the field.



What the Liberal party, which is not going to win many seats in the next election in any case, most urgently needs is to get two or three hell-raisers in the House so that the country is repeatedly made aware that there is a third party in action. Apart from Mr Thorpe in North Devon and Mr Bannerman in Inverness, it is difficult to pick out the future Liberal Sydney Silvermans and Gerald Nabarros from among the Liberal candidates most likely to succeed.

WAGE CLAIMS

Printers Press

THE stage is now set for what is always one of the most intriguing wage claims in any year to a weekly newspaper such as *The Economist*—and this year it could be more painfully intriguing than ever. Last week nine craft unions in the Printing and Kindred Trades Federation approached their employers, the British Federation of Master Printers and the Newspaper Society (who together represent all printing firms except those producing London daily newspapers), with a demand for a 10 per cent rise in wages and a shorter working week. The size of the claim—which, if extra overtime, increased pay and the industry's cost of living bonus are included, would raise printing wage costs by up to 17 per cent—is certainly in part a show of bargaining panache ; but by any standards, and especially those of wage settlements of the last two years, it is still exorbitantly high. The unions have not, however, achieved a united front with their demands. Natsopa, the other large printing organisation, which is primarily a union of semi-skilled and unskilled men, has decided not to join the craft unions in their claim. Instead, it is to present one of its own.

The reason for this split in the union ranks is the constant friction in this most sacred of craft preserves between skilled and unskilled workers. Lack of common policy among the unions over demarcation and differentiation has led in the past to a series of leapfrogging claims. Relations between the craftsmen and the rest were badly strained

'The Company then decided to place a order for an Emidec Computer . . .'

THE ORDER in question was placed by the largest firm of manufacturing wholesale and retail chemists in the country: Boots Pure Drug Co. Ltd. After a year's extensive investigation into the merits of 31 digital computers in Great Britain and the U.S.A., the final choice was the EMIDEC 1100—the final choice also of Glaxo Laboratories Ltd., the British Motor Corporation and others. As the activities of the E.M.I. Group are diversified over a wide product range, we fully appreciate all that is involved in the decision to install a digital computer. From our own experience we can assess a company's computer requirements and design the most suitable equipment. For your company, too, there are good reasons for bringing E.M.I. into your considerations. To enable firms to derive the fullest advantages from a digital computer, E.M.I. runs a programmers' training course, frequently also attended by those deputed by management to study methods of working, capacity, speed, organisation, etc. It aims to provide a thorough knowledge of the kind of work a computer does and the many ways in which it may benefit a firm. E.M.I.'s latest development in the computer field is the EMIDEC 2400, which has been sponsored by the National Research Development Corporation. The 2400 will be one of the largest and most advanced data processing systems in the world.

EMIAC II
In addition, E.M.I. manufactures analogue computers, and in the EMIAC II has produced an extremely versatile machine, with particular emphasis laid on simplicity of operation.

E.M.I. ELECTRONICS LTD., COMPUTING DIVISION · HAYES · MIDDLESEX

* *Extract from 'A case study of commercial electronic data processing' by the General Office Manager and the Chief Programmer of Boots Pure Drug Co. Ltd.*

five years ago by the dispute between Natsopa and the Machine Managers Trade Society (a small craft union which is now amalgamating with the London Typographical Society) over who should organise the machine minders on the new presses of the *Daily Sketch*. Natsopa has since left the printing unions' federation altogether and is unlikely, in the near future at least, to rejoin.

On the employers' side, too, there have been important changes since the last dispute in 1956. Then only the London master printers came to open battle with the unions; a long dispute followed, during which London printing firms closed down and their customers (such as this newspaper) had to appear from printing firms on the continent. Printing firms in the provinces were only lightly affected. This year a far greater sense of solidarity exists among the employers. They say that they are determined not only to resist the claim, which they have described as "staggering," but also to sign any agreement only with the printing unions as a whole and not, as in 1956, one by one. Much hard bargaining and a period of uneasiness probably lie ahead before the old agreement expires in April.

. . . and Builders Bargain

THE builders are another group who do not believe in doing things by halves. Last year, with unemployment threatening in their industry, they claimed an increase of 8d. an hour in their basic rates, both on account of rises in the cost of living and in order to offset any loss of wages suffered because of a shorter working week. In the end they got an extra 2d., half from an automatic cost of living award and half, five months later, from the Industrial Disputes Tribunal. This same cost of living scale has meant that this February the builders will again get an increase of 1d. an hour. But, alone at the moment among major groups of manual workers, they have now claimed an additional 4d., with extra allowances for dirty work, travel and tools to boot.

These flamboyant claims probably should not be taken too seriously—certainly not as seriously as those of the printers. One reason for this is that there seems to be little steam behind the demand for any immediacy in settling the claim. The question is being shunted into the industry's sub-committees, and probably no decision will finally be reached until late spring or early summer. A second reason is that the workers' negotiating committee, the National Federation of Building Trade Operatives, though covering more than one million workers and having (on paper) unusually strong federal powers over both the industrial and strike policy of affiliated unions, is by no means as powerful as it seems. Builders are not always the most disciplined of unionists, and there is some bad feeling in the federation over the increasing inter-union competition for unskilled workers. Before making any threat of aggressive action, the builders are bound by agreement to ask that their claim should go to arbitration. As the Industrial Disputes Tribunal has now been abolished, the final arbitration body they would go to this year would presumably be the Industrial Court. As they already have an agreement giving them automatic increases when the cost of living rises, they must know that the court, in present conditions, would be quite likely to turn down their claim. The union movement as a whole probably does not regard the building workers as the ideal pace-setters for any 1959 wages struggle.

COMMONWEALTH

Advance, Altrincham

ON Wednesday Lord Altrincham put forward some interesting new developments in Cwthmanship, the principles of which were set out, with notes on recent work, in *The Economist* of December 27th. J. Altrincham's latest findings must, like his earlier, be regarded as purely preliminary; but Cwthmen everywhere, royalist and republican, are bound to take the liveliest interest, as did the mixed audience of Cwthpapermen whom he was addressing.

The suggestion that Mahatma Gandhi, rather than St George, should be Cwthpatron has much to be said for it; it would meet Indian claims to set the general moral tone of the Commonwealth, and would not in practice prevent members from adopting strong-arm tactics against their more irritating neighbours—though some may argue that St George's obsolete type of military equipment accurately reflects the position of the Commonwealth in the thermo-nuclear age.

J. Altrincham's proposal that the Monarchy should preach and practice racial tolerance runs into the difficulty that HM ministers in each Realm write HM speeches for delivery there; they will very properly do so when the Queen goes this year to Ghana, where Cwthman K. Nkrumah is still promising, equally properly, to delay the declaration of a republic until after her visit. Royal speeches touching on racial issues would thus be differently phrased during visits to, say, South Africa and Ghana, though any references to the parliamentary opposition, the duty of judges, and so on, might of course be much the same. Research may show that the difficulty could be met by making a clear distinction between the occasions when the Queen speaks as Queen of a particular Realm and those when she speaks as Head of the Commonwealth; she could be far more independent in the latter role.

Cwthman Altrincham is not the first man since King Solomon to have seen the advantages of royal inter-racial marriages; but the best chance in this direction passed with the later Moghul emperors. It is now for the peerage of which he is a member to begin by developing more racial variety in the Upper House, which could attain new splendour under the title of Lords Spiritual, Temporal and Ultramarine; work on this ploy, following the Life Peers Act, is actively proceeding. But J. Altrincham's suggestion that the Prince of Wales should go to a non-U British state school is perhaps a bit uncwth. Not all Cwth members admire the achievements of our own Ministry of Education; more, perhaps, admire the Public School system, which is an OK but by no means an exclusively UK institution; and in any case the royal house of a cosmopolitan Commonwealth requires a more cosmopolitan training than either of these institutions can provide.

IRISH REPUBLIC

Mr De Valera for President?

OUR correspondent in Dublin writes: It looks as if Mr de Valera's campaign to remove proportional representation from the Irish constitution will culminate in his own removal from active politics and translation to the less exciting pasture of the Presidency. The electorate has

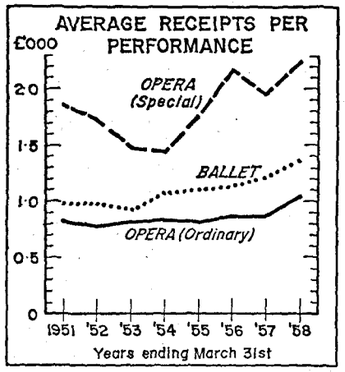
already had a thorough course of instruction in the merits and demerits of the single non-transferable vote. It will now be given an example of the mechanical working of a written constitution.

Last year Mr de Valera's government introduced two bills: one to amend the constitution by abolishing proportional representation and substituting the single-non-transferable vote and single-member constituencies, the other to

Financing the Arts

THE case for an increase in the state's subsidy to the arts has been fervently pressed home in the annual reports of the Tate Gallery and the Royal Opera House, Covent Garden, which have just been published for the financial year 1957-58.

At present the Tate Gallery receives an annual purchasing grant of £7,500; even with its additional investment income, the total money available falls far short of any reasonable assessment of the sum necessary to fill the more serious gaps in the gallery's modern foreign collection. This requires, the trustees consider, a lump sum of £100,000 to overtake arrears and an annual grant of not less than £40,000 for current purchases. These are not enormous sums in relation to present-day prices which, as the report points out, still seem to be rising. While the Treasury is making up its mind, the gallery is to be congratulated on having taken steps to raise some private funds through the subscription society "The Friends of the Tate."



Up till now, comment on the running of the Royal Opera House has been largely speculation. Only with the publication of this first annual report are the accounts made public; they are set out for each year since the formation of the present company in 1950. The taxpayer contributes to Covent Garden in the form of a grant made by the Arts Council; this rose from £145,000 in 1950-51 to £302,000 in 1957-58. But in only one of these years—1952-53—was this assistance sufficient to cover productions of opera and ballet in this country; and even when profits from North American ballet tours are included, the company has been running at a loss in each of the last four years. Its overdraft on March 31, 1958, stood at £163,287.

COVENT GARDEN EXPENDITURE, 1957–58

(Including tours; £'000)

Salaries and wages	781·8
Artists and management	*341·2*
Orchestra	*209·5*
Stage and staff	*177·4*
Administration	*9·6*
Front of house	*44·2*
Buildings	57·4
Rent, rates and insurance	*29·8*
Maintenance, etc.	*27·6*
Production and reproduction costs	62·0
Contract payments	37·2
Touring and miscellaneous expenses	359·4
Total	**1,297·8**

Inflation has been the main cause of rising costs. Until 1957-58, when responsibility was assumed for the Sadler's Wells Theatre Ballet, there had been only a small addition to the number of staff. In 1957-58, the salary

bill for artists and management, including temporary engagements, was £341,190—80 per cent higher than in 1950-51; the rise in the numbers of permanent staff in this category—from 178 to 276—was little more than 50 per cent. The rise in other pay seems to have been greater.

But, inflation or no, the root of the trouble is the vast expense of maintaining the building at Covent Garden and of putting on full-scale productions with a complete orchestra and large cast—in short, of running a great opera house. In 1957-58, when 259 performances of opera and ballet were given at Covent Garden, the total expenditure of the company on all items other than tours was £674,458, or £2,600 a performance. Admission receipts were £334,885—an average of just under £1,300 a performance, or half the actual cost. Tours in that year, including an American visit by the ballet, were run at a slight total loss.

Opera is the worse commercial proposition, rather more costly to produce and less popular than ballet. In the eight years since 1950, the average production expenses for an opera up to the date of performance—that is, the capital, as distinct from the running, costs—were £11,500 (most expensive were *Gloriana* in 1953-54 and *The Trojans* in 1957-58, each of which cost nearly £24,000). A comparable average cost for ballet cannot be given because so few new productions of full-length ballets have been staged. Of those that have been, the *Prince of the Pagodas* and *Sylvia* cost nearly £10,000, and *Ondine*, in the current year's repertory, will probably prove to have been more expensive. The cost of short ballets, forming part of "triple bills," has varied from about £1,400 for *Birthday Offering* to over £10,000 for *Petrushka*.

POPULARITY POLL, 1957–58

(Figures of average paid attendances. Number of performances in brackets).

Opera			
Highest		*Lowest*	
Madam Butterfly	(5) 2,167	La Boheme	(4) 1,517
The Ring	(2) 2,079	The Carmelites	(9) 1,428
Aida	(16) 2,034	Tales of Hoffmann	(13) 1,403
The Trojans	(8) 2,030	A Masked Ball	(10) 1,277
Tosca	(7) 1,907	The Magic Flute	(5) 1,237
Elektra	(4) 1,834	Rigoletto	(12) 1,186

Ballet			
Full-length			
The Sleeping Beauty	(8) 2,120	Swan Lake	(13) 1,983
Giselle	(10) 2,050	Coppelia	(7) 1,857
Sylvia	(4) 2,029	Prince of the Pagodas	(7) 1,542
Triple Bills	(52) 1,965		

In all these years, average attendances and receipts were higher for ballet than for ordinary opera. In four years special opera performances at higher prices were the best attended, and in all years they yielded the highest revenue. The seating capacity of the house is 2,200; last year it was 88 per cent filled on the average for ballet, 87 per cent for special opera and 73 per cent for ordinary opera. For 49 out of the 158 opera performances, the house was less than two-thirds full. Thus, higher prices for all seats for every performance are not the automatic answer, though more might be done by way of selective price increases.

Other countries face more vigorously the problem that opera is no money-maker. One useful change, however, has now been made in Treasury policy. Instead of a flat sum, it has been agreed that the Arts Council grant should henceforth be calculated as a fixed percentage of "approved expenditure," but the rate has still to be settled. The new arrangement will extend over three years, and the directors of Covent Garden believe that, at present-day prices, the annual grant required is about £500,000.

The three big institutions—the National Gallery, the Tate and Covent Garden—have made their annual financial needs clearly known. To meet them all, the taxpayer is being asked for a little more than £300,000 a year over and above what he is at present giving. This can hardly be called a runaway inflationary sum. Is it really worth the Treasury's while to go on boggling at it and to spend so much time haggling over details?

provide machinery for the referendum which is required before any change in the constitution can take effect. These bills have passed their second reading and are now in committee in the Dail.

But the timetable for them has run into that for another political event. Next June Mr Sean T. O'Kelly completes his second term of office as President. (The President is elected by vote of all the electorate, holds office for seven years, and is eligible for re-election for a second term only.) For some time there has been speculation whether Mr de Valera would be a candidate. Originally, most people assumed that the Presidency was probably too remote from practical politics to interest him, and that there would again be general agreement between the parties on a single candidate. But then Mr Costello's party put forward a candidate, General MacEoin. He would probably beat any of Mr de Valera's ministers, but not Mr de Valera himself. Mr de Valera has now indicated to his party that he will stand.

Mr de Valera has always insisted that the poll for the Presidency should be kept separate from the referendum. But it is possible that the Senate will reject the two bills and so hold them up for three months. In that event, the two issues will fall to be decided almost together, and it will no doubt be found convenient to have the voting for both on the same day. Now that Mr de Valera is definitely to stand for the Presidency, the Opposition may oppose the bills less furiously in the Senate than they have in the Dail and let them through in order to separate the issues. Mr de Valera is probably odds on for the Presidency, but it seems very possible that the electorate has not been at all convinced by the arguments against PR. All this reflects Mr de Valera's undying interest in political institutions and tactics. A disadvantage of this is that it takes up time that might be better devoted to economic and social issues; an advantage is that two years ago nobody would have believed that the IRA would have fallen so far out of public attention as it has at present.

HORTICULTURE

Part-time Producers?

THE most interesting and heartening feature of the National Farmers' Union study group on small horticultural enterprises is that its recommendation that the smallest growers should consider taking up other work and running their holdings part-time.

The study group's other findings are all fairly predictable, ranging from sensible advice on making more use of the National Agricultural Advisory Service, on co-operative purchasing, and on the improvement of records and accounts, to the usual plea for cheaper credit, bigger production grants, and higher import duties. The recommendation on part-time holdings stands out from the rest less by reason of its positive content than because it tacitly drops an assumption underlying practically every other pronouncement by a trade union or trade association—the NFU being, in this respect, very far from unique. This is the assumption that the only proper and tolerable arrangement of public affairs is one that will enable every individual currently engaged in the occupation concerned to go on indefinitely making a good living in that occupation. In the farmers' philosophy, the familiar major premise of all arguments about guaranteed prices or the volume of other aid to agriculture has hitherto been that, if these do not guarantee a living income to the very last holder of the very worst-placed and least fertile splinter-holding, then they are by definition inadequate and due for increase.

By advising its uneconomically small members to look outside horticulture for their main source of income, the NFU study group is conceding that there are limits to this usual doctrine of right-to-a-specific livelihood. Were it recognised not only that some holdings should properly be recognised as part-time enterprises but also (by not too difficult logical extension) that some holders should move out entirely, the ground would be cleared in more senses than one. The popularly accepted view that agriculture and horticulture occupy a specially significant place in the social and economic framework, calling for a degree of special privilege, would then become easier to reconcile with the general requirements of economic commonsense—such as that it is a bad idea to give £1 for a shillingsworth, or to encourage the expanded production of something for which the demand is already saturated, or, in general, to pay through the nose for the privilege of misusing one's resources. Any such general recognition is probably a long way ahead. But the report of the NFU study group on horticulture is a straw in the wind.

JANUARY 15, 1859

EVERY MAN HIS OWN BOSWELL

THE AUTOCRAT OF THE BREAKFAST TABLE. By OLIVER WENDELL HOLMES. Edinburgh: Alexander Strahan and Co. London: Hamilton, Adams, and Co.

There is a great charm in the familiar yet serious talk of an original and observant man—a charm, too, which is often altogether absent from his writings .... The sudden metaphor that comes as by inspiration and lights up the darkest parts of a subject; the thorough and unshrinking comprehension of whatever belongs essentially to the question at issue; the truths that have presented themselves to us, but which we have decorously banished from our consideration; ... these invigorating elements are wanting in almost all written thoughts, while they are daily experienced in the conversation of intellectual men. These constitute the attraction of Boswell's "Life of Johnson", ... and they also belong in no inconsiderable degree to the "Autocrat of the Breakfast Table". It is a genuine book of its kind, and we predict for Mr Holmes a large share of favour from readers on this side of the Atlantic. ... "The Autocrat" gives us his remarks at a series of breakfasts at an American boarding-house. He has it mostly to himself, though now and then a suggestion or remonstrance is permitted from one or other of the guests at the table. These consist of a schoolmistress, young and timid; a lady of a certain age, strict and angular; an old gentleman, mild and benevolent; a "Divinity-student", somewhat pedantic and priggish; a "young fellow, called John", a sort of American "gent", who is described as having the power of laughing and winking on one side of his face and looking perfectly serious on the other—an accomplishment which we suppose is not uncommon in the States, seeing that Mr Dickens also mentions it as belonging to Mr Scudder, the land agent, in "Martin Chuzzlewit". ... All these characters, it is evident from the very appellations of some of them, are of true native growth. ... The author appears to be a scholar and a traveller, but he has not sunk the Yankee in the cosmopolitan, and we like his book all the better for it; while his thoughts have depth and breadth enough to recommend themselves to cultivated men, whether of the Old or New World.

LETTERS

Baldwin's Statesmanship

SIR—In your current issue, you criticise sharply the tributes which Lord Attlee and Mr Macmillan have recently paid to Baldwin's leadership. Baldwin, you argue, led the country "too slothfully through depression and too calmly down the road to war": his, you state, is precisely the kind of leadership which is not desirable today.

It depends, of course, on how you look at it. (Not all of us feel compelled to base every historical or political judgment on the mythology of the thirties.) It could surely be put differently: truth, as Baldwin said, is many-sided. To me, it seems that Baldwin's achievement was to lead the country united through a general strike and a depression, and to enable it to enter a war in 1939 just as united. I cannot persuade myself that there is any more important function of statesmanship than the preservation of a country's unity.

As you remark, there is material for more than an article in this subject. I will confine myself to only one or two more obvious points.

No one, surely, would deny now that it was largely as a result of Baldwin's vision and influence that it became possible for working-class politics in this country to operate successfully within the parliamentary system. In France, the working class has, up to date, been excluded from the parliamentary regime, and therefore has looked for leadership to what Luthy calls "that internal *emigré* group, the French Communist Party." To prevent any substantial class, group or interest from being excluded, or itself seceding, from the state: this, I would suggest, is a vital property of statesmanship. Baldwin possessed it.

Thirdly, anyone who has read and studied the now copious memoirs of the twenties and thirties cannot fail to appreciate the skill with which Baldwin civilised his own party. The party which, spurred by him, overthrew Lloyd George in 1922 was a greedy party. Baldwin took it and gently and with a consummate practice of all the arts of political leadership dulled its appetite. Duff Cooper's account of how Baldwin handled the "forty thieves" inside his own party is worth reading and re-reading if one wishes to understand what political leadership is. Here, then, a third criterion of statesmanship by which Baldwin may happily be judged: using, as all politicians must, a party based on a sectional interest, he yet turned it into an instrument of national policies.

No one would try to conceal Baldwin's weakness: as Mr Macmillan himself remarked, "he did not understand foreign policy and here he failed." But to deny his greatness as a political leader is to ignore what the true functions of leadership are. Unity, calmness and stability: these are not slight achievements. The country which entered the war in 1939 united and remained in it united until 1945; which stood firm in 1940, when France collapsed; which calmly accepted the return of a Labour Government to power in 1945: this was the country which Baldwin created.

He devoted himself, as a statesman should, to the preservation of the fabric of society. That fabric is still strong, as the past few years have shown, and it is historically inaccurate as well as politically dangerous to deny Baldwin his substantial share of the credit. *Si monumentum requiris, circumspice.*—Yours faithfully, HENRY FAIRLIE

London, E.C.4

Controlled Expansion

SIR—Mr Douglas Jay in your columns seems to be vying with his colleague, Mr Anthony Greenwood, in those of *The Times*, in rushing from one sensational disclosure to another.

Having blue-printed the features of the "planned economy," which so notably failed between 1945 and 1951, he goes on to assure us that "there is no intention whatever that the next Labour government should embark on the nationalisation of the greater part of British industry". Is his party, or is it not, pledged to acquire the shares of the top 500 companies? What do the chairman and vice-chairman of the Labour party national executive say?—Yours faithfully, TED LEATHER

House of Commons

SIR—I am sorry that Mr Douglas Jay in his letter to you of January 10th should have decided to avoid the question put by Sir Robert Renwick and commented on by myself; namely whether or not the Labour party is genuinely abandoning nationalisation or merely abandoning the use of the word.

Nobody has asked Mr Jay or anybody else to divulge details of future budgets and his references to this suggestion are wholly irrelevant.

I do note that Mr Jay lists seven instruments of economic policy—including interest rates—but excluding nationalisation. He does say that the next Labour Government has no intention of nationalising "the greater part of British industry". Unfortunately his party's most recent policy statement directly affirms that public control must be extended over the Board decisions of about 600 giant privately owned firms. The same policy statement repeats the intention to renationalise steel and road transport. Sir Robert's original question remains wholly unanswered; perhaps Mr Jay regards it as too inconvenient a question.—Yours faithfully,

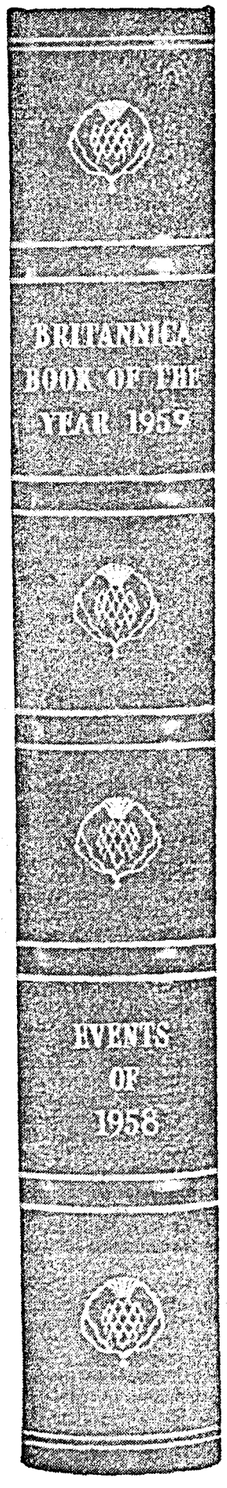
House of Commons ALAN GREEN

SIR—Mr Douglas Jay says that the Labour party wants controlled expansion of the economy and that the expression "controlled expansion" means full employment without inflation.

If he really thinks that the Labour party are capable of carrying out such a policy, please will he kindly explain why the Labour party were unable to achieve full employment without inflation when they were last in office.—Yours faithfully, G. S. NAYLOR

London, N.12

Independent MPs



SIR—You write "now is the time for all good East Harrovians to come to the aid of no party," and appeal for support for independent candidates. It is perfectly true that both major party machines are getting over-powerful, and that Parliament has been the poorer since the independently minded University members were abolished. But who abolished the University seats? Surely the Socialists! They destroyed the independent MPs, and they are the only party who could benefit if your advice were followed. Your independent candidates would not take any material number of votes from the Socialists, but would steal almost exclusively from the Conservatives, and to that extent would be wolves in sheeps' clothing. The Prime Minister has a perfect right to say "he who is not for me is against me," and every vote cast for any candidate other than the Government one is a vote to make Mr Gaitskell the Prime Minister, and Mr Bevan the Foreign Secretary. If that is what the people of Harrow really want, surely they should vote straight Socialist. If they don't want this change in government, they should support the Prime Minister's supporter.—Yours faithfully,

CYRIL OSBORNE

House of Commons

Local Government

SIR—Your note on "How to Govern the Midlands" seems to be based on the assumption that "Bigness is Best". This leads you to threaten the Boundary Commission with castigation unless it merges Rutland with Leicestershire and makes other changes designed to submerge "small" counties in larger ones. To anyone who has any personal knowledge of local administration in a small homogenous unit, your basic assumption appears unsound and unproven. Because of its "smallness", Rutland enjoys a local administration which by any known tests is cheaper, and just as efficient, as that of its "bigger" neighbours. It enjoys moreover a sense of community which is quite delightful and of great value. This is due, *inter alia*, to the more intimate personal contact which exists between the ratepayers on the one hand, and their representatives and the local officials, on the other. Moreover, people actively engaged in business, in the professions and in jobs of every kind (often the most valuable type of councillor) can and do afford the few hours necessary to attend small short meetings in a county town only a few miles from their own work places. THE BRITANNICA BOOK OF THE YEAR

The year that science fiction became fact!

1958—what a year it was! The new Britannica Book of the Year captures it all between crimson and gold covers. Rockets probing deep into space, reaching for the moon—satellites circling the globe, one even broadcasting President Eisenhower's Christmas message. And over the earth's frozen wastes and under the frozen seas, adventurous scientific journeys of historic importance!

Sir Vivian Fuchs completed his great trek across Antarctica—and in the Britannica Book of the Year he tells you the full story of his expedition's valuable contribution to the International Geophysical Year. In a graphic personal account, Captain Anderson of the U.S. Navy's atomic submarine *Nautilus* takes you with him on his epic voyage under the North Pole.

450 leading authorities have contributed to the Britannica Book of the Year, covering all the important events of 1958, including:

The Berlin Crisis • European Free Trade • The Middle East • China and Formosa • France • The New African Nations • The Commonwealth Armed Forces of the World Disasters • ZETA and Thermonuclear Power • The Royal Family • Famous People • Sport • Speed • Facts Figures • News Stories

These are only a few of the subjects dealt with in the new Britannica Book of the Year. It runs to nearly a million words, has over 550 pages and 400 pictures, maps and charts.

RESERVE YOUR COPY NOW! In response to public demand, this magnificent Year Book is available to all who *reserve quickly*. Originally produced for owners of Encyclopaedia Britannica, it is at present going to press in a strictly limited edition (ready March). It is advisable to subscribe now and secure priority for your order.

Post this coupon today for full details.

ENCYCLOPAEDIA BRITANNICA LTD.

Please let me have, without any obligation, full details of the Britannica Book of the Year.

NAME MR. MRS. MISS ..... (BLOCK LETTERS PLEASE)

ADDRESS .....

TOWN .....

the best will in the world the same type of people could not give up whole days to sit at large gatherings over twenty miles away concerned only incidentally with the problems of their own area.

It is remarkable that, apart from a somewhat sneering allusion to "aldermanic" views, nowhere in your note do you allude to the wishes of the inhabitants. Surely you, Sir, of all people, will wish to "Set the People Free" from attempts by theorists and bureaucrats to impose on them changes in local government which they do not desire and for which they can see no justification.—Yours faithfully, JOHN HOBSON

House of Commons

The Prudent Saints

SIR—Your review of "The Quakers" by John Sykes (December 20th issue) happens to contain a very misleading passage, viz. ". . . for an introduction to the religious technique offered by meeting for worship and meeting for sufferings, . . . this book is highly recommended." In the context, your use of small type fails to differentiate between two dissimilar conceptions.

No doubt meeting for worship could be described as a religious technique, since it is the name given to the normal form of Quaker service, held in quiet waiting. However, "Meeting for Sufferings" is merely the title of the executive body of the English Society of Friends—a particular group of representatives who meet once a month in London, to guide the current business of the society. The term is an archaic survival from the time of persecution in the 17th century, and many modern Friends do not like it for the confusion it causes; but at least it does not indicate an indulgence in morbid festivities!—Yours faithfully, T. S. BACON

Oxford

Teachers' Pay

SIR—Mr John Vaizey may be right in saying that there is no shortage of recruits for teaching if he takes as his basis the number of applications for places in training colleges. But that is far from the whole story. Many heads could tell him that there is a considerable shortage, both in quantity and quality, of scientists and mathematicians in all kinds of secondary schools; and those in touch with university education departments know that the proportion and quality of graduates who intend to teach these subjects do not match up to the need. Further, it is very doubtful if anything like enough of the training college recruits will teach them.

It is clear that the success of the Government's plans for expansion in science and technology must depend on an adequate, well qualified, and satisfied teaching staff in schools, technical colleges, and universities. The present manpower position in science and mathematics should therefore be a matter of grave concern.—Yours faithfully,

KINGSLEY M. RAW

King Charles I School, Kidderminster

BOOKS

Common sense for Development

The Design of Development

By Jan Tinbergen.
Johns Hopkins University Press. London: *Oxford University Press.* 99 pages. 20s.

As the world's population races up to five thousand million, and nearly half humanity continues to live largely under conditions of subsistence agriculture, no single issue is more urgent than that of economic development, by which is understood the process whereby static economies are given the technological dynamism needed for self-sustaining growth. But how is this vital transformation to be brought about? The answer varies, of course, from region to region and depends vitally upon local resources and the availability of outside stimulus. But some broad conclusions are possible, and Professor Tinbergen's compact and sensible "Guide to Development" sums up much of the relevant material.

He remarks that "programming is not an alternative to common sense." But programming of the type he outlines is a sort of systematised common sense, and although some of the techniques discussed—such as the use of "accounting prices"—will seem abstruse to the layman, the general design he proposes for development will commend itself to any reader by its reasonableness and good sense.

On the basis of much statistical information devised from past economic growth, economists are now inclined to believe that it takes between three and four units of capital to produce an additional unit of national income. When, therefore, population is increasing by between one and two per cent a year, national income will do no more than keep pace if only 6 to 8 per cent of it is used for productive investment. To break through the sound barrier into rising living standards and self-sustained expansion, an annual investment of not less than 12 per cent of national income is necessary. This is the starting point—an expansion of saving on the necessary scale.

But the types of investment must be as various as the economies in which it is to take place. Given the aim of expanding savings, what is the pattern that will ensure success? Are there alternative uses of local resources? Which programme brings about what modifications over the whole period of the plan? And which of these possible programmes uses all available means to the optimum degree? The process of answering these questions resembles, as Mr Tinbergen dryly remarks, "the solution of a jigsaw puzzle of considerable complexity" and one, moreover, in which the pieces, as in Alice's croquet match, obstinately alter their size and shape.

Yet even in this complexity, the programme makers have some fixed points of reference. One is "complementarity." It is useless to forecast a plan of development in which estimates of future power are unrelated to the actual provision of power, or factory construction to the availability of materials. That this occurs under public plans can be seen from the recent over-extension of manufacturing capacity in eastern Europe.

Another principle is consistency. It is not possible to accomplish a programme if its separate parts demand more resources than are actually available. Sometimes, it is true, consistency can be undermined by sharp changes in the resources themselves. The second Indian Five-Year Plan may have included a gamble on the scale of foreign assistance. It could not forecast the fall in India's export income as a result of the American recession. For this reason, as Professor Tinbergen points out, all planning must be constantly subject to revision and the element of guesswork recognised.

A number of different programmes may be based on both these principles. What is the final criterion of choice? Ideally the plan to choose is the one that uses available resources to produce the maximum increase in income. But this is not an easy judgment to make, particularly in areas where some resources are either especially scarce or over-abundant. In many parts of Asia capital is desperately scarce in relation to labour. This underlying disequilibrium distorts the picture of optimum use. The market cost of labour is fixed by trade union activity and may overstate the labourer's value. The price of capital may be too low as a result of government regulation or international loans at low rates. In these conditions, Professor Tinbergen believes that planners might substitute "accounting prices" for market prices—prices that would increase rates on capital and lower wage costs to bring them into line with reality. Only then would anything like a genuine maximisation of income occur.

However, as the study fully concedes, the chief enemy of consistency, complementarity and optimum use in planning is not so much the planner's errors in calculation as the unpredictable politics of government. There is so much "prestige" development these days, so much demand for the trappings of "modernisation," so much eagerness for flamboyant technology, that straightforward, effective, indispensable means

of capital accumulation, such as better land use, may be set aside for a steel mill—without iron ore—or a civil airline—without passengers. These are the hazards of development that not even the most painstaking planning can avoid. But national programmes can minimise the waste and Mr Tinbergen offers useful, sensible guidance for their construction.

Russell's Recipe

Common Sense and Nuclear Warfare

By Bertrand Russell.
Allen and Unwin. 93 pages. 7s. 6d. cloth, 3s. 6d. paper.

LORD RUSSELL has reached the conclusion that any nuclear war is bound to do frightful damage to all parties. Breaking away from the Aldermaston column of march, he opposes unilateral disarmament, pacifism, and passive resistance. Instead, he tells us that the only escape for mankind lies in a change of heart, universal agreement to re-educate all peoples on anti-nationalist lines, and universal tolerance between ideologies. After that, and only after that, a supreme world authority could be created (he does not say how it would be elected), with irresistible armed forces at its disposal (he does not say how they would be commanded).

As interim measures, he proposes a solemn renunciation of war and provocation, and the removal of various sources of local tension. Russia must join the western powers in guaranteeing Israel's present frontiers against any attack. Formosa should be handed over to China (without regard to any views its ten million inhabitants may have). All foreign forces must be withdrawn from Europe; the peoples of central and eastern Europe would then throw off their communist regimes and choose democracy, having no serious reason to fear a Russian invasion because their immunity would be guaranteed (he does not say how or by whom).

Lord Russell justifiably complains that policy-makers in all countries

> are too busy to be able to acquaint themselves with more than a small fraction of the facts upon which policy ought to be based.

Still, even a small amount of acquaintance with the more intransigent facts of life can be useful. There are at least a certain number of people who share Lord Russell's fears about a nuclear catastrophe but, being rather more directly involved in the human hurly-burly, find that it is not quite so easy. To him, the world's political leaders—he lumps them all together, though it is the Americans whose more alarming words he quotes, perhaps because he finds *Pravda* and the Chinese press hard going—are delinquent militarists, passing their time in playing "brinkmanship," and apt to feel that "loss of face is more dreadful than nuclear annihilation." Yet even a cursory reading of last year's newspapers might have led him to deduce that even the most powerful of these potentates are in reality worried and uncertain men, all of whom have in recent months accepted repeated "loss of face" rather than risk war.

Mankind's real problems in its struggle for peace are certainly complex enough to make both politicians and public look hopefully to such eminent figures as Lord Russell for philosophical guidance through the perilous maze. Books such as this must shatter these hopes. Instead of original thought, we are offered platitudes; instead of workable initiatives, pies in the sky; instead of bread, a stone.

Empire in Decay

The Sultan: *The Life of Abdul Hamid II*

By Joan Haslip. *Cassell.* 299 pages. 25s.

"THE Red Sultan," "Abdul the Damned," the "Great Assassin"—Abdul Hamid II, who for over thirty years presided over the decay and dissolution of the Ottoman empire, has never lacked opprobrious epithets. And most people would say that they were richly deserved. His latest biographer, however, is not concerned with moral judgments; nor with whitewashing. She simply sets forth, as far as she can, what sort of a man she believes Abdul Hamid to have been, and why.

The picture that emerges is not an agreeable one. Abdul Hamid was intelligent, and not without either kindness or affection; he was also shifty, unscrupulous, ruthlessly cruel and a victim of pathological fears for his own safety. But seen against the background of the decadent and intrigue-ridden atmosphere of the harem and the seraglio, judged in the light of his inherited conception of his position as sultan and caliph which he was determined to preserve, Abdul Hamid's actions become easier to understand if not to condone.

There is much, however, that remains unravelled. Was the air of sincerity that so moved the British ambassador on the eve of the Russo-Turkish war of 1877 assumed or genuine? Which of the strange contradictory reports of his behaviour at the time of the Armenian massacres had most truth in them? Those that said he was going mad, or those that suggested he had never been more sane? The author sensibly does not try to answer these questions or pretend to anything more than an incomplete understanding of an immensely complicated man, who was both a master of dissimulation and a victim of conflicting moods and impulses.

This is a very vivid, smoothly written, exciting book. It can also claim to be a serious study both of Abdul Hamid and of the Eastern Question as seen, not from London, Paris, Berlin or Petersburg, but from Constantinople itself. The author weaves her way competently and clearly through the maze of great power politics and diplomacy. But her attempt to marry the solidity of a serious study to the liveliness of a best seller is not altogether successful. The local colour, which in a book of this sort should enliven and supplement the solid stuff, tends to detract from its value. The description of Midhat Pasha, just before his dismissal by the Sultan in 1877, waiting for the fatal audience in an "airless stuffy room while in the distance, from the direction of the harem, came the faint notes of a piano playing a tune from Offenbach," is very vivid, but on what is it based? And how does the author know what went through the mind of Izzet Pasha, when, thirty years later it was his turn to be dismissed by the Sultan?

The author may have chapter and verse for everything she writes, but no memoirs or correspondence of either Midhat or Izzet is listed in the bibliography at the end of the book, and in the complete absence of any references, the reader cannot help wondering what exactly is fact and what only surmise. Many books suffer from an overdose of references; this book deserves a sufficiency and gets none at all. It also deserves an index and does not get that either.

East and West

Missionaries, Chinese, and Diplomats: *The American Protestant Missionary Movement in China, 1890-1952*

By Paul A. Varg.
Princeton University Press. London: *Oxford University Press.* 345 pages. 48s.

CRITICS of America's China policy complain that it is emotional; its defenders claim that it is based on moral principles. Emotion and principle are both in the tradition of American relations with China, the heritage, in part, of the Protestant missionary movement. Certainly America had commercial and industrial interests in China. But to thousands of ordinary citizens, China meant missionaries, and the Chinese were an especial American responsibility. To understand this attitude and its consequences is, therefore, an important step towards an understanding of American foreign policy today.

This would seem to support the diplomatic and intercultural approach that Professor Varg has chosen in this work. The author sees the missionary movement in terms of the impact of one culture on another and finds his sources mainly in the diplomatic correspondence and reports that attend such contacts. Within this framework, his conclusion must inevitably be that the missionary effort failed.

But the purpose of the Protestant missionaries was to convert the heathen, not to ease the impact of east and west. Or, failing conversion, the missionary intended to instil in the Chinese a regard for those values which seemed at the time to be the essential products of belief in the Christian faith. Given these primary purposes, it is unlikely that the missionaries would also qualify as diplomats in this sensitive world. But

then, it might be argued, neither would Christ.

Mr Varg's most important contribution is his description of the interplay of changing missionary attitudes, both in the field and at headquarters, with the necessities of a new Chinese nationalism and the legalism of a sterile treaty-port policy. But in his account of the Chinese reaction to American missionaries he is less successful. Depending heavily on State Department records and published missionary articles, Professor Varg has failed to utilise either the Chinese language source material, much of which is readily available in American libraries, or the mass of unpublished missionary correspondence. In consequence this important part of his story is secondhand and unconvincing.

As a study of the missionary movement, however, the main fault remains the secular and unsympathetic standards by which the missionary must be judged in a work on diplomatic history. If this study is taken as an essay on what may happen when east meets west, then Professor Varg has many useful and thought-provoking things to say.

Carrying Out the Charter

Britain and the United Nations

By Geoffrey Goodwin.
Oxford University Press. 478 pages. 38s.

India and the United Nations
Japan and the United Nations
La Belgique et les Nations Unies

Manhattan Publishing Company, New York. European distributors: *Martinus Nijhoff,* The Hague. Each $3.

SINCE 1952 the Carnegie Endowment for International Peace has been encouraging and helping national institutes such as Chatham House to prepare studies of their own countries' attitudes toward the United Nations. Over twenty of these studies have been undertaken, although the one dealing with Soviet attitudes is, perforce, emanating not from Moscow but from California. In most cases a study group has worked over a considerable period, but the published text has been primarily the work of one or two individuals. Thus Mr Goodwin's book derives from the generally agreed findings of a group appointed by Chatham House, while the volume sponsored by the Indian Council of World Affairs is mainly the work of Mr K. P. Karunakaran.

The tone set by these studies is admirable. Each reflects, as indeed it should, its national origins; but a visible effort has been made to stand well back and take an objective look at each particular nation's uneven record of fulfilment of its commitments under the Charter. There is some quietly frank comment, too, about the average citizen's ignorance of, or indifference toward, the United Nations, and the lack of enlightenment afforded him by the greater part of the press. (The Belgians, who give a particularly interesting analysis of this latter point, also provide the essential clue to its source: "*Le souci primordial d'un directeur de journal est que son journal soit lu,*")

One's main complaint against these otherwise very useful volumes is, paradoxically, that they are really too international. Each contains too much straightforward account of the UN's manifold activities to allow the reader to concentrate on the individual country's share in, or reaction to, these. The Indians make no bones about this, referring the reader to other publications for a fuller version of India's role in UN affairs. Would it not have been better to stick to narrower terms of reference, and to assume that the reader would be fairly familiar with, or would have access elsewhere to, the record of the international organisation itself? The British volume sins perhaps most in this respect, though it might be argued, in excuse, that Britain has been more directly involved in a greater variety of UN issues and activities than the other countries under consideration here. (The American study, it may be noted, is projected as a three-volume work.) However, one must not be ungrateful for the immense amount of work that has gone into these illuminating studies, whose only other fault arises from the difficulty of keeping publication schedules abreast of a fast-changing world. These four studies, and those previously published (which deal with Canada, Denmark, Egypt, Greece, Israel, Switzerland and Sweden), are necessarily focused on the United Nations' first decade. In the case of Britain, it would be of particular interest if a supplementary survey could be made, at a suitable time, to record the evolution of British policy and opinion in regard to the UN since "Suez."

Museum of Little Monsters

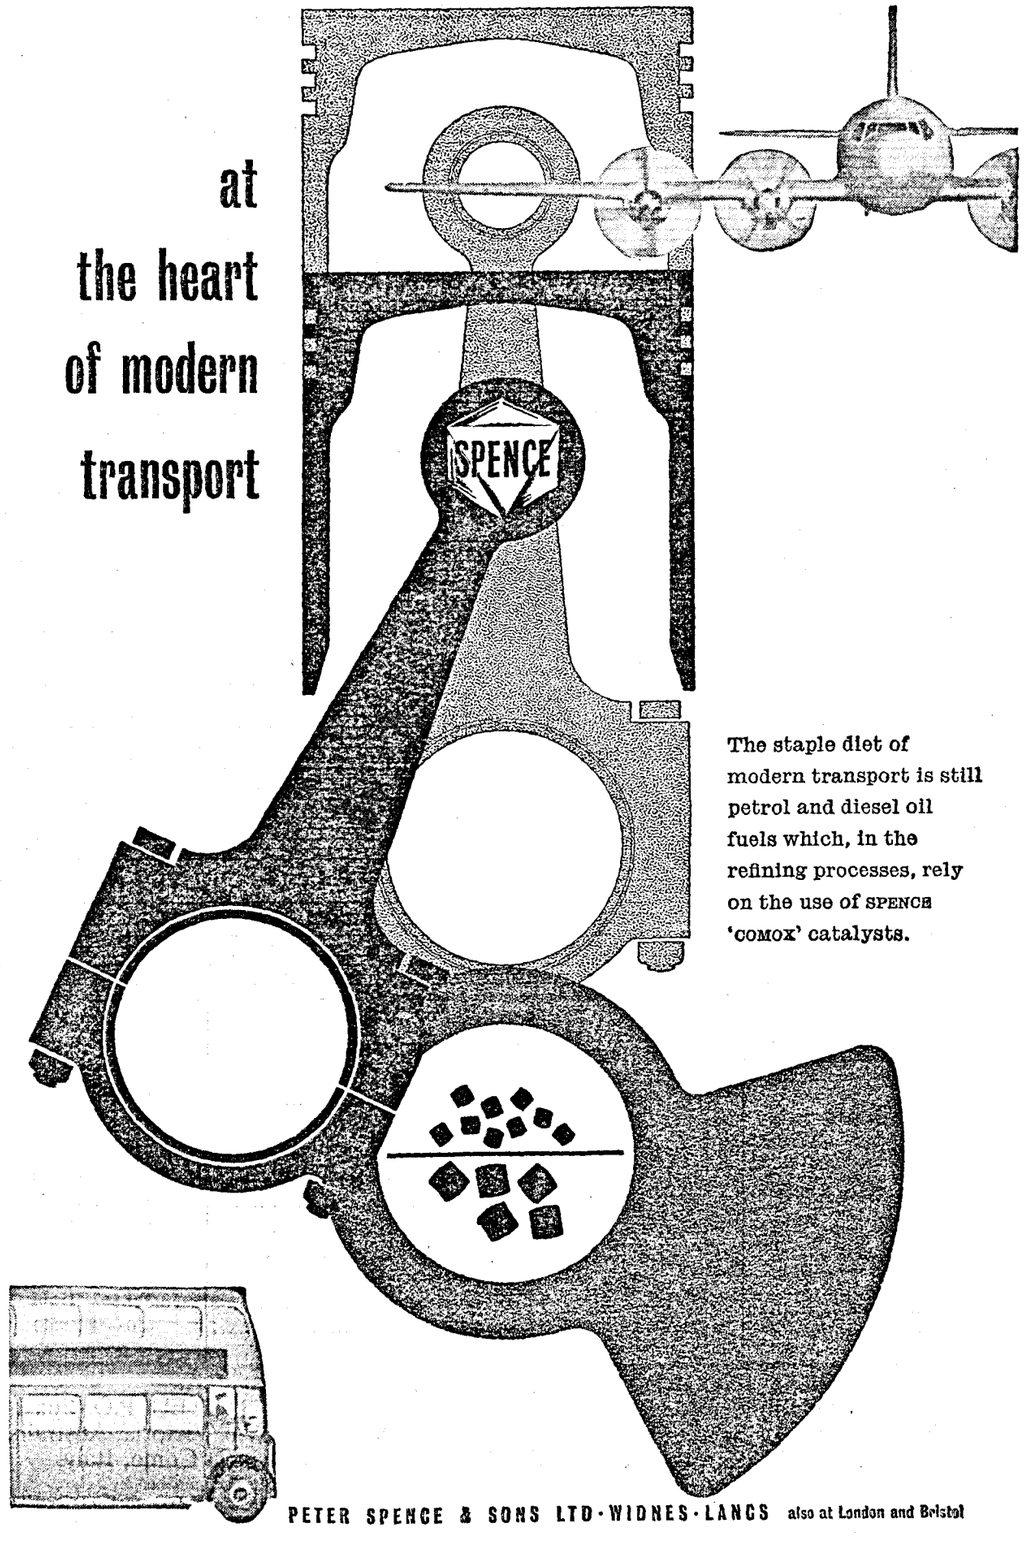
The Small German Courts in the 18th Century

By Adrien Fauchier-Magnan. Translated by Mervynn Savill
Methuen. 292 pages. 32s.

THE historical facts of court-life presented by M. Fauchier-Magnan are stranger than the fictions of A. E. W. Mason's "Königsmark," Preedy's "Rocklitz," or Feuchtwanger's "Jew Süss." Asserting that three-quarters of the princes and dukes were "not right in the head" and that "only the exiguity of the spheres in which they functioned saved these little monsters from the obloquy of history," he promises to "pursue them into their private lives and bring them into the light of day." But the pursuit is interrupted by somewhat repetitive speculations about foreign influences; and by lengthy lectures on the palace-building and landscape-gardening by which these petty despots bankrupted their states; so that it is difficult, even with occasional halts for gossip, to get a clear sight of individual oddities. And the title and the text do not harmonise: the only courts examined are those of Würtemberg and Montbéliard.

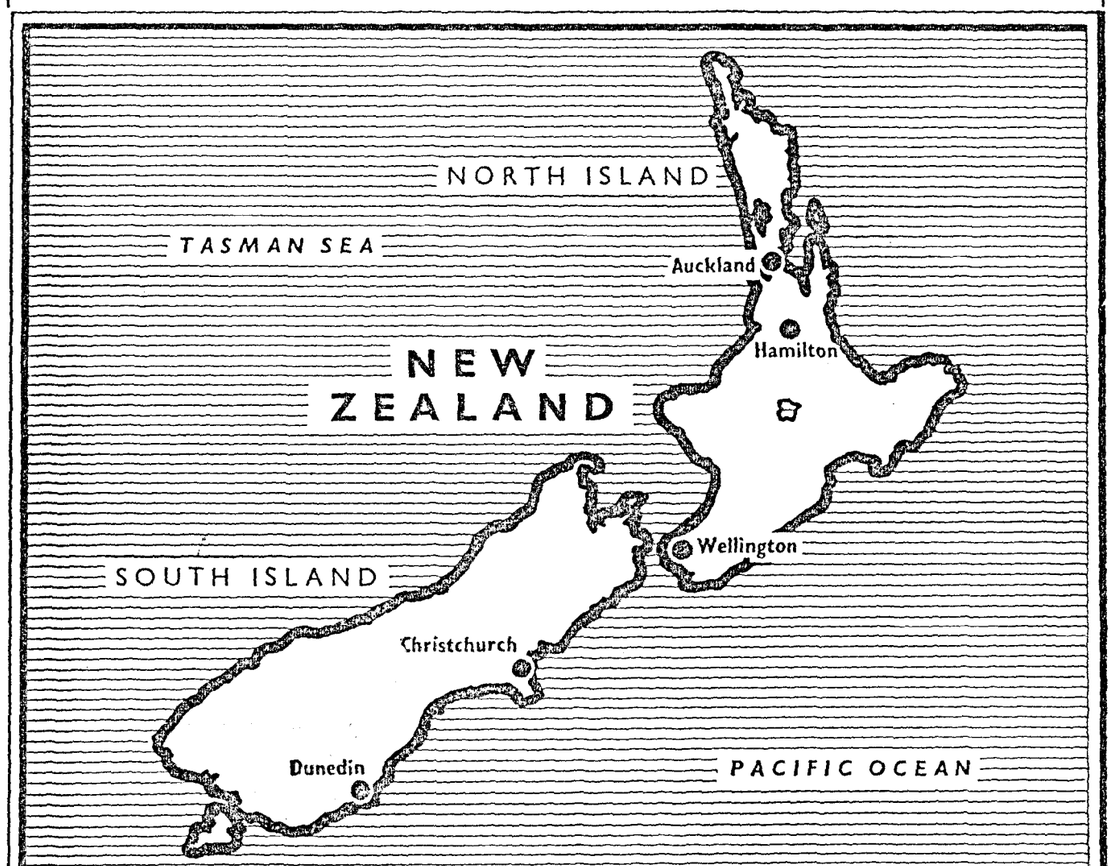
The careers of the Dukes of Würtemberg clearly exemplify princely tastes and aspirations. Everhard-Ludwig was dominated for twenty years by his mistress, Wilhelmina von Grävenitz, who persuaded him to banish his wife, establish a new court composed of her own friends and relations in a new palace eight miles from Stuttgart, and defy Pope and Emperor in an unsuccessful attempt to marry her bigamously and make her his duchess. Karl-Alexander succumbed to the wiles of Süss Oppenheimer, whose reputation for witchcraft was due to skill in procuring mistresses and extorting money from the Duke's subjects. Karl-Eugen hardly ran true to form, for a mistress whom he eventually married converted him to an unimaginative belief in "enlightened despotism"; she could not stop him building yet another palace, but she did make him found the repulsively spartan boarding school from which the young Schiller ran away. This comparatively respectable couple may have inoculated their subjects against revolutionary infection from France; but more credit should be given to the Würtemberg "Estates" for their persistent and successful assertion of constitutional rights in the second half of the century. Montbéliard seems to owe its inclusion to a dynastic connection with Würtemberg, and to its Count's unconventionality (even by contemporary standards) in justifying his own polygamy and the incestuous marriages of his children by inaccurate quotations from the Koran.

M. Fauchier-Magnan's entertaining exhibition of "monsters" and their attendant adventurers, buffoons, freaks, and professional hangers-on, would be worth the price of admission if the specimens were more carefully arranged.



OTHER BOOKS

LONDON'S RIVERSIDE. By Eric de Maré. *Max Reinhardt.* 272 pages. 30s.



This is the story of the part the Thames has played in London's history and of how the riverside has changed through the centuries. It is attractively written by an architect, who shows his affection for Thames-side without finding too much of the picturesque in its stretches of "seedy squalor." Mr de Maré is a planner who would like to tidy up the river banks, yet wistfully clings to the past believing that the new and the old can be coaxed into "a fascinating and viable whole." The book contains over a hundred drawings, maps, engravings and photographs.

SOCIAL ECONOMICS. By Walter Hagenbuch. *Nisbet and Cambridge University Press* in association with *University of Chicago Press.* 336 pages. 12s. 6d.

This thirteenth book in the Cambridge Economic Handbooks deserves to be lucky. Mr Hagenbuch has covered his subject well, with chapters ranging from population and housing to family allowances and charities. Most of the book is descriptive—as it has to be. But the opening chapter on the meaning of social economics shows the author's grasp of his subject in theory as well as in practice.

Facts about New Zealand

Area (square miles)	103,939	**DOMESTIC DATA**	
Population	2,229,000 (1957)

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

State of Some Disunion

WASHINGTON, DC

LAST Friday was the occasion of the President's annual speech to Congress on the State of the Union, the only day of the year on which a journalist or a bomb-thrower can count on finding the various parts of the American government assembled together in one room. It should be an occasion of some grandeur; and Mr Eisenhower's wistful opening words, calling for "co-operative work" between the new Congress and the Administration, showed that he hoped it would also be a visible symbol of national unity. That it turned out to be neither illustrates what the doctrine of the separation of powers leads to when President and Congress cannot agree whether to take the road of a high Budget or of a low one to the solution of their economic problems.

Mr Eisenhower, speaking with that oddly chewing style of delivery with which he tries to get some flavour out of the doughy American prose his speech-writers serve up, was greeted with polite applause and dismissed with rather less. The speech itself was interrupted by clapping unusually seldom—only twenty-five times—and in fourteen cases the applause came almost solely from the Republican side. The only propositions for which the Democrats could not forbear to cheer wholeheartedly were that Berlin must be defended, that Communists are untrustworthy and that disarmament would be a good thing. The studied boredom of Mr Lyndon Johnson, the Democratic leader in the Senate—wearing, after his first victory in the filibuster battle, the smile of a tiger who has just swallowed a whole platoon of liberals—summed up the refusal of most of the President's audience to take him quite seriously.

This is the more ominous because the speech was courageous and, in parts, very much to the point. Though not as crisp as last year's, it continued Mr Eisenhower's recent habit of concentrating on a few major topics and leaving the detailed proposals for subsequent messages to Congress. There emerged three dominant thoughts. The first was that the United States must not let itself be stampeded, in its anxiety to "catch up with the Russians," into wasteful and unnecessary spending on weapons and satellites. In part, the difference between the President and his critics on this point springs from a difference of premises: he is concerned chiefly with the military implications of the latest triumphs of Soviet rocketry—and rightly doubts whether they change the balance of power—whereas his opponents are worried about the political consequences of letting the world watch the Russians take the lead. But in demanding a balanced Budget he is also defying the influential prophets of doom who seem to have persuaded a great many people in both parties that the "missile gap" already threatens the Americans with military disaster.

This belief, as set forth in a number of recent articles, rests on two debatable assumptions. One is that, before the Americans get enough ballistic missiles to matter, the Russians will have acquired a system of anti-aircraft defence that can keep out all manned bombers, plus the guided missiles which some of them will soon carry. The other is that the principal function of the western deterrent is to strike back at Russian launching sites and airfields in case of attack (and not, as most people assume, to retaliate against Russian cities) and that there will not be enough missiles to do this for some years to come. It is good that someone of the President's authority should speak up, if only by implication, for the view that the principal job of the deterrent is to deter by its threat of general devastation—rather than to knock down the stable after the horse has left—and that, for this purpose, the West still commands weapons enough. One of the oddities of American politics is the readiness of many liberals to accept the alarmist theory. The last Congress, in the end, showed comparative self-discipline in adding to the defence budget; if this one is less restrained, it will be spending money that might have gone on social welfare at home.

THE President's second train of thought, if it really was a train of thought, emerged in a number of hints about central supervision of the nation's affairs. It may be that these constituted no more than a last obeisance towards the liberal Republicanism from which, in other respects, he seems to be retreating. If not, they contain the seeds of some disputes that will enliven Mr Eisenhower's last two years in office spectacularly. His suggestion of a "national goal" for education seems to imply a degree of federal intervention, in the shape of both money and prescribed standards, which the conservatives of both parties would bitterly oppose. His plan to set up a kind of royal commission to define the economic and social objectives of the next few years will toss such a body headlong into the heated controversies about the rate at which the national income ought to be expanding and the ways in which the increment ought to be spent. Perhaps the most pregnant sentence of all was that in which he announced his intention of seeking an amendment to the Employment Act of 1946 in order to declare war on inflation. A law which prescribes both full employment and price stability is going to set its administrator some fascinating problems.

Mr Eisenhower's third theme, the need for thrift and a balanced Budget, was the passage which clearly stirred the President's heart and set his Republican listeners on fire. On Wednesday, when he ventured into the lions' den of the National Press Club for the first time in his six years in office, he repeated his hint that taxes might be cut before very long if this year's Budget is balanced. He seems to be fixed in his belief that the growing revenue produced by the

economic recovery should be devoted to putting more money into private spenders' hands rather than improving the public services which America has neglected. The insistence on economy which, in the case of military spending, may be Mr Eisenhower's most valuable contribution to the cause of good sense in 1959 is far more questionable if it is extended to the social services. True, it is doubtful whether the electors, in voting for the Democrats so overwhelmingly last November, were directly calling for higher taxes or an increase in the national debt. But the election was evidence that they recognise the need for expanding what Senator Johnson gingerly called the "capabilities of government."

Last week's scene in the Capitol, in which an earnest and slightly baffled President faced an irreverent, even slightly contemptuous, Senate leader, suggests that the relationship between these two men is going to shape what happens in the United States in the coming year. Senator Johnson has demonstrated that he controls the big Democratic majority of this Senate as tightly as he controlled the tiny majority of the last one. But this is not the comfort to Mr Eisenhower that people might have assumed three months ago. Mr Johnson seems no longer to be in a mood to be mild and co-operative towards the President. His demeanour last Friday, and the whole tone of the private state-of-the-union speech which he delivered to his Democratic colleagues two days earlier—denouncing the Administration for "exalting the static" and for a "deficit of vigour and will"—is enough to make Mr Eisenhower swallow with apprehension.

At the same time the President, in his last years of power, is apparently moving to the right in matters of domestic economic policy. Whether this represents an eleventh-hour conversion, as the conservatives like to believe, or simply the emergence of the true Eisenhower, as the liberals claim, is irrelevant. Nor is it very important whether the change in Senator Johnson's attitude has been brought about by an adroit anticipation of what the new Democratic majorities want. These two centres of authority, originally made separate by the Constitution, are now divided by a widening gap of belief; and this has occurred just when Mr Johnson's grasp of the techniques of parliamentary power is at its height. He looks like being the most powerful man in America during the next two years.

Johnson Rules on Filibusters

MR JOHNSON'S mastery of the Senate has never seemed more complete than in the critical struggle over its own rules with which the session opened. To northern liberals of both parties a change in the rules, making it easier to bring debates to an end, was an essential preliminary to the passage of new legislation to protect and extend Negro rights. To the South, virtually unlimited debate has always been its chief safeguard against the tyranny of the majority. Senator Johnson's problem was how to force a compromise that would avoid a corrosive, time-consuming combat at the very outset of the session; this would almost certainly have split the Democratic party beyond repair. Five days after the session began, the compromise was an established fact, by the overwhelming vote of 72 to 22.

What the liberals sought was power to cut short debates by the vote of a simple majority rather than by two-thirds of the whole membership of the Senate, the requirement that has prevailed since 1949. What they secured at Mr Johnson's hands was a rule that filibusters can be ended by a vote of two-thirds of the Senators present and voting; whether this makes it easier to end debate depends on the turn-out of Senators, but at least absentees and abstainers will not be automatically counted on the side of the filibuster. Moreover, the same rule will apply to debates on changing the rules. For the past ten years these debates have been absolutely unlimited, which made alterations impossible unless the South acquiesced. Finally, as a sop to the Southerners, it is agreed that the rules of the Senate continue from one Congress to another. They cannot, that is, be changed by a majority vote at the beginning of a new session, as the liberals argued that they could and should.

In this argument progressives had the support of the Vice President, Mr Nixon, who presides over the Senate and hoped that his rulings would mark him as a vigorous champion of Negro rights. For once, however, his customary skill and calm self-assurance were lacking. Unlike Mr Nixon, Senator Johnson was well prepared. Conservative Republicans supported him; some of the fifteen new Democratic Senators owed him debts of gratitude for help given during their campaigns and none was allowed to forget that his committee assignments—which can determine whether a Senator is to bask in the limelight or lie forgotten in the shadows—would not be determined until after the vote on the rules. As a result, more than half of these new Senators, including the two from Alaska, stood with Senator Johnson on the critical votes. The significance of this technical victory is that the South will still be able to hold up most legislation protecting Negro rights. In view of the great adjustments required, this may be no bad thing.

Cuba Libre

THE summary executions of Batista followers by the new regime in Cuba provide a chilling response to the warm welcome offered by Washington to Señor Castro's successful revolution. Senator Morse, the sympathetic Democrat who is conducting a study of Latin American problems for the Senate Foreign Relations Committee, made an immediate protest. Unless the Castro forces restrain their not unnatural demand for vengeance, the Milton Eisenhower Doctrine—that the United States should offer a hearty embrace to Latin American democracies, but only a formal handshake to dictators—will be tarnished in its very first application.

The State Department moved with unusual speed to recognise the new government, no doubt in the hope of dispelling its suspicions that the United States, behind a veil of neutrality, had favoured General Batista's dictatorship. The American Ambassador to Havana has resigned; like his predecessor, who was a close friend of the dictator, Mr Smith was a political appointee whom the rebels felt to be hostile to their cause. Whether Mr Smith really behaved incorrectly may be the subject of investigation by a House subcommittee; he is expected to be succeeded by a career diplomat. Meanwhile, General Batista, who is in no present danger, will not be given asylum in the United States, as other dictators have, to the irritation of Latin American democrats. Although the State Department

AMERICA'S WELCOME
TO THE WORLD

Sheraton Hotels have become first choice of International visitors, as well as Americans, for many reasons. Here are a few:

- Reservations held if ship or plane delayed
- Facilities for banquets, business meetings and conventions
- Sheraton's family plan (*no room charge for children under 14 in same room with adult except in Syracuse, French Lick and Austin*)

For reservations see your travel agent, or write Mr. Albert de Leon, Director, International Department, Sheraton Hotels, Sheraton-McAlpin, Broadway and 34th Street, New York 1, N. Y., U. S. A.

managed to warn Congress only the day before it happened that General Batista was likely to fall, it prudently halted the sale of arms to both sides in the Cuban civil war as long ago as last March; incidentally this was before Mr Nixon's visit to Latin America, not afterwards as has been reported in some quarters. The three military missions sent to train General Batista's troops were not withdrawn but, as Señor Castro has mischievously observed, they were not notably successful.

What the State Department could not control was the pro-Batista attitude of most members of the American business community in Cuba; they found a venal regime easy to deal with and feared that victory for the rebels would mean expropriation and the closing of Cuba's notorious gambling casinos, many of which are owned by North Americans and some of which have been run—to the shame of the United States—by gangsters from the mainland. Now that nationalisation has been repudiated and gambling, if regulated, will be allowed to supplement Havana's other attractions for the tourist, American businessmen are quite reconciled. In all, about $750 million of United States capital is invested in Cuba, a third of it in sugar mills, a little more than that in public service industries, and a growing amount in luxury hotels.

Hunt the Submarine

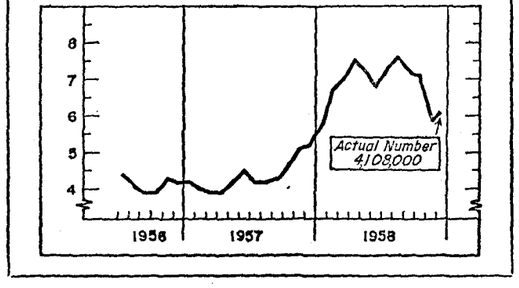
FROM A DEFENCE CORRESPONDENT

Two recent announcements suggest that the Navy is paying more attention to the threat of enemy submarines—and particularly of nuclear-propelled ones. Last summer the Navy unexpectedly refused to proceed immediately with the four additional nuclear submarines, designed to carry Polaris missiles, which a worried Congress had authorised, on the ground that five of the first-generation ones were enough; delay would enable later improvements to be incorporated in the others. But that was only part of the story. Contracts are now being let for four more nuclear submarines but, instead of being armed with Polaris missiles to be used against land-targets, they will be of the fast-attack type which is increasingly regarded as a most promising destroyer of hostile nuclear submarines.

The second development is the unexpected cancellation of the contract for the RAT (rocket-assisted torpedo), a complicated but highly praised anti-submarine device. The curt official explanation is that a much-improved weapon against enemy submarines is in prospect; an unofficial but responsible assurance is that the new device will be effective against nuclear-powered submarines, while RAT was not. The nuclear submarine, it should be remembered, is much faster while submerged than the electric one, and habitually travels at a greater depth, beneath the thermal layers which thwart most methods of detection.

The naval planners evidently recognise that in time the Russians are certain to produce a nuclear-powered submarine, as well as the nuclear ice-breaker already proclaimed by Moscow. No one will say how soon the improved RAT can be developed, tested, and put into production, but the readiness of the usually discreet Navy to mention it at all suggests that development is far enough advanced to permit contracts to be let for the launching mechanisms as well. In general, the device will follow the pattern of its predecessor which could be launched on or below the surface; it would mount into the air, proceed by guided rocket to a designated spot, descend by parachute, and then go on as a guided torpedo to the target. It is in this last stage that the naval scientists have apparently made revolutionary progress.

Wealth on the Shelf



FROM A SPECIAL CORRESPONDENT

Some time during the next few weeks or months the Supreme Court will be hearing the suit which the United States is bringing against the states bordering the Gulf of Mexico, to establish what these states in fact obtained by the "offshore" Act of 1953. This gave them the right to exploit the mineral resources under the ocean as far as three miles off the coast or to the limit of their "historic boundaries," whichever was farther. Texas and Louisiana claim that for them this means three leagues—or over ten miles—and there are other ambiguities in the Act which make it difficult to decide at exactly what point the underwater rights of the states end and those of the federal government begin. The latter, according to Congress, extend to the edge of the continental shelf—although the United States government's claims do not go so far in international negotiations on surface rights. It would be interesting if a foreign company or country were to begin underwater drilling for minerals on the American shelf outside the three-mile limit.

The immediate importance of the case before the Supreme Court lies in the potential earnings from oil, natural gas, sulphur and other deposits in the Gulf of Mexico. Already over $100 million in rents and royalties from the comparatively small area in dispute is being held in escrow until the court decides to whom it is legally due. Since 1954 the federal government has received about $400 million in revenue from the public domain under the waters of the Gulf and within the next fifteen years it is estimated that somewhere around that sum will be coming in each year from offshore oil and gas wells. But exploitation of the continental shelf, whether off the coast of North America or of other land masses, has only just begun, and the present developments are a minute portion of what may be expected as the world becomes increasingly short of raw materials for its ever-growing population.

Altogether, all the world over, there are some 10 million square miles of continental shelf—one-fifth the area of dry

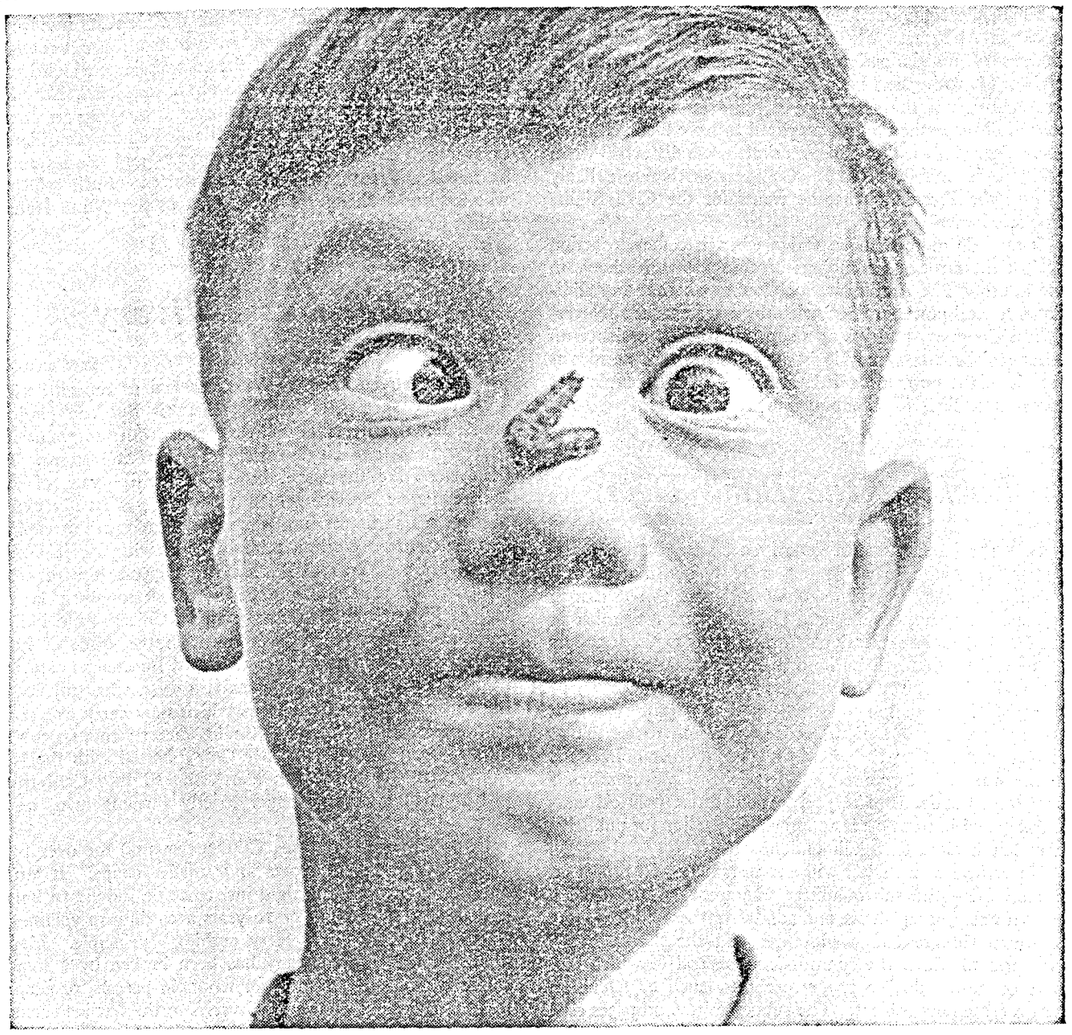
UNEMPLOYMENT in the UNITED STATES
PERCENTAGE OF CIVILIAN LABOUR FORCE
(seasonally adjusted)

land. By definition the shelf is land covered by 600 feet of water or less although, geologically speaking, all low flat coastal areas between high land and deep sea are part of the continental shelf; thus the minerals found under the land are likely to continue under the sea. This has already been proved very satisfactorily in the case of the Gulf of Mexico, where reserves of 12 billion barrels of petroleum and 70 trillion cubic feet of natural gas have been found—an addition of between one-third and one-half to those known on the dry land of the United States.

The whole country has nearly 300,000 square miles of shelf surrounding its continental area; this is widest off New England, where the shallow waters make good fishing but where so far little evidence of mineral wealth has been discovered. Alaska has brought into the Union with it a shelf equal to its dry land, 600,000 square miles, which may be equally rich in minerals. But this shelf is in large part shared with the Soviet Union, which also has one of the world's largest expanses of shelf off Siberia. Canada has more continental shelf than the United States, even if Hudson Bay is excluded, and another wide one is off south-eastern Argentina. In and around the Malay Archipelago, if the sea level were lowered a few hundred feet, there would emerge a continent as large as Australia, interspersed with deep sea inlets and lakes. Australia itself has a big continental shelf, especially towards New Guinea.

Until recent years, however, even the shallowest sea protected the offshore minerals from the depredations of man. Even now virtually all exploitation, except for some hundreds of miles of pipeline along the bed of the Gulf of Mexico, is from the surface of the water. Permanent steel islands, giant movable drilling rigs and platforms that can be temporarily anchored to the bottom by concrete piles are used to reach undersea mineral deposits. Some $2 billion has been spent in the Gulf of Mexico alone and so far only a fraction of it has been earned back by the drilling companies. Moreover, the cost increases substantially with each additional foot of water, quite apart from the awkwardness and danger of such surface operations. The deepest water to be penetrated successfully is 140 feet, which leaves much the greater part of the shelf out of reach, even in the shallow Gulf of Mexico.

Eventually, however, there may be permanent domes on the bottom of the ocean, protected by the sea itself from surface storms, containing home comforts for the workers who live there for long periods and serving as centres for drilling and mining operations for miles around. These domes might even some day be connected with each other, and with the shore, by tunnels through which would pass not only the pipelines carrying oil and gas and perhaps "slurry," a thin soup of minerals (which are already being transported long distances in this way by pipeline on dry land), but also a growing two-way underwater traffic.



Nor for that matter need exploitation of the bed of the sea be limited for ever to the shallow depths of the continental shelf and to semi-permanent installations. A recent scientific survey reported that large areas of ocean bottom in the depths of the south-east Pacific are covered with nodules containing nickel, copper, cobalt, iron and manganese, worth as much as $500,000 a square mile. Even the sea-bed itself may some day prove worth digging up and bringing back in. Each year some 6 billion tons of sand, soil and minerals are carried out to sea, containing such valuable items as phosphorus which, according to ecologists, is the chemical whose exhaustion may first limit life on land. Meanwhile men have already descended in the free-moving "bathyscaphe" or super-submarine as deep as 14,000 feet and there has been talk of giant heavy duty atomic submarines which might anchor themselves at the bottom of the sea to become underwater mining camps for drilling and exploratory operations and even for gathering minerals directly.

However visionary all this may seem, the continental shelf is obviously not as far out of this world as is the moon; it is certainly more accessible and both it and the deeper areas under the ocean are very probably more worth exploitation.

Rights by Degrees

ONE of the strongest passages in the President's State of the Union message was his condemnation of the closing of schools, to avoid mixing Negro and white pupils, because a bad impression is created abroad by thus depriving American children of the opportunity of education and because this discrimination flouts the principle of equality under the law. Mr Eisenhower promised to submit his proposals for dealing with this to Congress shortly but, when he was questioned at the National Press Club this week, his answers implied that nothing in the proposals would bear directly on the schools. These are a state responsibility with which Mr Eisenhower, like many Congressmen, believes the federal government should not interfere, tragic though their closing is and ineffective as the various legal steps to get them reopened have been so far. It has been suggested that the federal government might offer financial encouragement to southern communities if they begin to integrate their schools. It has also been suggested that the Justice Department might again ask for power, denied to it in 1957, to bring suits on behalf of individuals who have been denied their civil rights by racial discrimination in schools or elsewhere. It is still possible that such proposals may be included in the coming Bill but it is unlikely that the Southerners in Congress would permit them to become law.

What the President does definitely intend to propose is an extension of the life of the Civil Rights Commission, set up for two years in September, 1957, and some strengthening of its powers to investigate refusals of voting rights to Negroes. He, like many other people, argues that, if the right to vote is safeguarded, the observance of other rights will follow gradually. He will probably ask that the Department of Justice should have specific authority to subpoena voting records in order to prevent frustrations of the kind

One makes a pet!

The depredations of one caterpillar are nothing much, but caterpillars rarely come in ones. *Multiply by x . . .* and then, almost overnight, a cabbage crop can be eaten to the ribs, or a forest of young conifers become a desert of standing sticks. The only really effective answer is to strike back hard with insecticides. This is what growers are now doing with a new systemic insecticide called 'Phosdrin', developed by Shell specifically for the quicker, cheaper control of caterpillars and aphids. 'Phosdrin' virtually wipes out the heaviest infestations within a few hours of spraying. Yet it decomposes quickly, so that the sprayed crops may be gathered safely three clear days later.

Very many of the protective chemicals now in general agricultural and horticultural use are supplied by Shell. Some of the most successful, such as aldrin, dieldrin, and now 'Phosdrin', are the direct result of Shell's constant research.

Shell are also one of the world's foremost suppliers of essential chemicals to industry. If you have any task involving the use of *chemicals in any form*, Shell may well be able to help you do the job more efficiently. How about finding out?

Write to the Sales Promotion Manager, Shell Chemical Company Limited, Marlborough House, 15-17 Gt. Marlborough Street, London W.1, who will see that your letter is directed to the department concerned.

YOU CAN BE SURE OF SHELL CHEMICALS SHELL

to which the commission's officials have recently been subjected in Alabama. There they have been inquiring into charges of discrimination against Negroes who tried to register for voting and have been defied in a way which has lost Alabamians the sympathy of more far-sighted Southerners. Many who are not prepared to have black children share classrooms with white are nevertheless disturbed when a Negro is unable to vote. Congress is therefore likely to give the President what he wants for the Civil Rights Commission.

It may do more than he wants when it comes to action against the atrocious bombings of churches and schools in the South. The Administration doubts whether any additional federal powers to deal with these are needed. Nevertheless Congress, perhaps as a sop to its bad conscience on other racial matters, may insist on legislation. One idea is that it might be made a federal crime to bring explosives across state lines for bombing purposes.

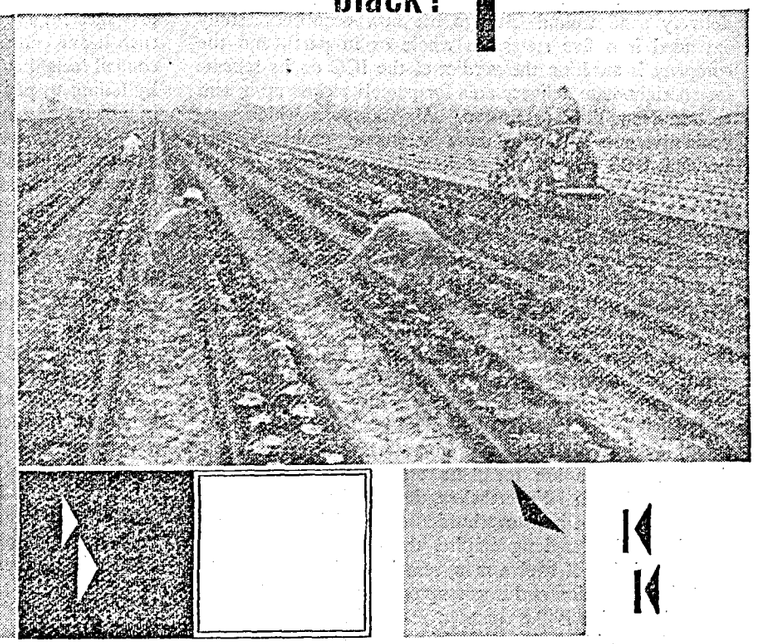
Locking the Back Door

THE special House Subcommittee on Legislative Oversight whose investigations were responsible for the downfall of the President's chief assistant, Mr Sherman Adams, his crony, Mr Bernard Goldfine, and a member of the Federal Communications Commission, expired quietly at the end of 1958. Even its own members do not propose that it should be given a new lease of life, although they urge that the investigation of the powerful agencies which regulate great sectors of the economy should be continued to discover whether they have "neglected their obligations to the public." Supposedly, this was the subcommittee's own task, but inadequate preparation, bitter political controversy and in some cases an unbridled passion for publicity have left it more than half undone.

Nevertheless, in its last will and testament—its report on its activities—the subcommittee unanimously supported a great number of legislative and administrative reforms, some of which Congress may adopt, to end the "back-door" pressures to which the commissions, several of which dispose of most valuable property rights, such as television licences, are now subject. The subcommittee proposes civil and criminal penalties for the exercise of improper influence, even by members of Congress or of the White House staff. Members of the commissions would themselves have to observe a code of ethics. The FCC, the most often hit target of the inquiry, is already moving to require a higher standard of conduct.

The subcommittee also wants to make the commissions more independent of the White House, which selects their members and chooses the chairman, but has only a very disputed authority—which the subcommittee thinks should be clarified—to discharge commissioners for neglect of their duties. It suggests that the chairman, who often wields great power, should be chosen by his fellow commissioners and serve for only three years; and that the agencies be given the right to institute court cases rather than having to rely, as at present, upon the Department of Justice, an arm of the executive, to do so. Finally the subcommittee feels that when the Civil Aeronautics Board awards an air route—a most profitable concession—the President, who has the power of veto, should not be able, as he is now, to suggest an alternative recipient. This procedure subjects the White House staff to great pressures from the interests involved. The subcommittee recognises, however, that it is not enough simply to pass more laws. If the commissions, which have many judicial duties, are to be above suspicion, like the courts, they need men whose ability and integrity are commensurate with their responsibilities. Political considerations must play no part in appointments, and salaries must be raised and tenure of office lengthened. Such reforms will require a change of heart both in the White House and in Congress.

Painless Delivery



NEW YORK

ON the streets of New York, packed to capacity with every species of vehicle, there is but one glaring omission: the fleets of delivery vans which customarily bear witness to a city's variety of shops and stores. In their stead are the large, brown, beetle-like vans of the United Parcel Service which today carry virtually every package which moves from shop to customer in this capital of retail trade. While a third of its activities are concentrated in New York, UPS has brought the joys of consolidated delivery to fourteen other metropolitan areas, including San Francisco, Los Angeles, Chicago, and Philadelphia. This network has grown, in the space of fifty years, out of a small, bicycle-based messenger service opened in Seattle by Mr James E. Casey, who still heads the enterprise with 6,000 vans which now carry over 180 million parcels in the year. Moving directly counter to the best pioneering traditions, Mr Casey started with the last frontier (the Pacific North-West), moved into California, and in 1930, when no longer strictly a young man, went East.

UPS delivers (and takes COD payments) for over two thousand department stores and smaller shops. It attributes its expansion to a rigid insistence on individual long-term contracts—of 1, 5 or 10 years according to volume—and on a "carry all or carry nothing" principle. Many a smaller carrying company has been broken by a shop's freedom arbitrarily to grant or withhold parcels, or simply to leave the more awkward deliveries to the outside carrier. Contracts vary widely from shop to shop according to the number of packages, the extent of the delivery area, and such considerations as local labour costs, traffic congestion (New York) and hilly streets (San Francisco). UPS is really interested only in parcels but, in order to make full provision for the needs of its customers, it has introduced an entirely separate Furniture Service to carry those items falling outside its definition of a package. In terms of size and facilities offered UPS has no rival. While several cities boast a local consolidated delivery service, real competition comes from the stores themselves, acting either individually or in groups. From time to time shops forsake UPS in the belief that they can conduct their own affairs more cheaply, but usually they return chastened to the fold.

