(10) March figures: total unemployed, 550,000 (Great Britain, 2·5%; Scotland 4·8%); unfilled vacancies, 179,000.

Change of name

ROSS GROUP LIMITED

(formerly TRAWLERS GRIMSBY LIMITED)

Increased Range of Activity

The Group is engaged in an increasing range of activities from deep sea trawling to the production, quick-freezing and marketing of a wide variety of frozen foodstuffs including fish, fruit, vegetables, poultry and other speciality products.

In his statement to shareholders at the Extraordinary General Meeting held on 4th March, the Chairman, Mr. J. Carl Ross, stated that profit from fishing operations in the year to 30th September, 1958, amounted to only some 40% of the whole. The value of fish landed by the Company's Trawlers was £3,017,713, whereas the turnover of other trading Companies in the Ross Group totalled £8,061,686.

Ross Quick-Frozen Foods

The already well-established "SeaSparkle" and "Westwick" ranges of quick-frozen foods will in future be marketed to the general public under the name of "ROSS", e.g. "Ross SeaSparkle Haddock" and "Ross Westwick Garden Peas".

An extensive and vigorous Press and T.V. advertising campaign for the Group's products will be launched later in the year.

A PERSONAL SERVICE

Manufacturers and traders wishing to extend their activities to Australia are invited to take advantage of our specialised Information Service.

Upon request we will furnish, without obligation, an individually prepared survey of any industry. Full reports are available on all matters incidental to establishing a business.

An expert advisory staff is always at your disposal.

A world of his own

He is in another world, so absorbed that for the moment you are forgotten. He feels secure because you, his father, are always there to comfort and provide for him. He never thinks it could be otherwise.

But you know differently. You know there is a possibility that he and his mother might one day be left alone, and that much of the security and comfort, the plans for his future, would be gone.

It is an anxious thought, but one which adequate life assurance can help to dispel. A Prudential policy could never take your place, but it could make a lot of difference to your son's future.

For advice on personal life assurance plans ...

APPOINTMENTS

Vacant 9/- a line; Required 6/- a line.

COMMERCIAL INTELLIGENCE OFFICER

required by

THE MORGAN CRUCIBLE COMPANY LIMITED

The ideal applicant would be aged about 30, possess a Degree in Economics, have commercial experience and be well practised in clear thinking and expression. As a member of a small team personality is important, and the work includes the presentation of the current economic scene by means of systematic commentaries and the graphing of economic indicators.

An interesting position which would appeal to those seeking a post where considerable maturity of outlook is required.

Write, in confidence, to the Staff Manager, THE MORGAN CRUCIBLE COMPANY LIMITED, BATTERSEA CHURCH ROAD, S.W.11.

AMERICAN COMMUNICATION CONCERN

requires

ELECTRONIC ENGINEERS

Positions open based on one year contract with probability of indefinite extension if services are satisfactory. In addition to salary, which will be based on qualifications and experience, FOUR U.S. dollars ($4.00) a day granted for living expenses while in Tripoli (Libya). Transportation will be provided from home to Tripoli and return on expiration of contract. In reply, state experience, present salary and salary desired in addition to living expenses. Ability to speak English essential.—Write air-mail to Hyton-Page Libya, P.O. Box 666, Tripoli (Libya).

ECONOMISTS

THE BRITISH & COMMONWEALTH SHIPPING CO. LTD. invites applications from ECONOMISTS with a sound knowledge of statistical method and preferably some experience in the application of economic analysis to industrial problems for the position of senior assistant in the Research Department. Applicants should have a good honours degree in Economics or Statistics and preferably at least two years' research experience in a University, Industry or Government.

The successful candidate will be required to assist in the application of economic and statistical techniques to a variety of problems associated with shipping and to develop the results for presentation to the Management. The work is of great interest involving research in original fields.

The conditions of employment are generous and the salary will depend on age and experience. —Applications should reach the Secretary, The Clan Line Steamers Ltd., 2 St. Mary Axe, London, E.C.3.

A GRADUATE with a good degree in Economics (specialities in Statistics and International Trade of particular interest) is required for an Assistant post in the Export Market Research Department of a large Engineering Group.

The post involves desk information work, the scanning of papers and periodicals, tariff and import regulation queries, and the issue of a regular Group Export Bulletin with special reviews on general export trends.

This work calls for imagination, a flexible mind, and an ability to write quickly and lucidly in plain English. Starting salary in accordance with qualifications and experience.—Application forms from: Secretary, Market Research Department, Tube Investments (Export) Limited, John Bright Street, Birmingham 1.

EXPERIENCED MAN required to organise Market Survey Department for firm of specialised engineers in Group of international repute. This is a Staff appointment and only candidates with previous experience will be considered.—Write, giving full particulars, to Box No. 535, 1 Aldford Street, London, W.1.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the following posts:
(a) Lecturer or Assistant Lecturer in Economics
(b) Assistant Lecturer in Economics.

Salary in the scale £900 x £50—£1,350 x £75—£1,650 p.a. (Lecturer), or £700 x £50—£850 p.a. (Assistant Lecturer), with F.S.S.U. and children's allowances.—Applications should reach the Registrar, The College, Keele, Staffs, from whom application forms and further particulars may be obtained, not later than April 15, 1959.

THE UNIVERSITY OF SHEFFIELD

DEPARTMENT OF EXTRAMURAL STUDIES

A STAFF TUTOR is required, with qualifications in ECONOMICS and an interest in problems of Trade-Union Education and Industrial Relations, to take up duties from September 1, 1959. Salary Scale: Staff Tutor (Probationary), £700 x £50 — £850; Staff Tutor, £900 x £50 — £1,350 x £75 — £1,650, with F.S.S.U. provision and family allowances. Initial salary according to qualifications and experience.—Applications (10 copies) by April 11, 1959, to the Registrar, from whom further particulars may be obtained.

NIGERIAN COLLEGE OF ARTS, SCIENCE AND TECHNOLOGY

(Principal: C. A. HART, C.M.G., T.D., D.Sc., Ph.D., M.I.C.E., M.I.Mech.E., F.R.I.C.S., A.M.I.Struct.E.)

Applications are invited for LECTURESHIPS in: A. COMMERCE: courses leading to A.C.C.A. and C.I.S. Inter. and Final examinations.

(i) ACCOUNTANCY SUBJECTS; (ii) SECRETARIAL SUBJECTS; (iii) ECONOMICS.

(i) Should be Chartered or Certified Accountants, recently qualified, preferably able to lecture in Financial and Management Accounting, and British Income Tax; should have had professional or industrial experience. Degree an advantage.

(ii) Should be Chartered Secretaries, qualified since 1948 with General Secretarial Practice in Final Examination; should state in what subjects prepared to lecture. Experience with Secretary of large joint stock enterprise desirable, relevant degree and teaching experience advantageous.

(iii) Should be graduates in Economics preferably with relevant business experience. Teaching experience desirable.

B. GOVERNMENT and ADMINISTRATION courses.

There is a two years' post-G.C.E. (A) Course leading to College Diploma, examinations to be moderated by University of Exeter; a one-year "In-Service" Course for Nigerian Local Government officers. Candidates should have appropriate degree or diploma, good Local Government experience and, if possible, relevant administrative or teaching experience—overseas for preference.

A Senior Lectureship may be available in any vacancy above in case of exceptionally well-qualified and experienced candidate.

Contract Salary Scales: Lecturer: £690-£1,529 p.a. Senior Lecturer Grade II: £1,254—£1,584 p.a. All plus inducement addition of £180-£300 p.a. for overseas appointees and gratuity at £25 or £37 10s. for each completed 4 months' residential service. Entry point according to qualifications and experience.

Pensionable terms may be arranged at appropriately lower salaries, or College will be prepared to take over and maintain employers' contributions to former F.S.S.U. policies.

Partly furnished quarters at one-twelfth basic salary rental. Tours 16-18 months but leave normally taken in long Vacation. Free first-class passages. Children's U.K. maintenance grant up to £150 p.a. and passages assistance.

Applications (6 copies), giving age, qualifications, experience and names of three referees, should be sent to the Council for Overseas Colleges, 12 Lincoln's Inn Fields, London, W.C.2, by April 10, 1959.

TELEVISION OFFICER

Applications are invited for new appointment to assist national industrial federations in projection of British industry. Candidates should have practical experience of broadcasting production problems and techniques as well as some knowledge of industrial affairs. Must be willing to travel extensively in United Kingdom. Salary starting at £2,000 a year.

Applications in strict confidence to Box 1143.

(3) Assistant Research Officer to assist with sample surveys covering wide range of Social and Economic problems. Qualifications are a University Degree or Diploma or experience of survey work. Some knowledge of statistical methods an advantage. Post is graded Assistant Information Officer (unestablished). (Ref. PE.463.) Salary according to experience and qualifications, rising to maximum of £1,085 (men); £1,038 (women).

Write to Ministry of Labour and National Service, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4, quoting relevant PE number and give age and full details of qualifications and experience. Only those applicants selected for interview will be advised.

ACCOUNTANT required by John Holt & Company (Liverpool) Ltd. for employment in French West Africa. Applicants must be under 40 years of age, speak fluent French and have wide practical experience of commercial accounting in a responsible position. The appointment entails management functions including negotiation with banks and Exchange Control Authorities. The post carries a salary of £1,750 per annum, with additional cost of living allowance whilst resident in French West Africa, pension scheme, free housing in Africa and home leave every 18 months.—Applications, stating age, experience and qualifications, should be addressed to Staff Director, John Holt Overseas Limited, India Buildings, Liverpool 2.

ADMINISTRATIVE OFFICER (Male), with special responsibility for accounts, required by a Professional Association with 20,000 members. Salary, in the range £850-£1,200, depending upon qualifications and experience. The post is pensionable. In addition to responsibility for accounts and members' subscriptions, the Administrative Officer will be required to undertake other duties of a more general character, including correspondence. He must be able to produce balance-sheets and other information required by the auditors.—Further information may be obtained from the Secretary, Incorporated Association of Assistant Masters, 29 Gordon Square, W.C.1.

EXPERIENCED CITY JOURNALIST wanted by National daily. University degree an advantage.—Write, giving details of qualifications, to Box 1144.

MARKET INVESTIGATIONS LTD. have a vacancy for a young male graduate to be trained in all aspects of market research with a view to promotion as a Research Officer responsible for the conduct of surveys and other marketing operations. Some commercial experience would be an advantage. Initial salary £650-£700 p.a. —Please write, with full details, to S. J. Orwell, Director, 1 & 2 Berners Street, London, W.1.

APPOINTMENT REQUIRED

VANCOUVER, B.C. Chartered Accountant (Edinburgh), with mercantile background, is visiting the United Kingdom shortly and would be interested to discuss any business proposition, preferably on a part-time basis, connected with British Columbia.—Box 1141.

BUSINESS AND PERSONAL

9/- a line.

WEST SIDE STORY—east, north, south, too.—The news travels fast that El Cid Amontillado is the superb choice in sherries. It comes from Spain and spreads enjoyment all through these islands. Just try it.

EUROPEAN MARKET DATA provides market research, analyses and forecasts at 15 Golden Square, W.1.

SPANISH HOLIDAY AGENCY, Blanes, Costa Brava, recommends hotels and books rooms without fee. State requirements, including dates.

"TIME AND THE TELEPHONE IN YOUR BUSINESS." A most important piece of literature for top executives. Send for your free copy to Hedley Telephone & Sound Systems Limited, Cape Hill, Smethwick, Staffs.

PLUG IN K.I.C. FOR ECONOMICAL CHEMICAL PLANT EXPANSION

Organized to serve the oil and chemical industries. Kellogg International Corporation can strengthen the chemical engineering departments of most chemical companies during their expansion programmes. Chemical concerns faced with the problems of executing large and small capital expenditures for new production facilities have found that plugging in the KIC staff to their organization results in an optimum capital investment for their new plants. KIC is equipped to deliver chemical engineering manpower at any point in the planning of a new plant from the early development of a new process through the pilot plant stage, the design of the commercial plant, the procurement of equipment and materials, the erection and finally placing the plant in operation. This broad experience of KIC, plus the additional chemical engineering depth available through The M. W. Kellogg Company in New York, has been used by many chemical concerns to make objective economical analyses of any process schemes as well as to find the answers to specific road blocks in the development of new processes.

By incorporating all the necessary services for assisting in the developing of new processes and designing and constructing new plants under one management team, Kellogg is able to deliver plants which will continue to be modern for years after completion. The constant effort on the part of Kellogg to reduce the risk of obsolescence to an absolute minimum is the best assurance that an investment in a new chemical plant will continue to yield a high return for a long time. KIC engineers welcome the opportunity to explain how KIC co-ordinates and controls the innumerable tasks and expenditures associated with building a new plant.

AROUND THE WORLD IN HALF AN HOUR

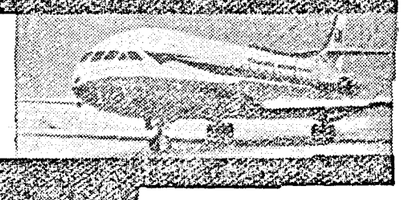
YOUR TRAVEL AGENT CAN BOOK YOU SAS FROM ANYWHERE TO ANYWHERE IN THAT TIME

For example, over the Pole to Tokyo This famous SAS short-cut saves you many hours. But you find that SAS time-saving starts at your travel agent. Within half an hour the SAS world electronic reservation system has been in touch with Tokyo and your booking has been made and checked back all along the route. SAS moves fast—even on the ground.

YOU FEEL LIKE A GUEST WITH SAS

A guest. That's how you feel when you fly SAS—a personal guest of the Scandinavians. Your flight to Tokyo shows you what Scandinavian hospitality means...

A face in the crowd



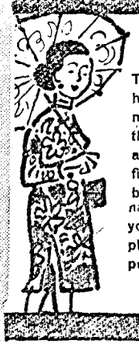
London Airport. Nice to see the friendly face of the SAS man who smooths your way through the crowd and on board your aircraft. SAS men are on the job right round the world at 85 airports.

Copenhagen here I come!

A trans-polar DC-7C awaits you at *Kastrup Airport. The flight from* London takes 2 hours 50 minutes. Time enough to enjoy a first-class meal and a fat cigar. The smoke won't bother your neighbours because the air in the cabin is changed once a minute.

CARAVELLE AT KASTRUP

Look!—there's a Caravelle carrying the SAS colours. She's one of sixteen due for service on their European and Middle-East routes. This new all-jet airliner has twin Rolls-Royce engines so powerful that one alone can power her from take-off to touch-down. Yet the Caravelle has the world's quietest cabin.

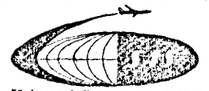


HAUTE CUISINE

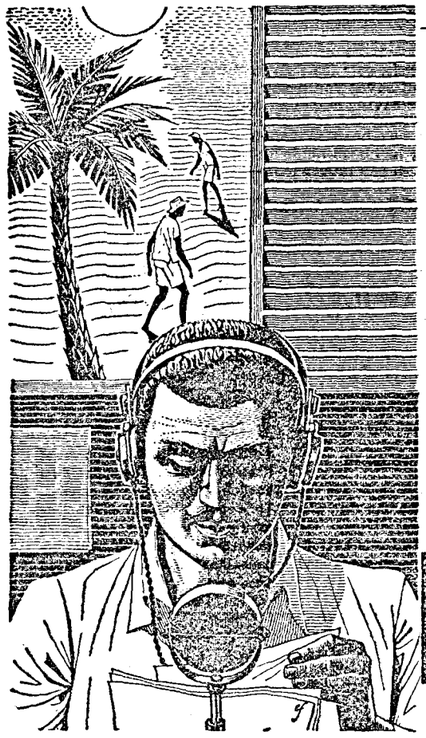
You're aboard the giant DC-7C—relaxed in the seat you *expressed a preference for when you booked.* You think again of food. Your table is set with Danish China, Norwegian Linen, Swedish Crystal... and time flows by unnoticed as you surrender completely to the magic of SAS chefs... caviar, pâté de foie gras, filet de boeuf, sauce Moulin Rouge, French cheeses, Danish pastry, succulent fruits, wines, champagnes, liqueurs! Your dinner on this *DC-7C is one you'll always remember.*

YOUR CAPTAIN If he is Hejall Hansen, he will be the man who was Chief Pilot on the historic SAS inaugural flight over the North Pole, from Copenhagen to Tokyo in 1956. He is proud that SAS was first over the Pole. The DC-7C he commands is the world's longest range airliner (about 4,500 miles) built in a special SAS version for Polar navigation. You cross the Pole, above the weather, at 20,000 feet. You feel on top of the *world—with a Polar Cocktail in your hand!*

Gateway to the East



Touch-down in Tokyo—only 35 hours from London by SAS. Within minutes you're in a car speeding to the town centre. SAS have looked after everything for you—even confirmed your hotel bookings and business appointments. In your hand, the SAS "Gateway Pass" gets you the best service at Tokyo eating places and nightclubs. SAS is the perfect host.



ASK YOUR TRAVEL AGENT, HE KNOWS

SAS

Services between London and Scandinavia are in pool with BEA

THERMOTANK IN THE MIDDLE EAST

Now they can give of their best

at an Iraqi wireless station

WORKERS can now enjoy ideal surroundings for comfort and efficiency where outside conditions of heat and humidity would make energetic activity almost intolerable. This typifies the installations carried out in the Middle East by Thermotank's branch at Basra. These include the Shatt-el-Arab Hotel, the head office of the Agricultural and Industrial Bank of Iraq, and the Iraq Spinning and Weaving Company's mills near Baghdad. *Thermotank can plan, design and instal air conditioning equipment for any requirement in any part of the world.*

A WORLD OF BETTER CLIMATES WITH THERMOTANK

Here are a few more examples of world-wide service from Thermotank:

BRITAIN Full conversion of the liner S.S. 'ORCADES' to be carried out, providing an installation with a capacity of 14,000,000 B.Th.U's per hour.

UNITED STATES Extensive air-conditioning equipment supplied for the State Department Building, Washington.

AUSTRALIA Installations for hospitals, hotels, schools and an electrical research laboratory, and for new 19,000-ton ships.

SOUTH AFRICA Thermotank installation for the new ten-storey headquarters of the United Building Society in Johannesburg, South Africa's largest office building.

Newfangled nonsense!

"Damn things stinking up the road," said Mr. Horatio Golightly's father in 1893. "Ridiculous fad. Won't last, you know. Not like Diabolo."

Mr. Golightly himself was saying much the same sort of thing in 1955 about independent television. He wrote to '*The Times*' about it, twice.

By 1959 though, even Mr. Golightly is prepared to admit that, like the motor-car, independent television is here to stay. And, in his less guarded moments, that commercials and all that do quite a job. He can even give you a reason or two.

"First," he says, straddling in his unlovable way in front of the fire, "22 million, *million* mind you, 22 million people watch it and like it."

"Second, it's given advertisers a new, whatyoumaycallit, a dynamic (that's it) a *dynamic* selling medium. Third"—but that's about as far as he goes. Chaps at ATV go further.

If you'd like to see how far they go with reasons and information and service and so on, write or telephone to ATV's Sales Department at any of the addresses below. Probably be a character there who can tell you just what you want to know—such as the cost-per-thousand on ATV being even lower than you think.

"Mind you, a lot of what's on isn't that good," says Mr. Golightly. "Take these science programmes. The atom and that. Damn newfangled nonsense!"

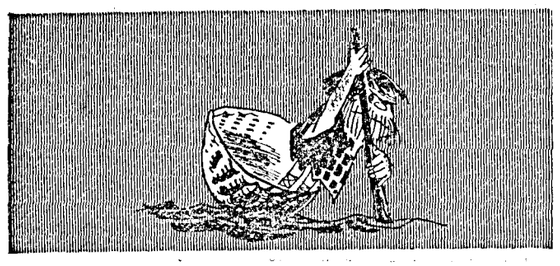
"The Quality" were shrewd judges of superior craftsmanship and design. Choosing a new carriage was a family matter of great importance. Colour, design and style were considered at length and catalogues carefully studied. Today the masses, not the few, are involved and their choice is made even more complicated by the competing claims of differing engines, brakes, tyres and other technicalities.



The Kenning Motor Group smooths away all complexities for the car buyer with friendly advice based on years of experience and showrooms always stocked with a wide selection of cars.

Over 100 depots in 25 counties represent the nation-wide contribution to the maintenance of road transport by the Kenning Motor Group—identified by the Kenning Shield, a guarantee of an efficient service.

Mr Khrushchev's Vanishing Act

WITH no major mishap, though not without setbacks and snubs from opponents and allies alike, Mr Macmillan has completed the programme of reconnaissance and consultation that he opened by flying to Moscow five weeks ago. Perhaps the resentment that his initiative aroused in some breasts in Paris, Bonn, and Washington can now be buried. He is not the leader of the West, and does not claim to be, but he has shown himself the West's good servant. Western leadership must necessarily now return to Washington, where it belongs, and it faces a situation which presents possibilities of manœuvre that were not apparent five weeks ago.

Just how much of the change Mr Macmillan can claim credit for is a difficult as well as an invidious question. That there is change is not to be denied, and the British Prime Minister's exertions have had something to do with it. Who would have thought, five weeks ago, to hear Mr Khrushchev concede that the Americans, French and British "have lawful rights for the deployment of troops in Berlin as occupiers"? With this remark at a specially called press conference on March 19th Mr Khrushchev blew away the contention of his own government in its Note of November 27th that the four-power occupation agreements of 1944 and 1945 had become "null and void."

One phase of the Berlin crisis is ending, another is opening. It is worth while at this stage to list briefly the modifications that the past month has seen in what looked like a rigid Soviet attitude. Mr Khrushchev no longer refuses to negotiate at any altitude below the summit; he accepts, albeit reluctantly, a foreign ministers' meeting first. (President Eisenhower has made the opposite concession by agreeing that a summit meeting shall follow the foreign ministers' meeting if "developments" justify it.) Secondly, Mr Khrushchev has removed from his six-months' time-limit the smell of an ultimatum; May 27th, he now says, was only an approximate date; assuming that the West does not actually refuse to negotiate (which can be ruled out), there will be no unilateral Soviet action then.

Thirdly, the idea of a separate peace between the communist countries and east Germany has been either tacitly dropped or at the least severely modified; this is to be gathered from the changed tone of east German pronouncements on the subject since Mr Khrushchev's last talks with Herr Ulbricht in Berlin. Fourthly, there is no longer any talk (of the kind Mr Khrushchev allowed himself at Tula in February) of communist interference with western military traffic to Berlin, on legalistic or other grounds. East German spokesmen now say that, while it will certainly be desirable that the western powers should get the arrangements for their lines of communication with Berlin down on paper in agreements with the east German government, such agreements need not necessarily involve recognition of the German Democratic Republic; they have plenty of agreements with governments—Bonn, for instance—that do not recognise them.

Finally comes Mr Khrushchev's staggering admission of the validity of the western rights of occupation in Berlin—rights, he agreed, which flowed from the capitulation of Germany. Life must lately have been hard for the Communist jurists who have been working nights to dress the Khrushchev policy in presentable garments of international law. It must have been especially hard for the political theorists of east Germany, some of whom believe in the state which they serve—and who may not find it easy to think of their country's rights as things of straw to be stuck up or blown down at the whim of a volatile man in Moscow.

How sudden the change has been is shown by the March number of the east Berlin foreign affairs journal, *Deutsche Aussenpolitik*. This devotes 25 pages to an essay, well-documented and historically interesting, seeking to prove that the protocols of the European Advisory Commission of September 12 and November 14, 1944, were designed to serve specific inter-allied purposes for a limited time; and that, the purposes having been scrapped and the time dragged out, the western occupation of part of Berlin is now without legal basis. On this east German argument supreme power in the whole of Berlin should long since have reverted to the Soviet commander-in-chief, and from him to the east German government. Mr Khrushchev in February would have assented to this proposition; Mr Khrushchev in March has torn it up.

WHILE Soviet policy for Berlin has been going through this startling evolution, what has been happening to western policy? Underlying all western discussion of the Berlin crisis has been the assumption that the Russians and the east Germans were planning either a new blockade of Berlin or at least a blocking of the approach routes to western military traffic. In the first case (it has been assumed), the communist action would outrage world opinion by its brutality towards the civil population of west Berlin; in the second, it would constitute a forcible interference with western military lines of communication; and either action could properly be answered—after an interval for recourse to the United Nations—by the threat of war.

This does not seem now to be what is going to happen. In reality, it was always unlikely that the east German communists would actually blockade Berlin, and improbable that they or the Russians were thinking of offering the West a clear *casus belli;* much more likely was a demand for compliance with formalities which it would have embarrassed the western governments to have to fulfil, but which it would have been patently foolish to go to war about. What doubt there was has now been removed; the case is not going to arise in a form in which martial resolution will meet it. Either Mr Eisenhower's statement that a land war in Europe was not feasible, or General Taylor's assertion that it was, may have hastened the communist decision to avoid unnecessary and unprofitable risks.

The Moscow communiqué of March 3rd, at the end of Mr Macmillan's talks with Mr Khrushchev, contained a suggestion of what many people have assumed to mean a first step in a disengagement of the western and eastern forces in central Europe:

> Further study could usefully be made of the possibilities of increasing security by some method of limitation of forces and weapons, both conventional and nuclear, in an agreed area of Europe, coupled with an appropriate system of inspection.

Here is the luggage that Mr Macmillan had to declare to the suspicious Customs of Paris, Bonn, and Washington, getting, in each place, no more than a severely limited clearance. Our Washington correspondent reports on page 1171 the cold reception it met with there. From the disturbance that it has stirred up, one would almost suppose it to be new, instead of the standby of foreign ministers' conferences and disarmament talks since 1954. Mr George Kennan is to blame, no doubt, for offering the west a political strategy and labelling it "disengagement," on the principle that in a region where the West is politically strong it can afford to withdraw its military outposts, provided that it gets an equivalent military withdrawal from the other side. General Norstad declared on March 20th that disengagement—"a withdrawal of forces leaving a military vacuum"—would be disastrous to western security. (Who, fifteen years ago, would have used the word "vacuum" to describe an area occupied by the German army?) This is accepted by all the western governments concerned; the Foreign Office, it appears, is "against" disengagement. In Bonn, Mr Macmillan agreed with Dr Adenauer that the limitation of armaments must not be confined to one country, nor must it "discriminate" against any nation or against any type of weapon; and even then, it would have to be accompanied by political concessions from the communist side. (The east Germans, by contrast, give theoretical support to any form of disengagement that has no political conditions attached to it.)

Washington, too, makes political changes in central Europe a condition of the zone of limited armaments. But Mr Macmillan's talks with Mr Eisenhower have also brought out a further western condition: not only is the regional limitation of forces and weapons not going to be a disengagement, it is not even going to be a thinning out, but no more than a "freeze" of forces at, or conceivably even above, the present level. It has to be remembered that German rearmament is still gathering way, and any device for relaxing tension in central Europe would necessarily concern itself with the level at which German rearmament was to be stopped. Still, by the time he has got it home, Mr Macmillan's diplomatic luggage is pretty light.

WHAT now remains before the foreign ministers meet is for the western governments to assess correctly where they stand in the struggle for Berlin which has not ended, but is only beginning. Mr Khrushchev's present ostentatious retreat from any position in which the future of Berlin could conceivably be settled by offering him the choice of peace or war does not mean that the West has won. On the contrary. The West has to worry about what happens to Berlin if, as begins to seem certain, a war for Berlin now is avoided. A leaf may perhaps be taken from the notebook of the tenth annual Anglo-German Conference whose discussions, held at Königswinter from March 12th to 15th, revolved mainly round Berlin and the German question, and were followed by further talks with Burgomaster Brandt and his colleagues in Berlin. Partly because of the immediacy of the Berlin question, but partly also because Dr Adenauer's single-minded pursuit of the Paris-Bonn axis is putting the Anglo-German relationship to a searching test, the Königswinter discussions were more concentrated and more real this year than for many years past.

If a single element has to be picked out from the consensus, it is that the western position in Berlin cannot be held, in the long run, in immobility or in isolation. Berlin is a city, not a fortress. If it remains an island the communists can squeeze out its life by slow and unobtrusive stages over many years; or events can pass it by and leave it an anachronism and a white elephant. All the participants at Königswinter were agreed that west Berlin must not be given up; most were agreed that it would be lost sooner or later if the West failed to discover and pursue a policy aimed actively at an all-German settlement.

It will be a pity if the West is deceived about this either by its own rightful resolution to hold on to what it has, or by the valorous demeanour of the west Berliners themselves. Certainly the west Berliners are steadfast people who know where they want to stand, but as humdrum working people they are also aware that a city, to live, has to have a function. The function of their city is to be the capital of Germany; it has no other, commensurate with its size or with the tension in which it lives. As a provincial town without even a province to administer, it will sooner or later go into a decline.

A policy designed to hold Berlin *for long* for the West must therefore include an intention to restore the city to its place as all-German capital. Plainly this is not going to happen overnight, but only at the end of a long chain of events—which, however, it requires a conscious effort of policy to set in motion. Mr Macmillan's suggestion for a zone of limited armaments in central Europe could be a possible start. It may by now have been so severely trimmed in one western capital after another that the Russians will not look at it. Perhaps, even now, it is not acceptable to the western governments either; that would seem to be the implication of what our Washington correspondent reports. If so, it is time for the Americans to fetch out one or other of the plans from the famous drawer in the State Department. A summer of conferences is, as it seems, to be the price for calling off this year's Berlin crisis; it would be a pity to buy nothing more with it than a few more months of rest and quiet.

An Early Election?

Mr Macmillan will presumably be deciding this weekend whether to call a general election in May. Some factors for him to weigh

THE polling at Harrow East last week suggests that it is still quite uncertain who would win any immediate general election. Compared with 1955, the Conservatives' share of the vote at Harrow fell by 1.6 per cent, of which 0.6 per cent swung to Labour and the other one per cent went to the independent small shopkeepers' candidate. This was a rather lower rate of loss than the Tories have suffered in most other recent by-elections. If opinion in the whole of the rest of the country turned out to have moved since 1955 in exactly the same way as it appears to have moved in this fully employed dormitory suburb of London, then the Government's present majority of just under 60 in the House of Commons would fall by perhaps 20 or 30-odd in an immediate general election. But Mr Macmillan would still get back to power.

Obviously, however, it must be expected that opinion in some of the more industrialised areas of Britain will have swung more firmly against the Tories than it has done in Harrow. Admittedly, the political effect of special factors like high regional unemployment very often proves to be smaller, in this remarkably homogeneous country, than the politicians themselves at first assume; those who talk of much greater discontent with the Tories in the north of Britain than in the south should be reminded that in last year's local elections the difference showed itself to be rather the other way round (the Tories then seemed to have lost more ground since 1955 in London dormitory constituencies, including Harrow, than almost anywhere else). But it is still logical to assume that the strength of local disillusionment with the Government will at present tend to vary somewhat with the length of local dole queues. In heavily unemployed East Belfast last week, in a by-election on the same day as that at Harrow, the Government's share of the vote fell by 4.7 per cent; the whole of this was gathered in by the Northern Ireland Labour party candidate, who also benefited from

the 7.3 per cent share of the vote which the Sinn Fein candidate had won in 1955.

There were other "special factors" in Ulster, beside the fact that it has the longest unemployment queues in the kingdom; since 1955 the Northern Ireland Labour party has gained more of the Protestant vote because it has become more locally "respectable" on the subject of partition. In Lancashire, Scotland and other areas of above-average unemployment most people would guess today that the average Labour pick-up of votes from the Tories would probably be somewhere between the 0.6 per cent gathered in at Harrow and the 4.7 per cent gathered at Belfast. But the key statistic to remember is that Labour would require an average pick-up of only just over 2 per cent of the vote in marginal constituencies across the country in order to reach parity with the Conservatives in the House of Commons.

THE only forecast which Conservative Central Office can reasonably give to Mr Macmillan at the moment is therefore that an early general election would look like being a very close-run thing. That forecast will not be significantly altered even if the Tories have won South-West Norfolk (still less if that by-election has thrown up that most beguiling but not altogether unlikely result, a Labour majority that is smaller than the number of votes siphoned off by the intervening right-wing independent). For the farmers of Norfolk might well be expected to show a regional swing rather different from either the suburbanites of Harrow or the still untested marginal constituencies of the north.

If this is the psephological advice that is given to Mr Macmillan by his party officials this weekend, what should his decision about the date of the general election be? On grounds of the domestic national interest, an election that seemed most likely to bring back either a Conservative or Labour government with only a very narrow majority would be the worst possible thing for the country. That provides one argument for delay. On grounds of party strategy there is no obvious reason why the Prime Minister should prefer an early election to an election next autumn or even next February (he would be able to defer his decision which later date to choose). Nobody can accurately foretell which way the pendulum of public opinion will swing next; but, if re-expansion of the economy is now getting under way, the odds probably seem slightly against its swinging progressively towards Labour. That provides a second argument for delay.

On grounds of foreign policy-making, different considerations could conceivably—but not necessarily—apply. If Mr Macmillan believes that this summer's summit meeting is likely to be a climacteric historical occasion, from which will flow decisions that should determine the whole course of international politics for years to come, then obviously it would be better for the British representative at it to be a man recently confirmed in office by his people rather than a man still teetering on an election's brink. But if he believes that a summit meeting in 1959 will be merely the first round in a patient negotiating process, designed to move the Russians towards saying "yes" eventually about things to which they are initially much more likely to say "no," then there is no reason why the international situation should affect his decision about the election's timing either way. This second reading of the prospect for the summit seems to be more in line with the things that he is reported to have been saying to President Eisenhower this week. On balance, the best advice that an outsider can give to the Prime Minister may therefore be that it would seem slightly wiser not to press the button for a general election within the next three months.

Middle Class Salaries

The current teachers' pay claim makes it of interest to compare the salaries of non-graduate teachers with salaries in some comparable professions

SINCE the war a growing number of middle class professions have adopted, at least for bargaining over pay, the organisation and some of the methods of trade unionism. This has raised a familiar problem. When one large trade union or group of trade unions secures a wage increase in the industrial field, the pressure upon other unions to ask for something similar becomes almost irresistible; the size of one increase sets a precedent for the next. Something of the same sort is now in train in middle class professions as well.

The civil service staff associations have successfully claimed for some time that the only fair way of fixing their salaries is to assess what people get in business for jobs of similar responsibility. More recently, the National Union of Teachers has employed, though in slightly veiled language, a double argument: first, that something more like the prewar differentials between teachers' pay and working-class pay ought to be restored; and, secondly, that teachers ought to have pay comparable with other professions "doing work of like importance." Organisations representing professional people now doing work which carries pay either just above or just below the teaching scale are naturally watching the outcome of the NUT's claim with close interest, determined that they should not be left behind.

The judgment of a Daniel (and the hide of a rhinoceros) are required by anybody who comments on particular differentials within the professions. In the first place, it is a delicate matter to decide who is comparable with whom. The teachers themselves do not explain whether they think that their proper professional comparison is with lawyers and doctors, or with the civil service, or with, say, staff nurses or other medical auxiliaries, or local government employees. Secondly, it is difficult to decide which salary scales or grades to pick out as representative of any profession. It is fairly easy broadly to compare busmen's earnings with steelworkers', and even shipbuilders' with printers', despite the diversity of skilled rates. Skilled and unskilled worker reach their maximum early in life. But the whole point of a professional scale is that it increases over a long period to its maximum, to correspond with the principles of experience and responsibility.

In addition, there may be supplements for special posts (as in teaching) or provisions to move to a higher scale (as in the executive civil service from one grade to another). Contributory and non-contributory pensions make another difference. Moreover, while the hours worked by manual workers are known, and are fairly comparable, this is not true of the professions, where there is rarely provision for overtime, and where the teachers' 13-week holidays contrast with the three weeks which, for example, hospital almoners get. (General practitioners get no *paid* holidays at all.)

In spite of these formidable bars to making comparisons, it seems worthwhile to attempt them. Successive pay claims by the teachers (or by any other profession) will cause them to be made anyway, though with much dispute about the value of this or that condition. The rough comparisons offered here will not satisfy any one of the professions mentioned, each of which will undoubtedly feel that they (*a*) tend to suggest that its members' average is higher than it really is, and (*b*) fail to show how much harder-worked its members are than all the others. But the rules of comparison we have adopted for our tables are fairly clear-cut.

We have concentrated on the salaries of non-graduate professional people; it will be noted that the entry qualifications into some of these professions are nevertheless in their own way formidable. We have not listed the salaries of the minority of people who rise to the very top of their professions, like headmasters of secondary schools or chief general managers of joint-stock banks. We have distinguished the professions mainly staffed by women (in Table I) from those mainly staffed by men (in Table II). We have listed non-graduate teachers first in each table, because the most topical arguments about comparisons in pay are concerned with them.

Table I shows the salaries now current in the mainly female professions. Comment on these figures could be extensive, but only one remark will be made here. Recent awards to nurses and medical auxiliaries have

TABLE I.—PROFESSIONAL WOMEN'S SALARIES

Profession	Basic Scale: Starting Salary	Basic Scale: Eventual Salary and rate of increments	Salary if Promoted	Age of Entry	Qualifications
Non-Graduate Teachers	£435	£891 by 17 annual increments	*Additions* of £79–£367 to basic scale(1)	20	2-year training
Staff Nurse/ Ward Sister	£496	£800 by 13 increments, but not regularly(2)	Matron's salary £840–£1,520 (in training hospital) (3)	21	3-year training as student nurse
Psychiatric Social Worker	£610	£845 by 7 increments of £25 and 2 of £30	Senior PSW's salary(4) £730–£960 (at age 39 at earliest)	27(5)	2 years social science diploma and training experience and extra year of training
Hospital Almoner	£525	£765 by 11 annual increments (6)	Head Almoner's (grades 2 to 4) salary(7) £655–£950	22	3 years training at university and hospital

(1) This must be added to basic scale and takes account of the promotional range from graded post I to departmental head (D), but makes no mention of possibility of promotion to head teacher which carries a further increment of £125 to £330. Twenty-six per cent of all women primary-school teachers are above basic, including 40 per cent of all women teachers aged 40 and over.

(2) Promotion to ward-sister is not guaranteed and minimum age is 25.

(3) Only a limited number of posts available. Salary according to number of beds.

(4) This scale is normally reached late in life; only limited numbers of such posts are available.

(5) The average age of entry to this profession is much higher than 27, as maturity of character is essential.

(6) This assumes promotion to scale of Head Almoner, Grade I, will be automatic in present shortage.

(7) Three scales, promotion on merit and as posts fall vacant; about 10 per cent reach these top scales.

TABLE II.—PROFESSIONAL MEN'S SALARIES

Profession	Basic Scale: Starting Salary	Basic Scale: Eventual Salary and rate of increments	Salary if Promoted	Age of Entry	Qualifications
Non-Graduate Teachers	£499	£945 by 17 annual increments	*Additions* of £79–£370 to basic scale(1)	20	2-year training
Civil Service Executive Grade	£390/ £510	£1,290 by 23 increments (2)	Senior Executive Officer's Salary(3) £1,360–£1,610	18/21(4)	GCE with 2 A level passes (or university, 2nd class honours)
Local Governmt. Admin. Profess. and Tech. Div.	£575	£725 by 5 increments	Senior posts at £725–£1,325 according to grade attained(5)	Varies	Varies according to to district and grade
Bank Clerk(6)	£260	£800 by 15 increments	Branch Manager's salary £1,350 minimum at approx. 40	16	Usually 3 or 4 GCE passes at O level
Probation Officer	£610	£910 by 12 increments	Senior Probation Officer's salary(7) £915–£1,035	23 (min.)	—

(1) See note (1) in Table I. Forty-nine per cent of all male teachers have supplementary allowances, including 60 per cent of men aged 40 and over, and 78 per cent of men aged 50 and over. The average salary of the head of a primary school is £1,200 and most men can expect to get it.

(2) Assumes that promotion to Higher Executive Officer will be automatic.

(3) This scale may be attained at age 45 by about half of the men.

(4) Entry by promotion from clerical grade is important, but people from this entry generally do not rise higher than about £800 p.a. owing to later age of entering the scales.

(5) This is a very rough approximation of the position; it is impossible to say what proportions reach these higher scales.

(6) Approximate only, as banks' conditions vary.

(7) About 1 in 10 reach this scale, and a very few reach higher scale—up to £1,300.

brought their salaries fairly well into line with the rewards of teaching for women ; but taking into account the arduousness and responsibility of the work, qualifications, age of entry, and conditions, clearly women teachers come out of the comparison very well even now. On April 1, 1961, women teachers are to reach full parity with men teachers ; they will then be doing, age for age, distinctly better than the other professional women listed in the table.

Table II shows current salaries in some mainly male professions. These figures suggest that the expectations of male teachers are now slightly behind executive grade civil servants with not dissimilar qualifications ; teachers who become deputy headmasters of secondary modern schools (at £1,400 a year) do nearly, but not quite, as well as senior executive officers. Bank staff who get branch managerships (as at least one in three expect to do now) do fully as well as male teachers. Local government officials, in general, do not. Most probation officers (who may have to deal with the teachers' products) are well behind male teachers, especially in the later stages of their careers. The picture here, however, is a much more varied one than it is with the women ; it would be wrong to generalise that, on present scales, non-graduate men teachers are better treated than most of the other men in our table with broadly comparable trainings and responsibilities.

It is not proposed to make detailed judgments on such rough and necessarily compressed figures. They could be extended to other professions not obviously lower or higher in status than teaching. The discussion could be widened by commenting on graduates' pay as well ; in general, graduate allowances for teachers are at present too low. If present salary scales of, for example, Government scientific officers or officers in the armed services are taken as a yardstick, all the men in Table II can complain that they have lagged behind.

But our figures do show that if the teachers' claims for a basic salary scale of £600-£1,200 (an increase of about 25 per cent) are granted, together with the other concessions they are demanding, women teachers will be far ahead of almost all professional women, other than graduates (for example, general practitioners). The men teachers will also then be better off than the other professions listed here, if not so decisively ; the pay of non-graduate teachers will then compare well with graduates in some other professions.

On good trade union principles, however, most of the professions listed here would then be entitled to claim that the differential between them and the teachers should be narrowed again. They—and other professions like them—would have a case for a general rise. (And probably the higher-paid professions would react by also demanding increases to restore their own differentials.) The present claims of the teachers would cost quite £60 million a year to ratepayers and taxpayers. Though teaching is a numerous profession, the other professional employees of the state and local authorities are even more numerous in aggregate.

This is not an argument for resisting increases in teachers' (even non-graduate teachers') pay ; but it is an argument against an increase in teachers' pay alone, unless teachers can establish a claim to special treatment. If the teachers get more, they will in fact have established a claim for what amounts practically to an all-round increase in the pay of the professional classes, as compared with the trade unionists below them and the business executives at present above.

NOTES OF THE WEEK

CENTRAL AFRICA

Setting Nyasaland on Fire

SIR ROBERT ARMITAGE'S blow-by-blow account (Cmnd 707) of the spread of lawlessness and violence by the Nyasaland African Congress party after the return of Dr Banda last summer confirms that he had defensible reasons for declaring a state of emergency. His despatch sets out his allegations of a culminating "R-day plot" by Congress to murder Europeans and Asians, sabotage communications, and assault authority within 10 to 21 days of Dr Banda's arrest. Sir Robert further suggests that Dr Banda meant to court arrest, did not want to negotiate with Lord Perth, and was privy to the "R-day" plan though he did not attend the conspiratorial meeting at which it was worked out. The source of Sir Robert's information must be police informers, and, presumably in order to protect their identities, no detailed evidence that a court would accept is offered. Nevertheless, in such deteriorating conditions, the fairest interim judgment must be that the governor cannot be blamed for acting on the reports of Africans in his security branch (though it is standard practice to divide these by about ten). The Devlin commission will now examine the whole of this aspect of the affair.

Sir Robert's despatch, however, makes no mention of the ramifications of the plot which Sir Edgar Whitehead alleges to have justified the Southern Rhodesian state of emergency and the repressive pieces of legislation which he has been introducing—one of which, his Detention Bill, he is having to modify after strong protests (from lawyers and liberals in Southern Rhodesia, just as much as from liberals in this country). Sir Roy Welensky and Sir Edgar Whitehead declared that there were to be diversionary uprisings in Northern and Southern Rhodesia, and have hinted that this

elaborate Federation-wide plot was hatched by some Russian master-mind at the Accra conference. These gaps in the white paper may be filled in later. But there is at least one difficulty about them.

To have carried through a successful bloody revolution in the Federation would have required very great skill, intelligence and co-ordination on the part of the plotters. The whole Nyasaland plot, as described in Cmnd. 707, seems to fall into one of two quite different categories. Either, first, it suggests a childish, if fanatic, inability to see realities or anticipate the inevitable reaction of the authorities. If the "R-day" plan in Nyasaland had been *initially* successful and the governor killed, what was supposed to follow: the proclamation of an independent republic, with no interference from anybody else ? Or, secondly, some people may plausibly suspect that the African leaders never really intended R-day to dawn ; they may merely have wanted the report of it to scare the authorities in central Africa into doing various excitedly repressive things, which would shock liberal opinion in Britain and increase support in this country for breaking up the Federation. If this is the right reading, the authorities in the Federation and both political parties at Westminster, *in their different ways*, have until this week seemed to be doing exactly what Dr Banda wanted. But now, and at last, one hopeful piece of news has come from Westminster.

Putting the Fire Out Again

THE one really hopeful piece of news about Central Africa this week has been the Colonial Secretary's intimation that he recognises that "Parliament would like to be associated" with any machinery that is set up for the coming review of the Federation's constitution in 1960. It seems possible that the British Government is thinking in terms of the early establishment of a body like the Simon Commission which considered proposals for a constitution for India thirty years ago, a body on which both Labour and Conservative MPs would be extensively and authoritatively represented. Some remarks by Mr Gaitskell on Tuesday suggested that he had been told some such idea was in the air, but that, so far, Sir Roy Welensky had not yet assented to the proposal.

He should be urged to assent to it promptly. Perhaps Sir Roy, at his great distance from Westminster, has not yet fully realised the dangerous straits into which party passions about his Federation have been drifting in Britain. Until this hint of a Simon-type commission was loosed behind the scenes, the British Government's decision to proceed to a probe in Nyasaland by way of a white paper and a judicial (instead of a parliamentary) commission was having the foreseeable and worst possible results. Many Labour and even Liberal MPs had decided to say that they did not believe Sir Robert Armitage's despatch in Cmnd 707 even before they had read it. If the four-man investigating commission under Mr Justice Devlin were to be the only body to look into the affairs of the Federation, some Labour MPs would be quite capable of impugning the accuracy of even its report. Attitudes in Westminster towards the Federation's crisis are in grave danger of becoming a matter of party political face.

The only way towards a policy of cooler bipartisanship is to send out MPs of both parties to the spot, in a Simon-type commission which will look towards the future instead of to the recent angry past. Many Southern Rhodesians bitterly oppose any such "interference" by British MPs. But in their own house they have been upholding the superior wisdom and competence of parliament as against the lawyers to handle their internal situation. A fair debating point can be made by quoting the unconscious wisdom of one Rhodesian member (Mr Pittman) in supporting his government's detention measure last week :

> Parliament is at least in as good a position as any other body to find out facts . . . it is in a better position than any other body to determine the political aspects of the inquiry.

If so, that goes for British as well as Southern Rhodesian MPs. A solution in central Africa can only be a political one, and is therefore best handed over largely to politicians.

NUCLEAR TESTS

Ticking Over

THE Geneva talks on the suspension of nuclear tests, which have been adjourned until April 13th, are being allowed to tick over until the foreign ministers—or directives from the summit itself—decide whether or not the machinery should be revved up again. The last brief that Mr Tsarapkin got from Moscow allowed him to agree to three more articles for the draft treaty ; but this did no more than let Mr Wadsworth and Mr Ormsby-Gore get away for Easter with a minimum of progress to report. The first four articles—principally concerned with setting up an international control commission—were agreed in December. Russia has now accepted two further American proposals. One stipulates that the agreement should remain in force indefinitely, but that any signatory may withdraw if it finds that it is being violated. The other requires the control commission to examine the system's workings after two years in the light of scientific progress in detecting explosions ; any changes would, however, be reserved to the treaty signatories themselves. The third new article accepted by the Russians is a British proposal to register the treaty with the United Nations.

This is as far as the talks have got after 18 weeks and 72 meetings ; it seems little enough after the Soviet Union's apparent acceptance of the report by the conference of technical experts last August. But the talks have at least elucidated the Soviet position on the three main issues. The Russians want a veto on all decisions of substance in the control commission. They want inspection of suspected explosion sites to be by *ad hoc* teams composed of nationals from the country being inspected, accompanied by foreign "observers." And they want all personnel at control posts to be nationals of the host country, with a few foreign "controllers" to observe, but not to interfere in, the operations.

The West has now to decide whether this type of "self-inspection" is better than nothing at all—in the hope that Soviet suspicions can be quietened by experience, so that an effective system can eventually be built up. Mr Macmillan is believed to be pushing the idea that the extent of a nuclear ban should depend on the initial control machinery's own adequacy. This would probably exclude tests held underground and in outer space—a position that comes close to that adopted by the American military advocates of continued testing last summer. It looks a modest step in all conscience, but Mr Khrushchev's present attitude does not allow higher hopes.

THE SUMMIT

Dacha Diplomacy

WHERE will the world's political Everest turn out to be, when the "summit" is finally scaled? Reports from Gettysburg tend to confirm the belief that, wherever the great men meet, it will be in some sylvan retreat, not unlike Camp David itself (formerly known as Shangri-La). The white elephantine palace by the lake at Geneva may be good enough for the foreign ministers whom Mr Khrushchev holds in such contempt, but not for top people. Geneva would, in their view, provide far too much room at the top—room for troops of advisers, battalions of reporters, brigades of photographers. (Geneva might also painfully remind Mr Khrushchev that at the 1955 summit talks there he ranked below Marshal Bulganin, whom he has since unmasked as a "double-dealing traitor.")

"The higher the fewer" is now the slogan; before talking it all over, the first essential is to get away from it all. Mr Macmillan has long been addicted to holding consultations during country-house weekends; Mr Eisenhower's predilection for Gettysburg and the golf course is backed by medical advice; Mr Khrushchev's country seat at Semyonovskoye and palace by the Black Sea are better known than his town residence; General de Gaulle and Dr Adenauer have enjoyed a whole series of rendezvous in the tranquillity of Colombey-les-deux-Eglises, Bad Kreuznach, and Marly. It is all very elegant in a quiet Edwardian way; hotel-keepers in Europe's more obscure spas must be hoping for a revival of the old combination of taking the waters and diplomacy; there has even been a hint dropped about Gleneagles. The only casualties are weekends: Mr Macmillan has just lost two, one closeted with Mr Khrushchev at the Semyonovskoye dacha, one with Mr Eisenhower in Maryland, but it hardly seems to bother him. The Prime Minister's apparent readiness to contemplate an infinity of quiet weekends at the highest level suggests that he will be quite at home in the new age of dacha diplomacy.

SOVIET UNION

Visitor to Britain

RECONNAISSANCE is internationally fashionable this spring. Among the various expeditions that have been sounding out moods in the capitals of East and West, last week's Soviet delegation to Britain held an important place. It included the editors of *Pravda* and *Kommunist*, and was headed by no less a person than Mr Mikhail Suslov. This thin, bespectacled intellectual, for all his donnish appearance, is one of the leading members of the party's presidium. He has long been a member of the secretariat, and has the reputation of a theoretician with a strong bias toward stalinist orthodoxy. He seems particularly concerned with other communist parties, and is always present at important inter-party negotiations.

This time, for a change, Mr Suslov was asked to get in touch with "social-democrats." The pretext for his visit was an invitation from the Anglo-Russian Parliamentary Committee, which is run by left-wing members of the Labour party; the main purpose was to talk with the leaders of the party. Despite Mr Khrushchev's jocular predilection for the Tories, Moscow seems to have grasped the fact that, whether or not the Labour leaders with whom Mr Suslov has been talking are destined to head the next British government, Labour is not without influence on official policy even while it is in opposition.

Moscow's search for allies has now become more sophisticated. The Soviet press has begun to draw a distinction between "reactionary social-democrats" like MM. Spaak and Mollet and "labour leaders" like Mr Bevan. Mr Bevan, who was violently criticised by Soviet commentators at the time of his H-bomb speech last year, is now very much in Russian favour. A recent issue of *Kommunist* reproduced an article of his from *Tribune* and interspersed it with friendly comments such as "wise people, and among them Mr Bevan. . . ." Russia may only have a single party, but the men in the Kremlin have realised that to deal with Britain it is not quite enough to lay out the red carpet for Mr Macmillan.

Changing Planners

THE Gosplan has changed heads. Last week Mr A. N. Kosygin was appointed as the new chairman of the Soviet central planning authority. His predecessor, Mr Kuzmin, had not stayed long in his job. He was the surprise choice for this key post less than two years ago, at the time when Mr Khrushchev was decentralising the management of the economy and reshaping the planning system. Formerly a rather secondary figure in the party hierarchy, he was thus put in charge of Russia's much-publicised first seven-year plan.

One possible explanation for his replacement might be a certain discontent both with the shape of the plan and with its fulfilment. During the recent party congress, several speakers hinted that the planners might have been over-cautious in their estimates. Another possibility is that Mr Kuzmin, as a newcomer to high office, could not impose his views on the heads of the regional economic councils. The decentralisation of management carried with it some risk of encouraging local tendencies towards autarchy and, to counter this, a more formidable personality may be required as boss of the Gosplan. Members of the party presidium may also have urged that the planning chief ought to be one of themselves, so that he could answer relevant questions at their frequent meetings.

Mr Kosygin seems well fitted for the post. He has a long party career behind him and has been prominent in industrial management for some twenty years. In recent years, as a deputy prime minister, he was responsible for light industry. He is also a candidate member of the party presidium. It remains to be seen whether the change of planners involves changes in the plan itself, and whether Mr Kosygin's past connection with light industry is an indication of their nature.

ALGERIA

Answering the Call

M. DEBRÉ'S luck seems to be in at last. He left for Algeria last weekend, intending to repeat General de Gaulle's appeal to the rebels to accept local cease-fires—"the peace of the brave"—in his speech at Constantine on Monday night. The marked lack of enthusiasm for this offer when it was first made last October suggested that repetition might be a politically hazardous enterprise; and M. Debré was painfully conscious of General Massu's disillusioning experience with the Algerian leader, Si Azzedine, earlier this month. But, fortunately for him, a rebel detachment was already on the way from Tunisia to give itself up. This band had apparently been at odds with the rebel leadership in Tunisia; there are suggestions that its leader, Ali Hambli, was among those involved in the plot against the rebel government's war minister, Krim Belkacem. Ali Hambli now says that he had always thought General de Gaulle's proposals had a real interest. While he seems to have taken some time to answer the call, it is an undeniable French success that he should have brought 150 men with him and beaten off determined rebel attempts to stop him. It remains to be seen whether his example will encourage further defections.

Ali Hambli's appearance will have been all the more welcome to M. Debré because both the Algerian command and the settlers' organisations have become increasingly restless over the need for more troops. The new emphasis is likely to be on a strategy of greater manœuvre by local commands, although settler opinion is opposed to any reduction of troops on guard duties in farms and small towns. Meanwhile, an optimistic economic report by the delegate-general in Algiers, M. Delouvrier, has improved the political atmosphere. He expects the iron and steel works at Bône to be built in four years (although financing has yet to be arranged); and the price of natural gas to be made available for Algerian consumption from Hassi R'mel is to be one of the cheapest in the world. Perhaps encouraged by this, 48 new enterprises are being set up in Algeria at present.

HOUSE OF COMMONS

End of Term Report

IN the interval between Christmas and Easter the House of Commons has amply displayed one of the two usual signs of approaching dissolution—thin attendance and apathy towards current business—but scarcely any of the other—an excess of the fractious froth of partisanship. The parliamentary reputations, which have been most noticeably continued on the upgrade have been those of Mr Iain Macleod, whose triumph in the unemployment debate adds one more claim for early advancement; Mr Gaitskell, whose grip on the party leadership is now obviously strong enough to withstand an electoral setback; and Mr Grimond, whose instinct for the jugular has repeatedly enabled him to exploit his peculiar position to marked effect. The Prime Minister continued to turn his tricks with a grandiloquent aplomb. But, in view of what was generally known in London at the time, one can only hope that when documents and memoirs are available a future Sir Lewis Namier will analyse without pity his remarkable statement in answer to the debate on the Anglo-Egyptian financial agreement, that Sir Anthony Eden had "the consistent and loyal support of all his colleagues in the Cabinet" from the beginning to the end of the Suez venture.

This replay of the rancours of Suez produced one of the year's best and most indicative debates. The Labour party at last seems to be coming out of the state of traumatic shock induced by the discovery that many of its rank-and-file supporters were not with it in its bold and angry stand against the attack on Egypt. Mr Gaitskell's speech was as incisive as, but more effective than, some of those that he delivered at the time. The Prime Minister's reply looks like a foretaste of the tattier tactics that will be used by the less inhibited Tories in the election. These will evidently be directed to depicting the Opposition as a soft, unpatriotic party, giving comfort to the country's ill-wishers abroad and in the colonies and saddled with leaders who lack the nerve to take risky actions in time. However he might subsequently act in Downing Street, Mr Gaitskell has been controlling his own party with a great deal of assurance. The efforts of Messrs Silverman, Mikardo and Zilliacus to carve out a public role for themselves in defining disengagement to mean immediate unilateral concessions have been allowed to dwindle away without fuss. This has been matched on the Tory side by the containment of the former Suez rebels over Cyprus. Both parties go forward unitedly towards the barricades, but neither gives the impression that it knows it is going to win.