Retail delivery, however, is a declining business, and in spite of its postwar territorial gains, UPS today carries rather fewer parcels for the stores. There are two main reasons for this: the shops, mindful of the charges involved, put more pressure on customers to take their packages with them; and the greater emphasis on suburban shopping centres means that more customers transport their own

Why is the field clothed in black?

Many people have been puzzled to see cultivated fields completely covered with black film made from UNION CARBIDE polyethylene resins. Through small slits in the film, plants may be seen growing. Or sometimes the plants are covered with plastic tents. This is just one of the reasons why you'll be seeing much more polyethylene film in agriculture, because results so far have been remarkable.

Different colored film is used for different purposes and for different crops. Black absorbs heat, warms the ground, and helps ripen crops ten days to two weeks early. Aluminum color reflects the sun and keeps the soil cooler in mid-summer. Other pigments keep out harmful red and infra-red and let in the growth-stimulating green, blue and ultra-violet rays.

IN ANY COLOR, film made from UNION CARBIDE polyethylene resins keeps down weeds, holds moisture and fertility in the soil, helps combat many plant diseases and blights, keeps fruit clean, helps give a greater yield of higher quality. It also helps promote plant growth by keeping the soil loose and does not interfere with normal harvesting methods, for rubber tires will not harm it. Users report that polyethylene film returns its cost several times over the first year, with every indication that the same polyethylene film can be re-used for three to five years.

FREE BOOKLET IE-1 describing the many uses of film made from UNION CARBIDE polyethylene resins in agriculture, including mulching, silage protection, lining ponds, irrigation ditches, and green house construction will be sent you on request. This booklet also includes information on other UNION CARBIDE products which serve agriculture; CRAG Agricultural Chemicals and EVEREADY Garden Products. Write to UNION CARBIDE INTERNATIONAL COMPANY, Division of Union Carbide Corporation, 30 East 42nd Street, New York 17, N. Y., U. S. A., Cable Address: UNICARBIDE, New York.

SYNTHETIC ORGANIC CHEMICALS • ACHESON Electrodes • LINDE Welding and Cutting Equipment
EVEREADY Flashlights and Batteries • ELECTROMET Alloys and Metals • NATIONAL Carbons

UNION CARBIDE

packages by car. To counter this trend, UPS has turned its attentions to wholesalers and, in the course of the last five years, it has signed up 25,000 of them; in 1957 a third of its bundles were wholesale ones.

As a common carrier of parcels (up to a maximum weight of 50 lb) the august and tax-exempt United States Post Office is the main competitor of UPS. But while its rates approximate to those of parcel post, UPS can offer a door-to-door service, faster delivery schedules and other advantages. Its wholesale division now operates in fifteen states and the present aim is to expand these separate units and to provide links between them. Apart from the economic problems of enlarging delivery zones, the crossing of state boundaries involves UPS in delicate and lengthy negotiations with the Interstate Commerce Commission. The delivery zone around Chicago has now been successfully extended into five states (in whole or in part), and the company is awaiting the verdict of the ICC on its scheme for an eight-state delivery area for parcels picked up in and around New York or Boston. Air transport, which conveniently cuts through these interstate problems, has enabled UPS to establish a long-distance service which links New York and Chicago with San Francisco and Los Angeles. In addition, UPS-Air, a relatively small affair, provides direct air service between a handful of cities.

UPS employs ten thousand men, and their wages make up 75 per cent of its total costs. Two-thirds of them are on the road; the remainder, apart from office staff, sort parcels, mainly at night. Reflecting the convictions of its founder, the company has a refreshingly Victorian flavour which has contributed considerably to its success: the appearance and conduct of its delivery men are governed by an outspoken and personal "Manual of Instructions" that would make even a Boy Scout wince—the more remarkable since its readers are members of the somewhat tough Teamsters' Union. Nevertheless, the world's largest carrier of parcels has not been overburdened with labour troubles. In spite of its far-flung empire, the central executive of UPS, consisting of twelve men, remains intimate, intensely loyal to its founder, and uncorrupted by the lavish interior decoration which is the common mark of a profitable concern. In addition, there are fourteen managers of local plants to whom responsibility is liberally delegated. The corporation, which is private and therefore keeps its finances to itself, is owned by those who work in it.

Security for Benefits

FOR nearly 90 million Americans—the 12.5 million receiving insurance benefits and the 75 million paying contributions—allegations by conservatives that the social insurance system is "bankrupt" strike an alarming note. They are based on the fact that last year, for the first time in twenty years, more was paid out to beneficiaries than came in; this is possible, without resort to general tax revenues, because a reserve fund of about $22 billion was built up in the early years, when total pension payments were small. Interest on this fund is expected to play an important part in balancing the social security budget in the long run.

At the beginning of this year, benefits went up again, by about 7 per cent; in election years, like 1958, Congress cannot resist the temptation to sweeten the social security cheques which reach so many American families. Last August, however, Congress also raised the social security contributions, which are paid both by employees and their employers, from 2¼ per cent of the first $4,200 of wages to 2½ per cent of the first $4,800. Higher rates were also introduced for the self-employed.

This increase in contributions is the chief reason why a special advisory council created by Congress in 1956 is able to declare that the system is financially sound. It reports that in 1960 income will once more exceed outgo and should continue to do so until 2020, if Congress sticks to another decision made last year: to raise the rate of contributions every three years from 1960 to 1969. By then, employers and employees will each be paying 4½ per cent of wages for social security, unless experience shows that such heavy contributions can be postponed. Although the council feels that the Treasury short-changes social security by failing to pay the market rate of interest on the bonds in which this money is invested, so far both Congress and the Treasury have regarded the social security reserves as sacred. New problems may arise if the progressive Democrats should succeed, over the protests of the American Medical Association, in providing a medical and hospital care programme for retired old people. But what really worries the advisory council is that in years to come pensioners who have paid in good money may be paid back in bad, unless creeping inflation can be checked.

SHORTER NOTES

As part of the general pacification proceedings by the Democratic leaders in Congress, Dr Dale Alford has been seated temporarily while charges that he won his victory over Representative Brooks Hays by fraud are being investigated. Dr Alford took the oath after all the other Representatives and therefore ranks behind them for privileges such as committee assignments. If the segregationist Dr Alford is finally seated permanently, liberal Democrats intend to protest against his recognition as a member of their party.

* * *

An exhibition which opened in Washington this week and which will be touring the museums of America until mid-1960, visiting small cities as well as large all across the country, is of sculpture, tapestries, ecclesiastical furnishings, ceramics, stained glass, metal work, everything except paintings and drawings, by 85 of today's leading artists in Britain. Careful selection and competent organisation have ensured an impressive display of works, many of them created especially for the exhibition, which demonstrate the outstanding contribution which British artists can make to the embellishment of churches, public buildings and private houses. The exhibition has been organised voluntarily by a group of enthusiastic Anglo-American women who wanted to prove that Britain can compete with countries such as Scandinavia and Italy which are famous for their contemporary craftsmanship.

* * *

The last of the aviation strikes, that against American Airlines by its pilots, has been settled by a wage increase which raises the earnings of a top-rated pilot to $22,500 a year from $19,000. He flies 85 hours a month, half by day and half by night.

THE WORLD OVERSEAS

Nato's Gaullist New Year

FROM OUR SPECIAL CORRESPONDENT

"YOU people are going to find us making quite a bit of trouble for you this year," said a French civil servant in tones of satisfaction to a number of Nato colleagues over a convivial glass recently. Last year—indeed, ever since Mr Sandys's first white paper on defence—the most irresponsible member of the alliance was felt to be Britain, which set a bad example to weaker brethren by cutting down its forces in Germany on specious pretexts that provided precedents for everybody to reduce defence spending, shorten national service, economise on equipment, and generally postpone the time when the Supreme Commander could count on the thirty divisions which he, like his predecessors, regards as the minimum for the shield. But it now looks as if, compared with a Gaullist government's policy for national greatness, Mr Sandys and his white paper are going to seem very small beer.

But it is Mr Sandys who has given the French their cue, and this is going to be remembered against him, even though Nato commanders feel that at long and weary last they have argued him into a more cooperative frame of mind. The French are now demanding British status, or are preparing to. Britain retains control over the bulk of its forces, allocating to the Supreme Commander (Saceur) only 55,000 men (and it may be only 45,000 next year); France means to take the same line. The renaissance of France must be based on the army, says General de Gaulle; this cannot be done if the army is commanded by foreigners, and Shape is altogether too Anglo-Saxon. The Mediterranean is a French sea—but the Americans have the biggest fleet there and the British have the nominal Nato command. Britain flourishes an independent deterrent, which enables it to economise on troops but spread itself in the matter of top posts, technical aid, and cosy little nuclear club talks; France cannot be fobbed off with less. Meanwhile France provides the basic military infrastructure on which the alliance is supplied. Yet, unsatisfied with this, the Anglo-Saxons want to take over France's skies too, and command them in the name of integrated air defence. This sort of thing, the general says (or his intimates say he says), is good enough for small countries, but not for France.

The British are busy arguing that they are not in the least responsible for such nonsense. It is time, they say, that the French (or the general) realised that everybody's forces are, and in peace remain wholly, under national command; Shape gives orders in time of war but is otherwise simply an allied planning organisation. Britain may have stressed its overseas commitments, but it has sustained these for years (to everybody's advantage), while supplying at first four, and even now three plus, fully-found fighting divisions to the alliance, compared with the French 1½ (if France's 60,000 troops beyond the Rhine do in fact include that many fighting effectives). This contribution, as well as the scale of the British naval and air effort, is the basis of the commands held by British officers; and anyway a French general has the command of all Nato forces in the vital central area. As for the deterrent, the British say the French argument is absurd: why, it was American legislation, not British love of national glory, that led them to undertake the hard, costly and unrewarding task of providing Europe with an indigenous nuclear striking force based on the pioneer British work done during the war. Britain is not insisting on British control of American-made warheads; the French are (or were). Finally, Britain has entirely agreed that in these days of supersonic aircraft British skies must become part of an integrated Nato air defence area.

This last argument, it is said, is specially resented by the French as a typical piece of Anglo-Saxon double-crossing. So, too, with the deterrent; of course France must insist on having control of American-supplied warheads in order to reach equality with Britain in keeping its deterrent under its own control; of course the British, having their own bomb, did not need to insist! Anyway, France is to make its own bombs, and when the first is detonated (probably this year) its allies will treat it with the respect due.

The British are all for laying on respect with a trowel; but they doubt if detonating one device will, in fact, make France a nuclear power. Five years after the British did the same, they remain five years behind the United States in respect of most types of warhead. France has, moreover, to develop means of delivery as well as warheads: and that means missiles, because (except for tactical use) aircraft are approaching their penultimate phase as carriers of the deterrent. It is all a terrible pity because France, by treading the bankrupting path to glory, will end up with no hardware worth having; whereas, if American terms were accepted, its aircraft could be adapted to certain nuclear missions immediately; and everything else would follow. American control is minimal, and not likely to last for ever. But if France follows in practice some of the lines of policy now being mooted, it will find that in a few years at most the Germans have a bigger, better army, more fully committed to Nato, with more claim to commands in the alliance. And it will be a far more modern army, equipped with, and trained on, a full range of efficient tactical nuclear weapons, which the French will be still years from making. Even if General de Gaulle cannot see the logic of this, it is suggested, younger de Gaulles of the future will see it. This may perhaps underestimate the work France's scientists have done before their first test explosion.

Meanwhile, despite all these wrangles, the unity of Nato is exemplified by the general acceptance of the requirements outlined by General Norstad in his MC-70 paper, and by the resolution to maintain allied forces in Berlin; France subscribed to both plan and resolution. Shape still assumes that France will put a full six divisions at Saceur's disposal when Algeria permits, and that, with MC-70 agreed, the miseries of year-to-year planning are over. Nato's atomic

stockpile will grow. As it grows, manpower needs will themselves change. The common market, atomic technology, the German army—all will tie France increasingly to Nato. But a period of difficult relationships lies immediately ahead (unless Berlin changes everything). The Americans are inclined to say: "Well, you British began it. It is you, and your demands for special treatment, that the French watch so jealously. What you do or say will make for unity or disruption. So for all our sakes be careful." Just now, they are probably thinking of that infernal machine, the annual British defence white paper, quietly ticking away the hours till its time comes to burst upon apprehensive allies.

M. Debré's Team

FROM OUR PARIS CORRESPONDENT

GENERAL DE GAULLE, like a good manager, did not want to alter more than was necessary the team that had served him well and faithfully, although the departure of the Socialists after the budget shocks meant that he had to relinquish M. Mollet, the man who had given him such great service as the team's left winger. Allowing for all the possible permutations, the changes are comparatively few. M. Debré, of the UNR, is promoted to the premiership. His more famous party colleague, M. Jacques Soustelle, becomes second in command, with the title of minister delegate to the prime minister. It is everybody's secret that M. Soustelle had other ambitions; having shown his skill in placing friends and influencing people at the ministry of information and having left this job to a reliable fellow gaullist (M. Frey, the secretary of UNR), he apparently wanted to exercise his skill on a wider scale at the ministry of the interior. This job, however, was given to Senator Berthoin, the only Radical in the cabinet. M. Soustelle was placated not so much by his new functions—he is in charge of overseas territories, the Sahara and atomic energy—as by the fact that through his new rank he becomes M. Debré's closest collaborator and a sort of deputy prime minister. In this position he can wait. After all, only eight months ago he was fleeing to Algiers in the boot of a car.

The neo-gaullist UNR, in addition to the Debré-Soustelle tandem, is in charge of information, justice (M. Michelet), and a couple of less important ministries. The conservative Independents are the second party in the government; they have one minister of state, M. Jacquinot. M. Pinay, having associated his name with the new economic policy, remains at the ministry of finance assisted by two party colleagues as secretaries of state. A senator of the same party is minister of agriculture. Thus the Independents have almost complete control of the economy.

Many Christian Democrats were reluctant to enter a cabinet saddled with such an unpopular budget. But they have joined the government all the same. Since M. Pflimlin felt in need of a rest, M. Lecourt has been appointed minister of state in charge of the French Community (M. Houphouet-Boigny of the African Democratic Rally is also a minister of state). Two other MRP ministers stay in their jobs.

The "technicians" form the biggest single group in the government. Out of 21 full ministers only twelve will now have to vacate parliamentary seats; the rest are outsiders. M. André Malraux, the famous ex-fellow traveller and novelist, has been promoted minister of state in charge of everything vaguely connected with culture. Civil servants are in control of key ministries like foreign affairs (M. Couve de Murville) and defence (M. Guillaumat). A newcomer to this group of technicians is the new minister of industry and trade, M. Jeanneney, a professor of economics and the son of the late speaker of the senate. The minister of education, M. Boulloche, is the Socialists' only link with the government; but he sits in the cabinet in a personal capacity.

M. Mollet had to take his colleagues into opposition. It is true that at the party's national council last weekend he defined this opposition as "constructive." He argued that the Socialists must not oppose the new regime but make counter-proposals whenever they disagree with the government's measures. Nevertheless the final motion adopted by the council attacks the government's economic policy in the most scathing terms as a denial of common sense and justice. On going into opposition, the Socialists have suddenly discovered the heavy cost of the Algerian war. This "discovery" by the party of M. Mollet, who when in office always tried to minimise the burden, has caused amusement, but memories are short and this is not the first of M. Mollet's somersaults. Yet his fate still remains linked to that of General de Gaulle. If the country swallows the new economic policy without too much resistance, M. Mollet will keep the leadership of his party and perhaps serve again. Otherwise all his dexterity may not be enough to channel popular discontent within the limits of constructive opposition.

GENERAL DE GAULLE will retain control of the government team but as president of the republic he also has a team of his own. The new staff at the Elysée Palace includes M. de Courcel, head of the French delegation at Nato; M. Brouillet, hitherto in charge of Algerian affairs; General de Beaufort; and M. Janot, who will deal with the problems of the French Community.

The general has immediately taken the initiative. The measures of clemency in Algeria are wide and significant. Seven thousand Algerian internees are to be freed. All death sentences have been commuted to life imprisonment. Ben Bella and the other Algerian leaders who were kidnapped by the French in October, 1956, on their way from Morocco to Tunis, are being moved from jail to a fortress. This is not yet freedom, but an implicit recognition that they are prisoners of war. These measures have made an impact—they have been received hopefully by liberal Frenchmen and angrily by the ultras in Algeria.

In Paris the mood was not unlike that last October, when on the eve of the general's press conference hopes of a negotiated settlement in Algeria rose high, only to be dashed a few days later. Once again, this week, the air has been full of rumours of secret talks in Egypt, Switzerland and Tunis. Then came the denials. Signor Fanfani, the Italian prime minister, denied that he had any message from President Nasser. M. Frey asserted that there could be no question of negotiation about the political status of Algeria. M. Yacid, the FLN minister of information, echoed from Cairo that any negotiation would have to be direct, based on "independence" and held on neutral territory. Yet, despite all these denials, rumours persist that Algeria might be offered a place in the French Community

(which would not exclude future independence). The snag lies in the French official refusal to discuss the status of Algeria. Can the FLN accept a cease-fire, taking the general on trust? Is the general willing to give them, publicly, any political guarantees?

M. Debré, speaking at the opening session of the Assembly on Thursday afternoon, gave no indication that a positive answer will be given tomorrow. Dismissing all "stupidly and complacently circulated rumours," he proclaimed that it was unthinkable to go beyond the general's offer of last October. If the prime minister speaks for the president the prospects of a negotiated solution are as dim as ever.

Economic Danger Signals in Spain

FROM OUR CORRESPONDENT IN MADRID

GENERAL FRANCO'S report to the nation at the year's end contained all the ingredients that Spaniards have come to expect: justification of the regime, assurances that it is here to stay, warnings to beware of "the enemy" abroad and of "detractors" at home, exhortations to maintain unity and discipline, regret at foreign "incomprehension." Throughout, the tone tended towards optimism and complacency. The average Spaniard, General Franco pointed out, was eating better than before. His standard of living was higher. Industrial production was increasing. Abroad, the regime had gained in prestige, respect and admiration. There were even imitators.

> We view with optimism the revolution on the other side of the Pyrenees provoked by the army backed by the vast majority of Frenchmen. Looked at in terms of political thought this has special meaning for us. For when our own national revolution undertook to restore order in government by circumventing parliamentary rule and the machinations of political parties its purpose was wrongly interpreted and unjustly criticised.

General Franco's speech was notable, too, for what it left out. There was no reference to an alarming side of the economic picture that thinking Spaniards are worried about. Nor was there any mention of the flight-of-capital scandal (see *The Economist*, January 3, 1959, page 65) uncovered last month; under another system of government the affair would have made newspaper headlines for weeks and possibly provoked resignations from high posts.

Most Spaniards today do live better than they did five, ten, and fifteen years ago, but at the moment it looks as if they will not be able to maintain their new standards. The economy has developed serious symptoms of impending crisis. The cost of living has soared 40 per cent in two years, thus wiping out the benefits of the large wage increase decreed by the government in the autumn of 1956. Too rapid industrial expansion in recent years has eaten away the nation's gold reserves from some $220 million in 1955 to $57 million now—and these $57 million are the "untouchable" minimum required as cover for the national currency. Foreign exchange reserves are virtually exhausted, partly because of the growing need for industrial raw materials to keep the country's expanding economy going. A year ago the total trade deficit stood at a record $387 million compared to $170 million two years earlier, and the figure for 1958 promises to be about the same. (True, American economic aid covers about half of the deficit, but what remains is too much to shrug off with a wish and a hope.) Foreign credits and necessary imports are becoming harder to obtain.

Lack of foreign exchange, for instance, is forcing the government to cut imports of petroleum products by something like twenty per cent. The gravity of the measure is clear: trucks, tractors and fishing boats stand to feel the pinch and the economy as a whole will be affected unless somebody (the United States?) comes to the rescue. Petrol rationing may have to be imposed (but foreign tourists would be spared this inconvenience).

Another sombre development concerns Catalonia's textile industry which has been caught up in a severe recession. The average Spaniard has begun to cut expenses, starting with clothing. In October textile sales were 25 per cent below what they were the previous year, and advance orders had dropped by 59 per cent. If the mills are forced to reduce output, 300,000 workers will be affected. Labour legislation ensures that the working man is paid for workless days, but there is always the risk that induced idleness will disturb social stability.

A curious feature of the country's economic plight is that things are bad although American economic aid to Spain has just passed the billion dollar mark (this does not include $350 million for the bases and $400 million for the modernisation of General Franco's armed forces). In explanation the Americans say that their economic assistance is not a recovery programme; it is for "defence support," that is, it is designed to help Spain to withstand the economic impact of the joint construction of military bases and the modernisation of the armed forces. American aid, therefore, is not being poured into the Spanish economy indiscriminately; it is being channeled into basic and selected sectors, notably to agriculture, electric power, transportation, and the supply of certain raw materials and foodstuffs. The Americans feel that their aid programme in Spain cannot be held accountable for a situation brought about by excessively rapid industrial development pushed forward at the expense of agricultural needs, by an immovable reluctance to disturb vested interests, by resistance to foreign capital investment, and by excessive government controls on private economic activity.

REFUGEES IN CENTRAL EUROPE—II

Who is a Refugee?

BY OUR SPECIAL CORRESPONDENT

THE refugee world is full of paradoxes. One of the more curious is that refugees who after long years of waiting in Austrian camps managed to acquire Austrian nationality, now find that they acted unwisely, or at least precipitately. Once they become officially Austrian, they are no longer under the mandate of the United Nations High Commissioner, and so are disqualified, after a year's grace, for the UN integration schemes. This would not matter if the Austrian government could afford to do as much for its refugee citizens as the High Commissioner is doing for the mandate refugees. But in Austria, where the UN has a much freer hand than in Germany, the Unref building

Advertiser's Announcement)

"Why no strikes in Steel?"

asks Margaret Stewart—and comes up with this astonishing answer

MARGARET STEWART *has been industrial correspondent of the News Chronicle since 1949, and before that was on the staff of The Economist. She is the first and only woman industrial correspondent of a national newspaper. She has also broadcast on current affairs for the BBC.*

Miss Stewart was educated at St. Leonards School, St. Andrews, and Newnham College, Cambridge, where she read Modern Languages and Economics.

Before entering journalism she was a research worker for the Nuffield Social Reconstruction Survey and prepared evidence for the Beveridge report on social insurance.

She has made a special study of industrial relations and trade union problems. So her remarks on Steel carry a good deal of weight, because she knows so much about the way other industries are faring.

Miss Stewart has been impressed by the absence of industrial strife in Steel. She writes: "In many years of industrial reporting, I have yet to come across an industry where there is such a 'will to peace'".

IN MANY YEARS of industrial reporting, I have yet to come across an industry where there is such a "will to peace" as in Steel.

In 1957, more working days were lost through industrial disputes in Britain than in any year since 1926 – the year of the General Strike.

The steel industry can plead "Not Guilty". Industrial strife has passed it by, and it has not had a major strike, apart from the General Strike in 1926, for more than half a century.

Last year, there were serious stoppages in road and air transport, and in the docks. This year? Many TUC leaders have voiced the fear that there will be more strikes, because of the Government's decision to scrap compulsory arbitration.

ROUND A TABLE

But such fears are irrelevant to an industry where arbitration by outsiders is the last resort and not an integral part of industrial relations.

This does not mean that there are never any disputes in Steel. It means that both sides prefer to settle their differences round a table. They use their own well-tried conciliation machinery to the full.

This machinery is so good that when Steel was nationalised in 1949, nobody wanted to change it. *This is how it works:*

At the top are national agreements for each section of the industry. These fix minimum wages and such matters as hours, holidays and the cost of living sliding scale. Heavy steel usually sets the pattern, but agreements vary to suit each section.

MEN ON THE SPOT

At the bottom are plant-by-plant negotiations – undoubtedly the key to success. The men on the spot who work on the job, and know the local conditions, fix the rates for a particular machine, mill or furnace.

If a dispute cannot be settled locally, it goes to a neutral committee of four – two management and two union men, drawn from firms *not* concerned in the dispute but thoroughly understanding the job.

These neutral committees nearly always reach agreement. If not, the top officials on either side take a hand and see if they can suggest a solution. If they fail, then – and only then – the dispute will go to arbitration. One side never *forces* the other to arbitrate. It is done on jointly agreed terms of reference, and on the understanding the award will be accepted.

SQUARE DEALING

Many other industries have just as good machinery on paper, but it has not prevented strikes and unhappy labour relations.

Steel has a tradition of fair and square dealing. "We talk the same language and we trust each other", was how one big steel executive described his relations with his men.

The unions, on their side, have for the past 90 years followed the maxim of one of their early pioneers: "Reason, not force, is the weapon men should use". Union leaders, at every level, exercise an effective discipline over their members, and insist, to the point of expulsion if need be, on the honouring of agreements.

Both sides can be tough. That is not surprising in an industry where the job is tough, the hours are tough, with round-the-clock working, and the product itself is tough. But both sides are conscious of the serious effects any loss of production would have in a highly capitalised industry, where each worker is backed by up to £10,000 worth of equipment.

In my view, the short answer to the question: "Why are there no strikes in Steel?" would be: "Men of Steel are Men of Sense."

This personal report was invited by the British Iron and Steel Federation, which believes that everyone in Britain should know the facts about steel and about the men who make it.

schemes are progressing much faster than government projects, and the new Austrians may, as they now fear, have only their right to vote to comfort them as they watch their companions house-moving.

The German refugees in Austria may be even worse off. A great many displaced people of German descent took German nationality after the war, not necessarily intending to go and live in Germany but tempted by the higher pension schemes. Now, although living side by side with the others, they are eligible for neither the UN projects nor for the more hypothetical Austrian schemes, and they see themselves stuck in the camps when the rest have departed.

These unfairnesses, which outside might be accepted as just part of life, are starkly resented in the close, institutional life of a camp. It is dreadfully difficult for the "integration counsellor" to explain to a man who is rather proud of himself for having taken the decisive step of adopting Austria as his permanent home, that he has thereby killed his immediate chance of a flat. The distinctions between refugees may be arguable enough at the High Commissioner's headquarters in Geneva; to the refugee it just seems that he is being penalised for showing initiative.

The counsellors, who by murmuring "don't we all want to be integrated" mock their high-sounding title, are forever trying to explain why one refugee is different in official minds from another. They have to tell families who on their own initiative moved out of camp into private lodgings that they are no longer eligible for international assistance. They have to pass on to old-age pensioners the change of directive that now disqualifies them for a flat. Perhaps their most difficult job is unravelling the abracadabra of the United States escapee programme, which is apparently capricious in the way it whisks one refugee off to the United States and leaves another stranded. But the counsellors themselves sometimes add to the confusion since many of them, although employed by the High Commissioner, belong to religious organisations. The more conscientious of them work impartially among Catholics or Protestants; others have their own protégés. And social welfare on a confessional basis is a puzzling affair.

In perspective, the mandate refugees in Austria are not now getting too raw a deal. Austrian citizens by birth, no less than the ineligible refugees, have to face the fact that accommodation which they need most urgently is denied them. But the refugee is by definition cursed with an insecurity that makes inconsistency particularly hard to bear.

(Concluded)

Israel's Election Starts Early

FROM OUR CORRESPONDENT IN TEL AVIV

WITH the election a good six months away, Israel's political parties are already manœuvering for position. There is not much of a floating vote among the older inhabitants, but this year, for the first time, newcomers will play an important role. Among the old-timers political affiliations are strong and hardened by tradition. The political loyalty of Labour supporters has been well fed by material benefits, such as cheap housing schemes, higher wages or social benefits. It is true that in the 1951 elections there was a swing towards the General Zionists; controls and a clumsily administered rationing system made even the adherents of a planned economy restive and brought the undecided over to the side that advocated less state interference. But controls were relaxed by stages, and in the last elections four years ago the government adroitly exploited the rising standard of living. The newcomers, unused to electoral procedures and strongly impressed by the officials who looked after them when they first arrived in Israel, did not play a decisive role but fitted surprisingly well into the old party patterns.

This time the newcomers will be more important. They have multiplied, and they have learnt something about the functions of government and trade unions as well as about elections. The party that can best attract them, will do well. Mr Ben-Gurion appears to be well aware of this and in particular of the need to attract the Oriental Jews to his side. He used the conflict with the orthodox wing in the Knesset—about the registration of children from mixed marriages—to co-opt into the cabinet the 76 year-old Sephardi Rabbi, Moshe Toledano, and admitted openly that this was done to increase the influence of the Sephardim in the cabinet. In this context, Sephardim means the Jews who came to Israel from Oriental countries. Many of them nurture grievances against the people at the top and against government officials because these are still drawn mainly from the Ashkenazim, the immigrants from Europe. The cleavage between east and west in Israel shows in many places and a political party stands to gain if it can either show that it offers opportunities to Oriental immigrants or exploit their resentment.

The venerable old Rabbi of the Sephardi community is not a newcomer. He was born in Tiberias but he has served among the Jewish communities in Casablanca and Egypt and is well known as a champion of the Sephardi Jews. It was, therefore, a clever tactical move by Mr Ben-Gurion to take him into the cabinet instead of a representative of the religious block, all of whom come from the West. On the other hand, Mapai may now loose votes because of the opposition of the religious block. Disappointed politicians from the religious parties play on the fear of parents that their children will be taken away from them by freethinkers and they do this now with fewer inhibitions than when they were still in the coalition.

It is impossible to say at this stage whether the elections will be fought on the question of "Who is a Jew?" and on the relations between church and state. In the past, Mr Ben-Gurion has always tried to avoid an all-out battle on these issues, and he may choose to fight the elections on other problems. Among these foreign policy does not promise much to his opponents except to the Communists and they still count only among the Arab minority. Heruth has lost much of its aggressiveness, people shun public discussions of security issues, and neutralist Mapam has lost some of its appeal outside its own party-ranks by its acceptance of the Eisenhower doctrine.

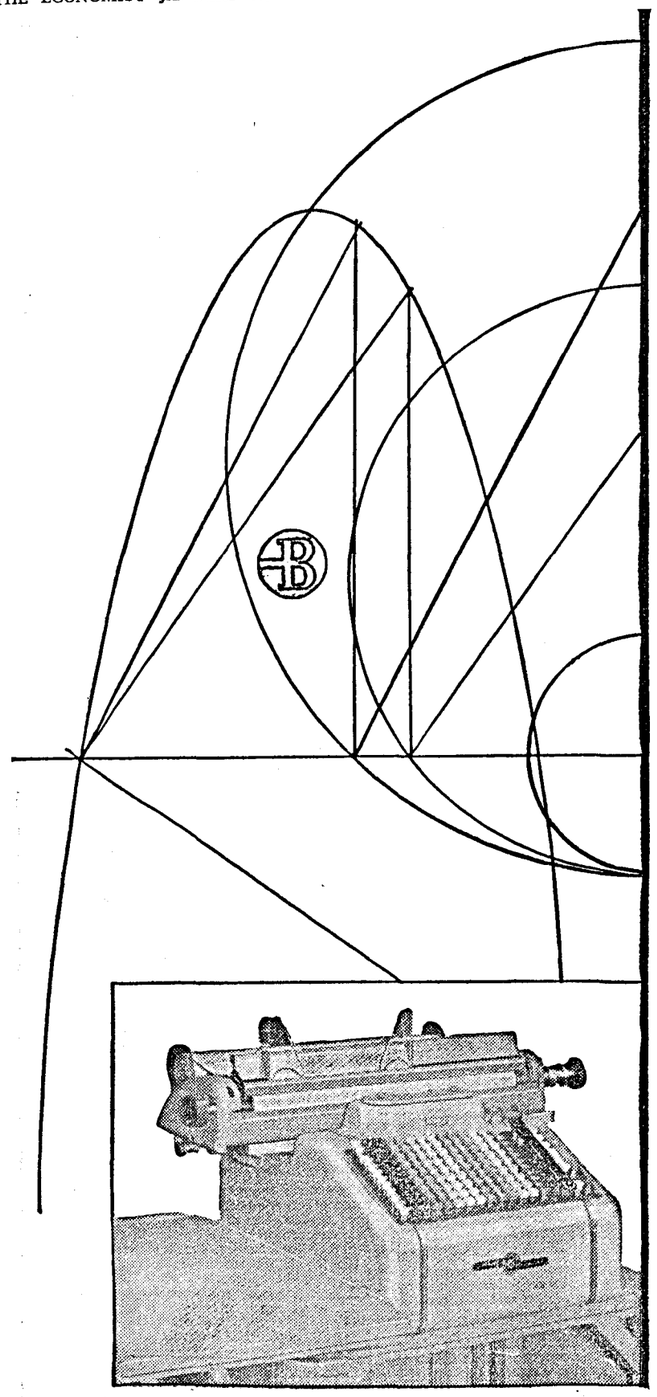
THERE remain the economic issues, which are both complex and urgent. Israel needs outside help to the extent of roughly $3 million a year. Everybody agrees that as long as this is the case it is no use talking about economic independence. But although the finance and trade ministers shout themselves hoarse with the slogan "export or unemployment" things jog along much as before. And people who listened to the budget speech of the minister of finance last week were well aware that the long predicted economic reforms would have to wait till after the elections. The government appears to be trying to keep as many

people as it can in work—partly by emergency jobs—so that the standard of living can rise and people will be in a good mood during election year.

The most revolutionary speeches come not from the right-wing opposition, which just repeats its war-cry of *liberalisation*, but from the ranks of Mapai itself. The leader of the revolt is General Moshe Dayan, the hero of the Sinai campaign who has recently entered politics. He is now a student at the Hebrew University in Jerusalem, and has proved himself as flamboyant a figure in civilian clothes as ever he was in khaki. He demands that workers should be dismissed for inefficiency—a sore point with the trade unions. He proclaims that the administration is overstaffed and should get rid of 5,000 officials. He complains that the Israelis eat the money needed for development. And he has attacked, with unprecedented sharpness, the old guard of Mapai. He maintains that the young people of Israel who have lain gun in hand among the thorns and sands of the Negev, understand as much of economics and politics as do the old teachers of Mapai who have sat for twenty-five years in the offices of the Labour Federation. This has led to an open running fight with Pinchas Lavon, the general secretary of the Histadruth.

Mr Ben-Gurion is well aware that success may depend on the absorption of the younger generation into the top ranks of Mapai. But even those who plead for economic reform and for a pruning of the wild growth of the administration are wary of backing General Dayan in the political arena. They realise that an army education is not an adequate background for a political career, and that the general and many of his friends who make up the young group in Mapai, know too much about military discipline and too little about parliamentary thought and democratic procedure. This is the more significant as Mr Ben-Gurion is reported to have selected General Dayan as his eventual successor.

Polish Writers Feel the Pinch



A POLL of writers conducted by the Polish communist weekly *Polityka* has had two interesting results. The writers listed "Dr Zhivago," which in Poland can only be read in smuggled-in foreign editions, among their favourite books of 1958; and *Polityka*, far from suppressing or hiding away this unorthodox expression of opinion, published it in a prominent place. Thus the writers demonstrated their persistent determination to hang on to some vestige of the freedom to write what they want (as opposed to only speaking it) which they thought they had gained in October, 1956, but which has been steadily eroded since; while *Polityka* demonstrated the unusual flexibility, the curious inconsistences, of the Polish communist regime, which makes the search for a *modus vivendi* between writers and regime more complicated and more nicely balanced in Poland than elsewhere in the Soviet block.

The tension between the writers (many of whom are themselves communists) and the Polish regime has lately become more acute and more open. The party line towards culture was redefined early last month; presumably aimed at a compromise, it achieved only ambiguity and dissatisfied the writers still more. At their congress in Wroclaw on December 15th and 16th they were openly critical of the government's present attitude towards literature, and in particular of the increasingly widespread operations of the censors. A resolution criticising the censorship and demanding freedom of expression was introduced by Jan Kott, one of the many intellectuals who supported Mr Gomulka in October, 1956, and adopted by an overwhelming majority.

After brooding over the Wroclaw congress for over a fortnight, *Trybuna Ludu* eventually published an admonitory article. It contrasted the writers' congress unfavourably with the conference of culture and education workers that took place in Warsaw a few days later. The Wroclaw atmosphere, according to *Trybuna Ludu*, was full of misgivings over the writers' ideological programme and fears of a return to bad old stalinist practices; by contrast, the cultural workers, although admittedly their discussion "was not very brilliant at many points," did at least have their ideological hearts in the right place. Instead of worrying about the way in which Polish literary works are lagging behind "the development of social consciousness," the writers at Wroclaw went on and on about the censorship. Nor have they yet finished. The chairman of the writers' union, Antoni Slonimski (who sent a telegram of congratulation on his Nobel prize to Pasternak and has never in any way suggested that this was a mistake), is now engaged in controversy with *Trybuna Ludu* over whether some of the writers at Wroclaw were opposed (as their paper alleges) to the principle of censorship, or whether they were only condemning (as Dr Slonimski maintains) the "often unjustified and damaging decisions of censors" against which, he says, there is no appeal.

THE censorship is an even more damaging weapon against recalcitrant writers than may at first appear. Not only does it keep their books in mothballs; it also prevents them from earning their living. It is in fact reported that Jerzy Putrament, the very minor novelist who is now the chief exponent of the party line on culture, told the writers not long ago that they would be starved out if they did not conform. Whether or not this report is accurate, some writers are already feeling the pinch. They include Adam Wazyk, who wrote the famous "Poem for Adults" shortly before Poland's "October days"; the poet and novelist Pawel Hertz; the poet Mieczyslaw Jastrun, who has just had a book banned; and Jerzy Andrzejewski, who is believed not to have earned anything since he was paid for the film rights of his novel, "Ashes and Diamond," eighteen months ago.

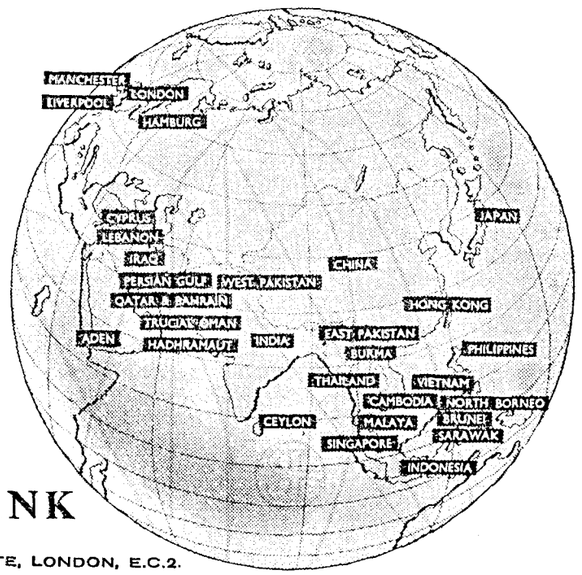
It remains to be seen how far this attempt to secure conformity through cutting off the cash will be pressed—if indeed it is as yet a deliberate and conscious attempt. Mr Gomulka will probably be most reluctant to push matters too far with a group of men many of whom were among his staunchest supporters in October, 1956. The Communists themselves maintain that they do not want to create a uniform style in the arts, that they approve of a free clash of opinions, and respect experiments and creative research. But it is another matter to reconcile these unexceptionable intentions with their avowed determination not to allow any straying outside the Marxist fold into revisionist or bourgeois pastures. In Gomulka's Poland, where stalinist police methods are becoming an unsavoury memory and where men have far greater freedom to speak their minds than elsewhere in the Communist block, the task of corralling the written word within strict Marxist-Leninist fences is bound to be immensely difficult.

best
background
for fast accounting

A Sensimatic cuts accounting time by up to 66%* —and that means costs, too.

With a Burroughs Sensimatic behind the scenes you can be sure of big savings, whatever your business, whatever your accounting procedure.

The secret of the speed, accuracy and flexibility of the Sensimatic lies in its exclusive sensing panel. This is a control unit which permits each job to be individually programmed, and four or more programmes may be incorporated in ONE unit. Maximum automaticity and economy are ensured and varying combinations of memory units are available. Simply select the combination appropriate to your specific requirements.



Automatic features simplify the operation of the Sensimatic, and up-to-date Management reports are provided as a by-product of routine accounting applications.

Contact your local Burroughs office or write direct to: Burroughs Adding Machine Ltd., 356-366 Oxford Street, London, W.1. Tel: Hyde Park 7061.

BURROUGHS SENSIMATIC

**The figure varies according to the nature of the accounting operation*

British Banking in Asia

These are the territories served by THE CHARTERED BANK and its wholly-owned subsidiary, The Eastern Bank Limited, through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by expert knowledge and long experience of Eastern trade, finance and industry. In London an effective credit information service and skilled assistance and advice are available to merchants and manufacturers seeking new business connexions in Asian markets.

THE CHARTERED BANK

(Incorporated by Royal Charter 1853)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2.

Branches in the United Kingdom at Manchester and Liverpool. Agencies at New York and Hamburg.

THE EASTERN BANK LIMITED

Head Office: 2 and 3 Crosby Square, London, E.C.3.

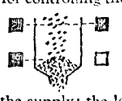
Electrical Aids in Industry — *Data Sheet* **No. 8**

Light-Sensitive Cells

What are light-sensitive cells? They are devices which can sense and measure changes in the level of light or, in some cases, respond to the quality of light falling on them. There are various types of cell and each has its particular field of use. One of the best known is the photo-electric cell.

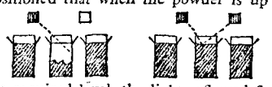
What can light-sensitive cells do? A change in the amount of light falling on the cell can cause a switch, relay or counter to operate. Alternatively, the direct indication of the light intensity can often allow some other factor to be determined and, if required, controlled. They are reliable and require little maintenance. Careful installation, as with all types of equipment, gives a good reward.

How can they be used? These cells have many applications in industry, for controlling processes, for inspection and measurement, for sorting material and for safety purposes:



Counting

Where objects on a conveyor belt are too soft or light to operate a direct mechanical counting device, where they are too delicate or freshly painted to sustain physical contact or where the articles vary in size, a light-sensitive cell can be used. This counts the objects by interruption of an appropriately sited beam of light.



Hopper or Tank Level Control

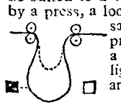
Many forms of feed can be accurately controlled by light cells. One important one is for controlling the input to a hopper of fluid solids such as sand or peas. Here, two horizontal light beams are required: the upper, when interrupted, indicates that the hopper is full and stops the supply; the lower, when it ceases to be interrupted, indicates that the hopper is nearly empty and restarts the flow.

Package Content

The level of powder in packages can be checked with light cells. The cell is so positioned that when the powder is up to the required level, the light reflected from the surface of the powder is picked up by the cell and causes the carton to be accepted. If not, it is rejected.

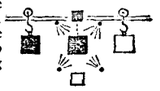
Colour Sorting

The quality of many articles can be gauged by their colour—seeds and nut kernels, for instance. The objects are fed into a tube by means of a vibrator pan and fall into the beams of three equally spaced light cells which scan them from all sides. If the object is acceptable it falls into a chute carrying it to one conveyor; if its colour is bad it is deflected as a reject.



Guillotine Guard

Light cells for guarding a guillotine or power press should be used only as a supplement to a mechanical guard or where the latter is impracticable. The interruption of a curtain of light by a hand stops the machine instantaneously.



Press Feeding

Where the rate of feed of strip metal must be suited to a varying speed of acceptance by a press, a loop of the strip is allowed to sag between the feed and the press. When the loop reaches a predetermined depth a light beam is interrupted and the slack is taken up.

Processing Objects on the Move

Many articles are processed while on a conveyor line. For instance, where articles are to be sprayed while on the conveyor, the paint saved by stopping the gun between articles will make the device worth while. The same principle applies in a bakery to the spraying of baking tins with fat.

Automatic Door Opening and Closing

Doors can be caused to open or close by the interruption of a beam of light. This has its uses in such cases as control of doors on a heating oven or for the passage of vehicles in a factory. This is effected by a light beam on the side from which the approach is made (in many cases, both). When the approach beam is interrupted it opens the door which closes again after a given time interval.

For further information, get in touch with your Electricity Board or write direct to the Electrical Development Association.

An excellent series of reference books are available (8/6, or 9/- post free) on electricity and productivity—"Higher Productivity" is an example. E.D.A. also have available on free loan a series of films on the industrial uses of electricity. Ask for a catalogue.

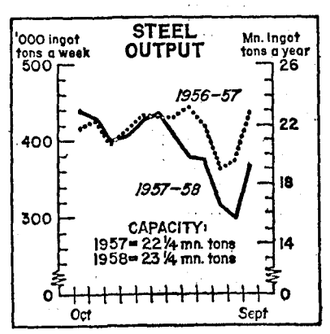
THE BUSINESS WORLD

Recession and Steel Profits

DURING its financial year that ended on September 30th last, the British steel industry produced just over 20¼ million ingot tons of crude steel. This was 6 per cent less than in 1956-57, and its deliveries of finished steel were about 5 per cent down. The industry's productive capacity—which in Britain means what the industry would have been glad to produce economically, not some theoretical maximum—averaged at least 23¼ million tons during the year, so that as a whole it operated about 13 per cent below full capacity. Steel's recession developed only after the beginning of 1958. In the October-December quarter of 1957 deliveries of finished steel were still nearly 5 per cent higher than a year before ; yet by the July-September quarter of 1958 they were 15 per cent lower.

During the first quarter of the current financial year—the last three months of 1958—steel production was at the rate of about 18 million tons a year, against a capacity of some 24 million tons. Nobody knows yet how much more consumers have reduced their steel stocks. But few people in the industry believe these stocks are low enough yet to revive buying quickly. On a conservative but not lugubrious forecast, allowing for some upturn in ordering by the middle of this year, one cannot now expect production in this financial year to be much above 19 million, from a capacity averaging say 24¼ million tons—operations, that is, averaging 20 per cent or more below full capacity.



On the face of these figures, one might expect to be recording a poor year for steel profits and looking forward to a still more doleful one. Yet the mixed array of steel profits that have so far been disclosed—which include all the industry's ten biggest producers of crude steel—has been by no means uniformly unhealthy. Preliminary and detailed trading figures for several concerns have been given already (and figures for four publishing full acounts this week are set out on page 236). Their comparison with 1956-57, in terms of trading and in some cases of operating experience, can be summarised.

Changes, 1957–58 from 1956–57	Output, ingot tons	Profit Before depreciation and tax	Profit After all* depreciation before tax
	Per cent	Per cent	Per cent
Colvilles	−12	− 7	− 5
Consett Iron	n.s.	−30	−40
Dorman Long (Steel)	− 9	n.s.	−21
Whole group	n.s.	− 3	−18
Lancashire Steel	n.s.	+36	+57
South Durham	n.s.	+38	+37
Steel Company of Wales	+ 4	+17	+25
Stewarts and Lloyds	−14	−19	−24
John Summers	+ 5	+16	+12
Richard Thomas & Baldwin	n.s.	−17	−27
United Steel	−5	− 5	− 3

* Including allocations to reserves for replacement of fixed assets.

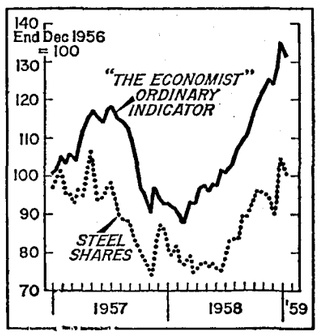
No company among these big ten has felt impelled to reduce its dividend ; several have increased them, either as a result of buoyant profits or grudgingly in retreat from a skinflint policy. Why have these results, in general, been more favourable than might well have been feared in a year of steel recession ?

The first answer, as the table shows, is that the recession hit different companies very unequally : three or four out of these ten big companies actually produced more steel in 1957-58 than in 1956-57. Demand for sheet steel, last year, almost completely escaped the recession, which was concentrated at the heavy end of the industry and in tubes. John Summers and Steel of Wales, accordingly, could record increases in output and very healthy increases in profits, while Consett, Dorman Long (Steel) and Stewarts and Lloyds were hit in output and more heavily in profits. Lancashire Steel and Richard Thomas and Baldwins do not fit this pattern of

recession and profit too neatly. Though the wire trade's relative prosperity probably meant somewhat increased output for Lancashire Steel, its production cannot have soared as much as its profits ; at the other extreme there seems no obvious reason why RTB's output should have slumped enough to cut profits by a sixth. But the spurt in Lancashire's profits ought properly to be set against their slump in 1956-1957 ; while RTB, which as yet has said nothing about its output or experience, is said to have had continued teething troubles in bringing in certain new plant recently, and may well have lost heavily for a while on some of its obsolete works before it finally decided to close them.

Secondly, for some companies the recession has been cushioned by profits from activities wholly or partly outside steel and outside price control. South Durham's engineering works making large-diameter pipe has been able to bail out Cargo Fleet from adversity, leaving a handsome increase in total profits in hand. Dorman Long, whose activities outside steel contributed nearly half last year's profits, did at least less badly in these structural engineering and chemical branches than in steelmaking. United Steel's rich assortment of products and activities, too, seems to have tempered the effect of steel recession upon profits.

Thirdly, steel producers in 1957-58 had the benefit of rather more generous treatment in the Steel Board's setting of prices than in the year before. During 1956 the recovery of extra costs was somewhat delayed on top of Mr Macmillan's plateau, and an increase in December that year left out special cost increases following the Suez affair. But in July, 1957, the next increase gave the industry, *inter alia*, £10 million a year extra for depreciation, by reducing the lives set for assets in the computation of this element in prices. The "profits after all depreciation" comparisons shown in the table on the previous page take account of the depreciation and replacement reserves the companies show, not what the board allows in prices. There was, admittedly, a small cut of 1½ per cent in steel prices in March, 1958—which, incidentally, altered the balance of costs between companies because prices of imported ore were made more realistic and the ingot levies on output everywhere were reduced. Since then landed prices of ore have come down further ; has the British Iron and Steel Corporation in turn reduced its internal price to steelworks that use this ore ? Apart from price control, export premiums on many steel products finally disappeared and there was some soft selling abroad. On the other hand, the "basket" of products actually sold abroad included proportionately more expensive items, so that the value of exports, ton for ton, was rather higher last year than in 1956-57.



It can hardly be said, therefore, that 1957-58 was exactly a testing time for conventional ideas about the effects of recession upon so highly capitalised an industry as steel ; a 5 per cent drop in output to 13 per cent below capacity, in a year when total price allowances for depreciation themselves went up by 10-15 per cent, is not exactly an acid test. Certainly British steel companies have not yet had occasion to rival their American counterparts in continuing to make profits when operating at 60 per cent of capacity or less. The industry has achieved some economies in prime costs from its lower rate of operations—not necessarily wholly offsetting the extra cost of spreading overheads over a lower volume of output, but enough to reduce the effect. Some old and inefficient blast furnaces and other plant have been taken out of service ; some reductions in the coke rate per ton of iron have come from running furnaces on slacker blast, though reductions here do not necessarily save as much money as they save fuel—they mean bringing in new sinter plant.

Moreover, the burden of fixed costs in this industry can be exaggerated. Depreciation probably accounts for 7 per cent or so, salaries for another 4-5 per cent ; total overheads may not exceed 15 per cent or so at a reasonable rate of operations. The industry has not laid off many men, but it has cut working time ; average earnings are down. Even accepting that labour costs do not fall fully in line with operations, the effect of operating at about 10 per cent below optimum capacity would not be too severe. This year, when the operating average might well be 20 per cent below capacity, may offer the applied economist more evidence to test his conventional wisdom.

The investor, as an applied micro-economist, will be less concerned with the effects of operating rates upon costs than with the commercial prospects that 1958-59 presents for individual steel companies. The companies making thin flat steel, once again, seem better placed, as cars and consumer goods ride the latest surge of hire purchase—though Steel of Wales will soon have to provide much more for depreciation when its latest cluster of investment projects comes into commission, and Summers has warned its shareholders that no further large expansion in output can be expected before 1959-60. South Durham, confident about its pipeline contracts, is perhaps the most bullish in its assessment of 1959. Most other companies have reported fewer orders in hand, and until heavy investment in things that take steel turns upward the heavy end of the business is likely to remain depressed.

But this year political prospects may well outweigh even the commercial chances of particular companies in the investor's mind. Before the current financial year ends, the threat of nationalisation may either have been postponed for another five years, if not for ever—or placed on the immediate agenda, making Mr Gaitskell's words about "full and fair compensation" a matter for anxious calculation. The prices at which renationalisation might be carried through put a limit on the commitment that even the most reckless investor dares take today. But the gamble is an attractive one. Most of the companies have raised their dividends in recent years. Yet the price of their ordinary shares have lagged behind the boom, so that dividend earning yields for steel equities are high. It is only politics that keeps yields on leading steel equities at about 8-9 per cent, nearly twice as high as those offered by "blue chips" in other industries. A Conservative victory at the polls would bring those yields down with a rush and give punters sizeable capital gains. But if the gamble comes off and the threat of renationalisation fades, individual steel shares—at present depressed into uniformity by politics—will have to be appraised and valued on their economic merits, as other equities are. Management, the pattern of profits and markets, the timing and finance of development would come again into the reckoning.

Policy on New Pensions

If the new proposals for national pensions were put forward originally with some thought of catching votes, they seem to be attracting singularly little popular attention now. Bills and Government Actuary's reports about something that does not start for two years are not everybody's meat, but employers ought to begin to form some views about the impact of the proposals on their own policies about pensions. Save in one respect, the Bill precisely follows the white paper proposals outlined in *The Economist* of October 18th last year. The Government has taken the point that the Exchequer contribution should have some relation, as in the past, to the contributions paid by employers and employed. Instead of finding a fixed annual sum of £170 million, the Exchequer will quite possibly be paying £216 million by the end of this century, some £80 million more than now.

That is the only change of substance that comment and representations about the white paper proposals have managed to evoke. The framework of the scheme and most of the cladding remain quite intact. Three major premises have been built into it on Government instructions: unemployment at 3 per cent; earnings rising by 2 per cent a year ; and 2½ million employed people outside the scheme. The graduated element in pensions starts with earnings at £9 and is limited to £15 a week. Two per cent per annum, without any extra help from inflation, will push more and more wage earners up to this earnings barrier. Average earnings of men are already over £12 10s. a week.

The first fact that employers must grasp is that this £15 limit is laid down now, starts to be applied in 1961-62, and will govern the graduated pension payable to the youngest entrants when they come to retire in the next century. The lad of 18 who enters the scheme in 1961-62 and averages £15 a week or more over 47 years will get £6 1s. a week in 2008 for himself and his wife. A man already 40 in two years' time who averages £12 a week for the ensuing 25 years will get £4 10s. a week for himself and his wife when he retires in 1986.

It is not easy to relate the benefits in the scheme, of which these are two examples, to the payments that secure them. Every man will have to do his own homework to see how he comes out. A full contributor in the scheme will pay 8s. 4d. a week (and the employer 7s.) for the minimum pension (£4) and for industrial injuries and national health service. A £15 a week man will pay 5s. 1d. on top of this for the graduated addition to his pension (£2 1s. if he enters at 18 and 22s. if he enters at 40) and a £12 a week man 2s. 6d. (20s and 10s. a week at these ages of entry). All graduated contributions are equally matched by employers. These are the opening rates of contribution. But the scheme arranges for quinquennial increases in both rates. From April, 1965, and every five years up to 1980 the minimum rates will be put up by 1od. a week (divided equally between the two sides), making a total weekly payment in 1980 of 18s. 8d.; the graduated contributions will be raised by about ½ per cent of earnings—1s. 6d. a week (again divided equally) for the £15 man, giving 16s. 2d. for

the graduated pension contribution in 1980 and a total contribution, from insured and employer, of £1 14s. 10d. a week.

The only firm thing that can be said about these scales of contributions and benefits is that they will not last for ever, and perhaps not for very long. The quinquennial increases are intended to bring the scheme into approximate balance on the new "pay as you go" basis. The Government Actuary's figuring on the prospects of the scheme over the next forty years looks hopeful enough on this new basis. But there are important reservations to be borne in mind. It is quite improbable that all the underlying assumptions will work out. It is virtually certain that political pressure will before very long demand "improvements" in the new scheme. There have been five increases in state pensions in the last twelve years. Is it really to be supposed that if earnings increase by 2 per cent a year, there will be no changes in the next twenty? If there are, contributions will certainly have to be raised too.

ALL this is relevant background that employers must keep in mind. Quite the most complicated clauses in the Bill relate to the provisions for "contracting out," which employers are allowed to do. The terms may seem stiff and the practical difficulties enormous. But so, on the other hand, may be the difficulties of many employers if they do not contract out. The first point here is whether it will be possible for an employer to contract in later, if the scheme or his own circumstances change. The clear inference from Clause 7 (3) of the Bill is that he may. Suppose that he has contracted out for the first twenty years of the scheme, matching in that time, as he has to, the graduated state pension by his own private pension arrangements. Then in 1981, the basis of the state scheme is altered to increase the future flat pension (which everybody has to pay for) or the future graduated pension. It may then suit this employer to come into the state scheme and suspend or modify his private scheme. Only if back dated increases are applied in the graduated pension between 1961 and 1981 will he be caught—and a retrospective increase of this kind is something that even the most cynical politician would think twice about. An employer who opts out now, because his scheme provides at least as much as the state scheme, can get in later if circumstances change.

This point is of immense practical importance. It gives employers real latitude in framing their pensions policies; they are not committed once and for all, either in or out, by any decision they may take at the start of the scheme. There are, indeed, some important immediate snags in contracting out. One is that a contracted-out employee will have to pay the present contribution of 9s. 11d. (including 2s. 6½d. for industrial injuries and national health) to secure the minimum benefit of £4. The contracted-in employee will pay only 8s. 4d. for the basic pension and if he earns no more than £11 a week he can get an additional graduated pension for another 1s. 8d. a week. This extra penny will give him 13s. extra pension if he enters the state scheme at 18. He would certainly want to know from a contracting out employer why he should be charged more for getting less. All employees earnings less than £11 will rightly object if their employers contract them out. That and not £9 is the practical datum level for contracting out at all.

The next point about contracting out is that the employer has to provide "equivalent benefits" related not to what an employee earns in fact but to the maximum earnings of £15 in the state scheme. The employer has to secure benefits of at least £2 1s. a week after 47 years' service, for all contracted out employees—whereas, to take an example, if the employee's earnings had averaged £12, his additional pension would be only £1. This is not merely a long-term obligation. It applies to all future service after April, 1961, and employers will have to provide on this maximum basis for all contracted out employees—a formidable burden for any business that has to cope with a high turnover of low paid staff.

For wages staff, many employers would have to increase their private provision if they wanted to match the state scheme. Insured pension schemes for wages staff vary according to what the employer is prepared to pay. There are some that provide as much as £6 pension for every year of service—nearly £5 a week for the man who serves 40 years. At the other extreme, where pensions of the order of 15s. to 30s. a week are provided, there will be a sizeable gap to fill if the employer contracts out. On such figures as these the less prosperous concern might be tempted to close down its private scheme and leave it all to the state. But many employers are likely to continue their own scheme regardless of the changes in the state scheme. If his employees earn about £11 a week, the employer's contributions under the new scheme would be the same as under the old. Even if all his employees were at the £15 level, his state contributions would go up by no more than 1¼ per cent of his pay roll. Many employers will think that such an increase in cost would not be all that burdensome and may therefore decide to ride both the state and their own scheme.

If that is the general view, the typical wages scheme should be able to live quite happily with the new state scheme. But in some staff schemes, as distinct from wages schemes, something may have to go. Some employers will have to think of splitting their pension arrangements between the state scheme and a revised private scheme. A sensible employer will certainly include all workers earning up to £11 in the state scheme. If he splits his arrangements at that level, and in addition provides privately for staff earning more, he will not prejudice his lower paid staff and should be able to do better for his higher paid staff than the state benefit. How individual cases will be sorted out is impossible to guess; the most formidable demands are going to be made on employers' time and powers of explanation and many of them will take the easy way out and go wholly along with the state scheme (with any additional private arrangements that they think justifiable) just to save themselves headaches and reproaches. The average employer is likely to content himself with making the best of both the state system and his own scheme, and his own scheme (whether on top of the state scheme or as a supplement to it) is likely to be more helpful to his higher paid staff than to his lower paid staff.

There are various possibilities here for the employer with higher paid staff. He can aim at a private scheme that, together with the state scheme, produces a given level of pension, whether expressed in terms of average earnings or final earnings. Or he can disregard a certain proportion or amount of earnings, and bring only the residue into the private scheme. Mr V. R. Jackson, the pension officer of the Unilever Organisation, outlined these possibilities in a public address two months ago and came down in favour of fixing a slice of earnings to be regarded as covered by the state scheme, leaving a balance eligible for inclusion in a private scheme. Let the state pension provide benefits, he suggested by way of illustration, on a slice of income corresponding to half the state pension maximum of £15 a week—that is on £390 a year. Then put your employee in your private scheme for the difference over £390—if he earns £600, put him in at £210. If you pay the whole cost under a non-contributory scheme, preserve the accumulated rights of existing employees, but reduce their pensionable salaries by £390 for the future.

Not all pensions officers and actuaries would support these views. An iron rule in any case is hopeless; every scheme and every set of employer's circumstances are *sui generis*. One of the frightening things is that there simply are not enough skilled people in the pensions business to guarantee that in the next two years the pensions affairs of about 5 million people in industry can be adjusted in good time for the introduction of the new state scheme. Industry will need all the best advice it can get—from pensions consultants, actuaries, insurance offices and, not least, from their own personnel officers. There is no ready made answer—only an urgent need for wet towels galore.

BUSINESS NOTES

SOCIAL INVESTMENT

Returns from Ravenscraig

A NEW semi-continuous steel strip mill at Motherwell, on the outskirts of Glasgow, cannot do the British economy any real harm unless.

1. it hampers the time-table of erection of the major strip mill that is to be developed at a deepwater, low-cost site near Newport, or
2. it weakens the potential competitive power of consuming firms that may be attracted to uneconomic locations by the supply of sheet and strip steel it will offer.

A third objection, that this would probably not be the best way to spend an extra £30 million on steel development during the period 1959-63, may be affirmed as stated. But there is no evidence that the Prime Minister was anxious to press £50 million of public money into the hands of steel producers for any other project, so that the misdirection of capital it may involve can only be reckoned against average returns on public and private investment in the British economy as a whole, not against returns on investment in steel.

There is nothing rewarding about taking so negative an attitude towards this new Scottish steel project, which may indeed bring sectional benefits to the locality in which it is to be erected. But the details of its financing—rather than details of the actual project, which are still being worked out—announced by Colvilles Ltd this week do little to commend it to the taxpayer who is providing the money. Colvilles' shareholders are not. The Government loans will reduce the amount of capital that the firm was reckoning it would have to find from its own resources and elsewhere during this period; and will leave it with more iron and crude steel capacity than it expected to have by 1963, rather more plate capacity, and modern plant for hot rolling and cold reduction of strip and sheet. So the directors of Colvilles may well commend it to their shareholders. The prospects of return are understandably couched in rather vague terms:

> It is obviously too soon to make a reliable forecast of the earnings to be expected from the scheme but when the strip mill reaches an output of 500,000 tons per annum, and assuming the profit margins are similar to those ruling at present, the plant covered by the scheme should earn sufficient not only to meet its own depreciation and interest charges but also to contribute to the general profits of the company, as well as generating a cash flow sufficient to provide for substantial repayments of borrowed moneys.

These are perhaps not quite the prospects of return that a steel company's board might require to take a decision about risking its own money on a normal investment project: but they are not doing so, and the project is not a normal one.

The Government's Part

ORIGINALLY Colvilles had planned to add to their new steelworks at Ravenscraig another blast furnace, extra coking plant, and more steelmaking capacity, plus a modern slabbing mill; a new plate mill to be constructed at Clydebridge would be fed by slabs from this new primary mill.

Over the six years 1958-63 this, with alloy steel development that is not affected by the new decision, was to cost £40 million. The plate project at Clydebridge has not yet begun: Colvilles says "the detailed plans will have to be reviewed as the proposed strip mill will now produce some of the light plates which it had been planned to make at Clydebridge." The semi-continuous strip mill planned for Ravenscraig in the revised plan will have an initial capacity of 500,000 tons of finished products, about half hot rolled strip and the balance light plates: the hot rolled strip will be cold reduced in a new plant at Gartcosh. A third blast furnace plus extra coking and steel melting capacity will be required; Colvilles' productive capacity, which was to reach 1,400,000 tons of pig iron and 2½ million ingot tons of crude steel by 1963, is now to become 1,800,000 tons of pig iron and 3 million ingot tons of steel.

The total cost of developments as revised is now estimated at £70 million instead of £40 million; the Government has agreed to provide up to £50 million in respect of the strip mill project by way of a loan repayable by 1978, so that the company may now need to find only about £20 million during the period instead of £40 million. The loan, to be provided in eight instalments, will be at interest rates "having regard to the cost of borrowing by H.M. Government at that each date for a similar period." Interest during the period until the works commence hot strip production will be postponed, and the company will have the option of postponing interest for a further three years from that date. Colvilles will not, without consent, during the currency of the loan borrow any money ranking in priority before this loan, except to the extent that the existing 6 per cent convertible debenture, issued to the public last year, has been converted or repaid; or carry out any other major new developments without Government consent.

This denationalised steel company now has £10 million of ordinary shares and £6 million of convertible debentures in the hands of private investors, with £4 million of cumulative preference shares and £10 million of 4½ per cent debentures owned by the Iron and Steel Holding and Realisation Agency. On completion of the Government loan, out of £80 million likely to be employed in the business, barring any further disposal of ISHRA's holding to the public private investors, £64 million would be public money.

THE ECONOMY

Indicators Uncertain

DURING 1958, on a comparable basis, Britain produced about 1½ million tons less steel than in 1957; and about a million tons of the fall in output was in the third quarter. Production in December, 21 per cent down, was indeed worse than most people had expected, making the fourth quarter 19 per cent below that of 1957. The comparison with production a year before, growing steadily worse as 1958 ended, does not indeed square too well with optimism about an upturn in parts of engineering: if all the recent statistics are equally correct, the reduction of consumers' steel stocks in the final quarter of 1958 must have been very considerable indeed. Interpretations of these figures, as of the rather duller export figures for December, and the figures of factory building authorised, vary according to the breakfasts economists and businessmen happen to have eaten—and where they do business. Gloom among some makers of heavy capital goods shows no sign of abating.

The Steel Board records that deliveries to heavy industry, and also to makers of intermediate engineering products such as bolts and nuts and drop forgings, have recently been a third below twelve months before. The hire purchase boom in cars and consumer durables should by now have worked through to the intermediate engineers; but it is only from firms concerned mainly with large scale public invesment programmes such as electricity supply (some of which have a very convenient spread into light engineering and durables) that one hears much optimism among producers of capital goods. Nor is there much hope from the Government's plans to increase public investment slightly over the next twelve months: many of the projects concerned make little call upon engineering—or steel. As one economist in the steel industry said this week: "The capital investment statistics are all very well. But 25 per cent of the actual expenditure on any investment scheme may well be shown in the final three months of it. Practically all the steel has been bought in the first month."

BRITISH ALUMINIUM

After the Battle

A NUMBER of details still remain to be cleared up now that Tube Investments and Reynolds have secured effective control of British Aluminium. Through the flood of last minute assents and through their own holdings, TI and Reynolds now control a little over 87½ per cent of BA ordinary stock. As Reynolds holds a preponderant share of it, the number of shares that TI will have to issue will be less than was at first expected; on Monday shareholders in TI sanctioned the necessary increase in capital. In law, compulsory acquisition of the stock requires a 90 per cent acceptance of a bid. Therefore for TI and Reynolds to secure 100 per cent control of BA, Reynolds itself would have to accept the bid in respect of all the BA stock it has acquired for cash. But neither TI nor Reynolds seem to want Reynolds to become a big shareholder in TI and Reynolds may put its BA stock straight into the holding company, which will preserve a 51 per cent control in TI's hands, leaving a small minority of BA stock in the hands of other investors. The Treasury is studying the details of these clearing-up operations before giving its consent to the TI-Reynolds bid. But there can be no doubt that consent will be forthcoming, especially as Alcoa has said that it is no longer interested.

What will the board of British Aluminium do now? Sir Ivan Stedeford said last Monday that the continuing endeavours of the existing organisation of BA would have the full support of TI, but after all the bitterness and criticism an accord with the BA directors seems inconceivable. TI and Reynolds have now to plan how to capitalise on their victory. It will be no easy task, for Sir Ivan has admitted that the price paid for British Aluminium has substantially discounted the early growth prospects.

Speaking for the City

MR OLAF HAMBRO, chairman of Hambros Bank and co-signatory with Lord Kindersley of Lazards for the group of City houses and companies that sought to defeat the Reynolds-TI bid, has added a public postscript to the affair in a letter to *The Times*, which is reproduced in part below:

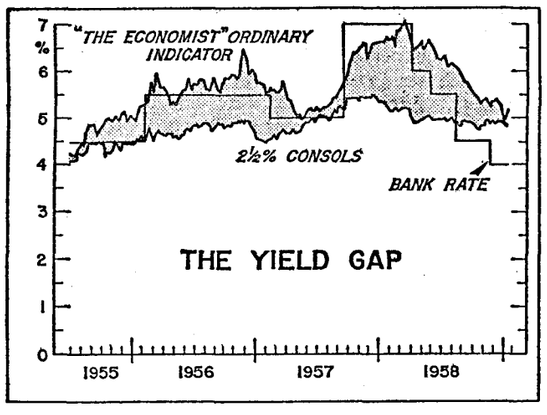
> . . . I can now reveal that it [the group] was far more numerous [than fourteen] and consisted of many large banking institutions and financial concerns who, for various reasons, did not want their names to appear on the list.
>
> It is, therefore, quite clear that except for the two houses who were connected with the Tube Investments as financial advisers and who would inevitably have to back their client, practically the whole of the representatives of the City were supporting the British Aluminium Company and its resistance to the American-dominated take-over.
>
> This being so it is very unclear why the majority of the City Editors of the Press seemed to be against City opinion and openly wrote in favour of the take-over bid. It may be that take-over bids backed by America may gradually absorb very many of our great industries but it seemed to us and our colleagues that some resistance should be made to it.

Since Mr Hambro's argument leads to the conclusion that the majority of City editors were perverse in their comments on the battle for British Aluminium, it is permissible for *The Economist* (without necessarily accepting his measure of the views of "practically the whole of the representatives of the City" or his gloss on the part played by the two houses connected with TI) to comment about its own role in this affair.

From the very start, the long-term importance of a link between British Aluminium and Alcoa was emphasised in these columns. This might have been the better arrangement, as we then said, and as many good judges in industry and finance certainly held. But the actions of the British Aluminium directors, and their inadequate explanations to their shareholders, never made that point conclusive. The Reynolds-TI bid was followed by the much criticised decision to raise the British Aluminium dividend. Even then, it was possible that the British Aluminium board would get sufficient support to win. But the intentions of the City group, which had become known several days before their formal offer, at a higher price and on both dubious grounds of argument and dubious conditions of purchase, immediately opened the way for the Reynolds side to start buying heavily. None of these mistakes was the fault of City editors; but they made the worst impression on those among them who had long respected the City's standards of reasoning and judgment.

IN THE MARKETS

Success and the Stags



THE declaration of a large number of three months "call" options this week was absorbed without any difficulty and equity prices remained firm enough to carry *The Economist* indicator up from 249.3 to 252.9, after the fall from the end-1958 peak of 255.6 But the focal point of interest was the continued strength of gilt-edged; the market is now wondering how soon the authorities will allow another small gilt-edged issue, and whether the coupon will be cut to 5¼ per cent. With fixed interest stocks back in favour, investors and speculators alike were quick to send in their applications for the £5 million issue by Fife County Council of a 5½ per cent stock (1974-76) at 99½ and for the £6 million issue by English-Electric of a 5½ per cent debenture (1979-84) at 97.

Both issues attracted the stags. The Fife stock was so heavily oversubscribed that no allotment of more than £3,600 of stock was made; smaller applications were pared right down and no allotment at all was made for applications of less than £1,200. That decision no doubt saved a lot of administrative bother, but weeding out the small stags weeds out the small local investors too. Nor did this basis of allotment weed out all the stags. That is an impossible task, for once professionals scent success they are not modest in the amounts of the stock for which they apply. Active dealings in the Fife stock began at a premium of 1 point and after selling by stags had been absorbed the price settled down at ¾ premium. A bigger premium than this is the confident forecast for the English Electric debenture, which attracted applications of not far short of £100 million by the time that the lists closed on Wednesday.

Eyes on the Yield Gap

THE closing of the gap between yields on long-dated gilt-edged and on industrial equities to the point where it almost vanishes has often in the past heralded a major change in the course of stock exchange prices. The gap almost vanished completely at the beginning of this year; now there has been a resurgence of buying in the gilt-edged market and far more restraint in the buying of industrial equities (with the exception of the special, political case of steel shares). Is the gap about to widen again?

The accompanying chart plots the yield on Old Consols against the average yield offered by the industrial equities

included in *The Economist* indicator. It begins in mid-1955, which marked the peak of the boom in ordinary shares, just after the authorities had moved reluctantly away from a short-lived 3 per cent Bank rate. The yield gap at that point had vanished, for investors were discounting the effects of inflation. Since then the economy has moved through two cycles, first through a period of relatively dear money—5½ per cent Bank rate—to expectations of cheapening money, and secondly through the 7 per cent Bank rate and the successive reductions to the present 4 per cent. The Government's actions in the second cycle were more bold and forthright than in the first and their effect on the market was correspondingly the greater.

The cycles have their logic. Abnormally high interest rates, after they have had their initial shock effect on the market and once investors see a hope of their passing, make gilt-edged stocks look cheap; while fears of their effect

upon industrial output, earnings and dividends, throw a shadow across the equity share. Thus the yield gap widens. The usual converse is that reductions in Bank rate encourage fears of inflation, or at least of counter-action through future Bank rate increases; and the buying of equities and marking down of gilt-edged prices lead to a narrowing of the yield gap.

That historical pattern, however, has not repeated itself in the latest narrowing of the gap. Gilt-edged have recently been firm, and prices have been rising rather than falling. The gap has narrowed because equity prices have been rising more quickly. The yields on these equities are still higher than they were in mid-1955, but so is the yield on Old Consols, even though Bank rate is one-half per cent lower than it was then. Fears of inflation are more subdued now than they were on the two occasions when the gap closed in the recent past. If the gap widens again now it may do so because investors have come to realise that the boom in equity prices has already discounted bigger profits and dividends well into the future. Another reduction in Bank rate, however, at this juncture might raise the bogey of inflation again and after its first impact it might have the effect of putting steam back into the equity market again and taking it out of gilt-edged.

OVERSEAS TRADE

A Fortunate Year

BRITISH exports did not fare as badly last year as was at one time feared. A big rise in shipments to the United States, plus a revival in shipments to other markets in the fourth quarter, brought the total value to £3,208 million fob, which was £116 million—3½ per cent—below the total for 1957. As export prices were only fractionally lower last year, the fall was almost wholly one of volume. The reverse was true of imports. The fall in commodity prices enabled Britain to import the same volume as in 1957 for a total cost of £3,782 million cif, which was £289 million—seven per cent—less than in 1957. That windfall can hardly be repeated this year. Re-exports rose by £14 million to £147 million, owing mainly to the increase in shipments of natural rubber to Russia, and the apparent visible trade deficit fell by £187 million to £426 million. In the first half of the year, when the apparent visible deficit was £173

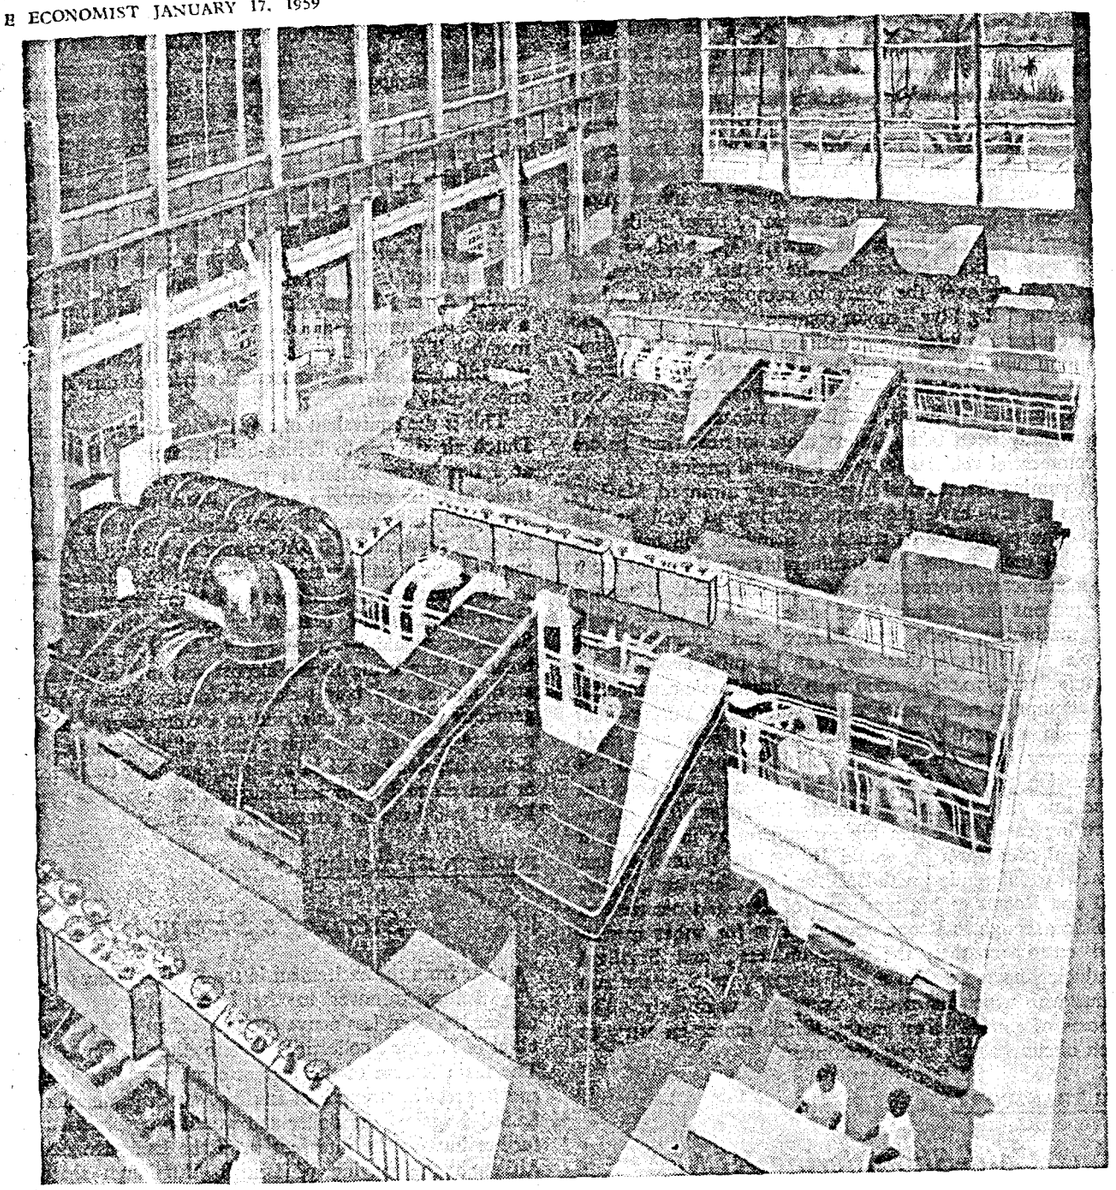
* Provisional. † Includes repayments of silver bullion to the United States amounting to £7 million in 1957.

million, there was actually a surplus on visible trade (taking imports and exports fob) of £137 million. The United States was Britain's largest and fastest-growing market; shipments to that country rose by £29 million to £273 million, and though shipments to Canada fell slightly, total exports to North America rose by £21 million to £461 million.

Last month the balance of trade swung heavily against Britain, but not as ominously as the bare figures suggest. Exports fell by £21.6 million to £269.4 million fob, while imports shot up by £40.5 million to £353.5 million cif; with re-exports £2.5 million lower at £10.4 million, the visible deficit soared by £64.6 million to £73.7 million. There is little reason to suppose that this deterioration augurs a change in trend. Exports in November were almost a record, thanks partly to an adventitious bunching of deliveries of ships and aircraft, while imports were seasonally low. Exports in December were relatively high, while the import figures were to some extent inflated by a technicality—the coming into force on January 1st of the new customs and excise tariff. There is always a number of import documents still to be settled with customs when the "trade month" ends. Last month the authorities, with the support of importers, tried to settle as many outstanding queries as possible before the new year began, so that importers would not have to re-submit their documents according to the new classification. A fairer picture is given by comparing trade in the fourth quarter with that of the same quarter of 1957. On this basis exports averaged £275.5 million a month, only 1¼ per cent below the average of a year ago, whereas between June and September exports were six per cent smaller than a year ago. Imports averaged £330.5 million a month, 1½ per cent more than in the fourth quarter of 1957, while re-exports were £300,000 higher at £11.9 million a month. The result was that the average deficit for the fourth quarter increased by £9.3 million to £43.1 million a month.



Shipments to North America remained high in December, in fact shipments to the United States set yet another record at £27.1 million, £700,000 above the previous best in November. Shipments to Canada fell by £1.3 million to £15.4 million, and a fall was to be expected owing to the freezing up of the St Lawrence.

STANDARD AND MASSEY-HARRIS

Divorce Proceedings

THE next, predictable figure in the stately but ungallant pavane that the Standard Motor Company and Massey-Ferguson have been performing over the past two years has now been reached: Massey-Ferguson has announced that it will not renew its contract for tractor manufacture with Standard, which has formally still seven years to run, that it intends ultimately to build all its tractors itself, and that it is negotiating to buy the tractor division that Standard has built up since the war. Discussions are now proceeding: apparently Standard would be willing to sell, in a deal which would probably also involve the 8 million ordinary shares in Standard that Massey-Ferguson has acquired, representing about a quarter of the equity.

Standard's tractor division, which comprises essentially the modern and recently re-equipped plant at Banner Lane, plus a half-share with Massey-Ferguson in a French tractor plant at Beauvais, represents a substantial investment, perhaps of the order of £10 million. Tractors make up roughly half of Standard's production, which in 1958 was about 148,000 units; originally this enabled considerable

Earning our keep

BRITISH ELECTRICAL EQUIPMENT OVERSEAS

Four times as much heavy electrical equipment—generators, switch gear, transformers and so on—is exported by Britain today as before the war.

A score of leading manufacturers and some hundreds of smaller firms make up the electrical industry, which directly employs over 200,000 people and sells fully a quarter of its products overseas.

In many cases this export trade has only been possible because British manufacturers were able to offer special credit terms extending over several years.

We in Lloyds Bank take pride in having been able to help by providing finance of this kind for projects in all parts of the world for the generation and utilisation of electricity.

LLOYDS BANK LIMITED

economies of scale in production, since the same basic engine block and components were used in the Ferguson tractor and the Vanguard cars, but with variations in design since the Ferguson interest was acquired by Massey-Harris, the degree of common machining and use of components may have declined. The contract has continued to supply Standard with a satisfactory bread and butter business and to even out its operations, since demand for tractors does not seem to have fluctuated at the same times as demand for cars; but the butter has always appeared to have been spread thin, moderating the profits that Standard could achieve over the years in comparison with others among the "Big Five" motor companies. In none of these does tractor manufacture constitute anything like as important a part as in Standard, nor do they forgo all marketing profits; they have tended to balance car production with commercial vehicles, and it is significant that Standard has recently been taking much more interest than before in commercial vehicles (also in industrial engines).