TV AND THE ELECTION

The Parties' Picture

THE announcement about arrangements for televising the election is pretty obscure. There are to be more "party politicals," which are sales pitches completely controlled by the parties, but they are to be shorter. It is now common ground that the day of the straight half-hour speech into the camera is over; the coming contest should see some intriguing if sometimes nauseating experiments in slicked-up advocacy. But the main trouble is that the parties have now been handed so many political shows during the short campaigning season that the broadcasting organisations are saying that this is very nearly all the politics which the public will bear without actually switching off. The commercial companies have a special problem because party political programmes mean abandoned revenue; they are therefore particularly susceptible to the feelings of the advertisers about the most popular way of filling the remainder of the time.

Nevertheless, the probably excessive amount of time which has been given to the parties should not be allowed to rule out the discussion and analysis of issues under conditions that are not controlled by them. Apparently all that the parties themselves have claimed is a right of veto on those of their own members who are invited to take part in these outside programmes—both Tories and Socialists suspect the weakness of the BBC and ITA for the Boothbys and the Foots. Is this the only restriction they have asked for, and what, if anything, have the broadcasting organisations demanded the right to do off their own bat? The public has a right to be told more about the understandings that have been reached. In the meantime, the BBC and the ITA should be prodded into making the kind of plans for illuminating the election, independently of the parties, that will establish their rights once for all.

All concerned should be congratulated on the agreement that television can treat election developments as news, though it is astonishing that anybody should ever have opposed it. It is good news that there are to be regional surveys of fights in constituencies in which minorities can take part, provided they are supplying an agreed quota of candidates within the region. (Absurdly the quota is supposed to be a secret, in case minorities rush to plonk down their exact number of deposits in order to buy time on the air; actually it is understood to be twenty per cent.) But all this is still

much too furtive. There ought to be some public body before whom aggrieved interests can object if they feel they are not given a proper outlet on the screen.

PROTECTING CONSUMERS

A Committee to Illuminate

THE Government's decision to set up a committee to "consider the whole question of consumer protection" is in part an electoral manœuvre. Labour was going to make quite a big thing in the coming campaign out of its promise in its recent sixpenny glossy that a Labour government would "insist that reasonable standards are laid down for a wide range of goods, and that goods are properly labelled." As Labour's projected patchwork of special legislation would have been much less appropriate than the general inquiry that is now to be set afoot, the Tories are not only pinching the Opposition's clothes, but are also proposing to wear them more efficiently.

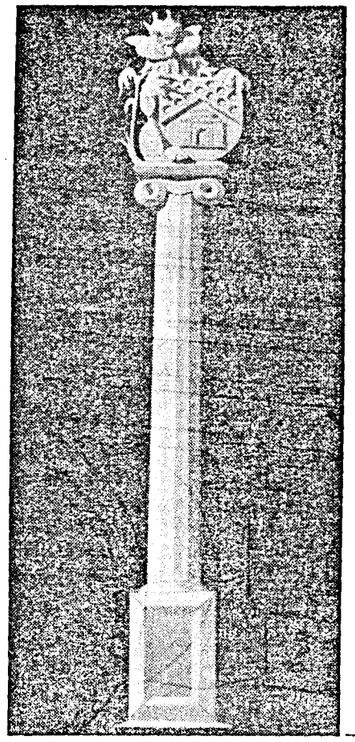
The inquiry should be welcomed, and its ambit should not be too restrictively confined. It will presumably include the whole field of weights and measures. Here the Hodgson Report of 1951 offers a none too happy precedent, demonstrating—as in the notorious question "what is the weight of a pre-packed mixed grill?"—just how awkward it can be to apply the apparently straightforward rule that foodstuffs must be sold by weight. It should include the matter of labelling—again straightforward enough if penalising positive misdescription is the only aim, but extremely tricky if full information is wanted. It should include advertising. Here the cause of consumer protection merges, at all events on the Labour side, into something which the charitable might qualify as an ethical and aesthetic crusade, and the uncharitable could tolerably describe as sheer vindictive bloody-mindedness. (Dislike of TV advertising, in particular, habitually leads Mr Francis Noel-Baker into sweeping denunciations of every product so advertised—which means, in practice, every product launched on the market since ITV was initiated).

The subject matter before the committee should also include the question of standards, whether centred on the single "good pass" of the British Standards Institution kitemark, or embodied in the more specific advice tendered by the Consumers' Association; and this in turn should raise the legal question of "slander of goods." It should include the terms of hire purchase agreements; the content of guarantees; the procedure of retailers, wholesalers and manufacturers in cases of complaints; and, by no means least important, the efficacy of those toothless watchdogs, the consumer councils of the nationalised industries.

What it should not include—and here one could wish for more clarity on the left—is "consumer protection" of the kind that would circumscribe instead of illuminating consumers' freedom of choice. It is no business of Parliament to forbid the competitive sale of junk, sham glamour, or even totally un-nutritious soft drinks. With reservations, admittedly extremely important, concerning actively dangerous or deleterious products, the only necessity is that the consumer shall know just what he is getting for his money. Any Conservatives who may feel unenthusiastic, in a cause so largely supported by the anti-business left, should remind themselves that the whole case for private enterprise rests on its superior power to satisfy—not to delude or to diddle—its customers.

TIBET

Clash of Arms



LAST week, the Indian foreign ministry confirmed the rumours that fighting was going on between Tibetan nationalists and the Chinese garrison in Lhasa. Neither the extent of the struggle nor its duration are easy to assess, for Tibet is now even more hermetically sealed than usual. It appears that the rebel Khamba forces, who control parts of southern and eastern Tibet, began their advance towards Lhasa late in February, and were joined and supported both by the local population and by the small Tibetan army. At the same time, the originally peaceful demonstrations in the capital, set off by popular uncertainty about the fate of the Dalai Lama, turned into clashes with the Chinese garrison. On the day of the official announcement in Delhi, Lhasa radio went off the air. Chinese troops were reported to have been digging trenches near the Indian frontier. The Tibetans are looking towards India for support: two members of the Khamba war council have crossed the frontier, hoping to enlist the help not only of their compatriots in India, but also of the Delhi government; and in Lhasa a crowd of women has demonstrated in front of the Indian consulate and appealed for intervention. Only ten days ago, Mr Nehru had dismissed the reports of unrest in Tibet as "grossly exaggerated," maintaining that it was "more a clash of wills at present than of arms." India now views the situation differently; but in spite of its close interest in Tibet, it is still very reluctant to do anything that would invite Peking's displeasure. Mr Nehru announced on Monday that he had "no intention of interfering in the internal matters of China."

The agreement signed in 1951, which promised internal autonomy to Tibet, has meant nothing to the Chinese communists. Although, two years ago, they had to make certain concessions to "local conditions," there were signs recently that they would again try to force the pace. The party conference in Sinkiang on the problems of local nationalism, which ended on March 6th, criticised "national minorities" whose subversive activities are "aimed at sowing dissension among nationalities and wrecking the laws of the state and the party." In a New Year pep-talk, Tan Kuan-san, the deputy secretary of the Chinese communist party committee in Tibet, condemned the practice of "rightist conservatism and tendency towards individualism within the party," and recommended an all-round tightening of discipline as a means of getting the Tibetans to imitate in 1959 the much publicised Chinese achievements during the past year. The Tibetans have evidently reacted sharply to this renewal of Peking's pressure. They seem doomed to share the fate that overtook the Hungarians in 1956; but the news of their rising and of its repression will now echo loudly round Asia, and will scarcely improve Peking's reputation among neighbouring peoples—including the people of India.

BALL ROLLER AND NEEDLE BEARINGS FOR PRACTICALLY EVERYTHING

Nasser has resorted to a more stereotyped way for an Arab to show that he is a better nationalist than his neighbour—action against Israel. He has accused General Qasim of failing in his anti-Israeli duties, and has demonstrated his own Arabism by stopping two ships passing through the Suez canal and compelling them to unload their Israeli cargo.

Israeli vessels have always been barred from the canal, but since the Sinai campaign other ships trading between Haifa and the East have been allowed through with only minor discomforts—for instance, they may be refused fresh water or put at the end of the queue. On February 26th, however, the Egyptians confiscated the potash and cement on a Liberian ship bound from Haifa to Ceylon, and a fortnight later they seized the cargo of a west German ship carrying cement to Malaya, Hongkong and the Philippines. Israel suffers no direct loss, since the cargoes had already been bought, but this sort of hazard will, of course, seriously damage its trading prospects with the East—and it sets great store by its budding friendships with a number of Asian and African states. As a first step, Israel has protested to the Security Council ; Egypt, in reply, argues that it can do what it likes since the two states are technically at war. This familiar wrangle has been chewed over time and again in New York to no effect. The lesson that the Sinai campaign succeeded, albeit only temporarily, where the United Nations has failed will not be lost on the Israelis.

The charge against General Qasim is that he failed to respond when, four months ago, President Nasser asked for Iraq's help against Israel's "aggression" on the Syrian border. In November and early December Israel protested to the Security Council about shelling incidents on its Syrian frontier. At the time it seemed improbable that the United Arab Republic wanted to risk a showdown, and the Israelis, in private, attributed the incidents to Syrian hotheadedness rather than to direction from Cairo. But now President Nasser, to drive home his forensic point, is speaking in terms of a decisive chance lost through General Qasim's un-Arab chicken-heartedness.

The Israelis, for their part, stick to the belief that President Nasser is the West's most dangerous enemy. Dismissing as naive the theory that there is a choice between Nasserism and communism, they argue that President Nasser himself is still the channel through which communism is entering the Middle East. Although this is out of key with the western assessment of the present situation, they are unlikely to change their minds while Cairo keeps on prodding.

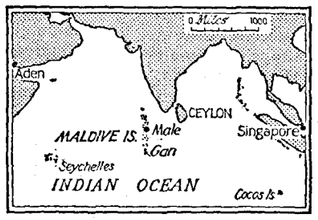
Red Herring from Brussels?

THE executive commission of the European Economic Community has now completed its first significant political task, a report on the six-nation community's relations with outsiders—the first attempt to fill the vacuum left by the collapse of the free trade area. But the Hallstein report got no bouquets from the ministers of the Six when they considered it last week.

The report begins by analysing why the free trade area plan broke down. A number of standard community objections to the scheme are listed; and the report points out that the new community is inevitably rather defensive in its resistance to other schemes that might weaken it. It agrees that there is something in the complaint that opposition to the free trade area was slow in making itself felt. It makes no mention of the fact that some French industrialists and politicians do not want Britain in on any terms. It notes the divergence of objectives among the free trade area's sponsors, some of whom wanted a step towards worldwide free trade, others further integration in Europe. The two aims were incompatible, the commission believes. If a free trade area had been loosely organised, tariffs round it would have certainly tended to fall to the level of the lowest; and some continental countries did not want this. But if existing tariffs were to remain effective, complex institutional machinery would have had to be created that might have strangled more trade than it freed.

The commission's *post-mortem* is interesting enough, but it has not drawn many constructive conclusions. Instead of concentrating on Europe, the report talks at length about the wider world. The commission has indeed discovered some facts which may be of interest to antiquarians—that Haiti and Salvador, Argentina and Peru, all send a larger proportion of their exports to the community than Britain does. One wonders for a moment if it is going to suggest they should join. But no such revolutionary suggestion is made. The commission makes a number of limited proposals for a world-wide approach to the problems the birth of the community has precipitated. The community, Britain and the United States should get together to concert policies for reviving the slack economy of the west; the European countries should agree on a joint and positive reaction to the American proposal for worldwide tariff talks in the General Agreement on Tariffs and Trade; and a number of proposals are made to help the undeveloped countries.

In Europe, on the other hand, though the commission gives three cheers for OEEC and three moans for the division of the western part of the continent, it has nothing more positive to suggest than an agreement to enlarge all quotas progressively by 20 per cent during each of the next four years, and to negotiate for other special arrangements if action by the six-nation common market hurts outsiders. That favourite British proposal, the "complaints procedure," has boomeranged. The report virtually admits that the commission does not know what to do about the division of Europe. While the community is in its infancy, it has some interest in ensuring that not much is done at all. And it knows that one member country, France, fully shares that view.



It is tempting to regard the world-wide approach as a red herring, designed to divert attention from the real issues in Europe; no doubt it was partly intended as such. But the proposals on the world-wide plane might be diverted back to a very useful purpose if placed in a different political context—the context of British membership of the community on the lines that have been considered in *The Economist*. The suggestions of the commission for helping the undeveloped countries—commodity agreements, and reductions by European countries in their revenue duties on commodities like cocoa and coffee—could form a vital part of the big deal with the Commonwealth and the rest of the world which would be necessary if Britain sought to join the community. And the proposal for tariff talks in Gatt would have to be taken up as a matter of urgency if America were to be brought to accept the proposal, and if the revision of Gatt which would follow inevitably were to take place in the right climate. The basic issue behind the free trade area clash—whether Europe should pursue liberal or protectionist policies towards the outside world—cannot easily be resolved; but it is important that the commission has now committed itself on the liberal side.

MALDIVES

No Agreement on Gan

RED herring must be a rewarding catch in Maldivian waters. The original dispute over the ratifying of the agreement between the British and Maldivian governments over the air base is becoming obscured by all sorts of other issues. Some of the southern atolls near Gan and Hittadu, on which the RAF is building its airstrip and radio station, have revolted against the authority of the capital, Malé, hundreds of miles further north. The Maldivian government alleged that this was the work of Major Stevens, a retired official who has conveniently been combining his ornithological interests with acting as the RAF's local liaison officer. The British Government is quite clear that the real reason is unwise taxation, and vexatious regulations about coconut trees, imposed by Malé. Then came the report that Maldivians were starving (and that eighty had died) on Suvadive atoll; whereupon the British decided to provision them as a humanitarian gesture, while Malé called this unnecessary foreign interference.

Behind all this lies the difficulty that, while the base is already being constructed, the agreement, although initialled, is not formally ratified. The Maldivian government now wants Britain to declare it formally sovereign and independent, but to continue *de facto* as the protecting power. The British government insists that any change in the present protection agreement (renewed in 1953 and 1957 and going back to 1887) must be renegotiated between both sides; but it is quite willing both to concede the Maldives freedom to negotiate with other governments on trade and cultural matters, and to contribute to the islands' economic development. Clearly London fears that if the Maldives were declared independent unilaterally, it would be possible then for Malé to claim that all previous agreements were null and void: and that might be the end of the RAF's rights on Gan. There seems to be a real fear that the Maldivian foreign minister, who for eighteen months has been conducting talks in Colombo, is receiving a good deal of outside advice on how to ease the British out of their legal rights in the islands. This will probably not be successful—but the RAF watches these events with anxiety, for it pins all its hopes for maintaining a Commonwealth network of Indian Ocean staging points on Gan, which now promises to replace Suez as the Clapham Junction of Empire.

MENTAL HEALTH BILL

Progress in Committee

THE standing committee on the Mental Health Bill is now streaking through its clauses with commendable speed; between February 10th and March 24th it had disposed of over half of them, including the most controversial of them all—those concerned with the compulsory treatment of persons suffering from mental disorder and the subsection defining a psychopath.

This progress does not mean that the committee's examination has been perfunctory. On the contrary, a few small but useful amendments have been accepted and some doubtful points discussed at length. The Minister, in resisting an amendment that local health authorities should be required to submit plans for the provision of community care within two years after the Bill receives the royal assent, announced his intention to give directions to local authorities under the National Health Service Act, which empowers them to provide for the care and after-care of the mentally disordered. Another important point dealt with was whether there should be some compulsion on hospitals to accept compelled patients in their area, as there is at present with regard to the certified. The Minister replied that it would be wiser to arrange for admission by administrative arrangements rather than by a legal obligation—which would restore the designation of certain hospitals (and consequently the stigma on them that the Bill tries to remove). It is still likely, however, in spite of the Minister's reassurance, that a class of unwanted patients will arise, who will be hawked around unsuccessfully.

A third point, on which Mr Walker-Smith gave some useful clarification, concerned the definition of a responsible medical officer, who, among other things, is to have power to discharge a compelled patient. He is to be the senior doctor in charge of the case, not, as at present, the medical superintendent. This is a further, and welcome, step in bringing mental hospitals into line with general hospitals; but it may also put the whole question of their administration into the melting pot.

Heifers in China Shops

IT is, however, clause 4, subsection 4, that has so far aroused the most interesting and prolonged debate in committee. Attempts were made, and resisted, to remove psychopaths altogether from the definition and classification of mental disorder; other attempts, also resisted, were made to narrow the definition by substituting the words "dangerously irresponsible" for "seriously irre-

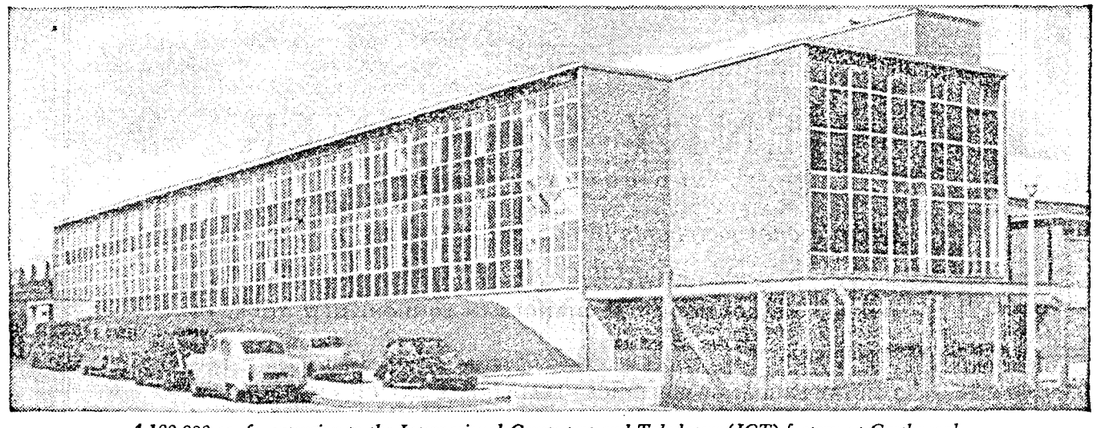
You can rent a NEW factory from 9D PER SQUARE FOOT

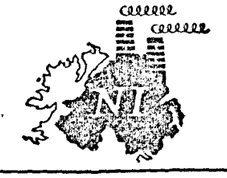


Premises . . . New modern factories are under construction with all services laid on; or can be built to order on a site of your own choosing. Sizes range from 2,000 to 73,000 sq. ft. Rents from 9d. per sq. ft. for the first ten years. Special-purpose factories of unlimited size can be financed on long repayment terms.

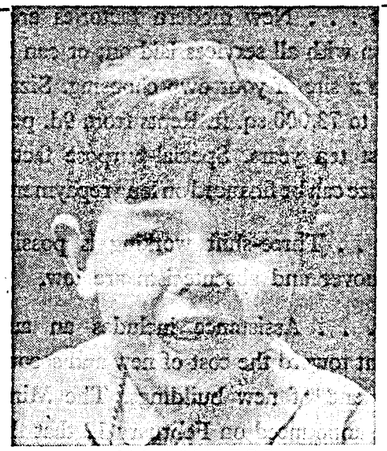
Labour . . . Three-shift working is possible and labour turnover and absenteeism are low.

Finance . . . Assistance includes an automatic annual grant toward the cost of new and second-hand equipment and of new buildings. The Minister of Commerce announced on February 12 that the grant rate was being increased from 25% to 33⅓%. The present maximum grant is £150,000 p.a. Alternatively, loans and larger grants are available for special projects.

Success . . . Over 130 British and American firms have set up in Northern Ireland since 1945; and many have expanded two and three times.



and get the benefit of
33 10/3% GRANTS towards CAPITAL OUTLAY



A 100,000 sq. ft. extension to the International Computors and Tabulators (ICT) factory at Castlereagh.

sponsible" conduct. A point of high principle was at stake. Should persons be compulsorily segregated from society because society finds them an intolerable nuisance, even though they have committed no crime? The girl described by Mr Hastings, who hurt no one but quietly [*sic*] broke china when no one was looking—subsequently referred to by the Minister as a psychopathic heifer in a china shop—is a test case. As another member pointed out, the argument was between those on the committee who would compulsorily detain the china breakers and those who would not.

By a majority of 20 the committee decided in favour of compulsion. But it is a pity that it did not seek clarification on the future of psychopaths, over the age of 21, who make frequent suicidal gestures. Unless such gestures are to be accepted as indicative of mental illness, these people would appear to be excluded from compulsory treatment, though they are, superficially at least, most in need of being protected from themselves.

BELGIAN CONGO

Reform and Its Timetable

THE Belgian government has now brought M. Joseph Kasavubu and two of the other African leaders of the nationalist Abako movement to Belgium. Evidently the idea is that they will become more reasonable and co-operative by studying Belgium's political institutions than by contemplating the walls of their prison. It is stated (though it is not entirely certain) that they are not in Belgium as negotiators, but strictly as state tourists. It is certainly possible that they will not receive as much publicity in Brussels as their counterparts from a British territory might get in London, even though the Belgian government is under heavy fire in parliament over its Congo policy. The situation in the Congo, where it is admitted that disturbances continue daily in the western areas, is evidently viewed as such a serious national crisis that feelers are being put out for a governmental coalition with the socialist party.

The proscribing of the Abako party has not brought about the improvement in feeling that was hoped for, though only the Bakongo tribal area is much affected. Evidently the announcement of the Belgian government's plans "to set up a Congolese democracy capable of exercising sovereign prerogatives and of deciding on its ultimate independence" has not so far won the confidence of the people. There seem to be two difficulties. The first is that there are no obvious African leaders to co-operate in the plan, though possibly M. Kasavubu is to be groomed in Belgium. The second is that there is no timetable and all the details remain studiously vague. All that is known is that urban and rural councils will soon be elected, who will then select from among themselves provincial councillors and—later on—a "general" or central council, which will "progressively assume powers of deliberation." There will be an executive "designed to convert the country gradually to ministerial rule."

Perhaps of most immediate impact will be the decision to drop all that remains of the colour bar, official and unofficial, and to ensure equality before the law for both races. Even these vague plans have made the white settlers restive; and events in British central Africa may increase their opposition. But a political structure without politicians (white or black) is a void; and the result may be the emergence of African leaders of a far more rough-and-ready sort than these refined arrangements seem to expect.

HOLLAND

Opening the Dance

DUTCH political parties measure electoral victories in terms not of tens or hundreds of seats but of single ones. The electorate is stable in its inclinations but the complex pattern of coalitions and alliances, shot through with confessional as well as political differences, can change colour like a kaleidoscope through a swing in a few seats. By British standards the Liberal party's gain of six seats in the latest elections was hardly spectacular. By Dutch standards it was. The Liberals, with 19 seats, are now the third largest party. The Catholics, with 49, as before, are now the largest party, for the Socialists slipped back from 50 to 48; and the Protestant parties have lost votes badly.

A long process of political manœuvre—almost like some formal dance—now traditionally takes place as various combinations are tried in an effort to form a government. This time the process may take months (unless an "extra-parliamentary" cabinet is formed as a stopgap) for the electoral shifts have increased the already serious difficulties of finding a balanced solution. One potential grouping—of all the Christian parties—has been ruled out by the losses of the Protestants. But a Catholic-Protestant-Socialist grouping, a smaller Catholic-Socialist alliance or a Liberal-Christian one are all possible.

The Economist

MARCH 26, 1859

CONFERENCE OVER ITALY?

Since we addressed our readers on the Italian Question, a new element has been introduced into the discussion. Russia has proposed a Congress, and France and Austria, as well as England and Prussia, have assented to the suggestion. The change which has thus come over the position of affairs is generally received as affording strong hopes of a pacific solution, or at least as indicating a sincere desire on the part of both the chief parties to the dispute for such an issue. The funds have risen in consequence both in London and Paris, and merchants and politicians begin to breathe more freely, and to speak as if danger were over. We should be sorry to say one word to discourage the attempt of the European Powers to avert the evils of a Peninsular war, which would be sure to be desperate, and which might become general; but at the same time we are anxious to warn the public against hopes which, though not unfounded, are at least premature and over-sanguine, and to protest against any possible secret action on the part of the Government which might make us parties either to a quarrel in which we have no concern, or to a compromise which would do us no credit and bring to Europe no permanent security. Whether the Congress is to do any good, or merely to postpone for a few weeks or months the impending conflict,—whether it is really designed by France and Austria as a means of settling their differences, or only as a contrivance for putting each other in the wrong,—will appear as soon as the public is informed of the *basis of the proposed negotiations*. Everything will depend upon this. . . . We can feel little doubt that the announcement of the Congress—if coupled with the condition, made by Austria and conceded by France, that the real *fons et origo mali* is to be withheld from all discussion—will be the signal for an Italian insurrection.

In policy the most awkward difference of principle concerns New Guinea. The Socialists are committed to give up this last remnant of the Dutch empire, though they are very much divided about who to give it to. The Catholics, on the other hand, are committed to hang on. Since the hiatus in government might last for months, Holland's allies are fortunate that in other aspects of its foreign policy it follows a steady course.

GILBERT AND SULLIVAN

No Prettier Property

"TAKE a pretty paradox, Dress it like a chocolate box. . . ." So sang the hero of "Perseverance" (by Silbert and Gullivan), that delectable plum of one of the most delectable revues of the 1930s. The recipe, tunefully elaborated ("one patter song and don't forget Your unaccompanied octette") ended in full chorus with the triumph of the "highly popular operetta" than which "there is no prettier property" for composers, librettists, and of course—though "Perseverance" did not make this point—their heirs and assigns.

It is not, however, concern for the well-being of Gilbert and Sullivan's heirs which accounts for the willingness of half-a-million people to sign the petition, presented to Parliament this week, in favour of the perpetual extension of their copyright. The heritage in question is national; and what is supposed to threaten it is not loss but possible defilement. Once the copyright for Gilbert's words has lapsed, which it is due to do in two years' time, anything is possible. Look at poor Shakespeare, with *Kiss Me, Kate*, and *West Side Story*, let alone *All for Love*, let alone all the producers' gimmicks, the cuts, the heresies of particular actors, and the films. There is apparently a large embattled army of D'Oyly Carte devotees whom any similar treatment of Gilbert's words would affect to frothing-point, like unkindness to animals or disrespect to the Royal Family.

Why this should be so is a sociological rather than an aesthetic question. Why should it be possible to mobilise such fervour, not even for the preservation of this particular national heritage—there will be nothing in the lapse of copyright to prevent a rigorous adherence to the Savoyard ritual by any performers who so choose—but against any irreverence towards it? Indifference towards aesthetic heritages is written large across the contemporary English landscape and townscape. Why this particular exception? What is the unique quality of those pretty paradoxes, those elephantine jokes, that stereotyped slapstick, that characteristic blend of the coy and the callous—even when redeemed by music which it would be unfair to blame because custom has rather more than staled its rather less than infinite variety? How, in fact, did Gilbert and Sullivan qualify for permanent membership of the Establishment—or at least the sub-Establishment? A probably very dull book could be written on the subject. Meanwhile those who have signed the worshippers' petition should be gently told that Parliament cannot be so presumptuous as to ban for ever any jazzed-up version of *The Mikado*, just as they themselves cannot be forced by anybody to listen to it.

LETTERS

Control of Government Expenditure

SIR—In your leader commenting on the Report of the Select Committee on Procedure you rightly point out that Parliamentary scrutiny of estimates has fallen into disuse because the House now prefers to use supply days for debating generalities. But instead of suggesting a remedy you seem to favour further weakening of Parliament's scrutiny.

Since the end of the nineteenth century—apart from a brief period after the first world war—the Committee of Supply lost interest in the detailed examination of estimates, which are now passed uncriticised as a matter of routine year after year. What you suggest is that this deplorable practice should now be confirmed by depriving Parliament of the means of resuming a critical examination of the estimates even if it should ever want to do so. You would like the Government to conceal from Parliament and from the public the details of its expenditure proposals. This may save printing costs, but the economy would be offset many thousands of times over by the increase of spending that would result from such a weakening of Parliamentary accountability.

Even as things are, the Treasury's control over the spending departments is ineffective in the absence of adequate Parliamentary scrutiny. The Chancellor of the Exchequer of the day is not in a position to argue in the Cabinet that a proposed increase of the estimates might encounter resistance in the Committee of Supply. If in accordance with your proposal the Government should now cease to publish the details of the estimates this would further reduce the Treasury's power to keep down expenditure. The grand totals of the main heads of expenditure could then conceal a multitude of sins of extravagance.

Admittedly neither Parliament nor the public makes much use of the details published. But surely the answer is that they ought to make more use of them and not that they should be deprived of the information. I am sure you would not think of advising a firm whose auditors have drifted into the habit of signing on the dotted line without even looking at the accounts that it should therefore cease to publish detailed accounts.