Presuming that the deal is satisfactorily arranged, Massey-Ferguson will have the manufacturing as well as the marketing profits for its tractors: Standard will have considerably more money but a vulnerably small output for a car manufacturer competing in the popular field. Wherever one reckons that economies of scale begin to shade off in car machining, body manufacture and assembly, few people would argue that they can be fully exploited by manufacturing 70,000-80,000 units of two basic car models. An attempt to reach more viable volumes of output—and sales—in a short period might involve new and rapid investment in manufacturing facilities; one has had the impression that more of Standard's recent investment has gone into strengthening tractor facilities than into manufacturing cars. The five big manufacturers in Britain, if the deal goes through, would be sorting themselves out somewhat differently; with BMC and Ford as giants, Vauxhall and Rootes as big producers of cars and commercial vehicles, though in Rootes' case catering for rather specialised customers than the other makers; and Standard producing no more than a fifth as many units as the two giants with which its models compete most directly. The process of amalgamation in the British motor industry, in such circumstances, might continue.

AIR TRANSPORT

Cold-Shouldering KLM

THE Ministry of Transport can never have expected its small-minded decision to ease the Dutch airline, KLM, out of Singapore airport to attract such an embarrassing amount of attention. International air transport is a great deal less competitive than most airlines like to paint it. One operator losing traffic to a more efficient competitor has no compunction about asking its government to restrict the flights that the other makes in its national territory. Airlines from big countries, such as the United States, can get their own government to retaliate in kind; other airlines can at least do what the Dutch have done this week—tip the dirty linen out in public. It may have some effect.

For many years KLM has been allowed to pick up and put down passengers at Singapore three times a week on its way to Indonesia. When the Dutch were turned out of Indonesia in 1957 the KLM airlift of refugees was based on daily flights from Singapore, the nearest big airport. As the flow of refugees began to dry up, KLM's flights were cut back to three a week, the number they formerly made through Singapore, but with this difference: instead of dropping off and picking up a handful of passengers at Singapore, KLM's flights now began and ended there. Many of the passengers may still, as the Dutch argue, be travelling on to Indonesia, but in BOAC's eyes KLM is now loading and unloading an entire aircraft on territory that BOAC and its close associate, the Australian airline Qantas, regard as their private preserve. BOAC complained to the Ministry of Transport and the Ministry began to turn the screw, cutting down KLM flights to Singapore from three to two a week last summer and to one a week at the end of this month. This amounts to notice to quit Singapore, since no airline can run a commercial service of this kind on a once-weekly basis.

This is the equivalent of a swingeing quota restriction on Dutch air services to British-held territory in the Far East at a time when Britain is preaching the liberalisation of trade to other countries and the Board of Trade is taking a generally unsympathetic view of other industries' requests for tariff protection. BOAC cannot be blamed for attempting to protect its commercial interests by whatever means it has to hand—most airlines would do the same. But the Government might bear other considerations in mind. Singapore would welcome regular Dutch services for the business they bring to the airport and to the surrounding area, just as any port welcomes foreign ships. And ungenerous gestures of this kind to a competitor that cannot retaliate have an unfortunate habit of rebounding. What Britain has done to KLM in Singapore, other countries may in turn do to Britain and British airlines, and if they do, BOAC will have no grounds for complaint.

FOREIGN EXCHANGE

Sterling's Strength

APART from the excitement in the Belgian franc, discussed below, turnover in the London foreign exchange market has been less active this week than in the first fortnight of Europe's collective move to external convertibility. The main feature of the market continues to be the quiet and impressive strength of sterling, which has hardened to $2.80½-⅝ against the dollar and would probably have risen further but for the intervention of the Exchange Account. Although the buying of British Aluminium shares by Reynolds Metals has now come to an end, there has been no reaction in the rate for security sterling, which this week has been quoted at $2.80⅜-½, only a shade below external account sterling. Even in the "grey" market in resident sterling the rate is above the dollar parity of $2.80. Sterling has also held firm against most European currencies; it improved fractionally against the mark from 11.72⅛ to 11.72¼ on the day on which full convertibility was announced in Bonn.

The market this week has begun to quote the Argentine peso on the basis of the new free rate. In Buenos Aires dealings had been suspended by the Government since December 29th when the rate in the free market was around 67 pesos to the dollar. When dealings were resumed at the beginning of this week the rate sent over from Argentina was 63-67 to the dollar. This gave a cross rate of around 182½ pesos to the pound and it is on this basis that dealings

Putting In Their Two Pounds' Worth

WHEN the National Institute of Economic and Social Research announced in July, 1957, that it had received a grant from the Ford Foundation to begin publication of a new economic bulletin, its initiative was welcomed on several grounds. First, the more informed interpretation of the current workings of the economy the better. Secondly, the institute planned to draw upon a team of economists and statisticians who could combine continuous study of the economy with more detailed research into particular aspects of it. Thirdly, these economists were promised somewhat fuller access to such information as Government departments gather but do not publish than the general press.

The first two-monthly *Economic Review*, published this week, promises fair to fulfil the hopes that have been placed upon it. Its editorial team has been fortunate, as it happens, in timing, in that the first view it has had to take of the economy is a firm and noteworthy one—that Britain is emerging from the recession. What it has to summarise this first time, on the first page that it has designed broadly for the managing directors whose companies it hopes will buy the *Review*, is a good deal more definite than much of the advice those said managing directors have recently been getting from their own economic advisers. (Their companies, incidentally, will be getting a quite remarkable bargain: some 20,000 words of expert economic analysis and a battery of comparatively clarified statistics, six times a year, for £2.)

Much the larger part of the *Review* is taken up with a full-scale assessment of the present economic situation and the prospects for this year. Indeed, if the National Institute is in fact getting full co-operation from the Whitehall economists and statisticians, it is difficult to see what there is going to be left for the official *Economic Survey* to say. Here and there are traces of the same convoluted, facing-both-ways language —"Disinvestment in stocks may not have been intensified . . ."—but in general this review is written in straightforward English.

I. CAUSES OF EXPANSION AND RECESSION, 1953–58

(£ million at 1954 factor cost at annual rates)

	1953 to 1955	1955 to 1957	1957 to 3rd qtr. 1958*
Changes in:—			
Exports of goods and services	+254	+126	−130
Fixed investment	+160	+118	+ 50
Consumers' expend...	+408	+148	+132
Govt. expenditure	− 30	− 34	+ 10
Investment in stocks	+ 76	+ 56	−430
Total expenditure	+868	+414	−368
Met by:—			
Imports of goods and services	+274	+130	− 5
Gross dom. product	+654	+178	−275
Statistical discrepancy	− 60	+106	− 88

* Seasonally corrected.

The institute's assessment of changes in demand in the first nine months of 1958 are shown in the first table reproduced here. These estimates of national demand and output in real terms (which are given in more detail in another table in the *Review*) have been made with assistance from the London and Cambridge Economic Service.

According to the institute's reckoning, after allowing for seasonal influences, the rate of investment in stocks in the whole economy fell from a quarterly rate of £101 million in 1957 (at 1954 prices) to £40 million in the first quarter of last year, to £10 million in the second quarter, while in the third quarter stocks were run down by £20 million. Its view that the fall in stocks may soon be reversed is perhaps the most challengeable of the institute's contentions.

II. CHANGES IN IMPORTS AND STOCKBUILDING

(£ million at current prices)

	Changes since previous year			
	In imports†	Of which due to prices	Of which due to volume	In stock-building
1951.....	+1,295	+970	+325	+249
1952.....	− 427	− 85	−342	− 45
1953.....	− 135	−370	+235	+ 5
1954.....	− 31	− 71	+ 40	−109
1955.....	+ 512	+114	+398	+ 30
1956.....	+ 3	+ 48	− 45	− 61
1957.....	+ 186	+ 66	+120	+154
1958*....	− 254	−183	− 71	−101

* First half of 1958 compared with first half of 1957. † Of commodities for which estimates of stock changes have been made.

As a step towards at least getting more data in part of this field, the institute has provided a new series of figures of stocks of imported commodities. Estimates of changes in stocks of commodities making up nearly two-thirds of all British imports and of the importance of stock fluctuations year by year in relation to the volume and prices of imports of such commodities can be seen from the second table reproduced here. The evidence is that for each period, except 1956, falling import prices appear to have been accompanied by a fall, and rising import prices by a rise, in stockbuilding.

In an analysis of industrial changes, the institute is bold enough to put out some figures of productivity. Taking 1955 as a starting-point, table III shows that in the last three years the change in industrial productivity as a whole has been negligible, but that the highest rises in productivity have occurred in industries in which expansion has continued.

Employment is only one of the factors for which the institute has now supplied series corrected to iron out purely seasonal fluctuations. But this one is, perhaps, its boldest statistical step. Once a year, employment figures are liable to revision by the Ministry of Labour, and these revisions may go back as far as eighteen months. The size of these revisions may not seem large in relation to the size of the whole labour force, but they can be very large in relation to the apparent changes from one year to another, sometimes changing a decrease into an increase. The statistical nicety of eliminating seasonal factors from figuring of this quality, can give an appearance of unwarranted precision.

But generally the institute should be congratulated on an excellent statistical appendix of twenty-one tables aimed at giving the main current economic data in the most digestible form. There are seasonally adjusted figures, quarterly or monthly, for output of many industrial groups, employment, excess demand for labour, overtime, incomes, consumer expenditure, fixed investment and volume of exports. (Perhaps rather surprisingly, no regular seasonal pattern could be detected in imports.) There is an important series showing changes in the volume of total and manufacturers' stocks. Figures are given for wage-rates in separate industries that are not given elsewhere. There are also three new commodity price indicators.

This first review devotes nearly all its discussion to the broad survey of the current economic situation: in most issues of a year it is intended to make the general article short and include special articles on "topical economic problems and studies of underlying trends." These—and indeed general discussion when trends in the economy show no marked shift—may be less easy to summarise in terms that will hold the interest of the managing director. Shorter, and less full-dress analysis of the economy, again, may be less easy to keep fresh and stimulating as well as cool and authoritative. From here on, that is to say, it gets harder: but the institute's team is no shorter of controversial opinions than of academic brilliance.

III. PRODUCTIVITY CHANGES

Per cent changes, average 1955 to 2nd qtr., 1958 (seasonally corrected)

	Output	Employment	Output per man year
Metals	− 5·4	−1·5	−4·0

Continued from page 244

were resumed in London. Thus the merging of the official and the free markets has had very little effect on the free rate.

The Belgian Scare

THE Belgian franc is not a currency accustomed to devaluation talk. For years after the war it and the Swiss franc stood alone as the hard currencies of Europe; and it has kept a very comfortable gold backing, now at about £440 million or $1,200 million. Yet at the end of last week speculators began selling Belgian francs heavily. The National Bank had to give continuous support in the official market, and in the free market in Brussels the Belgian franc fell to an appreciable discount against foreign centres, including Paris; the pound was quoted at 145, compared with the official parity of 140. The Belgian franc also moved to a discount in the official market for forward transactions, though the margin was never large. At the peak on Monday the three months discount in London was 35-45 cents; subsequently the Belgian franc recovered in both forward and spot markets.

What did the speculators fear? An early devaluation can hardly be on the cards. The Belgian authorities cannot intend it, immediately after cutting the Bank rate last week from 3½ to 3¼ per cent, and their cushion of reserves gives them ample room for manœuvre. The immediate pressure has come partly from selling of Congo securities such as Union Minière by foreign holders. A good deal of French money has in recent years taken refuge in Belgium, and Congo securities have been popular. Now the troubles in the Congo as well as the better prospect of the French franc are encouraging some of this money to return home. On the longer view, Belgium's high costs may be an increasing handicap in the common market. While the scare is now over, therefore, it may leave its mark. It is also some indication of what could be in store for a number of international centres if France did achieve a recovery impressive enough to draw back that estimated $10,000 million of flight capital. Observers with long memories recall the power wielded by the Bank of France over foreign centres, not least London, in the twenties when Frenchmen began to sell to it their accumulated foreign balances after the stabilisation of the franc.

A Contribution from Germany

IN Germany, too, the Bank rate was reduced last week, from 3 to 2¾ per cent; but this reduction, to the lowest rate in Germany's central banking history, was followed by an impressive display of strength by the mark. The German authorities have now given formal freedom to their residents to buy and hold foreign currencies as they please. Restrictions remain on payments for films, insurance and transport services, for special reasons of administrative regulation; there are also still certain limitations on capital transfers by business enterprises, though it is difficult to see how these could have much restrictive effect when German citizens have free access to foreign exchange. To some extent the freeing is a formal measure, for in the past two years few barriers have been put in the way of German residents wanting to transfer money abroad or buy foreign securities in Germany. But the new measure has important tangible results. Germany is now likely to establish a common list of imports free of quota, merging the existing OEEC and dollar lists; and restrictions have been lifted on re-export from Germany of goods bought in dollar countries for sale to non-dollar countries.

No country gave a more fervent welcome than did Germany to the establishment of external convertibility in Europe. Dr Erhard and the like-thinking officers of the German Bundesbank had their plans all ready for a move to complete freedom "five minutes after Britain"; and they are anxious now to make a contribution to the smooth working of the new system for which they have argued so strongly. It is in this context that Dr Erhard describes the Bank rate reduction; its limited extent—past reductions in the German Bank rate have been in steps of ½ per cent—suggests that there is no desire to give any strong stimulus to the domestic economy. The German authorities' chief aim is to encourage a further outflow of capital and short-term funds. The return of money at the end of 1958 (largely to meet the German banks' seasonal needs) has recently given way to a new outflow. Altogether, the German banks may hold the equivalent of some £80 million in all foreign centres; about half of this is offset by their own liabilities in D-marks to foreigners.

MOTOR INDUSTRY

Records on Record

MOTOR vehicle output during 1958 topped the previous peak year, 1955, by more than ten per cent, and brought a reversal of the pattern of distribution of output within the industry that was established during the recession and recovery of 1956-57. During 1957 the three largest manufacturers—BMC, Ford, and Vauxhall—increased their share of the total market to slightly over three-quarters, while the other two major producers, Rootes and Standard, declined; last year, with total production estimated to have risen by just under 20 per cent including over one million cars, Rootes and Standard, recovering, showed the biggest increases. The proportion of total production accounted for by the big five manufacturers remained about the same, at about 92 per cent. Production of commercial vehicles, while increasing by about one-eighth over 1957, was still below that of 1955. While a high rate of demand was maintained at home throughout the year, aided by removal of restrictions on hire purchase in the last quarter, a large part of last year's recovery was based on exports, and particularly dollar exports. Although final figures for the year are not yet available, it seems certain that British manufacturers outsold their closest competitor, West Germany, in the United States in 1958, after trailing them for the first four months; at the end of October over 111,000 British cars had been sold in the United States, compared to 102,000 from West Germany.

VEHICLE PRODUCTION—Cars & CVs
'000 (Estimated)

	1956	1957	1958

Ford	284	300	357
Vauxhall	123	150	175
Standard	66	(60)	(74)
Rootes	105	(97)	(135)
Total	995	1,140	Say, 1,350

Profits Under Pressure

IN the last quarter of 1958 the accounts of 506 public companies were analysed in this office. The usual detailed tables appear on pages 272 and 273. Most of these companies made up their accounts to June 30th or September 30th last. Their combined trading profits rose by nearly £24 million (7.3 per cent) to just over £348 million. They were dominated, however, by the results of the motor companies, whose booming recovery contrasted with the previous year of recession. Profits of the 37 companies in the "motors, cycles and aircraft" group rose by £24 million (34½ per cent) to just over £92 million. If this group, which enjoyed an exceptional year in contrast to the general experience of lagging production and profits, is excluded, the remaining industrial groups show no change in trading profits, at £254 million. This accords with recent trends shown by these quarterly analyses—a fall of about 1¼ per cent in the profits of the companies reporting in the third quarter of 1958 following a string of tiny gains.

With the exception of textile and plantation companies, ordinary shareholders in these companies have not felt the pinch in reduced dividends and the capital value of their shares has boomed in a stock market intent on discounting the future. This is neither surprising nor unexpected, for few British companies are excessively liberal in their distributions and the earnings cover on their dividends is usually generous. Moreover, most of the companies have made some gain in net earnings from last year's change-over to a flat rate of profits tax. As a result, the net equity earnings of the 506 companies have risen from £108 million to £114 million and net ordinary dividends from £41.2 million to £41.6 million. Absolutely, there is little change but relatively these ordinary shareholders are a little worse off, for while net earnings show much the same ratio of about 23 per cent to issued capital, in terms of assets available for equity, the earnings ratio has fallen from 9.0 to 8.7 per cent. Dividends expressed as a gross rate on issued capital have fallen from 15.4 to 14.7 per cent. Thus, the under-utilisation of capacity apparent in the fall in the rate of earnings on net assets has its reflection in a declining return on the equity subscribed by investors.

Few companies committed themselves to new capital investment programmes last year but some of them were completing earlier programmes. The balance sheets of these 506 companies, in fact, reflect little more than a normal process of replacement, with the gross book value of their fixed assets rising by £195 million, almost all of it self-financed. An increase of £21 million in liquid assets is balanced by the growth of £20 million in bank overdrafts. The aggregate value of stocks held rose by £26½ million to £682 million, but the single group of "motors, cycles and aircraft" showed a rise of £28 million to £209 million; the other groups therefore showed collectively a slight fall in stocks. Some £23 million more has been raised on debentures, loans and mortgages but only £9 million by issues of ordinary shares.

While the biggest increase in profits is reported by the group, "motors, cycles and aircraft," which has the biggest weight, the greatest falls in profits come from those groups—textiles and plantations—which have the smallest weight. For other important groups, the advance in profits has been neither large nor uniform. The breweries and distilleries group always looms large in the fourth quarter and their gross profits have risen by 3½ per cent; but their net equity earnings as a ratio of net assets have remained unchanged at 9.1 per cent. In the food and confectionery group, where gross profits have risen by 9¾ per cent, this ratio has actually fallen, from 10.3 to 9.5 per cent, as it has in the "miscellaneous manufacturing" group, where it is down from 8.8 to 8.4 per cent following an absolute fall of nearly 4½ per cent in gross profits. In engineering gross profits are up by 6½ per cent and the ratio from 10.1 to 10.2 per cent, and in building, gross profits are up by 6¾ per cent but the ratio has fallen from 9.1 to 8.7 per cent. In electrical manufacturing a rise of only 2 per cent in gross profits is reflected in an increase from 10.5 to 12.0 per cent in the net earnings/net assets ratio while an increase of one per cent in the gross profits of the "iron and steel" group (which reflects largely the experience of heavy engineering companies) is in contrast with a slight fall in the ratio, from 9.7 to 9.5 per cent These ratios roughly demonstrate the differing rates at which assets are remunerated and where they have fallen, in the face of an advance in gross profits, they are a reflection of the fact that some capacity is not being fully employed.

TRAVEL

No Show Him Pay

BRITISH RAILWAYS and British European Airways have simultaneously taken action against the passenger who books and never arrives. This type of traveller is a major pest on the railways' sleeping car services and on BEA's holiday flights. He is also well known in the United States where airlines have christened him "no show." To be sure of a seat or a sleeping berth, the "no show" traveller books on several different services and sits back to decide at leisure which booking to take up. This multiple booking gives a false impression of the amount of traffic; airlines put on special flights, railways make up special trains, genuine customers are turned away because the service is apparently fully booked, yet at the last moment services leave with empty seats and empty berths. About 12 to 14 per cent of the berths booked on the 12 sleeping car trains that leave Paddington station nightly are never claimed.

British Railways have always had the right to claim one quarter of the fee for berths booked and cancelled before 4 p.m. on the day of departure, but unless the tickets have been paid for in advance, they have no means of collecting. From next month, all sleeping car berths must be paid for when booked; if cancelled in time, British Railways will refund three-quarters of the fare, if not they will keep the whole of it. British European Airways has not yet been driven thus far. On the Channel Island services, where seats at peak holiday weekends are booked as long as eleven months in advance, they are demanding a non-returnable deposit of £1 on each seat, in the hope that this will check families who book on three consecutive weekends and decide later on in the year they will choose which to start their holiday. At present, neither they nor the travel agent who booked them incur any penalty provided the seat is cancelled roughly half an hour before the aircraft is due to take-off. But even if cancellations are made at rather longer notice, holidays are arranged so far ahead that BEA has often found it impossible to re-sell the cancelled seats. Although few travel agents will admit it, they are probably as much to blame as anyone for teaching the public these tricks. It remains to be seen whether the £1 per seat penalty imposed by BEA will be adequate to check them and, if so, whether it will be extended to other BEA holiday services. Other airlines have tried with no great success to beat the "no-show" traveller by insisting on re-confirmation of bookings, but if TWA's experience is in any way typical, between 6 and 7 per cent of passengers booked from London to New York fail to turn up. A special meeting of the International Air Transport Association will discuss in March what to do about them.

BANK REPORTS

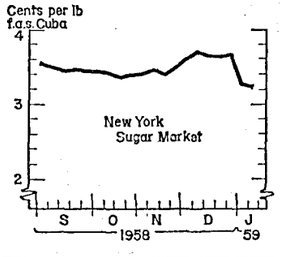
How It Happened

THE bank chairmen's reviews have been awaited with special interest this year after the exciting innovations of last summer. This week opened the series with two of the big seven banks, Barclays and Martins. Martins breaks new ground with a glossy cover and coloured photographs in a new format replacing the austerity of its former reports. The annual reports of the clearing banks have been some way behind the attractiveness of presentation of the reports of American banks and of many British businesses including big overseas banks operating from London. Sir Harold Bibby, Martins' chairman, reveals another innovation: Martins is to open the first British "drive-in" bank, in Leicester. The presentation of the report and accounts of Barclays, also, is improved; and Mr Anthony Tuke's survey provides a closer description and analysis of banking operations as such than English clearing bankers have given in the past.

How and why did Barclays line up with a hire purchase finance house after the chairman in his last report went out of his way to advocate a reduction in financial links between banks and hire purchase houses? A year ago, Mr Tuke now states, Barclays took note of the plans of its competitors to go into hire purchase, "either directly or by acquiring an existing company," and decided it would stand aside—resting on its plan for personal loans, which was worked out some months before the lifting of the credit squeeze enabled it to be put into operation. However, in May "an unexpected opportunity" arose to make an investment in the equity of United Dominions Trust, giving Barclays a 25 per cent share. This profits participation was "consistent with our policy of holding trade investments in businesses akin to our own, such as overseas banks." Mr Tuke's statement still leaves open one question: was the unexpected feature the fact that a minority participation was possible at all, or that it was possible in UDT?

In his opening remarks, Mr Tuke again expresses scepticism about the efficacy of the financial measures of September, 1957, and notably of the 7 per cent Bank rate. His remarks here seem a little grudging, and his chain of reasoning is open to challenge. Mr Tuke rightly emphasises the overriding importance of confidence in reviving both sterling and the gilt-edged market. Had 7 per cent nothing to do with that?

BUILDING SOCIETIES



Competitive Urges

FOR many months the building societies have been competing solely as borrowers, but recently funds have been flowing into shares and deposits at an impressive rate. This is especially true of the larger societies and of those who will be accorded trustee status under the Government's Housing Act. They have now to prepare to compete among themselves as lenders. The phrase "mortgage loans," so welcome to the young married couple, is reappearing in their advertisements.

There are other signs, too, of a revived competitive spirit. One is the competition by the Hastings and Thanet, the Co-operative and the Leek and Moorlands to take over the Sheerness and Gillingham society. The chairman of Hastings and Thanet has denounced this as "an unprecedented and ruthless war between building societies" and he argued that "public company take-over methods, if applied to Building Societies, will inevitably do great harm to the movement generally." The shareholders in Sheerness and Gillingham, however, have to thank the intervention of the Co-operative and Leek and Moorlands for the fact that the bonus offered by Hastings and Thanet for a transfer of engagements was raised from 25s. (the original offer, indeed, was 5s., which failed to secure the requisite number of votes) to 80s. for each £100 of shares owned.

The Co-operative Permanent was concerned in this affair and in that society the spirit of expansion has always run high. It seems now to be limbering up for the more competitive period ahead. It has absorbed Scottish Amicable without great difficulty and its reserve ratio, though not high, must now look more comfortable. It has followed the Building Societies' Association's recommendation in paying 3½ per cent net on its shares but since October, 1957, it has charged a quarter of one per cent more than the Association's recommended rate of 6 per cent on 20-year mortgages. During the squeeze it did not lend very much at 6¼ per cent on mortgages up to 25 years and 6½ per cent on mortgages from 26 to 35 years. On new mortgages it will now be in line with the other leading societies, charging 6 per cent on mortgages up to 20 years and 6¼ per cent for mortgages from 21 to 35 years. It is making no change "at present" on existing mortgages, most of which are at 6 or 5¾ per cent.

CASTRO UP, SUGAR DOWN

Sugar has fallen sharply since the civil war in Cuba ended. The spot price of Cuban raw sugar is now 3.25 cents a lb fas, half a cent below the December peak.

RHODESIAN COPPER

Strike Losses Small

THE losses suffered by the Rhodesian copper mining companies during the 52-day strike that ended on November 5th were very small. This was stated by Sir Ronald Prain, chairman of the Rhodesian Selection Trust group, during the informal shareholders' meeting in London this week. The real losers, he said, were the employees, because the leaders of the European mine-workers could have reached substantially the same settlement of the dispute without a strike. The RST mines were able to sell from stock, at prices that were inflated partly by the strike, and their stocks will have been fully re-built before the current financial year ends on June 30th.

Sir Ronald confirmed that his companies will not be able to make good the full tonnage lost during the strike. Output of Roan Antelope in the current year may not much exceed 77,500 tons, compared with a target of 80,000 tons; and output of Mufulira may not exceed 86,000 tons, compared with a target of 93,000 tons. The targets for both mines are below rated capacity, though the policy of restricting output became academic after the strike. Output at Chibuluma is expected to exceed 18,000 tons, compared with 17,860 tons in 1957-58, and Sir Ronald expects the output of all the mines to be sold.

RESTRICTIVE PRACTICES

Court Report

BY the end of last year 2,100 trading agreements had been registered under the provisions of the Restrictive Practices Act, which came into effect in August, 1956. The Registrar of Restrictive Practices notified parties to over 140 of these that he intended to refer their agreements to the seven-member Restrictive Practices Court headed by Mr Justice Devlin, which would decide whether or not they were contrary to the public interest; of these agreements, 55 were subsequently abandoned or modified to remove any registerable restrictions in them, and over 40 others were abandoned or suitably modified before being warned of his intention to bring proceedings against them in court by the Registrar. So while the Court has heard only two cases and given a judgment in only one of them—concerning the Chemists' Federation's Agreement—over 95 restrictive trading agreements have ceased to operate since the passage of the act. The formal threat of proceedings (or of their costs, which are borne by both sides regardless of outcome of the case) may well bring the abandonment of more agreements in the future before they reach the Court; in addition, it is possible that if the Court finds for the Registrar in future cases, as it did in the Chemists' case, an even higher proportion of agreements may be dropped by their makers before being referred to the Court.

From April, 1957, to September, 1958, when the order of cases was directed by the Board of Trade, parties to 81 agreements were notified that the Registrar intended to refer them to the Court; by contrast, from October to December, 1958, when the Board of Trade ceased to issue directions to the Registrar, Notices of Reference were received by parties to 50 agreements.

SHORTER NOTE

Two shareholders in Camp Bird, Mr J. C. George, MP, and Mr M. S. Crofton, have written a letter to other shareholders proposing that a shareholders committee should be set up to investigate the affairs of the company and its subsidiaries. The stock exchange quotation on the Camp Bird shares is still suspended.

COMPANY MEETINGS

BARCLAYS BANK LIMITED

MR ANTHONY TUKE'S SURVEY OF AN EVENTFUL YEAR

FREEDOM RESTORED TO BANKING

GOVERNMENT'S ECONOMIC POLICY

BANK'S ASSOCIATION WITH "UDT" IN HIRE PURCHASE FIELD

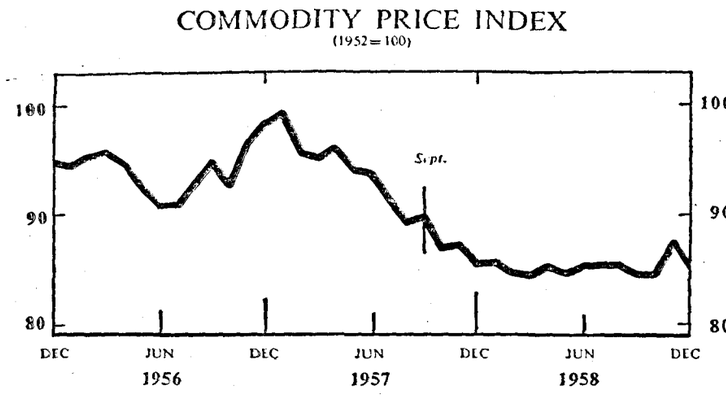
The Annual General Meeting for the year 1959 of the Stockholders will be held at the Head Office of the Bank, 54 Lombard Street, London, E.C.3, on Wednesday, February 4, 1959.

The following is the address of the Chairman, Mr Anthony William Tuke, circulated to the Stockholders:

Beyond any question the most exciting event of an eventful year in the banking world has been our release from the bondage of detailed restriction of our lendings. Bankers celebrated this happy event by a competitive display of fireworks which surprised the public and perhaps even their more sober selves. The populace responded to the gratifying spectacle by emitting, as is their custom, a long-drawn *oo-oo-oh!*, but the time has now come to subject the changed scene to objective survey. The banks will be free to compete with one another for business without any externally imposed limitations, which is salutary for us in that it will act as a stimulus to even greater efforts in providing our best service to our customers. The customer for his part will be free in all circumstances, if he is not satisfied with what his present bankers will do for him, to go (or I would rather say come) across the road to see if their rivals can do better.

Before I discuss in detail the uses to which we intend to put our new freedom, it may be desirable to submit to somewhat close examination the events which have made it possible. The short answer is, without doubt, the great improvement in Government credit, both externally and internally, since certain drastic measures were taken in September, 1957. The Government believe, I am sure quite sincerely, and would like us to believe, that it is a case of *post hoc, ergo propter hoc*. But what precisely has brought about this improvement, so that we may try to understand what has happened and know what to do next time? Our overseas trading surplus has been exceptionally good in 1958, but it was also good in 1957 when the disastrous fall in our gold and dollar reserves took place. Internally the explanation is not much clearer. In September, 1957, which was the moment of crisis, the then Chancellor, Mr Thorneycroft, announced various economies in Government expenditure, and imposed a further quantitative limit on bank advances; Bank Rate was raised to 7 per cent to help to intensify the pressure. The limits on banking advances were duly observed, but if one is candid one must admit that this was due more to a general slackening of inflationary pressure than to any further action that the banks may have taken at that time. If the inflationary pressure had continued unabated, I do not believe that the banks could have held their advances to their former level without gravely interfering with the country's industry and commerce and with their customers' legitimate business.

What then of the effect of the Government's economies in its own spending? It may be a matter of argument how this should be measured, and in view of the elementary form of the national accounts it is difficult to be dogmatic. To me, however, the annual overall surplus or deficit in the Government accounts is the best criterion. In his budget statement in April, 1957, Mr Thorneycroft reported an overall deficit in the 1956-57 accounts of £331 million and the actual result for 1957-58, allowing for any savings already secured as a result of the September measures, was a deficit of £212 million. Mr Micawber taught us the importance of sixpence in the family finances but £100 million in a national budget of £6,000 million can hardly be the full measure of the great change in our fortunes. What may be the outcome of 1958-59 we cannot yet know, but there was no further saving anticipated in Mr Heathcoat Amory's budget of April last, and recent Government decisions suggest that there may even be an increase in the deficit.



THE 7 PER CENT BANK RATE

There is, it is true, a great difference between the effect produced on the economy by the deficits of 1956-57 and 1957-58. The Government does not publish any figures relating to its operations in its own securities through the market, by means of which it carries out funding operations, including the funding of budgetary deficits. But it is commonly believed, and the appearance of the market confirmed, that in 1957, except for the early months, little if any net funding was possible, with the result that the necessary finance had to be provided by other means, such as the issue of Treasury Bills to the banks through the money market, which must have increased the inflationary pressure. In 1958, on the other hand, it has been evident that the Government has been a net seller of its securities on a large scale. The gilt-edged market has throughout the year presented a firm appearance, though still at a low level owing to the heavy Government sales, and there is little doubt that the Government has been able to provide for its immediate needs with something to spare. This, however, is the effect and not the cause of the improvement in our fortunes, the explanation of which must be sought elsewhere. Can it be found in the 7 per cent Bank Rate? This is very hard to believe taken in isolation. Previous attempts to check inflation by high rates (not, it is true, as high as 7 per cent), proved ineffective in the face of continued ease in the supply of money as distinct from its price. Doubtless high rates for money add to the force of other restrictive measures, and it may be noted that the yield offered on Government securities in 1958, when funding was successful, was in general higher than in 1957, when they were very difficult to sell. Even so, confidence is a much more potent factor than the rate of interest offered. Funding at 4 per cent on a rising market will be more successful than at 5 per cent on a falling one. Investors, and perhaps also their professional advisers, seem often to take short views, even when they are buying long-term investments. We should also remember that, although their immediate effect on the economy is the same, covering expenditure by funding is not the same thing as covering it by taxation. Funding is borrowing, and borrowing money involves the obligation to repay it one day. It is to be feared that the trifling distinction between a gift and a loan is often blurred in the discussion of our economic problems.

What effect did the 7 per cent Bank Rate have on bank borrowings? Here, if anywhere, I should be on firm ground, but I find the answer no less difficult. As a matter of historical record there was a substantial fall in the total of bank advances, but the highest point reached was in mid-May, four months before the raising of the Bank Rate (I ignore the June figure because it is not comparable) and they began to rise again before the first of the five subsequent reductions, despite the fact that the other restrictions were still in full force. We were, however, still well below our target average when the contest was called off in July.

Surely there must have been some other factor at work, one perhaps on which human influences have little effect; something which one hardly notices at first, such as a change in the direction of the wind. I referred in my statement a year ago to the fact that early in 1957 the prices of raw materials had begun for no immediately obvious reason to turn downwards, after having risen since the end of the war continuously and steadily, if one ignores a violent aberration caused by the Korean crisis. The reaction which would be expected in the banking accounts of manufacturers and others concerned did not begin until after May and does not appear to have become general until the introduction of the September measures caused business men to take stock of the situation. My conclusion is that as the raising of the Bank Rate was the most spectacular, as well as the most tangible, of these measures, it was effective in that it focused attention on a deflationary influence, which had in fact begun to take effect nine months before, but had been to some extent overlooked in the general atmosphere of gay inflation.

The following graph, which I borrow with permission from *The Economist*, demonstrates the considerable extent of the fall in prices and the rather surprising fact that the September measures do not seem to have had the effect of reinforcing the downward tendency as monetary action of a deflationary character might have been expected to do; in fact the curve flattened out soon afterwards. (It is also noteworthy that gilt-edged prices followed a parallel course during this particular period.)

A fall in the price of raw materials benefits the United Kingdom by reducing the cost of imports. It is true that a second factor enters into the final result, namely volume. Normally volume falls as prices begin to fall, and vice versa, but in 1957, whereas *The Economist's* graph shows that prices fell by an average of 2 per cent as compared with 1956, Board of Trade returns show that the volume of imports rose by 4 per cent. The comparison of prices between 1957 and 1958 is, however, much more marked; the average of the figures shown on the graph shows a fall of over 7 per cent, and as this was accompanied by a fall in volume also, the explanation of our astonishingly favourable balance of payments in the first half of 1958, and the continued strength of sterling throughout the second half, is immediately apparent. As compared with an estimate of no change between the Government accounts of 1957-58 and 1958-59, the overall cost of imports for the first eleven months of 1958 shows a fall of £340 million on the corresponding period of 1957.

This situation is satisfactory to the Sterling Area as a whole, though not equally so to all its members. It is widely appreciated that the United Kingdom is a very heavy net importer of raw materials and foodstuffs, but it may not be generally realised that, notwithstanding the vast production of primary commodities in other sterling countries, the Area as a whole is on balance a large net importer of these commodities, which have to be paid for in the main by the export of manufactured goods and of invisibles by the United Kingdom. Thus the losses of the other sterling countries on a fall in the price level would normally reduce, but not extinguish, the benefit derived by the United Kingdom. On this occasion the other sterling countries offset their losses to a large extent either by making unusually large gold sales to the United Kingdom or by receiving substantial capital and loans from outside the sterling area. The external effect of our improved terms of trade is thus precise and tangible. Apart from this we no doubt owe something to the mercurial caprice of a few foreign gamblers, but in the speculative field I regard as much more important the elimination of leads and lags: the reaction of business men, British as well as foreign, to the removal of their fears of a possible exchange crisis. Whatever the explanation, however, I am quite sure that the strength of the pound in the exchange markets of 1958 reflects its value much more truly than its weakness in 1957 and it has enabled us to take a useful further step along the road towards the full convertibility of our currency.

The internal effect of the fall in prices consisted largely in a change of outlook: a cessation of the hoarding not only of stocks but also, which is perhaps even more important, of labour; and its reaction was accentuated by the fact that a slight reduction in demand fell at a time when industrial capacity had been increased as a result of extensions to plant undertaken two or three years earlier. It is regrettable that the substantial fall in raw material prices has had no more marked effect on retail prices than to hold them steady. No one wants to reduce the selling price of his goods before he is obliged and 1958 has seen another round of wage increases which have not been sufficiently justified either by increased production or increased prices. All that can be said is that the percentages were lower than in previous years, but the country cannot go on paying higher and higher wages for the same work without a return of inflation. Furthermore, if the elimination of inflation has been caused, as I believe, by the downward trend of raw material prices, caused in its turn by over-production due to world-wide inflation, then an eventual resumption of an upward trend is liable to bring about a return of inflation in this country, because other elements, such as high Government expenditure and wage increases, are still present.

GOVERNMENT'S OUTSTANDING INTERNAL FINANCIAL SUCCESS

The Government's outstanding financial success internally in the past year lies, undoubtedly, in its ability to carry out sufficient funding to provide for its budgetary deficit and its maturing bonds, and in general to regain control of the short-term money market. This last has been expensive, but it may perhaps rank as the greatest of all the achievements of the authorities during the past year. It could not have been undertaken unless Government credit had first been restored and it is of the highest importance that confidence should not be lost again owing to a return to laxity in Government expenditure. Confidence is hardly won and easily lost; as elusive as it is precious, not only to politicians but also to bankers. Now that the pendulum has swung towards deflation, it has become necessary that the monetary and fiscal policy of recent years should be put into reverse, in order to prevent it from swinging too far. This is rightly the present policy of the Government, but I feel that there may be a risk of too much emphasis being laid in some quarters on directly encouraging the extension of industrial capacity as a means of bringing it about. The volume of production is, no doubt, the best measure of the general prosperity of industry, but can we expect an industrialist to increase his plant, and therefore his productive capacity, if he is already finding it difficult to sell his present production? Was it not better to begin as the Government did by stimulating demand at home and abroad: abroad by encouraging overseas loans and at home by relaxing restrictions on credit and perhaps by reducing taxation? If demand increases, will not increased production take care of itself without the adventitious aid of initial allowances or other fiscal devices? Indeed, is not the recent rather rapid rise in unemployment probably due, at least in part, to the fact that the nation's productive capacity has been increased faster than demand as a result of inflation?

If my diagnosis is correct it indicates an abnormal state of affairs which provides no clear precedent for corrective action on a future occasion. My final word on this difficult problem is that, in so far as we deny to the Government the credit for the improvement in our economic health, we must exempt them from blame for the temporary unemployment which has inevitably accompanied it. They might incur blame if they did not take action to mitigate it, but there is nothing that the Government has done, and nothing that any Government can ever do beyond checking, if they act wisely, or aggravating, when they act unwisely, the swing of a pendulum which is governed by the inexorable natural forces of supply and demand. The Prime Minister claimed recently, in the words of a now famous ditty, that he is entitled to "a little bit of luck." *So he is; he knows how to use it and his* friends will not grudge it to him, if only so that (to complete his quotation) "the bloodhound don't find out." That diligent and faithful animal has at any rate been doing his best to find out and follow the true scent.

THE USES OF FREEDOM

Let us now turn to examine the uses to which we hope to put our restored freedom. The first point to be made is that this freedom is not, and could never be, absolute. Our operations must always be controlled by the overall supply of credit, and there still remains the obligation on the borrower in certain instances to obtain the sanction of the Capital Issues Committee. Apart from the powers which the authorities have always possessed to encourage or discourage our activities by operations in the market, a new device has been invented whereby we may be called upon to place on deposit at the Bank of England a stated percentage of the money deposited with us, and this deposit will be sterilised so far as our ordinary business is concerned. The authorities are perfectly entitled to fortify their control machinery, if they feel, perhaps on account of the special problems relating to Government expenditure, that the conventional weapons may be insufficient; and the specific object of this device, which is expressed as being provisional pending the report of the Radcliffe Committee, is to restrict our ability to lend by reducing our liquid assets. Superficially, it bears a strong resemblance to the unpopular wartime device of the Treasury

Deposit Receipt, but we may hope that in practice it will be operated, if at all, more flexibly. To operate it fairly as between one bank and another may, however, prove difficult, if not impossible.

Whatever may be thought of the practicability, or the fairness, of the new device, it can hardly be denied that the present level of bank advances, though it has risen in recent months, is still very low, and when production has shown signs of faltering it cannot be wrong to let it rise if customers' demands tend to increase. First and foremost our existing customers of all descriptions will benefit, in so far as they may wish to do so, but there is room, at least in our judgment, for spreading our lending business more widely. The recent lifting of restrictions has given us an opportunity of doing something which we have long wanted to do in the direction of giving our services a wider appeal to that large section of the community whom, for want of a better term, I would describe as "the weekly wage-earner." We have long felt that he might be able to make greater use of the services of the Bank if these were presented to him in a more acceptable form and that they should include not only a current or deposit account but provide also for his borrowing needs, which had hitherto been restricted very largely to the field of hire purchase. So far as his borrowing was concerned, we were determined that it should be provided for him on proper banking lines as an individual customer dependent on his own credit-worthiness. In this respect, apart from others, the hire purchase principle, which relates the finance so closely to the goods, has always seemed to us to be undesirable as governing the relations between a banker and his customer; so also has the payment of commission for the introduction of business, which the hire purchase companies practise. Hire purchase business, however, includes a feature which is salutary both to borrower and lender, and which we were very ready to adopt for this type of lending, in its insistence on regular monthly payments in reduction of the debt. These thoughts crystallised in our minds, some twelve months ago, in the idea of the personal loan to meet the needs of the individual, the exact nature of which would be of less consequence to us than our estimate of his ability to repay. This principle is already well known in the United States of America and we did not imagine that we were alone in this country in allowing our thoughts to run on these lines in making our plans. Our discussions, however, appeared at the time to be academic, as it was manifestly impossible to court new lending business when we were obliged to ration our existing customers. We therefore put our plan into a pigeon-hole, ready for production when conditions were favourable. We have now been able to bring it out again and put it into operation. Its main effect so far appears to have been to revive an interest in banking generally, and we have lent more new money to private borrowers on conventional lines than by means of the new personal loans.

When it comes to considering the weekly wage-earner as a creditor customer, what we have to offer him is less apparent, much as we should welcome him in that guise. In the first place the famous Truck Act of 1831 makes it necessary that his wages should be paid to him in cash. When this Act was passed, it was no doubt desirable thus to protect the workman from being forced to accept part of his wages in kind; today his Trade Union is quite powerful enough to prevent an unscrupulous employer from imposing upon him in this or other ways. An even greater influence in promoting the banking habit would be for factory workers to accept payment on a monthly basis as office workers, some of whom receive less money, normally do. The thin end of this wedge has already been forced into the door, in factories where certain employees are being paid fortnightly instead of weekly. If this practice became more widespread and could be extended to allow for payment on a monthly basis, a banking account would become a necessity for the artificer, as the Act calls him, as it is now for the office worker, and this in its turn would greatly diminish the opportunities for highway robbery. It is not clear, however, what special attractions we can offer to him. His needs are likely to be simple and the meeting of them therefore relatively inexpensive. They will not, however, necessarily be stereotyped. Our private customers cannot be divided neatly into two classes, like the passengers in a railway train; in any case no bank would like any of its customers to feel that they were travelling second class.

THE BANKS AND HIRE PURCHASE

About a year ago it was becoming an open secret that certain of our competitors might be contemplating taking an interest in hire purchase, either directly or by acquiring an existing hire purchase company. A proposition of this kind did not at the time appeal to us; we were content to rest on our plans for personal loans to meet the need for consumer credit and to leave aside any participation in the field of medium-term industrial lending in which hire purchase companies also operate. However, in May last an unexpected opportunity arose for us to make an investment in United Dominions Trust sufficient to give us a holding of 25 per cent of the equity. This proposal was quite different from any which we had hitherto contemplated and it seemed to us to be attractive from several points of view; it was consistent with our policy of holding trade investments in businesses akin to our own such as overseas banks, which are a source of banking business to us as well as earning their keep on a relatively generous scale; if alliances were to be formed between banks and hire purchase companies, it was desirable that we should participate in one, provided that we could do so without becoming directly involved in the management of hire purchase, which we do not understand; and it was very agreeable to us that we were able to take an interest in the company which is the acknowledged leader in industrial banking, and which has for long regarded us as its principal bankers and clearing agents. That the ramifications of United Dominions Trust cover a much wider field than mere hire purchase business does not make the association less attractive, since their other activities and services are within the sphere of operations directed towards the greater efficiency of commerce and industry. So, having disclosed to their Board our intention to introduce a system of personal loans, and having found that this would not be likely to provoke a conflict of interest between us, we had no difficulty in reaching an agreement on the terms originally offered to us. We were obliged to put this plan also into a pigeon-hole, but it did not have to remain there long. At the beginning of July the Chancellor announced the impending relaxation of the credit squeeze, and his instructions to the Capital Issues Committee included the statement that the Treasury would be prepared to act on a recommendation in favour of an issue where the Committee considered that the raising of finance was desirable as a means of improving the stability of the hire purchase financial system. Apart from the fact that United Dominions Trust was not in evident need of greater financial stability, this formula might have been tailor-made to fit our agreement with them; and while any form of alliance with a leading clearing bank probably enhances the credit of any hire purchase company, thus conforming to the spirit of the Chancellor's direction, a transaction which adds substantially to its capital and reserves complies strictly with the letter of the new regulation in a sense that the purchase by new shareholders of existing capital does not. We could therefore feel confident that the Capital Issues Committee would give their consent, even though this was in a sense a test case, being probably the first to be submitted under the new regulations. So in fact it proved, and I have no doubt that it marks the beginning of a fruitful era of mutual co-operation between the two companies.

WIDER IMPLICATIONS

It may be of interest to consider what are the wider implications of these alliances. It seems possible, first of all, that business will tend to flow towards the hire purchase companies concerned in them, at the expense of those who remain uncommitted. Even when the link does not involve the moral obligations of a parent towards its subsidiary, its existence will help the hire purchase company to raise money from the public at more favourable rates, and thus to offer better terms for its lending business. Already there has been a considerable outbreak of competition in this field, which has served to emphasise an important point, hitherto generally overlooked, that the interest charged by a bank on a personal loan is in principle eligible for income tax relief, whereas the financial charge made by hire purchase companies on their normal contracts, being in the nature of rent, gives no similar right to the personal borrower. This may tend to draw away from the hire purchase companies some of the cream of the individual borrowings for personal consumption. There will, however, remain ample scope for them to expand their medium-term lendings to industrial companies and firms, where rent and interest rank alike as a charge against profits for tax purposes. The future of the smaller, uncommitted hire purchase companies would appear in many cases to lie in amalgamation with their larger rivals. Their situation is in fact not dissimilar to that of many private banks at the turn of the present century. The problem is complicated by the fact that in the last few years large numbers of new companies have been formed; in so far as these companies have financed themselves by offering very high rates of interest to the public, a general squeezing of profit margins under the stress of competition might make it difficult for some of them to continue to conduct a profitable business.

It will be interesting to see whether the recent practice of hire purchase companies of inviting deposits directly from the public (an unforeseen result of the credit squeeze which largely defeated its objects as applied to hire purchase) will be extended or contracted under the influence of their banking alliances. Personally I think it could well be extended always provided that the rates quoted are not extravagant, as they have appeared to be in many instances in the past. As I have said on a former occasion, it seems to me natural and proper that hire purchase companies should finance themselves in this way, as building societies do, relying on their banking associates or other bankers to provide them with temporary liquidity when the need arises. The fact that banks will thereby lose, or fail to gain, certain deposits seems to me a secondary consideration, at least in the public interest.

There is, however, one problem which is as yet unresolved. It is common knowledge that the authorities have wished to exercise more effective control over hire purchase lending in inflationary conditions, and that they have not hitherto found a means of doing so. It is also well known that official control over bank lendings is much more effective; even though it is normally exercised on a basis of voluntary agreement, there is a sanction which could be operated if necessary within certain well-defined limits. In so far as hire purchase business becomes a function of the banks, it becomes susceptible to control through the banking machinery. This would have been a sufficient reason, if none other had existed, to make us wish to avoid taking a direct part in this field of business, even through a subsidiary company whose actions we should have the power, and therefore perhaps the duty, to bring under formal control. It would be much better that the Authorities should find means of applying any control considered necessary directly to the hire purchase companies themselves.

There have also been several important events during the year which are of more parochial concern. I wrote to Stockholders in August to tell them of our plans for the increase of the Bank's Ordinary Capital by the issue to them of additional shares arising from the capitalisation of part of our Reserve Fund and also for the offer to the Staff of a further block of their Special Stock. The formalities of both operations have now been completed and the final ordinary dividend of 6 per cent which we are recommending will be payable on the new stock as well as on the old. During the year events have tended to favour our affairs. Both investment income and the earnings of our money market assets have shown substantial increases which, coupled with larger balances at our disposal and an easement in the necessity of setting aside funds by way of provision, have enabled us to bring down a very satisfactory profit. We have made a transfer from Inner to Published Reserves of an amount which, together with the transfer from this year's profits, will leave the Reserve Fund £1 million higher than it was a year ago.

REBUILDING OF HEAD OFFICE

The rebuilding of our Head Office is now proceeding apace. It is being undertaken in three phases, the first of which covers in the main the site of the former Church and Churchyard of All Hallows, Lombard Street. Here a forest of steel has grown up in the past few weeks and walls and floors are now beginning to appear. The foundation-stone of the new building will be laid on January 15th at a private ceremony, and a model of the building as it will appear when eventually completed will be available for inspection by any interested Stockholder on the day of the Annual Meeting. We have been subjected to inconvenience in our Head Office accommodation for so many years now that the prospect, even if it is still remote, of occupying an efficient modern office building gives us great encouragement.

We are also embarking on an important building operation in the neighbourhood of Northampton, where we propose in future to conduct all the clearing operations between branch and branch of our own Bank. These amount to nearly fifty million vouchers in the course of a year and require the employment of a staff of about a hundred. The transfer of routine administrative work out of London is in furtherance of present Government policy, and is entirely in keeping with our own long standing traditions of decentralised administration. The arrangements which we are making at Northampton are such that there would be no difficulty in extending them to cover the whole of our share of the inter-bank clearing in case the opportunity to do so should arise in the future.

We have opened a number of new branches during the year, including one in the West End of London under the management of a member of our women staff, Miss H. M. Harding. This interesting experiment has been hailed in some quarters as a portent, as indeed in a sense it is, but it may also be regarded as a natural and perhaps somewhat belated recognition that the holding of responsible posts in contact with our customers is no longer necessarily an exclusively male preserve.

The Board have recently decided to introduce into the Rules of the Bank's Pension Fund a provision whereby a member of the Staff leaving the Bank before pensionable age can, subject to a qualifying period of service, retain or take with him the benefit accumulated in respect of his past service. Our Pension Fund is non-contributory, and was already most favourable to the members both in respect of the basis of calculation and of certain valuable options available when the pension accrues; the new provision will bring it into full conformity with the most modern practice. It will come into operation as soon as the necessary alteration in the Rules has received the formal approval of the Inland Revenue.

I referred last year to our having come to the rescue of the depositors of a small savings bank in Birmingham known as The Ideal Bank. The result of this action has come up to our best expectations. We have been able to retain 90 per cent of the money deposited with The Ideal Bank and we have, we hope, made a large number of new friends in the Birmingham area.

THE NEW CHEQUES ACT

The new Cheques Act has now been in operation for more than a year and so far as the banks are concerned there has been no hitch nor difficulty in its working. It has, however, produced an unexpected secondary effect in that many trading concerns have taken advantage of it to discontinue the practice of issuing receipts to their customers, in respect of which their legal obligation has not in fact been altered in any way. The lack of any concerted plans or adequate explanation caused great confusion at first in many instances, but this is gradually being overcome, and in due course both debtor and creditor will no doubt become accustomed to the new system. We await with interest the introduction of further legislation removing the prohibition of the payment of wages by cheque or by direct transfer to banking accounts, which I have already mentioned and which will, I hope, now find general acceptance provided that it is permissive and not compulsory.

THE BOARD OF DIRECTORS

Before closing I must mention that we have welcomed to our Board during the year Colonel W. H. Whitbread, whose outstanding position in the brewing trade needs no emphasis from me.

We congratulate our colleague, Mr R. H. Parker, on his appointment by The Queen as Her Majesty's Lieutenant for the County of Cambridge, and also Sir David Evans Bevan on the Baronetcy conferred upon him in the Birthday Honours.

Finally, I must refer to a sorrowful event, the retirement of Sir Cecil Ellerton from the office of Deputy Chairman at the end of the year. Sir Cecil has been always at my right hand since I became Chairman in 1951 and we had previously been colleagues as General Managers during the war. I know, therefore, what I owe to his loyal friendship and wise counsel over many years. I know also that he would not like me to set it all down in writing, and although he is at this moment at a safe distance in the Antipodes, I will not incur his displeasure by trying to do so. I am happy to say that he will remain a member of the Board and will continue many of his activities in the City, in which he has performed great service not only to the Bank, but also to the Country.

When they were informed of Sir Cecil's intentions the Board appointed one of our Vice-Chairmen, Mr John Thomson, to take his place as Deputy Chairman, and they have now appointed as a Vice-Chairman Mr T. M. Bland, who has recently completed a distinguished two-year period as President of the Institue of Bankers, an office in which he followed after twenty years his father, the late Mr F. L. Bland. We have thus introduced into the highest offices in the Bank two of a younger generation, on whose wisdom and experience as bankers the Stockholders can rely with complete confidence.

FLOWERS BREWERIES LIMITED

INCREASED SALES

The Sixty-first Annual General Meeting of Flowers Breweries Limited was held on January 12th in London, Sir Fordham Flower, Chairman, presiding.

The following are points from his statement:

Despite the unfavourable weather last summer, the sales by volume of your Company's beers have increased by more than 3 per cent. This compares favourably with the national trend, for in the U.K. brewings up to September 30th, 1958, have decreased by 2.86 per cent. I am glad to report that Keg Bitter and Brewmaster have done particularly well.

Your group shows an increase in profits before deducting taxation for the past financial year. The first part of the financial year was extremely difficult, but a number of economies were instituted in the last six months and this action has had a beneficial effect on the results.

Since the end of our financial year, we have made a trade agreement with H. & G. Simonds Ltd., whereby certain beers of each Company will be made available to the other. I am certain that this arrangement will be mutually advantageous.

The arrangement with Friary-Meux has now been in force for two years and is proving satisfactory to both Companies.

Your Board has concluded an agreement whereby Schweppes mineral waters have been made available in our houses in the Luton and Tunbridge Wells areas.

We have opened a number of new off-licences and public houses. This programme should be continued and will require substantial capital sums over the next few years. It is vital that an expanding business, such as yours, should plough back considerable sums every year.

The report and accounts were adopted.

STEWARTS AND LLOYDS LIMITED

FACTORS AFFECTING THE YEAR'S RESULTS

HOME AND OVERSEAS TRADING POSITION

FINANCING LARGE-SCALE DEVELOPMENT PROJECTS

MR A. G. STEWART ON CURRENT AND FUTURE PROSPECTS

The sixty-ninth Annual General Meeting of Stewarts and Lloyds Limited will be held in the Merchants' Hall, 30, George Square, Glasgow, on Tuesday, February 10, 1959, at 12.15 p.m. The Accounts for the fifty-two weeks ended September 27, 1958, have been circulated with a Statement by Mr. A. G. Stewart, the Chairman, which reads as follows :

Shareholders will have noted from the dividend declaration that this year's financial results show a decline from the record figures of the previous year.

The profit of the whole Group amounted to £14,265,000 before tax and before charging £1,580,000 for Fixed Assets Replacement Reserve. The table set out below shows the proportions in which the decrease in the profits of £3,986,000 as compared with the previous year is accounted for as between Stewarts and Lloyds, Limited, as a manufacturing company, home subsidiaries, and the earnings from trade investments and overseas companies.

	Profit	Per cent of total profit	Decrease	
	£		£	Per cent
S. and L. Ltd.	8,510,000	59	2,477,000	23
Home Subsidiaries	3,230,000	23	1,389,000	30
Trade Investments and Overseas Companies	2,525,000	18	120,000	5
	£14,265,000	100	£3,986,000	

These results will, I think, come as no surprise to shareholders, bearing in mind what I said as to future trading prospects in my statement with last year's Report and Accounts and my remarks at last year's Annual General Meeting. Further, a statement was issued at the time of the interim dividend declaration last June recording not only a falling-off in home trade demand but that our export trade, particularly to the Oil Industry, was seriously affected. It was stated that practically all our works were on short-time with the result that the profits of the year ending September, 1958, would be substantially lower than those of the preceding year.

It will be remembered that as far back as the beginning of 1957 I reported a falling-off in home trade demand for general purpose tubes up to 4 in. diameter which comprises the largest single section of our business. I now have to report that from the early part of the year under review there was a considerable reduction in demand for casing, tubing and line pipe for the Oil Industry. This fall in demand is not peculiar to Stewarts and Lloyds but has also affected American and Continental producers.

The effect of these events on the earnings of the United Kingdom Group is shown by the fact that its estimated profits for the last three months of the financial year ended September 27, 1958, are about half those of the corresponding three months of 1957.

However, in view of the amount of cover still available, your Directors have no hesitation in proposing the same rate of Ordinary Dividend as last year.

TRADING POSITION

The total tonnages despatched during the year were:

	52 weeks ended September 27, 1958			52 weeks ended September 28, 1957	
	Tons	Per cent of total	Per cent variation on 1956/57	Tons	Per cent of total
Steel Tubes :					
Home, excluding Oil	424,000	49	−12	480,000	50
Oil Industry—Home	39,000	5	−33	58,000	6
Export, excluding Oil	186,000	21	− 6	198,000	20
Oil Industry—Export	217,000	25	− 7	233,000	24
	866,000	100	−11	969,000	100
Spun Iron Pipes and Castings :					
Home	247,000	74	− 4	256,000	70
Export	87,000	26	−21	110,000	30
	334,000	100	− 9	366,000	100

(a) Stewarts and Lloyds Limited

As will be seen, 866,000 tons of steel tubes were despatched in the year compared with 969,000 tons in the previous year. The low level of home trade demand for general purpose tubes in sizes up to 4 in. diameter continued until the end of the year, since when some slight improvement became evident. De-stocking by merchants and consumers has continued but with stocks now being maintained at minimum levels, the year ended with a realistic order book.

The demand for quality tubes throughout our range of manufacture which had been satisfactory until towards the end of 1957 fell away considerably during 1958 due to a contraction in demand from consumer industries affected by the general recession in trade and cuts in Government spending, one important instance of which, so far as we are concerned, being the retarding by twelve months of the nuclear power plant programmes. However, several important orders for pipework for Nuclear Power Stations have been executed, and a number of contracts have still to be completed. The prospects of future business in this field are most promising. We also have a good order book for large diameter mains.

During the year we commenced the manufacture of Rectangular Hollow Sections for structural and mechanical purposes. Initial experience confirms our belief that there is a wide use for members of this kind.

In export markets our order load from Oil Industry customers at the beginning of the financial year was sufficient to keep our works fully employed for six months ahead. It was clear at that time, however, that the immediate needs of the Oil Industry were being satisfied and that with reduced drilling activity a fall in the volume of new orders could be expected. By January, 1958, many of our oil company customers were not only unable to place new orders but in some cases were cancelling existing orders. Others continued to purchase but on a much reduced scale.

The figures in the table above show a fall in the volume of despatches for export to the Oil Industry in the year under review of 7 per cent in comparison with the record figures of the previous year. This reduction is very much smaller than the reduction in the volume of orders booked during the year and a further substantial fall in Oil Industry export despatches in the current financial year must be expected.

Export demand from customers, other than the Oil Industry, has remained fairly steady but competition has become more severe partly as a result of new tube manufacturers having started operations on the Continent. Export prices overall have for the first time since before the war been lower than home trade prices.

Despatches of manipulated pressure pipework were around the previous year's level but the value of orders received in the year was substantially down on that for 1957. Competition is intense and prices have not been very remunerative.

Our tube works operated in 1957/58 at 79 per cent of capacity in producing 815,000 tons as compared with 93 per cent of capacity in 1956/57 when 969,000 tons were produced. The reduced operations at our tube works have resulted in a reduced rate of working in the iron and steel works, which is referred to later in this statement, though this has been offset to some extent by increased sales of semi-finished steel and hot rolled strip. As the general decline in demand for steel products has progressed it has become more difficult to find outlets at home for increasing quantities of semis and strip but we have been able to make some sales in export markets though at very low prices.

In the home trade average prices obtained for steel tubes during the year were higher than in the previous year, due partly to a change in the composition of the order book. The increase in prices rather more than absorbed increases in costs of raw materials and freights. This advantage, however, was outweighed by the relatively lower level of export prices for general purpose tubes. It should also be noted that since the end of the financial year the British Transport Commission announced its intention to increase freight charges on raw matrials for the iron and steel industry by 7½ per cent, and, following the Engineering Award in October, 1958, wages of certain of our men have been increased.

(b) The Stanton Ironworks Company, Limited

Despatches of spun iron pipes and iron castings in the home market were maintained at a level only slightly below that of the previous year. In the export trade, however, owing to a world-wide recession in demand, despatches fell by 21 per cent. India's continued restrictions on imports, the unsettled state of the Middle East, and the increasing development of local manufacture in overseas markets, contributed to this result. Stanton was, however, able to maintain a proportionate share of business in world markets in spite of increasing competition from other exporting countries.

Vertically cast iron pipes for use as water mains have now been largely superseded by prestressed concrete pipes, of which Stanton is the only producer in the UK. Despatches during the year were more than 45 per cent greater than in the previous year. Despatches of concrete products, other than prestressed concrete pipes, were maintained at approximately the same level as in the previous year.

The foundry iron market remained weak and Stanton's despatches of pig iron were down overall by 24 per cent. A marked decline in home demand for high phosphoric foundry iron was partly offset by increased sales of low phosphoric foundry iron in the home and export markets. A changed pattern of demand from iron foundries has now become evident in which a tendency towards the use of lower phosphoric irons is increasing.

Requirements of steelmakers for outside purchases of basic pig iron fell away sharply during the year. This, combined with the decline in demand for foundry iron, meant that furnace capacity was not fully occupied. Total pig iron production represented slightly less than 75 per cent of available furnace capacity.

(c) Tubewrights Limited

Our wholly-owned subsidiary, Tubewrights, was engaged during the year in a variety of important work in the structural field. This included the construction for the roofs of the new hangars and workshops at London Airport. After prolonged design and development work, the Electricity Authorities in this country have accepted Transmission Line Towers of tubular construction and pilot orders are now being executed.

Turnover for the year under review was the highest yet achieved but as a result of the decreased demand for capital goods, the value of orders outstanding at the end of the year was considerably below that twelve months earlier.

(d) Stewarts and Lloyds Plastics Limited

During our first year of marketing polythene tubes, primarily for cold water services, we obtained a good share of the available business against severe competition.

Experience continues to indicate that, in their present form, plastic tubes are not likely to take any great tonnage away from steel.

FUTURE TRADING PROSPECTS

Prospects in the home trade for 1959 for general purpose tubes are on the whole more encouraging than they were a year ago owing to the stimulus now being given by the Government to public expenditure.

On the other hand, there are no firm indications of any early revival in demand for casing, tubing and line pipe for the Oil Industry. As I have stated above, 1959 prospects for this section of our business are not favourable, and a significant reduction in turnover in 1959 compared with 1958 would not be surprising.

So far as Stanton is concerned, its main business in the home market is largely dependent on public investment expenditure and is especially susceptible to Government economic policy. It is expected that the easing of credit restrictions and the positive encouragement now given by the Government to public investment spending will create an improved demand for cast iron pipes and concrete products in the current year. There are at present no indications of revival in the foundry iron market, although in this sector also recent Government action is expected to produce some increased activity.

Whilst immediate prospects are less favourable than for many years past and fully justify the note of caution that I sounded last year, I have no misgivings about the longer-term future. There is nothing novel in striking fluctuations in demand for general purpose tubes, and I see no reason to doubt that with the expansion in the general economy that we all expect, and the continued widening of their use, the demand for these tubes will in due time reach and indeed exceed its previous peak. I am also quite confident that demand from the Oil Industry will revive, and in due course greatly expand.

ACCOUNTS AND FINANCE

The accounts are presented in similar form to that used last year. The actual liability for UK Income Tax on profits of the year is reduced considerably due to the fall in trading profit and also because of the increased capital allowances, which amount to £1,900,000 compared with £692,000 in the previous year and arise from the heavy capital expenditure. Since the effect of these allowances is to defer payment of income tax they have been added to the amount set aside for equalisation of taxation.

It will be noted that in the UK Group of Companies the bank overdrafts increased during the year by £4,500,000 and at September 27, 1958, amounted to a total of £6,100,000 in spite of a reduction in stocks of almost £3 million. The chief reason for increased borrowing arises from our capital development programme which during the year in the UK Group amounted to a record total of £16,300,000.

It will be recalled that last year I stated that the balances of schemes approved at the end of September, 1957, amounted to £41 million. It should be remembered that when our plans were made for this substantial capital development, conditions of national and world trade gave grounds for an expectation of a more rapid expansion of demand than has taken place or seems likely in the immediate future.

Under these conditions your Board have reviewed carefully the whole of the development programme. It has been possible to rephase the rate at which some of the schemes are progressing and thus to reduce the rate of expenditure, particularly during the current financial year. It will, however, be appreciated that some of the major schemes are on the point of completion and no postponement of expenditure on these projects is possible.

The immediate reductions in expenditure that have arisen as a result of this review amount to about £6 million during the current financial year.

In spite of this revision, it is still likely that the amount of capital expenditure during the current financial year will approximate to the amount spent during the year to September, 1958. The balance of schemes approved at September 27, 1958, amounted to £28 million.

Your Board have had it constantly in mind during the past two years that our capital expenditure programme could not continue to be financed entirely out of retained profits even if the profit level were maintained, and that recourse must increasingly be had to borrowing and to consideration of a capital issue.

Your Board have been unwilling to raise new money of a permanent or semi-permanent nature on the unattractive terms arising from the political uncertainties surrounding the Steel Industry. The alternative that we have sought, therefore, is to approach our Bankers for their assistance. This has been forthcoming in full measure and we are assured of substantial support from them for a limited period, after which it is hoped that we shall then be in a position to judge how best to clear the major part of our indebtedness.

OPERATIONS AND DEVELOPMENTS

(a) Ironstone

There was a substantial fall in the output of the Group which was 26 per cent lower at 4,200,000 tons. The demand for ironstone for the furnaces producing foundry iron was particularly low.

We are still planning to increase our ironstone capacity within the next few years but some of this additional capacity may not be required quite so early as was previously anticipated.

The construction of a new large walking dragline has been commenced and this machine will go into production this year. It will be installed in an existing quarry where the depth of overburden will increase beyond the capacity of the existing excavator. The jib boom will again be of welded tubular construction.

Production has now started in our new underground mine in Rutland but owing to the difficult conditions which have been encountered underground the rate of development has been relatively slow.

I referred last year to the survey which, at the request of the Iron and Steel Board, we had agreed to carry out jointly with the United Steel Companies Limited in the

Northampton Sand Ironstone Bed in Rutland and South Lincolnshire. Work has proceeded as rapidly as possible and the Company has now obtained consents from 44 landowners to bore over an area of 24,000 acres. Approximately 100 boreholes have already been put down. The programme is an extensive one and it will be some time before it is possible to arrive at any conclusions.

The Company has a half-share in the Oxfordshire Ironstone Company Limited which, last year, produced 1,300,000 tons of ironstone against a capacity of 2 million tons. There are indications of a substantial increase in the demand on this field in a few years' time and plans are accordingly being prepared to increase capacity.

(b) Blast Furnaces

Pig iron production from Stewarts and Lloyds' furnaces at Corby, Wellingborough and Bilston during the year under review was some 74 per cent of the previous year's output. The internal demand was, of course, affected by the steelworks' operating programme, and the customary external iron sales practically ceased.

We expect to maintain our Corby blast furnace operations at a reasonable level during the current year, but operations at Wellingborough and Bilston furnaces are likely to continue on a restricted basis.

The additional ore preparation equipment at Corby, to which I referred last year, is now in operation and is providing improved facilities for preparing and sintering our Northamptonshire ores.

At the Corby blast furnaces, blowing equipment of increased capacity will be in service by June, 1959, and additional equipment for handling the blast furnace iron will come into service at about the same time.

At Stanton, good progress is being made with the new ore preparation plant which, it is expected, will be fully commissioned by the middle of 1959.

(c) Steel Works and Rolling Mills

Ingot steel production, as will be seen from page 25 of the Report and Accounts, fell from last year's record figure of 1,545,000 tons to 1,323,000 tons. The indications are that we shall be able to maintain Bessemer steel production at Corby at a reasonable level during the current financial year but that there will be considerable open hearth and electric furnace steelmaking capacity at Bilston, Clydesdale and Corby Works unfilled for the time being.

While strip mill and heavy rolling mill operations at Corby are likely to continue at a reasonable level, the rolling mills at Bilston may be working well under capacity loading.

Among major developments, it should be mentioned that the first stage of the reconstruction of the Corby heavy rolling mills should be completed in 1959. The replacement of the old blooming mill by a new 48 in. mill was carried out in December, 1958, an undertaking which reflects great credit on all concerned.

The new Corby tonnage oxygen plant, although actually installed, is, most unfortunately, not yet available for use owing to a faulty design which the contractors are now correcting.

At Bilston, the first of the new oil-fired *open hearth furnaces came into* successful operation last September.

Work on the installation of the new rolling mill plant, to which I referred last year, is proceeding and it is expected that the new mills, with their resulting econor ies, will be in operation in mid-1959.

At Clydesdale, the sixth open hearth furnace has now been completed and new steel casting facilities will shortly be available.

(d) Tube Works

Good progress has been made with the installation of the new Extrusion Plant at our Prothero Works, Wednesbury, for the manufacture of small diameter seamless tubes, and this unit is planned to commence operation in a few months' time.

Plans for the supply of Extreme Line Casing from tubes rolled at our new Seamless Mill at Clydesdale Works are now well advanced.

Reference was made last year to our plans for installing an Electric Resistance Weld tube plant at Shotton. The site has now been filled and building foundations are nearly complete. The main mill equipment is in an advanced stage of manufacture.

I have referred earlier to the present state of our order book, particularly in so far as the Oil Industry is concerned. We feel, therefore, that with capacity being available in our existing tube plants it may be some little time before a demand materialises for our Shotton project.

(e) General

The new building to house our Department of Research and Technical Development at Corby is now complete and in use. Much thought was put into the design of this building to enable it to meet our needs for many years to come, and we feel sure that it will be both a material aid and an incentive to all who work in it.

Reference was made last year to a LEO computer which the Company was proposing to install. This was delivered in April, and within three weeks was successfully doing the payroll work planned for it. It is our intention to extend the computer's activities as fast as we can.

OVERSEAS COMPANIES

South Africa and Southern Rhodesia

The turnover of the Stewarts and Lloyds of South Africa Group during the year under review was £13,600,000 as compared with £14,600,000 in the previous year.

The Vereeniging Tube Works had a sharp decline in production due to a falling off in demand mainly in respect of screwed and socketed tubes. The position was aggravated by the increasing cost of wages, fuel, power and consumable stores. At various times during the year some departments had to be placed on short time.

The demand for tubular structures is continuing and it was necessary to erect a new Bay for the further development of this department.

There was an improvement in the demand for non-ferrous and plastic tubes. Increased production facilities for the latter are contemplated.

The Que Que tube works of the South African Company were similarly affected, but here again an increase in tubular structures compensated to a considerable extent for the drop in output from the tube works.

During the year Stewarts and Lloyds of South Africa acquired the business of the Eagle Tube Company (Proprietary) Limited as a going concern. The main reason was that the time had arrived to increase their capacity for certain types of tubes and to operate the Company's works at Vereeniging more economically by concentrating on their standard products without the disruption caused by the more specialised lines. The Eagle Tube Company Works are at Germiston.

Australia

The Tubemakers of Australia Limited group of Companies has had a successful year. Production, in terms of steel consumed, at 279,000 tons and Sales at £A34 million were both higher than any previous year and profits were more than maintained. Export work accounted for rather more than 10 per cent of total sales and new markets are being developed.

In spite of the fall in wool prices, on which Australia's economy and prosperity so much depend, the new financial year has made a good start and prospects for the remainder of the year are considered to be hopeful.

New Zealand

Results for the year were satisfactory. As a result of falling prices for New Zealand exports, import licensing was imposed on January 1, 1958. Turnover has, however, been maintained in the year under review but this has been achieved at the expense of stocks which will be hard to replace until sufficient import licences are available.

So far, no reduction in the demand for steel products has been felt but with less money available for investment, the level of consumption could be affected in the future.

India

The Indian Tube Company (1953) *Limited.* The despatches of tubes made on the Continuous Weld plant increased by 30 per cent compared with their previous year to 45,000 tons. The demand for this class of pipe has increased at a faster rate than was envisaged but additional facilities for finishing will be completed in a few months' time when the limit to productive capacity will probably be the amount of skelp allocated by Government.

The production of cold rolled strip and Electric Resistance Weld cycle and other tubes has improved now that the initial difficulties regarding supply of hot rolled strip have been overcome. There is also a heavy demand for the products from these plants and with additional annealing capacity shortly becoming available there should be a considerable step-up in production during the coming year.

The Seamless plant is nearing completion and should be ready for trials early in 1959.

Stewarts and Lloyds of India, Private Limited.—This Company has had another profitable year. It has virtually ceased to be a merchant concern and its activities are now almost entirely concerned with the fabrication and erection of both pressure pipe work and structures. The Company has a very satisfactory order book.

Canada

Stewarts and Lloyds of Canada Limited had a more difficult year than last year. The demand for all categories of tubes was lower and increased capacity was available from Canadian tube plants. The Canadian Government for the first time imposed a tariff on imports of oil well casing and tubing, which nevertheless is preferential.

Ireland

Stewarts and Lloyds of Ireland Limited has had another satisfactory year and although demand has been low, the fall in trade there has not been so great as in the United Kingdom.

MR JAMES MITCHELL

It was announced in October, 1958, that Mr Mitchell had resigned from the Board.

He joined Stewarts and Lloyds in 1908 from the staff of the Metallurgical Department of the Royal Technical College, Glasgow, where he had received his training.

Mr Mitchell, during those 50 years, held various appointments of increasing responsibility and he became a Member of the Board in 1947.

The authority of his knowledge on all matters appertaining to Iron and Steel was accepted both in this country and abroad and was recognised by the Iron and Steel Institute in 1950 when he received the Bessemer Medal. I am sure it would be your wish to thank him for his long and faithful service to the Company.

EMPLOYEES

We very much regret that difficult trading conditions in the United Kingdom have led to some employees being laid off. Wherever possible we have found them alternative employment within the Company. If this was not possible, we have endeavoured to confine the redundancy to employees of retiral age or with short service. Redundancy compensation has been paid in the few cases where employees have been paid off who are ineligible for a pension and have appreciable service.

I would like to thank all employees at home and abroad for the notable part they play and to say how much we appreciate their loyal services.

NATIONALISATION

Shareholders will recall the resolution on this subject adopted by such a striking majority at last year's Annual General Meeting. Thus encouraged, your Directors have not been inactive. Shareholders will have noticed advertisements and correspondence in the local and national Press. More recently they have received a booklet entitled "20 Questioners." This booklet has also been sent to all employees and pensioners, all members of the House of Commons and to many other persons and associations. Other activities have been and are being undertaken.

Apart from this short report, I propose to deal with the subject fully in my address at the Annual General Meeting.

CHELTENHAM AND GLOUCESTER BUILDING SOCIETY

RESULTS FOR 1958

The Society's assets now amount to £31,604,000, being an increase of £1,329,000 during the year.

After deducting withdrawals, and allowing for interest, the total increase in savings in the Society amounted to £1,516,000.

A total of £3,129,000 was advanced on mortgage, which is considerably less than the figure for 1957 because of the restrictions on lending which had to be enforced whilst the credit squeeze was in operation. As a result of the improved inflow of funds during the past few months, however, these restrictions have now been very largely removed.

The improvement in the market value of the Society's quoted securities is over £100,000, and accordingly this amount has been transferred to General Reserve from Investment Depreciation Reserve. Total Reserves and Unappropriated Surplus now amount to £1,922,000, representing 6 per cent on the assets. The Society's liquid assets amount to 16 per cent of the total.

CLYDESDALE & NORTH OF SCOTLAND BANK

HIGHLY SATISFACTORY RESULTS

SIR HAROLD E. YARROW ON ESTABLISHMENT OF BASIS FOR COUNTRY'S EXPANSION

The one hundred and twenty-first Annual General Meeting of Shareholders of Clydesdale & North of Scotland Bank Limited will be held on Wednesday, February 11th, in the Head Office, St. Vincent Place, Glasgow.

The following are extracts from the circulated statement of the Chairman, Sir Harold E. Yarrow, Baronet, GBE, LLD:

The Balance Sheet shows a strong position and, in view of the difficult conditions, it must be considered that the results for the year are highly satisfactory. Our Deposits have been well maintained throughout the year, and show an increase of £626,303.

Our Note Circulation shows a small decrease of £222,228. This is the first decrease for many years and it undoubtedly reflects the reduction in the general trading activity.

The total of Acceptances, Confirmed Credits and Engagements on account of Customers stands at £8,513,141. This entry reflects some of the support we provide for our customers in their export activities.

Turning now to the Assets side of the Balance Sheet, you will see that Cash, Balances with other Banks, Money at Call and Short Notice in London, and Bills Discounted amount to £71,642,210. In relation to our Deposits and Notes in Circulation this represents a liquidity ratio of 35.6 per cent.

Our holding of British Government Securities at £79,612,485 shows a reduction on the year of £2,436,700. There has been a substantial improvement in the market value of these investments and the difference between book value and market value has been reduced to £1,542,488.

Advances show an increase of £5,919,568 at £48,503,294. Following the easing of credit restrictions there has been a general increase in our lending, which continues to be well spread, and we have also given increased assistance for the finance of exports.

From the Profit and Loss Account you will see that our net profit for the year at £497,971 shows an increase of £11,505. We propose to maintain unchanged the year's dividend of eighteen per cent and the allocations of £32,500 to the Staff Widows' Fund and £100,000 to Reserve for Contingencies, which will leave a balance of £214,881 to be carried forward to 1959.

RELAXATION OF CREDIT RESTRICTIONS

A year ago I referred to the "regrettable atmosphere of restriction" in which our affairs had to be conducted in 1957; in the interval the climate has undergone a remarkable change. In a period of under twelve months we have seen Bank Rate reduced by five stages from the high level of 7 per cent to one of 4 per cent, and as a result of measures announced by the Chancellor of the Exchequer in July, the Banks find themselves largely free—for the first time in many years—from artificial restrictions on their lending policies, restrictions which had long been irksome to Banks and customers alike. I echo Mr Heathcoat Amory's hope that control of the volume of Bank lending by "direc-tive" has gone from the scene for ever. It must not be overlooked, however, that the Chancellor has now in reserve—as an interim measure pending the findings of the Radcliffe Committee—a new method of controlling the level of Bank advances in the shape of Bank of England powers to call for "Special Deposits" by the Banks.

BANKING DEVELOPMENTS

I recall with pleasure that we were the first Bank in Scotland to announce the introduction of the Personal Loan Service, and the degree of advantage which has been taken of it by old and new customers is most encouraging and is ample evidence that there was a demand for such facilities.

The participation of the Banks in hire purchase followed the Chancellor's indication in his July announcement that the Treasury would view favourably developments which might be considered "desirable as a means of improving the stability of the hire-purchase financial system." The hire purchase system has obviously become an accepted part of our financial fabric, and personally I believe that wisely used it has a distinctive contribution to make towards increasing production and raising the standard of living generally. As I have already indicated, the Banks have chosen, and I think rightly, to enter the hire purchase field indirectly. For our own part, and in association with Midland Bank Limited, we made an offer in August last for the Share Capital of Forward Trust Limited which was accepted by the shareholders, and as a result of which this Bank now holds a 40 per cent interest in the Company.

BASIS FOR EXPANSION

While none can view with equanimity any under-employment of resources, either of manpower or of manufacturing capacity, we should be careful not to draw too gloomy a conclusion from the immediate outlook.

Last year I said that the country's position was inherently strong. Now we have established a firm base from which to begin our advance, having achieved relative stability in prices and in the cost of living. However, we may be faced with thinner and shorter order books in the trading conditions we are now likely to encounter, and what must be guarded against in the days ahead is the exploitation for narrow sectional interests of temporary advantages which may arise from time to time. In particular, it must be appreciated that we cannot afford so many stoppages of work as have occurred in recent years, a number of which are due to demarcation disputes between one union and other. There must be the closest co-operation between employers and employees, and in order to secure mutual confidence both sides of industry should approach every labour problem in a reasonable and conciliatory spirit. Industrial peace is vital for this country at the present time.

It would be idle to pretend that the coming months look like being anything other than difficult, but one would hope that by the end of this year world trade will again be expanding.

WILLIAMS DEACON'S BANK LIMITED

HIGHLY SATISFACTORY RESULTS

CONTINUED GROWTH IN BANK'S BUSINESS

STABILITY—FIRST ESSENTIAL FOR REAL AND SUBSTANTIAL PROGRESS

SIR ERIC A. CARPENTER ON THE HOME ECONOMIC SCENE

The Annual General Meeting of Williams Deacon's Bank Limited will be held on February 12th in Manchester.

The following is the statement by the Chairman, Sir Eric A. Carpenter, OBE, on the Report and Accounts for the year ended December 31, 1958:

The proceedings at the Annual General Meeting will be restricted to the transaction of formal business and I propose to continue the practice of recent years in issuing a brief statement on the Bank's affairs in advance of the Meeting.

From the Report in your hands you will see that the reorganisation of the Share Capital of the Bank, to which I made reference last year, became effective on June 23rd last, after the High Court had confirmed the reduction of Capital resulting from the cancellation of the uncalled liability on the "A" Shares. The Issued Capital then became a single class of 2,275,000 Shares of £1 each fully paid, the Authorised Capital remaining unchanged at £10 million. In addition, on December 18, 1958, an Extraordinary General Meeting of the members approved the capitalisation of £225,000 of the Reserve Fund, thereby increasing the Paid Up Capital to £2,500,000, at which it now stands. The balance standing to the credit of the Reserve Fund has been increased to a like amount by a transfer of £450,000 in all, £225,000 from the Profit and Loss Account and £225,000 from inner reserves.

Referring to the actual Accounts, you will see that Deposits stand at £138,858,226, an increase of £2,917,200.

On the Assets side, the liquid items, namely, Cash, Money at Call and Bills Discounted, amount in total to £43,080,668, or 31 per cent of our Deposits.

British Government Securities, which we have continued to value at market price or less, stand at £37,220,991.

The prices of gilt-edged securities have, generally speaking, risen slowly through the year with the fall in the level of interest rates.

Advances at £49,862,717 show an increase of £3,952,462 as compared with December, 1957. This, as you would expect, is the result of the ending of the credit squeeze which has enabled us to meet many of the requests of our customers which had previously, of necessity, been refused or curtailed to comply with official policy, and we are glad to be in a position to revert to ordinary banking practice in these matters.

HIGHER PROFIT

In the uncertain conditions prevailing in recent years our policy of strengthening the internal reserves of the Bank has been a major factor in determining the proportion of net profit available for credit to the Profit and Loss Account. I am glad to say that the Directors now feel that the time has come when a moderate relaxation in the policy can be prudently adopted. Our Net Profit, after making the usual provisions, which include contributions to Staff Pensions and Widows and Orphans Funds, and appropriations to Contingencies Account, is £474,334, an increase of £84,358 on the year.

With the balance brought forward of £285,830 a total of £760,164 remains to be dealt with. After transferring £150,000 to Pension Funds (additional to the usual contributions to these Funds) and £225,000 to Reserve Fund, and after having paid in July an interim dividend of 8 per cent on the then Paid Up Capital, we propose to pay a dividend of 10 per cent on the increased Capital, and to carry forward £136,764. I feel sure you will agree that these results are very satisfactory.

INTEREST IN BRITISH WAGON CO.

As already announced in the Press, we have, in conjunction with The Royal Bank of Scotland and Glyn, Mills and Co., acquired an interest of approximately 40 per cent in the capital of The British Wagon Co. Ltd. This extension of our interests from orthodox banking into the realms of hire purchase is one to which a great deal of thought had been given over a considerable period, and it was extremely gratifying that, when the opportunity arose, we were able to reach agreement with The British Wagon Company as the Bank has been very closely connected with that Company since they commenced business in 1869. I am sure that the arrangement will work out to our mutual benefit.

From the point of view of the Staff the year has been notable for the appointment of our first woman official, a move that has been widely welcomed.

BRANCH AND HEAD OFFICE EXPANSION

In accordance with our policy of widening the area covered by our branch system, branches of the Bank have been opened at Bristol, Cardiff, Chester, Leeds, Nantwich, Southampton and Warrington. We shall continue this policy as and when opportunities occur to acquire premises in other places.

By reason of our expanding business the Head Office premises of the Bank have now become inadequate. The present building was erected in 1862 and was then the only office of the Bank, when the staff was very small indeed. It is a tribute to the foresight of the Directors of those days that it has fulfilled its purpose for so long, although admittedly enlarged by the absorption of the adjacent office block. The time has arrived, however, when further accommodation is needed and it is proposed to add a new building on the opposite side of Mosley Street, Manchester. Plans are being drawn up and the work will begin as soon as possible.

THE POLITICAL ATMOSPHERE

I turn now to a wider sphere and regretfully record that the past year has been as much troubled as ever in the political sphere, though most of the trouble would evaporate if it were not communist inspired, or at least communist fostered. Fortunately, both in the political and in the industrial worlds the man in the street now generally recognises that communist agents and sympathisers are out to create strife for their own ends and a good feature has been the action taken of late by some of the Trade Unions to get rid of these elements in their midst.

The cold war goes on and the price of freedom is more than ever eternal vigilance. If such a thing can ever be certain, the dividing line between East and West seems to have been drawn a little more firmly in the last twelve months whether at Berlin, off the China coast or, less distinctly, in the Middle East. It is, however, regrettable that military rule has extinguished some of the struggling early forms of democracy in Pakistan and the Sudan, and also that the Cyprus problem remains with us and seems nearly, if not quite, as intractable as ever.

One of the more interesting, if terrifying, forms of competition between East and West is the rocket race, with the Russians now in the lead with the most spectacular satellite to be launched into outer space. It is a pity that these experiments are a facet of the desire to create missiles which could hurl destruction over great distances of the globe and that more co-operation of the sort seen in connection with the International Geophysical Year in Antarctica could not be seen. Both sides are building up weapons of frightening power and if the past is any guide these weapons eventually go off. We can only hope that some lasting good may come from the conference now proceeding at Geneva to control nuclear explosions, though previous experience of conferences with the Russians is not a good omen.

The most disturbing feature of international relations is both political and economic and concerns Western Europe alone, which in resources and manpower alike has enough to match either Russia or the USA. It is therefore greatly to be regretted that the negotiations for the European Free Trade Area have broken down and thereby close co-operation between all the nations of Western Europe, which might eventually lead to a third force of great strength in the world, has received a set-back. A trade war between the six countries in the European Economic Community and the rest of the countries of Western Europe, principally ourselves, is unthinkable and it is therefore a more hopeful sign that at the end of the year complete co-operation in currency affairs was forthcoming.

HOME ECONOMIC SCENE

In our domestic economic affairs, a year ago the bogey was still inflation and stern measures had been taken to deal with it. Whether those measures of crisis interest rates and other restrictions affecting bankers particularly could be effective was still a matter for conjecture. In the event they have been abundantly justified. It has since been possible not only to bring interest rates down to more modest figures but also to grant full convertibility of sterling for current transactions to all non-residents—a course which would have been unthinkable only a short time ago. Indeed, the need is now seen to be the active encouragement of expansion in the economy at home rather than the reverse.

For a period after the war we tried to manage with physical controls alone and found that course unsatisfactory. We have now had some seven years of operating largely through monetary policy and though this worked unevenly at first it can now be seen that if it is used resolutely and changes are made rapidly it can give us, when accompanied by other and complementary measures, that degree of stability which I am convinced is the first need of the economy if real and substantial economic progress is to be made.

I do not think that monetary policy alone can ever achieve all that is required. It is necessary for the Government to take other measures to supplement control of the credit machine and this the present Government has had the courage to do. With action on somewhat similar lines in the United States the stage does seem fairly well set for avoiding serious slumps in the future provided suitable steps are taken rapidly enough.

HEARTENING SIGNS OF IMPROVEMENT

We have had excellent figures in our transactions with the rest of the world. We achieved a surplus of no less than £334 million in our balance of payments in the first half-year and continued to show satisfactory surpluses in the monthly gold and dollar returns, so that by the end of the year these had risen by £284 million or 35 per cent—a truly remarkable achievement. We must not, however, delude ourselves into thinking that this can go on or that it would be desirable that it should. During the year we have been in the happy position of receiving payment for our exports at high prices whilst we have been able to obtain our imports at reduced prices, but this is to the detriment of the raw material producing countries who may later on be unable to afford our exports. Equally, our present relaxations have their dangers in that they encourage both domestic consumption and imports and could make exports seem less urgent. This has been the situation in most of the years since the war and it could easily recur. Relaxation can only be countenanced so long as there is some slack in the economy and so long as the old situation of too much money chasing too few goods does not reappear.

That there is some slack to be taken up is seen in the unemployment figures and in the fall in the Index of Industrial Production in 1958, neither of which is a matter for complacency. It is therefore heartening to see some signs of an improvement generally at the end of the year.

It is also very satisfactory to see that the trend in exports is improving and that applies particularly to exports to the United States. The decline in exports to primary producers also seems to have been stopped now that the fall in the prices of their products has apparently ceased.

One feature of the relaxation of restrictions which is of particular note is the course of events following upon the removal of restrictions on hire purchase. This has brought an immediate and very large increase in the sale of all those articles which are peculiarly suited to instalment finance, especially household durable goods and motor cars, and this increase in business so far shows no signs of abating. In this connection we have been pleased to help both our retailer customers and finance companies with some of the additional finance they have required. These sales will work their way through the economy and be of benefit ultimately in many quarters. The rapidity of the increase in sales is also of great interest to the monetary authorities in that it provides a very potent weapon for reverse action if and when that should be needed, but frequent and sudden changes from restriction to freedom and vice versa present grave additional problems for manufacturers whose production is affected by such measures.

NEW MONETARY DEVICE

This, indeed, applies also to Banking, as Bankers are also traders trying to earn a living by their art, though recognising their special responsibilities to the community. It was consequently with somewhat mixed feelings that the Banks saw the setting up of a new monetary device at the time of the ending of the credit squeeze. I refer to the system of special deposits at the Bank of England which the commercial banks can be called upon to provide at short notice, though the present intention is that this course will be taken only when the Banks are very liquid and might be tempted to expand their lending at a time when the authorities considered this to be undesirable.

This new system will, I am sure, only be brought into operation with the fullest co-operation between the two parties concerned and is in the best British tradition of having flexible rules to be used when necessary but altered to suit changing conditions and abandoned if proved to be detrimental. It is infinitely to be preferred to some of the rigid liquidity rules in force in some other countries. I repeat, however, that what we need most of all is reasonable stability if we are to make the best and, in the end, the most rapid progress.

In recent years almost everyone has become inflation conscious and has learned that it seems more profitable and more secure to have one's savings in ordinary shares which have become very popular to the neglect of the older forms of investment in fixed interest securities, notably gilt-edged. The year-end has seen a great increase in the popularity of the Unit Trust which enables the small investor to make use of the services of highly qualified experts in the field of investment and to spread his investment over a large number of leading ordinary shares. The provision of these facilities is wholly admirable, particularly so if it leads to a much wider circle taking the trouble to acquire knowledge of the workings of British industry. At the same time, prices of ordinary shares can go down as well as up and as a rule in the past have tended to fluctuate more than gilt-edged stocks, and this has to be borne in mind.

BANKS' INTEREST IN HP

The year has been an exacting and I might almost say an exciting one for Bankers. It has seen the heaviest restrictions on their activities succeeded rapidly by the greatest freedom since the war. It has also seen the institution of that American speciality, the personal loan, which we are now offering to our customers in suitable cases. Although to us in this country this is a slightly new method of lending there is nothing new in making loans to individuals with or without security with arrangements for regular repayment; indeed, that is the normal method, though hitherto it has been tailored to fit the individual case and where remuneration is received irregularly repayment has come in that way too. However, the habit of payment by regular instalments has become a feature of the age and the Banks have not only welcomed it but also gone further and taken a more active part by acquiring shareholdings in Hire Purchase Companies. In our case, as I have already said, along with the other members of the Three Banks Group, we have taken a 40 per cent interest in The British Wagon Co. Ltd.

CHARGE FOR BANKING SERVICES

I am sure you will want me to say a word on the subject of charges for banking services. We pride ourselves on the fact that all our customers are treated as separate individuals, and it is indeed surprising how different individual needs can be and how varied are the services which a Bank has to offer. A separate assessment is made by our Managers each half-year of the cost of providing the services used by each customer and a charge made accordingly. If the customer thinks the charge is too high the Manager is always willing to explain how it is arrived at and welcomes inquiries. We think that this is a fair method of dealing with the matter and that in the long run most customers will want to have the great convenience that comes from having the call of all the many services which the Bank provides.

INDUSTRIAL CONDITIONS

This has not been an easy year for individual industries. The cotton industry has experienced a particularly difficult year with steep falls in production and turnover in all sections, resulting in the permanent closure of many mills. While the continued increase in imports from the Far East has been a major contributory to the decline of the industry and some contraction was inevitable, a general lack of confidence has aggravated the position. The agreement reached after long negotiations with the Hong Kong industry and the decision pending regarding the Spinners Price Agreement may well restore a measure of confidence and enable the industry to assess more accurately the prospects ahead. Meantime, the contraction in the industry brings many human problems to an area where the employment of married women, who cannot move elsewhere, has been a major factor in the labour force for over a century.

Shipping is still suffering badly from the fall in freights and very many modern ships are laid up as well as even more older ones which seem unlikely to find further profitable employment. As a consequence orders for new ships are few, but shipbuilders still have substantial order books, though they are now becoming anxious about cancellations.

Perhaps the greatest change in fortune has come to the coal industry, which is now closing pits rapidly and has stocks of unsaleable coal lying stored in many places at considerable expense.

Some voices have been raised in criticism of the continued construction of atomic power stations because of the surplus of coal suitable only for use to raise electric power, but I am convinced that the right policy is being followed. Even if the cost of electricity from atomic stations is not yet below

that from conventional stations, it will be one day not very far off, and in any case the lead we now have over other nations in this field gives us the prospect of useful exports quite apart from the new opportunities which research and experience provide for further developments, many of which cannot yet be foreshadowed.

If steel has been feeling the effects of competition and reduced demand, the motor car industry which it supplies has been having a record year, both in total production and in exports. To some extent this is due to the relaxation of hire purchase controls, but exports to North America are a very satisfactory feature.

FUTURE VIEWED WITH CONFIDENCE

I view the future with confidence. Although we now have rather more unemployment than we like, I expect to see this reduced in the coming months, and if some industries are at present finding things difficult these problems should, and I hope will, lessen shortly. Our economy is now more soundly based, the monetary situation both at home and abroad is much more healthy and an air of greater confidence pervades the economic scene.

The year has seen a continued growth in the Bank's business. I would like to express on behalf of myself and my colleagues on the Board to Mr Allman, the General Manager, to the Assistant General Managers and to all the members of the Staff our best thanks for their devoted services throughout the year and our appreciation of their efficiency and enthusiasm.

BROOME RUBBER PLANTATIONS

The twenty-fifth annual general meeting of Broome Rubber Plantations Limited was held on January 7th in London, Sir Lionel Smith-Gordon, Bart (the Chairman), presiding.

The following is an extract from his circulated statement:

Those who followed the course of the market price of rubber during the financial year now under review will not be surprised that there was a reduction in our profits. However, by reason of an increase of nearly 400,000 lb in the crop and a reduction of over 1d. per lb in the cost of production, we arrived at a figure of £64,532, which compared with £74,056 in the previous year, and this result, in the circumstances, must be considered very satisfactory.

Our ability to meet future competition from synthetic rubber depends upon increasing our efficiency, and to do this it is essential to replace ageing trees with modern high-yielding material. We replanted 300 acres during the year under review. Since then we have replanted a further 172 acres, and plan to replant an additional 231 acres in 1959. We shall then have more than half of our planted area under high-yielding pedigree rubber.

With regard to the future I will go no further than saying that I feel reasonably confident. The experience of the past five months has been very satisfactory; the output has been fully maintained, in fact it is a little ahead of this time last year; a further reduction in cost has been achieved, and the price of our commodity has recovered considerably.

The report was adopted.

ANSELLS BREWERY LIMITED

SATISFACTORY SALES OF "THE BETTER BEER"

The fifty-eighth annual general meeting of Ansells Brewery Limited was held on January 12th at Birmingham, Mr A. E. Wiley (chairman and joint managing director) presiding.

The following are extracts from his circulated statement for the trading year ended September 28, 1958:

The year has been a period of continuous rising costs, including wages, materials, and services of all kinds, and you will also observe the higher charge for depreciation. Against these rising costs the group trading profit for the year of £2,500,767, shows a small decrease of £23,839 on that of the previous year, but that the net profit of £1,125,697, gives an increase of £5,997. I am sure you will agree that the results as a whole are very satisfactory.

During the year the sales of "The Better Beer" have been satisfactory, in spite of the very poor summer of 1958. Unfortunately, the increased sales were not sufficient to absorb the continuous rising costs.

MAINTENANCE OF LICENSED PREMISES

As in past years, it has been your Board's policy to maintain the licensed premises, Brewery premises and plant, at a very high standard of efficiency, and during the year no less than £622,000 has been expended, which is £134,000 more than the previous twelve months.

The consolidated Profit and Loss Account for the year under review shows a balance available for distribution of £1,602,320. The Charge for taxation, although not quite so heavy as last year, is still a penal one, amounting to £1,375,070. In this connection I feel it is my duty again to mention the unfair treatment which Companies such as yours receive in that no "depreciation of buildings" is allowed in respect of hotels, licensed premises, and other retail establishments, when making assessments for taxation. This is a matter which the industry as a whole should pursue, and press the Chancellor of the Exchequer to put right.

The net current assets show an increase of £60,726 over last year, the total net surplus being £2,329,435. In view of the heavy capital commitments, your Directors are of the opinion that the liquid assets of the Company for the time being are adequate. I am sure you will feel pleased by the continued growth of the Company.

DE-RATING OF INDUSTRIAL PREMISES

In regard to the future, I must remind you that there is still very increased inflationary pressure of rising costs, and I particularly refer to the fact that on April 1, 1959 derating of industrial premises will take effect, and the benefit of the allowance which has been in operation will be reduced from 75 per cent to 50 per cent. The increased assessment on industrial premises could be serious, but you may rest assured your Board will do everything possible, by way of increasing trade, to offset this extra expense.

Developments in the City of Birmingham are rapidly progressing. The new Inner Ring Road is well in hand, which of course means the demolition of many properties, including licensed houses, owing to the reconstruction of the City centre. We are in negotiation with the Development Companies to obtain suitable sites in their schemes, and we are hopeful that we shall be able to acquire positions which will prove to be beneficial to all parties concerned.

We have already commenced several new houses on new Estates, and in preparing our plans we are mindful of the necessity, which present-day conditions demand, to enable the residents to enjoy their leisure time. I would like to say we have had great support from the Chairman and Committee of the Licensing Justices, who have taken great interest in the plans submitted for their approval. These embody designs for the large "community type" house where the residents can enjoy both dancing and concerts, which, in our opinion, is essential in these new houses.

ALTERATIONS AND MODERNISATIONS

I referred last year to the alterations taking place at the "George Hotel," Solihull. This house was re-opened in February last, and although it has not yet completed a full twelve months' trading, has undoubtedly justified the alterations. I think the residents in that district, and the public generally, are very pleased with the amenities now available.

With regard to Leicester, the trade in this area is improving, and we have opened several new houses, all of which are doing a satisfactory trade, and we feel that the acquisition of The Leicester Brewing & Malting Company has proved a wise investment.

The trade in South Wales fluctuates according to the industrial conditions in the areas which we serve. I must repeat once again that the question of Sunday opening still remains a very sore subject with all licensees who trade in Wales. They do not ask for anything more than to be put on the same footing as Clubs, which are able to open on Sundays, and where many of their customers go as they are unable to obtain their requirements in their usual licensed houses.

In the industrial area of the Black Country, we have opened eight new houses during the past twelve months, and we are continuing our policy of replanning and reconstruction of our older properties so that they will meet with modern requirements.

It will interest stockholders to know that in all we have opened fifteen new houses in the various districts in which we trade, and we have many more in process of rebuilding. We hope these will restore some of the trade lost through the houses in the centre of Birmingham being demolished owing to the replanning of the City.

BENEFIT OF NEW BREWERY AND BOTTLING STORES

We are reaping the full benefit from the new Brewery and Bottling Stores, which have greatly assisted our output and the maintenance of the high quality of our beers. We are now actively engaged in reconditioning and modernising the older section of the Brewery, and re-equipping the old Bottling Stores, which will be completed in time for the summer trade.

The dividend recommended together with the interim dividend already declared, makes the same total distribution as that of last year.

The report was adopted, and a final dividend of 10 per cent on the Ordinary stock, making 16 per cent for the year was approved.

ANNUAL REPORT AND STATEMENT OF THE CHAIRMAN

Hawker Siddeley's Year of Consolidation

SIR THOMAS SOPWITH REPORTS GOOD PROGRESS

GROUP ASSETS NOW £200 MILLION; SALES £250 MILLION; EMPLOYEES 100,000

TRADING PROFITS FROM 'ANOTHER SUCCESSFUL YEAR' WERE £15,191,093

Some months ago an American survey classified our Company as the twelfth largest industrial organisation in the world, outside the United States. When one considers that our assets now exceed £200 million, our annual sales are running in excess of £250 million and our employees number around 100,000, our position and our responsibility as a world leader in industry comes into perspective.

This has been another successful year for our Group. As you know, in recent years we have been following a carefully planned programme of expansion and diversification. This year has been a period of consolidation—and the Accounts show it.

Trading profits amounted to £15,191,093 before taxation and special development expenditure of £2,886,203. This compares with last year's trading profit of £13,753,502 before taxation and special development expenditure of £1,645,019. The net profit attributable to members of Hawker Siddeley Group amounted to £5,118,601.

Your Board is recommending a final dividend on the ordinary shares of 7 per cent less tax, making with the interim dividend already paid, a total dividend for the year of 10 per cent less tax. This rate of dividend has been maintained for the last three years.

Dealing with Canada first, we are disclosing for the first time details of our investment in Canada. This is shown at cost which was £13,062,486. It is interesting to compare this figure with the Hawker Siddeley share of the Canadian net assets which now amounts to £29,329,055. This remarkable growth has arisen because our profits earned in Canada have been ploughed back into the business. It is noteworthy also that on the basis of current market quotations in Canada, the Hawker Siddeley investment in A. V. Roe Canada Limited has a value of approximately £26 million—just about double our original investment.

To turn now to the United Kingdom, as I have said, this has been a year of consolidation marked by the absorption of the former Brush Group into the new Hawker Siddeley Industrial Division. The Brush headquarters organisation has been abolished.

The expansion of the Group both in the United Kingdom and overseas has increased the amounts borrowed from our bankers to finance working capital.

You will have seen references in the press recently to the need to fund these borrowings. In the opinion of your Board the problem is not a pressing one, for two reasons—firstly, that approximately £10 million of it relates to Canada, which can reasonably be regarded as now able to finance its own requirements; and secondly, that the UK bank borrowing is not high in relation to the volume of trading. The position is, however, being kept under constant review by your Board and their advisers, and suitable steps to put the finances of the UK organisation on a satisfactory long-term basis will be taken only at the appropriate time. In the meantime, our main task remains that of completing the consolidation and reorganisation of the Group.

To conclude this financial review, the following facts and figures may serve to give you a general background picture of the Hawker Siddeley Group;

Total Assets exceed £200 million.
Total Sales last year exceeded £250 million of which about £113 million related to the UK companies and about £137 million to the Canadian companies.
Investment in new capital assets during the year exceeded £13 million. Our companies have some 100,000 employees, of which about 60,000 are in this country and about 40,000 in Canada. Last year we paid these employees, in wages and salaries, some £107 million.
For materials purchased we paid some £110 million.
In Taxes, Rates, National Insurance, etc., we paid some £12 million.

All our aviation interests have been merged into one new Aviation Division. To give you a picture of the strength of this new Division, I can do no better than to tell you that of the 182 aircraft flying at 1958 Farnborough Air Show, the show window of British aviation, no fewer than 129 came from Hawker Siddeley.

We have provided the Royal Air Force with its only day interceptor, the Hawker Hunter; the only all-weather fighter, the Gloster Javelin; and its most potent V-bomber, the Avro Vulcan. At sea, the Avro Shackleton III serving with the RAF Coastal Command is recognised as the most effective maritime reconnaissance aircraft in the world, and the Armstrong Whitworth Sea Hawk is in front line service with the Fleet Air Arm.

All our aviation companies maintained a high level of production during the year under review and they are still busy turning out 'Vulcans,' 'Hunters,' 'Shackletons' and 'Javelins.' Our order book, both home and export, is substantial.

But the present defence policy does raise many problems for the future. The aircraft industry is bound to contract if the Government continues with its policy of concentrating on Guided Missiles with the consequent rundown of manned aircraft. The Group, of course, has interests in the Guided Missile field and already has a number of notable successes to its credit with the Armstrong Whitworth Seaslug for the Royal Navy and the rocket motor developed by Armstrong Siddeley to power the Black Knight. In addition, the Avro Stand Off Bomb, a guided missile to be launched from the V-bombers, is actively being developed.

At home our Armstrong Whitworth Argosy, the world's first pressurised turbo-prop freightercoach, is just beginning its flight trials. This aircraft has been financed wholly by the Group as a private venture and it is designed for use as a commercial and military freighter as well as a freighter-coach. We are hopeful of receiving a production order for the military version of the "Argosy" from the Ministry of Supply for RAF Transport Command. This we believe will be the forerunner of more orders both from home and overseas because this aircraft with its capabilities is in a field and in a price class of its own.

Looking to the future, we have a number of new projects in the design and development stage including a novel form of vertical take off close support fighter.

When the policy decision was taken some years ago to expand and diversify, your Group's interests were then mainly in Aviation. That situation has been completely changed and our Industrial activities now account for about 70 per cent of our total net assets.

This achievement has entailed not only the expenditure of a great deal of money with the acquisitions of Canadian Car, Brush and Dosco, but it has also required a great deal of hard work to put these units together, to absorb them into the Company organisation and to reorganise and rationalise their production facilities.

The net result of all this has been that Hawker Siddeley is now an industrial complex of the first magnitude with great inherent strength for future development in many industrial fields.

In a Review such as this one must always ask the question—what about the future?

I feel strongly that we in the Hawker Siddeley Group can look to the future with confidence because we are dealing from great strength. Our business is now diversified to such an extent that it covers coal, iron, steel, alloys, and a very wide field of heavy engineering and power plant as well as aviation, so that we have within our Group not only tremendous resources but also the strength of great diversification. Our resources are deployed in such a way that we can move whichever way trade and commonsense dictates.

Our order book is substantial, our factories, plant and equipment are up to date and we are confident in our ability to continue making good profits in the future. You will not, at this stage of the Group's financial year, expect me to give you more than a general indication of how we are faring in it. I am, however, glad to tell you that compared with the same period last year, our turnover and profitability have been maintained and, subject to unforeseen circumstances, we may expect that the results of the current year will be satisfactory.

With a good year behind us and a promising year ahead of us, I am sure you will want to join me in expressing our thanks to our executives and employees for achieving these successes.

MARTINS BANK LIMITED

COMMENTARY BY THE CHAIRMAN SIR A. HAROLD BIBBY, DSO, DL

INCREASED DIVIDEND AND CAPITALISATION

AN ADVENTUROUS YEAR FOR ENGLISH BANKING

The one hundred and twenty-eighth Annual General Meeting of members of Martins Bank Limited will be held at Head Office, Liverpool, on February 11th. In his statement circulated to members, the Chairman, *Sir A. Harold Bibby, DSO, DL,* writes:

In presenting the accounts for the year 1958 in a new form, it is hoped to give shareholders a clearer picture of the progress and position of the Bank.

The graphs which we have included are intended to give our shareholders an indication of our progress.

Your Board feel that the time has arrived to increase the capital of the Bank and to raise the dividend.

Resolutions will be submitted to shareholders on the day of the Annual General Meeting on February 11th authorising the issue of one new share for every four held on January 24, 1959, which will involve the creation of 5,276,426 new shares and will increase the Issued Capital from £5,276,425 10s. to £6,595,532 by capitalising £1,319,106 10s. of the published reserve. A transfer from the Bank's contingency fund will then be made to restore the published reserve to £5,500,000.

Your Directors recommend an increase in the current dividend from 15 per cent to 20 per cent on the present Issued Capital for the year 1958 by paying a final dividend of 12½ per cent instead of 7½ per cent. In doing so it is the intention of your Board, unless unforeseen circumstances occur, to equalise the interim and final dividends at 8 per cent each, making 16 per cent per annum on the increased capital which will be equivalent to 20 per cent per annum on the present Issued Capital.

Your Board have reviewed the Bank's earnings and growth of reserves since the end of the war and, while internal reserves continually require to be augmented, your Board consider that a larger proportion of our profits can be disclosed and distributed. This does not mean that substantially higher profits have been earned in 1958 than in recent years but rather that some easement in the necessity of allocations to reserves can now be countenanced with safety.

In your Board's opinion such an increase in dividend is warranted and is well deserved by the members who have waited patiently and have not hitherto shared in any marked degree in the general increase in rewards during recent years such as have been made to our hard-working and excellent staff.

The net profit for the year ended December 31, 1958 (inclusive of a dividend of 5 per cent actual from Lewis's Bank amounting to £28,750 net) is £1,050,805 which compares with £901,402 in 1957. The past year has been a period of steadily falling money rates with no less than five changes in Bank Rate from the peak of 7 per cent at the beginning of the year down to 4 per cent at the end of December. Despite this, conditions have been generally favourable to our operations; our deposits have expanded; our advances show a satisfactory rise but general expenses have also shown a substantial increase and have largely offset the increased earnings.

Total advances inclusive of those made under the new Personal Loans Scheme now stand at £107,498,777 compared with £91,487,280 a year ago and may well continue to rise and for this reason, as in previous years, it is still considered prudent to maintain a high liquidity ratio which we consider important in the overall direction of our affairs.

Our total liquid resources as at December 31st were £123,208,616 (1957—£137,319,136) and the ratio of these resources to our deposits is 36.15 per cent compared with 41.01 per cent; the drop in the percentage ratio reflects the recent increases in lending.

With the lifting of the credit squeeze the return to the full exercise of lending, one of the bankers' traditional functions, is welcomed and the effect should be beneficial to our future earnings.

The total of our Quoted Investments has varied very little during the year; they continue to be valued at or under market prices. Over 99 per cent of the total are British Government securities redeemable at fixed dates, the majority maturing within six years.

The increase of £1,500,000 in our Investments in Subsidiary Companies and of £495,336 in Trade Investments is due to the interests we have acquired in Lewis's Bank Limited and in the Mercantile Credit Company Limited respectively.

Current, deposit and other accounts stand at £339,265,701 (1957—£333,948,312) and total assets at £373,781,066 (1957—£366,289,158); both these items constitute records.

THE DIRECTORATE

I, with my two Deputy Chairmen, have felt for a considerable time that it would be to the advantage of the Bank to have an additional Deputy Chairman and I am glad to report that in December Sir John N. Nicholson, Bart, CIE, agreed to accept this added responsibility and was elected a Deputy Chairman; I am sure his appointment will add strength to the Bank.

Earlier in the year we welcomed Mr Philip E. Bates, who is closely identified with Shipping and Merchant banking, to our deliberations on the General board and the Honourable M. A. R. Cayzer joined the London board in the place of Sir W. Nicholas Cayzer, Bart, who felt it necessary to relinquish his seat owing to pressure of other business. We are also pleased to have the assistance of Viscount Walberton on our Manchester board. In April last we lost through death the valued services of Mr P. H. Muirhead, CBE, who had been a member of the North Eastern board for a number of years.

During the year Mr C. Whiteley was appointed Assistant General Manager of the Bank and is stationed in London, and, following the retirement of Mr G. C. Dresser after 44 years' distinguished service, Mr L. J. Walton became North Eastern District General Manager.

NEW INTERESTS

It has been an adventurous year for English banking and, as will be seen from the foregoing figures, we have taken full advantage of the developments made possible by the easing of the restrictions imposed during the period of the credit squeeze.

For some years it has been felt generally that there were useful services which the banks could render to those who were not already fully using the banking system. No major developments in this direction could be made while the credit squeeze was in operation, but it was clear that with the country's improving economy these restrictions could and would be lifted.

Early negotiations were, therefore, started in anticipation to acquire a substantial participation in the hire purchase business. This culminated in an equal joint venture with the Westminster Bank to subscribe for new shares in the Mercantile Credit Company Limited which will ultimately result in each bank holding 20 per cent of the paid up capital of this company which is one of the leading and most experienced in this specialised business.

Altogether it is a most happy outcome and the final developments may well be far reaching.

In July 1958 Martins also acquired the full share capital of Lewis's Bank Limited which has nine branches in the department stores, including Selfridges, of the Lewis's Investment Group.

This has brought us over 130,000 additional new customers, most of whom had no other banking association and it is hoped and anticipated that this banking adventure will develop further.

In addition, the Personal Loans Scheme has been introduced which it is felt will provide a welcome facility for those who require this particular type of advance. It is as yet early days to assess to what extent this service will be used but it has made and continues to make steady progress.

All these schemes which have only been possible with the easing of the credit restrictions are a serious attempt to reach those who so far had not availed themselves of the normal banking services.

"DRIVE IN" BANK

Since the last report twelve new branches have been opened which with the nine Lewis's Bank branches raises the combined total of our branches to six hundred and thirty-three.

From the above it will be seen that Martins is pursuing a vigorous programme, all under our decentralised system, which ensures prompt and personal attention to our customers' problems and a local understanding of their requirements.

A new branch will be opened shortly which will incorporate "drive in" banking facilities as a contribution towards easement of transport problems for our customers.

So much for our domestic endeavours made possible by our country's improved financial position and the belief that our national and international trade, on a long term outlook, will continue to expand as world requirements continue to grow.

CONFIDENCE IN THE FUTURE

The courageous steps taken by our Government in 1957 arrested the downward trend in our national fortunes and today with our foreign trade in better balance and with the added degree of convertibility of sterling and the co-operation of other European countries in freeing currency restrictions the signs are all hopeful.

This easement in monetary relations should materially assist in the negotiations for the Free Trade Area which still remains the best hope for the expansion of European trade including our own.

If the new moves bring about a sustained sense of confidence trade prospects would certainly look brighter than for many years past.

Provided a check can be held on inflation we can face the future with some optimism. There is always the danger that the recovering convalescent may overtax his strength and extreme care will have to be taken to ensure that no relapse occurs by indulging in some of the practices which brought about the original malady.

A constant reminder that this nation or any other cannot have, nor is it entitled to have, more than it earns is ever necessary. An exuberance of spending could easily lead the country into even graver financial difficulties than those from which we are just recovering. Capital can only be increased from genuine savings, whether Governmental, industrial or individual, but capital investment can also be made by borrowing and it is this aspect which has to be so carefully watched.

The Government have now decided to alter their methods of controlling bank lending should this again be necessary.

For a number of years the banks have received "directives" which they faithfully followed in the spirit as well as in the letter. This system worked but it was agreed that that method should not continue indefinitely. In future, when necessary, in times of monetary difficulties the Bank of England can call upon the Clearing Banks and certain others to make special deposits at the Bank of England which would reduce their liquid assets immediately available and thus restrict the ability of the banks to make new loans for the time being.

The Radcliffe Committee, the result of whose deliberations we await with the greatest possible interest, may have other ideas to suggest.

PROSPERITY THROUGH MUTUAL UNDERSTANDING

The year under review, like many of its predecessors, has been marred by strikes, but this year more than previously the disputes have been unofficial strikes or inter-union quarrels largely over demarcation of work claimed by different unions.

With new techniques forced on industry, if it is to keep up to date and competitive, changes are inevitable but the problems involved are surely not insolvable without bringing an industry to a standstill, which achieves nothing.

Both sides of industry have not yet acquired the belief that the welfare of both employers and employed is wrapped up in the prosperity of their industry. Generally, in industry unless adequate profits are made there is no money available for new tools or even modernising old ones and, ultimately, the ability to pay salaries and wages will be endangered. In some quarters dividends are often considered almost shameful but unless these are on a level to attract new capital industry will be prevented from expansion, building new factories and so forth.

The British workman is inherently sound and logical in his thinking if the position is put squarely before him, provided that by good relations and close contact with the management he can be satisfied that no one is trying to trap him with fair words.

This mutual confidence cannot be built up overnight. It can only come from trust engendered by experience over a considerable time.

The lack of this may be due to the speed at which we live when no one has sufficient time to bother enough with the outlook of the other fellow, all being too preoccupied with their own point of view.

It is surely worthwhile for both employers and employed to make a concerted effort to be in very much closer contact so that an atmosphere can be built up in which mutual trust and understanding can prosper.

The employees' leaders would find their work very much easier in this atmosphere in their dealings with the employers and their position infinitely stronger with their own members.

So much of our industrial trouble has arisen by the rank and file refusing to carry out contracts made by their accredited representatives, resulting in unofficial bodies being set up and the authority of their official leaders being flouted by self-appointed men calling out their fellows in unofficial strikes.

Every industry and each business would have to work out its own particular methods and form of approach, but without doubt the time spent where this was done seriously and successfully would bring happiness and prosperity where otherwise there might well be mistrust and strife.

In the banking sphere the employees themselves through their own elected representatives of their staff associations have a ready access, freely availed of, for consultation on conditions of employment.

OVERSEAS TOUR

During the autumn, in company with Mr Conacher, our Chief General Manager, and Mr Wetherell, our Liverpool Overseas Manager, I completed an extensive tour of our business connections in the United States of America, Canada and Mexico.

I am happy to think that we have cemented many old friendships and established many new connections all of which should add to the mutual benefit of our friends and ourselves.

May I close my remarks by recording my thanks to my colleagues on our various Boards, to our management and staff from Mr Conacher to the last joined recruit for their loyal and enthusiastic work during the last year?

ORION PROPERTY TRUST LIMITED

INCREASED EARNINGS

The fifteenth annual general meeting of Orion Property Trust Limited was held on January 13th in London, The Lord Colgrain, MC, chairman, presiding.

The following is an extract from his circulated statement for the year ended September 30, 1958:

The profit, subject to taxation, is £94,054 compared with £66,984, an increase of £27,070, due to an increase in net property earnings amounting to £178,185 compared with £147,011. There is an item of £4,064 for Special Expenditure in connection with the 1957 Rent Act, and we have transferred £15,000 to Reserve for Repairs and Contingencies to meet the cost of Special Repairs carried out for the benefit of tenants, to encourage them to agree to our new rental proposals and to ensure that we are providing the best possible services. The total cost of repairs should not be so high in the future.

Our policy in carrying out these special repairs, and in associating ourselves with an action whereby a clear direction from the Courts as to the meaning of certain sections of the Rent Act was obtained, has resulted in an almost complete absence of complaints from tenants concerning our new rents.

Rental income should rise again in the current year and there should be a further saving in profits tax. The policy will be to seek to expand the portfolio either by buying existing buildings or by arranging for new properties to be built.

The report and accounts were adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to: The Company Meetings Department, The Economist, 22 Ryder Street, S.W.1.

THE ROYAL BANK OF CANADA

TAX FLEXIBILITY AND WIDER CONTROL NEEDED TO CURB INFLATION

RISK CAPITAL ENTITLED TO ADEQUATE REWARDS

MR JAMES MUIR ON SIGNIFICANCE OF MOVE TO STERLING CONVERTIBILITY

The Ninetieth Annual General Meeting of shareholders of The Royal Bank of Canada was held on January 8th at the Head Office in Montreal. Mr James Muir, Chairman and President, reviewing Canadian economic trends in the preceding 12 months, said:

"We seem to have reached the economists' hell on earth: inflation and unemployment. The alternately 'creeping' and 'surging' inflation is still the pattern—in recovery as well as in recession. I believe that this chronic inflation is the greatest single threat to Canada's economic development."

WIDER CONTROLS NEEDED

"Regardless of the skill and energy of the monetary authorities," said Mr Muir, "an effective monetary policy is impossible as long as consumer credit is free to move in the opposite direction. The Central Bank contracts credit in booms and expands in recession. Unregulated consumer credit expands in booms, contracts in recession. Those dependent on bank credit have to bear the full brunt of credit restrictions while others enjoy a spending spree. To break up this unholy alliance of injustice and futility, I have repeatedly urged that monetary and credit control should embrace a wider area of our financial world than they now do."

MORE FLEXIBLE TAX SYSTEM CALLED FOR

Mr Muir suggested that fiscal experts should devise a system that would minimise the role of the business cycle in determining the size and nature of government sponsored economic activity. "Surely," he said, "a more flexible tax system could be devised which would adjust tax rates to counter cyclical disturbances, not only quickly and effectively but without arbitrarily changing the relative importance of the government sector in our economic life. Such a system, combined with a more comprehensive coverage by our monetary authorities in the regulation of credit, could I think, provide an economic climate for high-level employment and economic growth and at the same time protect the value of our currency from the ravages of chronic inflation."

RISK TAKER DESERVES REWARD

"An important condition for economic development in any country," said Mr Muir, "is adequate reward for productive effort and risk. Greater equality through taxation has much to recommend it, up to a point. That point is where the incentive to produce is so adversely affected that the nation's total product falls short of its potential, and economic growth is retarded. To achieve a fair and economic balance between equality and incentive in taxation is, of course, a tremendous task. Nevertheless, in the interests of Canada's economic growth, I would like to urge that the government should make a thorough study of our complex tax structure with a view to improvement both in the distribution of the burdens and in the allocation of the net rewards for productive activity. If risks are taken to expand production in some direction, the opportunity for a correspondingly large reward is not only prerequisite, but justified to the extent of the risk-taker's contribution to general economic welfare."

SIGNIFICANCE OF STERLING CONVERTIBILITY

Mr Muir mentioned that one of the most important devices for ensuring the mobility of investment funds, capital goods, consumer goods and services among the nations of the world is a freely operating foreign-exchange market. In this context two recent events of special interest concern the French franc and the pound sterling.

"Devaluation of the French franc was inevitable. Now it remains to be seen how stable the new rate will be. Naturally this will depend upon how firmly the internal economy of the country can be built up and upon how faithfully the people will accept the new restrictions they must endure to come through successfully.

"The immediate significance of Britain's move towards convertibility must not be exaggerated. All she has done is to make formal what has informally been more or less the case, viz, put Canadian and US sterling, so-called, and Transferable sterling in the same bracket. This means that all non-sterling area holders of pounds are now in the same boat, which is to say they can freely dispose of their sterling for dollars or any other currency at the going rate within the support points established by the British authorities, viz $2.78 to $2.82 US.

"One important outcome is that London can deal freely and directly with all currencies and again get back to where she was before the war as the most important foreign exchange market in the world.

"The great hope is that these latest developments will hasten the day when the UK can throw all shackles overboard and make the pound free and fully convertible for everybody inside, as well as outside the sterling area."

AID TO UNDERDEVELOPED COUNTRIES

"Why are so many 'underdeveloped countries' very old countries—what has held them back?" concluded Mr Muir. "I believe the answer lies in certain cultural and moral values which are inconsistent with economic progress. This does not, of course, mean that the West has a superior moral code—far from it. But the apparent rigidity of certain customs, traditions, taboos and attitudes towards economic activity make me pessimistic. Aid is useless unless it leads to sustained, and self-sustaining, development; and fundamental social changes in the underdeveloped country are required before the spirit of enterprise is sufficiently strong to achieve what we might call 'escape velocity' independent of the temporary rocket-thrust of economic aid. Without these fundamental changes, greatly expanded aid fanned by overenthusiasm, if not emotional compulsion, may have perverse effects, not only in the inflation-ridden West, but in the underdeveloped countries themselves.

"I feel, too, that the identification of progress with industrialisation may lead to wrong policy at this stage. Before Britain had her industrial revolution she built up what was literally a grubstake by having an agricultural revolution. The underdeveloped countries appear at times to be attempting an industrial revolution based on a totally inadequate and inefficient agricultural economy."

THE LANCASHIRE COTTON CORPORATION LIMITED

MR R. M. LEE'S STATEMENT ON TRADING CONDITIONS AND PROSPECTS

The Thirtieth Annual General Meeting of The Lancashire Cotton Corporation Limited will be held in Manchester on February 12, 1959.

The following is an extract from a Statement circulated by Mr R. M. Lee, the Chairman, with the Accounts for the year ended October 31, 1958.

ACCOUNTS

There has been a reduction in the Group Trading Profit which this year amounts to £2,735,243 compared with £4,021,239 last year. This reduction is entirely attributable to the trading conditions which have prevailed throughout the year and to which I refer below.

The Board has decided to allocate to General Reserve £400,000 and also £400,000 to Replacement of Fixed Assets Reserve, and recommends a final dividend of 12½ per cent, less tax, on the Ordinary Stock, which is the same as last year, and with the interim dividend of 5 per cent, less tax, paid in August gives a total of 17½ per cent, less tax, for the year. The amount carried forward is £1,025,822, of which £147,495 is retained in the accounts of our subsidiaries.

TRADING CONDITIONS

When I reported to you last year, I indicated that the outlook was somewhat uncertain and depended largely upon the ultimate decisions regarding the continuance of the Yarn Spinners' Association, the European Free Trade Area and the importation of yarn and cloth from Asian sources.

Throughout the trading period covered by our accounts, no decisions were reached on any of these matters, and the resulting uncertainty undoubtedly had an adverse effect upon the whole industry, and was conducive to a lower level of activity in general.

Negotiations to obtain a voluntary limitation of imports to the United Kingdom of cotton textiles from India, Pakistan and Hongkong have dragged wearily along throughout the year. In referring thus to these negotiations, I would not wish it to be thought that I was in any way criticising

the efforts made by those who were entrusted with the onerous task of representing our industry. On the contrary, I would like to pay tribute to the patience, perseverance, and tenacity which they have exercised, and to express the hope that these may yet be rewarded by a satisfactory agreement being concluded.

I believe that this type of problem is likely to arise again and again and will not be confined to the cotton textile industry, and that some other way of reaching a speedy solution will have to be devised which will reconcile the desires of the under-developed countries for rapid industrialisation with the interests of long established industries in countries with higher living standards.

NEW DEVELOPMENTS AND SUBSIDIARIES

We have continued to pay close attention to all new developments in the textile industry and have tested and adopted many new techniques in the spinning of yarns from raw cotton and man-made fibres, and it is our intention to continue and extend these efforts whenever possible.

We have also continued our policy of diversifying our interests and in pursuance of this policy, in May we acquired the whole of the issued capital of the Accrington Brick & Tile Company Limited, and in September, Smith & Calverley Limited, of Huddersfield, was added to the Group. The latter manufactures fine woollen fabrics for the ladies' fashion goods trade. We believe that these companies with their skilled and experienced managements and reputations for excellent products, are likely to prove worthy additions to our Group of Companies.

YARN SPINNERS' ASSOCIATION

The most important single event for the cotton textile industry during the past year has been the hearing by the Restrictive Practices Court of the Yarn Spinners' Association case. This hearing, which commenced on October 27th, lasted for six weeks, and at the time of writing this Statement the Court has not yet delivered its judgment. From the comments I and my predecessor have made in past years regarding the Yarn Spinners' Association, you will not be in any doubt as to the importance to your Company of the decisions reached by the Court.

THE OUTLOOK FOR THE COTTON SPINNING INDUSTRY

Despite the fact that the contraction in the number of spindles installed in the United Kingdom Cotton Spinning Industry has continued at considerably more than one million mule equivalent spindles in each year for a number of years, it is apparent that further contraction is still urgently necessary. There is no doubt that this contraction will continue to take place, but it may be that the best interests of the industry would be served if some means could be devised to expedite the process, in order to bring about quickly a balance between productive capacity and potential demand. This could be achieved by an organised scheme to deal with the excess capacity.

This Corporation was formed in 1929 to bring about a measure of rationalisation in the industry and it is still ready and willing to play an active part in any such measures. Your directors have these matters constantly in mind and will do everything possible to promote the best interest of the industry in general, and it is hoped that in these endeavours they will be joined by others engaged in the industry.

JOHN SUMMERS & SONS LIMITED

ELEVEN YEARS OF STEADY PROGRESS

MR RICHARD F. SUMMERS ON THE OUTLOOK

The annual general meeting of John Summers & Sons Limited, will be held on February 5th at the Iron and Steel Institute, 4 Grosvenor Gardens, London, S.W.

The following is the circulated statement of the Chairman, Mr Richard F. Summers:

Believing as we do that the form which we adopted for our accounts some two or three years ago sets out the affairs of the Company as clearly and simply as possible under modern conditions, we have continued on the same lines this year, except for the fact that we have added at the end a table which shows the expansion that has taken place in production over the last eleven years, and a number of the more important Balance Sheet items during that period. I hope you will agree that these comparisons are interesting, and show the very considerable growth that has taken place. Coke production has increased more than three times, pig iron nearly four times, and the output of steel ingots has been doubled. At the same time the fixed assets have increased by £50 million, and the trading surplus by approximately £10 million.

Another feature that these figures bring out is that the growth has been steady and progressive, and has, in my opinion, borne out the forecasts which we have made from time to time as to what we hoped, and expected, to achieve. I should perhaps remark in passing that the relatively small reduction in the output of coke and pig iron in 1958 compared with 1957 is chiefly due to the lower level of operations at the Shelton Works at Stoke-on-Trent and partly to the fact that No. 1 blast furnace at Shotton was off production for nearly two months for relining after working for over five years.

VALUE OF CONSERVATIVE FINANCE

A further point which is borne out by the figures is the very substantial amount that we have retained out of our surpluses; had it not been for this policy the position of the company today would not have been nearly so favourable. I know that the question of the proportion of its surplus which a company should retain for the expansion and modernisation of its plant is a controversial one; I also know that it is not easy, when speaking about it, to be dogmatic—the answer cannot necessarily be the same for every industry. As far as the Steel Industry is concerned there are one or two special factors which must be taken into account. Firstly, it is perhaps one of the largest consumers of capital; modern equipment and plant are complicated and very expensive, and during the period since the war the technical advances have been rapid and numerous.

Secondly, it must be remembered that the maximum prices at which steel products may be sold are fixed and controlled by the Iron and Steel Board. In arriving at these prices the Board takes into account a number of points, one of the most important of which is that if the industry is to expand and modernise itself in line with the growing needs of the Country as a whole, the prices at which the Companies should be allowed to sell their products should enable them to provide a reasonable proportion of their future capital expenditure out of their current earnings. I do not think this policy can be criticised, because a company that keeps up to date, and wherever possible expands its capacity, must in the long run be acting in the best interests of all concerned. As far as this company is concerned, we have been spending very large sums of money; the table in the accounts to which I have referred bears out this fact, and also shows how very much the assets and earning power of your company have been increased by this expenditure.

STRONG COMPETITIVE POSITION

I hope you will agree with me that so far in our expansion dividend policies we have struck the happy medium. When we have completed the present scheme—which we anticipate will be towards the end of 1959, or at any rate early in 1960—the company will be in a strong and highly competitive position. It will then be a question of building up our production until we reach the target figure of around 2 million tons of steel ingots a year. Provided the demand for our products continues we should be able to start increasing deliveries of sheets immediately after the initial running in period of the new equipment has been completed, and with this increase in deliveries I would hope there would be a corresponding increase in our trading results.

From my own experience in the Steel Industry, it is unwise, except in particular circumstances, to make categorical forecasts about possible future expansion. Whilst we are now in sight of the end of our latest big scheme, we must always be on the look-out for ways and means of improving our efficiency and keeping our plant abreast of modern developments, and, should circumstances justify it, be prepared to embark on further expansion. We are financing our present scheme partly from the issue of Ordinary Shares which we made in May 1957, partly by Bank borrowings, and to a very considerable extent out of our own resources.

It will naturally be our desire to pay off our indebtedness to our Bankers as soon as possible, and as things stand at present the Unsecured Loan Stock falls due for repayment not later than 1964. If our hopes are realised the shareholders would be entitled to expect some reward for their patience during this growth period. Accordingly your Board would hope to be able to make appropriate recommendations when the programme which I have outlined above is complete, assuming of course, that the conditions then prevailing allow them to do so.

FUTURE PROSPECTS

The year which lies ahead of us may well be somewhat difficult, as it will not be possible to install all the new pieces of equipment without some interference with our normal production. The whole operation has, however, been very carefully planned, and we are determined that this dislocation shall be kept to the absolute minimum. We do not anticipate that there will be any significant increase in production and deliveries during the current year, but, as it would appear at the moment that the demand for our products is likely to continue at a high level, I am hopeful that when we present the account of our operations for the year ending September 1959 we shall be able to show figures somewhat similar to those which are before you now. In effect what I am saying is that I do not think that in the current financial year we can expect to see the same rate of progress as has taken place over the last three or four years, but, as I have previously mentioned, in the absence of any unforeseen circumstances I would expect the upward trend to start again in the latter part of the financial year 1959-60, with a further substantial improvement in the year 1960-61.

Currently in the home market the demand for sheets remains brisk, and, as I have already said, present indications are that at any rate for the next few months this state of affairs is likely to continue. In contrast, however, conditions in the export market are not so favourable; competition from Continental makers is now very keen, and there has been a substantial drop in prices.

SUBSIDIARY COMPANIES

I have already referred briefly to the reduction in output of pig iron and coke at Shelton. Here, where we make sections, joists, rails and other heavy steel products, there was a very marked falling off in demand, especially towards the latter end of the financial year, and great credit is due to the management there for the fact that in spite of these difficulties they were able to produce satisfactory financial results. Unfortunately, there are no immediate signs of any improvement, but every effort is being made to secure orders, and to effect whatever economies are possible.

Our Brick Works have also had a somewhat difficult year, with a smaller demand in some areas and keen competition in the building brick industry. The same sort of conditions also prevailed on the refractory side of the business, but here a large percentage of the production is used at the Shotton steelworks, and I am glad to be able to report that the quality has remained at a high level, and the supplies have been of considerable assistance to us. Labour and fuel are by far the biggest factors in the cost of producing bricks, and we are doing all we can to see how economies in these directions can best be effected.

NATIONALISATION

I dealt with this subject at some length in my statement last year, and made it quite clear that we were bitterly opposed to the nationalisation of this company and of the Steel Industry. I put forward certain arguments at that time, and you may remember that we circulated a copy of an article entitled "Leave Steel Alone" which I wrote, and which appeared in the "Sunday Times" on February 23, 1958. You may have noticed recently that one or two organisations outside the Steel Industry have published carefully considered documents on the subject of nationalisation. They come down very firmly on the side of leaving the Steel Industry alone, and are against any extension of the doctrine of nationalisation.

Our views are just the same as they always have been. We are still firmly convinced that the Industry under the present organisation can serve the Nation better than it could as a State monopoly, and we, who are responsible for the conduct of this business feel that it is our duty to take all the steps that we are legitimately entitled to take to try to convince people that the best interests of the Nation are served by leaving the Steel Industry as it is, operated under private enterprise, controlled by people who have spent the whole of their lives in steel, who have built up an unrivalled reputation for labour relations and good management, and have proved that they are fully aware of their duties to their customers and to the economic well being of the Nation.

TRIBUTE TO EMPLOYEES

In conclusion I should like to pay tribute to all those employed by the Group for their contribution to the year's results. The friendship and mutual understanding which have been such a feature of this company throughout its history remain strong. This is gratifying to me and to my colleagues for there is still much work to be done, but with so many willing helpers in the organisation I feel sure that we shall overcome whatever difficulties may lie ahead of us.

TATE & LYLE, LIMITED

AN ANALYSIS OF INCOME AND EXPENDITURE IN 1958

	£	£	*Proportion of each £1 of Income* s. d.
GOODS AND SERVICES PURCHASED FROM OUTSIDE :—			
Raw Materials (including £19,854,674 Duty, Levy, etc.)	102,084,637		15 10½

COMPANY AFFAIRS

HAWKER SIDDELEY

WHILE the full accounts of Hawker Siddeley left the impression that a capital issue of some kind could not be long delayed, they also suggested that this issue, when it came, would not fund completely the £10½ million in bank overdrafts in Canada and the £23 million in this country. The impression created by the full accounts has contributed to the recent firmness of the company's £1 ordinary units; they now stand at 31s. 6d. and yield, on the maintained dividend of 10 per cent, £6 7s. per cent.

Now shareholders have been told that the group is intent on raising about £15 million. With the air of an actor throwing away his lines, the chairman, Sir Thomas Sopwith, said at the annual general meeting that talks had begun about a £15 million issue of a convertible debenture stock. Thus the group will fund nearly half of its total indebtedness and will be financing permanently something more than the "hard core" of its indebtedness—the £10 million owed by the Brush Group—in this country. A convertible debenture issue may look from the company's standpoint the ideal solution of its financing problems, promising shareholders a fixed rate of interest while the process of reorganisation and consolidation is being completed and a share in the equity when the group's new interests really begin to pay off. Nonetheless, the directors have drawn a bow at a venture, for institutional investors are already having second thoughts about convertible debentures. It is to these investors that Hawker, just as any other big borrower must, has to look for support and it remains to be seen whether they will agree that this is the exceptional case where a convertible debenture is justified. The directors will no doubt explain in time why they have chosen this method of raising new money when a rights issue of ordinary stock for a smaller amount seemed at least theoretically possible.

A convertible debenture, by postponing the day when the equity is diluted, will give the group an opportunity of tackling its "main task" of completing the "consolidation and reorganisation" of its new interests. But the directors seem to be absolutely convinced of the rightness of their decision to diversify the group so much that its industrial activities now account for about 70 per cent of total net assets. Diversification of this radical order means, Sir Thomas suggests, that the group can deal from strength and can "move whichever way trade and common sense dictates." Looking at the more immediate future, he says the order book is "substantial" and the plant and equipment are "up to date" and he is confident of the group's ability to go on earning "good profits." So far in the current financial year turnover and profits have been maintained, and Sir Thomas expects the full year's results to be "satisfactory." This, as a whole, is a cheerful sounding report from a group that has invested large sums of money in ventures far removed from its traditional business of making aeroplanes and that has had to face up to big new managerial problems. And it is, of course, DOSCO that is the crucial test for the Hawker Siddeley management.

DISCOUNT HOUSE PROFITS

THE sharp decline in money rates from the abnormal peaks reached in 1957 has evidently affected the earnings of the discount houses even more favourably than it did those of the banks. A discount company, unlike a deposit bank, has to pay interest on virtually the whole of the resources it employs in financing its portfolios of bills and bonds; and when rates are falling the decline becomes fully effective almost immediately upon interest payable but does not affect interest receivable until the bills and bonds in portfolio mature and have to be replaced. In a phase of falling rates, therefore, the true profit margins on running the portfolios are substantially wider than the current margins between money rates on the one hand and bill rates and bond yields on the other. This factor, plus the associated recovery in the market value of short bond portfolios, is clearly reflected in the results announced by the three large discount houses that make up their accounts at end December. Each of the three reports a substantial increase in profit and each is either paying or foreshadowing an increase in dividend. However, these increases are no more than the market expected: in each case the shares dropped a little on the announcement, though the losses were subsequently made good.

The **Union Discount,** giant of the market and the only one of the big houses to have maintained its dividend through the difficult years since 1954, is repeating its payment of 12½ per cent for 1958; but the directors propose to make a scrip issue of one for five (capitalising £1,108,800 of reserves) and hope to maintain the present rate on the increased capital. Thus the distribution for 1959 should be the equivalent of 15 per cent on present capital. The Union shows a big rise in profits, from £415,253 to about £550,000—the highest yet. The carry forward is raised from £917,295 to £1,069,000. The **National Discount,** as reported last week. raised its dividend from 10 to 12 per cent (back to the 1954 level). Its profits show a big rise, but, as at **Alexanders,** they are still well below their 1954 level. Alexanders is paying 7½ per cent, after last year's cut to 5 per cent; but the rate in 1954 was 12½ per cent. Profits have recovered smartly from £50,900 to £166,943, after provision for depreciation of securities—which is now fully covered in the balance sheet. The carry forward is up from £142,000 to £198,543.

BORAX (HOLDINGS)

AS Borax (Holdings) has been prolific in quarterly statements of profits and interim progress reports from its directors, its preliminary statement for the full year to September 30th contains few surprises for investors. But the few new facts which do emerge make depressing reading. The ordinary dividend, paid out of the reserves of the parent company in this country, is left unchanged at 5¼d. per 5s. unit—just as it was expected it would be. The trading profits of the group over the full year have fallen from £2,970,780 to £1,624,997 and its net profits have more than halved, dropping from £1,203,237 to £573,976. This means that trading profits in the last quarter of the financial year amounted to only £453,227 and thus ran below the profit of £592,813 earned in the third quarter and the one of £533,382 earned in the second quarter. In a supplementary report to this statement the chairman, Lord Clitheroe, says that though borate sales "are as great as they have ever been" not all the difficulties in bringing the new plant at Boron into production have yet been overcome. On the other side of the business, Lord Clitheroe describes the immediate future of the potash industry as being "far from bright." Shareholders already know of the passing of the first dividend by the subsidiary, United States Borax and Chemical, in respect of the current year. The Borax 5s. units now stand at 16s. 10½d. and yield only 2.6 per cent. These units in 1955 and 1956 were bid up to fantastically high levels. As yet the new developments put in train by the re-organised group have not produced the results that were discounted in that boom.

LOMBARD BANKING

THIS vigorous company has stood apart from the other big finance houses in their affiliations with commercial banks: instead, it is spreading its interests through the Commonwealth and is seeking to absorb other smaller finance houses in Britain. Its latest acquisition, following the purchase of Awley Finance from Vactric last summer, is Equity Credit. This medium sized company has been bought from Mr Bernard Sunley and his associates, in exchange for 421,053 new Lombard ordinary shares of 5s. (the present shares stand at 21s. 3d.) plus £200,000 in cash. The net profits of Equity Credit in the year to end-February, 1958, were £56,000, and group assets at that date were £2,238,384. The main business was in vehicles, plant and machinery; and the group had subsidiaries in the Bahamas and Jamaica.

Thus Lombard acquires interests in the West Indies, adding to those in Australia, New Zealand, Rhodesia, Uganda and Singapore. Another valued aspect of this acquisition is the experienced staff —Mr R. S. Davenport is continuing as managing director of Equity Credit. Also, Lombard may now be hoping to get some of the financing business for Caterpillar tractors of Blackwood Hodge, of which Mr Sunley is chairman.

UNITED DOMINIONS TRUST

THIS giant finance house is broadening its business further. It has purchased, for £636,000 from private holders, the capital of British Trusts Association, a member of the Issuing Houses Association. UDT was already engaged in issuing business, and represented in the association, through its ownership of Old Broad Street Securities. The new acquisition will strengthen its hand in long-term financing.

RADIO RENTALS

THE demand for rented radio and television receivers has thrived but the industry has not been the authorities' favourite child. The curbs were first put on hire purchase and then they were put on rentings. Last year, however, controls over renting were completely removed. Controls or no controls the renters have done remarkably well and in particular Radio Rentals has expanded at a cracking pace. For much of its financial year to August 31st the renting controls were still in force yet the number of installations carried out by the group rose by 15 per cent, with the written down value of rented equipment rising from £5 million to £6.9 million over the year. The group has always traded on a narrow margin of liquidity, and pressure has been relieved—the authorities permitting—by a stream of rights issues. In February, 1958, when the Treasury still frowned on the raising of new capital by HP or renting companies the group raised money from its shareholders by the indirect and uncontrolled route of a "shell" transaction. Permission has now been obtained from the Treasury for a straightforward rights issue of 1,600,000 ordinary shares of 5s. each at 15s. per share. It has been the practice of Radio Rentals to inject a substantial bonus element into its issues and now does so again with this one for five rights issue, which at the current market price of 33s. 9d. puts a value of 3s. 6d. per share on the rights.

The new issue will bring in about £1,200,000. This should ease the strain on finance, as shown in the latest balance sheet by the excess of £1,211,709 in current liabilities over current assets. Profit retentions are inevitably an important—though not self-sufficient—source of the group's finance. The advance in gross profits from £3,350,688 to a record level of £4,194,643 was finally reflected in a rise in net profits from £613,410 to £804,658 and this enabled the directors to transfer £750,000 (against £405,000) to general reserve. The ordinary dividend has been set at 15 per cent; this is equivalent to the 1956-57 payment, but in addition a special interim payment of 5 per cent has been declared. The existing shares are thus on a dividend basis of 20 per cent and at their current price of 33s. 9d. they yield only 3 per cent. That dividend will no doubt be at least maintained on the increased capital and thus the new shares are offered at a yield of 6¾ per cent. The issue, in fact, sweetens the yield for investors, though in considering the new offer they will note that Mr P. Perring-Thoms, the chairman, says that the present high peak of public demand will undoubtedly level off in due course.

JOSHUA HOYLE

ANOTHER tough year seems to be in store for Joshua Hoyle & Sons, in the year to September 30th last. The statement by Mr Ducket, the chairman, issued in December with the full accounts made no direct comment on future prospects but at the annual general meeting Mr Enright, the deputy chairman, argued that the concentration of trade into the hands of big buyers such as chain stores and mail order houses, has made the cotton industry more vulnerable to recession than ever before. Buying, he said, had become "disorderly and spasmodic," making it impossible to maintain an even flow of production.

The company's difficulties, shared by others in the cotton industry, are of long standing. Mr Ducket had already stressed that the Hongkong agreement, though welcome, would be little more than a temporary palliative unless it provided "reasonable ceilings for a long period of time". He added that a breathing space was essential if Joshua Hoyle were to develop its output of more specialised cloths made from Nylon and Terylene.

As the 1957-58 ordinary dividend, which was cut to 5 per cent from 8 per cent in 1956-57 was short earned for the second time in three years, shareholders will perhaps have to pin their hopes for a dividend on the fact that Joshua Hoyle possessed £848,961 in liquid assets at the end of the financial year. But their hopes cannot be very sanguine ones for Mr Enright revealed that the company has been forced "to go to the limits of short time running," with its "resultant heavy losses." Demand has picked up following the end of the credit squeeze but the continued imports of foreign cloth and uncertainty about the yarn spinners' mark-up obviously restrict the scope for recovery. The yield of 6.2 per cent offered by the 2s. shares at 1s. 7½d. is low in comparison with the yields offered by other cotton equities.

WESTINGHOUSE BRAKE AND SIGNAL

THE advance of only £10,614 to £2,704,709 in gross profits which the directors of Westinghouse Brake and Signal reports for the year to September 27th last is a little disappointing. The chairman, Captain A. R. S. Nutting, over a year ago said that orders on hand (of which those coming from overseas form a high proportion) ensured a very busy year and he anticipated profits at least as satisfactory as those earned in 1956-57. The prosperity of Westinghouse is largely geared to the modernisation programme of British Railways for which it supplies braking and signaling equipment. But the group also makes compressed air and vacuum brakes for commercial vehicles, handling plant for collieries, and metal rectifiers. The subsidiary owning the "Vespa" motor scooter business and the companies operating in the Commonwealth have also made significant contributions to profits in the past.

Such a group as Westinghouse must spend large sums on fixed assets and research from retained earnings and therefore cannot afford to be too liberal in its dividends. Hence the decision to maintain the ordinary dividend at 10 per cent should come as no surprise, for net profits have fallen by £27,116 to £879,235, following an increase in depreciation by £118,979 to £669,608. The dividend is covered only about twice by earnings and the yield of 4.7 per cent on the £1 ordinary shares, now standing at 42s., looks forward to better results than those just published.

EDGAR ALLEN

EDGAR ALLEN, the Sheffield steel and tool makers and engineers, suffered a substantial reduction in its profits in the six months to September 30th, and with less than three months of the financial year to run the directors see no immediate prospect of any improvement. The galling fact for the directors is that profits fell sharply although turnover was running at a higher rate than the record level achieved in 1957-58. The galling fact for Edgar Allen's ordinary shareholders is that the directors have deemed it necessary to cut the interim ordinary dividend from 5 to 4 per cent even though the full year's dividend of 12½ per cent paid in 1957-58 was almost covered three times by available earnings and the balance sheet showed an adequate balance of liquid resources. The £1 ordinary shares fell 4s. to 32s. on the announcement. This result demonstrates how quickly engineering and tool-making firms can swing from conditions of boom to those of recession. One British subsidiary and the French subsidiary were alone responsible for the increase in sales, and sales by the parent company and other subsidiaries have fallen. As long ago as last March the directors spoke of a reduction in the value of unexecuted orders and of the growing severity of price competition.

ILLINGWORTH MORRIS

THE woollen industry is in a more confident mood, encouraged particularly by the steadying of wool prices. Lord Wilmot of Selmeston, the chairman of Illingworth Morris, which successfully bid for a controlling interest in Salts (Saltaire) last October, tells shareholders that there are signs of revival in the volume of business. He states that American trade for the autumn season was good and that if the home and European markets respond in the same way the group's mills may revert to full production. Industry has run down its stocks, and once trade does expand Illingworth Morris will be well placed, as it can now quote shorter delivery dates. The recession has allowed the group to consolidate financially; the run down in its own stocks from £3,891,252 to £1,969,443 in the year to September 30th permitted almost full repayment of the overdraft of £1,581,001. As the directors paid an ordinary dividend for 1957-58 at an effective rate of 7½ per cent (by adding a special "profits tax" interim of 5 per cent to the 2½ per cent dividend), from equity earnings of only 9 per cent, shareholders can reasonably look forward to its repetition in the current year. This puts the 4s. shares at 4s. 4½d. on a yield of nearly 7 per cent.

BRITISH INDUSTRIAL PLASTICS

MANUFACTURING moulding powders, unbreakable china, and fittings for a variety of trades, British Industrial Plastics is one of the leading firms in the plastics industry, and it has shared fully in that industry's postwar expansion. In the year to September 30th BIP's gross profits, despite more difficult trading conditions, rose by 8 per cent from £906,248 to £979,129. But a sharp jump of £41,707 in depreciation, reflecting investment in new plant and equipment, cut the gain in net profits to 5½ per cent (from £296,073 to £312,508). Shareholders were told in September that profits in the first nine months of the financial year were 20 per cent higher but the directors then emphasised the fact that as the last quarter of the previous financial year had been an exceptionally good one, a proportionate improvement for the full twelve months could not be expected. The £500,000 then raised by a "rights" issue was to be used in part to finance BIP's "much increased turnover," the remainder being ear-marked for the construction of a plant to manufacture formaldehyde and the modernisation of three factories operated by BIP Chemicals.

Following the repeated 7½ per cent interim on the old ordinary capital of £1,247,087, the directors have maintained the final at 12½ per cent on the new capital as they promised they would at the time of the rights issue. On a 20 per cent dividend, the 2s. shares at 7s. 3d.xd yield 5½ per cent.

DAVID BROWN

ONLY the preference shares of the David Brown Corporation are quoted on Throgmorton Street. The ordinary shares are privately held. This family business serves a number of markets and manufactures a wide range of products, including gear-boxes, gear-cutting machines, machine tools, castings, tractors and motor cars. In the year ended June 30th the development departments' "careful and patient study" enabled the group to penetrate new markets; and the group's efforts to develop new products, to invest in new plant and to rationalise production are paying off. In the latest year, the value of orders increased and turnover ran at a new record level, and net profits rose from £177,750 to £234,334. One reason for the comparative lack of buoyancy in net profits is that the company, intent on self-financing, does not pay an ordinary dividend and thus it was one of the companies to lose, rather than gain, from the introduction of a flat rate of profits tax.

But self-financed expansion has left the group short of cash, as the overdraft of £2,241,546 shows. Stocks rose by over £653,000 to £6,707,952 as customers are demanding shorter delivery dates, though Mr Brown says much of this increase is seasonal. Competition is still severe, he adds, and orders are won only on narrowed margins of profit. But orders in hand are worth over £7 million and all divisions, except the foundries, seem to have more than sufficient work. The £1 5½ per cent preference shares, quoted at 16s. to yield 7 per cent, are covered nearly five times by earnings.

ASSOCIATED COMMERCIAL VEHICLES

THE commercial motor manufacturers have not shared in the prosperity enjoyed by the manufacturers of private cars and in his statement to shareholders in Associated Commercial Vehicles about a year ago Lord Brabazon, the chairman, again said that "body building capacity in this country is in excess of probable requirements."

Hence another fall in equity earnings was not unexpected, but the slump from £430,618 to £163,003 in group net profits, despite a saving of £346,167 in tax, did surprise investors. Sales seem to have fallen in practically every market and in their report the directors say that keen competition reduced profit margins. There were also "a number of non-recurring factors . . . particularly the running down of production at Stockport. This factory has now ceased operation and production has been transferred to other group factories." The ordinary dividend has inevitably been cut—from the 22½ per cent paid since 1951 to 10 per cent. But a special "profits tax" interim of 5 per cent payable with the final dividend is also declared. Effectively, the dividend has come down from 22½ to 15 per cent. Trading, the directors add, is now at "a more encouraging level" and in the current year earnings should accrue from the production of the "Routemaster" buses. At 40s. 6d. the £1 ordinary shares yield 7.4 per cent.

London Stock Exchange

FIRST DEALINGS:	Dec. 31	Jan. 14	Jan. 28
LAST DEALINGS:	Jan. 13	Jan. 27	Feb. 10
ACCOUNT DAY:	Jan. 20	Feb. 3	Feb. 17

GILT-EDGED stocks were again strong this week. Short dated issues were in demand, Conversion 4¾ per cent 1963 gaining ⅞ to 101⅛ and Funding 2½ per cent 1956-61 nearly ¾ to 97⅝, as there was some buying in front of the repayment on Thursday of Conversion 2½ per cent. In medium dated issues, Transport 5 per cent 1968-73 rose by 1⅜ to 79⅜. Corporation loans were very firm, Birmingham 3½ per cent 1966-71 rising by ¾ to 76¼ and Bristol the same amount to 98¼. Dealings began in the new Fife Loan at a premium of 1 and the price then settled down at ¾ premium.

Industrial equities remained fairly strong before the week-end, reflecting the recovery on Wall Street and anticipating the prospect of buying by unit trusts. Monday was the last declaration day for the three month options bought when dealings in options were resumed at the beginning of last October. The declaration of many "call" options was absorbed without much difficulty by the dealers.

At the beginning of the new account interest in equities waned a little, but nonetheless, there were many gains over the week to Wednesday's close, and *The Economist* indicator rose from 249.3 to 252.9. In the engineering section Murex rose by 3s. to 47s. 3d. and Metal Box by 1s. 9d. to 69s. Among electricals, Johnson and Philips gained 2s. to 29s. 6d., Ultra Electric 1s. 3d. to 11s. 3d. and Plessey 3s to 74s. In Chemicals, Reichold were firm, rising by 1s. 3d. to 23s. 4½d. and British Xylonite gained 1s. 6d. at 48s. 9d.. In shipping shares, Donaldson gained 1s. at 24s. and P. and O. deferred rose the same amount to 38s. 3d. In the building section Wallpaper deferred rose 5s. to 84s. 9d., Eastwoods 1s. 6d. to 48s. 6d. and Costain 1s. 10½d. to 63s. 9d. In motors, Jaguar jumped by 2s. 3d. to 41s. 9d. on the record output and sales. Among newspaper shares, Amalgamated Press shot up from 50s. 9d. to 54s. 6d. and *Daily Mirror* "A" from 22s. 9d. to 23s. 1½d. In breweries, Bass rose by 2s. to 46s. 6d. and in distilleries, Teachers advanced from 33s. to 36s. 6d. xd. Tobacco shares were strong, "Bats" rose by 2s. 2½d. to 58s. 7½d. and Gallaher by 2s. 6d. to 44s. 9d. In stores, Woolworth gained 2s. 4½d. to 52s. 4½d. and Gamage 1s. 6d. at 63s. 6d. In the HP field, Bowmaker rose by 2s. 3d. to 34s. 10d. and UDT jumped from 116s. 6d. to 121s.

In the property field, British Land rose by 1s. 6d. to 25s. 4½d. and Town and City jumped by 7s. 6d. to 32s. 6d. In Kaffir shares, finance house issues were weaker but there were some gains among the OFS producers, Loraine closing on Wednesday 1s. 7½d. higher at 26s. 6d. and FS Geduld 1s. 3d. higher at 115s. Among coppers, Rhodesian Anglo-American jumped from 80s. 7½d. to 83s. 1½d. but "Tanks" lost 2s. at 53s. In rubber shares, "Suas" were 2s. better at 66s. 6d.

US Dollar premiums NIL on $2.80½

THE MONEY MARKET

FUNDS remained in short supply throughout the week despite direct and indirect help from the authorities. Small amounts had to be taken from the Bank on Thursday of last week and again on Monday and Wednesday. Tax transfers caused acute shortages at some stages and 3¼ per cent was conceded for overnight loans, but the heavy tax transfers on Thursday were offset by repayment of outstanding 2 per cent Conversion Stock and funds were just adequate without any intervention from the authorities. The amount of Treasury bills offered at this week's tender has been cut by £20 million to £240 million; and as maturities of £60 million of 63-day bills next week supplement £250 million of 91 day bills, the market will have a surplus of maturities of £70 million on a full allotment.

At last week's tender the discount houses kept the syndicated bid at £99 4s. 3d. for the fourth week running and received 47 per cent of its application at that rate compared with 52 per cent in the previous week. The average discount rate was £3 2s. 10.22d.

The reflux of Bank notes in the three weeks to January 14th reduced the active circulation by £134 million, just the same as in the corresponding period a year ago.

Enjoying the fruits!

After years of the daily perusal of various financial columns, you may conclude, without much fear of contradiction, that "nothing succeeds like success". It seems logical, therefore, to ally yourself to organizations which have attained such an enviable reputation. Thus you too can enjoy a share of the fruits of success. This is one very sound reason for insuring with the Legal & General. But in addition to being one of the oldest and most successful assurance companies in the Commonwealth, it also prides itself on having never lost the personal touch. For anything insurable, from your wife's engagement ring to a pension scheme for the largest of firms, the Legal & General will be glad to help you.

BIRDS EYE FOODS LTD

As a result of continued expansion, the following vacancies exist in this Unilever Company:—

1. **Development Department at Great Yarmouth Factory—**

(a) INSTRUMENTATION DEVELOPMENT ENGINEER
who will be responsible for investigations and assessment of instrumentation and process control procedures. In addition, he will be expected to promote the development of new techniques of electronic processing. Candidates should preferably have a degree in engineering with experience of process control systems and a knowledge of electronic mechanisms.

(b) PROCESS DEVELOPMENT ENGINEER
who will be responsible for the engineering aspects of process development, improvement, including refrigeration. Candidates should have a degree in engineering and experience of food processing machinery.

(c) FOOD PROCESS DEVELOPMENT MANAGER
who will be responsible for carrying out investigations on the characteristics of food products and their raw materials in relation to processing methods. Candidates should have an honours degree, or equivalent, in chemistry with experience of either food processing techniques or industrial process development.

2. **AN INDUSTRIAL STATISTICIAN**
based on the London Head Office to work on a variety of operational problems. Applicants should possess a degree in statistics, or qualification by examination of the A.I.S. Practical experience in experimental design is desirable and several years' industrial experience is required.

3. **TWO WORK STUDY MANAGERS**
based in London but required to make frequent visits to all parts of the country. These are newly *created posts resulting from* the extension of work study into the commercial and marketing fields. Candidates must have a University degree, or equivalent qualification, and possess a wide experience of work study.

These vacancies will be of interest to people already earning a four-figure salary, and applications should be addressed to the

Personnel Officer (Ref. DVB), BIRDS EYE FOODS LIMITED

Hesketh House, Portman Square, London, W.1

and should state for which vacancy the candidate is applying, giving details of qualifications, experience and salary required.

ORGANISATION AND METHODS. The British Oxygen Company Limited has vacancies in its Organisation and Methods Section, due to the expansion of the Section. Preference will be given to applicants between 30 and 40 with a broad practical experience in industry. Please apply in writing to the Staff Officer, The British Oxygen Co. Ltd., Bridgewater House, Cleveland Row, St. James's, London, S.W.1.

STATISTICIAN

The INTERNATIONAL FEDERATION OF COTTON AND ALLIED TEXTILE INDUSTRIES has a vacancy for the newly created position of STATISTICIAN/ACCOUNTANT at its headquarters in Manchester. The position will, after initial training, involve full responsibility for the Federation's world-wide statistical service. There is scope for initiative and development, opportunity for foreign travel and independent work in small, modern secretariat of expanding international organisation.

The candidate should have a *good education (academic or practical)* in statistics. He should be familiar with the techniques of collecting and compiling statistical data and have an adequate knowledge of economics to interpret statistics and observe and analyse trends. He should also be able to take charge of the Federation's accounts. In addition to English, a good working knowledge of French or German is required. Salary and pension by arrangement.

Applications with full particulars should be sent, marked "Confidential," to The Director, International Federation of Cotton and Allied Textile Industries, 557 Royal Exchange, Manchester 2, England. They will be dealt with in the strictest confidence by an Appointments Committee.

PRODUCTION ENGINEER, first-class *ability in factory management* and preferably with specialised knowledge of Plastics, required to join team of young executives in expanding organisation. Please state qualifications, experience, and salary required in detailed application to Managing Director, Box No. 1103.

AN AGRICULTURAL ECONOMIST, preferably with a good knowledge of statistics, is required for an interesting appointment in the Head Office, Marketing Division of the Milk Marketing Board. Applications are invited from suitably qualified graduates in the age group 25-30 years. Attractive salary will be paid to the successful applicant and the appointment is permanent and pensionable after a probationary period of service. Write for application form to the Personnel Officer (*Ref. 212*), *Milk Marketing Board, Thames Ditton, Surrey.*

HALLSWORTH RESEARCH FELLOWSHIPS

Applications are invited for the above Research Fellowships for advanced work in the field of Political Economy and Political Science. The value of the Fellowships will *normally* be within the range of £900-£1,800 per annum, according to experience and qualifications. Regulations governing the award of the Fellowships may be obtained from the Registrar, the University, Manchester, 13, to whom applications should be sent not later than March 15th, 1959.

MARKET RESEARCH

A SENIOR POSITION has fallen vacant in an expanding London *advertising agency*. The Market Research department requires a new head. The position calls for a man with several years' *experience* in the use of modern consumer research techniques either in an advertising agency or leading manufacturing concern.

Replies in confidence to The Managing Director. Box 1107, *Economist*, 22 Ryder Street, St. James's, London, S.W.1.

ASSISTANT to RESEARCH OFFICER. Typing essential, shorthand an asset. Must be able to handle figures; experience of economic and statistical research an advantage. Salary according to age and experience, on the scale £9 18s. to £12 13s., 5-day week, generous leave arrangements.—Applications to General Secretary, Society of Civil Servants, Palace Chambers, Bridge Street, S.W.1.

APPOINTMENTS
Vacant 9/- a line; Required 6/- a line.

SALES OPENINGS

with

CALTEX

in

EAST AFRICA

University Graduates in Economics, or Business Administration, aged 24 to 30 and preferably single, are required to train and thereafter control a Sales Zone in the marketing of Caltex Petroleum products in East Africa. Some previous selling experience is desirable, not a necessity, the commencing salary being £115-£130 per month, plus a cost-of-living allowance, at present 11 per cent. of salary.

Home leave is granted after the first three years of service and thereafter at intervals of two years and local leaves are also given.

Candidates should *apply in writing*, giving full particulars of experience, etc., and quoting "EAF," to CALTEX SERVICES Ltd., Caltex House, Knightsbridge Green, London, S.W.1.

NORTHUMBERLAND COUNTY EDUCATION COMMITTEE

ASHINGTON COUNTY TECHNICAL COLLEGE

Applications are invited for the following posts, training and/or experience in technical teaching an advantage.

(a) ASSISTANT (GRADE B) IN SHORTHAND AND TYPING

Man/Woman to take charge of the subjects throughout the Commerce Department under the direction of the Head of Department. The department is new and well equipped. Most of the work is in well established day courses. Considerable scope for initiative and development.

(b) ASSISTANT (GRADE A) IN SHORTHAND AND TYPING

Applicants (men/women) should have had suitable business experience.

Salary Scales:

Grade B
Men: £682 10s. x £26 5s.—£1,076 5s.
Women: £609 x £21—£861
(plus equal pay increments)

Grade A
Men: £498 15s. x £26 5s.—£945
Women: £451 10s. x £21—£756
(plus equal pay increments)

Approved allowances for graduation and training. Commencing salary determined by the teaching and/or industrial experience of the person(s) appointed.

Forms of application and further particulars may be obtained from The Director of Education, County Hall, Newcastle-upon-Tyne, 1, to whom completed forms should be returned not later than *fourteen days after the date of* this advertisement.

WORKERS' EDUCATIONAL ASSOCIATION—York-shire district (South). Applications are invited for the post of Organising-Tutor in North-East Derbyshire. *Applicants should be Honours graduates in history,* economics or other subjects appropriate to adult education. Salary scale £650 x £50 to £1200. Closing date twenty-one days after the *appearance* of this advertisement. Application forms and further details from District Secretary, W.E.A., 26 Campo Lane, Sheffield, 1.

UNIVERSITY OF EDINBURGH

DEPARTMENT OF *ECONOMIC* HISTORY

Applications are invited for the post of Assistant in the Department of Economic History. Salary scale £700 x £50 to £850 per *annum*, with superannuation benefit and family allowance where applicable. The successful candidate will be expected to take up duty on 1st October, 1959.

Further particulars may be obtained from the undersigned, with whom applications, giving the names of two referees, should be lodged not later than 16th February, 1959.

CHARLES H. STEWART,
Secretary to the University.

January, 1959.

GAELTARRA ÉIREANN

MANAGING DIRECTOR

Applications are invited for the position of Managing Director of Gaeltarra Eireann. The person appointed must be competent to discharge the entire duties of the office through the medium of Irish. It is essential that applicants should have several years experience in a senior executive position and special consideration shall be given to those having marketing and selling experience in Textile *Industries.*

Age group. 35-50.

A starting salary in accordance with experience of up to £2,500 per annum will be paid.

The successful applicant will be considered for inclusion in a superannuation scheme.

Those wishing to be considered for the appointment, as provided for in the Gaeltacht Industries Act, 1957, should forward their applications in sealed envelopes marked "*Managing Director.*" to

GAELTARRA EIREANN,
WESTLAND ROW,
DUBLIN.

to reach that office not later than February 19, 1959.

LARGE Industrial Group with Headquarters Manchester (not Cotton Textiles) requires two or three young executives, each initially as personal assistant to Chairman of an operating company, but with definite prospect of appointment to subsidiary company directorial status within two or three years. Age 35-45 (no higher).