During most of the nineteenth century there was strong public pressure for retrenchment. Consequently the Committee of Supply was doing its best to check waste. From time to time it actually amended the estimates in face of resistance by the Chancellor of the Exchequer, who ended by accepting the cuts in all instances but one. Having recently read through all relevant debates in hundreds of volumes of *Hansard*, I am firmly convinced that this practice was very effective in keeping down expenditure, taxation and the public debt.

A revival of the old practice would go a long way towards checking, or at any rate moderating, the non-stop rise of public spending. Perpetuation of the existing practice by concealing from Parliament the details of the estimates would, I am sure, produce the opposite effect.—Yours faithfully,

PAUL EINZIG

Clifford's Inn, EC4

Pocklington Canal

SIR—The comments in your issue of March 14th upon the proposal to abandon the Pocklington Canal lay very proper stress upon the social undesirability of the furtive and rushed procedure which the British Transport Commission has seen fit to adopt. But we should like equally to emphasise that there is no question of "the economic case for disposing of the sludge in the canal" being "overwhelmingly good." On the contrary, this association has put forward no fewer than four sites where the sludge could be dumped for many years to come, which are now derelict, and which could be acquired from willing vendors for a tiny fraction of the sum that it would be necessary to pay in compensation for the closure and extinction of the canal. Moreover, there is little question that it would cost no more to restore the canal so that modest revenues could be derived from it, than to abandon it.

The whole scheme is as unjustifiable in its strategy as in its tactics. But in both it is unfortunately typical of British Waterways, especially in the north eastern area.—Yours faithfully,

ROBERT AICKMAN
Vice-President
The Inland Waterways Association Ltd., London, WC1

Levant and Couchant

SIR—Your strictures on the Estler case last week were rightly severe. What is particularly sad about the case is that, although Mr Estler's claim to possess common rights was rejected, the larger question of whether Effingham Common is really common land at all is still unresolved. Nor will it be conclusively established one way or the other until the claims of each individual commoner, or alleged commoner, are properly tested. The prospect of a number of similar cases, whatever their outcome, is rather appalling.

The Effingham case, therefore, emphasises how important it is that the excellent proposal, advanced by the Royal Commission on Common Land in its report last year, for the systematic registration of common land and of the rights subsisting over it, should be implemented by Parliament at the very earliest opportunity. For Effingham Common is only one of scores of similar lands which are called commons, or have long been thought of as commons, and where the same uncertainties, the same barren arguments and the same costly and often inconclusive disputes, have already arisen or are soon liable to arise. Registration will have its own problems, but is a really worth while objective.

What happens to common lands, when they are finally established as such in the course of a systematic registration, is another matter: but the Royal Commission's recommendations offer a sound and constructive solution, and deserve an early trial. If Parliament shelves this admirable report, it will have only itself to blame for repetitions of the kind of law suit which your article described.—Yours faithfully,

A. O. B. HARRIS
Commons, Open Spaces and Footpaths Preservation Society, London, EC4

Size in Publishing

SIR—The writer of your article "Bigness in Publishing" of March 21, seems to be impressed by the factor of size in publishing and to be wholly unaware of the factor of quality or individuality. His paragraph on groups in publishing—Associated Book Publishers, the Heinemann group, the Hutchinson group, the Collins extension, the Reinhardt merger, and the MacGibbon & Kee purchases—is so compressed as to be worthless. These groups or associations differ so radically from each other, their histories are so unlike, and their working methods so completely dissimilar that to deal with them in 200-300 words is absurd and unfair.

As chairman of Secker & Warburg, one of the Heinemann group, I have an interest to declare, and this interest is to establish the truth, at least about the group to which I am privileged to belong. The words used by your writer, "Heinemann . . . have absorbed more completely such firms as Hart-Davis, Peter Davis (mis-spelt) and Secker & Warburg, while retaining their imprints," are laughably off the mark.

In a brief and hurried letter, it is not possible even to outline the relationship between a parent firm and an associated company in the Heinemann group, a task which I propose to undertake in the second volume of my autobiography, which will be published next year. But it is perhaps permissible to point out that my firm, and others in the Heinemann group, exercise complete and absolute control over the selection of books for their list, the production of these books, and their sales and promotion. These three key activities are what differentiate a publishing house from a mere imprint. We also control the hiring and firing of our own personnel.

The emergence of groups in publishing can have a bad as well as a good side. What matters is whether the group is run on lines akin to imperialist exploitation or in terms of commonwealth relationships. The Heinemann group is run on the latter lines.—Yours faithfully,

F. J. WARBURG
Martin Secker & Warburg Ltd. London, WC1

Public Libraries

SIR—It is misleading to say that the Roberts Committee "thinks that not less than £5,000 a year is needed to run an efficient library." The committee recommends that "the minimum annual expenditure on the purchase of books (excluding the cost of binding) expected from a non-county borough or urban district council as an independent library authority should be, at 1958 prices, either £5,000 or 2s. per head, whichever is the greater!—Yours faithfully,

London, W1 M. L. HENRY

The Common Market

SIR—In a Note in your issue of February 21st on the recent debate in the House of Commons on the free trade area, you mention that with one or two exceptions there seemed to be little understanding of the reasons why Britain should join the common market. It has been argued that solutions on the lines of the old free trade area are in the long run the only ones acceptable, but this shows a fundamental misunderstanding of the reasons for the failure of the British Government's proposals. The only hope now is to adopt the policy of joining the common market.

One of the main reasons for the breakdown of the negotiations was that the structure and principles of the proposed free trade area differed essentially from those of the European Economic Community, in particular with regard to the common tariff, agriculture, the harmonisation of social charges and the coordination of economic policy. Clearly, if the "Six" were to accept the free trade area, its principles and structure would inevitably replace those of the European Economic Community as in a wider grouping the rules of the area as a whole would be dominant. The "Six" as a whole are unwilling to accept any arrangement that would undermine the principles of the European Economic Community.

Only by accepting the principles and structure of the European Economic Community can we obtain the agreement of the "Six" and gain access to the European market. We should have to negotiate special arrangements to take into account our position in the Commonwealth, and we may be obliged to make concessions; but the long term interests of the Commonwealth countries are in obtaining a wider market for their raw materials and in the supply of capital for their economic development. The European Community with Britain as a member could meet both of these needs, but if Britain were excluded from the European market the Commonwealth would undoubtedly suffer.

Our acceptance of the common tariff of the "Six," it is sometimes argued, would mean imposing tariffs on Commonwealth produce and instead of giving imperial preference we would be agreeing to an anti-imperial preference. This might be true for a small number of products, but for many the United Kingdom and common market tariffs are zero (e.g., rubber, wool, cotton, jute, copper, nickel, tin and a number of metallic ores and scrap). In 1956 these commodities accounted for £356 million out of a total of £529 million of the United Kingdom's imports of raw materials from the Commonwealth. Apart from food, drink and tobacco, there are only about a dozen products imported in substantial quantities on which there are significant differences in the tariffs between the United Kingdom and the common market. Could not these be the subject of negotiations?—Yours faithfully,

E. G. THOMPSON
Goodmayes, Essex

BOOKS

The Red and the Black

The Catholic Church in the Modern World

By E. E. Y. Hales.
Eyre and Spottiswoode. 332 pages. 30s.

THOSE of us who still try to guide our course by the fading stars of the Enlightenment, who still cling to the hope that reason applied to human affairs may in the end prove as efficacious as in its application to the management of the world of things, must often reflect nowadays that the horizon is blocked by the war of two great organisations. Both of them deny our fundamental assumptions, and both of them are in consequence at once fascinated and repelled by the likeness to themselves that they find in the enemy's camp. Some people may indeed envy the certitude of those who have given their consciences to the keeping of the Kremlin or the Vatican, as the case may be. In the 1930s liberals were more likely to envy the communists: the enemies were black rather than red. Today, with fuller knowledge of the brutality and crudity of Soviet totalitarianism, one may (whatever one's religious beliefs or lack of them) find the College of Cardinals preferable to the Central Committee. But when one reads Mr Hales's informed and persuasive account of the vicissitudes of his church since the attacks made upon it by Revolutionary France, one is bound to ask whether (from the liberal point of view) the pendulum has not swung too far. Is it not possibly the case (to turn the well-known jibe the other way round) that what gives the Church the sympathy it now enjoys outside its own ranks is precisely the fact that the Pope has no divisions; that, unlike Mr Khrushchev or Mao Tse-tung, he cannot generally speaking enforce his dogma or silence his opponents?

Of course this is unfair both to the Church and to so able an advocate as Mr Hales; whether or not we accept his explanations for those things in the Church's recent history that have most adversely affected liberal opinion, they are put forward with modesty and caution. We are miles away from the uncouth barbarity of modern Marxist apologetics. For one thing, Mr Hales is prepared to believe that in temporal matters the rulers of the Church may have erred: for instance, the extent to which the Papacy recovered its territorial position after the Napoleonic wars meant that the standpoint of the Papacy was affected almost throughout the nineteenth century by what were often narrowly Italian and even Piedmontese issues. Or, again, he is for the most part prepared to treat his proper theme without distorting the secular history of the period within which it is set—though he cherishes the illusion common among Roman Catholic historians that the Austrian Empire was deliberately broken up by "vindictive" peacemakers at Paris. He is not indeed impeccable on detail. If the Orleanists failed to achieve a restoration after 1870 it was not because their candidate was a child—the Comte de Paris was born in 1838; to accept the Pope's peace proposals of August 1917 could not have kept America out of the war—it was already in it. But this does not matter.

What does matter is that Mr Hales is bound in the end to come down in favour of the standpoint that what matters most for the Church is to obtain the maximum opportunity for increasing the scope of its authority. For this end it can sacrifice no possible auxiliary, not even in some circumstances the use of compulsion. Many of Mr Hales's most interesting passages deal with the history of Roman Catholicism in the United States. But while he admits that the faith has flourished (at least numerically speaking) under a regime of separation of Church and State, and complete religious toleration, this does not mean for him that the Church can accept such a solution as valid for countries where it might hope for a more favoured position. In the end toleration is relative and not absolute; and is this so different from the communists' claim of full democratic freedom in countries where they are a minority and the right ruthlessly to suppress all opposition where they are in power? This does not mean that Mr Hales would wish to relight the fires of Smithfield; but it does mean that those who worried over the Ecclesiastical Titles Bill were not quite so ridiculous as he makes out.

For there is a real problem of Church and State—and on the side of the Church as much as on the side of the State; Mr Hales might for instance have dwelt profitably on the recent experiences of the Australian Labour party. It is not true that all the aggression has been on the side of the secular State, unless one happens to accept the Roman Catholic view of what the relations of Church and State should be. And regimes that seem prepared to go along with the Church may present their own disadvantages. (It is astonishing to find that the bibliography omits so masterly a work as D. A. Binchy's "Church and State in Fascist Italy.") Whatever the record of individual Roman Catholics, the Church's record of opposition to fascism and nazism on points where its own interests were not directly affected is not quite so clear as Mr Hales makes out. The Church, he might reply, has its own mission and must judge for itself how best to serve it; but that again is also true of international communism.

Young Man in a Hurry

Lord Randolph Churchill

By Robert Rhodes James.
Weidenfeld and Nicolson. 374 pages. 36s.

IS it likely that seventy years from now students of political history will still be busily debating whether Mr Thorneycroft, when he flounced out of the Chancellorship of the Exchequer a year ago, "forgot Heathcoat Amory"? What was it about Lord Randolph Churchill that has made his fatal resignation, whether he "forgot Goschen" or not, so famous a riddle for so long? It is not simply because he was his son's father—though that is clearly one reason for the renewed interest today. It is not because his withdrawal, even if unintended, from Lord Salisbury's Cabinet in 1887 really changed political history. After the first sharp popular shock, the wounds to the Conservative party leadership healed over as quickly and as easily as did the smaller hurts done to the same perpetually adaptable party by Mr Thorneycroft's departure in 1958 (not long this time after the retreat in dudgeon of the latest Salisbury himself).

Lord Randolph's tragedy, in fact, was personal not political. This is plain enough from Mr James's new and excellently told biography. The pillars stayed erect—and what a pillar Lord Salisbury was—but there was a sense then, which has survived until now, that this was a Samson-to-be who had brought himself down politically in the bid to assert first place, not yet in the Government, but in the shaping of party policy and organisation. Lord Randolph, his friends and admirers and even his enemies (in both parties) had believed, was bound to come out on top.

Like his Liberal opposite number and frequent behind-the-scenes coadjutor, the first of the Chamberlains, Lord Randolph glimpsed the political importance of the new electorate enfranchised in the sixties and eighties—and the obsolescence of both old Tories and old Whigs. His oratory, on backbench, frontbench or on the constituency platform, was—Churchillian. With Chamberlain again as mentor, he grasped as his son never did the decisive role in the new politics of party management. Yet for all the flavour and zeal of his "Tory democracy," it stayed a slogan and never became a prescription or the banner of a following; and it was precisely in the field of party management that he deliberately courted and suffered his final defeat at the hands of the Cecils.

Mr James does not like the Cecils, and is perhaps less than fair to both Lord Salisbury (who patiently suffered much from Lord Randolph) and Balfour —or to that worthy parliamentarian Stafford Northcote (who literally fell dead at Lord Salisbury's feet in the aftermath of Lord Randolph's political suicide). Nor, for all his scholarly use of new material, does his story or his verdict differ substantially from the slighter portrait of Lord Randolph which, far more than the panegyric on Sir Winston, was the high point of Mr A. L. Rowse's picaresque opus on the Churchills, published not long ago by Macmillans. But he is never more than fair to his hero; and the Churchillian qualities, which were alike the reasons for Lord Randolph's rise to fame and the highest promise and the causes of his sickening downfall, emerge eloquently enough from his terse, well-ordered tale.

The restless self-confidence, the assertiveness and the pugnacity, the quick, disconcerting, cross-bench and pragmatic improvisations, the brilliant unpredictability and the impatience—above all the impatience with fools and fuddy-duddies: these were the stuff of Lord Randolph's failure as, mellowed with time, they have been in his son the stuff of greatness. Lord Randolph called Mr Gladstone, whom he admired and harried equally much, an old man in a hurry; he was himself a young man in a hurry. That is really why he fell at his first big hurdle.

Is it, then, just because he has lived so much longer, unfelled by the disease that struck Lord Randolph down and carried him off before he was fifty, that Sir Winston has gone so much farther than his father? This is the sort of question that can never be answered. Sir Winston did not become Chancellor of the Exchequer until he was fifty; he had rushed at, and fallen at, several hurdles before then, and had other tumbles later before his great chance when he was nearly sixty-six. Lord Randolph was Chancellor of the Exchequer—and Leader of the House—at thirty-six, and dead at forty-six.

Certainly Lord Randolph had the other Churchillian characteristics, too: magnanimity after the fray, good humour with high temper, an open-minded and unbreakably honest independence, and the lively personal magnetism in discourse and friendship that made him and his lovely and remarkable wife still centres of social life in London even while the sulky face of "Tum-tum" and the Marlborough House set was turned away. Perhaps only the mellowing of time was denied him; perhaps the staying-power was not there. Whatever the truth, time and Sir Winston have brought their revenges.

Amassing Books

The English Library Before 1700

Edited by Francis Wormald and C. E. Wright.
The Athlone Press. 257 pages. 35s.

THIS book is based on lectures given under the auspices of the School of Librarianship and Archives of University College, London. The choice of authors is admirable and the quality of the essays high. The book lays no claim to continuity: it is presented as a "group of related individual studies"; but they are well spaced out over the period.

For the general reader, the gem of the book is an essay by Professor Knowles on the part played by monastic libraries in preserving the classics, a small masterpiece of compression and clarity; it is closely rivalled by Dr Talbot's fascinating study on the universities and the mediæval library, which gives (particularly to readers of this journal) more than its title promises, since it covers in small space such topics as the effect of the rise of the universities on the demand and supply of cheap manuscript books, the elaborate attempts at price-control and the interesting overlap between elementary mass production and do-it-yourself techniques. A few of the essays are of rather specialised interest; but there are others to delight every reader, such as Mr Wright's study of the dispersal of libraries at the Reformation, and essays on the development of libraries at Cambridge (mainly from the librarian's point of view) and Oxford (from the architect's).

The book is well produced and illustrated.

The Civilising Influence

The Use of Imagination: *Educational Thought and the Literary Mind*

By William Walsh.
Chatto and Windus. 252 pages. 25s.

THE organisation and methods of education are perpetual matters of debate, in both amateur and informed circles; selection at eleven-plus, comprehensive schools, institutes of technology, shortage of science teachers, redbrick universities—scarcely a day passes without these or similar topics getting a public airing. About the ultimate aims of education, however, much less is said —or thought; and about the qualities of mind and heart that should characterise a truly good teacher, one rarely comes across anything that rises above the level of platitude.

Mr Walsh, who is Professor of Education in the University of Leeds, has a conception of education that is at once idealistic and practical. Teaching, he insists, is a matter of human contacts, and language is its indispensable instrument. Unless the teacher himself is an imaginative, discerning and articulate human being, the acquisition of information and skill will profit him and his pupils little. Professor Walsh claims that literature is the supremely civilising influence; it enlarges our conception of human nature, and actually influences and modifies our development as persons. There would be nothing very new or exciting about this if he then went on to prescribe an orthodox course of Great Books; but instead he examines a series of writers, from Coleridge to Lawrence and Yeats, for whom the cultivation and discipline of the creative imagination are prerequisites for living a fully human life.

Sometimes, as in his studies of Keats and Hopkins, Mr Walsh exercises his abilities in straightforward literary criticism. In his chapter on the writer and the child, he suggests how insight into the emotional and mental processes of children may be quickened by books; Mark Twain, Henry James, Lawrence and De La Mare are the authors he touches on here. More directly relevant to the training of teachers is the chapter on the education of a cultivated élite; here he looks at the way in which Coleridge, Arnold and Dr Leavis have tackled this problem. Not all the essays are closely connected, but the method is consistent—the scrutiny of texts—and they do all reinforce one another, constituting an eloquent argument in favour of an education that nurtures the whole of the human spirit.

The scope of the book would have been more accurately defined if the title and sub-title had been in reverse order. "Educational Thought and the Literary Mind" gives a precise indication of the theme that holds all the essays together, whereas "The Use of Imagination" is too vast in its implications. Professor Walsh does not touch upon the life-enhancing powers of music and the visual arts, though there are many grown people whose imaginations are nourished as effectively by contact with these as by reading; children, also, express their fantasies in song and dance and picture-making quite as spontaneously as they do in words. But even if the title is over-ambitious, the book is both stimulating and heartening. Too many educationists occupy themselves with the paraphernalia of their life-work; Mr Walsh does not. Instead, he asks the essential question: how can education help us to better our quality as human beings? Persuasively, he suggests an answer.

WHO'S WHO

1959

Long regarded as socially indispensable, *Who's Who* is now recognised also as an essential and rewarding desk-book for the man of affairs. It gives ready access to dependable details of the origins and careers, achievements and interests, of thousands of the eminent and near-eminent in all walks of life.

Every entry is subjected to annual revision. To rely on last year's edition has often proved an expensive economy.

A. & C. BLACK

Ferment in Baghdad

Revolution in Iraq

By Caractacus.
Gollancz. 207 pages. 16s.

Iraq

By George L. Harris.
Survey of World Cultures Series. Human Relations Area Files Press. New Haven, Conn. 360 pages. $7.00.

THE Iraqi revolution of 1958 took place in a single morning; there was no opposition, and the *ancien régime* was replaced by would-be liberals. The first book explains why. Its author—the latest recruit to Mr Gollancz's cohort of anonymous Romans—is much more detached and less angry than the familiar red-and-yellow dustcover suggests. Ten years of mixing with the kind of educated Iraqi that former British ambassadors never met enable him to give a lively and accurate picture of what they thought. Everyone who was not in senior government employment reckoned that Nuri was an oppressor, that he tolerated crooks as ministers, that—far worse—he was Britain's lackey, and that therefore Britain tolerated oppression and crookery. Into this cauldron of public feeling Caractacus tosses the other main ingredients: a longing for "the pride of standing on their own feet," a desire for Arab unity in independence, and a craving for neutrality. If his word is accepted for these hard facts, much of what is happening in the Arab world is explained: widespread admiration for Gamal Abdul Nasser, Iraqi hatred for the Baghdad Pact, Arab admiration not (as might be expected of Moslems) for Pakistan, but for India. If Brigadier Qassim leans too far towards Russia, the book may serve to explain a movement against him better organised and less impulsive than that which went off half-cock in Mosul earlier this month.

The book is much better at analysis of what the Iraqis think than at assessing British reactions to their revolution, or at prescribing British policy. Apart from one cursory reference to "an impressive [British] effort to act with perfect neutrality" towards the revolution, the author writes as *if all Britons and Americans* wish ill towards the revolution. In fact, both British and American behaviour towards the Qassim government has been almost exactly as he prescribes. What his diatribes are really getting at is British complacency and inaction over the absolutism, and disregard for public feeling, which characterise certain rulers in the Persian Gulf. The good case to be made against this is not the one he makes, and this is a pity, for he will irritate where a subtler critic could have arrested attention.

But his book is lively, and comes from the heart, and gives the feel of ferment and anxiety in present-day Baghdad. The same cannot be said of Mr Harris's copious and painstaking handbook, which, for all its claim to be a portrait of "a society as it functions," is absolutely featureless. For instance, a "Health Week" is mentioned but not described, so that a comment that "their pride in the measures they learned has encouraged government advisers to suggest more of these projects" is just so much cottonwool. What measures and what projects? The rest of the page is blank, as if waiting for the practical details that would bring the book to life and impart to a series in which it is the third volume some usefulness in the Middle East. There, prejudice against Volume 3 will start at the preface, which gets the name of the head of the state wrong in its first sentence.

Sykewar

A Psychological Warfare Casebook

By William E. Daugherty and Morris Janowitz.
John Hopkins University Press. London: *Oxford University Press.* 880 pages. £5 net.

A SPECIAL branch of Parkinson's Law seems to ensure that the effectiveness of what one contributor in this volume cheerfully calls "sykewar" and others "psywar" is in inverse proportion to the number of warriors. There is no wartime activity in which the quality of the individual in direct contact with the target counts for so much. Nevertheless, current propagandists, though more likely to be born than made, should learn from past experience, and this symposium has much to teach them. It is not exactly what the blurb declares, a "readable how-to," though some of the articles are lively and informative. It does, however, as the compilers claim, illustrate "important aspects and principles of psychological warfare usage." Articles and case histories are contributed by seventy-three experts in this formidable collection. Some are from the type of expert known as a man who tells you something you know already in such a way that you no longer understand it. That is the fault of filling "psywar" ranks with psychologists who introduced Central European expressions such as "culture-pattern" and "personality-structure" (for "character").

Two contributions are of particular interest. One is a reprint of a lecture by R. H. S. Crossman—to whom his American colleagues pay deserved tribute—in which he plainly underlines the need for accuracy and condemns incitement to revolts that can only lead to death or imprisonment. This simple lesson is hard to learn, as is shown by the account of the activities of RIAS (the American radio station in West Berlin) during the East German rising of June 1953. RIAS, it is claimed, was responsible for spreading the revolt, and this is undoubtedly true. It is, however, hard to justify after the event. On the whole, "operational" subversive propaganda should not be used in peacetime, but solely as a preliminary to invasion in time of war.

Another outstanding bit of good advice in this volume is quoted from the findings of the President's Committee on International Information Activities in 1953. This called for the abolition of a so-called Psychological Strategy Board and said that:

> except for propaganda, there are no psychological warfare instruments distinct from traditional instruments of policy. The important task is to build awareness throughout the entire Government of the impact of day-to-day governmental activities and to co-ordinate and time such actions so as to derive from them the maximum advantages. . . . The primary and overriding purposes of the information program should be to submit evidence to the peoples of other nations that their own aspirations for freedom, progress and peace are supported and advanced by the objectives and policy of the United States. In carrying out this purpose, American broadcasts and printed material should concentrate on objective, factual news reporting.

The temptation to make "sykewar" direct policy, instead of the other way round, will remain, however, as long as the other side plays the game that way. The world has only recently seen a dazzling example of this policy in the Communist Chinese order to shell Quemoy on the stop-and-go principle, at the same time telling the inhabitants how pleasant their lives would be without the Americans. Nothing is too deceitful for war, said the relevant Chinese communiqué, but disclaimed that this move was deceit. It was, however, political warfare fought with the methods of torturers. Small wonder that "objective, factual news reporting" sometimes seems dull by contrast.

Dedicated to Flying

Heavenly Adventurer: *Sefton Brancker and the Dawn of British Aviation*

By Basil Collier.
Secker and Warburg. 242 pages. 25s.

THIS book recalls, with an amazing vividness, one of the most picturesque figures of the days, just after the first world war, when a few people were struggling to convert the aeroplane from a war machine into a vehicle of commercial transport.

In 1917, the Government established the Civil Aerial Transport Committee, whose chairman was Lord Northcliffe, to make plans for a postwar expansion of aviation on a commercial scale. This reviewer remembers "Branks"—as his friends called him—coming into the offices in St James's Square to discuss the agenda for the first meeting of the committee, in the deliberations and recommendations of which he played an outstanding part. At that time, with the rank of major-general, his official position was Master-General of Personnel on the Air Council. As Mr Collier so clearly shows, Sefton Brancker was a dedicated man. All his energy, and all his rare powers of organisation and negotiation, were devoted day in and day out to the cause of aviation, which he saw as a potentially almost illimitable world force. The enthusiasm of others seemed a feeble flame compared with the burning zeal of "the little man with the eye-glass," as Sir Sefton was often called as he dashed here and there to conferences, official meetings and pioneer flying-grounds. That familiar eyeglass of his seemed, sometimes, to flash and gleam as though reflecting in some way its owner's phenomenal vitality.

Brancker was completely tireless. After a day of gruelling work, he would throw himself with unabated zest into the night life of London. Yet at nine o'clock precisely each morning—trim, immaculate, and with eyeglass firmly in place—he would be found presiding briskly over a meeting of a sub-committee.

When Mr Holt Thomas, chairman of the Aircraft Manufacturing Company, decided to form a subsidiary company, Aircraft Transport and Travel, to operate in 1919 a first daily commercial air service between London and Paris, Sir Sefton relinquished his official work to become managing director of this pioneer airline. Here again he soon gave proof of his powers as an astute and far-seeing organiser. Subsequently he had the honour of being appointed the first official Director of Civil Aviation. It was he, more than anyone else, who steered commercial flying through those early teething troubles which Mr Collier outlines so clearly.

It was thus one of flying's greatest tragedies that he should have perished in the R.101, the lamentable story of which Mr Collier tells absorbingly in the final stages of his book.

A Noble House

The Lords of Cobham Hall

By Esmé Wingfield-Stratford.
Cassell. 437 pages. 50s.

FOUR tributaries feed Dr Wingfield-Stratford's family history: the de Cobham, Brooke, Darnley, and Bligh. Rambling nostalgically, growling menacingly, or chattering colloquially, they voice his prejudices and affections. Travellers down them are helped by three genealogies, a plan of Cobham Hall's growth, and some revealing portraits. Crowds throng the banks—and there are some memorable personalities among them.

John de Cobham, third Baron, Constable of Rochester, Admiral, ecclesiastical and military architect, and centenarian, is justly called "the Founder." He died in 1407 without male heir; but his daughter's marriage brought in de la Pole money; and her daughter's to Sir Thomas Brooke produced a son for whom the barony was revived. His descendants steered a prosperous course through the York and Lancaster wars and the treacherous currents of Tudor policy. Between 1558 and 1596 William Lord Cobham transformed his medieval manor into an Elizabethan mansion at prodigious cost, which included the transport of stone from Caen. But his son, less adept in calculating risks, meddled in conspiracy, nearly lost his head, and did lose his estates.

King James gave them to one of the Darnley Stuarts, Ludovic, Duke of Lennox and of Richmond. The Darnleys added heroism to the story: three died fighting for Charles I; and another rescued Frances, "la Belle Stuart," from Charles II's amorous designs by a runaway marriage. He erected an expensive Palladian centre between the pepper-boxed Elizabethan wings—but he died childless; and Cobham, disposable by will, passed from his sister to his niece; and then to his great-niece Theodosia Hyde, married in 1713 to John Bligh, an Irish MP.

Bligh's matrimonial venture was as shrewd as his merchant ancestor's investment in Cromwell's Irish enterprise: Theodosia's estate was impoverished; but financed by his Irish rents it gave him a position and influence appreciated by Walpole, and he was created Earl of Darnley in 1723—an odd Hanoverian compliment to her Stuart descent. The third earl's marriage to Mary Stoyte, daughter of a Dublin banker, was equally profitable: it paid for his son's additions to the hall and its contents—including pictures carefully selected in the Netherlands during the French invasion of 1792. The third and fourth earls occupy more than half this book: their letters reveal a singularly happy relationship, and fascinating glimpses of the life of an eighteenth century Etonian in the days when his valet was as important as his housemaster or his tutor.