Qualifications required: some specialised knowledge (irrespective of field), some experience of industry, and proved capacity to carry responsibility for the work of others. Capacity for team-work imperative.

These are exceptional opportunities of a career in top-level *management*, and applicants should give full particulars of education, training and experience to date, and also indicate present earnings level.

Absence of a University degree does not disqualify, but graduate applications welcome.

Please do not apply unless willing to give full details first letter, and unless prepared to risk being found unsuitable within twelve months. We are interested only in men of sterling character and unusual talent, and are well able to remunerate these qualities appropriately.

Apply to Box 1100.

THE BRITISH OXYGEN CO., LTD.

HEAD OF ECONOMICS AND STATISTICS SECTION

Applications are invited for the above post at the Company's Head Office in the West End. It is a *senior position*; applicants should have had industrial experience preferably on the finance side, together with a practical knowledge of statistical methods and a flair for carrying out investigations and writing lucid Reports. The post has been advertised before, but has not yet been filled; previous applicants should therefore not re-apply. Apply in writing to:

THE STAFF OFFICER,

THE BRITISH OXYGEN COMPANY LIMITED

BRIDGEWATER HOUSE, CLEVELAND ROW, ST. JAMES'S, S.W.1.

ACTUARY required by a leading firm of consulting actuaries in South Africa and Rhodesia. Attractive commencing salary and prospect of a partnership within a few years. Apply, giving full details of experience to Box 1101. All Applicants will be interviewed.

AUSTRALIAN NATIONAL UNIVERSITY

RESEARCH SCHOOL OF SOCIAL SCIENCES

Applications are invited for appointment to a READERSHIP IN INTERNATIONAL RELATIONS in the Department of Political Science and of International Relations.

The Reader in International Relations will be expected to engage in and to assist in supervising research into the political, legal and economic relationships between nations. In its empirical work the Department pays considerable attention to the Asian and Pacific regions.

The salary range for Readers is £A2,763-£A3,213. A Reader is appointed to the permanent staff; retiring age is 65 with the *option of retiring* after the age of 60. Study leave entitlement is one year on full pay in every six years, plus contribution of up to £A1,342 towards travel and other expenses.

Superannuation on the Federated Superannuation System for Universities pattern is provided and reasonable removal expenses are paid.

Further details are available from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London on 27th February, 1959.

STATISTICIAN / ECONOMIST

Old established firm of stockbrokers require senior statistician for work on research and preparation of reviews. This is a responsible position and will be remunerated accordingly. Previous experience of this type of work is essential, and qualifications although desirable are not strictly necessary. Applicants please write giving relevant details to Box B538, c/o Streets, 110 Old Broad Street, E.C.2.

NEWCASTLE UPON TYNE EDUCATION COMMITTEE

MUNICIPAL COLLEGE OF COMMERCE

Applications are invited from university graduates and professionally qualified persons with good industrial experience for the post of LECTURER IN MANAGEMENT STUDIES. Ability to assist with the instruction in Management Practice, Cost Accountancy, Factory Organisation or Work Study will be an advantage and *the lecturer will be encouraged to help with the* development of the Department and the organisation of research. Salary in accordance with the Burnham Technical Scale £1,200 by £30 to £1,350 per annum.

Application forms (returnable within fourteen days) and further particulars may be obtained from the Principal, Municipal College of Commerce, College Street, Newcastle upon Tyne, 1.

EDUCATION AND COURSES

9/- a line.

U.K.A.E.A.

how the POWER-GAS GROUP serves the chemical industry

This hydrogen plant built by The Power-Gas Group for Laporte Chemicals at Warrington illustrates how The Power-Gas Group undertakes the design and construction of the most advanced plants for the chemical industry.

In other industries, too, The Power-Gas Group makes notable contributions. In nuclear energy, petroleum, iron-making, gas, and oils and fats the Group plays an important part in the planning and building of new plants for many large companies. BP, I.C.I., Distillers, Unilever, The Steel Company of Wales, to name only a few, have all called upon the experience and resources of The Power-Gas Group. From initial conception to the final handing over of a producing unit The Power-Gas Group offers a comprehensive service that industry relies on more and more.

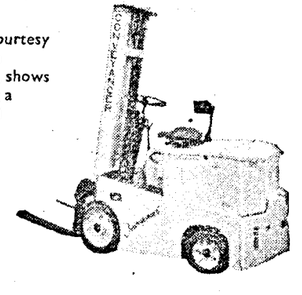
talking about Conveyancer



The Tushingham Metallic Brick Co. of Whiston in Lancs. is an old-established company founded in 1863 by the grandfather of the present Managing Director. The company owes its continuous success largely to the enterprise and foresight of successive generations of the Tushingham family.

The company's first Conveyancer was purchased on 6th May, 1955, since when a further two machines have been installed. The machines are used for handling unit loads of bricks in the yards and in the Hoffman and Transverse Kilns.

When bricks are placed to stock, the overall handling cost is reduced by 80 per cent., and many other less tangible advantages have resulted from the introduction of Conveyancers.

Photograph, by courtesy of the Tushingham Metallic Brick Co., shows the E4-20 entering a kiln with unit load bricks.

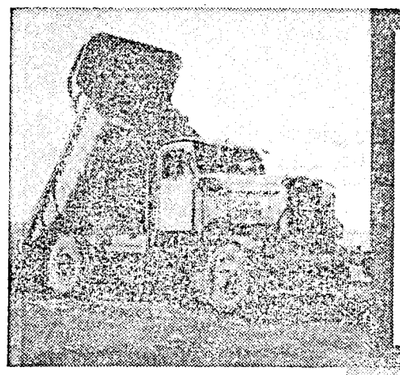
WORLD'S MOST EXPERIENCED AIRLINE

Austin on Britain's first Motorway

Early in November, 1959 you may be one of the first drivers to use the great London-Birmingham Motorway. Then you may well marvel at this latest and most untypical of British roads. Seventy fast motoring miles over 3-lane, 36-feet-wide, dual carriageways. A road remarkably straight, soaring over 150 specially built bridges; with flyovers, flyunders; with service and eating areas every 12 miles.

Staggering millions This, the first British national highway to be built in this century, has millions of staggering statistics behind it. Fourteen million cubic yards of earth will have been moved before 3700 men and 1000 major road-making machines complete the 4 million square yards of road. Eight million gallons of fuel will be used. £20,000,000 will have been spent and—most staggering of all—the whole gigantic construction will have taken only 19 months from start to finish.

Already the road is taking shape. Contractors for the 53-mile Luton Hoo-Rugby section are John Laing and Son Limited. They have a tough job on their hands. But Laing's men are equal to it—so are their vehicles. And among those vehicles are Austins. Robust go-anywhere Gipsys for maintenance and inspection. Five-ton tippers for dumping excavated soil, carrying surfacing material, doing a multitude of other back-breaking jobs. Ask the Austin driver what he thinks. "They're very good," he'll say, "they have fine engines and they're comfortable too."



* * *

Austins for every need The Austin commercial range includes all-purpose vehicles from ¼ ton to 7 tons with prime movers for gross train weights of up to 15 tons, and the FWD Gipsy with rubber torsion suspension. All Austins are warranted for 12 months and backed by B.M.C. Service—Britain's best service and parts organisation. Your nearest Austin dealer will be glad to give you full details of the range.

Free personal benefits for your drivers. Ask us for details.

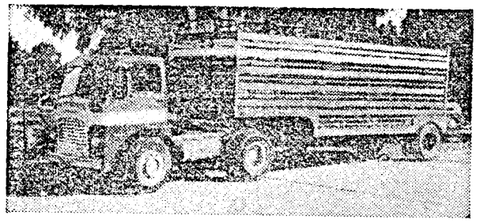
Albion Leyland

Our Customers never write "WISH YOU WERE HERE"

(Above) A Scammell 4 x 4 MOUNTAINEER Dump Truck with 8/10 cu. yards capacity and a tipping angle of 72° operating in S. W. Africa.

(Right) The rear-engined Leyland ATLANTEAN is the biggest advance of all time in bus design. Low-built and normal height bodies available, seating 73 or 78 passengers.

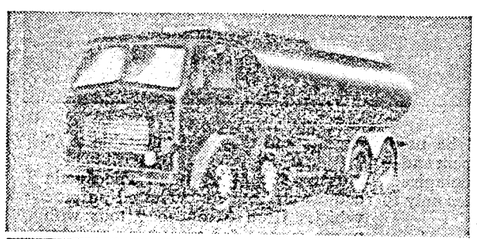


(Below) Operating in Johannesburg, this Leyland BEAVER articulated outfit is employed in transporting cattle over long distances.

(Bottom) This 8-wheeled Albion CALEDONIAN with twin rear driving axles is fitted with a 4,000 gal. tank. G.V.W. is 24 tons with payload of 16½ tons.

Why should they?

Although our vehicles are admittedly the most troublefree made, yet we like to keep on our customers' doorsteps . . . just in case. They don't have to worry as they run their Leylands in Lagos, Albions in Allahabad or Scammells in Scutari, because, wherever they operate, they know we are nearby to keep things moving—and earning!



Let us look at the set-up of the Group Service organisation

Home users have depots in 50 towns in Great Britain to give on-the-spot first aid. Overseas customers have call on branches in 70 countries for service, spares and replacement units. Our resident and mobile engineers will also seek them out to advise and help. In special cases, we fly out a team of experts from this country.

Like the service, the Group range of vehicles is the widest in the world. You can buy trucks from 3 to 150 tons, with models of every practicable capacity in between. If it's buses you want, we make single and double deckers, seating from 26 to 78 people.

Well, that's our story . . . BUT . . . though we've built up this widespread cover for customers, we ease things for ourselves by building the most reliable vehicles on the roads!

THERMOTANK IN AMERICA

Now they can give of their best

in a Detroit Research Laboratory

In a climate which is often uncomfortably hot in summer and cold in winter, administrative workers and scientists in this Detroit plant now enjoy temperate inside conditions right through the year. Careful control of the atmosphere for the work itself is provided in the cold-vaccine laboratory. This air conditioning installation is one of many important contracts secured in the United States by Thermotank. Others include the supply of 4,800 high velocity units to the New State Department Building in Washington.

Thermotank can plan, design and instal air conditioning equipment for any requirement in any part of the world.

A WORLD OF BETTER CLIMATES WITH THERMOTANK

Here are a few more examples of world-wide service from Thermotank:
UNITED STATES Contracts for Texas Instruments, Standard Oil, American Telephone and Telegraph Company, John Hopkins University, Ford Motor Company and General Motors.
BRITAIN Full conversion of the liner S.S. 'ORCADES' to be carried out, providing an installation with a capacity of 14,000,000 B.Th.U's per hour.
MIDDLE EAST Installations include the Fao Port Control and Wireless Station Building and the Iraq Spinning and Weaving Company's mills near Baghdad.
SOUTH AFRICA Thermotank installation for the new ten-storey headquarters of the United Building Society in Johannesburg, South Africa's largest office building.

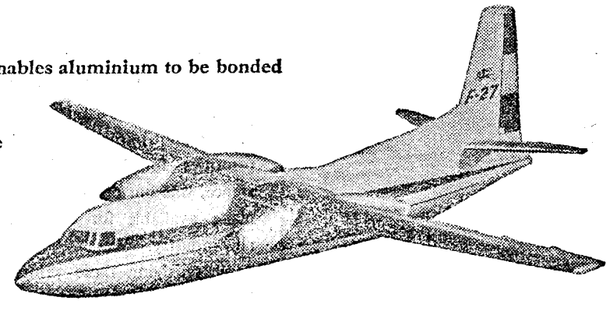
BRITISH EUROPEAN AIRWAYS



ANNUS MIRABILIS

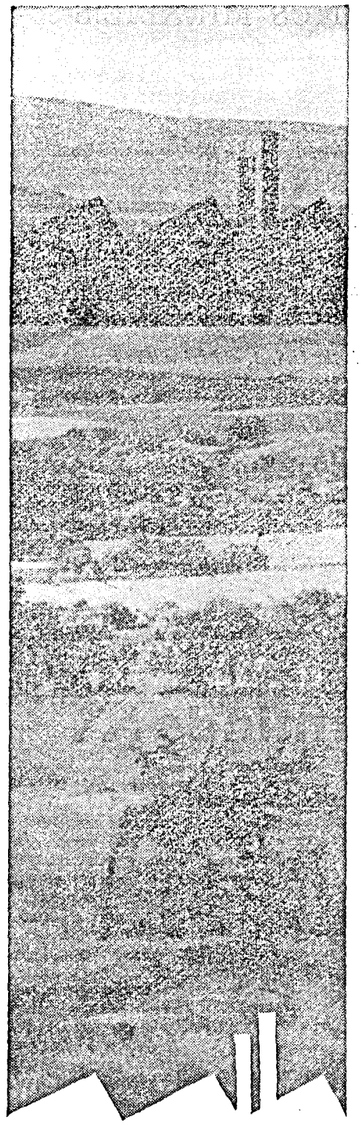
Aluminium was a precious metal when Napoleon III used it for the eagles on regimental standards. In 1886, two scientists —Hall in the U.S.A. and Héroult in France —evolved a method of extracting aluminium from its oxides. The availability of a metal both light and strong led to the development of the high speed petrol engine, which made possible mechanical flight.

Great minds . . .

Redux, introduced in 1942, enables aluminium to be bonded permanently, with freedom from fatigue stresses. It provides high strength with considerable saving in weight; it gives greater safety and more economical operation. Today, over 60 types of aircraft—from guided missiles to jet airliners—depend on Redux.

The Fokker Friendship makes extensive use of Redux

Redux adhesives for metal aircraft structures



Redux is a registered trade name

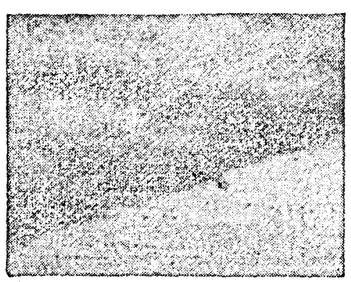
RANSOME AND MARLES CHOSE COUNTY DURHAM

– and started another success story

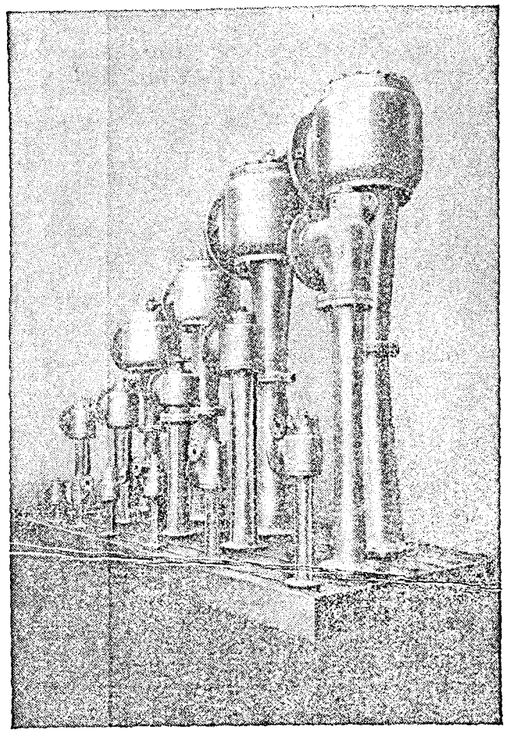
Site research on a nationwide scale preceded the decision of the Ransome and Marles Bearing Co. Ltd. to build their new factory at Annfield Plain—one of County Durham's many industrial sites. The company's major need was a large labour force easily trainable to the high precision standards of bearing manufacture, and this they have found in good measure.



Next consideration was the availability of factory services—water, fuel, transport etc., and here again demand was well satisfied.

So successful was this new factory in County Durham, that it was extended considerably only two years after opening, and the company own adjacent land against such time as further extensions may be required.

Every assistance for E-X-P-A-N-D-I-N-G firms



In addition to their basic requirements, Ransome and Marles found willing co-operation at all levels of local and national government. Housing priorities for key workers, for instance, was but one of the many tools made available for establishing this new industry.

After satisfying these primary needs Ransome and Marles found a number of advantages associated with manufacturing in County Durham. The easy access to all parts of the Kingdom via excellent road and rail routes. The fact that coal, coke, gas and electricity are the cheapest in the country. As production and sales continue to climb, Ransome and Marles view with every satisfaction their decision to expand in County Durham.

SITE VACANCIES IN COUNTY DURHAM

THIS CASE HISTORY reflects the favourable atmosphere for industrial expansion to be found throughout County Durham. Dozens of sites—hundreds of acres all over the County are ripe for development. And each site has its own local advantages for certain industries, plus the advantages of the County as a whole. Site details, together with full information on all factors affecting production and distribution are thoroughly surveyed in 'Industrial Opportunities in County Durham,' a 24 page digest specially prepared for firms contemplating expansion. *A copy is available from* THE COUNTY PLANNING OFFICER, DURHAM COUNTY COUNCIL, 10 CHURCH STREET, DURHAM.

Standard range of thermo-compressors

Thermo - Compressors

A simple, cheap and reliable method of achieving maximum economy is the upgrading of low-pressure steam by the employment of Hivac thermo-compressors Many units are constantly supplied for a wide variety of process equipment and flash vapour recovery.

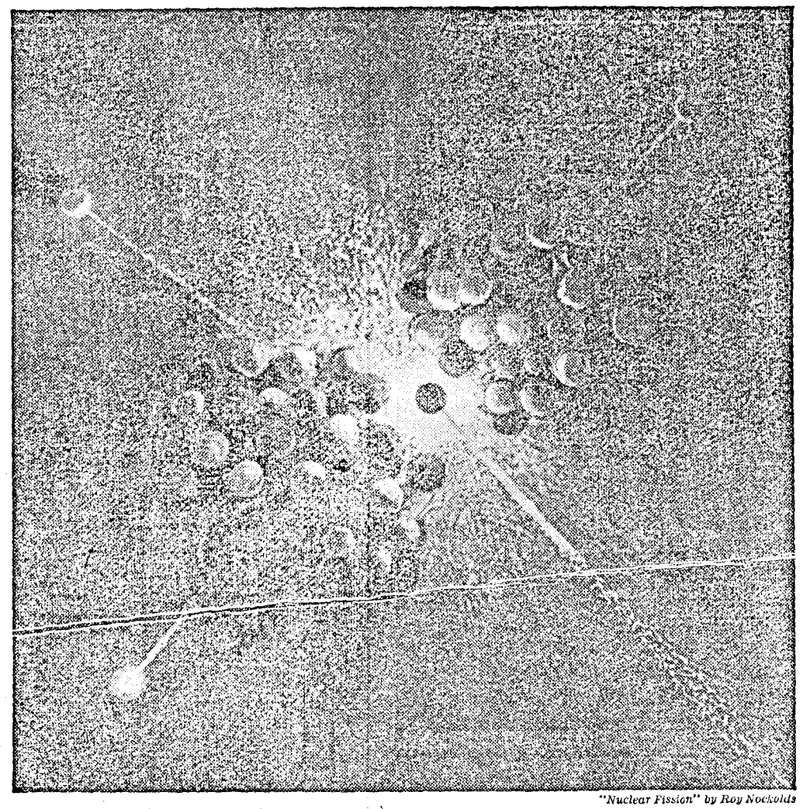
PIA SERVES THE MIDDLE EAST

Damascus Baghdad & Tehran

BY SUPER CONSTELLATION



LUXURY PIA Super Constellation airliners fly to Tehran and other oil-important centres of the Middle East! PIA Super Constellations offer comfortable 'Tourist' accommodation and luxurious first class 'Siesta Cabins' on all flights. Two east-bound services weekly from London, via Geneva and Rome; also two westbound services weekly from Karachi. With convenient onward connections for other key centres all over the Middle East. From Karachi, PIA's domestic network covers the main cities of East and West Pakistan, Afghanistan, India and Burma—*including* Lahore, Dacca, Delhi, Calcutta, Bombay and Rangoon. Reserved air cargo space is available on all flights.

PIA

For reservations and full details, see your Travel Agent; any PIA Booking Office; or PIA, 45 PICCADILLY, LONDON, W.1. REGENT 5544.

"Nuclear Fission" by Roy Nockolds

This is your world

A bombarding neutron strikes an atom of uranium. The nucleus splits, energy is released, and more neutrons shoot off, each capable of splitting another nearby atom. This is the chain reaction of nuclear fission. This is a source of unlimited power which is beginning to revolutionise the world in which you live.

Fifty years of scientific research have culminated in one of man's greatest achievements. The story is told in a brilliant 16mm colour film produced by Mullard Limited in conjunction with the Educational Foundation for Visual Aids.

This film—part of Britain's contribution to a co-production scheme initiated by the Western European Union—is available on hire or loan to industrial organisations and government and educational establishments. For further information write to the address below.

Masked Words

BERNARD SHAW believed, just before he died, that life could be made easier by adding a dozen or so letters to the alphabet. What is much more obvious, just before an election, is that politics could be made easier by subtracting a dozen or so words from the language. All through history British elections have been fought with the obstruction of certain standard adjectives and phrases, which are used unnecessarily to embellish good ideas, deliberately to obscure selfish ideas or wantonly to cover up the lack of any ideas at all.

It was about this dissembling vocabulary, it will be remembered, that Ruskin waxed very cross nearly ninety years ago:

> There are masked words abroad, I say, which nobody understands, but which everybody uses, and most people will also fight for, live for, or even die for, fancying they mean this or that, or the other, of things dear to them . . . . . There were never creatures of prey so mischievous, never diplomatists so cunning, never poisoners so deadly, as these masked words; they are the unjust stewards of all men's ideas; whatever fancy or favourite instinct a man most cherishes, he gives to his favourite masked word to take care of for him: the word at last comes to have an infinite power over him —you cannot get at him but by its ministry.

Today, between one election and the next, particular masked words rise or fall in popularity as quickly as women's hemlines. It is worth examining the changing fashion in two pairs of favourite masked words for 1959, both in order to put the elector on his guard and in order to glean some clues to how the politicians think that the pattern of public opinion has altered since 1955.

At the moment it looks as if the top of the bill for the election of 1959 is going to be the masked word "national." This is at present unpopular (and therefore avoided by its sponsors) in one form only: with the suffix "-isation," meaning publicly owned industrial monopoly divorced from some of the disciplines of market control. It is also a trifle past its peak as a vote-winner when attached to the word greatness, signifying cover-up for some past snafu in the Middle East or future inclination to break the Anglo-American alliance. At any rate Conservative spokesmen would probably be unwise to make too much use of the term *national greatness* in the coming election—although Labour would still be even more unwise to attack it. But, everywhere else, it looks as if national is going to be carried in this year's manifestos like the flag.

The National Union of Mineworkers, for instance, is now on the point of persuading Labour to opt for a *national fuel policy, meaning a purely* sectional one (stopping industrialists burning oil, instead of stopping them burning coal). The Conservatives—in sharp contrast to 1955—have found that to talk of "safeguarding the national currency" is the best slogan for a cautious economic policy; while Labour talks of a "national drive for expansion" as a synonym for precisely the reverse. And there is an increase, rather than an abatement, of uses of the adjective national that have gone on unchecked for a generation; such as

putting the word before Liberal (to make it mean Conservative), or before aspirations (to excuse the skulduggery of some right wing fascist dictator in the thirties or left wing coloured dictator now), or before interest (to signify the speaker's personal opinions).

The most interesting feature of the recent rise of the masked word national has been its tendency, even on the left, to demote the favourite 1955 masked word "fair." Four years, or for that matter thirty years, ago the mineworkers' slogan would not have been a "national fuel policy" but a "fair deal for the mines." To some extent, this change in labels was a foreseeable result of the howling failure of Labour's 1955 slogan "fair shares," which the Tories managed to make to sound like a socialist desire to return to ration books, more welfare orange juice and fish queues. But, historically, one would have expected "fair" to gain in the lists during a small trade recession, such as Britain has recently been passing through. Certainly one would have expected more use to be made of the masked word "fair" competition (meaning no competition) in protest against the welcome growth of cut price supermarkets and shops.

It seems reasonable to presume that this small change between two favourite masked words does indicate some change in public attitudes. Politicians now believe that it is a little easier to persuade the ordinary elector that he is being done down by foreigners, and a little harder to persuade him that he is being done down by the British rich. To that extent, it probably marks a swing to the right in what might be called the silly centre of British politics. But two things seem to have prevented this swing in public prejudices from being translated into a swing from Labour to Conservative. One is that Labour has moved over smartly rightwards itself; the other is that the second main change in masked words since 1955 has been to Labour's advantage.

THIS second change has been the slight but significant demotion of the slogan "free" and the partial recovery of the slogan "controlled" (though only in its adjectival form). It looks as if Labour is going to poke reasonably effective fun this election at last time's boast "Conservative Freedom Works." This is peculiar, since the main burden of current Labour propaganda is not in fact that Conservative freedom has failed, but that it has been disastrously replaced by Conservative restrictionism at home and the impulse for domination abroad. Any Rip Van Winkle asked to guess which party was more in favour of holding back demand—the one whose slogan was freedom or the one whose slogan was "controlled expansion"—would surely guess the wrong way round. The return to respectability of such a slogan as "controlled expansion," in which the adjective is quite meaningless except as a vague hedge, must (in so far as it really catches on) be a sign of lack of confidence among the electorate.

Thus the main changes in basic public attitudes which the politicians seem to think have occurred since 1955 are that there has been a further definite swing away from egalitarianism and nationalisation, but possibly also a slight swing towards apprehensive protectionism and towards distaste for rash experimentation. If so, it will be, on the face of it, a startling paradox if this also presages even a small party swing from Conservative to Labour. Yet that is precisely what most people are expecting in the coming election; statisticians disagree about who is more likely to win it, but hardly anybody seems to be forecasting an actual increase in the Conservative majority. Maybe all this is a sign that politics are no longer a battle between basically differing attitudes, but only between basically similar (because equally disguised) masked words. If so, some people will conclude, Ruskin has been proved right in his warning ninety years ago that the mongrel breed of the English language could pervert the whole democratic process.

BUT an alternative and much more moral lesson can be drawn. Elections are fought on masked words mainly when they are also fought on masked attitudes; and (because of the almost automatic swing of the pendulum) such disguised battles are nearly always against the interests of the government of the day. In 1955 the Conservatives avoided the usual swing against those in authority in the only possible and positive way. They managed to pose a clearly differing image of the two parties before the electors. Voters had a picture of a Conservative party which favoured opportunity and freedom and which believed that change was its ally (massively different from the Conservative party they used to know), while Labour was regarded as favouring egalitarianism and controls.

The Labour image of 1955 was so obviously unpopular that Mr Gaitskell was bound to try to change it this time. His new image is not, in its essentials, very different from that of the old pre-1950 Conservative party, which believed that change was this nation's ally only in very small doses. In each sector where change has threatened any pain to particular interests—as in threatening the right to a specified livelihood at a specific income with specified benefits at a specific place—Labour has hurried to propose old-fashioned Conservative actions (e.g. farm and cotton protectionism, development area grants, cushions under the rent act). And the Government in this Parliament, more often than in the last, has hurried into hasty intimations that at bottom it believes in much the same thing.

It is a favourite myth that Conservative publicity has been very good this last year, and that the Opposition has suffered from making itself look too like the Government. It is not impossible that future historians may draw precisely the opposite conclusion: that Conservative publicity has been rather bad all through the period from 1955 to 1959, and that the Government has failed to counter the usual swing against authority because it has allowed itself to look, even by using some of the same masked words, too much like the Opposition.

TOWARDS THE NINETEEN-SIXTIES—I

A Holding Operation

Now that the post-war period is over, is the world entering on a period of stability, or on a new pre-war period? It is possible that the next ten years will be neither of these, but a time of change and confusion in which the big powers are powerless either to make war or to achieve their objectives by other means. This series of articles will consider the international postures of America, Russia and Britain and the outlook for some of the crucial regions of the world.

THE most enduring influence affecting American foreign policy is a profound lack of confidence in the staying power of western public opinion when exposed to a sophisticated challenge from its potential foes. Memories of Munich and the pre-war neutrality laws dominate the State Department's view of the frailties of the west European and American masses just as the recollection of Pearl Harbour dictates the Defence Department's strategic apprehensions. The diplomatic errors which marked the end of the war have also left a seemingly indelible mark. Deeply conscious of European suspicions of a Soviet-American *rapprochement* at the expense of others, the Americans forswear any desire for a "summit for two," fearing that any such experiment on their part would encourage the growth of a neutralist third force in Europe.

Mr Dulles and his Democratic predecessor, Mr Acheson, are at one in assuming that the American public, which has accepted the decisive role of American power in the defence of the West, at the cost of three-fifths of the American budget, would not be willing to support the retention of American forces in Europe if they were to be withdrawn from Germany. In Europe itself, each fears the impatient pressure of a pacifically-inclined public eroding the western negotiating position during any long drawn-out conference with the communists.

Mr Acheson has made it plain that he opposes any "summit" conference at any time; he regards any conceivable agreement that could be reached now with the Russians as sure to be disadvantageous to the West. Mr Dulles, who, being in office, has to deal with America's allies—and with a President who may still hope to round off his political life with a major stroke for world peace—has never taken so dogmatic a position. But, under his guidance, America's appearance of a muscle-bound mastodon has convinced his critics that he has been possessed by the same negative thoughts.

In fact this is only a part of the picture. Two major purposes can be discerned behind the shifting expedients of American policy: to continue to hold fast, by both precept and example, the chain of loosely interlocked western coalitions, and to force upon the Soviet leaders, by the accumulation of unmistakable evidence, a change in the Marxist doctrine of international struggle. Only if the first purpose is not relaxed do Americans consider that the second can possibly be achieved. Under some conditions, Mr Dulles is prepared to take experimental but limited risks with American and allied public morale, in order to convince the Russians that American purposes are neither inconstant nor menacing. Mr Mikoyan's visit was one such risk: a great-power conference later this year might conceivably be another.

AMERICAN officials take very seriously the role of the United States as the western leader. They are sometimes criticised, despite the magnanimity and high cost of America's comfort and aid to its allies, for a failure to lead, in the sense of providing the main source of fresh ideas and initiatives. But they are convinced that they must not behave like the legendary loud-mouthed American tourist, telling the world how to solve its problems. Whatever luxuries their allies may allow themselves in the way of independent gestures, the Americans consider that the leader's true burden is to ensure that in any change of course, even the slowest and smallest member of the convoy will not be left behind. To suggestions of bold new moves to test the sincerity of Russia or to throw it off balance, they reply that America must make sure that all round the periphery of communist power, wherever the West has friends, the news of some lightning American gambit will not produce a flight from the political dollar.

They remind their European friends that it is not only European opinion that they have to take into account. Any sign of a *rapprochement* with China, for instance, might well cause a collapse of morale among America's friends throughout the Far East, so that the communists would have gained their objective through the mere fact of negotiation, without needing to make any concessions in the negotiations themselves. Similarly, the Indian five-year plan, which deserves American support, cannot be underwritten too dramatically without upsetting the Pakistanis, who demand to know why an ally should come lower in the queue for aid than a neutralist state.

By and large, the Republican Administration seems to have accepted both the responsibilities and the limitations philosophically, on the principle that, now that the United States has replaced Britain as a world

power, it must display such British virtues as understatement and a willingness to live with a problem rather than seek to force forward immediate solutions. This tendency to what might be called a rationalised sluggishness is increased by the peculiarities of American presidential government. Lacking a proper cabinet system, the Administration is so fragmented into such fiercely autonomous instruments as the Atomic Energy Commission, the State, Defence, and Treasury Departments (not to mention the splits within these institutions) that the task of evolving a new and agreed policy cutting across strict departmental lines is exceptionally arduous, rather akin to an international negotiation. Even when the President has made an apparently binding decision, it may later be sabotaged by the losers (as the Atomic Energy Commission's pet scientists may now be doing in the case of the technical agreement at Geneva over controlling a ban on atomic tests).

All the time, moreover, there is Congress to consider, with its investigators restlessly exposing to public gaze the raw nerves of controversy within the Administration, and its uncertain readiness to sanction any changes of policy that require legal adjustments, the ratification of a treaty, or the voting of money. The need for huge annual appropriations for foreign aid subjects foreign policy to an exceptional degree of minute congressional scrutiny ; while the conviction of many American politicians that, because of the size of the national debt, their country is teetering on the verge of bankruptcy, has made it hard to obtain funds and discretionary authority needed for the longer range economic plans that would fire the world's imagination with something that would seem different from a holding operation.

When to the strains of evolving a new American proposal are added the labours of securing allied agreement, it is little wonder that American negotiators are sometimes near the end of their resources before the negotiations proper have even begun.

The Americans firmly believe that first priority must go to bolstering, by military and economic aid together, the coalitions containing the communist world, because only when the communists accept their inability to extend their conquests with impunity can there be any possibility of effective negotiations. Mr Dulles, who regards himself as a shrewd student of Marxism (although his references all come from a single canonical work, Stalin's "Problems of Leninism," which he is said to keep by his bed), believes that normal relations will become feasible only when communist theology drops the conception of spreading communism by violence and the assumption that war between capitalist and communist countries is inevitable. At Suez the exemplary American ban on violence, by whichever side, was enforced at the temporary sacrifice of harmony with allies. The intervention over Quemoy was considered to be of a piece with the intervention at Suez ; Russia was being warned, in turn, to keep its own side in order.

The Americans are far too realistic to expect communism to disappear. They know that, in time, they will have to come to some terms with communist rulers both in Russia and in China. The question they ask themselves in each case is whether, given the limited concessions that the West can afford to make, it is likely to get a better bargain from the present communist rulers or from their communist successors. In the case of China the firm answer given by Mr Walter Robertson, the assistant secretary of state who dominates America's Far Eastern policy, is that the present Chinese rulers are far more dedicated communist ideologists than the Russians and that any concessions to them would be wasted.

In the case of Russia's rulers, the American analysis has wavered. The events of the Twentieth Party Congress led Mr Dulles to voice so optimistic an interpretation at a Senate hearing in February, 1956—even going so far as to say that Western firmness had forced the Russians to revise their creed "from A to Z"—that it permanently impaired the confidence of several members of the Foreign Relations Committee in his judgment. Despite their unaltered conviction that the congress did mark a step in a better direction, the Americans have since become very dubious about making progress with Mr Khrushchev. Above all, they do not want to throw away what they regard as the chance in a century to bury the German menace for ever, which is offered by the willingness of the present government in Bonn to tie Germany inextricably to European institutions, for the sake of a quick, superficial reconciliation with Russia.

What the Americans continue to hope for by holding firmly to their present positions is that, as Russia grows in economic power and self-confidence under the lead of the new technocratic middle class, its neurotic fears of the West will pass. Ultimately, the hypothesis goes, Russia will cease to be interested in holding down central and south-eastern Europe—provided that a premature Western eagerness to withdraw from Germany does not first offer the Soviet rulers the temptation of easy adventure.

ALTHOUGH the most noticeable features of American diplomacy are its inhibitions, it would be totally mistaken to assume that America attempts no positive policies at all. In the Middle East Mr Dulles in fact propounded a perfectly sensible and farsighted plan for settling the Arab-Israel dispute as far back as August, 1955 ; the President's address to the United Nations last year was simply the dressing up in dramatic form of ideas that the Americans had long been quietly advancing. The obstacle has proved to be the intractability of local political facts. The State Department, with the full agreement of the Foreign Office, did at one moment, in 1955, attempt to bend these facts to its will by a policy of building up Colonel Nasser, so that there would be one Arab leader with the prestige to make the indispensable concessions to Israel. After the lamentable consequences of the policy's failure, and the disproportionately small return for the large risks subsequently taken in Lebanon, it is, at any rate, understandable that the Americans should have resumed their mood of waiting upon events.

In their wistful moments many Americans still yearn to play the part of a super-Sweden or Switzerland, patching up other people's quarrels just as Mr Eugene Black has been doing in Cairo, rather than acting as a major interested party themselves. Some of that yearning came to the forefront at the time of the Suez crisis ; some of it is seen in the vestigial presence of the anti-colonial theme, while the painfulness of repressing this theme is betrayed by the violent reaction to the envied self-righteousness of Mr Krishna Menon. As a major motive of American policy, anti-colonialism is dead. But frustration at being prevented by British and French sensitivity from using the American anti-colonial tradition as a propaganda weapon in the uncommitted countries is still very much alive.

There are areas of the world, outside the main battle lines of the cold war, where the United States would vastly like to be the midwife of change. Mr Dulles's own proudest contribution to the literature of diplomacy has been his insistence that, in contrast to the League of Nations, international institutions must make allowance for the fact that "change is the law of life." But, on the two main fronts of Europe and the Far East, the alternatives that are offered seem to the Americans more fraught with danger than the *status quo* itself. In areas of intermediate importance, where the Americans would wish to take a more positive stance, the bonds of obligation to friends, who would feel let down if they did, become ever more constraining. The illusion of American omnipotence, if it ever existed, has now become something very like the disillusion of diplomatic impotence ; and the apostle of change may go down in this period of history, perforce, as a twentieth-century Metternich, the pillar of the established order.

The Public's Business

The desire to have braver candidates for Parliament should not be mixed up with the desire to make the selection of candidates more democratic

A NATURAL reaction to the comedy of errors in which the Tories of Bournemouth have involved themselves is that the Bournemouth East Conservative Association and Mr Randolph Churchill deserve each other. On television, Mr Robin Day put it to Mr Churchill that the only difference between him and the sitting member, Mr Nigel Nicolson, was that he recognised Sir Anthony Eden's policy at Suez to be a blunder two years later than Mr Nicolson did. Conceivably, after Lord Hailsham's seaside trip this week end, the association might settle for this tardier percipience. If left entirely to its own devices it would obviously prefer somebody like Major Friend who is a little more than two years behind the times.

But it is very important not to be unfair to reactionaries. They have no right to question their member's freedom to use his judgment. In Bournemouth they were quite wrong when they suggested two years ago that Mr Nicolson should suddenly resign a seat to which he had been elected for the duration of a Parliament (the dismissal of MPs from Westminster is a matter for the Queen, by the general process of prorogation, not for Major Grant). But reactionaries have as much right as anyone else to take a member's use of his freedom of judgment into account when deciding what sort of man they want to fight the next election.

In discussions, both of the Bournemouth imbroglio and of the episode in Belfast East (in which Mr Montgomery Hyde had difficulty in securing renomination mainly on account of his progressive views on moral and penological questions), some liberal papers have fallen into the trap of implying that a sitting member has a prescriptive right to his local party's support, regardless of his record in the House. This must be wrong. It would be undemocratic. It would reduce to a farce the conception of a member representing a particular area (which is already thin enough, with few constituents attending meetings and with some members bellyaching about doing welfare work). And it would deprive the member of any incentive to undertake the political education of his constituency. Without reference to the particular individuals recently involved, it is worth examining some of the issues of principle that their champions, perhaps unconsciously, raise.

ON national grounds, one would like to give encouragement to all MPs to be less timid about making up their own minds (instead of always accepting their parties' convenience) on issues of both conscience and judgment. But the price of insulating a member from his constituents, by accepting it to be a constitutional impropriety to challenge a member about his views and free votes, is too high a price to pay. The member has a duty to let his constituents know what he is at, because the process of representation in Parliament ought to be regarded as a form of participation by the people in their own affairs rather than their abdication of civil functions.

While a full sense of participation will not be achieved until the day, which is bound to come (although probably not for many years) when important debates in the

House of Commons are carried on television, the member can and should be expected to keep his constituents in the picture. At one end of the scale, it is mistaken to hold him unaccountable for his actions and therefore entitled to automatic renomination. At the other end, a member should no more be expected to resign and cause a by-election because of the apparent displeasure of his constituents over a single issue than a government should be expected to hold a general election just because a Gallup Poll shows that the country is temporarily lacking confidence in its capacity.

Cases in between these extremes present special difficulties only for reasons of machinery. Constituency associations are usually run by a small group of active and often extremist party workers. Even in theory this small group is elected only by the few hundreds of local zealots who work for a candidate, not by the tens of thousands who vote for him ; in practice it is often personally dominated by two or three active enthusiasts who have time to spare. Yet, because of the device of nominating a "prospective parliamentary candidate" well before the election, this tiny and unrepresentative group has absolute control over the timing of what is in most cases the *de facto* choice of a candidate. Thus, although Mr Nicolson could not be forced to resign over his attitude to Suez, the Bournemouth East Conservative Association was able to take instant action to nominate a different "prospective candidate." The implication of statements by Major Grant and officials involved in conflicts in other constituencies is that this is a private matter for party associations—rather like the selection of officials by a club—and that the general public (not even the Bournemouth general public, still less the national newspapers) have no business to poke their noses in.

But, if the coming election comes up to current forecasts, this will be the third time in a row in which the turnover of seats between parties will have been very small. This means that perhaps five-sixths of the seats in the country are currently regarded as safe. Their only focus of political interest as far as Parliament is concerned lies in the choice of candidate by the dominant party. Should this continue to be stage-managed, as at present in all parties, by at most fifty or sixty people and often by two or three ?

It happens that there does already exist in most of the American states a full-blooded alternative: the primary election, in which any voter who cares to register as a party member can go to the polls several months before the election proper and indicate his choice among candidates for his party's nomination. This is a great boon in democratic theory, but there are serious objections that would seem to be fatal to its adoption in Britain. In the United States elections take place at fixed periods, so that primaries can be scheduled at fixed intervals before the election. Further, American primaries have inherent disadvantages even in the United States—they lead to an excessive amount of electioneering (and consequently of expense to candidates who at the primary stage cannot be financed out of party funds), and they tend to narrow the range of people who have the time or can raise the money to seek election. Finally, the tradition of the secrecy of party membership in Britain is probably too strong to be modified in such a drastic way ; quite a lot of Labour or Tory voters would not like their business associates or workmates to know that they were registered as such.

The solution for a British constituency cannot be dogmatically laid down. The first requirement is that there should be much more public discussion, locally and nationally, about the process of selecting candidates. Constituency associations should rid themselves of any conception that this is a private matter. It is quite the contrary. The nature, quality and views of members of parliament are highly public matters, although the privilege of playing a decisive role is accorded, in a pragmatic British way, to private associations because this suits the public convenience. Therefore, the least that can be expected of such a constituency association is, first, that it shall so make its arrangements that there is maximum publicity about what it is doing ; secondly, that membership of the association is made as easy as possible (subject to simple verification that all members are in general support of the party and that there is no great influx of hostile tigers within the gates) ; and, thirdly, that everything is done to ensure that all members have a full say.

Mr Nicolson has proposed that where a few candidates have been short-listed for a nomination (or where, as in his case, the sitting member is in trouble) the prospective candidates involved should be given every chance to do the circuit of local ward meetings, rather than have the whole matter decided, as it usually is, by a short interview—rather as if it were a job in the civil service at stake. These suggestions seem very reasonable. Lord Hailsham would be wise to try to satisfy honour all round by getting something like them put in practice in Bournemouth East, and both Tory Central Office and Transport House should then try to give them more general application. The more radical suggestion, in Mr Nicolson's book, that two probationary candidates should normally be selected to compete with each other in the constituency for a year before the final nomination meeting, probably goes too far in the American direction and shares some of the drawbacks of the full primary. Perhaps there is a better case for one additional suggestion, which may be tentatively advanced here : when a defined minority of an association (say twenty per cent) sign a protest against a decision about candidates, there might be a right of an appeal to a secret postal ballot of the full membership.

But the spirit of the argument is not concerned, at this stage, with too many details about machinery. The immediate need is an appeal to the party organisations to take themselves in hand and ensure that democracy works meaningfully in safe seats, rather than, in effect, conniving at perpetuating public cynicism and inertia.

NOTES OF THE WEEK

PRE-ELECTION POLITICS

Polls and the Wind Up

The Commons returned to work this week in a rash of pre-election fever. The by-elections last November had already suggested that Labour and the Conservatives were running down the last straight of this Parliament almost exactly neck and neck. Now the public opinion polls, which for some reason were showing the Conservatives three or four points in the lead towards the end of 1958, also report that there is not more than about half a point between the parties. This has been widely interpreted as a sign that Labour has been catching up on the Conservatives in the last few weeks. Students of by-election statistics will suspect that it may merely be a sign that the polls have been catching up with the real state of electoral opinion. The latest "swing back to Labour" is, however, reported by the senior poll (the *News Chronicle* Gallup Poll) to be accompanied by all the normal leftward subsidiary movements—a little less personal popularity for Mr Macmillan, a little more for Mr Gaitskell, a more general agreement that the "most urgent problem facing the Government" is unemployment. This last point is regarded by many politicians as especially significant. Here again it would be wise to be cautious in interpretation. In December the "most urgent problem" was generally designated as Cyprus. Now Cyprus is out of the news, and those polled had to accord the palm in urgency to something.

The Where and When

There is no doubt, however, that the Government is taking seriously the shadow which it thinks that unemployment may cast over its electoral prospects. All the indications are that its recipe will be to continue Mr Amory's "progressive relaxations" of consumer demand, with a bias against doing anything really dramatic but possibly with an impulse towards hurrying things up. New efforts are being made to persuade industrialists to start enterprises in the development areas. The pricking of one's thumbs (or, more accurately, a guess at what most Chancellors would do under present conditions) must suggest that some more general—but probably deliberately undramatic—pump-priming action is a possibility in the next few days. Some reductions in purchase tax ? Or a new formula for the release of postwar credits ? Or an announcement that budget day will be brought forward earlier than April ? There is no sign yet of the administrative arrangements that might facilitate the latter decision.

Whatever happens in next week's debates, it would be a mistake to interpret any speeding up of the programme for reflation (or indeed any delay in it) as a sure pointer to the date of the election. That is much more likely to depend on the results in the impending series of by-elections. Southend West will be first in the field next Thursday. In this safe Conservative seat in 1955 the Tory candidate got 64.2 per cent of the vote, Labour 20.8 per cent and the Liberal 15 per cent. But Southend is one of those seaside resorts in which the Conservatives have done rather badly in recent local government elections ; the Liberals have a mature candidate, and the Tories' candidate (like three previous Tory incumbents) is a cadet of the Guinness brewing family and some locals are said to be annoyed at the implication that their constituency is being treated as an hereditary seat. If the Tories maintain their 1955 share of the poll here it will (*pace* the public opinion polls) be a sign of a definite recovery in their fortunes since November.

If there is such a recovery, party pressure will come strongly on Mr Macmillan for a May election. If there is not such a recovery, and party pressure turns the other way, Mr Macmillan should be urged to announce any decision for delay as soon as he takes it. The present pre-election fever in the House of Commons, the rising excitement, the tendency of all politicians to say and do things, not for their own sake, but for the sake solely of appearance, are matters which the Prime Minister himself is temperamentally well-fitted to view with aplomb. But the country and the pound may be less well fitted than he.

EAST-WEST RELATIONS

Trust the Summit Climber?

In his parliamentary answers the first day after the recess the Prime Minister's object was evidently to show himself to be as game for the summit as any head of government alive, without actually getting out of line with Mr Dulles. This has been something of a standard formula with Mr Macmillan for at least twelve months, but there was a hint this week of a special eagerness for the encounter. It is four years since a Conservative Prime Minister was quite so obliging to the small group of left-wing backbenchers who regularly provide the opportunity by enquiring about progress towards the summit ; and four years ago an election was also in the offing.

In 1955 President Eisenhower came out in favour of a meeting, thus making it a certainty, shortly before Sir Anthony Eden went to the country. "Eden the Peacemaker," it is now ironic to recall, was one of the telling slogans of that contest. This time an election might well again be held just before a conference, and the voters could be asked whether they really want to exchange "Unflappable Mac" for the leader of the "unpatriotic party" (Mr Soames's epithet) at the final staging camp. Alternatively, if the conference came first and dispersed in a general atmosphere of euphoria, the Government might be sorely tempted to cash in quick on the appearance of relaxed tensions. The danger then, of course, would be that the attainment of euphoria might be the British Government's primary objective at the meeting.

Mr Macmillan's responses to Mr Bevan's detailed questions on Germany differed slightly and perhaps significantly in emphasis from Mr Dulles's answers to the press. Mr Dulles said : "We would not be alarmed by the

broadness of the agenda; the only thing that alarms us would be the narrowness of the agenda." The Prime Minister said: "I would accept even a narrower basis such as the Soviet suggestion if we could in the course of discussion and negotiation broaden it into the wider consideration." But he endorsed both Mr Dulles's concession that there were other methods than free elections by which Germany could be unified, and his insistence that a united Germany must be free to follow the foreign policy of its choice. However, the pith of the exchange was Mr Macmillan's tantalising hints of much more western flexibility in private, provided that the West's opening stand was not eroded by excessive public debate in advance. "Trust Flexible Mac" is a slogan that at least attempts to reconcile good politics with good diplomacy. But if these slogans are to be bruited abroad, it would be much better to have the election before any Summit meeting, not after it.

Cards on the Green Table

A MOVE this week in the Geneva talks on nuclear tests supplied Mr Macmillan with a handy piece of evidence that, if impatient western critics will just leave diplomatic tactics to their governments, these can be trusted to be flexible enough when given half an incentive. Since these talks began on October 31st, no substantive progress has been made. The crux of the matter is whether Russia will accept any effective form of international supervision; and on this crucial sector the Russians have not yet budged.

Up to this week, they have clung to a formula which would be farcical if the matter at stake were not so serious. Mr Tsarapkin has argued that any "international" control post on Soviet territory must be manned by twenty Russians and only one foreigner; that no mobile inspection teams should be kept standing by to probe suspicious phenomena; that only in exceptional circumstances might an investigating team be tardily assembled (to reach the scene only when radiation had fallen off and other traces had been deftly obscured); and that each nuclear power should be able to veto even this hamstrung kind of inquiry. If this is the sort of "international control" which Mr Khrushchev has in mind for disarmament generally (and Mr Rapacki for his Plan) the outlook is gloomy.

Western impatience with this childishness (which Moscow has been understandably ashamed to reveal to its own people) has yielded two reactions. First came the contention by Dr Teller and his scientific and military associates that new information shows how certain nuclear tests can be harder to detect than last summer's conference of scientists thought. This seems a pretty contentious contention, by no means universally accepted in America itself, and evidently reflecting yet one more inter-departmental shindig in Washington; but its injection into the Geneva talks may still help to make the Russians see that they cannot squat in their frozen posture for ever. The same may be true, in time, of this week's joint western concession, the dropping of the argument that the duration of a ban on tests must depend on progress in other aspects of disarmament. The British and Americans have deliberately presented this in the form of a challenge to Russia to make matching concessions. If this works, they will certainly be able to claim that they know the best way of dealing with Moscow's skilful hagglers. But will it work? The Russians, who do not enjoy having their own standard gambits played back at them, sound unimpressed—so far.

UNITED ARAB REPUBLIC

The Thaw

THE financial agreement initialled last week in Cairo turns a sterile chapter in Anglo-Egyptian relations. However suspicious the two governments may still be of one another, it is something that they have agreed to put an end to a stalemate that had grown to be an intolerable nuisance all round. A financial settlement was an essential preliminary; now, after many false hopes, the way should be open for the resumption of a normal, working relationship not only with Egypt and Syria, but also with Saudi Arabia, which in a burst of Arab brotherhood broke off relations with Britain in November, 1956. President Nasser is still procrastinating for reasons discussed by our correspondent in Cairo on page 326. But neither Britain nor the United Arab Republic can go on affording the political luxury of openly snubbing the other. For more than two years, London and Cairo have had no diplomatic or consular relations and have consequently been even more in the dark about each other's intentions than they were before.

Negotiations for a financial settlement first began in Rome in May, 1957, six months after the Anglo-French expedition to Port Said. Since then the talks have been on and off four times, the last meeting in September, 1958 (when Anglo-American troops were in Jordan and Lebanon) being one of the least promising. Egyptian bargaining has progressively got stiffer, and it is quite possible that if the British had settled some months ago they might have got better terms. The details of the agreement, and its implications for British industry, are discussed on page 336.

The important thing is that the first hurdle has been taken. The leisured dignity of the Government's advance towards rapprochement with the UAR has been completely out of step with the pace of events elsewhere in the area. Although it is an idea that cannot officially be admitted, events in Iraq must certainly have forced the pace of negotiation. The British Government may not yet have come round to the view that it is self-defeating to try to fight communism, and Arab nationalism as led by President Nasser, at the same time; but it may have seen the need to prepare the ground for a change of attitude. And President Nasser, although bolstered by the great gathering of VIPs from east and west that created a shortage of palaces in Cairo two weeks ago, is openly unhappy about the growth of communism in Iraq. His acrobatics in attacking the communists in his own and other Arab countries while involving himself all the time more closely with the Soviet Union are difficult, but he is banking on the sound political sense that the Russians have already shown towards Arab nationalism. There is now at least an opening for the West to show good sense, too.

TEACHERS' PAY

Second Chance

BY great skill, the leaders of the National Union of Teachers have manœuvred themselves into a position in which they have been able to call a second meeting of their union delegates for this weekend. They will ask it to ratify a tentative agreement whereby the NUT would resume

negotiations in the Burnham committee for a new salary scale—and meanwhile accept the 5 per cent increase in pay which was offered in December to start on January 1st, and would now start on February 1st.

Will the delegates agree? The executive claims that it has extracted something from the tricky situation into which the militants threw the Burnham committee by rejecting its recommendations of last December. The authorities' side has now agreed to enter discussions on a new teaching salary structure "without preconceived ideas on the outcome" instead of, as previously, with the warning that they are not committed to any increase. One can argue interminably whether there is any real difference in this new formula. Further, the authorities have agreed to defer any decision about when any new salary scale should begin to be paid; this is in place of the fixed starting date in April 1960, which was previously proposed and which seemed absurdly remote to the militants last December. The authorities claim that they have not made any new concession here; but the NUT believes that, as the Minister behind the scenes has urged the authorities to accelerate negotiations, it can advise its members that an earlier date will in fact be achieved. The union delegates will be making a mistake this weekend if they spend too much time arguing whether the new formulae have been worth the forfeit of nearly £1 million, which teachers as a whole have suffered through the enforced delay of the 5 per cent increase from January 1st to February 1st. They would be wise to debate merely whether further delay might not be equally expensive without achieving more.

Assuming the executive carries the meeting, it will then promptly put up its own proposals for a new salary structure. The most dubious of these are some of its claims for adjustments of allowances (one of them springs from the desire to equalise the treatment of primary and secondary school heads), and its general emphasis on the need for a higher basic scale rather than on more incentive payments for special qualifications and responsibility. This latter emphasis, which the NUT has adopted mainly in the interests of women teachers in the primary schools, does not accord with present educational requirements. An adequate supply of primary teachers is still coming forward for recruitment, but there is a shortage of teachers with specialised skills. In passing, it may be noted that women teachers' pay between now and April 1960 will increase not only by the 5 per cent, but also by another 3 per cent (on the present starting salary), representing the agreed annual increases in their salaries which will make their pay equal to the men's by April 1961.

FARMERS

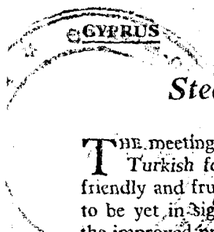
Olympian Sir James

THE annual general meeting of the National Farmers' Union this week produced a familiar list of arguments and resolutions. Full recoupment of costs at the price review; higher tariffs for horticultural products; regulation of imports; a "land budget" to protect agricultural land from development; an end to opencast coal-mining—all these subjects are hardy perennials on which farmers' feelings run deep and strong. But the Government must have been relieved to find the meeting in a milder mood than usual. There was, for once, only one resolution about prices and that was so intemperately phrased that Sir James Turner wisely obtained its withdrawal. The union will certainly be hoping to get a better price deal this year than last, when the Government cut its guarantees by almost the full permitted amount; and electoral strategy suggests that it may well succeed. But last year's settlement has damaged farming prosperity less than the union feared, and its first angry reaction has subsided.

This situation enabled Sir James Turner to celebrate his elevation to the House of Lords by advocating a broad, international approach to the basic problems of agriculture. He suggested that a greater degree of international price stability was in the long-term interests of Britain as well as of primary producers everywhere; and he wanted a high level Government committee to be set up to concern itself with the supply and prices of food for the British market. Behind Sir James's olympian approach and studied moderation lurks an obvious desire for a much stronger degree of direct protection for British agriculture. Sir James probably considers it safer than indirect protection by subsidies. But against whom and what is agriculture to be protected? Against the occasional dumping of subsidised surpluses? Or against the regular supply of more efficiently produced and lower-cost food from such sources as New Zealand, Denmark and Canada? It may be reasonable for British farmers to ask for protection against the first type of competition—although, as last year's Government investigation into butter surpluses revealed, it is often the regular overseas supplier (in that case New Zealand) who really suffers from the competition of low-price surpluses. But it is the second type of competition which is of most practical importance; and here the need is to reduce, not increase, the degree of insulation which British farmers already enjoy by way of subsidy. Sir James's concern for the world's primary producers has little relevance to this situation.

FREE TRADE AREA

M. Debre and Europe



ANY lingering hope that provisional arrangements might set a precedent favourable to a free trade area appear to have been dispelled by the meeting of ministers from the common market on January 14th. On French insistence, they finally turned down the British proposals for provisional arrangements to avoid discrimination. Instead, the Six will stick to the proposal they made in December—to extend the 3 per cent clause in the Treaty of Rome only to the members of the European Community, to enlarge all quotas on imports from other European countries by 20 per cent, and to ease any other special difficulties through bilateral talks. First contacts with the French do not suggest that they are likely to be generous. Any bilateral arrangements will cost them more in foreign exchange than the simple British proposal would have done.

M. Debré, in his statement of policy to the French National Assembly on taking office as prime minister, also gave little comfort on the long-term prospects for the free trade scheme. France, he said, was as determined as ever not to give up its requirement of guarantees of the kind accepted in the common market: common tariff, equalisation of labour costs, common agricultural policy and (a new demand in the free trade area context?) participation in overseas investments.

Except for the last demand, all this is hardly new. But it should extinguish any false hopes that M. Debré's party, whose nationalism accords so ill with the common market, is more likely to accept a free trade area instead. Perhaps the only encouraging aspect of the Gaullist view of Europe is the bearing it might have on any application by Britain to join the common market itself. So long as General de Gaulle is in power, it is quite clear that the community will not drift in the direction of a federal state; that should remove a good many political objections to a British decision to join.

At present the commission of the common market is conducting exploratory discussions with the six governments of the community on a long-term agreement with the countries outside. There are, however, indications that its thoughts are moving towards a world-wide arrangement—perhaps within the framework of the General Agreement on Tariffs and Trade—and not necessarily a European one. The prospect of anything like a free trade area looks dimmer than ever.

The French have got past the crucial deadline, January 1st, and have established a precedent of discrimination; they are in the clear. Thanks to the new French economic and monetary measures, the community's external policies are taking a more liberal direction than was feared at one time. That does not remove the objections to a division of Europe. Britain seems likely to be left with the choice of adjusting itself to the division, or thinking of joining the common market itself. Some thought is being given to this last possibility in British Government circles, but so far the arguments against have carried most weight.

Steadying the Applecart

THE meetings in Paris this week between the Greek and Turkish foreign ministers are reported to have been friendly and fruitful, although no concrete solution appears to be yet in sight. At present the British contribution to the improved prospect of a Cyprus settlement that has been created by the unexpected Greco-Turkish rapprochement is limited to not upsetting the applecart by some impolitic move in the island itself. This, however, is a highly exacting task.

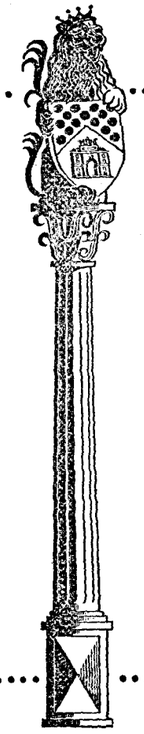
In spite of some threatening leaflets, Eoka has kept the "truce" which it declared on December 23rd. The British authorities have responded by lifting curfews, releasing an increasing number of detainees, and removing various restrictions. But military operations against Eoka have continued, and a lengthy, large-scale sweep against the terrorists in western Cyprus has been evoking bitter protests against "truce-breaking" from the Greek Cypriots. On Tuesday this operation was suddenly called off on the ground that it had achieved its purpose. On the same day, however, Mr Lennox-Boyd told the House of Commons that he could not ask for military operations in Cyprus to be stopped during negotiations. Assuming that there has been no muddle or division in high places, the local security operations that are to continue in Cyprus presumably constitute the steps which the Colonial Secretary thinks should be taken "to keep the peace and prevent the organisation of terror."

The record of events illustrates the dilemma in which the British are placed. Their object is to bring permanent peace and a settled future to the island. But so long as they lack the slightest guarantee against renewed Eoka violence, they feel bound to proceed in a piecemeal, unspectacular way which fails to disperse the Greek Cypriots' distrust of British intentions. As a first step out of the dilemma, might it not be possible to devise some means whereby the terrorist leaders' intentions could be more closely tested without asking them actually to surrender their arms or their persons? One way might be a public challenge to them to call off the boycott of British goods.

DOCTORS AND THE HEALTH SERVICE

The BMA Burns its Fingers

NEARLY two years ago, the British Medical Association, exasperated beyond all measure by the Government's blank refusal to grant any increase in doctors' pay or to agree to arbitration, produced a plan for the progressive withdrawal of general practitioners from the health service. The Government's reaction was to appoint a royal commission to consider all aspects of doctors' pay and to grant them an immediate increase of 5 per cent. As the royal commission is still sitting, a further increase of 4 per cent was made at the beginning of this month.



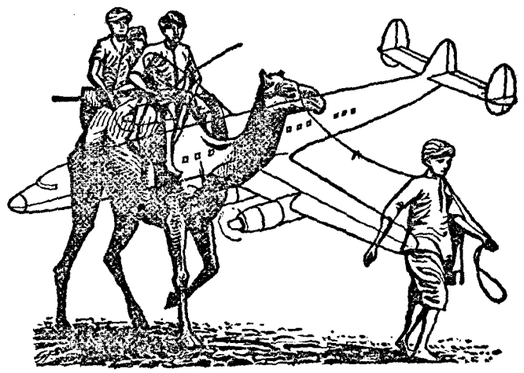
The doctors' plan for withdrawal was consequently shelved, but later a sub-committee of the BMA's General Medical Services Committee was appointed to consider and report on an alternative service to be provided by general practitioners if withdrawal were eventually decided on. But this sub-committee apparently could not agree, so Sir Frank Newsam, formerly permanent secretary to the Home Office, was asked to investigate any deficiencies in the existing service and frustrations arising from it, and to suggest practical modifications or alternative schemes.

Sir Frank's report has now been published, and it contains a useful and sound, though not very original, account of defects and frustrations. But on the main point, an alternative form of service, he was unable to carry out his terms of reference because, as he quite rightly points out, the health service is here to stay and "it would be quite unrealistic of doctors to think of withdrawing" from it. The council of the British Medical Association has indignantly dissociated itself from this conclusion. But the failure of its own sub-committee to agree on an alternative service obviously lends weight to Sir Frank Newsam's views. They will certainly be endorsed by the users of the health service, who are incidentally excluded from representation on the Porritt Committee—a body set up by the medical profession as a whole to consider the health service as a whole after ten years of experience of it.

IRAQ

Justice and Nationalism

THE president of the military court in Baghdad, Colonel Fadil Abbas Mahdawi, has added a new twist to military justice, turning aside now and then from the trials of former ministers and officials to give a news release. This week, as a former commandant of the police was being tried, Colonel Mahdawi announced that Rashid Ali al-Gaylani, four times prime minister of Iraq and leader of



Now we feel more like our old selves!

With the easing of the credit squeeze, the National Provincial Bank is once again able to meet generously the borrowing needs of all customers—old and new. Anyone who seeks to borrow secured or unsecured for private or business purposes is assured of sympathetic consideration by the Managers of the National Provincial Bank's 1,500 branches. And it is worth remembering that our banking rates are a good deal lower than is usual for special schemes.

National Provincial

for friendly service

NATIONAL PROVINCIAL BANK LIMITED

London today, Pakistan tomorrow

But here the adventurous businessman will be meeting people whose customs and traditions are very different from his own. That is why he will do well to consult the National and Grindlays Bank Limited. This Bank not only provides an efficient modern banking service but has also a fund of knowledge of all kinds concerning Pakistan.

the nationalist revolt in 1941, and Colonel Abd al-Salam Aref, the former deputy prime minister, had been tried for treason.

The overthrow of the Nuri es-Said regime in July ended nearly eighteen years of exile for Rashid Ali in Saudi Arabia and Egypt. From the day he left Cairo for Baghdad, proclaiming the imminent addition of Iraq to President Nasser's United Arab Republic, it was clear that he was out of touch with revolutionary affairs in his native land. When he arrived in Baghdad he made his first mistake by snubbing Brigadier Qasim and calling first on Colonel Aref.

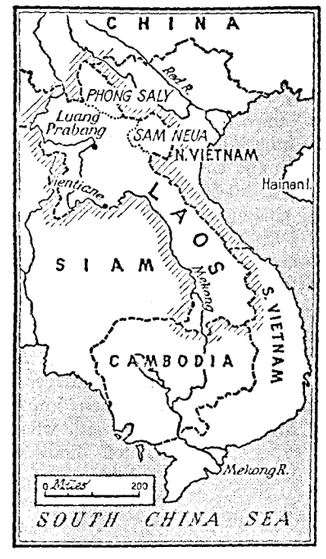
The career of Colonel Aref was much shorter. He was first heard of when he became deputy to Qasim at the time of the revolution in July. Some observers thought he was the man to watch among the new Iraqi rulers, that he would play the role of Nasser to Qasim's Neguib. But Qasim also seemed to feel that Aref needed watching, and soon relieved him of his positions as minister of interior and deputy prime minister. Aref was then packed off to an honourable exile as the Iraqi ambassador to Bonn but he never presented his credentials. In November he returned to Baghdad and arrest. The details of the plot, if there was actually a plot, engineered by Rashid Ali and Aref have never been publicly announced. According to Colonel Mahdawi, a recording was made of their trials and one day, presumably, they will be played by Baghdad radio.

The Iraqi government may have disposed of those former officials whose crime it was to have worked for the union of Iraq and Syria. Are we now to expect a new series of charges against those who, in one way or another, wanted to unite Iraq and the United Arab Republic? The rift between Cairo and Baghdad can no longer be denied, it is already assuming the dimensions of the old one between Nasser and Nuri. Faced once more with the necessity of taking sides, the weary Arabs must be hard put to explain Arab nationalism to each other. If this is so, what sympathy to their aspirations can they expect from the rest of the world?

COHEN COUNCIL

The Wise Men Going West?

It is not quite clear, probably least of all to itself, whether the Cohen Council is now gently fading away. By Christmas the only economist among its three wise men (Sir Dennis Robertson), the council's original secretary (Mr Hopkin), and its assistant secretary (Mr Blackaby) had all left. On the analogy of the ten little nigger boys, it seemed that the number of members would soon be none. But Messrs Hopkin and Blackaby have both been replaced and a small staff is carrying on background work on topics —such as the international position of sterling and the techniques of wage bargaining—which were listed in the council's first report as worthy of further study. In the absence of an economist, however, no actual report is being prepared. And although the first report came out last February, and the second after a six-month interval, nothing new will appear this February or indeed for some months.



Would not the Government now be wise to discontinue this experiment? The arguments against are presumably three. First, the personal one: that such action would be unnecessarily rude to the two wise men (the judge and the accountant) who still remain. Secondly, the psychological one: that the council had built up a reputation as a force favouring a stern economic policy, and that its abandonment might be taken by some suspicious people abroad as a sign that the Government was anxious to launch out to profligacy. Thirdly, the practical one: that the addition of this small research body to the economic establishment is still worth while. But this third argument is surely much weaker now that the National Institute for Economic and Social Research is to produce every two months its own closely argued assessment of the economy.

LAOS

Missing, One Dictator

After Burma, Pakistan and points further west, the kingdom of Laos has now dispensed with parliamentary government. Mr Phoui Sananikone, the Laotian prime minister, has been granted special powers for twelve months by the national assembly. He has undertaken to draft a new constitution and to hold fresh general elections when the draft has been approved.

It would be wrong to suppose that because Laos is underpopulated and underdeveloped it is ignorant of parliamentary processes. Since the country became independent after the Geneva settlement of 1954, it has held two general elections with evident fairness. On the other hand, its parties have been composed of individual leaders and their personal followings. The exception has been the Neo Lao Haksat, a thin disguise for the communists. The Haksat was set up under an agreement between the communists and the government in 1957, which provided for the return of two north-eastern provinces to the government. These provinces, Sam Neua and Phong Saly, had been under communist rule since the Vietnamese communist invasions of 1952 and 1953.

At the elections last May, the Haksat won nine seats; it had already been given two cabinet seats. The 1957 agreement had provided for the "integration" of the communist officials and soldiers into the national civil service and army—a prospect which the Americans, who foot the bills, did not relish. It did indeed seem possible that Laos might be taken over by its communist minority. Corruption in Vientiane, the capital, and currency fortunes from the overvalued *kip* provided fertile soil for communist tactics.

In the past few months, however, there has been a dramatic change. Crown Prince Savang, a determined figure, took over behind the scenes. The *kip* has been devalued. The former prime minister, Prince Souvanna Phouma, was sent to Paris as ambassador. An anti-

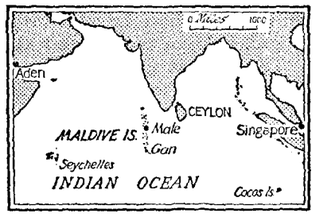
communist national association was formed. Of the communist soldiers, the majority were sent back to the villages, and two battalions appear to have been interned.

The request for special powers, however, stems not from the internal situation but from external threats. The communist army in north Vietnam is reported to have crossed the Laotian border at several points after accusing the Laotian army of doing the reverse. Democracy was too fragile to meet the menace. Mr Phoui, however, hardly looks like a dictator. Will Prince Savang fill the job?

MALTA

Mr Mintoff Weighs In

MALTA was the subject of the first parliamentary question this week, but the Colonial Secretary showed himself determined to postpone the post mortem on his policies there until the second reading of the bill that will give the island its new and unrepresentative constitution. The debate on that second reading will deserve to be searching, but meanwhile Mr Mintoff seems intent on making the task of Mr Lennox Boyd's critics as difficult as possible. He is now setting out the ways in which his party is to intimidate Maltese from co-operating with the Government; he declares that when the Labour party is returned to power it will take "legal action" against all who co-operate with the "Imperial Government's policy." This, of course, would be impossible without the introduction of communist-type laws and courts. In more general terms Mr Mintoff has assured his followers, and would-be members of the proposed governor's council, that all who profit from the people's tears will pay for their crimes. Meanwhile, the ball is to be opened by a general strike on the day that the new constitution comes into operation.

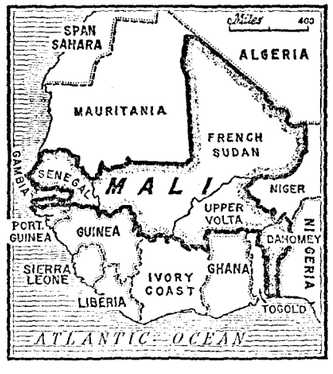


This is for local consumption. For the foreign press Mr Mintoff has now said that Malta does not necessarily want to leave the Commonwealth when independent. All it wants is the status of Trieste, with the money to keep it going. It will then repair the ships of all nations impartially, presumably using Messrs Bailey's shipyard, whose installation at British expense Mr Mintoff finds so "insincere."

MALDIVES REPUBLIC

Tell It Not in Gan

IT comes as something of a surprise to learn that the treaty between the British and Maldivian governments under which Britain was given rights to build a Royal Air Force staging post on Gan atoll, though initialled, is still unratified. The base itself may be completed this year, and the Secretary of State for Air has told the Commons that progress is satisfactory, while the Commonwealth Relations Office continues to hope for ratification. But despite the efforts of the newly appointed British representative to the Maldives (responsible to the High Commissioner to Ceylon), it is clear that the Maldivian prime minister, Ibrahim Nassir, is anxious to put off the evil day. It was his predecessor who made the original concession to the British in their extremity after they lost their bases in Ceylon. He regrets the way the Maldives are being dragged into global strategy, and it seems he is also apprehensive that the influence of the RAF on the unsophisticated outlook and moral purity of the Maldivian fishermen at the Gan end of the archipelago will not be what he would wish.



Hence, it would appear, the labour dispute in Gan, which took the unusual form of the government urging the Maldivian workpeople to strike against their RAF employers, and the workpeople chasing the official agitator into a British warship. It is clear that the Naafi has very real attractions for men who have live a toilsome, if meritorious, life at sea. The RAF has employed some 500 of them alongside 1,200 Pakistani labourers. While 500 of the Gan islanders have been resettled on other atolls at British expense (and they are pleased with what they have made out of it), another 300 have still to go. Finally, when the airstrip, fuel tanks and domestic buildings are completed, they will all go; but whether quiet will then settle on the base is a question. The Maldivians are all for visits to the Naafi, it seems, and good communications thereto. Their government is all against it. But in these arguments it is usually the consumer who wins.

AFRICA

Introducing Mali

THE French Community is on the move. Four of the newly autonomous republics of west Africa—Dahomey, Haute Volta, Senegal and Soudan—formed the new federation of Mali at Dakar last weekend. (The old African empire of Mali entered recorded history when its ruler was converted to Islam in 1050; it succumbed in the seventeenth century.) Although the delegates declared their "democratic republic" open to "every autonomous state of west Africa wishing to join it," few believed that the three separatist states of what was French West Africa would be in any hurry to do so. Balkanisation has its advantages for them. The rich Ivory Coast of M. Houphouet-Boigny, a minister of state in M. Debré's cabinet in Paris, prefers direct links with France. So, too, does the Niger, which claims to have better air communications with Paris than with Dakar. Its new head of government, M. Diori, is opposed to any restoration of the distant west African administrative system of French days under which the Niger usually came off badly. The third, Mauritania, has strong natural ties with the Arab Maghreb to the north, and its political leaders—some of whom have fled to Rabat in the past—have always sought to avoid submergence in a black African community.

Even so, the federalists counted it a success to have won the adherence of Volta, after the uncertainties of the Bamako conference last month. Volta's natural route to the sea is through the Ivory Coast, and M. Senghor, the federalist leader, spoke darkly after the Bamako meeting of the pressures—known and occult—that the Volta delegates had to resist. M. Senghor has denied that the federation is a step toward secession from the French Community. Mali intends to maintain close relations with its neighbours in the community, and its official language will be French. But with its federal government, assembly, judicial authority and high court, it must tend to form its own interests and go its own way. The four equatorial African states of Chad, Congo, Gabon and the Central African Republic (formerly Ubangi-Shati) which agreed to unite in a customs union last Saturday, have deliberately set themselves against a federal relationship; the nearest they go is a common transport system. The decision reflects the strength of M. Houphouet-Boigny's party in the four republics.

M. Debré's government in Paris is now hastening ahead in setting up the community's central institutions: the executive council is expected to meet for the first time next month. One problem for M. Debré is the status of Guinea. M. Sekou Touré is knocking at the community's door in the guise of an independent but "associated" state under article 88 of the constitution. But for the moment the way seems barred.

SIERRA LEONE

More Diamond Trouble

IN its statement last week the Sierra Leone government came near to admitting that it had lost control of parts of its territory, much as it lost control in the chieftaincy riots of 1955. Big mobs have even attacked and routed the police. As in so much Sierra Leone unrest, diamonds are to blame. This time the trouble is that the African diggers have made a solid attack on the preserves of the Sierra Leone Selection Trust. These are the areas reserved to the company under the agreement of 1955, when diamond mining was made legal in other areas of the territory over the whole of which the company once held a diamond monopoly. But this has meant that, once the African wildcat diggers have begun to exhaust their own diamondiferous areas by potholing for the best gem-stones, the company's more carefully worked areas have begun to tempt them.

The government rightly points out that this imperils the country's economic future, since it destroys a valuable natural asset. In his recent report on Sierra Leone's economic position, Professor Jack made the same point: with agriculture in a rather sickly state, the country's hope of an expanding economy lies in its mineral resources, mostly iron and diamonds. Without these, its prospects of viability as an independent state would become questionable; yet the pressure upon Sir Milton Margai, the premier, to move forward to this decisive step grows equally with the ferment in French Africa and with attempts in Sierra Leone to stop Sierra Leonians from poaching a foreign company's preserves. Shrewd and moderate, Sir Milton knows his country is not really ready for independence yet; but the Governor, a man of outstanding vision and liberality, knows that only an independent African government can take really strong action against Africans. A fully independent government would have to take action, however, not only against Africans but also against the Lebanese organisers of the traffic, who are well dug in; and it is by no means clear that it would have the strength of mind to to so.

SOVIET UNION

Eve of Congress

THE 21st All-Union congress of the Soviet Communist party will open on Tuesday. Though this is, in theory, the highest party body, Stalin did not convene a congress at all between the war and 1952, the year before he died. At the next one, held in February, 1956, Mr Khrushchev produced his time-bomb—the secret indictment of Stalin, which, when released, shook the communist world. Officially the new congress has been called to endorse the country's first seven-year plan; no doubt the *lumik* will help to endow its debates with a glow of self-confidence.

The progress report on the Soviet economy in 1958, published last week in Moscow, gives some insight into the state of planning. Gross industrial production last year rose by 10 per cent, and—thanks to a good harvest—national income increased by 9 per cent. Thus the annual plan was exceeded. All the same, the figures quoted below show that if Soviet basic industry were merely to continue at its present pace, then it would not reach the targets originally set for 1960. The switch from five to seven years as the planning period thus veils a slackening of the pace, though possibly only a temporary one. The same is true of light industry. Many of the pledges to the consumer, particularly about radio and television sets, will not be kept on time. Housing, on the other hand, with 68 million square metres of new floor space in the towns, made a big jump forward last year. Finally, the objective for grain output (180 million tons in 1960) is shown to have been completely unrealistic. Now that they have dropped the camouflage of a "biological crop," the Russians are quite frank about results. The barn crop was as low as 81 million tons in 1953. It rose to 127 million tons in 1956, fell to 104 million tons the following year, and then reached the highest recorded figure, 138 million tons, last year. Wheat accounts for 73 million tons out of this total.

SOVIET BASIC PRODUCTION
(million tons)

	1957	1958	1960 original target
Coal	463	496	593
Crude oil	98	113	135
Electric power*	209	233	320
Crude steel	51	55	68

* Billion kWh.

Mr Khrushchev's reforms in town and countryside have met with stiff opposition. The "anti-party" group may well be attacked during the congress as a warning to other oppositionists. But the congress will also talk about problems of the block and about international affairs. Mr Mikoyan has hastened home from Washington in time to help in the revision of that part of Mr Khrushchev's report. Even if it does not produce a secret time-bomb on this occasion the congress is a very important forum and the best guide to the current mood and plans of the Soviet leadership.

CAITHNESS

No Samaritans Wanted

THE lot of the superfluous Samaritan is a trying one. People who heroically dive to the rescue of perfectly competent swimmers; people who climb trees to retrieve agile and self-sufficient cats; even people who offer lifts to pedestrians out for a bracing walk, not only get little gratitude for their altruism, but look rather silly. As the presumed victims are apt—if human—to feel a shade silly themselves, such gestures can even generate acerbity.

This psychological element no doubt played its part in the reactions of the Caithness Public Health and Welfare Committee to the arrival, over the snowbound hamlet of Braemore (population 34), of an Automobile Association helicopter. This aircraft, the AA have explained, was merely observing the state of the roads, not preparing an airlift. But its presence brought an air of emergency. To sensitive spirits, it suggested a belief on the AA's part both that the Braemore villagers were a feckless lot, who could not be trusted to stock up against winter hazards, and that the Caithness council were complacently prepared to let them starve. More, it appears, will be heard of this complicated if wordless insult to Highland pride.

But there is more to the committee's indignation than psychology. There is a well-founded, bread-and-butter apprehension, shared by other Scottish local authorities, of onerous future expenses if heavy snow should come to be equated with emergency. Hitherto these authorities have got by without a comprehensive snow-clearance service—which in countries regularly snowed up for the duration of every winter is an obvious must, but which demands a capital outlay on snowploughs too exasperatingly uneconomic to be cheerfully undertaken where snow normally interrupts traffic only for a few days each year.

A few days' isolation, even a few weeks in an exceptional winter, is a normal feature of Highland life, better endured than cured at so disproportionate an expense. Thus the standard argument; but it has its critics. After the last comparatively protracted siege, three winters ago, the Scottish councils only just fended off an order to stock up with a full battery of snowploughs. Every isolated village that survives a siege, with plentiful supplies and everything under control, reinforces their case. By the same token, it is feared that every incursion of eager beavers in publicity-worthy helicopters implicitly puts the case for the snowplough. But is not this logic shaky? The advocates of a snowplough reserve see it as a necessary insurance against rare emergency. The helicopter—even intrusive, even unwanted—demonstrates that, for that rare emergency, the alternative exists.

ARGENTINA

Revolt against Austerity

PRESIDENT Frondizi has shown great sangfroid in persisting with his visit to Washington despite the trouble at home. In his absence, the Argentine government has broken the back of the general strike in Buenos Aires by arresting the strike leaders, calling up one group of reservists and mobilising the transport and oil workers so that they come under military discipline. This is the second time President Frondizi has bulldozed his way through labour troubles; it will almost certainly not be the last.

The strikes were in protest against the *austeridad* with which the president inaugurated the New Year. The Argentinians, who for years have been living beyond their means (helped by what is reputed to be the fastest note-printing press in the world), were unprepared for the check that President Frondizi has administered by limiting the supply of credit and making consumer goods more expensive. During this month prices have doubled and trebled, and wage earners—who are used to seeing their wages go up with the prices—have rebelled. Yet the austerity that they were asked to accept is mild. Argentinians today eat twice as much meat as Britons, and half as much again as each American.

President Frondizi won the elections last year because the *peronistas* believed him to be their man. Once in power, he showed very toughly that he was not. Disillusioned, they have opposed all his attempts to put the economy in order, and especially his decision to allow foreign companies to participate in the development of oil resources.

President Frondizi can rely on the support of the former provisional president, General Aramburu, who still carries weight in the armed services. But in Argentina, as in Venezuela, there are military cliques who dislike the president and who would dearly prefer a return to direct military rule. Their intrigues weaken his position on one side, while on the other General Perón still exercises remote control from the dictators' club in the Dominican Republic.

The Economist

JANUARY 22, 1859

THE LIMITS OF IMPERIAL POWER

Whatever may be the final issue . . . of the present critical relations between France and Piedmont and Austria, it must now be clearer to the Emperor than perhaps at any previous time since the *coup d'état* that the Imperial power in France is not so omnipotent as is ordinarily supposed. . . . Louis Napoleon has suddenly discovered that the tether of his power in France has a very definite limit. His despotic government is sullenly permitted, not actively supported by the public opinion of the middle classes. They feel that his government is in a certain sense necessary to the internal repose of France. They prefer him, even as he is, to the horrors and uncertainties of anarchy. They do not see their way to any change. But this is all. He has not sought to strengthen his government by consulting the popular opinion of the nation, and he is, consequently, left without anything more than its passive acquiescence. His schemes are matured in the isolation of his own brain—and are neither originated nor biased by the symptoms of national feeling. When he slowly brings them forth to the nation, they are received with the indifference and dislike that plans so originated generally meet with. What has not been born of any strong popular feeling, will not call forth any such feeling. The reveries of a cold, though in some sense a superstitious despot, cannot excite any enthusiasm in a people who neither associate his rule with any brilliant military success, nor feel any kind of national grudge towards the enemy he has so carefully and so meditatively selected. The Emperor is learning for the first time that no man, however powerful, can wield in Europe the full influence of France who has not really studied the feelings and won the *heart* of the French people. . . . The Emperor finds almost for the first time that it is one thing to be the real organ of a great nation's will, and quite another to be tolerated as the best substitute in the absence of any such real organ.

LETTERS

Diplomats

SIR—May I be allowed a mild word of protest at some of the suggestions made in the article on our diplomats in *The Economist* of January 17, 1959? For you suggest, unless I misunderstand you, that some of the limitations and inhibitions of which you complain are due to their public school upbringing. Is it permissible to remind you that Dr Arnold, to whom you refer, died some 120 years ago? And that even Newbolt is little more than an embarrassing memory in his own Close? May not some of these inhibitions be due to national temperament? The island race was never at its happiest with foreigners. May some of them even be due to the traditions of a service which may have adapted itself less quickly to the modern world than have the public schools? For when I call to mind those of my old pupils at school and university who are now members of the foreign service, I cannot say that I remember them as suffering from any such inhibitions when they left me.—Yours faithfully,

The College, Winchester H. D. P. LEE

SIR—Your description of the Nelson tradition in "How Green are Our Diplomats?" is a little odd. Nelson was not in the "habit of clapping the glass to his sightless eye right up to the moment when some new catastrophe hit (him)." Catastrophe usually came to his opponents.

At the battle of Copenhagen when the famous incident occurred, he first persuaded an irresolute and personally hostile commander-in-chief to allow him to make a daring attack on a formidable enemy. At the crisis of the fiercely fought battle which ensued, Hyde Parker flew the signal "Cease Action." It was this signal which Nelson disregarded, putting his telescope to his blind eye. Some time after this, sensing that the Danes had had enough, although still in the midst of the cannonade, he wrote a letter to the Danish Crown Prince and offered a truce. Sir Arthur Bryant wrote of the sequel ("The Years of Endurance," page 328), "The truce, prolonged from day to day, ended, thanks to Nelson's exquisite skill as a negotiator, in a permanent armistice."

There are many lessons in this superb example for our diplomats, our fighting men and even for leader writers in *The Economist*. Here we see high courage, unhesitating acceptance of responsibility, cool and calculating judgment in the midst of a hard-fought battle and an accurate appreciation of when to fight and when to talk. It is scant justice to the great admiral to compare this with the miscalculations of Baghdad and Havana.

Not that Nelson himself would have disagreed with your opinion of some of our diplomats. "I hate your pen and ink men" he wrote.—Yours faithfully,

Leeds JOHN G. WALKER

Cuba

SIR—In your article "Generals Sink in the West" you say that Batista ousted a corrupt and unpopular government in 1933. The Machado government fell on August 12, 1933, after many Cubans suffered and died fighting, but Batista did not make the slightest contribution to that fight and fall. Only on September 4th, when there was no danger or merit, did Batista lead the "sergeants' revolt" which overthrew the Cespedes government which had had no time to be anything except weak and tolerant.

Batista never ceased to try hard to win popular support. If he never succeeded it was due to causes which are rightly a source of pride to us Cubans. The vast majority of Cubans never forgave Batista for the way he reached power in 1952, ousting a government that everybody recognised as democratic and legitimate, no matter what he might have done or tried to do afterwards.

At first there was resignation, only because it was considered impossible to overthrow the military usurper. But the savage repression of the first attempts made by some isolated heroes changed that. After each new atrocity more and more people, instead of being intimidated, decided to join the rebels or aid them in some way. The murders were *non seulement des crimes mais des fautes*.

In the Cuban revolution there was no backing from the armed forces. Not a single organised military unit went over to the rebels. The army was soundly beaten by civilians in arms, and surrendered unconditionally.—Yours faithfully,

Havana, Cuba LEON PRIMELLES

Abortion

SIR—Although your article "Set the People Free" gave me great satisfaction, may I protest against an omission in your first short list of desirable reforms? Why urge changes in the abortion laws and not refer to the situation which so largely contributes to the problem? But in fact your omission is regrettable on much wider grounds than this.

It is true that there is no law in this country against the practice of birth control or the sale of contraceptive appliances, but under the national health service advice is available only to those for whom a further pregnancy would be detrimental to health. Other couples, who simply want to plan and space a family for the sake of their married happiness and the security of the children themselves, have to rely on their own common sense and initiative—hardly likely to be well developed in this field, in the prevailing social climate.

To those who suggest that *laisser faire* is proper in these matters I would like to show some of the records of the 300,000 patients who came to Family Planning Association clinics last year and the many thousands of letters which reach the association telling of threatened marriage breakdown through sheer ignorance and fear. In the sphere of preventive medicine should not the provision of advice to such couples merit statutory help at least to the same extent as the issue of orange juice and cod liver oil?—Yours faithfully,

A. J. CLIFFORD SMITH
General Secretary
The Family Planning Association, S.W.1

SIR—About the desirability of six of your suggested reforms I am sure that all liberal-minded adults will agree but I am equally sure that you are wrong, not only ethically but also socially, in advocating the legalisation of abortion.

The taking away of life is murder whether the destruction of the life occurs before or after its birth and the condonation of antenatal murder would be regarded as justification for infanticide and as grounds for the legalisation of that crime too.

The fact that the breaking of the seventh commandment is no longer a criminal offence is no excuse for suggesting that the sixth commandment also should be abrogated.—Yours faithfully,

MATTHEW STIRLING
London, W.1

Economic Review

SIR—May I correct one point in your illuminating and helpful comments last week on the *Economic Review* that this institute has just launched? You suggested that we were promised "somewhat fuller access to information in Government departments than the general press." In fact no such promise was asked for or given. The institute is an independent body which has enjoyed no special favours.—Yours faithfully,

C. T. SAUNDERS
Director
National Institute of Economic and Social Research

The Free Pound

SIR—While I appreciate your reservations concerning sterling convertibility, it seems to me that Britain's favourable experience in the past year is due to much more than "quite unusual good luck." The so-called flight from the dollar may be a further redistribution of existing gold reserves due to the strengthened financial position of many countries, notably Britain, who seems to have absorbed about half of the $2 billion gold loss of the US in the first nine months of 1958. (Must all additions to existing gold reserves outside the US come from current gold production?) Or it may be that one must regard fluctua-

tions of this order as normal phenomena caused by price movements, interest rate differentials, etc. It is not too surprising that a combination of relative monetary ease in the US and favourable balance of payments developments in Europe (including Britain) should lead to an accumulation of gold and a weaker preference for dollars abroad. One need not invoke the fear of dollar devaluation to explain the US loss of gold. The only remarkable thing about it is that it represents a flight from dollars into gold, not a flight from dollars into sterling. This in itself is reassuring.

Second, how "inadequate" are Britain's reserves to support sterling convertibility? £35 million was adequate in 1913; today we wonder whether $3 billion is adequate. To answer this question we must go beyond the figures on gold and dollars held by Britain and consider all sorts of second—and third—lines of reserves. What assistance can be obtained from the IMF under the increased quotas? What is the maximum accommodation that can be secured from US commercial banks? Such accommodation, it should be noted, has played an increased role in the recent past. What about bond issues? Would a slight increase in spreads dampen speculative movements of funds? A spread of only 2 per cent in each direction would mean a spread between 2.744 and 2.856. Finally, while recent experience has demonstrated that bank rate changes have a powerful effect on speculative movements of funds, Mr Harrod is probably right in saying that much of the speculation against sterling in 1957 might have been avoided by an earlier and much stronger official pronouncement of Britain's determination to defend the existing parity. Factors such as these make any single figure, such as that relating to gold and dollars, almost totally meaningless.

Your article under emphasises one potential danger spot. Britain's movement to external convertibility may be likened to its decision to return to the gold standard in 1925. The system that emerged at that time put excessive and almost exclusive reliance on domestic monetary measures as a means of preserving international equilibrium. A potential source of weakness in the system now emerging is that Britain may again find bank rate changes required to defend the pound incompatible with domestic policy objectives; the ability of America to utilise monetary measures for international ends may be similarly restricted. It is for this reason that many people today seem to apply stricter standards to what they regard as "adequate" foreign exchange reserves. However, the remarkable revival of the international capital market in recent years, as well as the degree of international co-operation, may well have added even more to the depth, strength and resilience of the world's reserve position than the remarkable increase in the amount of gold and dollars held by the European countries.—Yours faithfully,

New Haven

BOOKS

Striking a Bargain

The Economics of Collective Bargaining

By P. Ford.
Blackwell. 135 pages. 10s. 6d.

EVER since the demise of Ricardo's Iron Law of Wages, labour economics have remained in a thoroughly unsatisfactory state. There are two reasons for this. The first is that the theoretical assumptions, of small Marshallian groups indulging in independent bargaining, have been obsolete ever since national negotiations succeeded in tying most wages to those in a few key industries. The second reason is more topical. For now that a policy of full employment has largely removed the traditional market checks on wage increases, the real centre of theoretical interest becomes not so much the market as the internal power politics of the unions' and employers' associations concerned. Within wide limits, any rate or structure of wages is now possible provided it is agreed by both employers and unions through collective bargaining.

Up to a point, Mr Ford, who is writing about the real world of wage negotiation, realises this. In his numerous asides, he shows a ready grasp of how the trade unions actually work and of the wage problems they face. Moreover—and this is none too common among economists—he is able throughout the book to provide concrete examples to illustrate his argument. This is continually stimulating and has only been bettered by Mr H. A. Turner in his notable contributions on wages in issues of the *Manchester School*. But Mr Ford has not let his sense of realism take him far enough, and the final impression is, unfortunately, of an opportunity missed rather than of a challenge accepted.

The error Mr Ford makes, if error it can be called, is one of focus. His eyes are constantly on the market, where wage claims lead to unemployment in amounts depending on the various elasticity of supply and demand. But his questions are never the questions of the hour because his "labour market" no longer, in the *real politik* of collective bargaining, really matters. Wages today will rise when there is excess demand for labour; but they will not fall (as they did before the war) when demand falls and the market for labour is weak. The unions will go on raising wages (as they have done in textiles) and see that any unemployment that results is removed by men being absorbed into other more prosperous industries.

Thus, especially with both political parties working to remove any unemployment that does at any time appear, market checks on the level of wages (except those in the export market) are almost infinitely elastic. Each year the unions will put in a claim based on last year's profits; the employer will refuse it by pointing to a black future of internecine competition; and, at the end, both sides agree on a halfway award. Arbitration reinforces this pattern. Only in the last two years, because of a change in the employers' (and Government's) attitude, has this automatic process not worked so well. The results were the engineering strike of 1957 and last year's bus strike.

The economic haphazardness of collective bargaining is reflected equally in the attitudes on both sides of industry; but, when it comes to internal politics, it is on the union side that the balance of forces is most important and—because of the highly democratic union constitutions—most delicate. Employers and their federations resist claims; but it is the unions who both press them and determine their form. Demands made at the end of the war, for equal cash increases for all workers, by closing percentage differentials, twisted the country's whole wage structure against the skilled; since then, percentage wage demands have begun to twist it back again. And there is nothing arbitrary about the form of these claims. Equal cash increases will be demanded by unions with a preponderance of unskilled workers or by those recruiting them and wanting to appeal to members at the margin; percentage increases will be demanded by craftsmen. At the border between dissimilar unions lies an area of constant—and sometimes highly damaging—interunion conflict, which shows nowhere better than in such groups of dissimilar unions as are found in building and engineering.

Except in this context—of indeterminacy in the market and political balance across the bargaining table—it is almost impossible to make any sense of postwar wage changes. Between 1946 and 1950, the unions got smaller wage increases than the market would have allowed; since 1956, they have got more, and even in the years between the market (*vide* John C. Lewis's capital-squeezing tactics in the American coal mines) could, in the short run, have supported almost anything. But between them mass unionism and employers' resistance have created a wage logic of their own, with the fortunate result that economists in this field ought to be able to marry practice and theory with a neatness that is seldom possible. Mr Ford does the marrying admirably; but his analysis, though true enough, is not particularly relevant.

The Road to Cold War

A Diplomatic History of Europe since the Congress of Vienna

By René Albrecht-Carrié.
Methuen. 736 pages. 45s.

"DIPLOMATIC history" used to be concerned almost exclusively with the aims and machinations of foreign offices and the activities of diplomats. Its crises were preludes to war, its triumphs the negotiations of treaties, its moments of greatest glory the large international conferences. The study of "diplomatic history" differed from the study of "international relations" in its concentration upon the intricacies of negotiation and the nuances of agreements, and therefore in its precision, as compared wtih the many-sided, broader issues involved in "international relations" as a whole.

Professor Albrecht-Carrié discards this distinction for the purposes of discussing European history since 1815, and to many the title of his book will be misleading. What he has written is a careful, well balanced and sensible account of international relations since the Congress of Vienna. As required by his theme it is not even limited to Europe, and in the whole of its second half dealing with the years since 1914 he gives as much attention to world affairs as to more parochial European affairs. The book gives less attention than might be expected to comparisons between the procedures and organisation of the great peace conferences, and more than its title suggests to economic developments, population changes and the history of warfare. It is written, as its American spelling emphasises, from a transatlantic point of view, so that Britain is throughout treated as a part of Europe. This is done, avowedly, in defiance of the traditional British (and at times American) view, that "foreign affairs are something, usually unpleasant, that happens to other peoples."

The result is a more valuable and intelligible account, but also a less original book. The story here told has been told already many times, and the author has little that is original to offer in the way of interpretation or fruits of research. It is best on the years before 1919, and gets less sure in touch as it approaches its terminal date of 1956. It is outstandingly good on the nature and outcome of the first world war, and on many matters it provides neat, concise assessments, pithily phrased. The reader is constantly reminded that the components of power, which underlie foreign policies, include economic resources, tough social institutions and public morale, no less than military forces and strong allies. The relativity of great power status is never neglected, and the eventual dwarfing of Europe by the two super-powers of the American and Soviet Unions casts a long shadow backwards over the account of earlier twentieth-century events.

The success of the book is the encompassing of so vast a theme in so workmanlike a manner. As a moderate-minded compilation of existing knowledge about how and why Europe took the road it did during the last hundred and forty years, it is admirable. There are, inevitably, a few slips and repetitions, and a few generalisations that are dubious. The view that in 1945, as regards postwar France and Italy, "Britain, or Churchill, tended to support the more conservative forces, in contrast with the American tendency to favour the elements of the Left," must make the shade of Admiral Darlan smile, and raise the eyebrows of President de Gaulle. The author is more than generous in his interpretation of Gustav Stresemann. The maps are too few and too small to be adequate, unlike the footnotes, which are too many and too long to make for tidy reading. These are minor blemishes in a useful addition to the secondary literature on modern Europe.

Non-Cyclical Cycle

Business Cycles and Economic Growth

By James S. Duesenberry. *McGraw-Hill.* 335 pages. 50s. 6d.

THIS is, in intention, a high-grade textbook, part of its publishers' Economic Handbook Series, which includes among others Professor Hansen's "Guide to Keynes," Professor Lerner's "Economics of Employment" and Professor McCord Wright's "Capitalism." Readers of any of these will be aware that originality of thought is not excluded from the contributors' notion of what a textbook should offer; and "Business Cycles and Economic Growth" is in the same tradition. It is not easy reading or meant for laymen; parts of it are unmistakably stiff; but it offers a remarkable combination of scholarship plainly interpreted, theoretical excitement, and common sense.

Its central thesis is that depressions are of two radically different sorts, of which the genuinely and purely "cyclical" are comparatively unimportant—their tidal ebb and flow being of a gentle, as it were Mediterranean or Baltic type, not a Bay of Fundy race. The serious depression, the 1929-type catastrophe, is another matter altogether; a matter of some particular shock impinging on an economy which for institutional and structural as well as cyclical reasons is especially vulnerable. The arguments leading up to and expounding this thesis are skilfully organised. The cyclical, "accelerator-multiplier" mechanism as expounded by the major post-Keynesian theorists is related to pre-Keynesian theory and to Keynes himself, and its working is explained from the point of view both of growth and of stability. Professor Duesenberry then gives his reasons for supposing the fluctuations generated by this mechanism to be, in themselves, comparatively innocuous; there are more self-correcting elements in the economy than Mr Harrod, for instance, allows for. Were truly cyclical elements alone in question, activity would fluctuate, over perhaps a three-year period, shallowly and quite tolerably. Their real importance lies in the fact that they periodically bring about a state of affairs in which, if any specific shock hits the economy, its resistance is low.

From this analysis he goes on to consider the structural and institutional changes that make the economy more fundamentally vulnerable to shock, and the nature of the shocks to which it is subject. Between 1900 and 1929, he argues, the American structure evolved so as to reduce the rate of growth of demand and, for this and other reasons, the stability of the American economy. No equivalent driving force replaced the expansion of the "frontier," and the process of railway construction, which supplied the main nineteenth-century dynamic; population growth slowed down; more immediately, in the late 1920s, the working off of the postwar housing backlog, and the gearing of consumption directly to security values by the spread of speculation to the general public, between them abolished two normally effective stabilising influences. When the shock came—in itself not very different from others which in the past, impinging on a fundamentally expansive economy, had produced only short-lived effects—its results were consequently devastating.

The doctrine of specific shocks has a good deal in common with Professor W. W. Rostow's theory, and it is a pity that Professor Duesenberry leaves that theory undiscussed and indeed unmentioned. But the synthesis of this essentially historical and particularist explanation with general, quasi-mathematical analysis is both new and promising. Much testing and probably much modification will, its author makes clear, be needed before it can serve the purposes of prediction or policy, but it would be hard to upset his modest claim that it makes better sense of past events than do its possibly more elegant rivals.

Fabled Land

Ethiopia Today

By Ernest W. Luther.
Stanford University Press. London: *Oxford University Press.* 158 pages. 25s.

FOR centuries, Ethiopia has been a fabled land, hymned by romantics ranging from Sir John Mandeville to Miss Sylvia Pankhurst. Over and above their adulation, it lately collected a martyr's crown at the hands of Mussolini. Additionally, its highlands are so remote, and most of its lowlands so hot and dreary, that few travellers know the whole of it. Even today, it is easier to get about by air than by road. It dwells inviolate (except Eritrea and Addis Ababa) in ignorance and self-satisfaction. Who can say that it is worse off than Cape Canaveral or Swaffham? The least attractive aspect of its way of life is that its tiny ruling class succeeds in forbidding re-entry to anyone who ventures, as Miss Margery Perham once did, on helpful criticism.

On the whole, this diet of unadulterated worship does it damage—damage

to its own assessment of its role and possibilities, damage to the cause of the young Ethiopians who aspire to crack the carapace of tradition and conservatism in which it lives. This outspoken book, kindly though it is, will not find favour with Ethiopians though it could do them much service if they were to heed its comment instead of writing it off as beneath their notice.

Now that the country's commercial possibilities have excited attention, advisers pour in, lenders lend, and travellers keep arriving. Since the war, it has prospered on the strength of a coffee-boom (though its other exports are so poorly graded that they do not earn it what they might, and though nothing yet goes to show that any of its many known minerals are present in commercial quantities).

To all such visitors, Mr Luther will be a godsend. He has travelled all over the country as economic adviser to the state bank. He has experienced, as have the Food and Agriculture Organisation and Point Four, all the frustrations that attend such a role; he knows how far Ethiopia has yet to go before it plays the role it would like to play—that of a Switzerland to the milling crowds of Black Africa. He puts his finger into all the familiar chinks in the armoury of an underdeveloped land that lives in complacent satisfaction with its own long history: notably, unwillingness to take responsibility except at the very top, and unwillingness to trust any fellow creature with the business details that need to be imparted before there can be development. His book is indispensable to visitors, and will do Ethiopia a service if these no longer arrive, as most have done since the Portuguese landed in the sixteenth century, expecting something rosy, only to come away disillusioned.

Speed on the Ground

The Racing Driver

By Denis Jenkinson.
Batsford. 207 pages. 18s.

MR JENKINSON is a motor journalist with a little experience of motor-cycle racing, and as passenger to Stirling Moss: he is writing about the top-rank professional drivers, not the happy band of club amateurs. He sets out to show how a racing driver manages a given type of car, how and why he is able to corner fast in a four-wheel-drift, and what problems he has to contend with—very swiftly and neatly—if, indeed, he finds himself "over the limit." But his chapters on oversteer and understeer, for example, will be of interest to many amateur drivers, who are likely to be safer as a result of knowing what they are attempting to do and the technical reasons why their cars do or do not respond.

The author is concerned only with what makes the racing driver outstanding in his professional sphere, and of this nothing is omitted. The danger of being "speed happy" and of keeping going until a crash happens; the importance of good eyesight; the difficulty some first-class drivers have of reading the instruments, even to quoting a figure after their practice laps from a dial which has been removed from the car; the different methods of making a good start when the flag falls, how drivers of different temperaments act after an accident—these and many other intimate aspects of motor racing are fully and scientifically discussed. The medical aspects of racing are included, and Mr Jenkinson tends to dispose of the popular theory that the racing driver senses how his car is responding through the "seat of his pants," preferring the more scientific explanation that the driver's "proprioceptive system" comes into play. Although this is primarily a scientific study of the modern racing driver and the cars he is called upon to drive at the limit, Mr Jenkinson's book is punctuated with many fascinating episodes put in to illustrate his points and which bring in most of the famous names in present day motor racing.

One chapter discusses driving in terms of "tenths." It is suggested that the average slow driver in an unwieldy car is driving at what the young man in the sports car would call two-tenths, but which the harassed man in the slow vehicle regards as four-tenths. As he reaches clear road the young man in the sports car will probably drive at seven-tenths, and if he is experienced and really in a hurry, he may proceed at eight-tenths. By way of comparison, Mr Jenkinson holds that racing drivers habitually use nine-tenths; an occasional relaxation at a corner to a mere eight-tenths means that all hope of making a record lap or perhaps of winning a race will be lost. After making this comparison in driving ability the author goes on to remark that what constitutes eight-tenths to the average road driver would be regarded as five-tenths by drivers of the ability of Fangio, Moss or Hawthorn.

Commemorating Freud

Psycho-Analysis and Contemporary Thought

Edited by John D. Sutherland.
Hogarth Press and the *Institute of Psycho-analysis.* 149 pages. 25s.

Freud and the Twentieth Century

Edited and selected by Benjamin Nelson.
Allen and Unwin. 314 pages. 28s.

Festschriften tend to be repetitive and uneven, with reminiscence gaining status from the qualities of the person to whom honour is being done. These two books are no exception to the rule. The first is a collection of six lectures given by members of the British Psycho-analytical Society in 1956 to celebrate the centenary of Freud's birth. The second contains a set of papers for the most part specially written for the same centenary; the authors are mainly American.

To say that a book is uneven need not be regarded as merely disparaging; both these books contain papers that are well worth reading. Of the six lectures in the British volume, the second, "Psycho-analysis and Child Care," by Dr John Bowlby, is a little masterpiece of clarity and good sense. The author is an authority on this topic, who has been at pains to communicate his findings to the mothers and nurses who have to use them. He writes persuasively with hardly a trace of jargon, whereas the third paper, "Psycho-analysis and the Teacher," returns to the cloudy abstract style that is typical of so much psycho-analytic literature.

The paper on "Psycho-analysis and Art" might be read along with the twelfth chapter of "Freud and the Twentieth Century." Both are difficult, and Miss Milner sometimes seems a little perverse, but they grapple with a real problem, and the reader, even if he disagrees, will find that his awareness of the creative processes in art has been heightened.

The papers on "Psycho-analysis and Philosophy" and "Psycho-analysis and the Current Economic Crisis" are intelligent and challenging, though it is not always clear how much the ideas they express derive strictly from psycho-analysis.

The second book is much wider in its appeal, and contains sixteen papers arranged in six sections, which include "Society and Politics," "Literature and the Arts," and "Philosophy and Religion." Alfred Kazin opens with a brilliant essay, "The Freudian Revolution Analysed." "Freud," he says, "a tough old humanist with a profound sceptical mind, would have been shocked or annoyed by the degree to which everything is sometimes explained by 'Freudian' doctrine. He offered us not something that applies dogmatically to all occasions, but something useful, a principle of inquiry into those unconscious forces that are constantly pulling people apart, both in themselves and from each other." Mr Kazin goes on to complain about "the increasing tendency to think that all problems are psychological," to ignore the real conflicts in society that underlie politics, and to interpret politicians and candidates—especially those you do not like—in terms of "sexual" motives. Nigel Walker develops the theme that what Freud really did was to "invent something useful." He offers us a technique not a *Weltanschaung.*

Both books have something to offer the general reader, but "Freud and the Twentieth Century" is a much more considerable publication if choice has to be made.

France and the Levant

Syria and Lebanon under French Mandate

By Stephen Hemsley Longrigg.
Published for the Royal Institute of International Affairs by *Oxford University Press.* 404 pages. 42s.

THE history of the French mandatory regime in Syria and Lebanon is not a happy one. French claims to the territory were based on a desire to strengthen a centuries-old *mission civilisatrice* by adding political control to it. When the mandate came to an end it was found that political control had been a failure and that what France had left in the Levant was a rich legacy of education, public works, and law and order.

In an effort to establish a firm foundation for political control, France pushed aside, as being of no importance, the growing aspirations of Syrians and Lebanese for independence. True, a small group of clients soon gathered around to encourage the French to believe that they were loved and wanted by the local inhabitants, but French failure to recognise how shallow was this pool of affection led to continuing troubles between them and the people of Syria and Lebanon. The French administration in Beirut, always at the mercy of ever-changing governments in Paris, acted as if the mandate was meant to last forever; the Syrians and Lebanese were determined that it should not. It came to an end when it did simply because it would not work any longer.

Brigadier Longrigg has given us more than a history of the Levant under French rule. He has painstakingly sorted out the wartime promises made by often unauthorised Britons to the French or to the Arabs. He has calmly traced the basic reasons for French suspicions of British actions in the Middle East during two great wars. He has, however, not limited himself to a discussion of French shortcomings and says that these are too often remembered not only by the Arabs but also by British, Italian and American critics.

The Ghost of Rome

Power and Folly: *the story of the Caesars*

By Ivar Lissner.
Cape. 384 pages. 35s.

The Great Invasion

By Leonard Cottrell.
Evans. 209 pages. 21s.

AS a result, partly, of the emancipation of the masses into the wide world of TV and the cinema, there has been a remarkable revival in Roman studies, not only in Britain. These two books testify to the popularisation of what was once recondite knowledge. Dr Lissner's, though admirably translated from the German (by J. Maxwell Brownjohn), is described on the jacket by *L'Express* as "historical journalism"; but it is, unhappily, not even good journalism. It is hard to guess why it should have been published in English to sell at so high a price to what can only be an uninstructed mass public. Dr Lissner has scripted—it seems the best word—chunks of Suetonius, Seneca, Petronius, Sallust, Ammianus, Eusebius, Dio, Appian, Lactantius, and others; but his stitching is jerky, and many of his *obiter dicta* are odd. He seems surer than his sources of his subjects' feelings, words and motives: and he even imputes to them beliefs imperceptible in any sources. He thinks "character" is "an immutable factor" to be best studied in "family background." Neither Gibbon and Burckhardt nor modern authorities warrant his view of Constantine's calculations; and he lends the pious Eusebius altogether too much credence. He should consult Hume or Carcopino on "the populousness of antient nations." He brackets Socrates and Seneca as the only two philosophers of the ancient world who went to death in serenity, and forgets Boethius. He thinks Caesar "possibly the most versatile genius ever born," and peppers his work with generalisations like "the audacity which springs from frequent failure and lack of money." The Celts—see the learned journals *passim* today—were never "the forefathers of the English." Diocletian was a cool genius, not a glory-drunk. The good things in this book are the quite lovely plates of the heads and other features of the Caesars and their families and mistresses. All look tough, able, handsome.

Mr Cottrell's work is simple, clear, factual and informative. It brings together, though also jerkily, almost all we know of the Roman invasions of Britain, the occupation, and the organisation of the country while it was under Rome. It is a pleasant book to browse in, but it is not for serious students, as can be gauged from this: "There was an ancient festival in Rome called the *Saturnalia* (our Christmas festivities are descended from it) . . ." Its author's infectious enthusiasm, however, should convert some uninformed browsers into serious students.

Elizabethan Bureaucracy

The Queen's Wards: *Wardships and Marriage under Elizabeth I*

By Joel Hurstfield.
Longmans. 378 pages. 42s.

TO write, as does Mr Hurstfield, of feudalism resurgent under the Tudors may appear surprising. Yet the Crown's feudal rights to administer the lands and control all marriages of all minors who were heirs to estates held of the crown by knight service offered a source of revenue which the Tudors could not ignore. The Court of Wards, set up in 1540 to collect an erratic form of death duties and abolished by parliamentary ordinance in 1646, has long awaited its historian. In the last five years it has found two: Mr H. E. Bell, who recently published an admirably lucid account, and now Mr Hurstfield, who concentrates upon the social and political aspects of the court under Elizabeth I. The Court of Wards mirrors in miniature much of Tudor government and society: the domination of the two Cecils, masters of the court from 1561 till 1612; the desperate recklessness of their rival, Essex; the gross venality of the officials, multiplying in accordance with Parkinson's law; the widening gap between aspiration and achievement; and the failure of James I to remedy what had become a major political grievance of the gentry.

Mr Hurstfield carries a great deal of learning very lightly. His statistics and accounts of procedure are enlivened by delightful studies of individuals. As the author of one of the official war histories, he makes enjoyable comparisons between bureaucratic ways under Elizabeth I and in the Second World War—and effectively punctures any complacency in the reader. In his discussion of the difficult problem of Elizabethan corruption he is penetrating and balanced; he patiently traces the bribes received by the Cecils and points out that "without these apparently corrupt practices the Elizabethan civil service would have gone inadequately paid and have ultimately collapsed through shortage of men and money." Indeed he ventures the provocative remark that "the Tudor attitude to office and administration was more flexible and more frank than our own." In his preface Mr Hurstfield promises a full-scale biography of Robert Cecil, and it will be extremely interesting to see how he deals with that most flexible statesman.

Goods in Transit

The Changing Pattern of Distribution

By Nicholas A. H. Stacey and Aubrey Wilson.
Business Publications, in association with *Batsford.* 380 pages. 45s.

DISTRIBUTION is a large subject and Messrs Stacey and Wilson cast their net wide. The reader is invited to consider the Antonine age in Rome, as well as the risk of salmonella food poisoning

THE POWER ÉLITE

C. WRIGHT MILLS '. . . one of the most acute critics of the recent development of American society . . . . His new book analyses the composition, outlook, nature, and recruitment of those in the seats of power, with more than a glance at the mass society underlying their exercise of power—of which, he argues at length and cogently, the essence is organized irresponsibility. Mr Mills's acute insight is that of an economist who is also a psychologist, a moralist, and a social analyst.' *Scotsman* 42s. net

SMALL-TOWN POLITICS

A Study of Political Life in Glossop

A. H. BIRCH 'This is a penetrating study of political life in an English industrial town of about 18,000 inhabitants . . . the findings are of wide interest . . .' *Yorkshire Post* '. . . there is a great deal here which ought to be read with care by party organizers.' *New Statesman* 'The sections of the book on political opinions and voting habits add usefully to the growing literature on this subject.' *The Times* 25s. net

Oxford University Press

in frozen whole egg pulp. The appendices tell him that there were 8,051,000 life insurance policy holders in 1949, and that sales of white fish not for human consumption are used partly for fish and partly for animals. The authors discuss not only the varying fiscal structures of the Free Trade Area countries, but also the tenth commandment. Even so the book is not exhaustive. There is a chapter on the United States, but recent and often more instructive developments on the European contingent are barely mentioned. The bibliography includes "Love in a Cold Climate" but not "The Economics of Resale Price Maintenance." Square milk bottles are recommended to save space, but the "Tetra-pak" is ignored.

With whatever surprising omissions, however, here is a storehouse of information, much of it never before between hard covers. At least two chapters are sensible and straightforward. But the value of this compendium is reduced by its untrustworthiness: the number of Co-operative supermarkets in 1957 is wildly understated, and an OEEC estimate that not more than 1-2 per cent of goods reach the retail level unpackaged is made to apply to "all foods" instead of to the grocery trade alone. There is bound to be confusion, too, if the reader remembers what has gone before; the statement approved on page 42 that not one department store "could be rebuilt today to operate at a profit" hardly prepares him for the reference on page 199 to new department stores "now being built."

Much of the book looks at distribution from the manufacturers' point of view, and since the authors' own field is market research this is only natural. This background may account also for their reluctance to state their views on many of the major issues in distribution today, such as the optimum number of shops, the tied filling station, vertical integration, the economies of scale, resale price maintenance, and whether department stores should trade "up" or "down." All these issues are desultorily discussed, but (except for a forthright rebuttal of the restrictive retailer's arguments against organisation discounts) in no case is there a clear statement of pros and cons or a firm conclusion. The concept of the public interest is introduced on page 123 rather as if it were some strange new animal; and it is left there.

Particular attention, however, is given to new techniques, ranging from electronic computers to fork-lift trucks, and from quick-freezing to motivation research. The assessments usually conclude that they are "of the greatest importance" but "require intensive study." Problems are "not insuperable" and possibilities, "while not limitless, are still extremely wide." Unfortunately, hasty finish is evident in every chapter, not only in misprints but also in sentences without main verbs, unorthodox punctuation and other literary abberrations.

Distribution is emerging from its role as the Cinderella of economic studies. The statistical blackout is being lifted, and not by the 1950 census alone; as managements become less secretive, trade journals are becoming more informative; the spread of new methods is attracting public scrutiny; and, particularly abroad, the flow of valuable studies sponsored by universities, trade associations or government bodies is increasing. There is still a long way to go; great statistical and conceptual difficulties remain; the patient sifting of facts and the clear-headed development of criteria of the public interest are much needed. But the time has gone when one would have welcomed almost any book on distribution, however haphazardly thrown together and inaccurate in detail.

Legal Aspects of the Civil War

The King's Government and the Common Law: 1471-1641

By Charles Ogilvie.
Blackwell. 176 pages. 21s.

SIR CHARLES OGILVIE, formerly Lecturer in History in the University of St. Andrews, has written a useful small book, which helps notably to revive the often neglected legal aspects of the Civil War period. The book would have been still more useful, and more convincing, if it had been composed to a different and a larger design.

It is a book that is in no way pretentious; but its main thesis is too big and complicated to be demonstrated adequately in 168 pages divided into nineteen short chapters that cover much more than the period mentioned in its title. It is not possible, for example, to say anything very illuminating about "The Origins of the Common Law" in a chapter of five and a half pages, especially when the author's mediæval scholarship is hardly up-to-date. Nor is it necessary indeed to say anything about so remote and intricate a theme when the main thesis of the book concerns the motives and objectives of the common lawyers in their opposition to the first two Stuart kings. The whole book lacks structural unity, and the succession of chapters reads more like a course of lectures than integral parts of a literary entity.

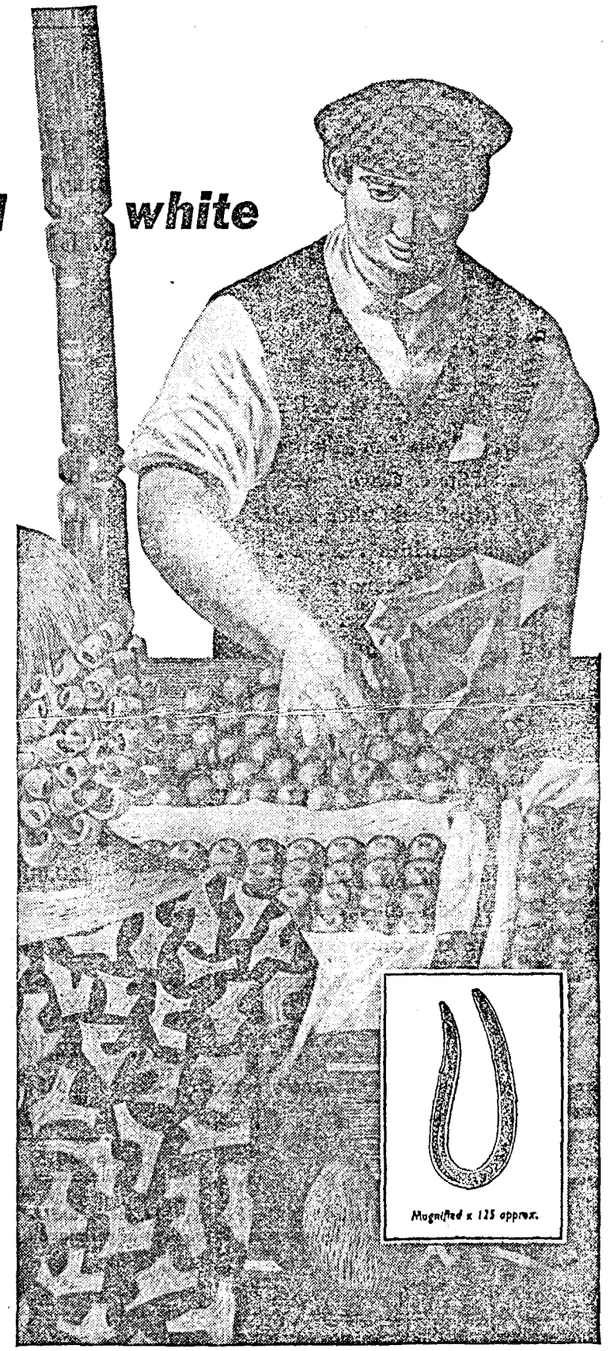
There is little material in the book that is not readily accessible in well-known secondary sources, but Sir Charles performs a useful service in bringing together and discussing evidence that emphasises the corruption, vested interests, dilatoriness, and inefficiency of the common law courts in the period; the decay of equitable jurisdiction; and the ineffectiveness of the Crown's not very persistent efforts to reform them in the sixteenth and seventeenth centuries. He also brings together material that tends to show the value of the prerogative jurisdiction exercised in the King's Council, Star Chamber, Court of Requests, and elsewhere, with their much more expeditious and impartial procedure. It is useful to have the enormous deadweight of common law procedure, with all its gross abuses, exposed, but the argument would have been clearer if fewer detailed illustrations and trivial instances had been included.

The argument itself seems to rely too much on magnifying sinister professionalism on the part of the common lawyers in their opposition to the Stuart kings, much of whose legal and administrative activities were hardly so pure and disinterested as the author seems to imply. The common law admittedly was the protector of property, as Sir Charles reiterates. But it was also and in the process the protector, the only possible protector, of the rights of the individual. If organised opposition to the Stuart policy was to come from anywhere, it is difficult to see where it was to come from, if not from the common lawyers (or some of the most influential among them), clumsy and self-interested even though that opposition was in some degree. The Puritan bodies as such could scarcely have accomplished much on their own. It may be true in part at least that "the real victors of the Civil Wars were the lawyers," but when all is said and done, it does not follow that we ought to lament this result.

OTHER BOOKS

SIR CHARLES DILKE. By Roy Jenkins. *Collins.* 447 pages. 25s.

Our review of this book, which was printed in *The Economist* of November 8, 1958, was, on one point, unfair to Mr Jenkins. Our reviewer accused him of ignoring the damaging remark about Dilke's way of life that is said to have been made by Lady Dilke to W. T. Stead. Mr Jenkins does, however, quote this remark, though he does not tackle its implications.



THE TAXATION OF GIFTS AND SETTLEMENTS. By G. S. A. Wheatcroft. *Pitman.* 287 pages. 52s.

This is the third edition of a book that first appeared in 1954 and immediately established itself as a classic. The new edition covers the most recent legislative changes, including Section 23 of last year's Finance Act—a section of staggering incomprehensibility which of all recent changes in the tax law was probably least considered and understood in its progress through Parliament. In these measured pages, there is little about the arranging of personal affairs to minimise the taxpayer's burden that is missing.

THE TRAVEL TRADE. By L. J. Lickorish and A. G. Kershaw. *Practical Press Limited.* 356 pages. 42s.

This useful book presents a detailed and all too rare examination of the structure and economics of the travel business. The standard throughout is high—as one would expect from Mr Lickorish, who, as deputy director of the British Travel and Holidays Association, has world-wide experience of the trade. It is primarily designed to help students and managers in industries connected with travel; but anybody interested, both in the past and the future of the world's biggest industry and Britain's largest dollar earner (tourism beats both whisky and woollens in this respect), will find this volume useful.

In the pink and white

In April, there is ski-ing on the eastern slopes of the Cairngorms. In late May snow water still swells the salmon pools of the Spey. Even in the lowlands, spring in Scotland can be chill and drear, with rain like steel needles piercing from the North Sea. But in the glasshouses of the Lothians and the Forth-Clyde valley there is no bad weather, and the tomato plants come dark green and sturdy, an inch taller day by day.

Yet, as in all growing under glass, there are still serious hazards. Mosaic disease and spot mildew. Buck eye and spotted wilt. Red spider and tomato moth. And, in the warm soil itself, nematodes—deadly eelworms almost invisible to the eye, so insidious that they can be accidentally brought into the glasshouse in the mud on a worker's boot, carried in countless thousands in a single gallon of water from an infested stream. Nematodes, both the Root-Knot eelworm (*Meloidogyne incognita*) and the Potato Root eelworm (*Heterodera rostochiensis*), are serious pests of the tomato—as they are of many valuable world crops—and for years growers had to resort to laborious and expensive soil sterilisation with steam to keep them in check.

To-day, D-D Soil Fumigant is the chosen weapon of an ever-increasing number of growers, because it effectively controls the parasites, thereby greatly increasing both growth and yield. In some Scottish glasshouses where D-D was injected into the soil at a rate of 400 lb. per acre (452 kg. per hectare), plants spurted to twice the height of those grown in untreated soil, and the yield increased by 40%. In other tests in the U.K., some yields increased by a full 100%—with a general average of over one-third. To tomato growers indeed, D-D is an assurance of a crop in the pink—and the pink and white.*

** In the U.K., first-grade tomatoes are known as 'pink and whites'—indicated by coloured papers in the container. Other grades are 'whites', 'pinks' and 'blues'.*

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

An Innocent in America

WASHINGTON, DC

MR MIKOYAN, having come in like a lamb, has now gone out like a lion. On Monday, his last day in the United States, he attacked in turn Mr Harry Truman, the State Department and an interviewer who had questioned him on television the day before. He thus caused eyebrows to go up simultaneously among Democrats, Republicans and journalists, and stung the State Department into the undiplomatic retort that "this man" was being "fatuous." This has demonstrated that, for a Russian trying to make a good impression on America, it is better to travel hopefully among millionaires than to arrive in Washington. It may also help to correct the idea that he has been getting on altogether too famously with his hosts.

A good many Americans agree with Mr Mikoyan that he was treated cavalierly towards the end of Sunday's television programme, "Meet The Press." Some also suspect that Mr Truman is being unduly (and uncharacteristically) timid in doubting the value of meetings such as those the Russian Deputy Premier has been having with American businessmen. But Mr Mikoyan's angry replies have reminded his audience that he represents a regime which does not easily accept disagreement or criticism ; and they have recalled a number of similar incidents earlier in his tour—such as his reference to the Hungarian demonstrators as "hooligans"—which got less attention at the time than they deserved.

In the long run, the visit may prove to have played a small part in a process which is very radical indeed. But in the short run, it will cause fewer changes than many foreigners, including perhaps Mr Mikoyan himself, expected. Maybe he was a victim of his own Marxist dogma in thinking that American policy is controlled directly by the bankers of Wall Street and the industrialists of the Middle West. It was among these audiences that he was most charmingly persuasive. No doubt their applause, when he told them that Russia was growing daily more democratic, and their happy blushes, when he complimented them on American efficiency, led him to believe that this newfound warmth would be reflected at once in the local newspapers and, before long, in the attitude of the Administration in Washington. In fact, he was greeted so genially because he came from a country which is, to most Americans, as fascinatingly remote as Mars and yet he turned out to be human ; because he was attentive and impressionable ; and because he did not claim that Russia was perfect. Mr Menshikov, the present Soviet Ambassador, created much the same stir when he first arrived in Washington, and yet the ripples he set moving among the cocktail parties have never penetrated to Mr Dulles's office.

Indeed, there are some who think that in the immediate future Mr Mikoyan's visit may have more effect in Russia than in the United States. Any visitor who wants to leave his mark on the grass-roots of American public opinion has to browse a good deal more extensively than Mr Mikoyan could in a couple of weeks. But, as Senator Humphrey perceptively pointed out last Saturday, the grass-roots in the Soviet Union consist of the handful of people on the Central Committee of the Communist Party. There is reason to believe that Mr Mikoyan, like anyone who last came to America in the aftermath of the great depression, has been deeply impressed by its consumer comforts today ; his report may be a revelation to the hermits of the Central Committee.

This is not to say that feeling in America about the Russians is not changing and will not change still more. Fear that Mr Mikoyan might exploit the reaction from the hostility of the McCarthy era is presumably what has led people like Mr Truman to regret glumly that the Americans could not treat him with the clammy aloofness with which the British treated Mr Khrushchev and Marshal Bulganin in 1956. Last weekend Senator Bridges, misappropriating Kipling, invoked the God of Hosts lest Congress forget what the Communists are really like. But the Americans, though many of them like to believe it, are not glacial Anglo-Saxons ; in their attitude towards foreign powers, particularly Russia, they are notably volatile. It is just conceivable that five years from now there may have taken place a return to something like the optimistic amity of the nineteen-thirties. But, if there has, it will have sprung from deeper causes than Mr Mikoyan's visit.

IN the two subjects closest to his heart, the German problem and Soviet-American trade, he has clearly achieved less than he hoped for. It is now generally accepted in Washington that there will be fresh negotiations on Germany, probably at the level of Foreign Ministers, in the spring or early summer. In part this has been made possible because both the latest Soviet note and Mr Mikoyan himself have taken care not to imply that the West is confronted with an ultimatum on Berlin, a situation in which it was plainly unwilling to negotiate. Mr Dulles, for his part, contributed his widow's mite of flexibility last week by suggesting that free elections were not the only means of reuniting Germany.

Since then the State Department has been at pains to explain that this was an exercise in pure logic by a man who is still, at heart, a lawyer rather than a diplomat. Conceivably, when Mr Dulles's hint of "other means" is put to the test, it will turn out to refer to some entirely abstract possibility like the voluntary self-liquidation of the East German government. But until then, the journalists to whom his remark was addressed—and the Russians—are entitled to assume that he is at least mulling over the

thought of something more substantial. Quite possibly he has not yet made up his own mind. Whether he is genuinely flexible, or whether he is simply leading the Russians up the path to the conference door, may depend on what his advisers at home and his allies abroad say in the interval. In the past, the most influential voice has been that of Dr Adenauer, and there is no reason to think that Mr Mikoyan's drowned it last week.

The idea that some kind of "deal" is brewing between the Americans and Russians is further deflated by what happened in the discussions about trade. It was clearly Mr Mikoyan's failure to make any headway in these that left him so short-tempered on Monday. In the last few years trade between the two great powers has been reduced to the muddiest of trickles; the total for the last four years put together is substantially below that for 1938 alone. In part, the Administration is entitled to say that Congress is responsible. It is Congress which bars the purchase of specific items such as furs and crab-meat and which, since 1951, has forbidden most-favoured-nation treatment to be extended to other Russian imports. But the Administration could, if it wanted, seek changes in these laws. Moreover, it could—by executive action, without reference to Congress—ease the flow of exports to Russia. At present all of these, with the exception of a small "general list," have to have individual export licences; this applies even to items which do not come under the embargo on strategic goods, and the Administration has told the Russians that it does not know whether their request for consumer goods can be approved until they have submitted an itemised list.

Those who think free trade is a good thing in principle ought to conclude that it would be a good thing to practice with the Russians. The Americans, however, are entitled to make one or two qualifications, quite apart from the problem of strategic exports. There is the fear that the Russians are "dumping" some items. Mr Mikoyan's bland denials have not entirely removed the suspicion that they have been doing this with tin. But the American procedures for finding out whether "dumping" has in fact taken place are very complex ones, including the despatch of an investigating team to the country in question. Would Mr Khrushchev let such a team in? Moreover, since the Russians are unlikely to be able to sell as much as they want to buy for some years, they would need extensive long-term credits. At present these are denied, under the Johnson Act, to countries in default (as Russia is) on earlier debts. Apparently the State Department still regards these as hopeless hurdles. In this respect, as in others, Mr Mikoyan has been unable to persuade it to put on its vaulting shoes.

Balanced or Complacent?

THE basis of President Eisenhower's 1960 Budget, for the year beginning on July 1st, and of his Economic Report, covering what happened in 1958 and what is expected to happen in 1959—and covered in pink paper even rosier than its contents—is that the recession is over and prosperity is here again. Few people dispute this assessment of the situation but there are many who disagree with the President when he argues from it that the main duty of the Administration is to encourage future economic growth by preserving stability and avoiding inflation—the most immediate threat to America today, according to Mr Eisenhower. These people, who include most of the Democrats who control Congress, and quite a number of Republicans, contend that the Budget is the unrealistic calculation of a complacent President rather than a constructive forecast of the fiscal needs of the next eighteen months.

Mr Eisenhower claims that the Budget is balanced, with a small surplus; responsible, because the absence of a deficit means that the cost of living will remain stable; confident, because it expects revenues to increase; positive, because it responds to national needs without extravagance; and attainable, given the co-operation of Congress. And if it is attained, he offers hope of reduced taxation. His critics insist that the balance is entirely notional, being achieved by overconfident forecasts of receipts and by irresponsible and negative efforts to hold down expenditures which should be increased in the interests of both the security of the nation and the welfare of its citizens. Finally, far from co-operating, Congress is already at work on Bills which would increase government spending in various ways and which are completely at variance with the philosophy of the Budget. The President can, and presumably will, reply with a veto if these Bills go through in anything approaching their present form. But in the Eighty-sixth Congress, unlike the three others with which President Eisenhower has had to deal, the two-thirds majorities in both Houses, which are needed to over-ride presidential vetoes, are practical possibilities.

Massive Resistance Collapses

TWO years ago Virginia, the intellectual leader of southern opinion, passed a series of laws to prevent local communities and their school boards from obeying federal courts which ordered them to admit Negro students to the white schools. The Governor was given the power to close schools, to assign students, to cut off state funds for education, and to provide tuition grants for white students who refused to attend mixed schools. Since last autumn, such "massive resistance" to the Supreme Court has locked about 13,000 children out of schools in three communities; Norfolk, the big cosmopolitan naval base, Charlottesville, the home of the University of Virginia, and Front Royal, a country town. Schools in other places—Arlington and Alexandria—were in danger of being shut.

On Monday, however, the closing of certain schools in Norfolk was struck down by a federal court as incompatible with the federal Constitution and the Supreme Court of Virginia itself ruled, in a five to two decision, that all these laws are incompatible with the constitution of Virginia, which requires the state to maintain an efficient system of free schools. The decision of the State Supreme Court cannot be appealed and is therefore of the greatest immediate consequence. The federal decision, which applies only to Norfolk, is an important precedent for other cases which may be brought because it lays down the principle that a state may not discriminate by shutting certain schools and leaving others open; it must obey the federal courts or sacrifice all public education.

The legal collapse of "massive resistance" was not unexpected. The test was sought by the state itself, probably because Mr Almond, the Governor of Virginia, a reasonable man for all his talk of continued defiance,

How the 1960 Budget is Balanced

THE reliability of this week's **estimates** of the government's receipts and expenditures in the fiscal year which begins next July, and is supposedly going to end with a surplus of $100 million, seem a little suspect when it is remembered that at this time last year the 1958 year was expected to show a deficit of $400 million and the current, 1959, one a surplus of $500 million. Yet, when the 1958 year ended, just five months later, the actual deficit came to $2.8 billion and the present estimate for 1959 is for a deficit of $12.9 billion.

But allowance must be made for the fact that last January's calculations were completely frustrated by the recession. This has brought a fall of $5 billion in estimated receipts from income taxes during the current year and has pushed up spending with special remedial programmes such as supplementary unemployment benefits and housing subsidies. The 1959 estimates also now include for the first time $1.4 billion for an increase in the American contribution to the International Monetary Fund. And last year's good harvest meant an enormous rise in farm subsidies which the President has dramatised by treating agriculture separately from other domestic programmes in his Budget summaries.

In these circumstances, and particularly since the recession programmes are only temporary, the President's forecast of a reduction of $3.9 billion in **expenditures** during the 1960 fiscal year does not seem impossible even if, as is likely, his hopes of saving money by shifting some of the federal burdens on to state, local and private agencies fail to materialise. Outlays in 1960 will still be higher than in any year, except 1959, since 1945 and, as the President points out, they will be $12.5 billion more than in 1955, which means an increase on the average of nearly $2.5 billion a year. This provides some answer for those who say that the Budget makes no allowance for the growing needs of an ever-expanding population.

It is more difficult to accept the estimated rise of over $9 billion in **receipts** during the 1960 fiscal year, mostly from income taxes. Mr Eisenhower argues that this is less than the increase which in fact took place in the year after the 1954 recession. But so far there is little indication that the expansion in the economy this year is going to reach the boom proportions of 1955 and 1956. The President also proposes a number of minor changes which would push up receipts—if Congress accepts them. Most of these are either technical tax changes, relating to insurance companies, co-operatives and mineral depletion allowances, or are intended to make existing services more nearly self-supporting—the post office and the highway and aviation programmes in particular. Finally, the current "emergency" rates of taxation on corporate incomes and excise taxes are to be continued for another year.

Of the other **legislative recommendations** in the Budget message, a number cover areas where the Democratic Congress is already preparing to do far more than the President asks. These include grants for:

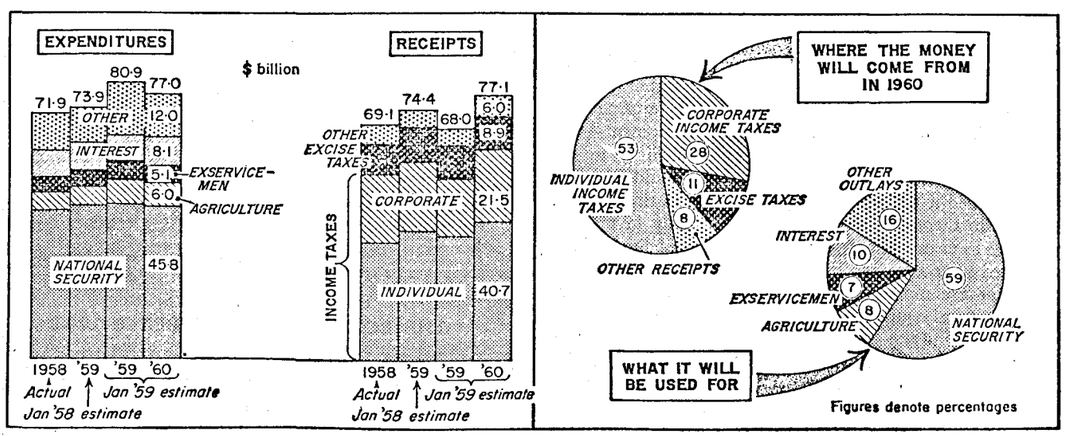
- construction of civil airport facilities;
- aid to areas of chronic unemployment;
- urban renewal.

The President also asks for:

- revision of the farm price support programmes;
- statehood for Hawaii;
- home rule for the District of Columbia;
- an increase, to $285 billion, in the permanent ceiling on the national debt;
- authority to veto individual items in spending Bills—which he is most unlikely to get.

In the labour field he recommends:

- broadened unemployment insurance;
- improved laws on hours of work and minimum wages;
- stronger regulation of the financial affairs of trade unions.



Where defence is concerned the President wants:

- conscription to be continued;
- limitations on the minimum strength of the reserve forces to be repealed.

Total **spending on defence** in the 1960 fiscal year, at $41 billion, is put at $145 million more than in the current one, but $800 million more is allowed for missiles and research and development by the Department of Defence. Expenditure on **military assistance,** mainly payments for deliveries ordered earlier, will be substantially lower—$1.8 billion compared with $2.3 billion—than this year, but those for **economic aid abroad** will be slightly higher—$1.65 billion compared with $1.57 billion. The President wants to emphasise the developmental aspects of foreign aid programmes by:

- increasing the American contributions to the International Bank and Fund;
- supplementing the capitalisation of the American Development Loan Fund at once by $225 million, since its entire capital is now committed;
- adding $700 million, less than had been hoped, to its authority for 1960;
- creating a development bank jointly with the Latin American countries;
- expanding the investment guarantees under the mutual security programme.

This "hold-the-line" **Budget,** according to President Eisenhower, will increase the military effectiveness of the United States, help friendly nations, enhance the country's well-being, preserve fiscal soundness and encourage economic growth in years to come. And he believes that all this can be done within the country's income, without any deficit financing.

Fiscal Years ending June 30th

Continued from page 318

appreciated that the scheme must eventually be struck down in the courts, that it was unpopular with parents, and that some concessions must be made to the letter, if not to the spirit, of the Supreme Court's ruling that racial segregation is unlawful. Long ago Mr Almond said that if the test went against massive resistance he would call a special session of the State Legislature, presumably to adopt a system of pupil assignment which would provide for token compliance while preserving segregation in most cases. But meanwhile control over the schools returns to the local communities. In Charlottesville it seems likely that the schools will reopen with some Negro students enrolled, but in Norfolk the courts may have to intervene again, for the City Council, unlike the school board, does not want to open the closed schools until the Legislature acts ; in fact it is even threatening to cut off funds from all but the primary schools.

Security by Turbine

THE Office of Civilian Defence and Mobilisation has ruled that the English Electric Company's bid of only $1,450,700, to supply two hydraulic turbines for a dam being built by the Army Engineers in Arkansas, must be rejected in favour of one of $1,757,210 put in by the Baldwin-Lima-Hamilton Corporation of Philadelphia. The official explanation is that, if the American company does not get this contract, so-called "jumbo" machine tools will fall into disuse while the national security demands that they should be kept in working order. The latter assertion may well be true but it makes an unconvincing excuse for a decision which contradicts the constantly repeated American contention that foreign countries should earn their dollars by exporting instead of receiving them as gifts from the American taxpayer.

Unofficially, the reason for the decision seems to be a desire to reward the unemployed voters of Pennsylvania for having gone against the national trend last November by choosing a Republican, Senator Hugh Scott, to represent them in Washington. Unemployment in the Philadelphia area cannot, however, be given as the official reason because the English Electric bid is more than 12 per cent below that of the successful American firm, and 12 per cent is the maximum advantage which the law allows to an American bidder in these circumstances.

It is, however, some consolation that the OCDM used the machine tool difficulty as an excuse rather than the more general complaint normally advanced by American firms against imports of heavy electrical equipment—that their manufacturers lack adequate repair facilities in the United States and that the national security would therefore be threatened if the equipment broke down in time of war. Tenable in theory, this claim does not usually in practice stand up to examination ; but it is the basis of the petition presented some time ago by a group of American manufacturers for a complete ban on imports of certain types of heavy electrical equipment. The OCDM is still considering this petition and the strong and well-publicised British protests against the Arkansas ruling, which is unlikely to be reversed, may at least give the OCDM strength to resist the pressures for a decision, on this broader and much more important case, which would be even more harmful to America's international reputation.

New Voices on Old Committees

THE eighteen newcomers to the Senate were agreeably surprised last week when their committee assignments were announced. Each had a plum in the shape of appointment to one important committee. Moreover, this principle of fair shares was incorporated, for the first time, in the rules of the Senate, which in the past has reserved its rewards for its senior members. Mr Johnson, the Democratic leader, who began six years ago to chip at the privileges of senority to give new members some scope, is to be commended for doing away with the bad old practice of condemning newcomers to begin their senatorial careers on obscure committees. This helpful reform will soften resentment of the rough-shod manner in which Mr Johnson got his own way in the debate over methods of ending filibusters and will steer the energies of his critics into constructive channels. By expanding the size of six of the major committees, Mr Johnson has been able to show his magnanimity even to newcomers who voted against him. Although the Republican strength on individual committees has been reduced to reflect the fact that they have only 34 Senators compared with the Democrats' 64, they have grudgingly followed Senator Johnson's example in modifying the principle that seniority is all.

In the House, where Mr Rayburn, the Democratic Speaker, is challenged, so far unsuccessfully, by an even larger contingent of new liberal Democrats, efforts have also been made to give them no cause for complaint. Three have made their way at once to the important Foreign Affairs Committee ; room has been found for eight others on the new committee on space. The committee on labour and education has been given a large influx of Democratic liberals to overpower the conservatives of both parties who have held up controversial measures. But in spite of their greatly reduced numbers, the Republicans, under their new leader, Mr Halleck, have seized other key points for the conservatives. The appointment of two reactionary Republicans to the House Rules Committee, to reinforce its conservative Southerners, means that Mr Rayburn will not find it easy to keep his promise to clear a way for legislation involving new spending. And the four Republicans sent to the tariff-writing Ways and Means Committee are all protectionists who oppose the President's freer trade policies.

The Second Series of Reports in our New Subscription Service

DURABLE CONSUMER GOODS

will be available at the end of January

This regular, comprehensive service combines economic forecasting with consumer research. Each report contains the results of a survey based on a random sample of 3,000 households in Great Britain ; these results are combined with an assessment of trends in the economy as a whole and in each particular industry to give an estimate of the scale and quality of demand for the following goods during the next six months:

Electric washing machines and spin driers
Refrigerators
Vacuum cleaners
Electric fires and convector heaters
Gas and electric cookers
Sewing machines
Passenger cars
Radios, radiograms and record-players
Television sets

This service is provided jointly by

THE ECONOMIST INTELLIGENCE UNIT LIMITED

and

THE BRITISH MARKET RESEARCH BUREAU LIMITED

Further information from the E.I.U. at 22 Ryder Street, London, S.W.1. Whitehall 1511, ext. 13

This Republican refusal to bow to the election returns may be underlined when the chairman of the party's Senatorial Campaign Committee is chosen. He is virtually certain to be Senator Goldwater of Arizona, a forthright Republican conservative who managed to survive the liberal tide in November. He is young and energetic, and should be successful at the important task of raising funds, but Republican progressives fear that he will give a fatally anti-labour tinge to their party between now and 1960.

Atoms Go Underground

FROM A CORRESPONDENT IN COLORADO

THE first large-scale use of atomic energy for peaceful purposes in the United States may be to release the reserves of energy contained in the enormous oil-shale deposits of western Colorado. These deposits are estimated by the Bureau of Mines to contain more than 1,000 billion barrels of recoverable oil, about ten times as much as the whole world has used up to now. But at their best these deposits are 90 per cent rock and only 10 per cent organic matter. Exploiting them by conventional methods apparently would not pay, at the present price for crude oil, but atomic energy may make it feasible.

The Atomic Energy Commission feels that the success of its "Rainier" project in September, 1957, showed that subterranean atomic explosions can be used for many peaceful ends and it established "Project Ploughshare" to explore some of them. "Rainier" released energy equivalent to 1,700 tons of exploding TNT. A second experiment in Nevada in October, 1958, exploded a bomb equivalent to 20,000 tons of TNT, the same size as those dropped on Hiroshima. Both were well-contained underground, released no harmful radiation into the atmosphere, and fused and fragmented the subterranean rocks in a sensationally efficient manner which at once opened up many possibilities. But progress in investigating them is likely to be slow. Eventually the United States hopes that nuclear explosions underground will be allowed, under supervision, for peaceful purposes, but at the moment such experiments fall under its self-imposed ban on atomic tests of all kinds.

Recently, however, a conference on exploiting the deposits of oil-shale was held at Dallas, Texas, between representatives of the petroleum industry, of the Atomic Energy Commission and of the Bureau of Mines, which has charge of oil-shale research and which for a decade conducted a big experiment on the best methods of extraction. The major petroleum companies have bought up almost all the deposits of oil-shale to hold as a reserve. But they are interested in commercial exploitation when it becomes profitable and the government hopes to enlist them in a joint programme of research.

The proposal outlined by Mr Gooding, of the Bureau of Mines, is to set off an atomic blast—of an unspecified power—deep within the richest stratum of oil-shale, one estimated to contain 35 to 50 gallons of oil to each ton of shale. This, he said, would release immediately an estimated 15,000 barrels of oil from the rock plus 10,000,000 cubic feet of natural gas. The heat would set fire to the pulverised shale and the resulting gases, rising up the shaft, would be trapped. Also the heat would, in effect, "fry" out the oily rock, as surface-retorting does now, and would produce large quantities of oil that could be pumped out. The spent shale could be left in place. This is an important consideration, since it has been estimated that, if all the oil-shale were exploited by conventional methods, enough slag would be left to cover the whole state of Colorado seven feet deep. The government's experts gave an assurance that all radiation would be confined underground and that there would be no danger of its escaping. Some 1,500 feet of rock overlie the richest, or "mahogany ledge," stratum in which the explosion would be set off.

The Atomic Energy Commission is prepared to pay for the explosion, which will cost about $1 million ; and it was proposed that the government and the oil industry should share equally the cost of the succeeding elaborate studies, which, it is estimated, will be about $1.2 million. Even if the oil industry agrees to shoulder its part of such heavy expenses, only preliminary preparations can be made this year, since the government has pledged itself to set off no more atomic explosions before October 31st at the earliest.

ANOTHER experiment which is being seriously considered is the explosion of a similar atomic charge deep within the massive salt beds that underlie much of eastern New Mexico. The purpose would be, not to obtain salt, but to release atomic energy in an environment which would retain the heat at usable levels for a long time. In "Rainier," the 1957 experiment, the explosion blew a molten bubble of rock some 55 feet in diameter, which was sustained momentarily against the weight of the crushed rock above it by a pressure of a million atmospheres and a temperature of a million degrees fahrenheit. But the water in the surrounding rock was so efficient a heat-exchanger, diffusing the heat in all directions, that within a few days the temperature dropped below that of boiling water.

The salt beds of New Mexico, which are hundreds of feet thick, contain almost no water. Hence the expectation is that the heat generated by the explosion would be maintained at a temperature several times as high as that of boiling water. The resulting energy could be drawn off and used directly, or to make electricity in a plant built above the underground site. As the heat fell below usable levels, new explosions could renew it. The Livermore Laboratories of the University of California, which perform these underground tests for the AEC, estimate that a kiloton bomb (one equivalent to a thousand tons of exploding TNT), exploded every ten days, would provide such a plant with a continuous supply of energy. The heat would be extracted by running water down into the salt, and guiding the resulting steam through turbines.

The enthusiastic scientists connected with "Project Ploughshare," including the experts of the United States Geological Survey who have provided technical advice on geological effects, see many other possible peacetime uses for the vast energies of exploding uranium and plutonium. Among these are the cheap moving of earth in huge quantities, such as the instantaneous creation of harbours where none exist—off the northern coast of Alaska, for instance ; digging huge canals by connected explosions that would leave little to do but tidy up ; damming mountain canyons to hold back water for irrigation projects by blowing a section of the canyon wall into the bed of the stream ; and creating artificial acquifers, or reservoirs of underground water, by shattering dense rock to provide the fragmented

rock in which such water collects. An expert at Livermore estimates that one underground explosion could provide storage for 80 billion gallons of water.

The shale-oil experiments might also be modified to exploit the immense tar sands of Athabasca and elsewhere, which have so far stubbornly resisted commercial development, to renew oil fields exhausted by conventional methods, and to convert coal into energy without lifting the coal itself to the surface. Another possibility is that in a "magma" of molten rock, such as is created by underground explosions, the heavier elements would settle to the bottom before the mass cooled, thus making extraction of ores easier. Clearly the proposed oil-shale experiment is of wide interest.

California's Young Entry

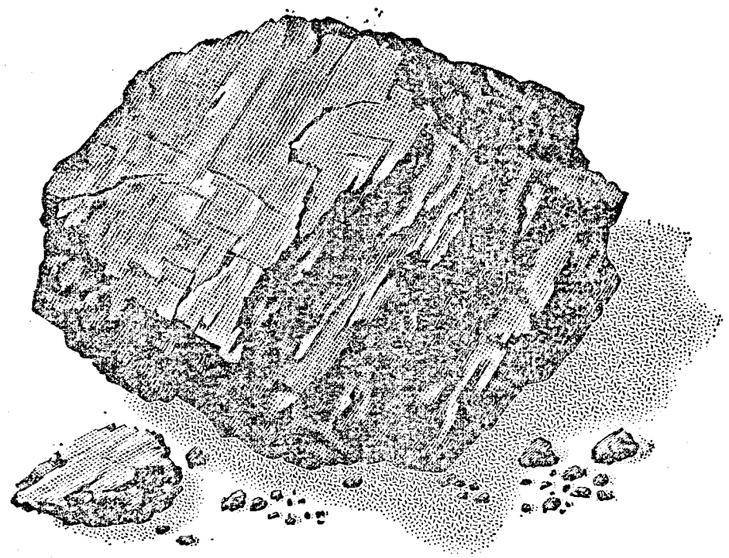
FROM A CORRESPONDENT IN SACRAMENTO

CALIFORNIA'S new Democratic Administration got off to a good start on January 5th with even the Republican minority in the State Legislature behaving almost as though it was sharing the victory which last November gave the Democrats control of both houses for the first time since 1889. Obviously the Republicans like Mr "Pat" Brown, the second Democrat to govern California in this century. They have known him for years; once he belonged to their party but they learned to admire him for his fairness and moderation when he, by then a Democrat, was Attorney General in the recent Republican Administrations in the state. Governor Brown therefore took office as the heir to the non-partisan tradition in Californian politics. Many Republicans in the state have more sympathy for his moderate liberalism, even though he is a Democrat, than they have for the relentless conservatism that has characterised some of the local leaders of their own party.

California is changing too rapidly, expanding too fast, to be attracted by conservative thinking—which is one reason why the Democrats won last November. Another allied one, particularly telling in the voting for the State Legislature, was the emphasis they put on youth, the first time California has really acknowledged politically that it is a young state, made up predominantly of youngish people, who seldom look back and who feel that anything is conceivable when it comes to the future. As a result the thousand guests who packed the green and gold assembly chamber in the handsome State Capitol to listen to Governor Brown's inaugural address saw something new as they looked around. The 40 State Senators and 80 Assemblymen who were their hosts included more young men than any state house in the country had probably ever brought together before.

Not all these young men are Democrats, but the party's candidates last November were certainly notable for their youth and attractiveness. The main asset of most Republican candidates was that they were incumbents; this meant that they were political "veterans" who had almost lost track of the passage of time, so long had they been in the State Legislature. Thus in Santa Rosa, a town full of young families, where the school population has quintupled since the war, a young Democratic lawyer was elected State Senator. He replaced a veteran Republican and thinks that a major reason for his success was that he belongs to a school-conscious, growth-conscious, future-conscious group of youngish citizens.

This kind of thing happened all over California. It looked almost as if the election results were more a matter of the rising fortunes of youth than of the rising fortunes of the Democratic party. But it was that party, not the Republican, which took up the challenge, mainly through the Council of Democratic Clubs, a volunteer organisation predominantly youthful in its membership. There are many talented young Republicans in California but so far they have no such enthusiastic and dedicated organisation.



Recognising this trend Governor Brown has picked a staff of young men to help him to develop policies which the youthful legislators will favour. He calls them "creative thinkers" and trusts to his own experience to moderate their ideas to the extent necessary to produce programmes which the older groups who remain in the Legislature will also accept. Some of these members feel that it is their function to save Mr Brown from the ultra-liberal wing in his own party. What the outcome of all this will be will not be apparent until the Legislature completes its work in about five months.

Counting the Savers

THE first long-term Treasury bond offered since the near-disaster of last June, a 4 per cent one maturing in 1980, $750 million of which were sold last week, at a slight discount to yield 4.07 per cent, was carefully aimed at savings institutions. They are given four months to pay, keep off signs were posted for speculators and commercial banks, and the price was attractive. Even so, the response, although adequate, struck the market as less enthusiastic than had been expected and prices of long-term government securities fell; they were already depressed, partly because of the conviction that the Treasury will seize every opportunity to offer more long-term bonds.

Most of the new money sought by the Treasury to carry it through until April was, however, raised by the sale of $2.2 billion of 16-month, 3¼ per cent notes, also offered at a small discount; these were bought chiefly by the commercial banks. It had not been thought that the Treasury would seek so much, but it evidently decided to safeguard itself against the high level of spending on agricultural subsidies and against the risk that investors may demand a big proportion of cash next month when $15 billion of maturing securities have to be refinanced.

The Treasury has already announced that it may offer, in part exchange, an intermediate-term bond maturing in ten or twelve years; this would be another step away from the hand-to-mouth financing forced on the Treasury—in a year when a $13 billion deficit is being incurred—by the nervous state of the bond market. The expectation that the Treasury will be competing with private interests for the available savings is one reason that some increase in rates of interest is likely this year; they are already back to the levels prevailing before the recession began. This would not necessarily look like a calamity to the Federal Reserve Board, which in its fears of inflation is keeping the banks short of reserves. But it might embarrass the Administration in two ways. If the pace of recovery is curbed the rise in revenues, relied upon to balance the Budget, will also be slower. And if long-term interest rates go up much more, they may exceed the 4¼ per cent which is the most that the Treasury is permitted, by law, to pay.

MAKING THE BEST OF IT

Gladstone was Prime Minister when Simon-Carves built Britain's first by-product coke ovens in 1882. Simon-Carves have since become leading international coke oven builders and have immensely extended their connections with coal. Today Simon-Carves build collieries: they build plants to wash as well as carbonise coal *(to make steel and gas and smokeless solid fuel)* and to recover and refine coal by-products *(used in dozens of industries in hundreds of ways)*. They build great water-tube boilers at power stations and collieries and factories and so forth *(coal into steam and electricity)* and plants to prevent chimney gases polluting the air with dust and grit and chemicals *(cleaner towns, less smog, fewer coughs)*. Total gasification, briquetting of non-coking coals and other look-to-the-future coal processes are right up their street. Simon-Carves do these things in a big way all over the world.

COAL?

Simon-Carves have been learning to make the best of it ever since Gladstone was Prime Minister.

SIMON-CARVES LIMITED IS A LEADING COMPANY OF

THE WORLD OVERSEAS

The Fight for Algeria—I

FROM OUR SPECIAL CORRESPONDENT

If there were only one Algeria, the problem of what to do with it would be soluble, if unpleasant. There are, however, two: the one a scattering of Mediterranean trading towns along the Barbary coast, the other a land mass where the soil, the climate and the population are all equally hostile to any European way of life. France has been caught between its indiscreet attachment to the one Algeria, and its failure to get the measure of the other. It is not altogether surprising that France has, at the same time, been caught between the settler and the military interests. For while to the Europeans in the towns it appears as the simple duty of France to protect a way of life and keep the East at bay, the French army, busy in the valleys and mountains and across the high plateaux of the interior, has committed itself beyond recall to a more complex and ambitious task, the pacification and civilisation of the Arab and Berber peoples against heavy demographic and economic odds. The interests of the European settlers and of the Army are by no means the same, but it is easy to see how both groups found the conventional prefectural administration of the Fourth Republic, which worked tolerably well in the Loiret or the Manche, hopeless in face of a surge of Arab nationalism in an undeveloped country.

Having combined in the *coup* of last May to sweep the prefectural administration away, and having swept away the Fourth Republic in the process, they have been left with very little in common. If the settlers do not yet recognise this fact when they talk to a stranger, the army officers, in general, do. "Integration" was the formula on which the Europeans of Algeria, and the Army, united ; but integration means one thing in the half-European towns of the coast, and quite another in the African countryside. To the settlers it offers a refuge from the minority complex, to the Army a mission of social transformation. Of these two groups, the Army and the settlers, it is quite obvious that the Army is the stronger ; on the other hand, it is the Army that has taken on the Augean task.

Prefects, sub-prefects, and directors-general are now gradually being infiltrated back into militarised Algeria under the circumspect eye of General de Gaulle's admirable delegate-general in Algiers, M. Delouvrier ; but it is perfectly clear that the rough work of administration up-country is going to continue to be done by the Army, if only because of the Army's simple belief in itself as the only body in the French state equipped and ready to do it. The belief is not unfounded. The French Army had generations of experience of this kind of work in the nineteenth century, when the military *bureaux arabes* were the instruments of pacification, just as the military SAS (*sections administratives spécialisées*) are now. Events in Morocco, Indo-China, and elsewhere enabled it to keep its hand in while Algeria was relatively quiet. It saw, in 1955 and 1956, the established structure of civil government in the countryside swept away by the rebellion. Its officers have in their minds a clear conception of the means by which the rebellion can be rooted out, not only on the ground, but in the minds of the Muslim population. As the generals will explain, it is the minds and the hearts that have to be conquered. Their conception involves not only sustained military and police work, not only an ambitious programme of social and economic modernisation, but the transfer and regrouping of vast sections of the population, to produce a country which it is possible not only to police and control, but to render workable in a modern way. In this way, it is supposed, life will be made worth while and the Algerian Arabs given a reason "why they should feel French."

Seen at close quarters, the resettlement of the Muslim population shows, as clearly as anything could, the way in which the tasks of fighting and of governing have become fused. The indigenous communities and tribes have moved, or have been moved, in different ways and for different reasons. Since the early outbreaks in the towns were mastered, the French forces in Algeria have met their main difficulties in the mountain regions which cover a good half of the country, but which house very little of its organised economic life. In some of those regions they needed the population out of the way in order to find the rebels and fight them effectively, as well as to deprive them of food. In others, the Arabs themselves found life insupportable under the harrow of the French forces by day and the rebels by night—the French interrogating them, searching their houses, burning down their trees to deprive the rebels of cover, and fighting over their land, while at night the rebels moved in to take their money, their livestock, and their sons, gave them jobs of sabotage to do, and cut their throats if they did not obey. Some were pulled, others pushed, into leaving the disturbed hill country where they lived and trekking down into the valleys ; there the Army assembled them in new settlements designed to provide them with homes, food, protection and discipline.

Probably not less than 600,000 Muslims of Algeria have been moved in this way ; many hundreds of completely new villages have been built, or are building, to accommodate them. Experts on rural economy in the civil government will say that these new settlements are intended for the most part as temporary shelter, and that two-thirds of the displaced people will go back to their old grazing-lands when things are quiet again. The soldiers take a different view ; to them the new villages—compact, rectilinear, easily policed, rainproof and furnished with electricity and water—represent a great advance on the old Arab way of life as well as a great advance in security, and have therefore come to stay.

To visit a few of these new villages is to be made to feel the audacity of this conception, the depth of the economic misery with which the French soldier-reformers have to contend, and the imperious pressure of population growth which threatens to make nonsense of their efforts. The first product of the migration is a collection of home-made shacks thrown together from petrol tins, loose stone, mud,

wood, osier, coarse cloth, or whatever material can be scrounged. A good SAS will supervise this first stage to see that the home-made dwellings are as good as sensible advice can make them ; even so, they are ghastly. As they go up, new groups of families collect round them. Work starts on a road, a school, and a settlement of more permanent houses. These may be no more than one room without chimney or window—the suspicion of windows, as admitters of evil spirits, has not died out—but with the necessary yard and outer walls to enable the Arab to keep his womenfolk screened off from the world. Or they may, in the neighbourhood of a big town or in the more advanced west, be fairly decent one-storey dwellings of two or three rooms with electricity and sanitation.

In either case the real trouble is that they tend to have to house very large families—who sleep all together in one room, on the floor—and that there is often little, and sometimes no, regular work for the menfolk. Where there is public land to be put to use, the SAS distributes it, or allocates pasture rights, or even forms the village into a collective farm. But in many places there is none to spare. What do people do for a living then ? They cannot all find employment in building their new village, or not for long. The agricultural estates have the workers they need already. Sometimes there is a bit of industry in the neighbourhood, but never enough ; thus at Oued Fodda, near Orleansville, a model of this kind of settlement built round an enlightened and patriarchal civil engineering establishment, the available work is rotated so that each man gets three days' work a fortnight. Oued Fodda has been particularly energetic in education ; all its children are at school. But what will become of them when they leave school ?

If France is fighting for their minds, this may be decisive. By an immense and ruthless effort, the Army has got the military situation in hand. This does not mean that the rebellion has been extinguished. Trains are still derailed, bridges blown, power pylons cut down ; funds are collected at night under threats, collaborators with the French are occasionally murdered. Wire perimeters round the new villages, patrols, curfews, roads closed at night, are reminders that the war goes on. Now and then an Army sweep through the mountains ends in a bloody engagement. The rebels are, however, much more confined in their movements than they were ; more and more of the population is being put out of their reach ; the elaborate electrified barriers along the Tunisian and Moroccan frontiers have made supply and reinforcement difficult for them.

Assuming that no international event intervenes from outside, and assuming that the taxpayer of the mother-country continues to bear his lot with resignation, the French Army can maintain such a war of attrition for very many years. It is apparently resolved to do so. But it needs to see light at the end of the tunnel, however long. The light it has chosen is social and economic change. The population of Algeria has gone through a major upheaval, and it is the present French policy to make use of that upheaval to modernise Algerian society. Only if that is done (the theory runs) can the Algerian Muslims be set on the road to equality with the European citizens of France. A second article will consider whether there is any economic basis on which the ambition might be realised.

(To be concluded.)

Cairo: All Passion Spent?

FROM OUR SPECIAL CORRESPONDENT

By their financial agreement initialled on January 16th, Egypt and Britain have given themselves another chance to find a working relationship. The negotiators have laboriously cleared the site but nothing worth while has yet been done to lay the foundations of a better relationship than existed before 1956. It would be dangerous, therefore, to be too optimistic about a situation in which the will for positive co-operation may be lacking.

The British Government is doubtless still unhappy about much of Egyptian policy. President Nasser, on his side, is far from convinced that the British have ceased to regard him as their principal foe in the Middle East. It is symptomatic of this continuing distrust that the Egyptian government firmly believes that British meddling in post-revolutionary Iraq led to the defeat of the pro-Egyptian nationalists by the communists. It still believes that there are clandestine radio stations, directed by Britain, that seek to undermine President Nasser. The financial settlement in itself does nothing to remove these and other causes of distrust and conflict. For this reason the establishment of diplomatic relations on a scale sufficient for creative diplomatic effort would be the real measure of progress in Anglo-Egyptian relations.

At the moment, it is Egypt which is reluctant to take the diplomatic plunge. It is not that it is reluctant to explore the possibility of political understanding: on the contrary, President Nasser is believed to want this. But he is so used to the idea that British embassies everywhere work both openly and covertly against him that he would like more positive signs of good will before allowing such a potential enemy to take up position in Egypt. In this he is too cautious. In the present situation Britain and Egypt need to sweat out their distrust in daily diplomacy: the diplomatic mechanism needed to implement the financial settlement would not be enough for this purpose.

The position is analogous to that of October, 1954, when an Anglo-Egyptian agreement on a larger scale liquidated a long standing dispute ; but any constructive possibilities it contained came to nothing. If the conflicts since then have left many new wounds, they have also helped to explain the revolutionary process now taking place in the Arab Middle East. President Nasser, who has led the Middle East into economic involvement with the eastern block, is now emerging as the balancing factor. His position is still tentative, for he is taking what is possibly the gravest risk of his career in challenging the Arab communists, who are

AIR SUBSCRIPTION RATES

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

	Airmail	Air Freight		Airmail	Air Freight		Airmail	Air Freight
Australia	£10 6s.	—	Hongkong	—	£8 15s.	Nigeria	£9 0s.	£6 10s.
Canada	—	$25 or £9	India	£9 0s.	£7 10s.	Pakistan	£9 0s.	—

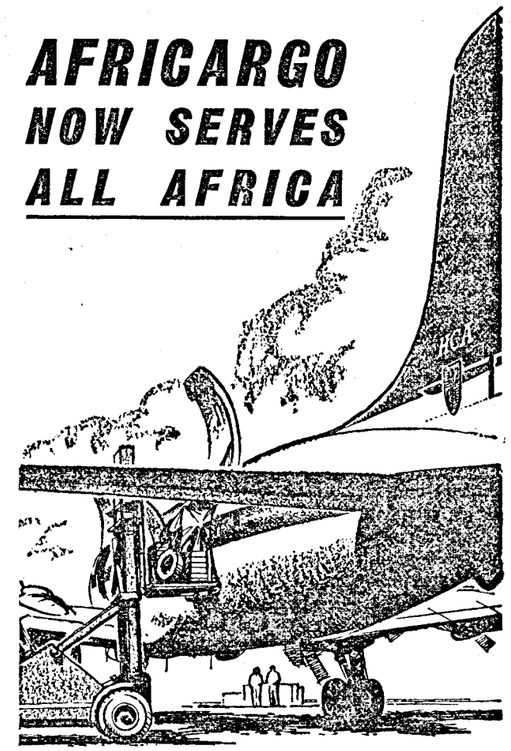
NATIONAL INSTITUTE

ECONOMIC REVIEW



The National Institute of Economic and Social Research announces the publication of a new two-monthly bulletin, the NATIONAL INSTITUTE ECONOMIC REVIEW.