After 1830 only three Bligh's are likely to arouse interest: the Victorian earl whose frigid grandeur so alarmed the author—and most other people as well; Ivo who captained an England XI; and Esmé the artist. The book ends at his death, with the words "Esto Perpetua." Their apprehensive sadness is already justified.

Second War Commander

Full Cycle: *The Biography of Admiral Sir Bertram Home Ramsay, KCB, KBE, MVO*

By W. S. Chalmers.
Hodder and Stoughton. 288 pages. 30s.

ALTHOUGH senior commanders of the last war have not hesitated to criticise each other in their memoirs, to one of their brotherhood they have universally accorded nothing but praise. As this welcome and ably executed biography shows, Sir Bertram Ramsay fully deserved their confidence.

The success of the operations he was responsible for is on the record. Through his letters and diary we can now appreciate his great strategic insight and his remarkable grasp of the operations of war by land, sea and air. As a junior officer he had never hesitated to express his opinions irrespective of their likely popularity with his seniors; as a senior officer he equally never hesitated to insist on his view when he knew he was right, a policy that led him at times into conflict with, among others, those redoubtable getters of their own way, Cunningham and Montgomery. That Admiral Ramsay so often prevailed and yet retained their respect and admiration is a measure of how right he was.

His service during the second world war covered most of the major amphibious warfare experiences of the British forces—Dunkirk, North Africa, Sicily and Normandy, but it is more than just a record of amphibious operations; it is, as Admiral Chalmers brings out, a vindication—if one were needed—of the policy of the use of sea power to prosecute a maritime strategy.

The Dunkirk evacuation forced Britain to exchange the continental strategy with which it had started the war for a maritime one—only for the lesson to be forgotten after the Normandy landings, though Admiral Ramsay tried to persuade the Allied Commanders to continue to use their command of the sea to support and extend the left flank. Had his advice been accepted the Scheldt could have been opened sooner and the war might have ended earlier, but Generals Eisenhower and Montgomery, engrossed in their argument on the relative merits of the broad and narrow front advance, did not listen.

The Black Berets

The Tanks: *The History of the Royal Tank Regiment*

By B. H. Liddell Hart.
Cassell. Two Volumes. 462 pages and 552 pages. 70s. the set.

THE Royal Tank Regiment, or the Royal Tank Corps as it was, has found a worthy historian in Captain Liddell Hart. As one of the prophets of armoured warfare and as one of the few to make military sense out of the military nonsense of the 1914-18 war, Captain Liddell Hart was the obvious and right choice. Although, as often in his books, his own personality obtrudes, he has done a brilliant job, showing other regimental historians that what happened to Captain Jones that day can be woven into a serious piece of historical analysis. To adopt one of the titles of his earlier books, he has written of the British Way in Armoured Warfare.

It was the oil-stained rather despised mechanics in the black berets who worked out the theory of armoured warfare and of the *blitzkrieg* before the war, only to have, through no fault of their own, their ideas and their tactics used against them by the German Army. It was upon their training methods and their doctrine that the counter-blows were prepared and the Royal Tank Regiment, as part—perhaps the essential part—of the Royal Armoured Corps, was in on the final victory. But throughout the war the regiment was but part of a much bigger whole, and that is perhaps why the second volume of this history is less fascinating than the first. This volume contains some noteworthy chapters, especially on the fighting in the Western Desert. But it is not altogether clear on what was wrong with British and American tank design, and there is a tendency—an understandable one in view of the author's predilections—of playing up the role of tanks as independent striking forces at the expense of their role as infantry support weapons. Tanks were not merely the

first, nor merely the second. They were both.

The tanks as a support for the infantry was an easy enough idea for the orthodox to accept. Their worth in that role, after all, had been proved at Cambrai. But to see beyond the mud of the trenches to the roads and fields behind and to recognise the tanks as weapons in their own right required the proclamation of a brave, new heresy. In describing how this was done and how men like Fuller, Martel, Hobart and the author himself fought against the odds of tradition and conservatism, the first volume of this history is a biased and utterly convincing account.

OTHER BOOKS

Memoirs

Economics

ECONOMIC ARITHMETIC. By Robin Marris. *Macmillan.* 349 pages. 28s.

Designed primarily to give economic students an introduction to the integration of economic theory with statistical practice, this book will be found of practical assistance to many users of economic statistics. Mr Marris describes first of all the kind of statistics required to formulate a general picture of the British economic system, as illustrated by diagrams of the circulating flow of goods and money, although he departs from completeness in his illustration by omitting stock changes. The problems of measuring the various factors and collecting the raw data are described and an outline given of the main sources of British economic statistics, with a more detailed discussion of national income accounting. (But why is there no reference to the official publication *Economic Trends*, which first carries the quarterly estimates of national income ?)

After describing some of the ways of dealing with figures—graphs, interpretation of time-series, regression analysis and correlation—the final chapters of this book are concerned with index numbers and their properties and, in particular, with their application in the measurement of changes in the real national product. Although it is widely recognised that such changes are not capable of precise measurement, the implications behind the ambiguities are by no means so readily appreciated. With the aid of an algebraical appendix, Mr Marris gives a lucid demonstration of the imperfections in each of the types of index number technically described as base-weighted and current-weighted. This discussion can be recommended to those perplexed consumers of statistics faced with an index-number which, on one basis, shows a rise over a certain period, and yet, on another basis, shows a fall. But it cannot satisfactorily resolve the dilemma: it can only suggest a compromise solution.

THORSTEIN VEBLEN: *A Critical Reappraisal.* Edited by Douglas F. Dowd. *Cornell University Press.* London: *Oxford University Press.* 317 pages. 40s.

This collection of seventeen essays (plus a bibliography) commemorates the centenary of Veblen's birth, and grew from a series of lectures organised by the Department of Economics at Cornell University, where Veblen began his professional career. It covers every aspect of his many-sided life-work and makes a valiant effort to assert its significance for the present day. With few exceptions—one may gratefully note Professor Sweezy on "American Capitalism," Mr Goodrich on "The Case of the New Countries," and the editor, Mr Dowd, on "Technology and Social Change"—the contributors are fabulously unreadable.

THE KEYNESIAN THEORY OF ECONOMIC DEVELOPMENT. By Kenneth K. Kurihara. *Allen and Unwin.* 218 pages. 21s.

This book constitutes one more step in the application of Keynesian analysis to those dynamic, long-run processes of economic evolution which Keynes himself treated only incidentally and never incorporated into the subject-matter of the "General Theory." Professor Kurihara is a specialist in this field, and his book, which relies heavily on mathematical exposition, is exclusively addressed to specialists. Much of its matter, indeed, consists of an attempt to co-ordinate the theoretical constructions of Harrod, Hicks, Domar, Nurkse, and Joan Robinson. His purpose, however, is practical—to provide a firm backbone of principle for the policies of development; and between the equations he shows himself aware that sociological circumstances alter cases.

Text and Reference

BRITAIN: *An Official Handbook.* 1959 Edition. Prepared by the Central Office of Information. *Her Majesty's Stationery Office.* 347 pages. 21s.

Keeping up the high standard of previous editions, and at an unchanged price, this useful reference book covers events up to September, 1958.

THE CONNOISSEUR YEAR BOOK 1959. Edited by L. G. G. Ramsey. *National Magazine Co.* 140 pages. 25s.

This annual publication contains twenty-four articles on subjects as widely ranged as church towers and bookbinding; as usual it is finely illustrated.

BIOGRAPHIC DIRECTORY OF THE USSR. By Wladimir Merzalow. *Scarecrow Press,* New York. London agent: *Bailey Brothers and Swinfen.* 797 pages. 144s.

In the absence of an official Russian Who's Who, the members of the Institute for the Study of USSR (an American-supported organisation in Munich of mainly recent refugees from the Soviet Union) have compiled this biographical guide. Although there are a number of striking omissions, it contains more than 2,000 entries; these give factual and reliable information. Since it is the only work of its kind, it is an important contribution to the study of the Soviet Union.

From The Times of March 6th.

Messrs. Keith Cardale, Groves and company were concerned in these transactions.

to review the whole administration, organization, and policy of the Ulster Transport Authority, was passed.

CANADA'S TRADE DOORS "WIDE OPEN"

An outspoken reply to criticisms of the apparent unwillingness of Canada to buy adequate quantities of British goods was given in London yesterday by Mr. George Drew, Q.C., the High Commissioner for Canada.

A month ago, Sir David Eccles, President of the Board of Trade, told members of the Canadian Chamber of Commerce in Great Britain: "It goes very hard with a very great number of people in the United Kingdom to see anything so much made in this country as Canada is willing to buy."

Addressing the same organization yesterday, Mr. Drew said: "What will stem us [illegible] Canadian market [illegible] exports so [illegible] yet [illegible] exporters of [illegible] countries who are busy looking for outlets instead of markets.

[illegible] only [illegible] imports we can be expected to [illegible] exports. That will be measured by their effort to sell."

[illegible] away [illegible] Trade [illegible] to understand the concern [illegible] views expressed in some quarters [illegible] British trade with Canada. It would [illegible] unfortunate to call the impression [illegible] removed [illegible] ment to [illegible] Canada's [illegible] exports to [illegible] had increased [illegible] Kingdom exports to Canada had increased by 42% per cent.

He had been disturbed by recent Press reports which seemed to convey the impression that while exports to the United States were booming, those to Canada were declining. In 1958 the United States imported from Britain at the rate of $4.54 a head. At the same time Canada imported at the rate of $30.66 a head—seven times as much as the United States.

The important thing was the balance of payments between Canada and Britain. It was true that Britain's deficit balance in merchandise trade for 1958 was $254m., but on the other side of the ledger were the so-called invisible items such as insurance payments, shipping revenues, tourist expenditures and so on.

"MUST BE SOLD"

In 1958 Britain had a favourable balance in the invisible payments of more than $100m., so that the net British current account deficit for 1958 was about $154m., much less than it was in 1954, 1955, and 1956.

Canada long ago took the necessary Government action to make increased sales possible. "We have no quotas, specific restrictions on particular articles, nor any limitations on our financial operations of any kind," he went on. "A Canadian purchaser is completely free to sit down with a representative of a British firm and make a contract for the purchase of British products. That is a situation which we hope will soon return here.

"The friendly Canadian market is wide open, but the day of the seller's market is gone. Neither Canadians nor others will go abroad to beg for the right to buy. British goods must be sold, and they can be sold in greatly increased quantities—by methods which built up the position of Britain as the trading and financial centre of the world."

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Washington Holds Out

GETTYSBURG, PA

THE bare and barn-like hall in this battle-haunted little town, where a hundred and twenty journalists gathered, like frustrated bees in a dusty bee-hive, to report on Mr Macmillan's talks with President Eisenhower last weekend, was entered through the foyer of a cinema showing the film *Rally Round the Flag, Boys.* Separated by twenty-five miles and the cheerfully incommunicative Mr James Hagerty and Mr Peter Hope from the subject they were covering, the journalists had little choice but to obey. It is known exactly how long the great men conversed in each session, what sort of seats they sat on and what the preacher preached to them about at church on Sunday (it was perseverance). The choice by an Anglican Premier and a Presbyterian President of a Lutheran form of service suggests a nice sense of compromise. Beyond this no one can honestly offer more than a reasoned hypothesis about what went on at Camp David.

Plainly the meeting was less productive than some people had hoped. The only clearcut outcome is that there is virtually certain to be a summit conference this summer. But that became obvious ten days ago, when the President said that he sought no more than "justification" for going to the summit, a word which neatly covers either success or failure at the earlier foreign ministers' talks. On the much more interesting subject of what to propose to the Russians, the two leaders apparently did no more than exchange ideas. In particular, the British—though their spokesmen gallantly deny it—can hardly be overjoyed that the Americans merely promised to study Mr Macmillan's idea of "freezing" military forces in central Europe.

What lies behind the Americans' qualms is fairly clear. In the first place, although they accept the general principle of a policed limitation of arms, they suspect that this particular freeze might prevent the issuing of tactical atomic weapons—even without their warheads—to new German divisions. The British visitors were obviously impressed while they were in Moscow by the Russians' fears that, once the Germans got the weapons, they would sooner or later get the business end of them as well.

In the second place, the British and the Americans have not yet agreed on the price to be exacted from the Russians for this limitation of troops. Even within the British delegation, opinions were divided on whether it would be best to concentrate on inducing Mr Khrushchev to accept a suspension of nuclear tests—by persuading him to allow an annual "ration" of on-site inspections by control teams—or to return to the old and weary problem of relations between East and West Germany.

If the latter were chosen, the Americans would be considerably more reluctant than the British to shelve, even by implication, the idea of reunifying the two halves. The mysterious "draft plan" which has been haunting despatches from Washington in the past fortnight is the skeleton peace treaty which the Americans want to put before the Russians at the coming conferences; it would propose a gradual process of reunification, starting with some loose confederate link but going on eventually to all-German elections, accompanied by a military security pact which would be widened at each step. Neither side at Camp David had high hopes that the Russians would swallow the plan whole. But the British are apparently more willing than the Americans to settle for agreement on the earlier stages—which would amount to a rough-and ready form of confederation—if the Russians reject the later ones.

There also seem to be differences about Berlin itself. It is generally believed in Washington that the British would accept some fairly substantial modifications of the western position in the city, short of total withdrawal, in return for a guarantee of free access. These might include a reduction in the size of the allied garrison, introduction of a "United Nations presence" and the voluntary winding-up of the West's propaganda base in the city. The British are also quite willing to grant the East Germans the right to stamp the documents of supply convoys. But President Eisenhower has committed himself not to give an inch; and by most American measuring rods, certainly those of Congress at the moment, these ideas come to more than that.

Thus Mr Macmillan, although he seems to have won the argument about going to the summit, has not yet succeeded in getting the West to agree on what it should do when it arrives there. Halfway through the talks at Camp David, the British spokesman said that he expected the "broad principles" of the western position to be settled by the time the foreign ministers of the North Atlantic Treaty countries assemble on April 2nd. This now looks highly optimistic. Since it would be equally optimistic to expect the four-nation working party in Paris—the chief centre for allied consultation remaining after that—to resolve these difficulties by itself, it is thought inevitable in Washington that there will be some more high-level flying to and fro in the next few weeks.

Argus Eyed

ARGUS, the many-eyed, is commemorated in the explosion, last August and September (just before the temporary ban on nuclear tests began), of three low-yield atomic bombs at a height of 300 miles, outside the earth's atmosphere. The purpose was to test a theory about the trapping of high energy particles in the earth's magnetic field, and to find the best height at which to intercept a ballistic missile—which explains the sponsorship of the Department of Defence. To

some Americans, Argus was "the greatest scientific experiment ever conducted." Whatever the truth of this contention—and so far too little is known to judge—its secret was certainly one of the best kept. Apparently undetected (though not wholly unsuspected) by the Russians, it was known to hundreds of Americans. Yet it was left to the *New York Times*, which had been told about the project before it was carried out, to let the cat out of the bag last week. The fact that the experiment had taken place could not, in any case, have been kept secret much longer. The data recorded by the satellite Explorer IV, sent up to keep an eye on Argus, must be made public because it is part of the programme of the International Geophysical Year.

Although the Department of Defence was driven to call a press conference, its experts on weapons, supervised by Mr Quarles, the Deputy Secretary of Defence, offered the exasperated journalists only a sketchy scientific brief instead of answers to exciting questions such as whether similar explosions would enable an attacker to disorganise communications and wreck anti-missile defence, or a defender to neutralise ballistic warheads in mid-air. Mr Quarles's statement that the findings would cause no change in the radar-dependent Nike-Zeus anti-missile programme suggests, however, that the blackout of radio communications was not severe or widespread—if it took place at all.

For six months, behind the scenes, a great dispute has raged between the military and the scientists over whether information about Argus should be made public. Recently, some officials at the Department of Defence are said to have come round to favour publication. This may represent a move to torpedo finally the Geneva talks on the suspension of atomic tests, on the ground that no method of inspection could close the gaping loophole disclosed by Argus. Certainly it introduces a new and unwelcome complication. But one of the crumbs dropped by Mr Quarles was the statement that detection of explosions outside the earth's atmosphere is not nearly as difficult as that of underground explosions. And the need to bring about a suspension of tests was strongly underlined when Senator Anderson, the chairman of Congress's Joint Committee on Atomic Energy, released letters showing that the Department of Defence believes that radioactive fall-out of strontium 90 is proceeding far faster than had been thought—and that it is greatest on the United States.

Short-term Solutions

THE Treasury kept its long-term flag flying this week by offering investors $500 million of 10-year 4 per cent bonds among the securities it issued to raise $4 billion in new money. But this was no more than a gallant gesture. The bulk of the money is to be raised by short-term securities—$1.5 billion by a 4-year 4 per cent note offered, like the bond, at par, and $2 billion by 289-day bills. These are the first instalment of a new device. Eventually $8 billion of the one-year debt should consist of bills which will be sold on an auction basis and rolled over on four known dates each year with, it is hoped, as little strain on the market as is caused by the present 3-month and 6-month bills. The Treasury, realising that it must depend on short-term securities for virtually all of the $26 billion of refinancing which lies ahead this year, is making the best of a disagreeable necessity. Other short-term maturities are also being grouped tidily together.

The omens for this particular financing were fair. The rise in the discount rate, which earlier overhung the market, was out of the way; the 4 per cent bond was part of an earlier issue which has been selling at a premium; and the new cycle of bills should get off to a flying start because the recovery of profits has given many corporations bulging bank balances which they like to employ profitably. The question is whether such corporations will not find other uses for their money later in the year as economic expansion continues, and whether the banks will not once more become the mainstay of the short-term government market. As for the long-term market, few investors want to hold on to government securities when they can earn higher returns on mortgages, many of which the government helpfully guarantees, or on the tax-exempt obligations of states and cities; compared with a return of 4 per cent on Treasury issues, these now offer the equivalent of 7 per cent or more to taxpayers in the 50 per cent bracket.

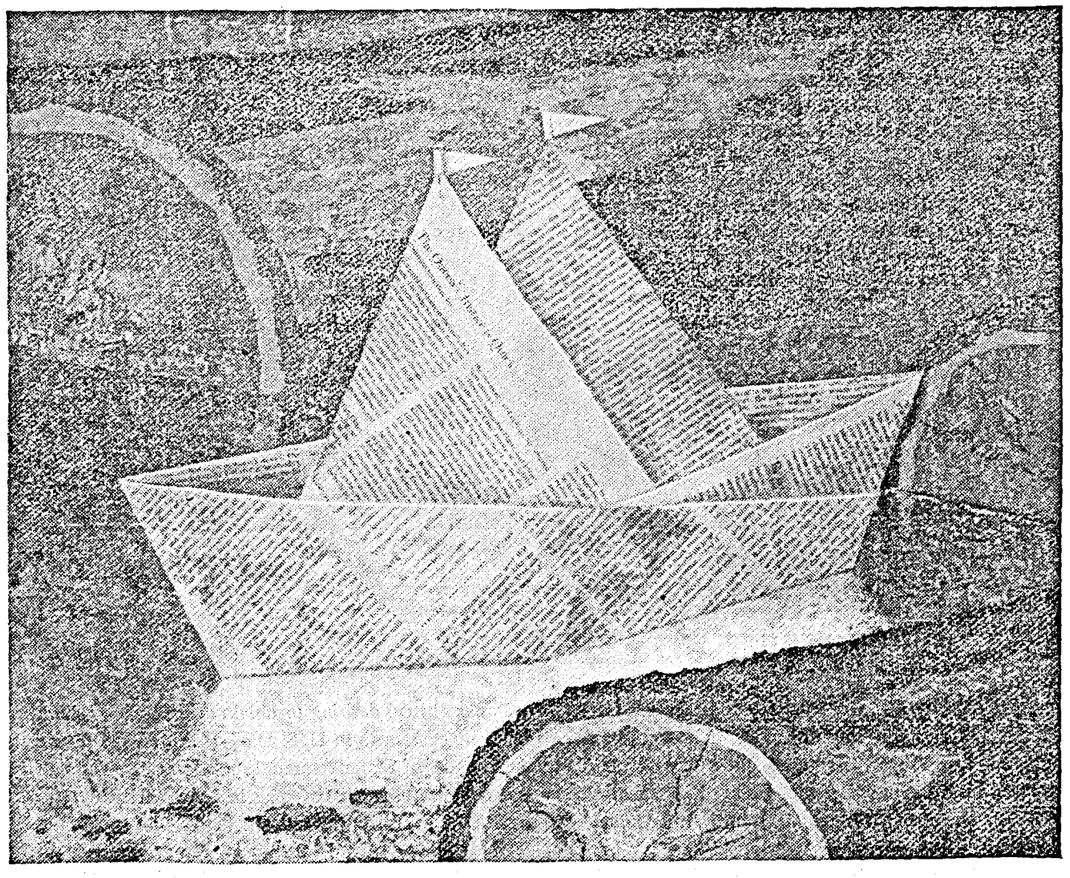
No early solution to this dilemma is in sight, but a joint inquiry by the Treasury and the Federal Reserve Board is under way to discover what changes, if any, are needed to improve the functioning of the market in government bonds. It collapsed spectacularly last summer under a weight of speculative excesses and consideration will be given to means of discouraging speculation and the violent swings it produces. Although buyers of shares must pay 90 per cent in cash, buyers of government bonds need put down little or no money. But reform in this direction would not necessarily give today's thin market the breadth and resilience that are needed.

Inflation's New Culprit

WASHINGTON, DC

"OLIGOPOLISTIC COMPETITION," which has long harassed economists and politicians, is now being blamed for the most recent period of inflation in the United States. This is something new in the spectrum of economic analysis. Studies of oligopolistic industries, those made up of, or dominated by, a few large firms, have always centred on the behaviour of prices, but only in a narrow sense. Not until very recently has anyone thought to accuse these industries of being the cause of a general increase in prices. That the thought has arisen now is almost entirely due to the work of a persistent, unorthodox economist, Mr Gardiner Means. A quarter of a century ago he invented the term "administered prices" to characterise price behaviour in oligopolistic situations. At that time he was concerned mainly with price rigidity in the face of fluctuating demand. But lately, annoyed at the neglect of his concept since the war, he caught the ear of Senator Kefauver of Tennessee, a famous tilter against monopoly, at a time when inflation was a subject of great public concern and seemingly had certain non-classical attributes.

Mr Means testified before a subcommittee headed by Senator Kefauver twice—once in 1957 and once again in January this year—and, perhaps because of the unusual confidence with which he treated complex problems, each time his evidence attracted considerable public attention. At his most recent appearance Mr Means came with a set of charts, of which two are reproduced. These show that the general increase in prices, which arose out of the last world war, was led by prices in the highly competitive industries, as would be expected in a monetary inflation, while the



DOW CHEMICALS *and paper*

Great logs float downstream on the first leg of their long journey to serve a paper-consuming world. They're part of the endless supply of raw materials required by the fast growing pulp and paper industry. Equally important to this industry is an enormous quantity of chemicals . . . chemicals to help make wood into pulp, pulp into paper, boxboard and building materials.

Dow serves this basic industry with a great variety of specialized chemicals. Coatings made of Dow latex give paper and boxboard a better printing surface. Separan* flocculants improve uniformity and speed papermaking operations. Dowicide* preservatives protect paper from damaging mold growth.

Through a continuing program of research and development, Dow creates new and improved chemicals for the pulp and paper industry. The Dow representative or branch office near you will welcome your inquiry.

WHICH OF THESE AMERICANS IS A CUSTOMER FOR EUROPE?

A Texas cowboy, a Maine lobsterman, an Iowa farmer's wife, a Chicago corporation lawyer, a New York department store buyer. These are but a few of the incredibly varied types who are classified as Americans and comprise the American market. They differ radically from each other and other Americans in tastes, desires, needs and ways of life, and, naturally, in the kind of merchandise they buy.

Banks abroad desiring to obtain a favorable position for their customers in U. S. markets are invited to use the facilities of Manufacturers Trust Company. Through our complete branch coverage in New York City and our thousands of correspondent banks throughout the United States, we are exceptionally well equipped to obtain data on local market conditions in the United States and to handle all types of banking transactions.

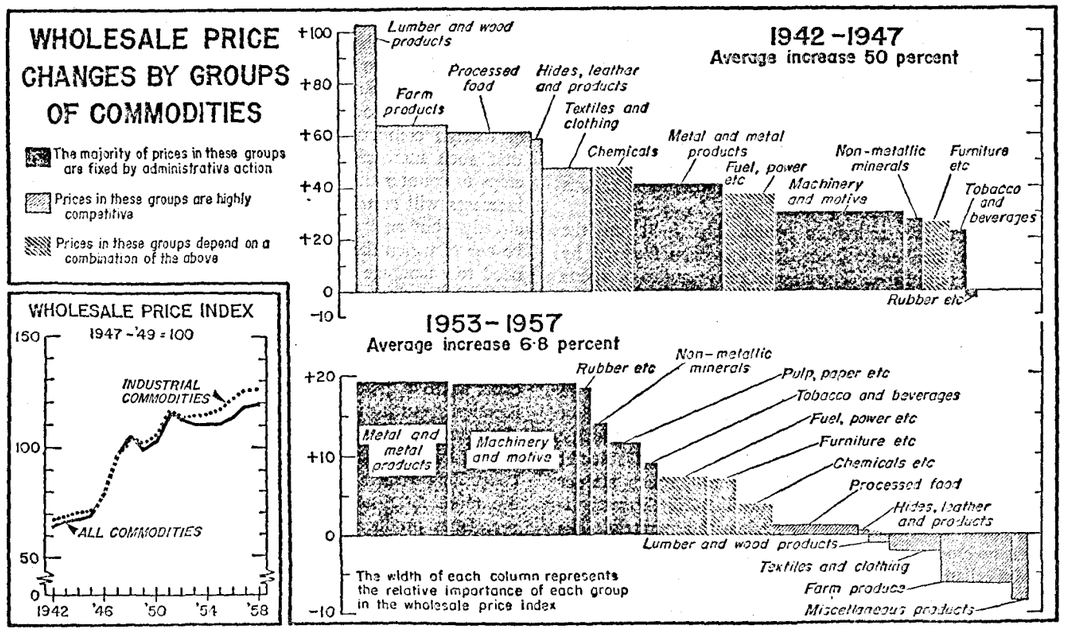
increases between 1953 and 1957 came about entirely from prices in the oligopolistic industries—the pattern of an administrative inflation. These charts were so telling that they virtually compelled comment even by those who had never taken the problem of administered prices very seriously.



No doubt to the surprise of Mr Means and Senator Kefauver, comment came even from the Federal Reserve Board, by nature the stronghold of scepticism about newfangled theories of inflation. In public statements Mr Ralph Young and Mr Woodlief Thomas, two of the members of the top triumvirate of the central bank's staff (the third is Mr Winfield Riefler), have fully accepted the term administered prices, have not sought to challenge Mr Means's figures, and have expressed great concern about the economic difficulties raised by industry's pricing power. Neither has gone so far as to accept the idea that the inflation of 1955 to 1958 was an administrative inflation, as claimed by Mr Means, but their anxiety about the problem in its narrower sense has given new heart to those, like Senator Kefauver, who believe something ought to be done about it. Mr Saulnier, the chairman of the President's Council of Economic Advisers, has also admitted that the pricing policies of the steel and automobile industries hurt the country's economy during the period in question, while Professor Galbraith of Harvard, naturally ready to go much farther, has accepted the Means analysis and its consequences fully, and has concluded that the only way out is a system of price control limited to oligopolistic situations.

Last summer when the steel industry raised its prices while operating at only 60 per cent of capacity, Mr Means seemed thoroughly vindicated. The monetary authorities complained, first in private and then in public. In an exhaustive, and exhausting, set of hearings last year—without help from Mr Means on that occasion—Senator Kefauver sought to show that, at least in the case of the biggest steel and car firms, price increases were far greater than could be accounted for by the rise in direct labour costs. It became clear that the leading firms in oligopolistic industries, with what Professor Galbraith called "unliquidated monopoly gains," could raise their prices at almost any time; the fact that they often chose to do so when wages had gone up seemed simply to be a matter of good public relations.

But has it been proved that the recent rise in prices in the United States was an administrative inflation which could not have been controlled by monetary and fiscal means? Perhaps the greatest weakness in Mr Means's case is the performance of corporate profits. While there is some evidence that many of the larger firms have widened their profit margins and increased their profits, the general course of corporate profits has been steady or declining. Administered pricing is presumably inflationary only if it causes a general rise in prices for the sake of profits and, over the American economy as a whole, that has not happened.