The first issue, January 1959, is now available.

The ECONOMIC REVIEW will provide a continuous study of current economic trends and problems and is designed to help all those who have to take a view of the economic situation and prospects. It contains an appendix of key British and overseas statistics, including a number of new series.

The annual subscription is £2 or $6, including ordinary postage (single issues 8*s.* 6*d.* each). The REVIEW is obtainable from the NATIONAL INSTITUTE ECONOMIC REVIEW, 2 Dean Trench Street, Smith Square, Westminster, S.W.1.

AFRICARGO NOW SERVES ALL AFRICA

with a new, faster airfleet

West Africa and Johannesburg—as well as East and Central Africa—are now linked with the U.K. by the Africargo airfreight service. This Hunting-Clan express service is now operated with modern pressurised Douglas DC-6C 'Liftmasters' cruising at over 300 m.p.h. and with vastly increased cargo space. The all-cargo flights are supplemented by freight capacity on the scheduled Safari Viscount services. With Africargo, you get specialist care and handling as well. Cargoes are accompanied by trained flight attendants, you get firm bookings, and many other advantages an all-cargo service offers.

Consult your forwarding agent or write to :

already seeking to represent him as having abandoned the revolution. In effect there is a regrouping of forces within the Arab nationalist movement with President Nasser drawing together the broadly based indigenous elements. This seems to be mainly in response to trends in Iraq and it is the Egyptian press and radio which make the most effective protest against Iraqi excesses.

Perhaps President Nasser has gained more from his outright attack on communists and from the Anglo-Egyptian settlement than he realises. Syrian businessmen, who looked with fear on United Arab Republic policies, seem to have been at least partly reassured. The Syrians who rushed to the new Iraq in search of old trade returned full of fear at the trend of events. In Lebanon there also seems to be a shift of moderate opinion in Egypt's favour. In Cairo one senses a general relief. Two large classes of people are pleased for workaday reasons: city workers, taxi drivers, waiters, servants, and so on, look for more and better employment; business men hope for wider trading, particularly in the sterling area. But also among the left-wing nationalists, who welcomed Egypt's eastern connections as a defence against the wicked imperialists, there seems to be genuine hope for more neutrality in Egyptian foreign relations.

President Nasser clearly cannot go too far too fast, and he would probably be greatly embarrassed if Britain and the United States started throwing kisses in his direction. However, if it was made clear in practice that Britain was willing to work with Arab nationalism as led by President Nasser, this might give courage and strength to the moderate nationalist opinion that is now showing its head, and make possible a durable detente with Britain.

IN itself, the financial settlement will help to avoid new friction because it is—as far as is known—a much more workmanlike document than the Franco-Egyptian agreement. The British Government stood out against a cumbersome implementation commission such as the French accepted, and private British claims have been effectively removed from the Egyptian state council to the British Government. Both arrangements will save many British people from frustrating delays, new financial losses and ill temper. Some people are bound to suffer pecuniary losses; it is impossible to liquidate almost the entire British position in a country and then convert it into cash two years later. Then there is the little man—Maltese, Cypriot, or stateless Jew—who lost not so much his wealth or job as his way of life. It will take a lot of good will to win back for them their residential visas.

What the Egyptian government wants most of all is the restoration of trade, and if this follows the diplomats' task will be greatly eased. The release of the blocked sterling will end Egypt's acute shortage of foreign exchange for the moment, but only trade can give permanent value to the agreement. As usual there is an almost frightening optimism about the commercial resurgence which may soon lead to disappointment. If Britain does want good working relations with Egypt it should first look to the economic side. More people here ask if Britain will buy cotton than whether it supports positive neutrality.

However, there is now a great deal of individual good feeling for the British. Cairo seems genuinely pleased to see the British who are already back and anxious to welcome more. Why not?

Stoicism for Germans

FROM OUR BONN CORRESPONDENT

THE broodings of the editor of *Die Welt* on the Soviet proposals for a German peace treaty read like a page by Marcus Aurelius. Herr Zehrer deplores the agitated despatch of messengers to Washington to make soundings and suggestions, and "gradually get on American nerves"; and he maintains that it would be just as mistaken for the Germans to try to conduct talks of their own with Moscow. "One must know when to talk and act, and when to keep silent and await events," says the stoic of Hamburg:

> For Germany the moment has come to do the latter—when only two things can be said and demonstrated: that Germany has full confidence in America's friendship, and that it is ready at any time for a tolerable settlement and an understanding with the Soviet Union. . . . One can say "no" without possessing power, rockets, and satellites. Unhappily the latest Soviet proposals are such that we must say "no" before history and posterity. But we cannot reach up to the level on which the decisions are being made.

The agitated messengers have returned to Bonn and reported inconclusively to the Chancellor and the cabinet. They have been unable to add anything more definite to the uncertain and shifting picture produced in the normal course of duty by the German ambassador and his staff in the United States. Herr von Brentano would not have sent off Herr Dittmann in such a hurry had not Dr Adenauer commissioned his indispensable factotum, Herr von Eckardt, to trespass on foreign office preserves. But for a few days there was an understandably prodigious flap in the provisional capital. As if the Soviet proposals, the Dulles oracle, and the teasing Mikoyan activities were not quite enough for the augurers to be going on with, there was the simultaneous spectacle in yet another direction of the east German premier, Herr Grotewohl, hobnobbing with Mr Nehru and President Nasser. While officialdom twitched nervously, politicians plunged precipitately into debate, mainly through the party press services. In the circumstances it is probably fortunate that the Bundestag is only just getting down to work again. (Its foreign affairs committee is meeting this week-end to consider the Soviet proposals.)

The national stoicism preached by the editor of *Die Welt* is now to some extent being practised, if not quite to the point of resignation which he seems to consider proper. Although nobody likes to voice his misgivings in public, it is widely admitted in private that western Germany may not be as nearly finished paying the bill for defeat as was generally supposed. To many west Germans it looks as though a Berlin transport agreement with the east German regime is going to be the lowest possible price demanded of the Federal Republic for getting the West out of the predicament tentatively billed for May 27th.

Yet most politicians believe there is still some useful purpose to be served by Germany trying to influence the powers one way or another. Not all members of the Christian Democratic Union are happy about Dr Adenauer's and Herr von Brentano's first flat rejection of the Soviet draft as containing "not a single proposal that could be usefully discussed." They want the government to present constructive counter-suggestions, and in this they have been publicly supported by the chairman of the coalition German party, Herr Herbert Schneider. The Social Democrats are consistently repeating their thesis that the business of clearly defining the military status of a re-united Germany must come before that of holding free, all-German elections. The Free Democrats have set up a committee of seven Bundestag deputies to work out their counter-proposals; and it seems that these will recommend an itinerary starting from the same point as that of the Social Democrats, but leading to a referendum before elections for an all-German parliament.

Faced with this new manifestation of Russian intentions—to deny a united Germany free choice of government, and of military and economic association—the Federal government feels compelled to play for time. It will continue to urge its western partners to press for the time being for a general agreement on disarmament rather than for a detailed German settlement, chiefly on the ground that the "German problem" is a symptom and not the cause of tension.

The officially sponsored noises from eastern Germany are of course confident, if not jubilant. In its westward broadcasts the east German radio talks seductively of the real sovereignty of a Germany united on the Russian terms, of its prosperity through trade with the eastern block, and of an era of lasting peace with former enemies. But it seems that there are still Germans in the east who have not yet been cured of old nationalist stirrings, and who consequently share the dismay that has swept through west Germany at the prospect of a Fatherland shorn irretrievably of so much glory and opportunity. During the past ten days thousands of party propagandists have been on the move in east Germany explaining to doubters and unbelievers the virtues and benefits of the Russian proposals.

Nenni's New Departure

FROM OUR SPECIAL CORRESPONDENT IN NAPLES

AFTER years of hesitation and travail the Italian Socialist party has put itself into the hands of a united directorate, pledged to keep it free from communist influence and interference. The Socialists have also pledged themselves to remain true to the "democratic method" in government as in opposition. The independent platform proposed by Signor Nenni two years ago in Venice prevailed at the party's thirty-third national congress last weekend in Naples. This time, however, the programme is to be implemented by men who have staked their political future on the battle for "socialist autonomy." Forty-seven of the eighty-one seats on the central committee have gone to the "autonomists" and Signor Nenni, thanks mainly to the determination of his lieutenant, Riccardo Lombardi, agreed on the need not to invite the "opposition" to join the executive. It is the boldest step he has taken since the Liberation. The party is committed to a policy of complete independence (Signor Nenni does not like the expression "splendid isolation"). There is to be no more talk of collaborating with the Christian Democrat party in its present condition or of a merger with the Social Democrats. Signor Nenni proposes to make the Socialist party strong enough in the country and in Parliament to become "an alternative" to Christian Democracy.

He and his friends control a bare 58 per cent of a party which is itself scarcely more than a third of the left-wing opposition in the present Parliament, but their programme should not be dismissed as utopian. In its new state of grace the Socialist party should be a powerful magnet for thousands of voters who swore, after the general election last May, that they would never again give their votes to one of the smaller parties.

One third of the congress voted for Signor Vecchietti and the group of party bureaucrats who sabotaged Signor Nenni's policy in the previous directorate. The Communist party's fifth column—an important item on the PCI's budget—is lodged in this Socialist left-wing. Since Signor Nenni recovered his ascendancy the Communist party treats him officially with respect; and should the Communists feel that the Socialist left-wing is likely to remain isolated for long they may decide to cut their losses and retrench. One reason why Signor Nenni and his friends hope for an early election is to eliminate the communist fifth column from their parliamentary ranks.

The Naples congress has put an end to the prospect of socialist unification in the form of a merger, at high level, with the Social Democrats. This line was always unpopular with the Socialists and Signor Nenni dropped it before the congress. Like the Church of Rome, the Socialist party claims to be ready to "unite" with all who wish to enter its bosom. Signor Matteotti, Signor Zagari and several other left-wing Social Democrats are said to be contemplating this step within the next three months. Should the government fall before then the Social Democrat party itself will have to revise its position.

The coup de grace to the old unification plan seems to have been delivered, perhaps unwittingly, by Mr Crossman, who told some reporters in Naples that he personally believed that the majority of the Labour party would like to see the Socialist party enter the International. Interpreted as a statement of Labour policy, this remark had its effect. Not all Signor Saragat's indignation can wipe this out or cancel the fact that, after so many years in government, the Social Democrat party has ceased to fulfil any political function except to provide favours for its clients.

IT is too soon to assess the full impact of the Naples congress upon the Christian Democrats. The Socialist programme assumes that in the foreseeable future the Christian Democrat party will either split, or its left-wing will drop quietly away and sever its political from its religious allegiance. The accession of a new Pope and the signs of a change in Vatican policy towards the Catholic party in Italy—the fact that the direction of Catholic Action has been delegated from the Pope to the Italian episcopate—were welcomed in Naples with varying degrees of caution. The immediate effect of the congress is to deprive Signor Fanfani of the prospect of Socialist help in Parliament, where he is being harried by his own right wing. Even if the bulk of the Social Democrat party remains in the government it will be difficult for Signor Fanfani to find a majority. But beyond the immediate prospect of a possible government crisis is a more important query. Will the new Socialist challenge speed the Christian Democrat party towards division, or galvanise it into a new cohesion? A period of uncertainty could be followed by a big Catholic drive for a much stricter Christian Democrat regime, starting with a reform of the election law on the French model.

There is one unfortunate side to the Naples congress. Two of the best men in the party, Lelio Basso and Vittorio Foa, are not in the new directorate. Signor Basso is the leader of a minority group which stands in a position of such absolute intransigence towards Catholics and Communists alike as to be outside the realm of practical politics.

He obtained eight per cent of the votes. Signor Foa is a trade union leader, a brilliant economist and a man of integrity. His belated alignment with the pro-communist left wing was a shock to the Nenni faction and a disturbing factor in the congress. At its best this became a dialogue between Foa and Lombardi. The first claimed that the Socialist party is not strong enough in Italy to fight the class struggle alone. The second maintains that the party must cease to think in terms of an industrial economy of the time of Marx or Robert Owen. A modern Socialist party must fight not only in the unions but in Parliament, where it can influence investment policy and industrial development. The banks, not the factories, are the nerve centres of a modern capitalist state. This obvious truth has shaken both the party and its opponents and, with luck, may become the starting point for a concrete socialist policy.

Turkey's Uneasy Politicians

FROM OUR CORRESPONDENT IN ANKARA

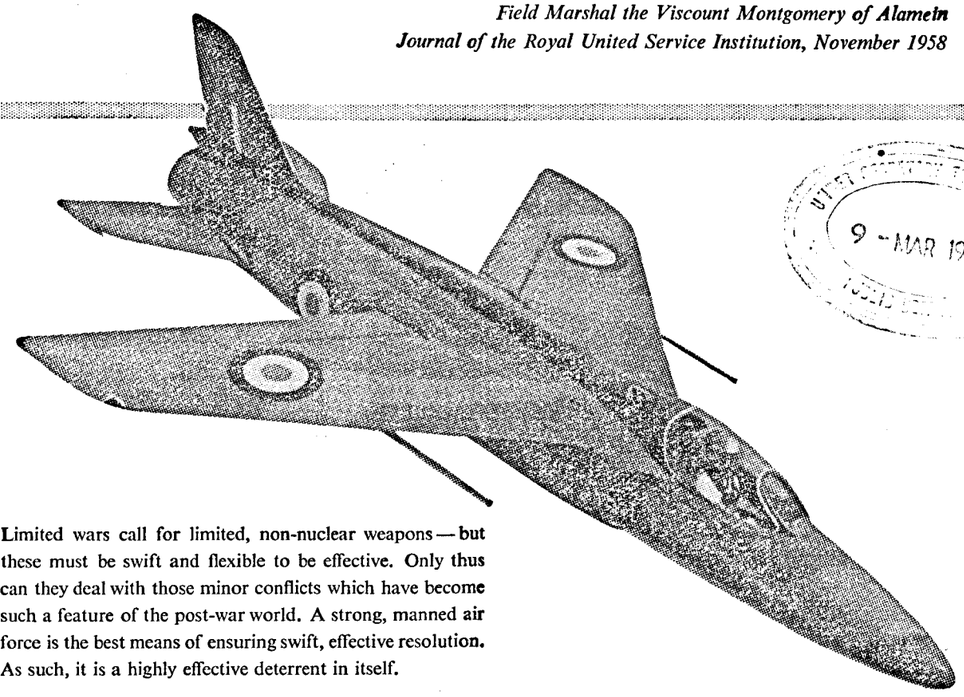
WESTERN ears are so inured to resounding clichés about Turkey being the linch pin of the alliance in the Middle East, that one is inclined to forget that they are true. The Turks themselves have no doubts whatever. Despite Mr Khrushchev's disparaging comments to Mr Walter Lippmann about the uselessness of Turkey to the West in the missile age, Turkey will go to the meeting of the Baghdad Pact Council in Karachi on Monday as the strongest and most confident Asian member of the pact, almost jubilant that the quasi-defection of Iraq has transferred the pact's headquarters to Ankara.

This attitude is common to both the leading Turkish parties. Although the opposition Republican Peoples' party's attitude towards the pact and its criticism of western intervention in Lebanon and Jordan in the summer have called down on its head the opprobrious epithet of "neutralist" (which it hotly denies), there is no doubt that if the party came to power it would follow the same lines of foreign policy as the Menderes government. It has never even debated the principle of having missile bases on Turkish soil. On Cyprus it has also adopted a relatively statesmanlike posture by not harassing the government, even at a moment when it seems that some modification, indeed exclusion, of partition is in the air. Nevertheless, at the Peoples' party congress last week, the opposition leader, Mr Inönü, reaffirmed his party's view that partition is the "final solution" for Cyprus.

The Peoples' party congress—the first to be held since the controversial elections of 1957 which the opposition claims to have won—was a more moderate affair than might have been expected after the violent political strife of recent months. The opposition had predicted for Mr Menderes the same fate as that of Nuri Said in Iraq, and the prime minister had retaliated with talk of the gallows. When the opposition claimed that the government was encouraging religious reaction, Mr Menderes had retorted by dubbing them "infidels"—a word of extraordinary virulence in a Muslim country and a reference to the Peoples' party's identification with Ataturk's secular state. President Bayar, whom the opposition claims to be less impartial than the spirit of the law demands, joined in the fun with a speech in which he talked of crushing the opposition "like an ant." As the President had been observed taking the air one day with a walking stick bearing the Democratic party crest, the congress not unhumorously passed a motion presenting the Chief of State with a second stick embossed with the Turkish national emblem, the star and crescent.

Though the underlying strife is as bitter as ever, the feeling current in November that there might even be an armed clash between the parties has abated. This is partly due to a certain restraint on the part of Mr Menderes, who is fully occupied, not only with Cyprus and the economic situation, but with restiveness in his own party. His supporters are anxious about the effects of the economic reform programme undertaken by the government on the insistence of those western nations which baled Turkey out of the red last July. The Turks so far seem sincerely wedded to this programme—a fact which was appreciatively noted by OEEC and IMF experts who visited Ankara last week—but its consequences are politically most awkward. There has been a sharp rise in the cost of living since the devaluation of the lira in August, and a marked increase in unemployment as a result of the almost too abrupt credit squeeze which succeeded the runaway spending gallop of the last few years. Unless Mr Menderes gets the large drafts of further aid for which he is reported to have already angled, he has a sticky time ahead of him—and his more nervous supporters know it.

This malaise within the ruling party, even if it may not amount to much, has put a brake on those who would like to hamstring still further the troublesome opposition. Meanwhile, the Peoples' party, having increased its strength and momentum by a merger with the high-minded but unsuccessful Freedom party, and encouraged by reports that the country is swinging its way, feels that this is the tide which, taken at the flood, leads on the fortune. Only it is a bit doubtful how to cash in on it. The party congress ended with a high-sounding declaration of human rights, most of which (the right to strike was a notable exception) are to be found in Ataturk's republican constitution. This is all very well, especially in the light of the government's despotic tendencies. But some Turkish intellectuals wonder whether it strikes a sufficiently different note from that of the ruling party—which also subscribes in name to all these freedoms.



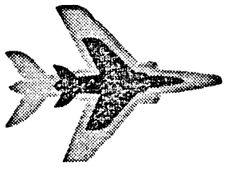
One result of the congress was a reinforcement of the opposition's support for the right to strike, which does not exist in Turkey. There was also talk of making the Peoples' party a social (though nobody ventured to say social*ist*) party. This raises the interesting question whether a party of the left will develop in Turkey. Since 1945 several attempts to found one have failed also to accompaniment, at times, of arrests and prison sentences. Proximity to Russia has meant that left-wing movements, however innocent, are lumped together indiscriminately as "communist." (A Turkish journalist is at present being sued for libel for calling another a "leftist.") A clause in the Turkish penal code prescribes the death penalty for anybody convicted of creating a subversive political party. This in itself is enough to cow the Turkish Fabians, of whom there are more about the place than one might think. Still, with the growing number of wage-earners and a mounting urban proletariat, the first party to brave this law in Turkey, provided it has good leaders, will probably reap political advantage.

Correction.—In the article "Israel's Election Starts Early" on page 231 of *The Economist* of last week, the figure given for the amount of outside help that Israel needs annually should have been $300 million, not $3 million.

THE FIRST PRIORITY

'The first priority for the N.A.T.O. nations is to be able to tackle quickly and effectively cold war activities and to play their full part in limited wars. This means the provision and upkeep of efficient conventional forces.'

Field Marshal the Viscount Montgomery of Alamein
Journal of the Royal United Service Institution, November 1958



9 MAR 1959

Limited wars call for limited, non-nuclear weapons — but these must be swift and flexible to be effective. Only thus can they deal with those minor conflicts which have become such a feature of the post-war world. A strong, manned air force is the best means of ensuring swift, effective resolution. As such, it is a highly effective deterrent in itself.

The Folland GNAT makes the fighter component of such an air force not only effective but economic. One of the fastest aircraft in service, it is far more manoeuvrable than most fighters, has a higher ceiling and a remarkable rate of climb and radius of action. It can take off in 400 yards and land in 600, with a powerful armament of rockets or bombs.

Moreover, its extreme simplicity of design makes maintenance easy, even at advanced tactical airfields and with the minimum of tools and equipment. Reversing as it has the modern trend to greater size, complexity and cost in fighter design, the Folland GNAT makes an effective fighter and ground-attack force a sound economic proposition.

THE BUSINESS WORLD

Banking for the Bankers

BANKING in Britain in the past year has broken free of its shackles. It has been competitive, exciting, profitable and businesslike. In the few months since the authorities called off the credit squeeze last summer, the banks have regained, largely through a series of dramatic innovations, much of the goodwill they sacrificed during their enforced passivity. The changes have attracted widespread public attention; on the Stock Exchange they have transformed bank shares from virtually fixed interest money stocks to equities with a new growth potential.

How do the bankers themselves regard their new situation? The annual reports, which always command an audience much wider than the banks' shareholders, gave the bankers an occasion to describe their revolution. But only two do so. The two bank chairmen who set off the fireworks, Mr Anthony Tuke of Barclays and Lord Monckton of the Midland, tell something of last summer's changes and give some facts about how they are going. But the rest (all the big English banks except the National Provincial have now published their statements) are in this respect disappointing. A number of the banks' reports are better dressed, and that is welcome. But contents matter as well as clothes and the banks' own activities certainly deserved a report this year. It is, after all, a little *piano* to say of the unprecedented participation in the capital of a hire purchase company that it was undertaken "after careful consideration," and that the bank is "wholly satisfied" of its desirability.

The bankers' views on wider topics are as interesting as always. Indeed they would surprise many people. The chairmen of the great deposit banks are far from being hard money men, still less deflationists. They show a remarkably unanimous restraint in the way they greet external convertibility and they all join in welcoming the government's measures to pull the economy out of its modest recession. And, once again, no special enthusiasm is displayed for the use of the thoroughbred controls—Bank rate and open market policy. Bankers' views on monetary policy would be very welcome, together with more detail about commercial banking operations. But the bankers' comment about the economy might be more selective. Where their comments are drawn from their particular experience they still have a unique interest; but the general survey nowadays has to compete with a profusion of economic comment from ever widening sources.

Although most of the bankers are reticent about monetary policy, almost all of them express their hearty welcome for the end of the credit squeeze—and their reservations about the scheme for "special deposits" at the Bank of England. (Sir Oliver Franks of Lloyds, a member of the Radcliffe Committee, eschews comment.) The strongest condemnation of special deposits comes from Lord Aldenham of the Westminster, who regrets the decision and trusts that the power will never be used. "I would have thought," he adds, "a better method would be for the Government itself to refrain from creating an excessive volume of credit." At the other extreme, Mr Tuke, long sceptical about the efficacy of Bank rate, holds that the authorities are "perfectly entitled to fortify their control machinery"; whether it can be operated fairly between individual banks he is less sure.

Mr Tuke, as noted in these columns last week, spells out in some detail the considerations that led Barclays to take up a 25 per cent interest in United Dominions Trust last July. His fellow bankers—who had less past criticism of HP to live down—are less forthcoming about their own HP affiliations. Not all of them are as emphatic as Barclays about the need to keep HP at arm's length. Lloyds, which like the National Provincial has not gone in for the new personal loans, has over £13 million invested in three finance houses; Sir Oliver Franks says the spread of the bank's interest is a natural extension into a field that might be described as the "first cousin" to banking proper. That is the

view that has generally been taken by Lloyds' associates in Scotland; and Scottish leanings about HP are reflected in the acquisition of the Midland Bank group, of which 40 per cent has been taken by the subsidiary, the Clydesdale and North of Scotland Bank.

The most controversial of the year's banking innovations, the introduction by the Midland of "personal cheques" offering a cheap bare bones transfer service, still shows no signs of being followed by other banks. Mr Tuke refers meaningly to "second class passengers," and Lord Aldenham states flatly that it has not been thought necessary to "advertise a special cheap restricted current account"; in fact the Westminster scored a record number of new accounts last year. But Lord Monckton, too, reports a "marked acceleration" of day to day business of the established kind, following the introduction of personal loans and personal cheques. These new facilities thus seem to be succeeding in getting a new class of customer into the banks. "Large numbers" of personal cheque accounts are being opened every day, and the average balance on these accounts has exceeded the bank's expectations. Employers have shown a lively interest in them, in connection with paying their staffs; and here Lord Monckton joins Mr Tuke in a plea for amendment of the Truck Acts, which at present inhibit employers from paying "artificers" by cheque.

The Midland also attaches particular importance to personal loans, which it was the first to announce, though other banks had their schemes waiting in the pigeon holes; and it is the only bank that gives any information about them. Up to the end of December the Midland had made 45,000 personal loans, averaging about £160; the amount outstanding was about £7 million. Lord Monckton states that the demand has been evenly spread through the country, and that over a third by number, and a half by amount, have been for purchase of cars. This bears out Mr Tuke's point that the banks may draw away from HP companies some of the cream of their private business.

Most of the increase in advances since the end of the credit squeeze, however, has been through overdrafts. In all the rise has been considerable—over £200 million or 10 per cent in the second half of 1958. But on a long view, as Mr Tuke points out, the level of bank advances is "still very low." Advances are far smaller than they were in relation both to the banks' own assets and to the volume of credit available to business. The ratio of advances to deposits is particularly low at Barclays and the Midland. Their jockeying for position has played a big part in the more venturesome and competitive attitudes the banks have recently taken. The Midland has just managed to regain its lead in total resources helped by a big increase in foreign business and foreign deposits. Both banks seized the new opportunity to serve their borrowing customers and attract new ones. The Midland proudly points out that its liquidity was strong enough to permit this expansion without any sales of investments. The other big London banks have each had to sell.

Some of the bank selling, especially of medium dated stock, has incurred the displeasure of the authorities, who in a delicate gilt-edged market have sometimes taken stock straight into departmental portfolios. These moral overtones from the Old Lady seem rather out of place—especially as the authorities during the prolonged curb on advances were encouraging the banks into gilt-edged. Long years of inflation have indeed left the gilt-edged market uncomfortably narrow and ill placed to absorb substantial sales; but in the long run the market will not be helped if banks are made to feel, by dint of the official frown, that they have not full freedom to manage their portfolios. The great achievement of this past banking year has been the restoration of banking decisions to bankers; the authorities, as well as the bank chairmen, must accept the logic of freedom.

Leaders and Laggards

THE growth in bank resources has been led this year by the Midland and Barclays, the Midland edging back to first place. On the longer comparison Barclays shows easily the fastest growth—deposits up 23 per cent since the end of 1951. The National Provincial has lost ground, though it has been doing well in the past year. But the two biggest banks are those with the smallest proportion of their assets in advances—probably the most profitable of bank assets. Lloyds, the National Provincial, and the District succeeded in raising their ratios of advances through the years of the credit squeeze—though this rise in ratios was partly a reflection of the slower growth of total resources at these banks. Even after the increases of recent months, advances at end-December still totalled only 28.9 per cent of deposits at Barclays and 29.9 per cent at the Midland—compared with 35.6 per cent at the National Provincial (in November), 33.3 per cent at the District, and 32.7 per cent at the Westminster. Barclays has the highest ratio of investments, at 32.5 per cent (though in August it was even higher at 36.8 per cent). All the banks have lightened their investment portfolios since 1954; again, the Midland and Barclays show smaller reductions than the rest. The Midland gives more detail than most on the composition of its portfolio. Purchases last year took a "very small fraction" into a maturity of just over ten years; well over three-fifths matures within five years. Although the Midland has not sold investments in recent months, it still has the best liquidity ratio of the big five, at 35.3 per cent. The Westminster, despite recent sales, showed only 33.2 per cent—but it has gained relief from the mid-January maturity of Conversion stock.

Closing a Branch Line

British Railways has a major headache when it closes even a minor line

MANY of the unprofitable railway lines which the Transport Commission is now closing were uneconomic to build in the first place; others have simply failed to survive in competition with road transport, and railway management has long been saddled, in attempting to pay its way, with the problem of how to cut these losses. Most of the obsolete services removed by the Transport Commission are passenger services, for the railways are still the best carriers of heavy freight; and most of them are branch lines, although the Midland and Great Northern Joint Line—most of which will be closed at the end of February—is a railway system 176 miles long. In the past nine years, 183 lines have been closed, with total savings of £2½ million a year.

One example of this type of unprofitable service was the branch line which ran from Abergavenny, in Monmouthshire, via Tredegar to Merthyr Tydfil in South Wales. It was founded in 1859, and bought by the London and North Western Railway in 1866, in an attempt to take traffic from the Great Western. The Merthyr, Tredegar and Abergavenny line ran 24 miles through rugged coal and steel country, connecting such places as Gilwern, Nantybwch, Hoelgerrig, Cwnantgam and Pantysgallog. It is probable that on strict costing the service never paid from the time it was introduced. Most of the freight service was removed in 1953 because of falling receipts, and in 1955 the future annual deficit on the passenger service was estimated at £58,939. The closing of the MTA line offers a case study of the way that the Transport Commission removes an unprofitable service.

On July 25, 1956, after more than a year's study, the Branch Lines Committee of the Western Region officially recommended that this line should be closed. The expenses of running it in 1955 had totalled £64,744—staff costs of £30,171, costs of rolling stock, £5,897, permanent way maintenance and renewals £19,369 and other expenses £9,307. Future annual receipts were estimated at £5,705 a year; thus after allowing a £100 subvention for the provision of extra bus services in the area, the net saving from closing the line was put at £58,939 a year. If the line was to be kept open, £8,550 of major repairs were needed in the next two years. The Branch Lines Committee recommended that passenger services should be withdrawn completely, leaving a single-track freight service running over part of the line.

Studies were made to see if the line could profitably be operated with lightweight diesels. Savings of £10,134 could have been made in this way, but even allowing for a sizeable increase in traffic, a big loss would have remained. The committee's report was submitted to the Western Area Board of British Railways, which approved it on November 13, 1956, and the Transport Commission gave its approval on December 14th.

The next step was to submit a complete brief to the Transport Users' Consultative Committee for Wales and Monmouthshire. Consultative committees are appointed by the Minister of Transport to represent transport users; their heaviest job is to consider proposals to withdraw services. They do not sit in permanent session, and their members are unpaid; they are not tribunals, and their work—relatively little of which is done in public—is to advise the BTC and the Minister, rather than to formulate transport policy. There are nine area committees covering England, separate committees for Scotland and Wales, and a central committee. After studying the facts about a proposed withdrawal of services, the committees sometimes hear deputations from objectors, before making their recommendation to the Minister.

Soon after the Welsh Users' Committtee received details of the proposals for the MTA line, notices were posted informing the public of the Commission's plans, The committee held its first meeting at Llandudno on May 24, 1957, to circulate details of the Commission's brief; objectors were given simplified statements of the costs and estimated savings involved. On June 15th representations against the closing were received from the local authorities of several towns in the area, including Abergavenny; on June 17th, another

group of 1,125 people headed by a resident of Pantysgallog, near Merthyr Tydfil, submitted an eight-page protest and replies to these were prepared by the Transport Commission.

At the committee's next meeting, held at Cardiff on July 12, 1957, the Commission's replies were further attacked by spokesmen for the protesting groups. Deputations are sometimes represented by lawyers (even by QCs) although since the committee has no judicial powers, this is unnecessary. Railways are objects of enormous sentimental attachment, and nobody—particularly no railway man—much likes to see one closed. Many of the objections—that the line had strategic value in wartime, that snow and ice sometimes made roads in the area impassable, that tourist trade or industrial expansion would be thwarted—simply could not (even if wholly true) justify a loss of £59,000 a year. Serious proposals were advanced by protesting groups for running the line at a profit or, more realistically, at a lower loss, chiefly by re-scheduling trains and by using lightweight diesel equipment. But an enormous amount of new traffic, or a heavy increase in fares, would have been required to produce this result, and the Commission has plenty of opportunities to use its diesel equipment where it will make a profit, and not merely reduce a large loss.

In the majority of cases the loss on these branch lines does not arise from the use of expensive equipment ("spartan" would often be a generous description of the rolling stock in operation) but from heavy fixed costs which are shared among far too few passengers; the average number of passengers per train per day on the MTA line during 1956 was 36. When passenger lines are closed, the Commission attempts to arrange for extra bus services in the area, which is usually simplified by the fact that it owns the country's two largest bus groups, Tilling and Scottish Omnibus. Where these extra services would also be unprofitable, a subvention is sometimes made.

On July 25, 1957, the MTA line was mentioned during an adjournment debate in the House of Commons by the Member for Merthyr Tydfil, Mr S. O. Davies. (It may be recalled that the earlier case of the celebrated "Bluebell Line" in Sussex also received the attention of Parliament.) Since the case was before the Welsh Users' Committee, no official reply was made. On September 27, 1957, the committee met again to hear further representations; its final meeting over the MTA line was held on October 18th, when it recommended that the line be closed.

Recommendations of the Welsh and Scottish committees go directly to the Minister of Transport without the ratification of the central committee, which is required for the decisions of the English area committees. The Minister of Transport subsequently approved the Committee's recommendation, the closing date decided was January 6, 1958, and the public was notified of the closing date on December 6th. On January 5, 1958, the Stephenson Locomotive Society ran a special train from Abergavenny to Merthyr Tydfil and back, and 250 of the Society's members mourned the line's passing in the presence of BBC Television cameras. The next day the MTA line was formally closed. Nearly a year later, *The Economist* wrote to the major objectors to the closure, asking how transport conditions in the area had in fact turned out since the line was closed, and whether the result was better or worse than they had expected. None has replied.

BUSINESS NOTES

EGYPT

£27½ Million for What?

THE press reports from Cairo about the Anglo-Egyptian financial settlement have left business men in Britain pretty much in the dark about where they stand. Signature of the agreement and a statement from London are expected shortly after this issue of *The Economist* goes to press. It may then be possible to assess Egypt's reported agreement to pay £27½ million (compared with Britain's request for £35 million) in compensation for British concerns that have been "Egyptianised" and to meet claims for losses on property that was sequestrated, and will now be returned. At present it is still not wholly clear in London what property has been "Egyptianised" and what is to be returned.

As expected, Britain has set off its claim for the installations on the Suez military base against Egypt's claims for war damage. Egyptian sterling balances will be released: but it should be remembered that ever since 1945 the larger part of Egypt's balances have been blocked in No. 2 accounts, with agreed annual releases, dutifully continued into the (temporarily blocked) No. 1 accounts. The balance in the No. 2 account is now around £27 million.

Egypt's total sterling balances are estimated, at market value, at some £73 million. About £10 million may be deducted for compensation to shareholders of the former Suez Canal Company, under the terms agreed; and the £27½ million for holders of British property would be paid within one year. Britain has asked that administration of claims should be handled by Foreign Office representatives installed in Cairo.

Disorder and Probable Sorrow

THE largest concern seized by Egypt and now to be returned is Anglo-Egyptian Oilfields, of which BP and Royal Dutch-Shell each own 31 per cent; ten per cent is owned by the Egyptian Government and the rest of the shares are held publicly. Anglo-Egyptian's production in 1956 was 1,380,000 tons, out of total Egyptian production of 1,800,000 tons; since then the country's oil output has been growing, new fields having been found in the Sinai peninsula, and was estimated to be over 3½ million tons last year. Anglo-Egyptian owns the largest of the country's three refineries, which is located at Suez and has an annual capacity of 2,200,000 tons, and a coastal tanker company. Two marketing companies—Shell Company of Egypt and BP (Egypt) Ltd—are subsidiaries of another company jointly owned by BP and Shell. In addition, Shell Chemicals Distributing Company of Egypt, wholly-owned by Shell, was seized. A settlement concerning these properties was announced on December 19th by Jonkheer J. H. Loudon, after returning from negotiations in Cairo, although its terms have not been revealed pending the signature of the general agreement between Britain and Egypt; it is expected that Shell and BP will resume operation of these properties.

Over 350 British firms in all are believed to have been seized. Some of these, like Anglo-Egyptian, were sequestrated, i.e., were seized and managed by Egypt but still technically owned by Britons. About 50 others—the number is uncertain—were "Egyptianised," and became wholly Egyptian-owned. The Egyptian Government has said that sequestrated properties will be returned to their owners, while former owners of Egyptianised companies will be paid compensation for them. But the distinction between the two states is not clear in practice, and in the two and a half year limbo since seizure many firms have no clear idea of the exact condition of their properties. Barclays Bank DCO formerly operated about 50 offices in Egypt, which were Egyptianised; its balance sheet in 1956 showed £17.6 million of advances and bills discounted in Egypt and £18.2 million in local cash and short-term Egyptian Government securities. The Ottoman and Ionian Banks also had branches Egyptianised. None of the three companies has any clear idea of the compensation it is likely to get.

Many of the companies concerned were small, some of them being only agencies or sales offices. Over 50 British insurance companies were in business in Egypt before November, 1956; some of these were sold to Egyptians after sequestration. The Egyptian Government has announced that it will levy a ten per cent charge on the sequestrated assets, to pay for expenses of administration. After deducting claims for Egyptianised property—which also seem unlikely to be settled at anything like their full value—it seems doubtful whether many of the owners of the returned assets will be fully compensated for the depreciation of their property while it was in Egyptian hands.

ELECTRICITY

Borrowings and Costs

TWO things were politically notable about this week's debate on the Electricity (Borrowing Powers) Bill, which seeks to increase the borrowing powers of nationalised electricity authorities in Britain by £1,060 million: the studied disingenuousness of Mr Maudling, and the new, possibly incidental back-bench alliance of Mr Nabarro, Mr Birch and Mr Enoch Powell. In their exchanges, Mr Nabarro, who never gets the same thing wrong twice, demonstrated how much he has been learning about the economics of fuel and power, whereas Mr Maudling might have been trying to demonstrate how much he is trying to forget; Messrs Birch and Powell, resigned to being sea-green incorruptibles, were concerned essentially with the financial probity of committing public expenditure far beyond the tenure of this Government and possibly beyond the tenure of the next one.

Debatable but conveniently esoteric statistics enabled Mr Maudling to proceed smoothly from saying that the electricity industry's investment programme will enable it to increase its margin of spare generating capacity over peak winter demand in future, as it has in recent years, to claims and hopes about a "continuing" improvement in load factor. He told the House that since the White Paper on the nuclear power programme was published there had been "a certain recalculation of the comparative costs of conventional generation and nuclear generation." Without disclosing that this recalculation had in general made nuclear costs look rather worse against comparable base load stations using coal or oil, he broadly managed to imply the opposite:

> Our calculation now is that the Hinkley Point station, of which the capital cost will be £120 a kilowatt against £145 in the case of the earlier ones, should be marginally, slightly more economic than a coal-fired station operating in the same area, because one must compare the nuclear power plant, not with a coal-fired plant operating in the coal fields, but with one operating away from the coal fields and in the area where a nuclear plant will be, which will make a big difference.

These first nuclear plants, certainly, have been put down in places where there might once have been a choice between local generation with high-cost coal and generating the power at low-cost stations on the coalfields and transmitting it there over the Supergrid. But this is not the relevant companion. The new atomic power plants can be justified only as base-load stations, with their costing reckoned at a load factor of 75 per cent more than any existing plant today achieves. No one in his senses would have proposed a base load coal plant at such a place as Hinkley Point. The whole logic of pre-nuclear generation and transmission planning was to generate cheaply on the coalfields and transmit the power because this is cheaper than hauling coal. Incidentally, one might further ask whether the reduction in cost per kilowatt for Hinkley Point was simply a matter of technical progress: and equally, if one is considering actual costs as against negotiated prices, whether all—or indeed any—of the consortiums building these first nuclear power stations expect to break even on their contracts.

Budgeting for Power Investment

OUT of the £2,130 million that the English Electricity Council expects to invest in the electricity supply system of England and Wales during the next seven years, it proposes to find £980 million from internal sources (finally from prices), or what Mr Maudling reckons "austerely" at 46 per cent. This compares with 33 per cent of its capital expenditure since nationalisation, and represents a large increase. "To go further," argued the Paymaster General, "would involve increases in the current price of electricity which would certainly not be popular—which is not so important—and which would not be economically sound." As a discussion of the principle of

self-financing, this is unexceptionable. But Mr Maudling did not address himself to the question of the return that electricity obtains from those current prices upon its huge capital investment in comparison with the return that private capital investment in the economy, without benefit of gilt-edged rates of interest, has to earn. This, and not some abstract discussion of "How much ought one to self-finance?" should be the principle that determines prices and the financing of investment in this industry.

Messrs Birch and Enoch Powell, echoed by Mr Nabarro, would like to cut the period covered by this bill, to impose an annual limit on the borrowings of electricty as well as coal, and to give the Select Committee on Nationalised Industries an official of the stature of the Comptroller and Auditor General to investigate nationalised industries on its behalf. To give Parliament a chance to look closely at capital spending in the nationalised industries at least once a year is a reasonable ambition, though it might best be fulfilled by a full-dress debate on the annual white paper on their total spending (into which transport should be brought along with the fuel and power industries). Appointing an Auditor-General without giving him the actual auditing job—which the late Sir Frank Tribe reckoned might mean recruiting half the accountants in London—would be administratively difficult, though the Government at the end of the debate promised to consider it. Mr Enoch Powell, since he left the Government, has discussed the possibility of broad estimates looking forward five years or so in national budgeting as a whole, partly because of the various long-term capital programmes that the Treasury has now to finance. This, rather than chopping up the borrowing allocations of nationalised industries into unreal yearly instalments, might be the wiser course in the long run.

FBI ON THE BUDGET

2, 4, 6, 8, 10—or 9½?

THE recommendations of the Federation of British Industries for tax changes in the forthcoming budget are restrained. The federation considers that the coming year should aim at "expansion in all sections of the economy, short of the revival of inflation." The main reliefs it recommends in income tax, surtax, profits tax and purchase tax are estimated to cost £265-£280 million, which would not be an excessive figure if the Chancellor were to plump for major fiscal reflation. In addition, the FBI asks for the substitution of investment allowances in place of initial allowances, at the rates as increased in 1958 to 30 per cent for equipment and 15 per cent for industrial buildings. The federation would like to see commercial buildings eligible too. The change, broadly involving the replacement of a loan by a grant, would have no immediate effect on the revenue. But not everyone is convinced of the economic logic, in a relatively advanced economy, of subsidising investment.

The proposal that attracts warmest sympathy is for reductions in income tax from 8s. 6d. to 8s. in the standard rates and from 6s. 9d. to 6s., 4s. 9d. to 4s., and 2s. 3d. to 2s. in the lower rates (along with the raising of the upper limit of the band of income taxed at 2s.). The FBI proposals would thus produce, at a cost of £125-£140 million, the 2-4-6-8 that *The Economist* assessment of the 1958 budget suggested should be the aim for 1959; but they would give 9½ instead of 10 for companies, since the FBI urges that the profits tax should be reduced from 10 to 7½ per cent. The federation also proposes relief for surtax, possibly through extension of the earned income relief at present granted to income tax.

The recommendation on purchase tax is a modest one: no general cut in rates, but removal of the tax from materials and equipment "used in production"—notably commercial vehicles and stationery (cost £37 million); the repeal is urged of the duty on light hydrocarbon oils used in industrial processes (£11 million). The FBI also repeats past pleas for technical reforms, some of which were argued by the Royal Commission. The Federation's list includes:

- depreciation allowance for commercial premises;
- allowance of cost of the right to work minerals;
- substitution, for deduction of expenses, of "all expenses personally incurred for the appropriate performance of the duties of the office or employment" for the present "wholly exclusively and necessarily incurred in performance of the duties";
- treatment as overseas trade corporations of subsidiaries registered overseas;
- more flexible valuation by the Inland Revenue of stocks and work in progress;
- consideration of the "current year basis" of assessment for companies; and
- fairer valuation for estate duty of shares in closely controlled companies.

All this is germane. Finally, the FBI this year recommends that tax allowances should be given for all educational grants or endowments, and not only those related to the trade of the donor.

STOCK MARKETS

Sense and Sensitivity

THE market is both active and sensitive. One reason for its activity is the cash released by Reynolds Metals' buying of British Aluminium stock in the earlier account. Another is that the willingness of small investors to take their profits when prices are high is matched by continued buying on the part of the institutions in a market that is still short of stock. This balance of forces produced on Monday a record number of bargains, with 19,831 dealings marked. But after their long rise, prices are sensitive to changes in the political winds in this country and to economic winds on Wall Street. An opinion poll that suggested that the Conservatives had lost their electoral lead combined with a little uneasiness on Wall Street scared some of the short-term speculators, and prices turned down both in the gilt-edged and the industrial market. But the check was only momentary. Basically, the gilt-edged market remains strong, with the authorities easing on the reins a little but not letting the horse bolt away. And when Wall Street rallied, so did the British industrial market. The final result over the week to Wednesday's close was that the *Financial Times* government securities index fell only slightly, from 86.94 to 86.52, and *The Economist* ordinary indicator fell only from 252.9 to 251.6. The quickness of equity prices to respond to economic and political cross-currents is a symptom not so much of volatility as of common-sense caution.

The £6 million issue of English Electric's 5½ per cent debenture 1974-76 at 97 was home and dry, with

a massive over-subscription, before the market in fixed interest stocks faltered. Applications were cut down to about 5½ per cent, with a minimum allotment of £100, and dealings began at 2¼ premium before the price settled down at 2 premium. At one moment the £5 million issue by the Port of London Authority looked as if it might become a casualty. This 5½ per cent stock 1975-78 was offered at 99½, on terms practically identical with those of the Fife County Council issue; but, unlike that stock, it is a non-trustee issue and in the less buoyant market this week it did not attract the stags. But the rally in gilt-edged prices came just in time to allow the issue to scrape home, oversubscribed but only just so. Applications of up to £10,000 were allotted in full and above that sum they were scaled down to 65 per cent. Dealings began at ⅛ discount but the price quickly improved to just under par.

Cheaper in Switzerland

THE British Petroleum Company is to make an issue for 60 million Swiss francs (some £5 million) in Zurich around the end of February. This could be an important augury for big British firms, and for the international capital market—which is becoming much more of a reality. Hitherto, firms operating from the United Kingdom have not had access to public capital markets overseas. The exchange control authorities have generally felt unable to give permission because of the commitment for interest and repayment in foreign currency. Some issues have gone through, but apart from the special issue by Bowater in the United States some years ago to finance its mill in Tennessee, this is the first major one to receive public attention.

The attraction for BP is obvious. It is expected to issue a loan stock at 4½ per cent; in the London market it could not offer less than 5½ per cent. At the same time, it does incur a certain exchange risk: if sterling were to depreciate in terms of the Swiss franc, the company would face a heavier burden of repayment. The proceeds of the issue follows the raising of £17 million on the London market in two operations for the financing of tankers. The Swiss money will presumably be used for BP's growing interests on the Continent, in refining and distribution.

It will be surprising, if the differential between interest rates in London and centres such as Zurich remains, if the Treasury is not confronted with more applications for long term borrowing overseas. Having said yes to a concern in which it has a direct financial interest, it might have difficulty in turning down a serious application from another large business, especially one with important international interests.

MOTORS

Return to Seasonal Demand?

PRODUCTION in the motor industry this autumn has not completely fulfilled the industry's expectations of a return to sharper seasonal fluctuations, because freeing of hire purchase came to stimulate buying in November and December, but there were still signs of the "normal seasonal pattern" that the industry last experienced before the war. In the years immediately following the war, pent-up demand at home kept production at maximum levels throughout the year, taking all the cars spared from export; later, the high rate of exports to countries in the Southern Hemisphere also kept output artificially high in the last half of the year. The return to a more seasonal pattern has been predicted for some years, but recession and recovery in 1956-57 further blurred the picture. Last year a total of 364,670 cars and commercial vehicles were made in the first quarter and 361,143 in the second quarter. In the third quarter, because of holidays and quite apart from demand, production fell to 310,954. It rose again, with the stimulus provided by removal of hire-purchase restrictions, in the fourth quarter, but not quite to the levels of the first half year.

Any continued return to "normalcy" this quarter will be further upset this month by two apocalyptic events: the fire at the Pressed Steel works at Oxford, which will affect supplies of bodies for the Standard Vanguard and Hillman Minx and Gazelle, thus reducing output of both Rootes and Standard, and an unofficial strike called this week at the Birmingham plant of Fisher and Ludlow, which supplies car bodies to both BMC and Standard. At one point Standard had increased output of its other models to make up for the reduction in production of Vanguards, and had laid off 500-600 men; BMC had laid off 4,000 workers and suspended production on six models. As this issue of *The Economist* went to press no settlement had been announced.

Evidence that seasonal demand is returning has been revealed by Vauxhall, who have announced that they will shortly start overtime working in order to meet increased demand for cars and trucks. Production schedules have been drawn up on the basis that overtime will be worked as necessary during the first few months of the year (though the company state that this will not be "compulsory"), and a limited number of workers will also be taken on during the next few weeks. Vauxhall have announced that orders for both cars and trucks for delivery during the first six months were rising, and have told their workers that since demand will be greater in the spring than in the autumn overtime will be required during the next few months, if "large fluctuations" in the labour force were to be avoided later in the year.

The Farina Line

THE first fruits of the collaboration of BMC with Pinin Farina appeared in the unveiling towards the end of last year of the new Austin A40—something between a station wagon and a saloon—which seems to be winning public acceptance as a practical, useful and very handsome little vehicle. Two more offspring have since come to bless the union, the Wolseley 15/60 and the Austin A55. Both use most of the same body panels. The Wolseley's frontal appearance acknowledges the ancestry indicated by its name, with a resemblance to the Wolseley 1500. The front of the Austin also makes allusion to its descent, and especially to the new A40, with a rhythmic and rather more satisfying shape.

The A55, judged in the showroom, seems to have what it takes to sell well—and with Issigonis, who left BMC after designing the Morris Minor, returned to the fold and responsible for engineering BMC designs, it would be surprising if its behaviour on the road were not first class. It seems likely that within the next year or two BMC will have a new range of cars, covering the gamut of the high volume categories upwards from the new very small car that is expected to be forthcoming next May. If Issigonis

and Pinin Farina can repeat the achievement throughout the BMC range, the effect could be far reaching.

The production facilities of BMC are not inferior to any in Europe, and capable in total of an output nearer three-quarters of a million vehicles than half a million. Their mechanical components, engines, and gearboxes, are excellent; but for years the Morris Minor has been their only passenger car of outstanding sales appeal. A range of cars, all of which proved to be winners, could take up the unused slack in BMC's production facilities and bring down costs. The end result, in terms of sales at home and abroad, could have an important effect on the balance between the British and the Continental manufacturers in all the contested markets.

The fact that this new body for the Wolseley and the A55 is made by Pressed Steel suggests that it will be some time before BMC goes as far as General Motors in exploiting the full cost savings of a big group. In the States GM uses common body panels for cars sold under several different names; there seems to be no reason why Austin and Morris should not do likewise. But in that event, one would have expected the bodies of models in the high volume ranges to be made by Fisher & Ludlow, BMC's own subsidiary.

OPERATION BRITAIN

Triumphs of Engineering Dept.

ASPIRATION and performance in the British civil engineering industry now ranges from the readiness to guarantee that a nuclear reactor to be built in Japan will be proof against earthquakes to the inability to guarantee that a new motor road surface laid in Britain will be proof against a normal winter frost. Cracks, corrugation and crumbling of the asphalt surface of the Preston motorway, which this week caused it to be closed just 48 days after it was opened, have occurred at about fifteen to twenty places; though they affect only about 1,200 square yards out of 225,000 square yards of carriage way on the 8½ mile motorway, they have been enough to cause traffic to be diverted. This surface, laid by the Tarmac Group, was classed as a "temporary surface" which meant that subsidence might be expected during the first two or three years, after which a permanent surface would finally be laid: it was put on top of a 9-inch layer of "wet mix" waterbound macadam developed for road construction by the Lancashire County Council. The reason why "temporary" and "wet" have taken on a new meaning in these circumstances appears to have been that the under surface was not properly dried, because it was raining most of the time while the road was being completed; water got into the weak spots, and frost followed by a quick thaw has broken them up.

The Tarmac Group has said that it completed the road surface according to the specifications laid down by the Ministry of Transport, and has suggested that the problem of building in and for severe weather is one to which no fully satisfactory answer seems yet to have been found. This does not sound promising for the several sections of the London to Birmingham motorway which have been under construction throughout much of the same period as the Preston road, and on which similar standards of construction are presumably being used. British standards of motorway construction are claimed to have taken advantage of all the lessons of trunk roads built overseas, and a large amount of research into road surfaces has been done in Britain's road research laboratories. If this is a foretaste of what has been learned, it is not encouraging.

Not According to Poster

DURING 1958 British shipyards obtained orders for only 144 ships totalling just under half a million tons gross, even including some tankers in building programmes announced in earlier years; an almost equal tonnage of ships on order was cancelled; and the yards completed 1,464,000 gross tons, so that tonnage on order at the end of the year declined to 5,430,000 gross tons—which still represents four years' work at the industry's current rate of output. Ranking now third (by tonnage launched) among the world's shipbuilding nations, the British builders retain today perhaps only this consolation—that their combined orderbook represents employment for a considerably longer future period than Japan or Germany can at present foresee. This is not full employment in any real sense of the word, however, since the orders are so concentrated into heavy tankers; the arithmetic of total orders against output offers cold comfort to some of the builders of smaller dry cargo vessels, who have comparatively little work on hand and see no early prospect of any revival in merchant ship ordering.

At the end of December, British yards had 2,334,158 gross tons of shipping under construction, about 3 per cent less than a year before. Japan had less than a million tons. This partly represents different methods and timetables of construction: British yards ordinarily lay keels well in advance, and have fifteen months' "output" of ships in progress at the same time. Nevertheless, the Japanese figure of tonnage construction in hand is now about a third lower than a year ago, and the fairly large export orders it received in the last quarter still brought its orderbook to only about two years' work. Sweden and the Netherlands are the only major shipbuilding nations with a higher tonnage under construction than a year ago. Across the world, shipyards are operating far below the capacity that they built up during the last boom.

BRITISH ALUMINIUM

The Treasury Agrees

ON the same day that Reynolds Metals had to settle in cash for all the British Aluminium ordinary shares it had bought in the market, the Treasury announced that it had given consent to the acquisition of BA by Tube Investments and Reynolds Metals on the understanding that control of BA would remain in this country. TI and Reynolds have sorted out their holdings of BA stock acquired for cash and tendered in acceptances of their bid in such a way as to fulfil the intention that BA should be controlled through Reynolds-TI Aluminium in which TI will have a 51 per cent majority interest. These arrangements cannot be modified without the consent of the Treasury.

FOREIGN EXCHANGE

Foreign Funds to London

THE demand for sterling in the foreign exchange market has continued strong this week. At this time of the year the seasonal demand for sterling area commodities is running high; sterling has also been in demand on capital account

Falling in love

They've discovered each other, and they're wonderfully happy . . . as you will be, when you discover the Zodiac. Let your eye linger on elegant lines and lovely colours, single or two-tone . . . the sumptuous interior, with soft leather seating, rich astrakhan carpets. Feel the *power*—fast, safe, and, if you wish, fully-automatic. Note the *very* reasonable cost and *all* the built-in extras. You'll *know* . . . you and the Zodiac are made for each other!

Price £675 plus £338.17.0 P.T. = £1,013.17.0 With Overdrive £1,077.12.0 or Fully Automatic Transmission £1,186.7.0

and there has been consistent bidding for sterling from New York and most Continental centres. The rate against the dollar has hardened to $2.80\frac{3}{4}$. None of this demand seems to have been diverted from the market by requests for "interim finance" from the Bank of England under the new Monetary Agreement, which has supplanted EPU. That is not surprising, since any sterling borrowed by European central banks under this provision would have to be repaid after the clearing at $2.82, or equivalent Continental rates, the most unfavourable for them. Turnover in the London exchange market is being maintained at a level consistently higher than it was before the move to external convertibility. The excitement in the Belgium franc had died down; the National Bank shows a gold loss of £7 million in the week to January 15th.

Foreign money continues to be drawn to the London market for short-term investment. During the past week there has been evidence of German, Swiss and Dutch demand for bills and short bonds: and since the currency freeing of December, much of this money has been left uncovered in the forward exchange market. With the Dutch Bank rate down to $2\frac{1}{2}$ per cent this flow of short-term money may increase in the near future—though the bill rate in New York went above 3 per cent this week, narrowing the margin in favour of London below $\frac{1}{4}$ per cent. London is still the most attractive centre in Europe for short-term investment.

France Frees External Capital

The French franc has been weakening slightly against sterling, moving to 13.76$\frac{3}{8}$ in spite of this week's announcement that gold and dollars have been flowing into the French reserves since devaluation at the rate of between $10 and $15 million a day. Nor has there been any marked response in the exchanges to the announcement from Paris that the "capital franc" (comparable to security sterling) is being abolished and that for non-residents the French franc is to become convertible not only for current but for all capital transactions. The rights of convertibility and repatriation already existed for new and authorised foreign investments; but the proceeds of sales of prewar investments in France had to be credited to capital franc accounts and either reinvested in France or sold at a discount, which before the devaluation had widened to the extent by which the franc was in fact devalued on December 29. The sums involved must be considerably smaller than would be affected by the freeing of security sterling.

The aim of this grant of convertibility to the proceeds of capital transactions held by non-residents is to encourage the inflow of foreign, and particularly German and American, capital, on which high hopes are placed for development of the Sahara's oil resources and the industrialisation of North Africa. Prices on the Bourse have risen strongly. There are also French hopes that with the advent of the Common Market and the knitting of closer ties between French banking and industry and firms in other Continental countries, French securities will be admitted to quotations on the German, Belgian and Dutch Bourses. The granting of full convertibility to the proceeds of capital transactions is an essential preliminary to this move. Reforms on the French Bourse itself, including stiffer requirements for firms to give information, are expected shortly.

IMPORTS THIS YEAR

Rise in Volume and Prices?

In 1958, a year of recession, the volume of Britain's imports was just as large as in 1957. Imports of basic materials fell sharply, and imports of semi-manufactures less sharply. But the volume of manufactures brought in continued to rise, while imports of crude oil were about one-fifth higher than in 1957, when supplies were curtailed by the closing of the Suez Canal, and arrivals of refined petroleum were slightly higher in quantity. Food items, which accounted for nearly 40 per cent of the total cost of Britain's imports, rose by about five per cent in volume last year. As Britain climbs out of recession imports are bound to increase. Consumption of food will remain high (though a good harvest would diminish the need for imported feedingstuffs) and industry will need larger stocks.

There are already signs of an increase in imports of industrial materials. The total value of imports in December, at £353 million cif, was nearly £40 million higher than in December 1957, though a part of that increase was adventitious. The figures were swollen by a drive to clear outstanding documents through customs before the new tariff list came into force on January 1st. And imports of tinned salmon, which were relaxed in September, shot up by over £10$\frac{1}{2}$ million to £11$\frac{1}{2}$ million, more than the whole import in 1957. Britain can hardly eat salmon at that rate for very long. But arrivals of some industrial materials, such as raw wool, softwood, woodpulp, aluminium and copper were all higher in quantity than a year ago. The recovery so far has been modest, and not broadly based. Some rise in prices of industrial materials is also to be expected, though it would start from a relatively low level. While import prices of foods and manufactures were three to four per cent higher in December than a year ago, prices of basic materials remained weak and were over 13 per cent lower than in December 1957. Import prices as a whole are clearly not likely to be as favourable as in 1958, when they fell by seven per cent.

This was the main reason for the sharp drop of £189 million to £424 million in the apparent visible trade deficit. Most of that improvement occurred in the first half of the year; in the second half the apparent deficit was £251 million, only £25 million lower than in the same period of 1957. An article in the *Board of Trade Journal* this week states that "it is certain that the exceptionally large payments surplus on visible trade in the first half of last year [of £137 million, taking imports and exports fob] will not be repeated in the second half, and there is likely to be a return to a small deficit as in 1956 and 1957." A small deficit on visible trade, however, would be comfortably offset by invisible earnings.

MACHINE TOOLS

A Sensible Proposal

Something over 10 per cent of the plant and machinery installed in British factories during the recent investment boom has come from abroad; probably 15-20 per cent of that imported equipment has come in without paying duty; and maybe half of the duty free machinery that has been imported into Britain has been machine tools. The Machine Tool Trades Association has now proposed to

the Board of Trade that arrangements for the duty free entry of machine tools should cease and that, as a *quid pro quo*, the duty on foreign machine tools should be reduced from 17½ per cent to 10 per cent.

There is a good deal of sense in the machine tools industry's argument, though believers in free trade might prefer the duty to be cut further or even abolished. Exemption from duty for machinery imported into Britain is licensed when the Board of Trade, advised by a committee including businessmen, is persuaded by the buyer that a particular item of equipment is either not available from British manufacturers or can only be delivered after unacceptable delay. The amounts of equipment brought in under such arrangements accounted for a fairly large proportion of the total machinery imported into Britain in the thirties and an even larger proportion during the immediate postwar years, when British industry was re-equipping in the teeth of shortages of all kinds. All issues of duty free licences were suspended from 1952-54 (though much of the machinery imported by the Ministry of Supply for rearmament came in under special arrangements). No recent detailed statistics are available: but during the past three years, since the system came fully into operation again, published figures about amounts of duty remitted suggest that the amounts coming in are of the order of some £20-£25 million a year out of total machinery imports of about £125-£170 million a year.

The machine tool industry thinks that the procedure by which a customer wanting to buy a foreign machine has a standing temptation to argue that it cannot be obtained here at all or cannot be obtained in a reasonable time provides a constant source of friction between the British machinery supplier and its customers. It argues, moreover, that if a British manufacturer really insists on an American or Continental machine in preference to what British machine tool makers can offer him, a 10 per cent duty would probably not be a very powerful deterrent. During certain periods of shortage here customers have been prepared to pay premium prices for quick delivery of foreign equipment that would significantly outweigh such a duty. It is not easy to guess whether a 10 per cent duty without exemptions would afford the machine tool industry more effective protection than a 17½ per cent duty which possibly half the imports of machine tools escape. However, it should not be impossible for the Board of Trade to arrive at some rate of duty that would even things out. If it can, anything to get rid of these elaborate consultative procedures and arguments between customers and suppliers about the relative virtues of their machines might on balance be a good thing.

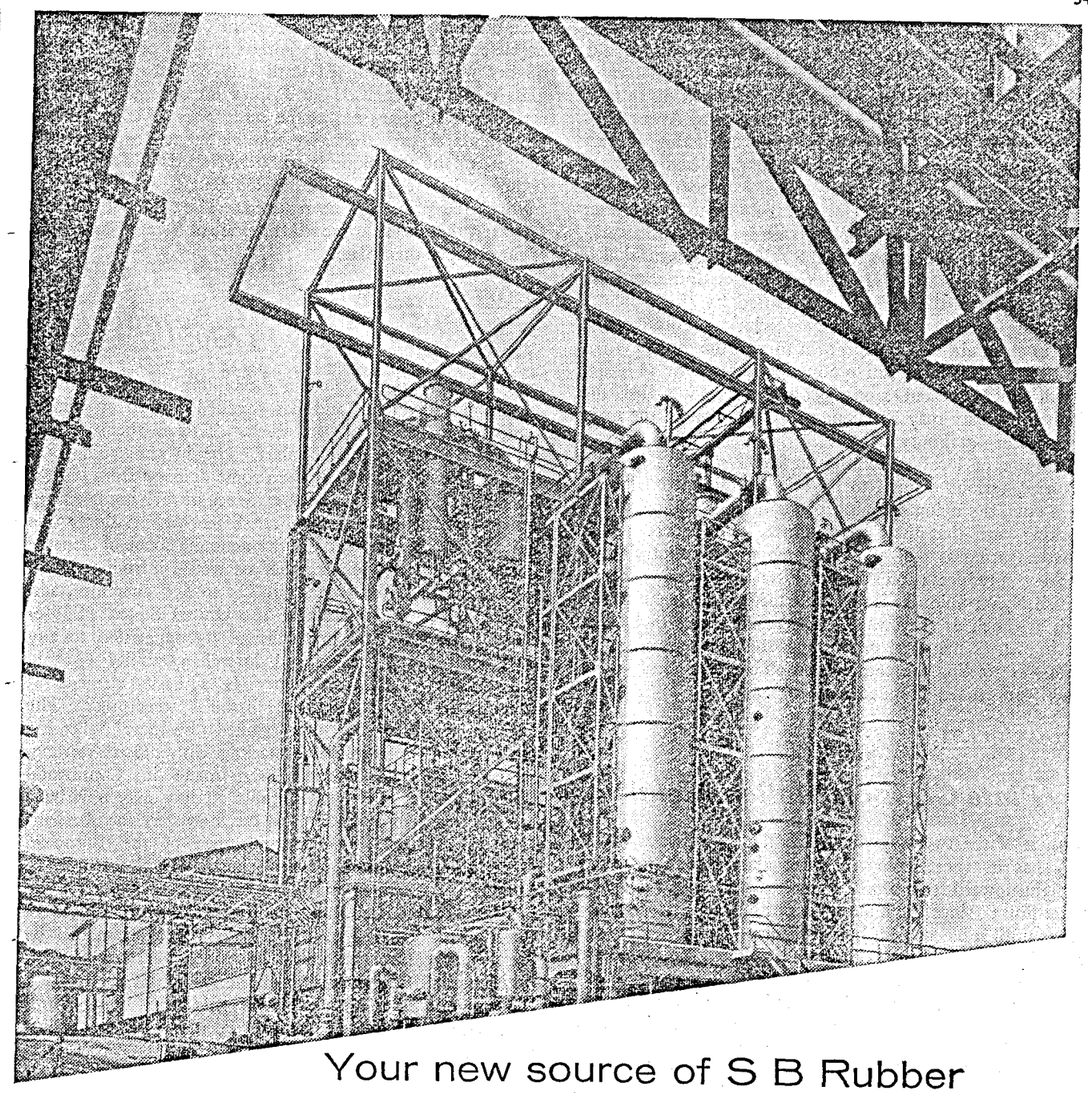
STRATEGIC STOCKS

Has Policy Changed?

THE Government appears to have decided that there is no longer any need to hold strategic stocks of industrial raw materials. Three years ago the defence white paper stated that in the light of the new priorities for defence such stocks could be run down "to some extent without risk." The running down began, though sales of a number of items have been suspended owing to the weakness of the market. But on two occasions the Board of Trade has announced that a particular stock is to be run down, not "to some extent," but to zero. In October, 1957, it said that the 20,000 tons of lead remaining in the stockpile was to be sold, and last month it said that the 30,000 tons of copper left in the stockpile was also to be sold. If Whitehall now considers that there is no need to hold a strategic stock of lead and copper it is difficult to see why this view should not extend to stocks of other metals and fibres. If there has been a change in policy the sooner industry is informed the better; consumers should be left in no doubt that they will not be able to rely on help from the Government if normal channels of supply break down.

DISPOSALS FROM U K STRATEGIC STOCKS

Item	Size of Stock	Comment
Copper	85,000 tons	About 55,000 tons sold. Remainder for sale up to November, 1959.
Lead	50,000 tons	36,700 tons sold before sales suspended in June, 1958.
Wool	96 million lb	About 31 million lb sold before sales suspended in April, 1958.
Softwood.....	230,000 standards	All sold.
Hardwood.....	1·8 mn. cu. ft.	All sold.
Plywood.....	16 mn. sq. ft.	All sold.
Rubber.....	Est. 125,000 tons	No action.
Item	**To be Sold**	**Comment**
Zinc	27,000 tons	About 18,000 tons sold before sales suspended in Feb., 1958.
Tin	2,500 tons	No action.
Aluminium	52,000 tons	Over half sold before sales suspended early in 1957.
Nickel	1,600 tons	All sold.
Wolfram	500 tons	Less than half sold.
Jute.....	20,000 tons	All sold.
Jute goods.....	15,200 tons	All sold.
Manila hemp	2,900 tons	All sold.



The approximate size of the strategic stocks is known only for a few items. Stocks of copper and lead, which are listed in the first part of the table, were equal to about 15 per cent and 30 per cent respectively of annual British consumption (excluding scrap) and stocks of wool were equal to about one-fifth of consumption. The stock of natural rubber, which can only be roughly estimated at some 125,000 tons, appears to be large in relation to the recent rate of consumption of about 180,000 tons a year.

As the Government believes that a war, if it comes, is more likely to be an all-out nuclear conflict than a Korean-type affair, it follows that there is little purpose in holding stocks of raw materials for consuming industries that may well be wiped out. If this argument is accepted, the right policy is surely to build up stocks of food, medical goods and other items needed to care for survivors. The Pettibone report on United States stockpiling policy recommended that emphasis be shifted from raw materials to finished items, and contrasted the billions of dollars spent by the American government on stocks of raw materials and the comparatively tiny sum spent on medical and other items for civil survival and relief. Is the British Government giving fresh thought to this aspect of stockpiling policy?

NYLON

The New Site

HAVING been refused permission from the Board of Trade to build a nylon spinning factory near Southampton because this was not "a development place," British Nylon Spinners has now arranged to take over a factory at Brockworth, Gloucestershire, which is not one of the Government's favoured areas either. This may not be the most encouraging first "response" from industry

Your new source of S B Rubber

I S R's Intol... Stable Price, Consistent Quality, Immediate Delivery

I.S.R.—The International Synthetic Rubber Co. Ltd.—
is 'on stream' at Hythe, near Southampton, 24 hours a day, every day of the year, producing 'INTOL' S B Rubbers.
Production of 'INTOL' is constant and completely predictable, so that delivery promises can be met without fail. The quality of 'INTOL'—produced in the world's most modern synthetic rubber plant—never varies. The price is unaffected by day-to-day market fluctuations.
'INTOL' is the only British-made S B Rubber on the market.
Three grades are in production.

Full technical data are available on all INTOL grades. I.S.R. offers a full advisory service to manufacturers.

to the Board of Trade's latest appeal to put new development where unemployment is high rather than where costs would be low; but it can fairly be considered as a special case. The factory BNS is taking over has been owned up to now by the Ministry of Supply, and used hitherto by Armstrong-Siddeley for aero-engine manufacture. Shrinking aircraft orders have raised serious employment problems not only here but in the neighbouring Gloster Aircraft factory, which, like Armstrong-Siddeley, also belongs to the Hawker Siddeley group. Nylon spinning, with its three shift working, uses much the same kind of skilled and semi-skilled labour as these works did. British Nylon Spinners' long search for a third site has been caused by the difficulty of finding one that has the right technical requirements, such as clean air, and enough men to staff the plant. When the new factory is in full production some time in 1961, it will employ about 2,000 people, suggesting that the planned capacity may be about two-thirds that of the main BNS factory at Pontypool.

In spite of local difficulties in some stocking knitting factories, serious enough to have led to discussions about wage cuts, the nylon spinning plants are still selling all the stocking yarn that they can produce. But where a year ago the yarn was still allocated among the country's 200 stocking producers on an unofficial rationing scheme, British Nylon Spinners is now able to provide its customers with as much as they want. The result seems to be that the industry's marginal producers—and there are many of them—are feeling the competition of big producers selling heavily-advertised branded stockings.

FL(O)AT GLASS

Plate Glass on Molten Metal

EACH of the two ways by which flat glass is now made has its shortcomings. Sheet glass, which is drawn straight upward from a pool of molten glass, has a desirable "fire finish" since the material is not touched except at the edges until it has cooled, but is distorted by the weight and viscosity of the rising glass, while plate glass, which is poured out horizontally, is free from distortion and perfectly flat but must be ground and polished before it can be used. The best features of each method are combined in a new process developed by Pilkington Brothers, called the Float process; the high finish of sheet glass is produced without distortion and without the necessity for grinding and polishing the finished product. In the float process, a continuous ribbon of molten glass is fed out of the furnace across the surface of a tank of molten metal in a controlled atmosphere, gradually being allowed to cool. Since the glass is untouched except by the metal while it is hot, the finish is better than that of ordinary sheet glass and, since the surface of the molten metal is flat, is entirely free from distortion.

Float glass, as Pilkington's call the new product, is thus suitable for mirrors, motor vehicle windows or shop windows, for which plate glass is used. Since the plant required is roughly half the size of the £10 million factory now needed to make continuous plate glass (because grinding and polishing are eliminated) and since labour costs are correspondingly lower, it costs much less to make. The furnace and cutting equipment used are the same as those now used in making conventional plate glass.

The Float process was first thought of by Mr Alistair Pilkington, the technical director of the firm, in 1952; a full-scale plant has been in operation at the company's factory in St Helens since April, 1955, although glass of satisfactory quality was not produced until July of last year. Float glass is now being used by Triplex for automobile windscreens; it is being sold at the same price as conventional plate glass at present, although Pilkington Brothers state that when the technique is fully developed (and when the company has recovered its development costs of over £4 million) the price will be reduced. They do not believe, however, that it will approach the price of sheet glass, which is far cheaper than plate.

GOLD

A Flurry in Gold

THE dollar price of gold in the bullion market has been rising this week and has touched $35.10 an ounce, compared with $35.06 last week. This is the result of widespread demand, which has come in the main from the Continent. There has been some demand from central banks, but there has also been evidence of reviving hoarding demand, particularly in the French market. A flurry was caused over the weekend by the announcement of Senator James Murray of Montana that he would introduce a bill to raise the price of gold from $35 to $70 an ounce, and restore a free gold market in the United States. Subsequently the US Treasury affirmed its opposition to any such measure: "the assured interchangeability of gold and dollars at $35 an ounce is a basic element of strength in the international financial structure." The London gold market has gained business following the merging of transferable sterling with official sterling. Sales of gold which had been made in Continental markets against cheap transferable sterling may now have been diverted to London. So far, however, the Russians have sold little. The disappearance of the European Payments Union and its replacement by the European Monetary Agreement may lead to less active intervention by European central banks in the gold market. Many of their operations had in recent years been stimulated by the arbitrage turn that could be gained by covering their positions in EPU, calculated at the mid-point parity rates, through purchases or sales in the gold market, in accordance with their debtor or creditor positions and the bullion prices quoted.

BANK FIGURES

Scotland and Ireland

ALL the English clearing banks that have shown their gilt-edged investments above market value in recent years have now succeeded in getting rid of the disclosed depreciation and return to the traditional valuation, below market value. The last to do so was the Midland Bank; but both the Scottish and Ulster subsidiary still show a depreciation: the Clydesdale and North of Scotland Bank of £1.54 million, on a book portfolio of £79.6 million and the Belfast Banking Company a depreciation of £1.02 million on £14.16 million. This bank shows a small reduction in profits, from £116,179 to £115,626. On the other hand the Ulster Bank, subsidiary of the Westminster, has closed the gap in its investment valuation and shows an increase in profits from £182,230 to £196,337. Profits at the National Bank are up from £227,979 to £268,757, and its dividend

is raised from 12 to 14 per cent; both the Northern Bank and the Royal Bank of Ireland, two other banks in the Irish republic, show modest increases in profits and higher dividends. Profits at the Clydesdale and North of Scotland are up from £486,466 to £497,971; the distribution is unchanged. The Royal Bank of Scotland, the only other Scottish bank with an accounting year to December 31st, shows an increase in profits more in line with those of English banks—from £637,253 to £690,771, and its dividend is raised from 14 to 16 per cent.

WHOLESALE PRICES

Stability in Manufactures

IN December British manufacturers were paying six per cent less for their basic materials than a year earlier, and fuel prices were only a little higher. Yet the prices they charged for their products barely changed over the year. There had been a slight fall in the price index for manufactures (excluding food and fuel) up to August, but by December the index had risen fractionally to 113.1 (1954=100), just 0.3 per cent below the level of December 1957. This rigidity in prices of manufactures is more apparent than real. Materials usually account for a small part of the total cost of finished goods (the import content of manufactures is reckoned to be one-fifth), and labour costs were rising last year. Wage rates in manufacturing went up by roughly 3½ per cent and productivity fell; labour costs per unit of output probably rose by about five per cent.

Source: *Board of Trade.*

Prices of materials and fuel used in the mechanical and electrical engineering industries fluctuated narrowly and closed no higher than in December 1957. Materials and fuel for the textile industries were 11 per cent lower in price, following the sharp fall in raw cotton and wool, and some part of this was reflected in prices of textiles (excluding clothing), which dropped by 4½ per cent. Materials used in building and civil engineering fell by one per cent over the year, and building costs remained stable. Prices of chemicals and iron and steel fell by about one per cent.

RESTRICTIVE PRACTICES

An Agreement Dismantled

COUNSEL for the British Constructional Steelwork Association told the Restrictive Practices Court this week that the Association had abandoned that part of its agreement which contained a price-fixing scheme, and would submit to a Court order formally declaring it to have been contrary to the public interest under the Restrictive Practices Act. The Agreement also contained recommendations for standard conditions of contracts made by the Association's members and for agreements with customers like the Coal Board and Central Electricity Authority. Counsel for the Registrar noted that these provisions did not appear to have any substantial economic importance; accordingly, the Court was not invited by the Registrar to consider them. The Association has given an undertaking to the Registrar that they will give 28 days' notice of their intention to revive their previous price-fixing scheme or to introduce a new one; the Registrar has accordingly made a representation to the Board of Trade under section 12 of the Act to have the Steelworkers' Agreement removed from the register, since it apparently no longer contains any item of economic significance.

BANK CHARGES

Value for Money

BANK charges on current accounts are among the latest items to come under the microscope of *Which?*, the magazine of the Consumers' Association. The investigators have not fared much better than anyone else in face of the diversity of practice among English bank managers (the Scottish banks have a fixed scale). The sample of individual people's experience "illustrates the point that the English banks do not have a fixed system of charges. . . ." The nearest the report can get to a generalisation is the usually quoted basis of 9d.-1s. for each ledger entry set against a credit of 1-2 per cent on the average daily credit balance. But the survey does a good job in presenting the range of choice available to the customer, showing how cost can be cut down as the facilities available are reduced to the bare function of transferring money. In ascending order of banking "service," and of probable cost, the main alternatives are: Post Office Savings Bank, Co-operative Wholesale Society Bank, Midland Bank personal cheques, and normal current account service.

ECONOMIC SURVEY OF A TOWN

READING

The Economist Intelligence Unit Ltd. has prepared a detailed report on the prospects for retail trade in Reading over the years ahead. This report analyses trends in population, employment and incomes in the Reading area, and considers the effect on the town's prosperity of new developments in housing, shopping facilities and communications.

All those doing business in the Reading area should apply for further details of this important study from

AIR TRANSPORT

A New Independent?

BEHIND the streamlining now going on at Airwork Ltd and its several subsidiaries can be seen the outline of a sizeable new independent airline. Besides its own services, flown mainly to Africa and Far East with a mixed fleet of new Viscounts, old Hermes and older Vikings, Airwork has substantial interests in at least four other independent airlines, its most recent acquisition being the Morton company operating from Croydon together with its subsidiary, Olley Air Services. Individually these companies are no great shakes. But collectively they have quite a useful route network ranging from short-range internal and cross channel services to long-range trooping and charter work. Their fleets are made up of a mixed bag of aircraft ranging from the very old to the very new. Airwork is now beginning a slow process of consolidation that will probably end in these separate companies merging their identities into a single big airline. The first stages involve the transfer of Airwork's own Viscounts to its subsidiary Transair at Gatwick, the sale of Airwork's obsolete Vikings and Hermes, and the closing of the Airwork base at Blackbushe airport. Airwork will then cease to be an operating and become a holding company, co-ordinating services from two bases, Southend and Gatwick. If it succeeds in welding its separate purchases into a compact operating unit, then the company may be on the way to providing the air corporations with their first serious taste of competition at home.

LUNCHEON VOUCHERS

The Perk Is Not for Taxing

THE Chancellor of the Exchequer opened the batting after the Christmas recess by telling the House that the Inland Revenue took the view that the majority of meal vouchers in use today are such as to render them taxable. The use of such vouchers is now so widespread that a rigid application of this Revenue opinion would produce chaotic results and Mr Amory hastened to add that he proposed to continue the extra-statutory concession under which they have been previously exempted from tax, but now subject to three conditions. Vouchers must be non-transferable and used for meals only; where any restriction is placed on their issue to employees, they must be available to lower paid staff; and their value must not exceed 3s. for each full working day.

These conditions are not very different from those under which the Revenue has hitherto operated the so-called concession. They are not to begin till April 6th, and it would be interesting to know why the announcement was thought desirable. If the law is already watertight no legislation would appear necessary; but is this matter quite so free from doubt as the Revenue seems to suggest? Many authorities, including the editors of Simon's Income Tax, think otherwise; they regard luncheon vouchers as inconvertible benefits which are not money's worth and therefore are not taxable in the hands of employees earning under £2,000 a year. This question of convertibility is probably the mainspring of the announcement. Most vouchers are already in form non-transferable and inconvertible, but in practice they are widely used as cash tokens for purchases other than meals. It is hard to see how the Chancellor's first condition can be policed: the Revenue will not welcome the task.

The statement may also be a move to discourage the increasing provision of untaxable benefits in kind which, as the Royal Commission said, and as most will agree, is capable of becoming an abuse of the tax system. It is wrong that an ever greater proportion of an employee's true remuneration should be expressed in a form which is neither money nor convertible into money. With present case law it is difficult to see how the trend can be reversed without legislation on the lines that already apply to higher paid employees.

SHORTER NOTES

The Sugar Board has raised the surcharge on raw sugar by 4s. 1d. to 14s. 3d. a cwt, or by ½d. to 1¾d. a lb on refined sugar. The board buys Commonwealth sugar at a fixed price, and sells it to the trade at the world price. In the financial year to last June the board incurred a deficit of £7.6 million. Recently the world price has fallen to about 29s. 6d. a cwt while the price fixed for Commonwealth sugar in 1959 was raised to 45s. a cwt. The board must adjust the surcharge from time to time to ensure that over a period the consumer pays the true cost of sugar.

COMPANY MEETINGS

LLOYDS BANK LIMITED

SIR OLIVER FRANKS ON FREE WORLD'S NEED FOR CO-OPERATION, NOT EXCLUSIVENESS

SATISFACTORY GROWTH IN VOLUME OF BUSINESS

NATURAL EXTENSION OF INTERESTS INTO HIRE PURCHASE FIELD

BASIC IMPROVEMENT IN STRENGTH OF STERLING

PROBLEMS OF TRADE BETWEEN INDUSTRIAL AND DEVELOPING COUNTRIES

The Annual General Meeting of Lloyds Bank Limited will be held on February 13th at the Head Office, 71 Lombard Street, London, E.C.3.

The following is the statement by the Chairman, The Right Honourable Sir Oliver Franks, GCMG, KCB, CBE, which has been circulated with the report and accounts for the year ended December 31, 1958:

I have to record with great regret the retirement of Lord Brand, who first joined our Board nearly forty-three years ago. He has served as a Director for the whole of this period apart from a two year gap during the time in which he represented HM Treasury in Washington from 1944 to 1946. We have all had the habit for many years of turning to him for advice on the bank's affairs and it is difficult to say how much we shall miss his wisdom and dispassionate judgment.

We congratulate Sir James Turner on the conferment of a barony, and also Sir Jeremy Raisman on becoming a Knight Grand Cross of the Order of St. Michael and St. George.

I now turn to the Local Committees. I must first refer with regret to the death of Viscount Bledisloe, member of our Capital and Counties Committee since its inception in 1918 and a Director of the bank 1918-1924.

We have newly constituted a Local Committee at Bristol for the Counties of Gloucester, Hereford and Somerset. The first members are Sir Egbert Cadbury, DSC, DFC, DL, Chairman, The Duke of Beaufort, KG, GCVO, Colonel T. F. Hood, OBE, TD, DL, and Sir Reginald Verdon Smith: of whom Sir Egbert Cadbury and Sir Reginald Verdon Smith are members of our Board.

At Birmingham I must record the resignation, owing to the pressure of other commitments, of Mr K. S. Peacock, who of course remains a member of the Board.

Mr T. C. Buckingham has been appointed to the Devon and Cornwall Committee on his retirement as District Manager, and Mr A. L. Ball has joined the Pall Mall Committee on his retirement as Manager of Pall Mall Branch.

At Salisbury I must record with deep regret the death of Sir Philip Williams, who served on the Committee for more than ten years. Mr Anthony E. Ledger Hill, OBE, has joined the Committee in the course of the year.

I have also to refer with deep regret to the death of Mr Guy Bown, of the South Wales Committee.

Mr G. M. Warry has been appointed a Joint General Manager in succession to Mr F. O. Faull who, on retirement, has been appointed a member of the Yorkshire Committee.

PROFIT AND LOSS ACCOUNT AND BALANCE SHEET

The profit for the year, at £2,727,535, is £225,144 higher than last year and the dividends paid or proposed represent an effective increase from 13 per cent to 15 per cent allowing for the enlargement of the capital by the issue of one new share for every two shares held.

The business of the bank has shown a satisfactory growth over the year, and this applies to all categories of our domestic affairs; the number of our customers continues to increase as the banking habit spreads to a wider section of the population. To provide for this steady growth we continue to open new branches, particularly in areas planned for expansion in population; 29 additional offices were opened during the year.

With the growth in earnings we have experienced a further rise in operating costs, especially in salaries as a result of the improved scales of remuneration introduced a year ago.

The year has been a difficult one for officials and staff; at short notice they have had to adapt themselves to far-reaching changes in the conduct of our business. They merit our warm commendation for their excellent work.

Dealing with the principal items in the balance sheet, our deposits have increased on the year to a record figure of £1,298 millions. Loans and advances to customers are more by £65 millions than they were a year ago, while on the other hand Investments are lower by £23 millions. "Other Trade Investments," however, show a substantial increase, largely as a reflection of our entry into the hire purchase field. Our total investment in hire purchase finance companies is £13,326,500.

The offers to purchase the Ordinary and Preference share capital of Olds Discount Company Limited at 35s. 6d. and 20s. per share, respectively, as announced in the press at the time, were accepted to the extent of 99½ per cent of the Ordinary Share Capital and 97¾ per cent of the Preference Capital. Steps are being taken to acquire the outstanding balance in each case. The purchases were made in conjunction with The National Bank of Scotland Limited and The Commercial Bank of Scotland Limited and have since been transferred to a new holding company, Lloyds and Scottish Finance Limited, to which company the Commercial Bank of Scotland has similarly transferred its holding of shares in Scottish Midland Guarantee Trust Limited. The Commercial Bank of Scotland and Lloyds Bank each hold 50 per cent of the capital of this company at a cost to us of £10,300,000.

Our bank has also subscribed for 2,000,000 new Ordinary shares of 5s. each in Bowmaker Limited at 29s. 6d. per share, costing £2,950,000.

The profit and loss account for 1958 has not benefited from these investments, the first dividends thereon being payable in 1959.

EASTERN BRANCHES

The year 1958 proved a difficult one for our Eastern Branches. The continuing restriction on imports in both India and Pakistan has inevitably been reflected in a reduced call for our services; in addition to which we have during the year under review seen some decrease in the rather exceptionally heavy demand for bank advances which we experienced in 1957.

In spite of these adverse factors our Eastern Branches have succeeded in maintaining our business at a satisfactory level, thanks in no small measure to the high standards of loyalty and service of our officials and staff. We are grateful for all they have done during the year.

I hope and believe that Lloyds Bank, with the benefit of the experience we have gained in past years, can continue to play its full part in furthering the interests of the countries in which we operate in the subcontinent.

LLOYDS BANK (FOREIGN) LIMITED

The subsidiary Company has again had a satisfactory year, especially in France where a substantial increase in resources enabled it to satisfy a strong demand for advances. After providing for a heavy addition to operating costs, especially for salaries, the net profit is virtually the same as for the previous year. A dividend of 6 per cent has been declared, compared with 5 per cent for 1957.

During the year a controlling interest in the Banque de Cannes SA was acquired. This old established bank has a good business which should be of increasing value to the Foreign Bank in the future.

At the close of the year the French franc was devalued and it is impossible at this stage to estimate the effect which this will have upon the business of our subsidiary company in France, but the introduction of the Common Market and the fiscal and other measures announced by the French Government should be to the long-term advantage of the French economy and of our business.

The staff in France, Belgium, Switzerland and Monaco have given splendid service in a difficult year, and our warm thanks are due to them.

NEW TRENDS IN BANKING

The ending of the credit squeeze was rapidly followed by a number of interesting new departures in the field of banking. For our own part, we have so far felt that in the freer conditions we can once again fully serve the interests of our customers and of the general public without the introduction of special schemes for personal loans or for a class of customer entitled to less than the general services of the bank. The change in official policy did, however, provide an opportunity to put into effect our plans for participation in hire purchase finance, the details of which have already been mentioned.

Now that the official restraints have been relaxed, it seems natural that our bank should extend its interests into this field, which might be described as first cousin to banking proper. It seems natural, also, that our participation should take the form of acquiring the ownership or part-ownership of established organisations possessing the specialised experience required for this type of business. The association between our bank and the finance companies in question promises to be of mutual advantage from the commercial point of view and we feel no doubt that our investment will prove worth while.

It is an odd fact, with interesting implications for the social historian, that such a relationship had not existed since the time when consumer credit first began to increase. So competent an authority on the banking scene as Professor Sayers, surveying the long-term trend of bank advances of the conventional kind, has concluded that the banks should consider extending their operations to consumer credit and other kinds of lending that they have not traditionally undertaken. To my mind, there is much force in his observation that "in a community where wealth is growing and the ordinary people are becoming more sophisticated in their personal business, the profitable future for banking may lie in more varied catering for the needs of small customers."

TOWARDS CONVERTIBILITY

Meeting at Bretton Woods in 1944 to thrash out a post-war monetary system, forty-four nations agreed that the interests of the world would best be served, after a transition period, by a regime of stable and convertible currencies, free of exchange restrictions and discrimination.

The recent return to convertibility of the leading Continental currencies, and the merging of the official and transferable rates for sterling, clearly brings us a long step nearer to such a system than anything we have seen hitherto. It opens a fresh chapter in world currency relations, a new phase in which the dollar will be only one among many convertible currencies and in which, therefore, special discrimination against dollar goods will cease to have any point. Several factors have combined to make this concerted move possible, among them the continued rise in the American price level, the adoption of a more realistic parity for the French franc and the prospective increase in the resources of the International Monetary Fund.

It has been confirmed on numerous occasions, the latest of them the Montreal Conference, that full convertibility for sterling remains the object of British policy. In form, the recent move was an important advance in this direction. In reality, it changed but little the situation which has prevailed since 1955, when it was decided to support transferable sterling at levels only slightly below the official rate. That decision was taken because experience showed that if the discount became at all wide the reserves were exposed to a heavy indirect drain through so-called "shunting" operations in commodities. Ever since, the reserves have been as effectively committed to support of transferable as of American account sterling and for many months prior to the recent move transferable sterling had been quoted above the lower limit for the official rate.

That being so, it does not appear that the recent move commits us to any new policies or imposes any major restraint on our freedom of action over and above that which is always implicit in the need to have regard, in our own interests, to the soundness of the currency. Nevertheless, the move could be made only at a time of high external confidence in sterling, a factor closely bound up with the level of the reserves. For more than a year past, these have shown a rapid and sustained recovery to their highest point since the eve of the 1951 crisis. This still leaves them far short of the desirable level, especially when allowance is made for our short-term liabilities. The improvement has, however, been sufficiently great to encourage the authorities to resume service of the American and Canadian loans and to announce a programme for the repayment of the International Monetary Fund.

BASIC IMPROVEMENT IN STERLING

All this implies confidence that the recent improvement in sterling will prove more lasting than that which took place, for example, in 1954. There are good reasons for hoping that this will prove to be the case.

The first is that the recovery in the reserves has not been offset by an increase in liabilities or a reduction in other assets. An increase in this particular asset, gold and foreign exchange, has sometimes been achieved at the cost of running down another kind of asset, stocks of food and raw materials. That has not been the case on this occasion. Again, an improvement in the reserves has frequently been accompanied by an increase in our liabilities on sterling balances. At such times, it was the overseas members of the sterling area that were earning a surplus in trade with the outside world, paying their foreign exchange earnings into the central pool and receiving sterling in return. In the twelve months following the crisis, however, the overseas sterling countries actually drew down their balances by more than £200 million; and although non-sterling countries were rebuilding their London funds, the sterling balances as a whole were reduced by more than £100 million. Hence the recovery in the reserves has gone on side by side with a reduction in our sterling liabilities; it has been due entirely to the improvement in the United Kingdom's own balance of payments.

Secondly, the monetary climate of today is obviously very different from that of 1954. Since the Radcliffe Committee, of which I am a member, has not yet issued its report, it is not my intention to discuss domestic monetary policy or the efficacy of the various measures adopted. It is, however, interesting to note the marked change that has come over our monetary situation in the past two or three years.

In discussions of monetary policy as a means towards keeping the economy on an even keel, the "liquidity" of the economy is usually regarded as important. A convenient measure of this liquidity is the relationship between the size of the money stock (currency and bank deposits), on the one hand, and the level of money incomes or expenditures, on the other hand. If the situation is inflationary, the authorities are likely to take measures which have the effect of reducing liquidity as so measured, possibly through an actual contraction in the supply of money.

In the recent experience of this country there was only one period, from the middle of 1955 to the spring of 1956, in which bank deposits were actually falling. Since the middle of 1956, they have been steadily rising again, so that by November last the index of bank deposits published by this bank had just about regained its previous peak level touched in February 1955. Over this period, then, from February 1955 to November 1958, the supply of bank money showed no change, either upwards or downwards.

But another influence has been at work to reduce the liquidity of the economy very considerably: namely, the continued rise in money incomes. Over this period, the money turnover to be financed rose by some 20 per cent. The result is that the stock of money (currency and bank deposits taken together) is now far smaller in relation to current incomes than at any previous time since soon after the 1914/18 war. That was already true in 1957 and the ratio probably fell a little further last year.

In drawing attention to this fact, I am not wishing to imply any special moral. There is no pre-determined right ratio between money stock and national income which holds good through time. Nevertheless, it is important to realise that a very considerable change in the fundamental monetary situation has in fact been taking place.

INDUSTRIAL PRODUCTION SLOWS DOWN

While all this is most satisfactory, it is well to remember that the improvement in the balance of payments has been largely the product of special circumstances: a decided shift of the so-called terms of trade in our favour, due to the combination of stable prices for our exports with lower prices for primary products. The fall in import prices between the first half of 1957 and the third quarter of 1958 was in fact equivalent to an annual saving of well over £400 million. The improvement in the terms of trade should not be exaggerated. The relationship between our export and import prices, though more favourable than in any previous postwar year, is still less favourable than immediately prewar. All the same, it is the improvement in this respect which has gone a long way towards enabling us to earn what the Chancellor has called, perhaps a little ambiguously, "the surplus of the century."

The most disappointing feature of our situation, on the other hand, has been the failure of production to expand. During the first decade after the war the world passed through a major boom. In the last two or three years the pace of activity has slackened, not only in this country but in North America and most other industrial countries. In our own case, after two years or more of stability at a high level, production fell away perceptibly after the spring, though in recent weeks there have been signs of improvement. In the United States, on the other hand, after a very sharp decline in activity during 1957, a pronounced upswing had already set in before the middle of 1958, with the result that nearly the whole of the lost ground had already been regained by the end of the year. Whether, and if so at what rate, that recovery will be maintained is one of the outstanding questions in the world economic outlook.

The sharpness of the American downturn was due largely to a change-over from the building up to the running down of stocks—a movement that was continuing, though on a much reduced scale, as late as the third quarter. But the recession was something

more than an "inventory shake-out." Throughout the previous period of expansion it became evident that the rate of increase of capacity was outstripping the expansion of demand; surplus capacity has piled up in many branches of industry. In the recovery which has occurred, the most potent influence has undoubtedly been the pumping out of purchasing power in the form of a large public deficit, a factor which has helped to sustain personal expenditure on things other than durable goods. The outlook appears favourable but there are as yet no more than tentative signs of revived investment in plant and equipment of the kind which in the past has normally provided the basis of a sustained recovery.

It would be an over-simplified picture to regard the fall in the prices of primary commodities simply and solely as a reflection of failing demand on the part of the industrial countries. There is evidence that in some branches of primary production, too, the post-war decade saw a major expansion of capacity. Nevertheless, the fact remains that at a time when many industrial countries have been following restrictive policies, often to safeguard their balance of payments, many primary producing countries have felt bound to restrict—in some cases severely—their imports of manufactured goods. To this extent, the contraction in world trade has something of the appearance of a deflationary spiral, about which I expressed some apprehensions in last year's statement.

It would have been far more severe had the American recession brought, as one might have expected, a sharp fall in American imports. Consumer incomes and expenditure having been well maintained, this did not happen. Instead, we have seen a pronounced fall of some 20 per cent in American exports, which have been rendered relatively dear by a continued rise in costs; and this, in combination with other factors, has caused a deterioriation in the American balance of payments such that the United States has lost well over $2,000 million of gold since the beginning of 1958. Even so, it is reassuring that at the annual meetings in New Delhi of the International Monetary Fund and the World Bank the member countries decided that action should be taken to sustain international purchasing power by augmenting the resources of these two institutions.

THE EUROPEAN ECONOMIC COMMUNITY

On the long view, the most significant developments of the past year have been the entry into force of the Rome Treaty creating the so-called European Economic Community, and the attempt to bring into being, as an adjunct to the common market of the six countries of that Community, a free trade area that would include the United Kingdom and other members of the OEEC.

Even from the economic point of view, the formation of the common market can be an event of overwhelming importance. Admittedly, the application of the treaty is likely to be so gradual, the transitional stages so prolonged, that it may be some years before really dramatic results are seen. But the underlying conception is on the grand scale. It is gradually to remove all barriers to the free movement of goods, of capital and of people between the six member countries. The aim is to create a vast market capable of supporting large-scale industries employing the most modern techniques of production, so that in the end the economies of the six nations will be welded into a single economic unit of great power. And this in an area which contains almost as large a population as the United States and about one-fifth of the manufacturing capacity of the free world, an area which in 1957 took about £500 million of this country's exports and a further £1,000 million of goods supplied by the overseas sterling countries.

To regard this great experiment simply as a move towards greater economic unification, however, would be to mistake its real meaning. In the minds of the creators of the common market, economic unification is itself far more a step towards greater political unification. They feel that they have drawn the true lessons of history: that the boundaries of the small nation state are an anachronism in this day and age; that European culture cannot survive if Europe is to be torn apart by internal conflicts; that it is necessary, even at a sacrifice of old-fashioned sovereignty, to create a political entity more likely to be viable under twentieth century conditions than the nineteenth-century nation states of Western Europe.

Historically, this country has for centuries been opposed to the emergence of a single dominant power in Europe. Should we, then, look askance at this new development? Surely not: for the size of the unit has changed. Europe is already dominated by a single monolithic power. It is the welding together of our friends across the Channel that is needed to help preserve the world balance. And, indeed, it can be said that the attitude of this country has throughout been well disposed towards the common market plan, notwithstanding the painful adjustments that might be involved for particular groups and interests, whether we were to participate or not.

At the same time, it must be recognised that the creation of the Community can hold certain dangers for this country and for others outside the charmed circle, dangers which were thrown into relief during the protracted negotiations for a Free Trade Area.

Since the war, seventeen countries of Western Europe have created important new institutions for the discussion and resolution of their problems of defence, of trade and of payments. This degree of co-operation is itself a remarkable advance compared with the anarchy of national rivalries that we knew before the war. It has been made possible, in the sphere of trade and payments, by the principle of absolute non-discrimination between the member countries; each of them deals on an equal footing with all the others. It would be regrettable if the Little Six, in drawing closer to each other, were to move farther away from the remaining eleven and so create a rift within Europe that would jeopardise the existence of the OEEC, with all the political repercussions which that might involve. At the eleventh hour, fortunately, the prospects of preserving co-operation within the OEEC framework, and also of harmonious trading relations between the Common Market countries and the other members, seem to have been greatly improved by the adoption of a more realistic parity for the French franc and the other recent currency changes.

Even so, it remains to be seen what direction the European Economic Community will take as it develops. Its effects upon the outside world will depend very much upon how far it creates an expansion of trade by the lowering of barriers, how far it merely diverts existing trade into new channels. It could become either a great area of complete free trade internally, trading liberally with the outside world; or it could become a discriminatory bloc. The intention is that the removal of barriers between the six countries should not be accompanied by any raising of barriers, on the average, against the outside world. But certain provisions of the Rome Treaty leave it open whether this is in fact what will happen.

The improvement in the standard of living of the six countries which is expected to flow from the creation of a customs union would be realised through an all-round lowering of production costs. Yet some provisions of the Treaty seem designed rather to force up the production costs of the more efficient towards the level of costs of the less efficient. To the extent that this happened the Community would tend to become a high-cost area. The markets of the six countries would become still more attractive to imports from the outside world; yet by the same token the countries of the Community would be less willing to receive those imports. A pressure towards greater protectionism might well result and might not be resisted.

This is not just an issue between the members of the Common Market and Britain, or indeed between the Common Market and other industrial countries in general. The agrarian countries of the world also have much at stake. To mention only a few examples within the Commonwealth, the countries of the Community take nearly a third of the exports of Ghana and Kenya, a quarter of the exports of Pakistan, getting on for a quarter of the exports of Australia and Nigeria. Yet, as is pointed out in the recent report to GATT by a panel of four economists of international repute:

> The association of the overseas territories with the EEC will give rise to discrimination against other overseas countries in Africa and elsewhere, not only in the area of tariffs, but also through long-term arrangements or contracts and through preferential treatment with respect to investment. Concretely, arrangements are to be made to channel German, Dutch and Italian investments into French and possibly Belgian territories in Africa.

Thus, apprehensions on the score of possible discrimination reinforce those which are felt in under-developed countries about the limitation of the outlets for their products by agrarian protectionism in Europe and in the industrial countries generally. Already, we are told, at the Montreal Conference of the Commonwealth countries many delegations expressed anxiety lest arrangements for closer economic association in Europe should result in a narrowing of the trading opportunities for outside countries, or in the extension of protection, especially in agriculture where they feared that existing tendencies might become reinforced and entrenched.

TRADE WITH DEVELOPING COUNTRIES

This whole question of the trading relations between industrialised and less developed countries has been rendered a matter of lively international concern by the decline in commodity prices. The difficulties of developing countries are repeatedly stressed in the report of the Montreal Conference, where it was agreed that we must do all we can, "even to the extent of some sacrifice," to assist in their solution, knowing that in the end this would be of material benefit to us all.

Fears are often expressed in this country that the favourable swing in the terms of trade, by reducing the incomes of so many of our overseas customers, may react adversely upon our export industries. From the purely domestic point of view such anxieties appear excessive. By definition, the shift in the terms of trade means that, to pay for a given volume of imports, fewer exports are required. And a reduction in demands upon the export industries, leading to a release of resources from them, might in some circumstances prove helpful in meeting a resurgence of domestic demand (spontaneous or induced) without a relapse into inflation.

From the international point of view the question is more serious. With some exceptions, the standard of living of primary producers, especially in tropical areas, is deplorably low by European standards. There is an obvious danger of the gap between rich and poor countries widening still further. Aside from all other considerations, the political dangers of this are apparent.

What kind of policies ought we to be adopting to give practical expression to the undertaking to help given at Montreal? Obviously, the under-developed countries cannot be free to embark upon development programmes, regardless of their own resources, and then demand that the industrial countries underwrite these to any extent that the former may wish. At the same time, it is true that the developing countries, if they are to have any chance of raising their living standards (for there is no certainty that this will happen if populations expand too rapidly) must undertake capital development on a scale which means their demand for imports will outrun their ability to pay their way by exports, even under favourable conditions for primary products, for many years to come.

That we must accept: in an expanding world there will be a gap to be covered—by finance or by gift—from the savings of the more developed countries. It is of mutual advantage that the export earnings of the primary producers should be raised, if only to prevent this gap from becoming too wide. Recent events have reminded us that the industrial countries cannot guarantee at all times to prevent temporary contractions in their markets, even in their own interests, to say nothing of the interests of others. At such times, there may be a case, as the GATT experts suggest, for measures to help in stabilising primary prices, though the difficulties of such schemes (and in particular of ensuring that "stabilisation" does not come to mean holding prices above an economic long-term level) are notorious.

What the under-developed countries can reasonably demand, in any event, is that their products should not be unfairly denied access to the markets of the industrial countries. At Montreal, there was in fact agreement on the need "to limit and to seek progressively to reduce the level of effective protection afforded to basic agricultural commodities and minerals," though in the report of the conference this is at once limited to cases where such protection tends to discourage domestic consumption or cause difficulties for low-cost production elsewhere. One would have thought that all barriers to trade were bound, in some degree or another, to do both; but this, as we all know, is a particularly difficult question from the political viewpoint. Nobody supposes that agrarian protectionism is going to disappear overnight, in the Commonwealth or anywhere else; but the Commonwealth is at any rate committed in general terms to its reduction.

Whether transfers of capital take the form of investment or of aid, the essential condition in either case is that we should have a surplus in the balance of payments available for investment overseas. At Montreal, some doubts were expressed about the need for a new Commonwealth financial institution, and those doubts I share. If the savings are available, the existing financial machinery is adequate for the task.

This problem, in any case, is not one for this country alone, or even for the Commonwealth alone. As a family of free nations, the Commonwealth has, as the Montreal report says, "a unique responsibility to help in fostering the progress of human society." But the whole spirit of the report is outward-looking and not inward-looking. It is recognised that we cannot hope to flourish by developing trade between ourselves alone, that to achieve Commonwealth expansion we require the co-operation of other countries, "and especially that of the United States with its great economic power."

Co-operation, not exclusiveness: that, surely, must be the guiding principle throughout the free world. The arrangements between the six countries of the Common Market, the discussions in Montreal, are each in their own way recognitions of the growing interdependence between nations; yet neither of these groupings is sufficiently embracing by itself to provide a satisfactory answer to the problems they set out to solve. Our interest is that a solution should be found of the difficulties in the relations of the Common Market and of the developing countries with the rest of the free world which gives an extension of liberal trading policies over the widest possible area. But if we and others are to play our parts in finding a solution, it must be recognised that there is no constructive element in recrimination. It must be recognised that, given good will, a solution is completely possible. And it is easy to foresee the verdict of future generations if we and others allow ourselves to get stalled in fruitless "Whodunit" politics.

HEWITT BROTHERS

SATISFACTORY TRADING RESULTS

The annual general meeting of Hewitt Brothers Limited was held on January 21st in London, Sir James Charles Calder, CBE, (the chairman), presiding.

The following is his circulated statement:

The trade of your Company and its Subsidiaries for the year shows a satisfactory increase at £418,617 as against £408,002 for the preceding year and, after charging £214,231 for taxation, the net profit is higher at £130,148 as against £124,265. An amount of £10,680 for Taxation in respect of previous years no longer required has been brought back into the Accounts during the year. After allocating a sum of £55,000 to General Reserve bringing this up to £500,000, your Directors recommend a Final Dividend of 17½ per cent on the Ordinary Capital, making a total distribution of 22½ per cent for the year compared with 20 per cent for the previous year.

Our sales have been well maintained considering the poor Summer weather. The Subsidiary Companies have also had a good year and the Dividends received have contributed to our higher profits.

The properties are in very good condition and considerable expenditure has been made on improvements during the year. We have now completed the new houses in Immingham and Scunthorpe which I mentioned last year, and these are proving satisfactory, even bearing in mind the large capital outlay. The house at Immingham is jointly owned and operated by your Company and Messrs. Bass and Worthington and is a great success. We are planning to erect two further houses next year, one in Hull and another in Scunthorpe.

We owe our thanks to all the employees who, by their efforts, have helped to maintain the quality and standard of our products. Trade generally has been maintained since the end of our Financial Year, and I hope that I may be able to give as good a report next year.

The report and accounts were adopted.

NELSON FINANCIAL TRUST LIMITED

SIR DENYS LOWSON'S ADDRESS

The Annual General Meeting of Nelson Financial Trust Limited was held on January 8th in London.

Sir Denys Lowson, Baronet (the chairman), presided and in the course of his remarks, said: The total gross Revenue for the year of £116,778 compares favourably with that of the previous year which amounted to £103,152: the Net Revenue of £36,579 compares with a figure of £25,562; and thus shows an increase of some £11,017.

The Directors recommend the payment of a Dividend of 7 per cent, less tax, on the Ordinary shares compared with 6 per cent paid last year; and, if you approve this recommendation there will be £50,250 to carry forward against £42,998 last year.

The valuation of our investments at October 31st last shows an appreciation of 30.62 per cent or some £411,475 over the Balance Sheet figure.

FUTURE OUTLOOK

I expect you would like me to say something about our future prospects for the current year. It would appear that conditions in the United States and Canada will continue in a favourable climate for investments in those countries. On the other hand it is obvious that both the United States Government, and also now the Canadian Government, are facing substantial Budget deficits; and that so long as this deficit financing continues there must be an inflationary tendency.

Also I think one must recognise that it would be satisfactory to see the basic businesses of those countries, particularly the United States, showing a more general and uniform recovery.

There is still a very large measure of unemployment in certain sections of industry in the United States—at least large as measured by most of our existing standards here. That being the case, while one can look forward to a year's prosperity in North America the future outlook is clearly somewhat uncertain until the natural and substantial annual population growth in those countries again overtakes the existing manufacturing facilities.

It follows therefore that it would be wise to look for a somewhat similar impact on our own markets in this country in due course. The price of shares as a whole today stand at a high level both in this country and in North America. Undoubtedly exports may tend to become more difficult for us to make over the next twelve to eighteen months; so that while we may look forward on the whole to maintenance of dividends from our investments, we are bound to encounter some disappointments, even if there are also some increases.

We are hopeful that in this Company when we meet you again next year that we shall at least be able to pay the same dividend.

The adoption of the Report and Accounts was seconded by Mr Guy Nelson, OBE, JP, and carried unanimously. The formal resolutions were adopted; and the proceedings closed with a warm vote of thanks to the Chairman, Directors and Staff.

DISTRICT BANK

LIMITED

ESTD. 1829

CHAIRMAN'S STATEMENT

The Chairman, Sir Thomas D. Barlow, GBE, has circulated with the report and accounts the following statement to the shareholders of District Bank Ltd., prior to the

129th Annual General Meeting

to be held on Friday, the 13th February, 1959, at the Head Office, Spring Gardens, Manchester:

Before turning to the accounts it is appropriate to refer to the step we took last August which identified us more closely with hire purchase finance. The decision to extend our interests in this way followed a change in the official attitude towards the participation by banks in this field of business and we acquired a substantial interest in The Astley Industrial Trust Limited on terms which by them and by us are considered satisfactory. We much welcome the formation of so important a link with this progressive company with whom, as their bankers, we have long had most friendly relations. The closer association will we feel sure be of mutual benefit and also to the advantage of the wide public we both serve.

STATEMENT OF ACCOUNTS

From the Balance Sheet you will see that Current, Deposit and other Accounts are nearly £2 million higher than they were in December, 1957. This increase would no doubt have been greater had the fall in interest rates not induced some customers to make heavy withdrawals during the Autumn for the purpose of providing in advance for taxation by the purchase of Tax Reserve Certificates.

On the assets side, Cash, Money at call and short notice, Treasury Bills and Bills of Exchange amount to £82 million. Of these items Treasury Bills have been sharply reduced during the year in order to provide the additional accommodation required by our customers. Notwithstanding this variation, our ratio of liquidity represents 32 per cent of our liability to depositors.

Investments are slightly down in total. Underlying this change is, on the one hand, a reduction in British Government Securities and, on the other, an increase in Trade Investments due to the inclusion of our shares in The Astley Industrial Trust Limited. All our holdings of British Government Securities, the values of which are appreciably higher than they were twelve months ago, have a fixed date of redemption and a large proportion reach maturity within ten years. Investments again appear in the Balance Sheet at less than their market value.

INCREASED LENDINGS

It was with considerable satisfaction that we learnt last July of the Chancellor's relaxations in credit control. To have a large measure of freedom restored so that we could once more base our lendings on traditional banking principles would be welcome at any time, but was particularly so last Summer because the de-restrictions provided a most timely incentive to sluggish trade.

As will be seen the increase in our advances over the year amounted to £17 million. To some extent the requests for finance we have been receiving relate to projects which, although unexceptionable and sound in themselves, had not been put forward during the credit squeeze because customers had assumed the propositions did not come within the Government's rigid conception of lending and would, therefore, be automatically refused. But on the whole the inflow of applications from industrial and commercial concerns would suggest a growing demand for accommodation for general business purposes. The larger amount that we are lending to the farming community is chiefly to meet their needs for capital expenditure on buildings, machinery and equipment.

Since consumption, as distinct from production, had been deprived of bank finance for many years it was only natural as well as desirable that we should give immediate consideration to its requirements, and we particularly welcomed the opportunity of again being able to place at the disposal of our private and professional customers the overdraft facilities to which they had previously been accustomed. But as the aim of good banking is to serve people in every walk of life and there are now many thousands who, consequent upon the redistribution of incomes, could, yet do not, make use of a banking account, we lost no time in adding to our already comprehensive banking services a less conventional scheme of lending. This new facility makes available unsecured loans for personal requirements and is particularly adapted to the need of the salaried and wage earning public because the amount borrowed is repayable by monthly instalments. That there was a call for such a facility has been abundantly proved by the steady flow of inquiries, and we are very satisfied with the general response and the quality of the business which is being transacted.

FOREIGN AND TRUSTEE SERVICES

Most of the decrease in the item Liabilities of Customers for Acceptances, Confirmed Credits and other obligations is due to a marked diminution in the volume of foreign exchange dealing, particularly for forward delivery. Inevitably these transactions reflect the ups and downs of sterling and therefore it is not surprising that, with the pound very much stronger than it was at the end of 1957, our figures should be so much smaller. The rest of the contraction can be explained by the general decline in overseas trade during the first part of the year, but with a reversal of the downward trend in the Autumn there has been some increase in the amount of foreign business handled.

It is now fifty years since the Bank took the necessary powers to act as a Trust Corporation and the present size of our Trustee Department with its area branch offices in important centres and its trained and experienced staff shows that its specialised work forms a most important side of present-day banking.

As in previous years, it is gratifying to record the continued expansion of this department. Last year there was, in fact, a record intake of new business particularly affecting such services to customers and others as the administration of estates, the supervision of investments under Declarations of Trust and the Trusteeships of Pension Funds and of Debenture Stock issues.

BANK PROPERTY AND DEVELOPMENT

The expansion of the Bank's activities is under constant review and to this end we have purchased premises in places where we intend to open branches. These acquisitions, together with the reconstruction and building of offices where our business has outgrown the existing accommodation, explain the increase in Bank Property. During the past year we have opened branches at Oxford, Swindon, Wolverhampton and York, and we have just opened an additional branch at Newcastle upon Tyne.

THE YEAR'S EARNINGS

Last year we paid a greatly increased amount of interest to our depositors and, due mainly to increased salaries, the upward pressure of operating costs continued. There have, however, been compensating factors in that the increasing pace of business during the second half of the year has enabled us to employ our funds more remuneratively. I am, therefore, pleased to say that the position is sufficiently favourable for us to show an increase of £65,237 in Net Profit over the figure for the previous year. After making the usual provisions this profit amounts to £738,197 and, adding the amount brought forward, there is for disposal £1,041,667. As mentioned in the Report we are appropriating £300,000 to our reserve for contingencies. With recent developments creating opportunities which have long been denied to banking and with the possibilities of benefiting from any additional business that may be generated by economic expansion we consider the time is propitious for an increase in dividend and are recommending a final payment of 9½ per cent, making 17 per cent for the year. It is the Board's intention, in the absence of unforeseen circumstances, to pay an interim dividend of 8½ per cent in August next. After the appropriation to the reserve for contingencies and providing for the dividend payments there remains a sum of £351,789 to be carried forward to the next account.

These good results reflect the high standard of service achieved by both management and staff and I have pleasure in expressing my thanks and those of the Board to all concerned. Although such excellent work owes much to the example and leadership of the officials and experienced members of the staff, the necessity for organised training remains and to extend our existing facilities for tuition we have during the year opened a Staff Training Centre in Manchester. The courses held there will supplement the practical knowledge gained in our Head Office departments and at branches and will be of material assistance to our younger employees.

INCREASED INTERNATIONAL LIQUIDITY

The past year has been marked by the unexpectedness and rapidity with which economic stresses and easements have followed one another. Within the twelve months the United States experienced a severe recession which it was thought would have world-wide repercussions culminating in a general loss of reserves. In the event, however, she made a rapid recovery and the rest of the world, instead of losing, actually gained gold and dollars. On our part we began the year with a 7 per cent Bank Rate and signs of considerable external strain, but a series of reductions eventually brought Bank Rate down to 4 per cent, and so great was the improvement in our payments position that it gave remarkable strength to sterling.

Nevertheless with so much uncertainty pervading the year it was not surprising that the nations became increasingly aware of the shortage of liquidity and the urgent need to add to existing resources. The fact that most important steps are being taken to rectify this position should do much to recreate confidence. But a larger supply of money is not an end in itself. Although more international liquidity means access to much needed additional foreign currency, neither exchange stability nor economic expansion will be achieved unless primary production and the development of backward countries are kept within the limits of what can be soundly financed, and the highly industrialised countries vigorously pursue good creditor policies. In short, additional liquidity should provide more oil for the wheels of international trade, but the economic behaviour of countries will determine their pace.

Meanwhile, although the monetary forces conducive to recovery are gathering strength, the recession in world trade lingers on. Admittedly the business revival in the United States has arrested the downslide elsewhere, but it is open to question whether the improvement across the Atlantic, even if sustained, will be a sufficiently strong stimulus. That is a cause for uneasiness in Europe, where the recession is still troublesome. Whilst expansion there largely depends upon a restoration of demand from raw material producing countries for manufactures, these countries in turn largely depend upon the Continental market to buy their products. Plainly with such interdependence the way out of a recession is not easy, and is likely to remain so, while trade between Common Market countries and the rest of Western Europe is so far from being based on the principles of non-discrimination and multilateralism. It is too early to say whether the recent concerted advance of the major European currencies towards convertibility, together with the other financial measures, will bring this ideal within easier reach, but they at least denote a forward movement in world economic relations which is encouraging, having regard to the imperative need for all nations to co-ordinate their policies and resources if full advantage is to be taken of the projected increase in international liquidity.

STERLING AND UNJUSTIFIED COMPLACENCY

Whatever may be the outcome of recent deliberations in the sphere of international finance it is certainly gratifying that underlying the proposals to strengthen currency reserves there is much greater comprehension of the place of sterling in the world's exchange system. The importance of the Sterling Area and the ultimate responsibility of the United Kingdom for the value and stability of sterling have indeed become more widely understood—and perhaps not surprisingly in view of the pound's performance during 1958. Although there have been persistent and heavy drawings by Commonwealth countries on their sterling balances owing to the fall in commodity prices, other countries, because of increased confidence in the pound at the time when the dollar has been showing signs of weakness, have added substantially to their balances. Still more impressive has been the big inflow of gold and dollars arising out of the sizeable surplus in this country's current payments with the rest of the world. So sterling has had a remarkably good year: good enough in fact to enable us to propel the pound another step towards full freedom, to make some repayment of our external debt and to give creditable support to the new moves for the re-expansion of world credit and trade.

Whilst these achievements are in no small measure due to official policy, and even though our overseas payments are producing a worth-while surplus, I think we need to guard against any feelings of complacency. The stronger position is very much due to external conditions over which we have had no control, notably an improvement in the terms of trade. A fortuitous development of this kind is on the face of it gratifying but, because the underlying factor has been the slump in world commodity prices and these still

show recurring signs of weakness, the attendant improvement cannot be looked upon as lasting. Our gains clearly imply losses of such magnitude for other countries as may yet enforce a marked curtailment of their purchases from us: indeed some reduction is already reflected in their intake of our exports. Perhaps the best we can hope for is that the race will be close between the depressing effects of further cuts in such purchases and the liberalising effects of the easier lending policies of the United Kingdom and other countries.

A matter of no less concern is lest our rapidly acquired payments surplus should have led us to give too much credit to the policies we have been pursuing and too little to the favourable terms on which we have been buying from abroad, and that we should rely upon these policies to maintain this improvement. In reality, however, had there been no convenient turn in external events and we had therefore been forced to press on more vigorously with corrective measures, inflation, always in the background, might not still be so ready to emerge. It is, of course, a lack of balance between wages and output that is particularly conducive to its resurgence, and I should say that, without the windfall brought by cheap imports, wages would by this time have had to be much more closely adjusted to production. That wages have been rising at a pace that could be justified neither by the increase in productivity, the number of under-employed, nor the rise in the cost of living is proof of the indulgence we have allowed ourselves in this matter. The consequent maladjustment presents, in my opinion, a most pressing problem and one which, if not energetically tackled, may soon become very serious.

POLICY FOR EXPANSION

To permit wage inflation now might well build up such pressures as would prevent our policy of economic expansion ever getting into its stride. Yet this forward movement we must have if our country is to counteract the recession which threatens some of its industries. However, I do not believe the danger of inflation is so imminent nor the trade situation so critical as to necessitate anything in the nature of shock tactics. Even so, steering a middle course between inflation and deflation, especially with limited official influence over wage rates, is no easy matter, and there is much to be said for continuing the "step by step" action we have been following.

Actually the reflationary moves that have already taken place make an imposing list. The lowering of Bank rate, the easing of credit, the de-restriction of hire purchase and the aggregate commitments which the Government has already undertaken in respect of Commonwealth programmes, the capital projects of nationalised industries, the increased expenditure of local authorities and the drive for house ownership add up to a considerable stimulus. Moreover moves such as these are warranted by the strength of our external financial position and by the slack that is now present in the economy. Indeed, by making fuller use of under-employed resources of capital and labour these measures could lower costs and thus counteract the inflationary forces inherent in re-expansion.

On the other hand under-employed capital resources add a complication to the recovery programme. Considerable capital expenditure over the past few years has left industry with a good deal of latent productive capacity, so much so in fact that private enterprise cannot be expected to undertake further capital development without the assurance of adequate future demands. In the realisation of this, and because capital projects must be got under way if we are to succeed in putting the economy into higher gear, it has been considered necessary to stimulate consumption first. Granted that our existing stability permits this priority, yet re-expansion this way is not without its risks. For one thing the stimulus we are administering, if used to excess, could deflect export effort to the home market. Thus by the misdirection of easements and incentives we should be in danger of adding to the import bill without assuring a satisfactory increase in our export income. Furthermore, to whip up our existing level of consumption and then impose on this the additional consumer demand that will inevitably be generated by oncoming capital development could, if the new levels of demand prove artificially high, saddle us with an embarrassing surplus of productive capacity. So would our last state be worse than our first. Provided these risks are not disregarded, it is reasonable to hope that the stronger position the Government has worked so hard to achieve may permit us to proceed with expansion in a way which will obtain maximum reward without endangering the smooth working of the economy.

SAVINGS AND TAXATION

But a recovery programme, however soundly directed, which is largely based on spending, much of which has to be financed by Government borrowing, must give consideration to the over-riding importance of savings. After all we are forcing the pace of capital expenditure despite the fact that even a low level of investment can, in the absence of adequate savings, be inflationary. And we are forcing the pace of consumer spending, although such spending in itself is incompatible with personal savings. It is true that the latter are encouragingly high, but they are not large enough in relation to personal incomes to justify the view that all is well with savings.

Briefly, our national problem is the reconciliation of high investment and expansion with stable prices and freedom from inflation. That being so we can surely best achieve our ends by ploughing back profits and increasing personal saving in order to create a sufficiency of savings. But with so much dependent upon them how are savings to be nurtured whilst industry and individuals continue to be so frustrated by taxation? It can be argued that lower taxes would merely add to present spending. Yet what could be more conducive to extravagance in business, to slipshod management and to listless effort than penal taxation? If this is agreed, carefully considered tax incentives would undoubtedly make it more worth while for trade and industry to curtail wasteful expenditure in order to augment profits and for individuals to save instead of spend. Nor do I think these concessions, if put into practice, would necessarily entail a loss of revenue since, given sufficient inducement, both industry and individuals would strive for bigger earnings, the higher levels of which would yield more in taxation for the Exchequer.

A TRYING TIME FOR TEXTILES

As to the industries which might be in need of such concessions, none could make out a better case for special treatment than textiles. Taxation, however, is only one of the many difficulties that are being encountered. In addition to such long-standing problems as fierce competition from Asian countries and interference by Governments in the price and marketing of raw cotton with the consequent lack of effective hedging facilities, sales have been adversely affected by the downward trend of prices, the imposition of import quotas and restrictions abroad, to say nothing of two wet summers in succession at home. But a further explanation of the slackening in activity has of course been the stringent monetary conditions. All things considered it would be surprising if these misfortunes were not now being reflected in the trading results of many companies.

Of material consequence at present, however, is what the trade may expect from the recent relaxations of economic policy, and here it has to be acknowledged that the public's early reactions to the easing of credit and controls have been to display more interest in durable consumer goods than in clothing and household textiles. Nevertheless it is perhaps reasonable to look for some improvement, since, as trade recovery gets under way, there should be an increase in the total volume of purchasing power and with this an expanding home market for fabrics.

Because the setback to production during 1958 must have reduced the industrial use of textiles and curtailed the orders of distributors, any expansion of trade as a result of Government policy should quicken this demand. In any case the use of fibres is likely to increase, for progressive developments in the older industries and the emergence of new industries create ever-widening needs for yarn and cloth. With an easing of financial restraints the opportunity is also provided for buyers generally to build up depleted stocks to a higher level. Moreover, given time, there is no need to rule out the prospect of some change for the better in overseas markets. The expansion of trade being the aim of recent Commonwealth and International conferences, it is not over-optimistic to hope for easier market conditions and for a general increase in purchasing power, all of which should facilitate sales of the kind of textiles the United Kingdom industry manufactures better than its competitors.

Any improvement in demand that may be forthcoming must not, however, lead the industry to overlook the fact that the range of fabrics in which it is free from overseas competition is constantly narrowing, nor be allowed to deflect attention from the urgent task of increasing efficiency in order to lower cost of production. Such a reduction would mean not only the multi-shift working of extremely expensive machinery but the utmost use of technical ability in order to improve quality and design.

ASSOCIATED ENGINEERING LIMITED

A VERY SUCCESSFUL YEAR

PREVIOUS TURNOVER RECORD SURPASSED

MR H. R. MOORE'S STATEMENT

The twelfth annual general meeting of Associated Engineering Limited was held on January 15th in London, Mr H. R. Moore (the chairman) presiding.

The following is an extract from his circulated statement:

The more active trading conditions of the second half of our financial year to September 30, 1957, continued throughout the first half of the year under review and produced the excellent half year's results which were reported to you last May. In that half year turnover expanded by approximately 20 per cent over the corresponding six months of 1956-57, which it must be remembered was a period severely affected by the aftermath of the Suez crisis; and turnover for the second half of our financial year showed a small increase over the comparable period of last year. Cost increases resulted in a small reduction in profits for the second half of the year as compared with those for the first half year.

Overall, however, the year has been a very successful one for your Group, with a record turnover which has resulted in a Profit before taxation of £2,532,698. This is the highest in our history, and exceeds the previous years' figure by £316,890. In normal circumstances an increase of this magnitude would justify raising the rate of the final dividend on the Ordinary stock. However, after very careful consideration your Directors felt that the interests of the Ordinary stockholders would at this stage be best served by maintaining the total distribution for the year at the same rate as last year, and conserving our resources against known capital commitments in what appears to be a more difficult year ahead.

CAPITAL EXPENDITURE

The present programme of capital expenditure which was commenced in 1956 will be nearly completed by September 30, 1959, and will require a cash expenditure of approximately £1 million during the current year. Firm commitments of £445,000 against this figure had been made at September 30, 1958. A number of new schemes are at present under consideration, but the total involved will not add considerably to the Group's commitments.

CAPITALISATION OF RESERVES

The Consolidated Balance Sheet shows that the accumulated Reserves (including the Share Premium Account) attributable to the Ordinary stockholders amount to £6,323,129. The whole of these Reserves are used in the business of the Group and are in addition to the issued Ordinary capital of £3,452,003. Accordingly your Board considers that it would be advisable to capitalise part of the total Reserves in order to bring the amount of the issued Ordinary Stock more nearly into line with the real capital employed.

It is therefore intended to recommend to the Annual General Meeting that the sum of £1,726,001 10s. out of the Share Premium Account be capitalised and distributed to the Ordinary stockholders in the proportion of one new Ordinary Share of 5s. for every two Stock Units of 5s. each.

A Resolution to increase the authorised capital to £10 million will be submitted to the Members at the Annual General Meeting. Although this increase is somewhat greater than the amount required for the proposed capitalisation, the Directors have no intention at present of issuing any further Ordinary capital. In any event it is not their intention, without the consent of the Stockholders, to issue any further Ordinary capital which would materially affect the control of the Company or the nature of its business.

DIVIDENDS

The preliminary announcement of the results for the past year and of your Board's intention to recommend the capitalisation of part of the Reserves was accompanied by a warning that this latter proposal was not to be taken as implying any increase in the total distribution for the current year. It is, however, our intention during the current year, in the absence of any unforeseen circumstances, to maintain the present rate of the Interim Dividend at 5 per cent less Income Tax, on the increased Ordinary Capital with the object of reducing the present disparity between the Interim and Final Dividends. This would be done at the same time as we publish our half year's trading results.

After reviewing in detail the Group's overseas interests, the statement concluded.

FUTURE PROSPECTS

The British Motor Car industry has been working at almost peak capacity throughout the past year, and is very much to be congratulated on the remarkable results it has achieved. Although there are signs of a return to a more seasonal pattern, the outlook is still a very promising one. As I mentioned last year, your Group supplies approximately 40 per cent of its total turnover to this industry.

Activity in certain other industries supplied by the Group is not so great and whilst we have suffered some reduction in the demand for Turbine Blades for jet aircraft engines, it is anticipated that production will continue at a satisfactory level during the current year. We are, however, continually developing into new lines with the object of spreading our activities over a wider field, and this is a valuable factor in levelling out the effects of fluctuations in any particular section.

I am very optimistic about the long-term possibilities for the growth of your Group; but feel that I should sound a note of caution about the current year, as at present it looks as though it may be difficult to maintain the same level of profits as were achieved in the past year.

The report and accounts were adopted and the proposed increase of capital and scrip issue were approved.

BAJOE KIDOEL RUBBER & PRODUCE

The forty-seventh annual general meeting of the Bajoe Kidoel Rubber & Produce Company, Limited, will be held on February 11th in London. The following is an extract from the circulated statement of the chairman, Mr J. A. Clubb:

The combined net rupiah profit of the two subsidiary companies, after taxation of Rp.4,850,000, rose to Rp.4,559,300. NV Rubber Cultuur Mij.Bajoe Kidoel has remitted to the UK £1,090 in respect of its 1955-56 profits and expects to remit another £218 on this account. There are outstanding applications for permits in respect of profits for the years 1954-58 totalling Rp.3,900,550 for the two subsidiaries. On past experience, it is impossible to predict what this sum will realise in sterling when remittance can be made. Intimation has been received from Djakarta agents that a permit for the remittance by NV Celebes Landbouw Mij. of Rp.851,134 in six equal monthly instalments in respect of profits for the year ended March 31, 1957, has been granted. If remittance is effected at the present rate, about £8,030 should be received in London. After reviewing the whole matter, the board felt that a dividend might be paid in respect of the current financial year of the company. They declared accordingly an interim dividend of 10 per cent less tax, payable on January 14, 1959. Subsequent to the date of the balance-sheet of the parent company as at March 31, 1958, a capital repayment has been made to members of 1s. for each 2s. share, totalling £62,240, and the issued capital is now £62,240 in shares of 2s. each.

APEX (TRINIDAD) OILFIELDS

The thirty-ninth annual general meeting of Apex (Trinidad) Oilfields Limited was held on January 21st in London, Mr F. R. Cottell (the chairman) presiding.

The Chairman in submitting the accounts for the year ended September 30, 1958, said that after provision for development and contingencies and depreciation of fixed assets, net oil revenue was £1,190,000. After providing £625,000 for taxation in Trinidad and the United Kingdom, the net profit for the year was £685,000.

The Directors recommended a final dividend of 1s. 6d. per 5s. unit of stock, making a total dividend for the year of 2s. free of income tax per unit of stock.

The year's production of crude oil and casinghead gasolene was 3,258,000 barrels and deliveries amounted to 3,268,000 barrels.

The fall in oil prices which had been the general experience during the year, and a further addition to the Company's costs, only partly offset by increased production, together accounted for the reduction in the net oil revenue.

As regards the Company's prospects for the current year, the recession in oil prices had so far continued. This recession had halted, the Chairman trusted temporarily, the policy of paying steadily increasing dividends to stockholders. This policy had been so successful that over a period of 12 years the cash dividend had increased more than threefold. At the same time the Company had been able to build up its reserves to the point where it could regard them as sufficient for its requirements as seen at present, so that it was expected during the current year to maintain the dividend at its present rate.

MIDLAND BANK LIMITED

Viscount Monckton on testing time ahead for U.K. production and employment

The One Hundred and Twenty-third Annual General Meeting of MIDLAND BANK LIMITED will be held on February 13, at the Head Office, Poultry, London, E.C.2.

The following are extracts from the statement by The Right Honourable The Viscount Monckton of Brenchley, P.C., K.C.M.G., K.C.V.O., M.C., Q.C., the chairman, on the report of the directors and accounts for the year to December 31, 1958:

The past year has been one of the most eventful in the history of the Bank, by reason of the innovations made in banking service, the publicity attracted at home and abroad by these developments, and the volume of new business that has come to the Bank as a direct or indirect consequence of them.

EXPANDING VOLUME OF BUSINESS FROM NEW SERVICES

The first innovation, at the beginning of September, was the Personal Loans Scheme. This was an extension of service, quite new for this country, which had been under consideration for some time past; the lifting of the "credit squeeze" opened the way for its speedy introduction. I need not recite details of the scheme, which has features distinguishing it from ordinary borrowing from a bank on the established patterns; the extent to which the facilities have been taken up has confirmed the existence of a considerable demand which can be met within the broad principles of commercial banking. Up to the end of December we had made over 45,000 personal loans, for sums averaging about £160, and the amount outstanding on them is nearly £7m. Analysis of the purposes for which the loans have been taken shows that over one-third of them by number, and over one-half by amount, have been for the purchase of motor vehicles. The other major elements in the demand are for furniture, fittings or equipment, and for repairs, decorations or improvement of premises. In all these groups are to be found many loans related to small business and professional, as distinct from personal, requirements. The demand has been evenly spread throughout the country.

A few days later we made available a second new service, by introducing the Personal Cheque Account. Here we were concerned to develop our business by enlarging the range of resort to cheque payments—a process which has been rendered more practicable and desirable by trends in the distribution of incomes and by the spread of substantial and regular payment obligations. It is obstructed, in this country as compared with some others, by the existence of the stamp duty on cheques; but early experience has shown that even so there is room for expansion. The Personal Cheque system is designed to meet the needs of people requiring a standard, limited banking service, provided at the lowest possible cost, known in advance. It was foreseen that to achieve widespread recognition of the advantages of such a service would require steady, sustained publicity through the various techniques now available. Here, too, however, we have been gratified by the immediate response. Large numbers of Personal Cheque Accounts are being opened every day, at branches throughout the country, and the average balance on such accounts has exceeded our expectations.

One item on the balance sheet reflects a welcome addition to our group of affiliated companies, resulting from the acquisition, jointly with the Clydesdale & North of Scotland Bank, of the share capital of the Forward Trust Limited. The arrangements for taking over the shares and for the establishment of an effective working partnership have gone ahead smoothly and we have been impressed by the possibilities of fruitful development, among other things through branches to be opened in major cities of both England and Scotland.

REMARKABLE CHANGE IN COUNTRY'S MONETARY SITUATION

It cannot be necessary for me to recall in detail the remarkable change in the country's monetary situation during the past year—a change that was recognised, in domestic affairs, by the lifting of the credit squeeze, and the many steps by way of relaxation and stimulus that have been taken during the past nine months. Concurrently, credit has been re-expanded and interest rates reduced, and the long upward trend of prices has been restrained.

On the external side, the year ended with notable steps in the general direction of enlarging the convertibility of the pound sterling. The timing of this action, as part of a broad return of European currencies to free markets, was doubtless influenced by the fact that the United Kingdom's external monetary position was probably stronger than at any other time since the war. Compared with the position a year ago, the basic reserves have been fortified. Confidence abroad in sterling is high. The balance of payments is in a healthy condition; exports have declined less than might have been expected, and are particularly well maintained in the dollar markets; and some relaxation of remaining import controls had already been found practicable.

The unification of various types of sterling into the single category of "external sterling" brings almost to completion the restoration of full convertibility of the pound for people outside the sterling area. Thus we are, so to speak, mid-way towards the objective of free convertibility which has been in view throughout the period since 1945. Once this new position has been consolidated, within the modified structure of European monetary arrangements, the next long-range process is presumably towards equality of status between sterling coming into the hands of sterling-area residents and sterling passing into the possession of people outside that area. This process, however, may well prove to be prolonged, since it implies the working out of a practical reconciliation between the maintenance of a fixed exchange parity in a free market and the pursuit of a domestic policy aiming at a high level of employment and continuous improvement of the standard of living.

THE DOMESTIC SITUATION

At the moment, the disquieting aspects of the domestic position have to do with production and employment. The higher figures of unemployment and short-time working are in themselves disturbing; so is the fact that the productive capacity of industry—greatly enlarged by heavy capital investment—is not being fully used. No doubt the situation is in part to be regarded as an easing of unhealthy tension; but it would be wrong to shut our eyes to the risk of positive recession. The real test will come when, in the spring of this year, the indices show or fail to show a seasonal improvement of average or more than average magnitude.

ROLES OF GOVERNMENT AND PRIVATE BUSINESS

A year ago I stressed the need of adaptability, in the regulation of bank lending, to changes in the general business situation. The same quality of flexibility is needed on all aspects of national economic policy; and in fact during the past year the direction of policy has been radically altered by a series of steps, taken one by one as soon as it seemed evident that a change could be made with advantage and without prejudice to the long-term gains already in hand.

In these days we look to Government as exercising major responsibility for modifying the climate within which private industry and trade are carried on. This extension of responsibility is perhaps the most significant addition to the functions of Government that has taken place since the 'thirties. The past year has brought us to the first occasion after the war on which Government has been called upon to face what, in the absence of positive action, might merge into serious depression. The fact that Government recognises its new responsibility, and has already acted upon it, is a source of reassurance; so also is the fact that it is better equipped, with statistics and other information, for its task than it has ever been before; and again that its discretionary powers to influence the economic situation are both wide-ranging and adaptable.

THE LIMITATIONS ON GOVERNMENT ACTION

In practice there are limitations on a Government's powers, not least because in a free economy it must act largely by way of inducement, persuasion and deterrent; only to a limited extent, usually on the negative side, can it order or dictate; and the magnitude of those operations which it directly controls, while substantial, is by no means as large as the total volume of business which is governed by private decisions. These limitations, it should be noted, apply both when striving to check over-expansion and when seeking to combat recession. Yet experience suggests that inducement and persuasion may prove to be less effective, once recession has been allowed to take a firm grip of the economy, than deterrents are likely to be at a time of excessive activity.

It would be easier to carry out a continuing policy, promptly adapted to changing conditions, if the available instruments of policy could be used with equal facility. But in fact they cannot. At one extreme the authorities have at their command such means as Bank rate, credit restriction and hire-purchase regulation, which can be put into action immediately, and without notice, once the necessary decision has been taken. At the other they have fiscal measures and the speeding-up or slowing down of programmes of public capital expenditure, which take time to come into operation though the decisions themselves may have some influence in the period immediately following their announcement. On occasion, indeed, the psychological effect of the decisions taken may be more important than their direct practical results.

Finally, account has to be taken of this country's special international position—special in degree if not in kind. It is by now, for example, generally recognised that the increased surpluses on Britain's current balance of payments have been the consequence in large part of a so-called favourable turn in the terms of trade; on the other hand, some export trades have been feeling an unfavourable reaction from the loss of purchasing-power suffered by overseas customers through this same fall in the level of prices of primary commodities. Experience has taught us, too, that our economy is exceptionally vulnerable, not only to trends in world trade, but also to the impact of unfavourable events that cannot be foreseen.

There is and always must be a large element of the "hunch" and the "intelligent guess" in the efforts of any Government, however wise and well-informed it may be, to maintain lasting equilibrium on a steadily rising trend. In my view, there is good reason to hope that action already taken, perhaps supplemented by further steps in the same direction, will go far to bring about a resumption of general economic expansion coupled with monetary stability.

THE CONTRIBUTION OF PRIVATE BUSINESS

It is well, however, to remind ourselves of what business undertakings, for their part, can do, in the present phase, to encourage a speedy re-expansion of activity. There are three lines of action which I suggest are worth consideration by those in control of such undertakings, and one or more of them will be found relevant to every branch of business. First, close attention might be given to all possibilities of lowering prices of goods sold over the counters in the day-to-day run of retail trade, for along this line lies the best hope of removing any undue hesitancy among buyers resulting from loss of overtime earnings or the fear of redundancy. Secondly, now rather than when business is at peak level is the time to consider pressing on with plans for physical reorganisation and expansion and for raising standards of efficiency in production and distribution; the speeding-up of private capital investment is one of the surest ways of stimulating a broad-based business revival. And thirdly, it is vital to swift re-expansion that the country's export earnings of every kind should be enlarged to the very utmost.

There must be a combination of well-judged action at Government level and sustained effort and enterprise in private business if forces making for recession are to be overcome and the national economy firmly established once again on a steadily rising trend of employment, production, consumption and investment.

WESTMINSTER BANK LIMITED

SATISFACTORY TRADING PRODUCES LARGER PROFIT AND DIVIDEND

FURTHER GRATIFYING GROWTH IN OVERSEAS BUSINESS

RESTORATION OF CONFIDENCE IN STERLING

SUCCESS OF GOVERNMENT'S POLICY

LORD ALDENHAM ON FACTORS IN THE OUTLOOK

The annual general meeting of Westminster Bank Limited will be held on February 11th at the Head Office, 41 Lothbury, London, E.C.

The following is the statement by the chairman, The Right Honourable Lord Aldenham, circulated with the report and accounts for the year to December 31, 1958:

It is with the greatest sorrow that I have to tell you that Mr C. D. Hely-Hutchinson, who had served as a Director for nearly twenty-five years, died in November last, a few days after his ill-health had compelled him to retire. Lord Dudley, who joined our Board in 1937, also retired during the year as, on medical advice, he now has to spend the winter months abroad. We shall sadly miss the wise counsel of two Directors who had rendered such valuable service over a long period.

In December, 1958, we welcomed to the Board Sir Walter Barrie, four times Chairman of Lloyds, and Major-General C. A. L. Dunphie, Managing Director of Vickers Limited, who received a Knighthood in the New Year's Honours List. I am sure we shall benefit greatly from their breadth of experience.

The General Management suffered a great loss when Mr L. E. Aldridge retired in June after nine years as a Joint General Manager. He was succeeded in that office by Mr R. E. Elliott, formerly an Assistant General Manager. This was the only change in the General Management, and mentioning it I am prompted to reinforce the evidence the results themselves supply by paying tribute to the untiring efforts of Mr Chesterfield and his colleagues.

RESULT OF YEAR'S OPERATIONS

Our profit for the year of £2,069,747 was some £217,000 higher than in 1957 and the satisfactory trading experienced in 1958 has enabled us to pay a final dividend of 1s. 6d. per share on the "B" shares, making for the year 2s. 6d. per share compared with 2s. 3d. per share in 1957

We have allocated £900,000 to Published Reserve and after this allocation and allowance for the increased distribution by way of dividend, our Profit and Loss carry-forward is down by some £8,000.

The factors affecting our trading figures this year have been numerous, the most significant being the persistent downward trend in the Bank rate and the restoration, after many years' absence, of the freedom we enjoy in the conduct of our business. In some ways these two factors, when considered in terms of trading results, tend to conflict and their impact in a full year cannot accurately be assessed. At the same time they provide a challenge to us all in seeking and applying new methods of operation.

Our Current Deposit and Other Accounts have increased by over £36 million to a new peak figure of £917 million, but in this connection it should be borne in mind that the attraction of a Bank Deposit Account, brought home to so many of our customers in the high interest rate period from September, 1957, has tended to remain, and much of our increase in this item is in the form of Deposit Account balances upon which we are paying interest. It is against this background that we have to regard the profitability of the overall rise in our Current, Deposit and Other Accounts. Incidentally, I am pleased to record a very large increase in the numbers of the new accounts opened during the year—indeed, the largest increase on record.

SUBSTANTIAL INCREASE IN ADVANCES

Turning to the Assets side of the Balance Sheet, you will see that Advances have increased substantially, by £53 million, a pleasing indication of the needs of our customers and our present ability to satisfy them wherever we can properly do so.

The rate of earnings on our Loans and Overdrafts has fluctuated with the various changes in Bank rate, the average being rather lower than in 1957. The expansion in our Advances during the last few months has not quite compensated, in terms of total earnings, for this downward trend in the rate and I would not attempt to assess the likely result under this heading in 1959.

You will recollect that at the end of 1957, with a desire in the conditions then obtaining to be rather more than usually liquid, we were employing a substantial portion of our resources in the purchase of Treasury Bills. With the gradual reduction in the yield on these Bills since early in 1958 and bearing in mind the return to more normal considerations of liquidity, we have switched in some measure not only into the much more remunerative Advances but also, at favourable opportunities, into British Government Securities. Our employment of resources in this latter manner has risen by nearly £16 million and it is eminently satisfactory to report that the deficiency in terms of market value, which we have noted since 1955, has now disappeared from our Balance Sheet: once again we have not used reserves to write down our holdings.

HIRE PURCHASE FINANCE

Our Trade Investments reflect the purchase of a 20 per cent interest in the Mercantile Credit Company Limited, which we undertook after careful consideration of the desirability of obtaining a participation in the field of hire purchase finance, about which we are wholly satisfied: we are hopeful that our total investment in this Company of some £2 million, of which we have paid one-quarter to date, will be of benefit to our profits in the years ahead.

EXCELLENT STAFF RELATIONS

Once again by far the largest of our outgoings, payments to or for the benefit of our Staff, has risen: there has been a modest increase in our Staff numbers.

I am pleased to say that relations between the Board and Management of the Bank and our Staff Associations, both Clerical and Non-Clerical, have continued to be excellent and I have no doubt of the value of the many meetings that take place from time to time during the year and at which views are most freely exchanged.

During 1958 our banking offices rose in number to 1,199 and with the lifting of restrictions on expenditure in this field we are not unhopeful of materially improving our representation throughout the country.

SERVICE TO PRIVATE CUSTOMERS

While we have had a full share in developments in domestic banking generally in 1958, we have not thought it necessary to advertise a special cheap restricted Current Account. As a Bank which has traditionally served the private customer, we have always given careful consideration to his particular needs and I am confident that we remain as fully competitive in this service as we have always been, not only in terms of commission charges but also in the comprehensive nature and manner of our service, which after all is the best advertisement we could have.

I am sure that most of our private customers, as well as our commercial customers, are pleased to be able to receive printed detailed statements from any branch at which they may keep their account: I believe that although we introduced, and advertised, this beneficial service in May, 1956, no other country-wide Bank has emulated this achievement.

TRAVELS ABROAD

1958 has been another year of extensive travel abroad by members of our senior Staff. The United States, South America, the West Indies, the Far East, including China, and Europe have all been visited and the establishment of new, and maintenance of old, contacts have done much to bring about the further gratifying growth in our overseas business. Much credit is due to the Officers who have given up so much of their time to this end, for I know how very concentrated and arduous can be these journeys on the Bank's behalf.

Indeed we are grateful to the whole Staff of the Parent Bank for their efficient and loyal services. Our thanks also go out to the Staffs of the Ulster Bank—which had an excellent year's trading—and of Westminster Foreign Bank, which in a not very easy year has also done well.

CONFIDENCE IN STERLING

In September, 1957, confidence in the International value of the pound sterling was not very strong abroad, and severe steps were taken to remedy the situation—Bank rate was raised to 7 per cent and the credit squeeze reinforced: but it was not until well into 1958 that there was any certainty that the desired results of checking inflation and restoring confidence in our currency had been achieved. It is noteworthy that, with the exception of a very few days, the pound sterling has been above par in relation to the US dollar throughout 1958.

It is probable that the obvious determination of the Government to maintain the value of the pound even at the cost of some slight loss of production was an important factor in this success; but there were of course other factors such as the encouraging stability of the value of our exports and the continued fall in the prices of our imports. Sterling in common with other European currencies was helped by the adverse balance of payments of the US which resulted in a large outflow of gold and dollars to the rest of the world.

EXPORTS TO USA

Our exports to the United States have continued to expand and this enabled the Chancellor of the Exchequer to announce at Montreal some further welcome liberalisation of our imports from the dollar area and to hold out the hope of yet further relaxations in 1959.

The recession in the United States caused industrial production there to fall steeply from September, 1957, until April, 1958: but since then well over half of that fall has been recovered. Even during the worst stages of the recession consumer demand was surprisingly well maintained: this was reflected in the continued high level of American imports of manufactured goods. Europe has also experienced a minor recession. The worst feature of the setback in world industrial production was that it caused a fall in commodity prices with a consequent loss of income to the primary producing countries. Loans have been made during 1958 by the World Bank and the International Monetary Fund to Overseas Sterling Area countries: these loans have helped to meet current deficits which would otherwise have had to be met from our gold reserves

HEALTHY BALANCE OF PAYMENTS

The effect on primary producing members of the Sterling Area of the reduced demand for their exports was also eased by the way in which they drew on their sterling balances: large drawings by Sterling Area countries were more or less equalled by the inflow of foreign money. Our very healthy balance of payments—£334 million in the first six months of 1958—has been used principally to increase the gold and dollar reserves, and to make long-term investment in the rest of the Sterling Area and in Canada, most of it on private account.

During 1958 the reserves in fact increased by £284 million to £1,096 million at the end of the year. They are, however, still too slender for comfort, especially in view of the known claims on them in the coming months. The Government has declared its confidence by undertaking to repay, by April, 1959, £71 million of our debt to the IMF. There are other payments to be made from the reserves. Repayment of the debt to the US Export-Import Bank of £89 million is due to begin in 1960. At New Delhi the decision was taken, largely at the instigation of this country, to strengthen the resources of the IMF. When this is ratified by the member governments, a payment of £58 million will become due in respect of the UK share: but this strengthening of the IMF will add to the stability of the pound. There will also have to be a small contribution to the new European Fund which replaces the EPU.

CONVERTIBILITY OF STERLING

In December it proved possible to announce legal convertibility of sterling held by residents abroad: a step which is already helping to increase the income from our foreign business, and which is welcome too in that it implies that the Government do not intend to permit expansion to lead to renewed inflation.

The price of the restraint necessary to achieve these successes has been a slight fall in industrial production during the year, and some increase in unemployment and lessening of overtime earnings. But the price, measured solely by the amount of unemployment, would I believe have been very much higher if inflation had been allowed to continue unchecked. It was, however, natural and proper that, as soon as stability had been attained, steps should be taken towards renewed expansion. At the end of July the credit squeeze was officially ended and freedom of competition between the banks was thereby restored. By October all restriction on hire purchase was ended. Bank rate had been gradually reduced during the year, and stood at 4 per cent by November. Advances from the Clearing Banks have moved up sharply since July, though not more than was to be expected after the long period of repression: in this connection the introduction of personal loans for current expenditure has had its effect. Moreover, we expect that some of our medium-term commitments—largely concerned with exports —will be used.

Some of our senior officials, in visits to the United States over the last few years, studied the results of the personal loans schemes operated by American banks and their reports convinced us that the business would be useful to the community and profitable to ourselves, and should be introduced as soon as Government policy permitted. It must be remembered, however, that before the credit squeeze we regularly made loans on the security of personal character and the prospects of the business. But it is true that, for the first time, lending to the individual has been widely advertised by us. By an odd chance I received a letter from a customer, just when personal loans were being announced, thanking the Bank for having lent him £10,000 some years ago on what he himself regarded as entirely inadequate security: he was repaying the last penny, and was left with a prospering business of his own.

SPECIAL DEPOSITS REGRETTED

When ending the credit squeeze the authorities decided, pending the report of the Radcliffe Committee, to take power to call for Special Deposits if necessary to control bank lending. I regret this decision, and trust that the power may never be used. I would have thought a better method would be for the Government itself to refrain from creating an excessive volume of credit.

So far the result of steps towards re-expansion has been most apparent in the sale of consumer goods: quick alternation between the application of the brake and the accelerator creates unease, whether in driving a car, or in planning long-term investment. The stimulus to consumption has made many businessmen more confident than they were a few months ago: but reports from our Branches still give little sign that private industry is resuming investment in plant and buildings on the scale necessary to increase the future prosperity of our industries.

GOOD FEATURES IN NATIONAL RECOVERY

There have been many good features in the recovery achieved during 1958. The Savings Movement has been increasingly successful; less time has been lost in industrial disputes; and there has been wider recognition of the fact that full employment can be secured only when our costs of production are kept in line with those of our competitors.

Our farmers have had an arduous and disappointing year. After early promise of good yields, for some months it seemed that bad weather would make the 1958 harvest a disastrous failure: but in the end, though harvesting costs were high, the yield of cereal crops will probably not prove to be very greatly below the average of the last five years. The Government have introduced a Bill to give further help to small farmers.

A CAUTIOUS OUTLOOK

The prospects for 1959 have to be viewed with caution. There seems no certainty that the West is nearer to an accommodation with Russia, and there is considerable danger in the possibility of a Western European split over the Common Market and the Free Trade Area. It was easy to understand the French anxiety about the Free Trade Area, when her price level was not competitive, and it is greatly to be hoped that the recent devaluation of the franc will have removed this obstacle to agreement. At the same time, the fact that France has liberalised her trade in accordance with her obligations to OEEC has gone a long way towards answering our complaint about discrimination against non-Common Market countries

Recent reports from the shipbuilding, textile and coal mining industries do not indicate much early improvement: and the heavy fall in the volume of imports of the raw materials of our main industries during 1958 does not give cause to expect a rapid up-turn in production. Moreover, just as the reserves have gained by the using up of raw materials for exports, so they will suffer when the stock of raw materials comes to be made good. The latest figures for manufacturers' stocks of raw materials suggest that their running down may not go very much further and that before many months industry may find it necessary to start rebuilding those stocks. A possible immediate stimulant to several industries would be to declare that there will be no important alteration in purchase tax this year: there is always a considerable reluctance to buy during the months before the Budget if a change downwards in purchase tax is generally expected: and we are told that the next three months may see more unemployment. But the Budget date is generally in April: a long time to wait if unemployment trends continue upwards.

Since profits have been harder to earn the revenue may be less buoyant than of late, and there are many clamorous calls on the Public Purse: but this should not deter the Chancellor from fulfilling the faint hopes he has given of a reduction in taxation, which, as the Cohen Committee suggests, would be an important stimulant to production.

THE UNITED STEEL COMPANIES LIMITED

Extracts from the Statement by the Chairman Sir Walter Benton Jones, Bt., on the Accounts for the year ended 30th September, 1958.

The consolidated accounts and the Report of the Directors give a full and clear account of the year's operations and their result.

As explained in the Directors' Report, larger non-recurring and extraneous items and smaller net transfers to specific reserves make the balance carried to the appropriation account considerably larger than for the previous year.

In comparing one year with another trading results can be affected by variations in the realizable values of stock. If changes of cost are immediately passed on in selling prices, a fortuitous gain or loss will arise when the stocks on hand at the time of the change are sold at the new prices.

Such an occurrence is not uncommon and it arose in both 1957 and 1958, affecting the comparison of the two years to the detriment of 1958. But for this, the starting figure in the profit and loss account for 1958 would have been slightly better than the starting figure for the previous year.

Capital Expenditure

The amount spent on capital account in the year was £14 million which compares with an average of £11 million in the last five years. It is expected that it will continue at about this level for the next five years.

Activity and Capacity

It is not a simple matter to calculate the rate of capacity we are working at any one time either in volume or value, because no two departments are working at the same rate continuously.

The rate fell during the latter part of the year under review and we are now working at an average level of about 80 per cent. The present indications are that we can hope to maintain this level.

The following analysis of the markets which we serve may help you to form opinions for yourselves.

	%
Direct Export	11.5
Constructional engineering, building and contracting	9.9
Shipbuilding and marine engineering	9.1
General engineering	12.3

Iron Making at Appleby-Frodingham

The blast furnace installation at Appleby-Frodingham consists of four furnaces built between 1939 and 1954. With the knowledge and experience available when the installation was designed in 1939 we estimated the capacity of each of the two furnaces installed in that year would be 2,500 tons per week. Following the experience which we have gained in the beneficiation of our low grade ores, coupled with modification in design and operation of the furnaces themselves, the performance of the four furnaces has increased and exceeded what had been common practice. The highest production achieved experimentally on one furnace has been 11,750 tons in a week. These developments have enabled us to demolish all our older blast furnaces and the new installation of four furnaces will make all the iron we expect to require for the present.

Employment and Unemployment

The number of employees on our books is 36,862. The normal recruitment by which the regular wastage through retirement and other causes is made good has been restricted in recent months to mitigate the effects of the reduction in activity which we have suffered. Every effort has been made to avoid dismissals for redundancy; men employed in steel-making work under an agreement, common in our industry, guaranteeing four shifts work per week, and this arrangement has been widely used in recent months. Overtime work has been considerably reduced and the fall in working time has been shared as widely as possible over our labour force.

Engineering

The main purpose of our Company is, of course, the production of steel in many different forms, but in the course of years our activities have extended to engineering on a large scale.

Important work recently undertaken by this company has been the Jodrell Bank Radio Telescope, Barton Bridge, a dual-carriageway road bridge over the Manchester Ship Canal, and the steelwork for two large power stations. The company is now engaged upon the steel building for the Hinkley Point nuclear power station.

We were the principal contractors in the building of the Jodrell Bank Radio Telescope, which is now finished and in use. If we take credit for the part which our company played, which we may well do, it should not be forgotten that the men who actually built the structure were partners too. Some of the erection took place in hard weather and a great deal of it involved working at high levels in a very exposed situation.

As you may remember, Yorkshire Engine Company is a locomotive building works of long standing. It is now concentrating on the building of diesel locomotives, for which it has a large order book.

The Distington Engineering Company is a large undertaking established by us since the war. It has one of the largest iron foundries in the country, specialising in the casting of ingot moulds and other heavy castings used in steelworks and elsewhere. And in its machine shops it undertakes general engineering and sub-contracting to engineering companies which cater for steelworks plant.

The Owen & Dyson company specialises in machining and assembling railway wheels, axles and tyres which are made at Steel, Peech & Tozer.

In addition to these subsidiary companies we have large maintenance engineering shops at our steelworks which are run on the lines of independent engineering undertakings.

All these works together employ 4,854 men which gives an indication of the size of our engineering interests and establishments.

Free Trade Area

Not everyone is engaged in industry and trade, but all are concerned in the outmoding of wars and all fear the devastating possibilities of nuclear weapons, H bombs and all that.

Such fear is natural. But if we cannot exclude nuclear weapons and world wars from our own thoughts we have to turn our urgent attention to the building up of Western Europe into an integrated trading and commercial unit which in common with all English speaking nations can stand up to the rest of the world.

Given peace, there can be little doubt that in this age of technological advance, the industries of the Free Nations of Europe will expand and prosper. Here we are all concerned, because it is just under these conditions that a failure to keep the peace will spell not only economic ruin, but suicidal devastation for all concerned.

Last year, after various ups and downs in Western European relations, the Treaty of Rome was signed, largely owing to the dynamic leadership of the then Belgian Foreign Secretary, M. Spaak. This created amongst the same six nations a Common Market for all other commodities (besides coal and steel) and at the same time founded a special organisation known as "Euratom" for dealing with the peaceful development of nuclear energy. The first reduction in trade barriers between the Six came into force on the 1st January, 1959 and the Rome Treaty provides for their complete elimination in 12 to 15 years.

This has given rise to very intricate problems for the other Western European trading nations and particularly for the United Kingdom. Negotiations, which have had a distinctly chequered history, are still being carried on in the hopes that the remaining eleven O.E.E.C. powers, with Great Britain inevitably in the lead, will succeed in establishing a working relationship with the Common Market of the Six, by forming a complementary association, originally to be called the Free Trade Area.

These proposals raise many delicate political and economic issues which are outside the province of this statement. But, I venture the opinion which I know you will share, that the prime need for the Free World is the establishment of closer links which will reduce the risks of war. We must hope, therefore, that a sufficient spirit of give and take will be shown by all concerned to ensure the setting up of some form of Western European economic union on an enduring basis. What is good for Europe should be good for the United Kingdom.

Nationalisation

The present Parliament and previous Parliaments for some years now have been composed almost entirely of two political parties. Basically one party strives to conserve the freedom of the individual; it is called the Conservative Party. To the other party the freedom of the individual is a secondary consideration; this party is called Labour, I do not know why.

Immediately after the war, in July 1945, the Labour Party was returned to Parliament with a large majority, viz. about 150. In pursuit of Socialist dogma it proceeded to nationalise, as it is called, a number of activities which we now speak of as the nationalised industries.

It is generally accepted that this nationalisation movement has been a failure, that it has cost the State a lot of money, and that it will cost the country a lot of money in the future.

The steel industry was not included in the first nationalisation campaign. It was nationalised all by itself by an Act of Parliament called the Iron and Steel Act 1949, the date of which was the 24th November 1949.

It is true that when that Act was passed the Labour Party still had its large majority. But men soon forget and so it is as well to recall by how small a majority the nationalisation of the steel industry was actually brought about.

The Bill to nationalise the steel industry was introduced into the House of Commons in October 1948 and met with the strongest opposition in both Houses. Eventually a compromise was reached. This provided that the actual vesting of the steel companies which were to be nationalised would not take place before the next General Election and the Act fixed the earliest vesting day as the 1st January 1951.

Another General Election was held in February 1950 and as a result the Labour Party's overall majority was reduced to no more than six. In this new Parliament before the vesting day arrived the strongest opposition was renewed but the Labour Party persisted and used its majority in the House of Commons, small though it was, to force their decision. The recorded majority was ten votes. It may therefore be said that at the time when the properties of the iron and steel companies concerned became vested in the State the Labour majority was no more than ten.

Only ten months later the Labour Party went to the country and was defeated. A Conservative government succeeded which denationalised the industry by means of the Iron and Steel Act 1953 and established a new form of Public Supervision exercised by the Iron and Steel Board which has been in operation ever since.

All the arguments which the Labour Party have brought forward in support of nationalising steel have been refuted time after time. They are being refuted day by day and refuting will continue. In spite of this lack of support the Labour Party still persists in declaring that if and when it is returned to power it will nationalise steel again. The only reason left to it is the pursuit of an outmoded Socialist dogma. Or perhaps there is even less in it than that. Perhaps it is for no better reason than the reason why a girl once became the owner of a double bass, a true story which came within my personal knowledge many years ago. I do not remember the girl's christian name, but let us say it was Sally.

Sally was walking along a street when a friend stopped her and asked:

"Whatever is that musical instrument you are carrying on your back?"

"Oh" she said "it is my double bass".

"But can you play the double bass?" her friend asked.

"Don't be silly" she replied.

"Then why have a double bass?" said her friend.

"Well, you see, it was this way. I told me Momma I wanted one and so me Dadda went and bought me one".

Staff

At all our branches and at our headquarters and at all times we know that we have the support and the co-operative inspiration of our staff at every level. At our meeting I shall ask you to join us in a resolution to tell them of our appreciation and our thanks.

Copies of the full Statement can be obtained from the Secretary,

THE UNITED STEEL COMPANIES LIMITED · 17 WESTBOURNE ROAD, SHEFFIELD 10

H. & G. SIMONDS LIMITED

SALES MAINTAINED AT HIGH LEVEL

EXPANSION AND DEVELOPMENT

The Annual General Meeting of H. & G. Simonds Limited was held on January 19th at Reading. General Sir Miles Dempsey, the Chairman, presided, and the following are extracts from his circulated statement:

FINANCE

The year's operations resulted in a small increase in the profit from trading, which amounted to £1,113,256. The profit before taxation was £22,798 higher at £850,799, and the tax charge, mainly by reason of the alteration in profits tax, was lower by £10,782. The profit after taxation was £384,818, as compared with £351,238.

Capital Expenditure on properties during the year was in excess of £400,000. Whilst this partly reflects the building and other costs incurred on new and existing houses, the major proportion of this year's expenditure arose from the purchase of the freehold of a group of Licensed Houses in the Bristol area, previously leased by us. This important investment formed a part of our planned Capital Investment programme.

TRADE

Our total sales of beer were almost identical with the previous year. As these had constituted a record, we feel that we have stood up fairly well to the effects of a cold, wet summer, and of economic recession in some of the areas we serve.

The structure of our sales, however, revealed certain differences, notably that the quantity of bottled beer declined slightly, while that of draught beer increased by nearly the same amount, thus reversing a trend which has been in evidence for many years.

During the year we again directed our greatest sales effort towards promoting our "Tavern Ale," both in bottle and can. I am glad to report that we achieved a satisfactory increase, despite the overall fall in sales of bottled beer. *This will continue to* be our policy, as we have great confidence in the quality of "Tavern Ale," and our wide publicity will still further emphasise the merits of this beer.

Wine and Spirit Sales, representing a most important fraction of our total turn-over, maintained about the same rate of expansion as for the past year or two, but there are definite indications that this is now slowing up.

LICENSED PROPERTIES

Six new Public Houses have been opened during the last year, and work is now proceeding on five more new houses, respectively at Reading, Oxford, Swindon, Bristol and Cwmbran New Town, all of which should be completed within the next twelve months.

PLANT

Our efforts have been bent mainly on improving productivity as fast as resources permit. We have pressed on with schemes at Reading and Devonport, and have locked into them further important plans. These will have the effect of closing down our Bottling Stores at Bristol and of greatly increasing our bottling capacity at Reading by installing the most modern and efficient high speed machinery.

ARTHUR COOPER

The Arthur Cooper organisation now controls fifty-two retail Wine Shops, and experienced a marked increase in turn-over resulting in a substantial extra profit.

From a small beginning seven years ago, this group has now become very well-known throughout our trading area, and is contributing worthwhile profits to our account.

Since the closing of the financial year, we have entered into a trade agreement with Flowers Breweries whereby certain beers of each Company will be made available to the other. We are hopeful that this arrangement will be mutually advantageous.

The Reports and Accounts were adopted, and the Retiring Director re-elected.

MINWORTH METALS LIMITED

FACTORS AFFECTING EARNINGS

The eighteenth annual general meeting of Minworth Metals Limited was held on January 16th in London, Sir John Fox, OBE (the chairman), presiding.

The following is an extract from his circulated statement:

Again stock losses during the year under review, due to the downward trend in the price of Wolfram Ore, which is the raw material for Ferro Tungsten, adversely affected our earnings. In July 1957 the price of Ferro Tungsten was 9s. 8d. per lb, a downward trend continued throughout the year and the price at July 31, 1958, was 6s. 6d. per lb, representing a difference of approximately £285 per ton.

It is generally agreed that during the period the price of Wolfram fell below its economic level. The July price was the lowest for ten years and in terms of real money far below the 1948 price. At the time of writing this report prices are rising and today Ferro Tungsten stands at 8s. 6d. per lb., but to attempt to prophesy as to the possible antics of this metal would be folly.

Technically the year was one in which investments of the past paid full dividends, a large part of the earnings being due to the research and development of previous years.

Results for the first part of the year were very satisfactory but from January onwards we began to feel the effects of the recession in the steel trade, which continued into the present year. As the standard of living rises there is an expanding market for our products, and whilst our trade is one to feel the effects of a general recession it is one of the first to feel the effects of a recovery.

The Group Trading Profit for the year was £94,332. Taking into account the setbacks encountered during the year we may with reason congratulate ourselves that this was only £3,090 less than the previous year. Your Directors feel justified in recommending a dividend of 25 per cent.

I extend our thanks to all our staff for the loyalty and co-operation which has contributed in full measure to the results achieved, in spite of the difficulties to which I have referred.

The report was adopted.