Mr Means is also attacked on the ground that his charts represent coincidence rather than cause and effect. That is, it so happened that 1955 to 1957 was a period of boom in which demand was heaviest in those sectors which are oligopolistic. Thus, it is said, the rise in prices can be explained in great part in terms of classical demand. But this does not apply to the increases that took place in 1958 during the recession; Mr Means has added new figures in recent days showing that administered prices moved up in 1958, though less than during the boom, while the more competitive prices were in general the only ones that fell.

Finally, there are doubts about the pervasiveness of the effects of oligopoly. It is fairly clear that retail prices, as distinct from wholesale prices, are not massively affected by an increase in the price of steel or electric generators. Economists are divided over whether the degree of concentration in the American economy is any greater in the present decade than it was earlier in this century: if it is

not, then administered prices could scarcely be a major new force for inflation that did not exist before.

But what undoubtedly is new is the monopoly power of organised labour, for the industries characterised by oligopolistic competition are also for the most part those which now have large and well-organised trade unions. The fact that the steel industry seems often to have raised its prices at times of wage increases more than was justified by the rise in direct labour costs does not change the fact that the initiating push on the cost side came from the trade union. This is generally accepted, even by Senator Kefauver. The most important consequence of the resurrection of the concept of administered prices could be—although it will not come soon—a Galbraith-type of price control: but it seems clear that, given the present state of thought on the subject, controls on wages would also be part of the machinery.

Labour Bill Marks Time

Two months ago one piece of legislation which seemed sure to get through this Congress in record time was the Labour Bill, but now it will not reach the Senate floor until after Easter; then a hard fight is inevitable there, while the House is not planning to finish committee work on it before the beginning of May. It looks as if Governor Rockefeller will again get ahead of President Eisenhower; he has sent the New York Legislature a Bill providing safeguards for trade union funds and curbs on union officers which is not only expected to pass quickly but which is better liked by labour leaders than are any of the Bills to achieve the same purposes now before Congress.

The only one of these which is acceptable to labour is the Kennedy-Ervin Bill. This is partly because it provides only for criminal penalties for union officers who break its regulations against corruption in trade unions, while the Administration's Bill, sponsored by Senator Goldwater, provides for administrative penalties on the union itself as well. But the main attraction of the Kennedy Bill is its "sweeteners" in the form of amendments, made to the order of the labour leaders, to the basic Taft-Hartley Act regulating trade union activities. The Administration, however, insists that, if the Act is to be amended at all, the changes must also include some to which the unions object violently.

The recent procrastination which has held up the legislation in the Senate committee has been fostered by supporters of both Bills. The Republicans want to postpone final votes until the appearance of a report from Senator McClellan's investigating committee on abuses in trade unions, since it is believed that this evidence will improve the chances of the Administration's stronger labour reform Bill. The Democrats, on the other hand, want time to mobilise support for their Bill, which they fear may be lost to a coalition of Republicans and conservative Democrats. Much turns on Senator McClellan, a southern Democrat himself, who has introduced his own Bill, much sterner than either of the others but with no Taft-Hartley amendments; he thinks these should be dealt with separately. His Bill has no chance of passage, but the Republicans hope that Mr McClellan may desert his party on this issue and vote for the Administration's Bill.

In the end it seems possible that Senator Kennedy's Bill will pass without any Taft-Hartley amendments and that the trade unions will have to make the best of what will then be to them a bad job. Meanwhile the Department of Justice is trying to fill the gap by methods which may eventually prove more effective than any Bill. It is prosecuting trade union racketeers all across the country for "restraining trade" under the Sherman Anti-Trust Act. And Mr Dave Beck, of the teamsters' union, who started it all, has been convicted for violating the income tax laws.

Quotas Begin to Bite

Last week the international oil companies felt the teeth of the new compulsory quotas for imported petroleum. Officially, at least until the arrangements are reviewed at the end of June, no company is to have its quota reduced by more than 20 per cent from its voluntary one; but that applied only to crude petroleum while the mandatory quota includes unfinished products, so that a firm which has been importing large quantities of the latter suffers severely. The Socony-Mobil and Tidewater companies are both cut by 40 per cent; the Texas, Gulf, Standard Oil of Indiana, Sinclair and Atlantic companies will all be importing about 30 per cent less than they have been. One firm, the Shell company, not a very large importer, receives an increase of 27 per cent. The quotas will reduce total imports of crude and unfinished oil to 936,770 barrels a day from 1,113,500 under the voluntary programme. They are based on the total amount of oil which each company used in its refineries in 1958, without regard to its sources of supply, and every refiner is entitled to a quota whether or not he has ever used imported oil.

It is generally expected that one or more of the worst-bitten companies will seek a court test of the legality of the allocations; this might lead to an injunction against the quotas while the case is being heard. But if the new regulations give the oil industry a chance to interfere with the government, they also give the government yet another chance to interfere with the industry, in a most unwelcome way. For they carry a surprise warning that, if prices of crude oil or its products go up as the result of the lessening of foreign competition, and if the government considers that such increases are unreasonable, then it will take steps to counter them by relaxing the quotas. Some price increases will certainly be allowed—there have been some already—but an "unreasonable" increase will presumably be one of which the inflationary repercussions outweigh the need to encourage domestic oil production for the sake of national security—the official excuse for the quotas.

The rejoicing of the independent domestic companies at their new protection has been dashed, but not doused, by this threat of price control, put into the proclamation in order to make the new policy run less counter to the Administration's much-publicised fight against inflation. It may also have been hoped that the possibility of price controls might stifle some of the inevitable protests from oil-consuming states, in New England and elsewhere, which are more interested in cheap fuel than in the profits of petroleum producers in the Gulf states. But, led by the Republican Senator Aiken of Vermont, Senators from Rhode Island, Florida and Oregon, joined by spokesmen of the international oil companies, are already attacking the new programme from every angle.

Equality on the Air

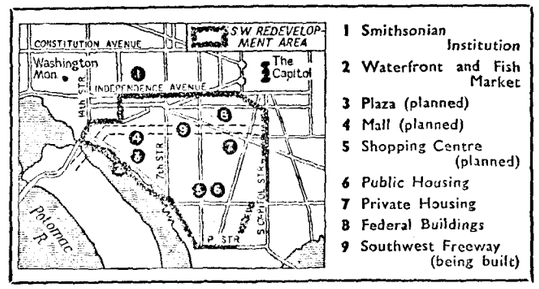
Section 315 of the Federal Communications Act requires that any wireless or television station which permits a candidate for public office to use its facilities must afford equal opportunities to all other candidates for that office if requested. If this were in fact ever requested to the full extent possible, the section would long ago have proved its impracticability in a country where at the quadrennial presidential elections twelve or more parties offer candidates for President and Vice President, all but a few of whom represent small fractions of the community, such as prohibitionists, and where in the innumerable other political contests there is always a sprinkling of "crackpot" candidates. But it was left to a perennial seeker after office, running in the Chicago mayoral election early this month, to convince the President that section 315 really is ridiculous and that the legislation should be changed, in one respect at any rate.

Mr Lar "America First" Daly was trying to be nominated for Mayor. One of his opponents was the incumbent and was naturally televised in the course of his official duties; he also appeared with a third candidate on the screen when both filed their nomination papers. All of this was merely in the course of ordinary news broadcasts but, when Mr Daly appealed to the Federal Communications Commission it held that under the law he must be allotted equal time. This regulation has never before been applied to news programmes. In the last presidential campaign one of the big networks devoted some 20 per cent of its total news coverage to the candidates of the two major parties; it would obviously have been impossible to give equal time to those of the other ten parties and to deal with other current developments as well.

If Congress takes steps to remedy this situation, it may also rectify another recently discovered defect in section 315. The regulation states specifically that a wireless station may not censor the remarks of any political candidate exercising his right to equal time on the air. In North Dakota another perennial candidate, Mr Townley, the founder of the Non-partisan League, a farmers' protest organisation that swept the prairies between 1915 and 1925, alleged, in 1956 and again last year, in air time granted to him under section 315, that the senatorial candidates of the major parties in the state were controlled by the "communist-dominated" Farmers' Union, an organisation admittedly somewhat to the left of the Republican party but one which has fought communism hard.

The North Dakota branch of the union filed suit for heavy damages against the two broadcasting companies which carried Mr Townley's remarks. In one case the State Supreme Court has held that Congress could not have meant to make broadcasters liable for remarks which it compels them to carry without censorship. This decision has been appealed to the Supreme Court of the United States. Meanwhile, the second company settled out of court by paying the Farmers' Union $10,000 and by acknowledging that Mr Townley's remarks had indeed clearly been defamatory. But as a result of all this the stations involved, and some others as well, refused to allow any of the candidates for the Senate to appear on their facilities during the last month of the 1958 campaign in North Dakota.

Capital Improvements



FROM A CORRESPONDENT IN WASHINGTON, DC

Between the Capitol and the Potomac River, in the south-western part of Washington, some of the city's worst slums have existed, until very recently, right under the nose of Congress. Now the curious who venture into the 550 acres bounded by Independence Avenue, South Capitol Street, Fourteenth Street and the Potomac River find a square mile in which all the dwellings have been levelled to the ground or are vacant and awaiting demolition. Only yesterday 20,000 people lived here, overcrowded into two-storey slums and alley tenements with open privies, relying on outside pumps for their water. Rats lived here, too, and rumours persist that they made a concerted departure the day before the order to vacate took effect.

It is five years since Mr Zeckendorf, a private developer, first presented the capital with his bold plan for reclaiming this neglected quarter, but at last the progress being achieved is breath-taking. The local government has acquired more than 80 per cent of the privately owned land and has razed half of the 5,000 buildings on it. The Redevelopment Land Agency has already completed 456 units of a large public housing project. About a quarter of the former residents are expected to be eligible for its one- or two-bedroom flats or its terrace houses for larger families, which have three, four or five bedrooms. Rents vary according to the income of the tenant and the size of his family. Those consisting of only one or two people are admitted if their income is under $3,200 (about £1,140) a year and may stay unless it exceeds $4,000; families with seven or more members are accepted if their income does not exceed $4,100. The monthly rate for each room is about $17.

The beginning of an extensive housing estate for the middle and upper-middle classes is also visible. With government financing, a well-known private firm has built and will open next month the first of eight towers, each containing over 400 flats. One—kitchen, living room, bedroom—will cost about $155 a month. There will also be modern terrace housing, the biggest such development in the country, and two- and three-bedroomed detached houses, to tempt back into the centre of the city some of the comfortably-off families who have been moving to the suburbs. As usual, the lower middle-class people, who cannot afford private rents and are not eligible for public housing, are likely to be left out in the cold. In the end the population in the area will be almost as large as it was before, but its composition will be different. There is to be a new shopping centre for these houses and flats.

At the Potomac end of the area, a replanned waterfront running all the way from the Fourteenth Street Bridge to

Original and Provocative Investment Letters From America

The Monthly Letters published by J. R. Williston & Beane have proved to be of interest and investment benefit to serious investors around the world. These original and stimulating essays are prepared by the partner in charge of our Research Department. They attempt to define current business and economic trends and estimate their probable effect on the stock market and specific issues.

The following headlines illustrate the wide range of subjects dealt with in our most recent Monthly Letters:

"Is It Too Late To Protect Yourself Against Inflation?" . . . "Does Pan Arabism Make It Dangerous To Own Mid-East Oils?" . . . "Is Moscow Determining Your Investment Future?" . . . "Your Basic 1959 Investment Policy"

If you would care to receive a current copy of this unusual investment publication, without cost or obligation, write to Mr. H. Thomas Osborne, Foreign Department.

Seventh Street will provide an expanded marina for small boats and offer riverside attractions reminiscent of Fisherman's Wharf in San Francisco and the Tivoli Park in Copenhagen. The L'Enfant Plaza, covering 25 acres along the forthcoming Tenth Street Mall, is to have a 1,000-room hotel and end overlooking the river; a restaurant will be built there to take advantage of the view. Another redevelopment scheme, for Northwest Washington, is still on paper, but is in an advanced stage of planning. It will rehabilitate existing buildings in a run-down 900-acre area that is roughly co-terminous with the city's Second (and wickedest) Precinct.

At the same time great efforts are being made to break the stranglehold of inadequate transport on one of the fastest-growing metropolitan regions in the country. These also affect housing; a question often heard at cocktail parties is, "Have you heard yet whether the road is coming through your house?" A new eight-lane road, the Southwest Freeway, should be finished by 1961. Two new bridges are scheduled, one near Fourteenth Street and another crossing the Potomac by way of Theodore Roosevelt Island. Outside the city the bull-dozers are already at work, clearing the way for the Circumferential Highway, which is to encircle the city and be connected with a transcontinental highway. Steel flyovers will leap areas where forward buying of land for public use was put off too long.

Cultural developments are also blossoming. A large carillon was recently dedicated in the Capitol grounds in memory of Senator Taft and a great excavation along Constitution Avenue promises the Smithsonian Institution additional space, which its curators grieve to say is already committed to the last inch. In Foggy Bottom, near the State Department's building, $700,000 is being spent for the last acre of a ten-acre tract for a National Cultural Centre. The President has appointed a rather pedestrian committee of fifteen private citizens to serve with a like number of officials as its Board of Trustees, with the initial task of raising about $20 million for a concert hall seating 4,000 and a theatre for a projected repertory company—and to provide the patrons of these creative arts with room to park 1,000 cars.

Linen in Public

NEW YORK

THE housewife bored with caring for her menfolk's shirts will soon be able to escape by contracting for a regular flow of freshly washed and suitably sized garments; moreover, the supplier will also take over all her problems of wear, tear and replacement. While the squeamish may hesitate to draw their clothing from a common, even if sterilised, pool, the prospects for a shirt-rental service are promising enough for one of the largest linen suppliers in the country to be about to launch out into this relatively untried field. For a service of five shirts a week, the customer will pay $1.85 (about 13s. 6d.).

By supplying all types of linen at a cost which is little more than the standard laundering charge, linen suppliers have persuaded more and more large commercial and institutional users—as well as private individuals—that it is cheaper to hire than to own. The best customers are the hotels, motels, restaurants and bars which absorb an unending flow of clean towels, sheets and pillow-cases—as well as uniforms for their employees. Office and factory washrooms have in the past been major users of rented towels—and many suppliers have provided soap and other toiletries as well—but the paper towel is now a formidable and unwelcome rival. More recently an important new field has opened up with hospitals showing signs of abandoning their own laundering activities in favour of a rental service. For commercial users such service was first introduced in the late eighteen-eighties but it is only in the last decade that hired sheets, pillow-cases and towels have appeared in private houses: in the New York area today, there are about 100,000 of these domestic clients.

The industry has expanded rapidly, both on the commercial and home front, and last year its customers paid more than half a billion dollars for their rented linen. While there are thousands of these suppliers, the business is effectively dominated by a small group of very large companies which, by swallowing up the smaller firms in their path, have established wide territorial empires. Lately, however, they have been having some of their own dirty linen washed in public. Last summer their monopolistic habits in the New York region came under the anti-trust spotlight and, as a result, two linen supply associations and eight companies were fined a total of $355,000, and four individual leaders were convicted of unacceptable business practices. The offence was not primarily bigness as such, but the industry's predilection for fixing prices, for allocating markets and customers, and for effectively prohibiting new entrants. Other large firms are now nervous that their own ramifications may incur similar penalties. To complete the industry's present discomfort, its name has cropped up in the course of the congressional investigations into racketeering in the service trades.

SHORTER NOTES

During the next year the president of the United States Chamber of Commerce in Washington will be Mr Erwin Canham, the liberal editor of the *Christian Science Monitor*. This is the first time that this group of businessmen has chosen a newspaperman as their head. Mr Canham, who writes a weekly column on international affairs for his paper, appears on a weekly television programme and advises the government on information policy, is a highly articulate advocate of a free market and opposes too much power for either big labour or big business.

* * *

The National Steel Corporation whose chairman is President Eisenhower's mentor and former Secretary of the Treasury, Mr Humphrey, is to a build a new steel mill in Indiana, on Lake Michigan. It is to be part of a $300 million programme of expansion in the rich steel market of the Middle West which will make National, the fifth largest firm in the industry, almost as big as the Jones and Laughlin Steel Corporation, the number four. The project should stimulate development of a deep water port when the St Lawrence Seaway is complete; unfortunately it also frustrates hopes that the dunes along the lake might be turned into a national park.

* * *

In California an American of Chinese ancestry has for the first time been appointed a judge; Mr Wong, who sits on the municipal bench in Los Angeles, was born in California 38 years ago and educated in the state.

Man spreading the news abroad
Is himself made of **Cariflex** *S2105 which is the latex designed for foam rubber manufacture. This particular rubber is only one of twenty different types of Shell-made rubbers currently available. Your Shell Company will gladly answer your inquiries about any member of the* **Cariflex** *family.*

Shell extends its service.

Shell advances in step with progressive industry. To the world's rubber industry whose demands can no longer be fully met by natural supplies, Shell introduces **Cariflex** general purpose butadiene-styrene rubber... Shell-made to standard specifications, now available in twenty different types of dry rubber and latex. The **Cariflex** range consists of hot and cold polymers, oil masterbatches, carbon black masterbatches and hot and cold latices, and covers applications varying from tyres and mechanical goods to battery-cases and adhesives. Ask your Shell Company for details of **Cariflex** Shell-made rubber.

Whatever Shell does, Shell does well.

the things they say!

Hello! Where did you drop in from?

I've just got in from Malaya. I.C.I. has a lot of customers out there. I've been giving them a hand with some of their problems.

Does a company as big as I.C.I. really care about customers' problems—surely they're content to make a sale and collect the cash?

Not at all! We want only *satisfied* customers, and each of our manufacturing Divisions operates a Technical Service organisation, staffed by specialists, to be sure that our products give the performance we claim and the customer expects. Many of the I.C.I. companies overseas provide a similar service of their own.

Can anyone get this service?

Yes; and if any I.C.I. company abroad wants an expert from the U.K. to help solve some particularly knotty problem, we send one.

You surprise me. Operating a service like this at home and abroad must cost I.C.I. a packet.

Roughly one and a half million pounds a year. But look at the results! By keeping the highest quality standards and backing our products with this sort of Technical Service, we've built up not only a huge trade in the home market but export business worth over £70,000,000 a year.

THE WORLD OVERSEAS

Moderates Gain Ground in Northern Rhodesia

FROM OUR CORRESPONDENT IN SALISBURY

ALTHOUGH Sir Roy Welensky's United Federal party may have won a resounding victory in the battle on its right wing against the Dominion party in last week's Northern Rhodesian elections, it has undoubtedly lost what was its more important battle on the left wing. For though African voters made up just over a quarter of the 30,234 electorate, not more (and probably considerably less) than 400 of these 7,617 African voters cast their vote for a United Federal party candidate ; and although, in the complicated structure of twelve ordinary, six special, two European reserved and two African reserved seats, the UFP won thirteen of the fourteen seats in which the European vote is the predominating factor, it failed to win any of the seats in which African and Indian voters played any large part.

Two important results stem from this. The UFP has failed in its main election bid to win sixteen seats, which would have given it a clear majority in the thirty-strong legislative council (six official and two nominated members make up the number) and would have allowed it to a great extent to take over the government of the territory from the Colonial Office. And the fact that the UFP has been clearly shown to be a European party rejected by other races—it put up four African candidates, two of whom were elected but only by the weight of Europeans voting the "party ticket"—must give the British Government (and one hopes the Federal Government also) some occasion for soul-searching.

The rejection of the UFP by the Africans went to extraordinary lengths. It produced the spectacle of Africans voting in their hundreds for Dominion party candidates who were hardly likely, if elected, to put African interests first. Voters were following the directive of Mr Titus Makupo, the secretary general of the African National Congress, who told them to vote in such a way as to hurt the UFP. As a result, two Dominion party mineworkers (at Mufulira and Kitwe West) got 277 and 224 African votes while their opponents got only 18 and 31. The Dominion party responded by endorsing the candidature of Mr Lawrence Katilungu, the president of the African mineworkers union—greatly to his embarrassment, for though standing as an independent his views are those of the liberal Central Africa party. The fact that neither he nor the two Dominion party mineworkers were in the end elected should not obscure the importance of the feelings behind these moves.

The poor showing of the Dominion party was not surprising. It was mainly relying on the appeal of its "central African alliance" scheme, which is a plan to contract the Federation's boundaries to a dominion composed of Southern Rhodesia, the copperbelt and the central line of rail strip joining them, and to turn the troublesome "black" areas of Northern Rhodesia and all Nyasaland loose as grant-aided protectorates. At a time when Rhodesian troops and police were embattled in Nyasaland, this was considered defeatist rather than reasonable talk. For the rest, Sir Roy Welensky grabbed what thunderbolts the Dominion party might have taken, and hurled them like an indiscriminate Zeus at every target from Dr Nkrumah and Mr Todd to the next (as yet unchosen) governor of Northern Rhodesia. The result was that the Dominion party won only one seat and the solitary victor, Dr Gert Smith, scrambled in by five votes only because Africans marched to his rescue under their anti-UFP banner.

While Sir Roy Welensky and Mr John Roberts, his territorial leader, were winning this fight on their right wing, over to the left Sir John Moffat and his Central Africa party liberals were gaining unexpected ground. They campaigned for security from fear for all races and states rights for Northern Rhodesia while the UFP was suggesting an explosive plan to federalise the police force. The first augury of liberal gains came when Mr Norman Hunt, who got only 64 votes in the November federal elections, increased his poll tenfold with Indian and African support and came close to storming the UFP stronghold of Ndola. Then a teacher, Mr Alfred Gondwe, beat both Congress and UFP opposition handsomely to win a special rural seat for the Central Africa party ; a day later, Sir John's own victory—which had been very doubtful because of the heavy devaluation of special votes in his constituency—was announced with a three to two margin suggesting that he was supported by some tobacco farmers as well as by Africans, Indians, and missionaries ; by Tuesday the party had gained a third seat. (In two more special constituencies, elections are still to be held because candidates had not come forward.)

Although Mr Roberts is likely to press his threat to make the constitution unworkable (by not taking part in the government and by opposing all legislation with his thirteen votes) unless the Governor accepts his nominees for six executive council and the last two legislative council seats, Sir Arthur Benson cannot yield to such pressure after these results (if he had ever thought of yielding before). Behind the UFP argument that they cannot continue to share "collective responsibility" in the government with the members of other parties lies the realisation that this is the last (and only) chance for a white settler party to take over the running of the country. Two choices now face them: either to change their policies radically in order to win African support, or to see their influence dwindle in succeeding elections as African voting power grows.

The Central Africa party, under the joint leadership of Mr Garfield Todd in Southern Rhodesia and Sir John Moffat in the north, has begun its life with gusto. Sir John (a member of the most famous Rhodesian family, which has produced chief justices, missionaries and district commissioners in every generation) should be able to gather a voting block of nine or more, in the new legislative coun-

cil. This will require all his statesmanship, for the block would have to include the independent-minded Congress president, Mr Harry Nkumbula (incidentally, though the Northern Rhodesian Congress is legally represented in the Northern Rhodesian house, it is now illegal for anyone in—or visiting—Southern Rhodesia to belong to it). But if Sir John can weld this block together the future in Northern Rhodesia may lie not with Sir Roy Welensky's white settlers, nor with the 44 Zambia Congress extremists now "rusticated," but with the moderates of all races who support Sir John.

Mr Gomulka Consolidates

WARSAW'S highest skyscraper, the elaborate Palace of Culture, described by the local wits as a pastry-cook's nightmare, has now returned to normal. On Thursday of last week, the third congress of the United Workers' (Communist) party ended its proceedings after nine days of lengthy speeches and debates. It gave a striking demonstration of the extent to which Mr Gomulka has consolidated his position and strengthened his hold over the party machine in the two and a half years since his dramatic comeback. Three new members have now been added to the party's political bureau, and all three (General Spychalski, Mr Loga-Sowinski and Mr Kliszko) are close collaborators of Mr Gomulka's, and were fellow sufferers with him. The central committee was also renewed. Several prominent Stalinists of the so-called Natolin group (like Mr Mazur) were kicked out as well as a few "revisionists." Mr Gomulka, however, felt strong enough to keep on a few repentant members of the two opposing factions.

Mr Gomulka is now in full control. As if to emphasise his leadership and erase the painful memory of his disgrace, the congress took the unprecedented step of declaring null and void the decisions of previous congresses which "on the basis of false and mistaken premises stated that inside the party there existed a right-wing deviation." This was the charge under which Mr Gomulka had been removed from the post of first secretary in 1948 and later imprisoned. Thus, at the very time when Mr Gomulka was asserting the supremacy of a resurrected party, the congress implicitly admitted that the party is not infallible.

The view that the Polish leader has also consolidated his position within the communist block by an unwritten agreement with Mr Khrushchev was confirmed by the speeches made during the congress. In his report, Mr Gomulka naturally spoke at length of the Oder-Neisse line, the west German designs against it and Poland's wholehearted support for the Soviet peace proposals. He took pains to emphasise the leading part played by the Soviet Union in the communist block. In a special passage on Jugoslavia he argued that there is no room for "outsiders" and expressed the hope that the Jugoslavs will come back to the communist fold. As to Poland, he left no doubt about its place. The price that Mr Khrushchev is apparently willing to pay for this allegiance is relative "non-interference" in Poland's internal affairs. Mr Gomulka summed up this bargain in a quotation from Lenin: the basic principles of communism must be applied in such a way as to fit the national peculiarities of each country.

How much has Poland been able to preserve these peculiarities, which not so long ago made it into a very exceptional place in the communist world? The congress provided an opportunity to check the party line on some of these issues. Mr Gomulka repeated his pledge that everyone is perfectly entitled freely to exercise his religious beliefs. At the same time, he warned the Catholic Church not to interfere with non-believers and, above all, not to get involved in the political life of the country as the mouthpiece of the opposition. This warning shows that the honeymoon between church and party, which followed the change of regime in October, 1956, is over, but the two sides may still get on together fairly peacefully through mutual toleration.

Poland's other characteristic feature, the slow pace of collectivisation, is to remain. Mr Gomulka paid lip-service to the system of collective farming. So did Mr Ochab, his predecessor as party secretary and now minister of agriculture. But both spoke of it as a desirable distant aim. Eighty-five per cent of the land still belongs to individual farmers, while the 2.2 million horses are the chief means of traction in the countryside. A more plentiful supply of machinery, persuasion and example—these are the means prescribed to achieve the long-term objective. In the meantime, the task is to get higher yields and a 30 per cent increase in output over the next seven years. Peasants still account for nearly half the country's population and the government clearly wants to avoid a rural upheaval. Unless it is driven to action by resistance in the countryside, it seems determined to proceed with collectivisation at a snail's pace.

THE most striking aspect of the Polish October was the astonishing amount of freedom enjoyed by the population and, particularly, by the very articulate intelligentsia. But, after about a year of almost uncensored expression, the printed word gradually came under stricter control. Mr Gomulka has now confirmed this trend and given his reasons for it. His attack was mainly directed against "revisionist" writers who took advantage of the party's disarray to publish works "blackening socialism and praising its enemies." The result was a gloomy literature "proclaiming despair and man's hopelessness in the face of evil." Mr Gomulka resented the accusation that writers are now required to idealise existing conditions, but he made it plain that they must have a positive attitude towards the regime.

Whether these words are the forerunner of a further tightening is not certain. But Mr Gomulka's inability to have a dialogue with intellectuals is obvious. There is a divorce between himself and the young intellectuals who had cheered his return to power. And, for all his prestige, Mr Gomulka cannot induce them to toe the party line. Is he not a living proof that the party can be wrong? Sooner or later, the party will have to attract the young intellectuals and revive their enthusiasm; otherwise it will be paralysed by apathy and fall victim to the "bureaucratic sins" which are now deplored as an error of the past.

For the time being, the new regime is mainly concerned with ensuring a steady economic improvement and a reinforcement of social discipline. Only after a period of consolidation is the party likely to revive the October dreams of workers' control and greater democracy. Mr Gomulka sits firmly at the helm. Once again he has the party under full control. But the future course of the Polish experiment is still intimately linked with developments beyond its eastern frontier and with the general international situation.

Dr Verwoerd's "New Vision"

FROM OUR CORRESPONDENT IN SOUTH AFRICA

SOUTH AFRICA has been watching the development and handling of the crisis in the Federation of Rhodesia and Nyasaland with concern and sympathy (for the white settlers). The government itself has maintained a stony diplomatic silence, but there has been a good deal of "I told you so-ing" among the less inhibited echelons of the Nationalists who tend to ascribe all the Federation's ills to its failure to apply apartheid. The United Party opposition, too, has maintained an uneasy silence, although here the tendency has been to suggest that Dr Verwoerd's Bantustans must some day demand independence as the Nyasaland Africans are doing now, and that the only way to avoid this is to integrate the African territories economically and politically instead of trying to develop them as separate entities. Only from the African National Congress and Liberals has there been forthright criticism of the Federation's handling of the emergency.

For the Nationalist government the crisis came just as it was beginning to give a verbal refurbishing to its own apartheid policy. It is concerned about the happenings in the Belgian Congo, aware of the need to bring its own policy into closer alignment, even if only visually, with developments in other parts of Africa, and acutely conscious of growing world antipathy to apartheid and a heightened sense of disillusionment within its own intellectual ranks. The prime minister reacted with a "new vision" speech made early in the present parliamentary session. In this he held out the prospect of African areas in which there would be a growing measure of self-government and the gradual disappearance of "discrimination and oppression."

The plan, tabled in Parliament on Tuesday, envisages the appointment of white ambassadors to these areas, which in turn will send tribal representatives to their own people living in the so-called white areas. By a system of Bantu authorities the African areas are to be given local councils with limited authority always subject to the control and discipline of the central government and under the influence of chiefs. The members of these councils or authorities will be liable to dismissal by the Minister without explanation. In addition a Bantu Development Corporation with an initial capital of £500,000 is being set up to help with the economic development of the African areas; two years ago the Tomlinson Commission recommended the expenditure of about £10 million a year over ten or twelve years on such a corporation.

Nationalist spokesmen have been saying openly that these gestures were intended primarily to satisfy world opinion and to convince Africans that apartheid will be their salvation. The prime minister himself has been at pains to convince his opponents that his scheme of Bantu Authorities in the reserves is very similar to Basutoland's self-government plans. His critics, however, reply that whereas in Basutoland the national council will be largely elected by the people and given authority in all spheres except those specifically reserved for the British Government, in the Union reserves the authorities being set up will be the creatures of the Minister; they are to be nominated bodies with no real powers except at the lowliest level, and they cannot hope ever to be anything more than advisory councils. Moreover, in Basutoland the powers are being given after the fullest consultation and with the agreement of the people, while in the Union it is a purely unilateral arrangement announced by the government on a take it or else basis.

Dr Verwoerd argues that since the development of Africans in the Union cannot be halted, there is only one way in which to prevent the loss of political control by the white man and that is to give the Africans rights in their own areas, and for the whites then to live in friendship with them. But white and non-white, he says, will never sit in one Parliament or one government. If the Basutos have no representation at Westminster why should the reserve Africans want representation in Cape Town? The Union itself will become something like the Commonwealth "where the various constituent members are not represented in the mother parliament."

The extensive use that Dr Verwoerd, the arch-republican and non-admirer of the Commonwealth, makes of British imagery is thought to be a measure of his embarrassment and of his anxiety to prove to his critics that he is not really the ogre he has been made out to be. That apart, however, the fatal weakness of his scheme is that he makes no provision whatsoever for the most important sector of the Union's African population, those who do not live in the reserves. These people not only constitute the Union's labour force but are the most advanced economically and educationally and therefore have real claims to a political voice, for which the demand is becoming increasingly insistent. Even on the basis of the Tomlinson calculations they will always outnumber the whites, and no plan which fails to provide for their political needs can be taken seriously.

NEVERTHELESS it is regarded as very significant that the Nationalist government should feel compelled to make these—for it—extravagant gestures in the direction of "self-government" for the African people. They are felt to be partly an admission of the failure of apartheid to produce anything positive for the Africans, but also a striking manifestation of the tremendous impact of events in Africa on Nationalist thinking. The tragedy for South Africa is that just when the impracticability and political dishonesty of apartheid stand revealed, no realistic alternative is being put to the people. The United Party, although highly critical of Nationalism's "solution," stands lamely by the so-called settlement of 1936, which gave the African people token communal representation in both Houses of Parliament and the Cape Provincial Council in exchange for common roll rights in the Cape. This representation is about to be abolished, and although the United Party will fight this, it has little positive to advance as an alternative. The small Liberal Party puts its faith in a universal franchise, denying that this might well produce a tyranny as bad as any.

Outside the party political sphere, however, more and more thought is being given to a constitutional arrangement which, while giving all races a political voice, will contain adequate checks and balances to prevent domination by one race or group. The South African Institute of Race Relations has already made a few suggestions. The events in central and west Africa have added urgency to the task, for as Mrs Margaret Ballinger, MP, told Dr Verwoerd the other day, South Africa is "the one multi-racial country in Africa where a happy accommodation can still be made with the African population." But this will not remain true indefinitely.

Canada's Defence Perplexities

FROM OUR CORRESPONDENT IN OTTAWA

CANADA'S new policy on North American defence carries such sweeping implications that few people have yet grasped their scope. The official statements by Mr Diefenbaker and Mr Pearkes, the defence minister, were so bland that either they must have been artfully designed to conceal their significance, or else they meant that the ministers did not realise the implications of what they said. The large impact of new defence plans on Canadian industry has long been recognised by the service chiefs. But they have stuck to their professional role, and left it to their civilian masters to puzzle out the long-term consequences. Officials, in the Department of Defence Production and other places, have accepted the logic of the advice of the chiefs of staff on immediate needs. But many people, in and out of official positions, are deeply concerned that Mr Diefenbaker and his ministers have not insisted on a more thorough analysis of their recent decisions.

This concern arises, in the last resort, from fear that Mr Diefenbaker, in a characteristic fit of absence of mind, may have surrendered control over the most vital of Canadian policies. Defence decisions are directly involved. The pattern of Canada's industrial future is at stake at only one remove. And only two removes away is the question whether Canadian foreign policy and Canadian diplomacy must also be paralysed.

The cancellation of the Arrow contract with the A. V. Roe companies has been justified primarily, and reasonably, on the ground that before the Arrow could be in service the manned bombers, which it was designed to meet, will no longer be a primary threat to North America. By 1962—or more probably 1963—when the SAGE-Bomarc system (using ground-to-air defensive missiles under semi-automatic control) might be installed, the main threat will come from intercontinental ballistic missiles. No air-breathing weapon will be in the front line of attack. Therefore the present elaborate system of defence against manned bombers and air-breathing missiles will become as obsolete as a suit of armour. This applies not only to the existing warning chains and networks of search radar, ground control and interceptors, but equally to the planned radar extensions, the semi-automatic ground environment and the Bomarc missiles which the United States is already installing and which it is planned to extend to Canada. If Russia uses manned bombers at all by 1962 they will be no more than a supplement to the *main*, significant assault by salvoes of missiles.

The Conservative government, like its Liberal predecessor, keeps repeating that the defence of Canada is inseparable from the defence of the United States, and that Canada must co-operate in the integrated defence of North America. It takes no account, in any official statement so far, of the transformation that has come over the whole defence scene since it came to office. The official doctrine still proclaimed at Shape as the basis of all Nato policy finds no echo in Ottawa's statements. At Shape the highest authorities declare that so long as the West retains its retaliatory power—in the American Strategic Air Command and in Britain's nuclear bombers—there will be no deliberate attack from Russia. The constant repetition of the slogan of "integrated North American defence" merely feeds the nostalgic dream that the object of air defence is to protect cities and industrial areas and civilian populations from attack. The government here seems to believe that the Canadian public expects to be protected against nuclear attacks in the same sort of way that London was defended in the last war. Its statements seem designed to perpetuate such an illusion, though the public is probably far more realistic and sensible than Mr Diefenbaker dare admit.

If it is once admitted that the defence authorities have no more ambitious aim at present than to ensure the survival of the deterrent or retaliatory force, then Canada's part in the elaborate SAGE-Bomarc scheme immediately appears in better proportion. Even if any effective defence of Canadian cities were now possible, it is doubtful if it is necessary. And if it were both possible and necessary, this SAGE plan would not provide it. The United States Air Force insists on having a buffer zone of 400 to 500 miles, covered by radar ground controls, in which its interceptors and missiles can try to attack the attackers before they reach their vital targets in the United States. If they are right, it follows that the defence of the Montreal-Ottawa-Toronto area (which is the only region that Canada makes any pretence of defending) would require a buffer zone extending another 400-500 miles further north. The airmen are, indeed, dreaming about shifting the chain of air bases and radars further north; but the idea comes from the American Air Force planning for future weapons, like the F108 interceptor, which it hopes it can operate without ground controls.

Two-thirds of the cost of all the SAGE-Bomarc installations in Canada is to be paid by the United States and a third by Canada. Washington cannot say that it is getting a bad bargain. The question that bothers informed Canadians is whether Canada should pay even a third of the cost of a system which even the Defence Department expects to be almost as obsolete as the Arrow by the time it is finished, which at the best will provide little or no protection for Canadian territory, and which is designed to meet a form of attack which Canadians see little or no reason to fear.

DOUBTS about the reasonableness of the government's proposition are intensified, not lulled, when Mr Diefenbaker and Mr Pearkes give cheerful assurances that Canada retains the power of independent decision. They declare with bland innocence that, of course, Canada must concur in American decisions about installing SAGE and Bomarc in Canada. Yet all the military experts agree that the SAGE computer with all its attendant gadgets is far more complex and expensive than Canadian conditions require (even granted some Canadian use for it). When doubts are expressed about the value of the Bomarc, the Canadian services can only reply that the Americans tell them it is all right, and that in any case integrated defence requires uniform weapons.

The Royal Canadian Air Force is now in process of replacing the few score of American Air Force officers in control of the "distant early warning" line which fringes the northern shore of the continent. The move is designed to obliterate the bogey of yesterday, which was the familiar revulsion against having American troops based on native soil, even when they were defending it. In the case of the DEWline it has a somewhat better basis because Canada may have to rely on the doctrine of "effective occupation" to maintain its territorial claim to all the Arctic territories.

But in the case of the new SAGE-Bomarc installations much further south people are beginning to ask why Americans should not man them, since it is the United States which insists on having them, the United States which determines their nature and the United States which pays two-thirds of their cost and gets nearly all the benefit—if there is any. The alternative, as some Canadians are beginning to see it, is that Canada not only must "concur" (as the defence minister puts it) in any project the United States may want to carry out on Canadian soil, but must also feel bound to carry part of the cost. A precedent has now been set, and if it is followed further Canada's real freedom of decision is reduced to vanishing point.

This readiness to "concur" with American defence policy in the name of integration inevitably raises questions about what freedom of action remains in Canadian diplomacy. This especially and seriously worries many people—in Canada and abroad—who believe that in recent years Mr Lester Pearson made a real contribution to peaceful prospects precisely because he was able to speak and negotiate from a position friendly both to the United States and to Britain, but unquestionably detached from both. On the optimistic assumption that the Conservatives can maintain the detached position in which they certainly believe, is it enough to be just without being seen to be just? The assumption is probably unreal. Although almost every week brings fresh evidence of the Diefenbaker government's ability to straddle two irreconcilable positions, eventually even its ability to do the splits like a chorus girl must fail before the attempt to accept American policy in defence without accepting it in diplomacy. And, if it could be done, no one would believe it. The uncommitted world, whose confidence was Mr Pearson's proudest wreath, would soon begin to regard Canada as the old lady regarded the giraffe—with stunned disbelief.

The Canadian acceptance of the SAGE-Bomarc project, with its two-to-one cost-sharing formula, involves also a more direct abandonment of Canadian interests to the mercy of the United States. The two-to-one formula is not new: it was used when the earliest radar defence (the Pinetree network, now to be integrated with SAGE), was established. The United States was then responsible for financing and manning two-thirds of the stations. Canada financed, manned and supplied the equipment for the other third. Today's two-to-one split is quite different. Now the American two-thirds represents all the technical equipment. Canada's third is all to be spent on construction. Consequently all defence business for Canadian plants, in any advanced technological field such as aircraft and electronics, must come—if it comes at all—from American sub-contracts. For a government pledged to promote more advanced manufacturing in Canada the implications of this are serious.

Italy's Contending Christian Democrats

FROM OUR OWN CORRESPONDENT

SIGNOR FANFANI'S political fortunes reached their lowest ebb early last week when the Christian Democrat party's National Council refused to reject his resignation as party secretary. Only 37 members out of 112 voted for the former leader whose "friends" once dominated the council. His own faction, the left-centre *Iniziativa Democratica* divided, about two thirds of it siding against him. Signor Fanfani, who disdainfully refused either to attend the proceedings or to avoid a discussion by confirming his resignation, had the bitter satisfaction of seeing his former friends obliged by the open ballot procedure to confess their desertion.

Previously the council had passed a vote of confidence in Signor Segni's right-centre government. The unexpectedly heavy vote against Signor Fanfani showed that most councillors looked on the issue as a straight fight between Fanfani and Segni. The council rejected a proposal to put the secretaryship into commission between representatives of the party's five recognised factions, and elected Signor Aldo Moro, a former minister of education in the Fanfani government, as secretary. Signor Moro is classed as a member of *Iniziativa Democratica* but after Monday night's vote it is doubtful whether this faction can still be said to exist.

This protracted and highly dramatic session of the party council leaves two questions unresolved. Have we seen the last of Signor Fanfani and his left-centre programme? And how is the Christian Democrat party likely to fare with the electorate under the leadership of a right-centre direction? Signor Zoli, the party's elderly and popular president, pleaded with the councillors for honour's sake not to turn their backs upon the man who had rendered immense service to the party, giving it a modern organisation and bringing it twelve million votes in the last election. His warning that the party is verging on a state of anarchy was echoed by another veteran leader, Signor Gonella, who declared that the Christian Democrats are racked by a deep spiritual crisis.

The party is virtually divided into two camps, the left and the right. The centre has disappeared. The choice before Signor Fanfani is either to retire from politics or to come back, not as potential leader of a united party, but as leader of a newly organised Catholic Left. This is the position which is offered to him by the remnants of his own group and the scattered forces of the Christian Democrat left, composed of a few trade unionists and a staunch but not very numerous group known as "The Base." With reason these groups claim to have their roots in the Catholic electorate and there is no doubt that Signor Fanfani could, if he wished, build up a strong and united Christian Demo-

crat left wing. Sooner or later such a position would oblige him to come to terms with the Socialists and there, of course, lies the rub.

At all events it is unlikely that Signor Fanfani will take up the challenge before the party congress, unless this is deferred to October. His best plan at present is to wait and see whether outside events tend to second his purpose. For instance, it would be much easier for him to regain his ascendency over the party if there should be a summit conference and the conference itself should bring about a measure of détente.

The Lourdes Centenary

FROM A CORRESPONDENT IN THE PYRENEES

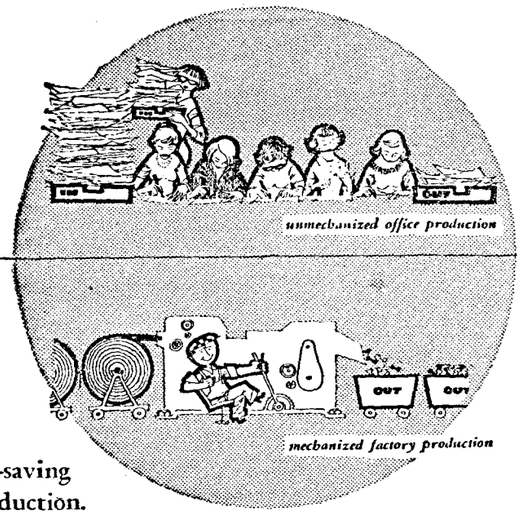
THE Pyrenees abound in healing springs and accounts of miraculous happenings involving adolescent shepherds and shepherdesses. Around the grotto at Lourdes and the ecstasy there, a hundred and one years ago, of the pious shepherdess Bernadette have sprung Christendom's greatest pilgrimage, an industry with an annual turnover of more than £15 million, and an ugly quarrel between leading dignitaries of the Catholic Church in France.

The centenary-year celebrations, just ended, drew to Lourdes (normal population 15,800) five million pilgrims and tourists, transported in 1,050 special trains, 30,000 coaches, 4,000 aircraft and more than a million private cars. Four million were French ; 90,000 came from Britain and 65,000 from Ireland—though these figures are only approximate since few Lourdes hoteliers keep scrupulous records or require their clients to fill in the usual *fiche*. For the same reason, and to the local tax-collector's despair, only the visitors' minimum expenditure can be assessed: they are estimated to have spent at least £17 million on food and shelter in the town's 600 hotels and *pensions* and £12 million on the aids to worship and souvenirs sold by more than 550 shops. They mailed four million letters and fourteen million postcards and contributed 50 million dollars' worth of foreign exchange to the French treasury.

The commercial possibilities of the centenary year attracted capital from many parts of the world, including the Near East. Modest hotels changed hands at £1,000 per room. Key money of around £50,000 was paid for the lease of a small shop near the main approach to the shrine. Shop-windows were stacked with tinkling musical Virgins, luminous Virgins and hollow Virgins whose crowns and haloes unscrewed to allow them to be filled with brandy or eau de Cologne. There were knives and corkscrews with Virgins on them and lilliputian Christs whose blood-red hearts lit up at the press of a switch. Soap, eau de Cologne and sweets were advertised as being made of " miraculous water from the grotto " and one sweet manufacturer issued a warning against unscrupulous rivals who did not use genuine grotto water.

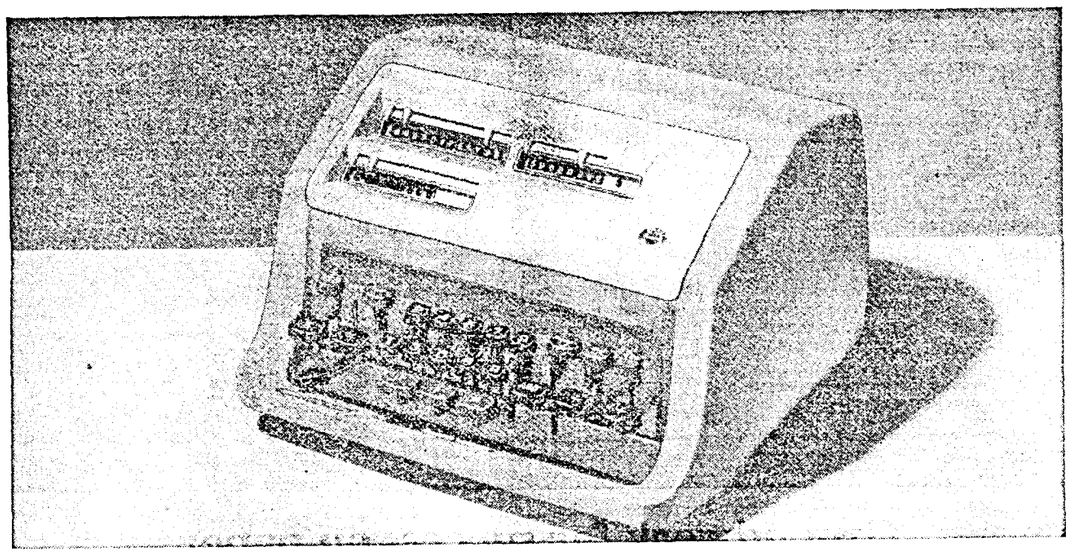
Unfairly, but inevitably, thousands of curious non-Catholic tourists judge Catholicism by what they see at Lourdes, and Protestant evangelists in the Pyrenees like to quote Matthew XXI, 12-13 (the expulsion of the merchants from the temple) ; but no one has denounced the hucksters of Lourdes more vehemently than the town's own Catholic bishop, Mgr Théas:

> What lusts and appetites for gain this centenary has aroused ! There are profiteers everywhere ! . . . But must one not denounce also, and above all, their clientele ? If there were no buyers there would be no sellers. Pilgrims with a true religious sense would be discriminating in their choice of souvenirs.



The younger generation of Catholic intellectuals in south-west France, including some priests, stress that " one may be a Catholic without according any exceptional significance to Lourdes." Their contempt for such initiatives as that of the government of distant Monaco, which issued a set of thirteen stamps to mark the centenary, is withering. They denounce the commercial Catholic press for claiming that between 6,000 and 9,000 miraculous cures have been effected at Lourdes since 1858 (the ecclesiastical authorities put the total at 54), thus swelling the heart-rending flow of sick, crippled and blind pilgrims (34,000 in 1954, 55,000 in 1958) who brave the high death and accident rates inevitable on any such a journey, in quest of divine favours.

A RESTRAINED form of what Mgr Théas regards as commercialism got a foothold within his own sanctuary during the centenary year. In order to cope with the centenary crowds, the bishop embarked on the construction of a vast sunken basilica to hold 20,000 worshippers. But beneath the site chosen was the huge natural reservoir which supplies the spring in Bernadette's grotto, and fresh springs gushed up with every grab of a mechanical shovel. The basilica cost twice as much to build as originally estimated (final cost: £2 million) and the bishop was advised by the Vatican to seek the aid of the Opus Coenaculi, a rich secular order financed largely by Canadian funds and closely connected with Cardinal Tisserand, a powerful critic of Mgr Théas's at times embarrassing outspokenness. The cardinal is himself criticised by Pyrenean Catholics for his " authoritarianism," and when it became known that Mgr Théas had been obliged to cede to the Opus Coenaculi, as the price of its aid, control of all the Lourdes shrine's finances and fund-raising for a period of ten years, there was a storm of protest. The priests of the region appealed to the Vatican which appointed a coadjutor, Mgr Maury, with a mission of conciliation. But while Mgr Théas continued to denounce—more pointedly than ever—" the spirit of lucre," and to stress " Our Lady's desire that the water of the grotto be available freely and without restriction to all," the local representatives of the Opus Coenaculi obliged visitors to purchase what amounted to an entry permit (price 6s. for French citizens, 12s. for foreigners) and littered the sanctuary with collection boxes and stands selling " official souvenirs." " The Opus Coenaculi," wrote a Catholic publicist close to Mgr Théas, " is behaving like a conqueror in occupied territory."

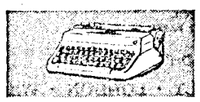


Some Lourdes churchmen believe that these tactics enabled the order to recover in one year the whole of the money advanced to Mgr Théas. They quote its representatives' announcement of their intention—with the blessing of Cardinal Tisserand—to devote future revenue from the grotto to a new information service and publishing enterprise. As the centenary year ended, Mgr Théas was angrily denouncing this empire-building and instructing Pyrenean Catholics to boycott the information service ; and the cause of the quarrel, the new basilica, a grim grey concrete hangar 200 yards long by 80 wide, stood empty and all but forgotten, deserted by pilgrims and tourists alike in favour of the older, more colourful basilicas and churches elsewhere in the town.

are your office tools

up to production standards?

In the factory... in the office... cost-cutting, labour-saving tools are equally important for competitive production.



Let your Facit dealer show you exactly where and how the Facit fully automatic electric calculator can lower your operating costs and increase your office production! See for yourself that his recommendations are sound. He lends you, absolutely free, the Facit CA1-13 calculator for a two-week trial period.

Groundwork for success on paper

Your pen glides smoothly. Your pencil makes its mark. Giant machines reproduce printed matter by the million copies. And it all depends on paper that's *right for its purpose . . .* strong, smooth and absorbent to precisely the right degree. Reed Group companies make a wide range of printing and writing papers—and make them *better* because of *4 extra assets* shared by every individual company in the Group.

THE 4 EXTRA ASSETS ARE THESE:—

REED EXPERIENCE The know-how of men who have pioneered many of the great advances of modern paper making . . . who today make a vast range of paper and paperboard products, from wrapping papers to corrugated cases, printing papers to pitch-fibre piping, horticultural packs to laminated plastics, paper sacks to all types of cartons.

REED RESEARCH Exhaustive market and scientific research both at Group and company levels.

REED RESOURCES The great modern machines and abundant raw materials which make it possible to standardise quality and "deliver the goods" in *any* quantity.

REED INITIATIVE Each Reed company is free to think and act for itself and for *you* the customer.

Reed PAPER GROUP

"YOU profit from the initiative of each Company backed by the resources of the Group"

THE BUSINESS WORLD

Labour and the Pound

STERLING has recently withstood a number of adverse influences. But the world's confidence in the pound is not absolute. In particular, it is qualified by the possibility that a Labour government might be returned at the next election. Swiss bankers say simply "The Conservatives must win." British business men and the City are not usually so blunt, but they share the sentiment. Politics entangle all major financial and business matters, nationally and internationally. That is a misfortune for political democracy, and equally for business and the economy. But it is no use kicking against the fact. People with money have never yet effectively been stopped from moving it in response to their fears. The point is rather how far these fears are founded on calculation rather than instinct.

Two broad questions are involved here. One is what impact the probability or actual arrival of a Labour government would have immediately on the pound ; the second is what impact a Labour government would make on financial confidence through the years. Some strain on sterling must in any case be expected as soon as the election is announced—which could be within a few days and must be within the next year. The considerable bull position in sterling that has been built up during the past year would itself expose the pound to pressure. The psychological pressure will redouble if the public opinion polls point Labour's way. It would presumably reach a climax on a Labour victory—even a victory of the least unnerving kind with a small but stable majority, say in the 30-50 range. Would pressure on the pound in such circumstances be supportable ?

Experience in the summer of 1957 shows that psychological strains can develop quickly and extensively in complete disregard of the fact that the current balance of payments is strong. But at this moment there are certain reassuring factors that should help to contain pressure, even if they do not prevent it. It could be said of the sterling crises of 1955, 1956 and 1957 that they all more or less burst from the blue. But there is nothing adventitious in the fact that a general election has to be held some time in the next fourteen months, and the authorities have had plenty of notice to provide for it. Secondly, the reserves have been considerably reinforced since 1957, to the end-February level of $3,156 million. Last week Britain repaid $200 million to the International Monetary Fund as a first instalment on the Suez drawing of $561 million, and later this year as much or a little more will be needed for the gold portion of the increased IMF quotas of this and other sterling countries. Allowing for these special drafts—which in any case reinforce Britain's second-line reserves—the managers of sterling exchange should still have around $1,000 million of ready money in hand before the reserves reached the danger point at which crisis action has been found unavoidable in the past.

Is this enough ? Foreign funds that have come to London in the past year or so are obviously sensitive. They might be guessed at around £150 million ($420 million), which is roughly the amount by which non-sterling countries have increased their sterling balances since the low point of 1957. Some of this money has not been covered forward against the exchange risk, and this would be the first to go. But an even bigger strain than the flight of hot money could come from the action of ordinary traders, including British traders, in accelerating their foreign payments and delaying their transfers into sterling—the notorious leads and lags in international payments. If all the hot money went and the leads and lags swung to the extreme bear position, the reserves might be in danger of falling below the "psychological minimum" of $1,800 million or so. But last December Britain renewed its stand-by facility of $739 million with IMF ; a sudden election strain would obviously justify its use.

The continued firmness of sterling, through the current election talk, is itself modestly encouraging—though this is not a complete test, since most people still expect a Tory victory. But one helpful influence now,

which could be very important at election time, is the unattractive look of sterling's main competitors as repositories of international funds. The dollar is under a cloud, and political fears about Berlin have taken some of the glamour off the mark. All this is very different from 1957. "Ex-election," so to say, the current influences are not unfavourable.

The decisive factor is still likely to be the attitude of the Labour leaders. If it is politically extremist, weak or vacillating, so much the worse. The signs are that, at least on the morrow of victory, Labour policy would be none of these things. Mr Harold Wilson, the shadow Chancellor, has given private assurances in a number of places that the party would be prepared to take all measures to fight off a speculative attack; and in these measures he does not exclude Bank rate. Mr Wilson would make a helpful contribution to sterling, and would ease the problems he hopes to face, if those reassurances were put publicly on record. If a strong stand is taken, there seems a good chance that, given the underlying strength of sterling, a Labour Chancellor would be able to hold the line.

How long he could do so depends on the second major question—the effect of Labour on sterling and the British economy through its period of office. Will Labour be soft and inflationary, over-addicted to controls rather than to fiscal and monetary medicines? And will it be nasty to capitalists, through discriminatory taxes on dividends and the like? These are really two distinct questions, with different consequences for the economy and the financial markets.

Just as Tory prime ministers are prone to be polite to trade union leaders, so every government of the left is under a certain pressure to be more orthodox than the establishment. In the history of postwar budgets, at least, that seems to be the experience. There was never a Labour precedent to the pre-election budget of 1955. When Sir Stafford Cripps fixed budget day in 1949 two days before the London County Council elections the Tories howled accusations of sharp practice; when Sir Stafford had done his worst the screams (and the election losses) came from his own party. In 1951 the Labour leaders failed to act against the crisis that blew up in the summer; but Mr Gaitskell's 1951 budget was perhaps the toughest peacetime budget ever. The Labour Government of 1945-51 had a fairly harsh budgetary record; though its negative monetary policy tended to undermine this.

Most things that have happened since 1951 probably encourage the tendency for Labour to be conservative in the balance of its financial policy (though not necessarily in particular measures). There is greater awareness in Britain of the severe limitations on freedom of manœuvre at home that are imposed by conditions in the world outside, and, above all, by confidence in sterling. There is much wider acceptance of the use of interest rates as a regulator. Labour has still to be tested on its political ability to resist pleas from all and sundry for lower interest rates, but the extremes of Daltonism are not likely to be attempted again. The report of the Radcliffe Committee, due this year, is bound to be an important influence on governments in the next few years. There is more realism, too, about controls. Labour's master pamphlet confines itself to specifying two: controls on industrial building, and flatly, "exchange control." That takes no one very far, as exchange control has never been abandoned though it has been much modified. Labour can certainly be expected to keep a very close eye on the efficacy of controls on export of capital. But Mr Gaitskell has said, if grudgingly, that "we should have to do our best" to work convertibility; and even if, as foreign holders of sterling fear, Labour instincts in a crisis will push them towards controls, it would still remain to be seen whether they would refuse to listen when the technicians point out the difficulties of any partial retreat from freedom. The biggest trap a Labour Chancellor could fall into would be to appeal to patriotism and threaten controls. But Labour is not entirely insensitive to City taunts of incompetence and irresponsibility; and a Labour Government that ran into and ran away from a bad sterling crisis early in its term would be much damaged politically—probably much more so than would a Tory government. Ambitious Labour leaders whose main article of faith is that they could run the country better than the Tories may be expected to fight quite hard for financial stability.

This is not to argue that, economically, there is no difference between the parties. Of course the Tories are basically more sympathetic to business enterprise. They find room, too, for a certain element of business unenterprise, but broadly they believe in the system as it is now run. At any rate, they do not face Labour's dilemma of trying to encourage enterprise and investment among private firms by taking a swing at the rewards of investment and enterprise. This may mean that returns on investment and on equity shares will be depressed under a Labour Government. Nationalisation poses the same threat, especially if it is to take the form of part-buying of profitable businesses. But Labour's threat of nationalisation and its attitude towards business is also held by foreign opinion to justify fears about sterling and gilt-edged, and that is not so logical. The crux here surely is whether Labour will be more ready than the Tories to let inflation get on the rampage again.

Past experience does not warrant the assumption that Labour will necessarily pump more money into the economy through the budget (though it is admittedly very hard to see how it could avoid doing so if it did try to implement all its promises). But the balance of the budget itself is not everything. Labour likes to put things into the hands of the state rather than leaving them to private initiative; and if government expenditure and taxation both rise, this discourages private savings. The Labour pensions plan is a case in point: its formal fiscal effect on paper looks deflationary rather than inflationary, but no one expects this to be its net effect. Labour may also be softer to special interests, including borrowers of money; and it remains to be seen whether it can again succeed in restraining the unions from pressing their wage claims. Perhaps, too, the Tories are prepared to allow more slack in the economy than Labour would, and thus to put the economic brake on wages. But the fact is that they brought themselves to do this, for a short time, only after a desperate exchange crisis. And, it might be that Labour, if it were cautious about inflation, would have more difficulty than the Tories in wiping out black spots of unemployment: industrialists might be even more reluctant, during such an administration, to set up new industries in declining areas.

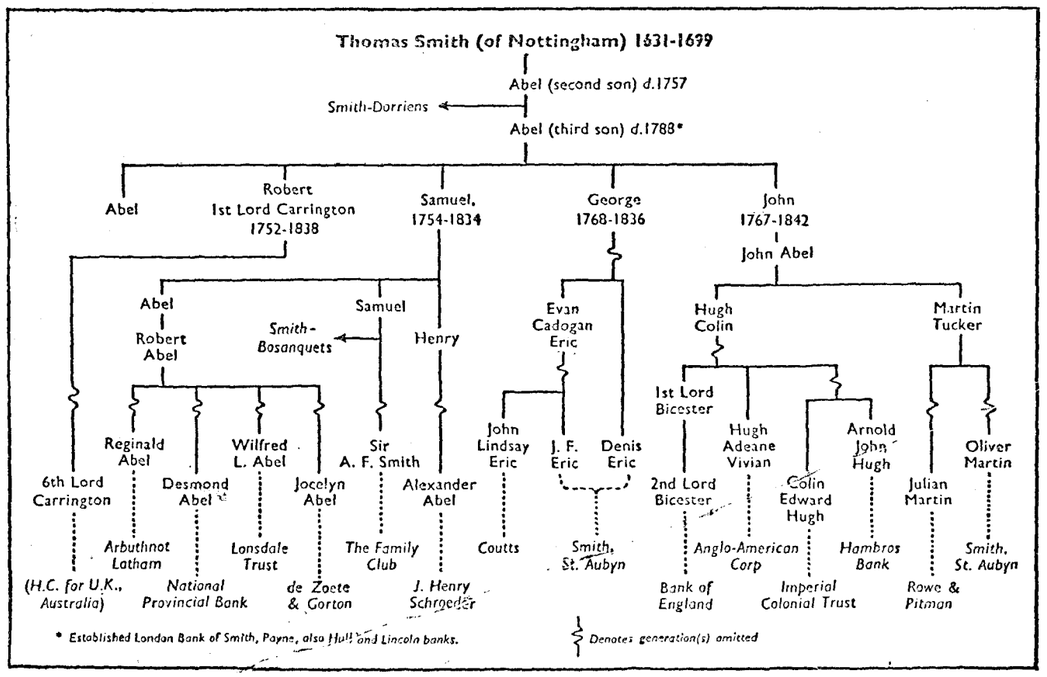
To sum up: because of Labour's distrust of business, involving traditional pressure from the rank and file for anti-business gestures, and because of the reciprocal distrust by business of Labour, a Labour administration would normally start with a built-in disadvantage in keeping the British economy straight and prosperous. The key question is whether a Labour Cabinet will take sufficiently strong measures to offset its basic deficiencies in business and foreign eyes. If it does not, many business men and most owners of equities will presently find themselves doing very well out of the inevitable inflation. If financial policy is sufficiently firm, political measures against profits may hold up expansion and discourage businessmen, but the net result of that would not necessarily be a constant drag on the pound. Gilt-edged would fall in the short term, but recover later as interest rates were brought down and confidence recovered. It would be surprising to see high bull positions maintained in sterling; the arrival of a Labour government would no doubt lower the absolute "level" of confidence in sterling, but there is no reason why sterling should in such circumstances be continuously under pressure. There are fair chances that the circumstances may be such.

This thesis, it may be said, puts the prospect in its most favourable light. That is true; but it does no more. It is a prediction, not of what will happen—no such prediction is possible—but of what might not happen. *The Economist* is not saying that everything will necessarily be all right; it is simply saying that the approach or the arrival of Labour to power need not bring the certainty of disaster.

The Financial Smiths

Every year in summer one of the grey, white and gilt regency style rooms in Fishmongers' Hall is booked for the annual lunch of an unusual society. This is the Smith Family Club, an informal body founded by the late Mr Owen Hugh Smith, President of Hay's Wharf and a director of many City companies, and now carried on by Sir Arthur Francis Smith who is usually the host. The subscription is only ten shillings a year; but the qualification for membership is ability to prove patrilineal descent from Thomas Smith of Nottingham, who was born in 1631 and who founded his bank there just three hundred and one years ago. Other clubs may have been founded to serve the interests of a great family, though they must be rare in these individualistic times; but the importance of this particular Smith family is, of course, its unsurpassed record, and continued stake, in the City. If all of Thomas Smith's descendants who hold City appointments manage to attend this year's lunch there will be some seventeen of them. Between them they hold eighty-seven directorships in seventy-five companies, including six chairmanships and three managing directorships; and two partnerships in stockbroking firms to boot. Some of these directorships are in industrial firms, but the preponderance of City interests among them fully justifies the description of the family as the "Financial Smiths."

The family is not, of course, exclusively a business dynasty, though its prosperity was founded on banking. One reason for the Smith luncheons is to give the younger generation (now the tenth from Thomas Smith) an opportunity, when in its last year at the university, to discuss their careers with older members of the family. The young men can usually get advice on all the services, armed, home and diplomatic, from well-placed representatives of them who are also members of the Smith family (one, Lord Carrington, is United Kingdom High Commissioner to Australia). But besides admirals, generals and ambassadors, the family has provided the country with squires and farmers (mainly in Hertfordshire), and it likes to remember that it has done some service at Court. It has representatives in the professions, and even one socialist economist. With time it has ramified into several branches, and (like the Whigs in Disraeli's days) is now all cousins. The main, and largely financial, branch are the Abel Smiths, descended from the son and grandson of Thomas Smith who took that name; but from the cadet line spring the Hugh Smiths (which included the Bicester title) and Martin Smiths, and more distantly, the Smith-Dorriens, Smith-Bosanquets and other kin. They are woven at every point into the fabric of what the young gloomily term "the Establishment."



It is above all on financial matters that the younger generation can get it from the horse's mouth in converse with their elders. Lord Bicester is a director of the Bank of England and managing director of Morgan Grenfell; but he is also a director of Vickers, Associated Electrical Industries, and Shell Transport. Mr Desmond Abel Smith is chairman of Cox and Kings and of Bryan, Donkin and Company; and he is besides in oil (as a

director of British Petroleum), as well as in finance (as a director of the National Provincial Bank and the Equitable Life Insurance Company), and is a director (formerly chairman) of Borax Holdings. Mr John Hugh Smith divides the City (he is a director of Hambros Bank) with metals (he is chairman of the British Metal Corporation and a director of a group of companies with parallel interests). The Hon. Vivian Hugh Smith's interests are mainly mining and South African (he is, *inter alia*, a director of Anglo-American and Consolidated Diamond Mines); Mr John Lindsay Eric Smith, on the other hand, divides the City (he is a director of Coutts and Company) with Australia and the Middle East (he is a director of the Australian Agricultural Company and of the Ottoman Bank). Mr Reginald Abel Smith is similarly senior partner of Arbuthnot Latham and a director of the Australian Pastoral Company; (Mr Desmond Abel Smith, incidentally, is a director of Dalgetys). Mr Alexander Abel Smith is managing director of J. Henry Schroeder, another powerful merchant bank. Mr W. L. Abel Smith is a director of the Lonsdale Investment Trust, Mr Colin Hugh Smith, chairman of London and New York Investment Corporation, and Mr Julian Martin Smith a director of Ashdown Investment Trust—to take a mere sample of the Smiths' interests in the boards of investment, finance or mortgage firms. On the Stock Exchange, Mr Jocelyn Abel Smith and Mr Julian Martin Smith are partners, respectively, in De Zoete and Gorton, and Rowe and Pitman.

This is an enviable family success story. Yet many members of the family—at least from the Abel Smith branch—cast a regretful glance back at the days when the Smiths were a family of bankers. A tricentennial volume published last year by the National Provincial Bank* tells the story both of how they rose to be the most powerful group of private banks operating in London and the provinces, and how, failing to unite in the age of joint stock banking empires, they lost their identity in that of the Union and National Provincial Bank at the turn of the century. It can hardly be described as a story of clogs to clogs in ten generations. But the special genius of the Abel Smiths lay in their family solidarity. This permitted them, in the days before joint stock, to build up what was virtually a single banking service in London, Nottingham, Derby, Hull and Lincoln; though Smith, Payne and Smith, in London, was in no sense either head office or headquarters. In the eighteenth century the eastern counties were among the greatest centres of wealth; and from service to their citizens and to the industrialists of the early industrial revolution the Abel Smiths rose to hobnobbing with and then to marrying the nobility.

Pitt made Robert Smith a peer (admittedly an Irish peer) and "took the pen from behind his ear"; but though the family lost some members to total gentility, and even their names, others found it possible to combine being bankers, country gentlemen, and members of parliament without difficulty. They made their mark both in banking and in politics. The current genera-

* *Smiths the Bankers* 1658-1958. By J. A. S. L. Leighton-Boyce, National Provincial Bank, Limited.

tion are inclined to agree with their collective biographer that, especially in the City, they grew too conservative in the last quarter of the century; failed to make alliances in the new industrial areas; and finally failed to bring in the new capital that expansion required while it was still possible to combine a public issue with family control. They can comfort themselves that in the fullness of time they would have probably lost Smiths' Bank anyway, unless it remained very small. Their real strength is what it always was—as a family with an inherited strain of financial acumen allied to a strong sense of kinship. They sold the Smiths' banks for £1,156,543 13s. 1d. in 1898; today, the combined capital of the public companies that they help to direct totals close on £1,500 millions.

This is in a traditional pattern of business leadership. So far as is possible, the rising generation is bred in the tradition. The family's founder's prayer that Providence should prosper the family so long as it conducted its affairs "with Fidelity, with Industry and with Honour—and no longer" is impressed on young Smiths in turn, with particular reference to the responsibility devolving on the individual from the rule that no Smith cheque would ever, under any circumstances, be returned R.D. The young, traditionally, are educated at Eton and Cambridge; but though Eton continues to be *de rigueur*, every Smith paterfamilias now faces the fact that future descendants of Thomas Smith of Nottingham may be forced to accept their higher education from provincial universities (none has yet gone to Nottingham). They still tend to concentrate on classics and economics, the banker's sure foundations; but now that they are beginning to go into industry directly—one younger Smith is a Fison's executive, and another an apprentice at Head, Wrightson—it looks as though the technological era is beginning for the Financial Smiths. It is perhaps a sign that they feel the primacy of the City is no longer absolute.

BUSINESS NOTES

THE ECONOMY

Before the Survey

By the time that the Treasury makes its last proof corrections in the Economic Survey that will be published next week along with the other pre-budget white papers, it will presumably have had an indication of how industrial output fared in February. That advantage is simply an accident of timing; there is also some unpublished data still reserved to Whitehall, notably information upon the state of orderbooks in a fairly wide range of industries. But its own virtuous progress during the past two years in making more current statistics available faster has correspondingly reduced the amount of new, unpublished information that can appear in the annual Survey nowadays; moreover, there are more independent surveyors around, notably the Federation of British Industries and the National Institute of Economic and Social Research. The FBI is doing a different kind of economic survey, the National Institute one very much like the Treasury's if a little more sophisticated; both, however, are essentially forward-looking, which since the 'forties the official Economic Survey has been less and less inclined to be. Whether its changed "statistical climate" and its extra competition will have any effect upon the form of the Survey, or its authors' readiness to chance their official arms, will be seen next week.

Indications of output in February, following upon the early count of March unemployment, may at least give the official economists some inkling whether production is still roughly level after its rise in the late autumn, or whether there are further signs of re-expansion. These signs may be crucial less for the Survey than for the final expert advice on the budget. The broad question remains whether the reflationary measures taken last summer and autumn, particularly the freeing of hire purchase, which clearly had a marked effect upon consumption, may now have largely spent themselves; and how much further encouragement to re-expansion is needed and can be afforded now.

The National Institute, whose second *Economic Review* happens to have been published this week just ahead of the official analysis, reckons it likely that further measures—say 6d. off the income tax, a slight reduction in purchase tax, and some further slight incentive to investment—will be introduced. It expects about £200 million in tax relief; and concludes, on balance, that such a stimulus would be inadequate to bring about any "substantial expansion." Anything stronger, it admits, must mean some risks for the balance of payments; but "only if Britain and other industrial countries pursue expansion and face the risk of some deterioration in their foreign payments can world trade be expected to revive."

Imports and Expansion

Another article in the same review, however, throws doubt on the usual assumption that the tendency for imports to rise faster than national output is closely linked to economic expansion. The institute is not suggesting that the tendency does not exist: all it says is that it may be largely independent of how the internal economy is faring. An impressive array of statistics and their analysis suggest that—with the exception of emergency imports of coal and steel in 1955 and 1956—most of the disproportionate rise in imports since 1954 has resulted from a substitution of imported for home-produced goods that has gone on steadily at the rate of some £40-£50 million a year, independent of changes in output.

The table shows for what kinds of imports demand has gone up much more than would have been expected. In

1958, imports, valued at 1954 prices, cost £251 million more than they would have done had they remained in the same proportion to national output as in 1954, after making due allowance also for changes in stockbuilding and re-exports. Extra food imports alone accounted for nearly £100 million of this "excess" bill. Food imports have been rising faster than food consumption, partly because of a switch in taste

IMPORTS AND NATIONAL OUTPUT
£ million at 1954 prices

	1954	1955	1956	1957	1958
Actual imports	3,374	3,766	3,736	3,872	3,862
Imports proportional to growth of national output since 1954	...	3,502	3,512	3,565	3,553
"Excess"	...	+264	+224	+306	+309
Due to differences in stock-building and re-exports since 1954	...	+ 43	+ 6	+138	+ 58
Remaining "excess"	...	+221	+218	+168	+251
Of which :—					
Food, drink and tobacco		+ 28	+ 36	+ 48	+ 99
Agricultural materials		+ 2	− 4	− 8	+ 13
Industrial materials		+ 92	+64	+ 24	− 93
Fuel		+ 51	+ 50	+ 7	+ 76
Finished manufactures		+ 29	+ 51	+ 73	+ 87

to foods that are mainly imported and partly because a larger proportion of supplies of some foods, such as beef and bacon, have been bought from abroad. Fuel imports have been rising, not because of an excessive rise in fuel consumption, but because of the progressive switch from coal to oil. The 1955-1956 peak in the import content of industrial materials was entirely due to abnormal steel imports in those years; the underlying trend of imports of other industrial materials has been below that of output. And it is finished manufactures that have been the fastest growing sector in the import bill since 1954 with, contrary to the experience of earlier years, British imports of finished manufactures from Europe rising more than British exports there.

The factors behind this trend are not discussed beyond the contention that it has come about "not because the British economy was expanding faster but presumably because it was becoming less competitive." It is, however, also fair to note that this may well be a return towards a prewar level of dependence upon imports rather than a new independent increase. Imports of food, for example, as a proportion of consumption, have been growing since 1954: but they are still far below the 40 per cent reliance on imports in 1938. The review, however, is concerned mainly with the relevance of these growing imports to policy now. Given adequate coal and steel supplies, it concludes that "there seems no reason to fear that a rise in national output will by itself lead to any disproportionate rise in imports . . . in our judgment the disproportion may well be less if national output expands than if it fails to rise." This is a heartening piece of evidence for expansionists. But it does not, of course, remove the balance of payments problem, expansion or not: it merely shifts the emphasis of the problem.

RESTRICTIVE PRACTICES

The Letter of the Law

A JUDGMENT delivered this week by the Restrictive Practices Court, concerning the agreement of the Blanket Manufacturers' Association, is the most revealing example so far of how tightly the Court is interpreting the letter of the law as it is expressed in the Restrictive Practices Act. The Court held that the removal of a restriction in the agreement which provided for a "minimum substance" (i.e., minimum quality) in blankets would deny specific and substantial benefits to the public; but it held that all of the other restrictions in the agreement, with one exception, were contrary to the public interest as it is defined in the Act. The exception was a clause concerning sanctity of contract, on which the Court said it had no jurisdiction to rule; the minimum-price clause in the agreement, essentially a stop-loss feature, was ruled against, although the Court admitted that no detriment to the public resulted from it.

The significant thing about the Court's judgment is that none of the restrictions in the agreement was held to have been detrimental to the public. They were declared contrary to the public interest because they did not provide the "specific and substantial benefits" which the Act requires. Mr Justice Upjohn, who read the Court's decision, warned that the blanket manufacturers' case did not necessarily afford a guide to other cases where different circumstances existed. This has always been so; but this latest decision appears to indicate that restrictions whose effect on the public is neither good nor bad, but merely restrictive, have little chance of getting past the Court.

This is being argued by some commentators to be getting very far away from the real purpose of the Act, which is to suppress agreements that operate against the public interest; and it may be held to be an unwarranted intrusion into the affairs of ordinary businessmen. But individual businessmen are free to act in any way they please under the Act, provided they do not agree with each other to do so. The harmless restrictions in the blanket manufacturers' agreement were of a more rigid nature than the genuinely optional recommendations for standard conditions of contracts which were contained in the Constructional Steelwork Association's agreement, and which were removed from the register as being of no economic significance. If they brought the public no substantial benefit, it is difficult to see why they should have continued to operate.

How Much Competition?

TWO warnings of the dangers of excessive competition have come last week from Britain's manufacturers of electrical equipment. One—the more broadly phrased—was delivered last week by Sir George H. Nelson, Chairman of English Electric, in his annual address to the company's shareholders. Speaking of the intensification of competition in export markets in the past few years, Sir George noted the need to increase efficiency in design and manufacture in order to decrease costs; he then went on to argue that

> competition for its own sake or pushed to extremes can cease to be beneficial to this country and in fact can become positively detrimental. Indeed, a position could be reached where the standards of all countries of the world who produce the highly technical products in which we are interested would be adversely affected by artificially debased prices.

He added that competition which forced prices so low that research and development, education and training, and modernisation of plant were sacrificed, while benefiting the industry's customers in the short term, would be "disastrous" in the long run.

The British Electrical and Allied Manufacturers' Association, in its latest report, was more specific. Reviewing the activities of the Restrictive Practices Court, the BEAMA Report came to the conclusion that a plea that abandonment

of a restrictive trading agreement would cause serious and persistent local unemployment (which was a part of the Yarn Spinners Association's case) is unlikely in future to find favour with the Court. The BEAMA then added that either the Restrictive Practices Act in its present form is too rigid and needs alteration, or the Government should give industry some assurance that, where hardship will arise as a result of abrogating restrictive agreements, steps will be considered to soften the long term effects of the judgment, particularly in the case of capital goods industries.

No heavy electrical engineering industry in the world is ever over-enthusiastic about the prospect of unlimited competition, particularly in its home market. That the British manufacturers should in the same breath offer exhortations to compete more fiercely abroad may seem a paradox. But similar views are widely held by the electrical engineering industries of other countries, notably Germany and the United States (where English Electric recently met them head-on at Greer's Ferry).

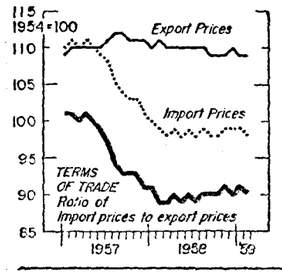
ATOMIC ENERGY AUTHORITY

Musical Chairs

It seems doubtful whether Sir Alexander Fleck, in his report eighteen months ago, did in fact find the best formula for running an organisation such as the Atomic Energy Authority. The changes in administration that took place on his advice after he had conducted a far-reaching inquiry into the AEA at the time of the Windscale fire are now being put smartly into reverse. Up to that time, the AEA was divided into three divisions dealing with research, weapons, and production. The three men who ran those divisions had seats on the AEA's board. They split their time between policy meetings in London and the day-to-day running of the establishments under their control—and Sir Alexander Fleck was not the only person to think that they spent too much time on the latter.

The executive functions were therefore after his report hived off to deputies and seats on the board were converted into full-time jobs with no executive responsibilities. This arrangement has lasted barely a year. Meanwhile the AEA has lost the two key men who had created and guided the atomic energy project from its outset in 1946: Sir Christopher Hinton left first, Sir John Cockcroft is soon going. The AEA's first chairman, Lord Plowden is retiring in a matter of months, and its commercial director, Mr Strath, is going back to the Ministry of Supply. Either because the AEA now finds itself seriously short of top executives, or because it is not in the nature of a good scientist to be content with the remote preoccupations of long-term planning (never a strong point of the AEA), the Authority is going back to the old pattern that it preferred in the past. Whatever board member is responsible for any branch of the AEA's work will once again be responsible also for running those plants connected with it. The only change is that there are now four separate branches. Sir Christopher Hinton's old empire at Risley is being split into a production division concerned with turning out nuclear materials like uranium and plutonium, and an engineering division responsible for the design and development of new reactors.

The rate at which the AEA has grown can be judged from the size of its wages bill, which is due to rise, according to the current Civil Estimates, from £26 million this year to more than £32 million for 1959-60. No big new projects are being started in the coming year and AEA's spending on construction is actually falling off, from £45 million to £37 million. But this research, development, and weapon manufacturing organisation has still much more of the character of a vast laboratory than a big manufacturing company and for that reason responsibility for running the separate plants may not be quite the day-to-day routine job that it appears. It is possible that the AEA was not yet ripe for the form of organisation suggested by the Fleck reports; it is also proving more than usually difficult to find men to fill the jobs so created.



EXCHANGE RELAXATION

An Extra Risk?

The Bank of England last week made two relaxations in exchange control. Both widen the London market; and neither involves any perceptible increase in sterling's vulnerability to bear attack. Hitherto, residents of the sterling area have been permitted to buy or sell foreign currencies forward only to match a transaction in merchandise trade or to cover freight charges. Now they are also permitted to cover, for a maximum of six months, payments or receipts other than for merchandise trade, including interest and dividends, royalties, and capital investment.

The market in forward exchange is thus widened; and in a speculative crisis, more sterling would doubtless be sold forward. But even then, on balance, the net result might not be additional strain, as has been suggested. When forward facilities were not available for people expecting to make payments abroad in the near future they did their own forward deal: they advanced the payment whenever they could (this is the "lead" half of the leads and lags), and thus exerted a strain on sterling in the spot market and on the reserves. Now that such transactions may be covered in the forward market there will be less incentive to advance the payment. The purchase of dollars forward will normally be matched by the dealing bank covering itself with a purchase of dollars spot; but this is not invariably the case, and the effect of more forward selling of sterling and fewer "leads" in spot payments might yield a small net saving to the reserves during the crisis. On the other hand, it is true, there are some payments for invisibles, such as dividends due at fixed dates, that cannot be advanced, but can now be covered forward; these would involve a new strain. But many such payments are by non-residents, who have had full freedom in using the forward exchange market.

IMPORT PRICES FALL

Import prices fell by one per cent in February. With export prices unchanged, there was a favourable movement in the terms of trade.

Imported food became cheaper; there were also marginal declines in prices of basic materials and fuels.

Payments for "invisibles" from Britain are smaller than receipts. People receiving foreign currency have no way of speculating against sterling with it in the forward exchange market (the way they speculate is to delay their payments—this is the "lag"). The cover the market provides them is against depreciation of foreign currencies. Since the move to convertibility, European currencies can fluctuate within a total swing of 3 per cent at their existing parities.

Forward Gold Market

DEALINGS on the London gold market were hitherto only for settlement within two days. Operations for longer periods could be and were undertaken by authorised bullion dealers, but in each instance the consent of the Bank of England had to be obtained. In recent months, as world speculators distrusting the dollar have sought a flurry in gold, the market in London has chafed at this restriction, which places it at a disadvantage to foreign centres. The Bank of England has now given way, but with some diffidence. It is anxious that the emergence of an active forward market in gold in this country should not be interpreted as encouragement to speculation against other currencies.

Secondly, forward dealings in gold are at present exclusively one way—all purchases and no sales—and they thereby draw gold from the Bank of England during the currency of the forward purchases, A forward purchase of gold from a London dealer—which has to be against dollars or other foreign currencies—would normally be covered by the dealer buying gold for cash and holding it until the metal had to be delivered to the buyer. As the seller of the last resort, the Bank of England operating for the Exchange Equalisation Account would thus be exchanging gold for dollars and would be financing what might be a speculative operation against the dollar.

The authorities have therefore arranged that forward dealings in gold will not be in a formal market. No forward price will be given at the daily fixing. Dealers will simply quote prices in response to demand. But the main deterrent to speculative use of this market must be the cost of dealing. The forward price of gold will have to cover the spot price plus the cost of financing the gold until the date of delivery; this cost is set by the loss of interest on the money locked up.

BRITISH EXPORTS

Revival Slows Down

A FEW months ago there were some signs of a halt to the fall in the primary producing countries' imports. Exports from Britain to these countries as a whole had stopped falling; the decline in the total imports of the overseas sterling area slowed down in the third quarter, and in the fourth quarter, according to the information then available to the Board of Trade, the trend appeared to "improve considerably." But was this a real, or a temporary, improvement?

The latest evidence is not encouraging. In the first two months of this year British exports, at £260½ million a month, were three per cent smaller than a year ago, whereas in the fourth quarter of 1958 they were only 1½ per cent smaller than a year ago. The detailed trade returns now show that this deterioration was wholly attributable to a renewed fall in shipments to the overseas sterling area (which draws about one third of its total imports from Britain). Taking January and February together, total exports (including re-exports) to the overseas sterling area were £110.3 million a month, 15 per cent lower than a year ago. Shipments to Australia, Britain's second largest market, fell by 16 per cent to £34½ million and shipments to New Zealand, at £14¼ million, dropped by almost one half. Exports to South Africa, the Rhodesian Federation and Malaya fell by one-fifth, and exports to India fell by 13 per cent to £23.3 million.

Fortunately the sharp contraction in exports to those markets, and also to Latin-America, has been partly offset by bigger shipments to non-sterling countries, which at £160 million a month (including re-exports) were six per cent higher than in January and February last year. The growth in exports to North America has accelerated, the total of £41 million a month being one-fifth higher than a year ago; exports to the United States alone rose by 24 per cent. The revival in exports to Western Europe has continued, exports in the first two months, at £75.3 million a month, being three per cent higher than a year ago, reflecting gains among countries within and outside the common market. Exports to Russia, Poland, China, Japan and some Middle East countries were also up (though total exports to Russia were down because of the steep decline in re-exports of rubber). With governments in Britain and other countries now bent on re-expansion the primary producing countries' exports should be higher this year than last year in quantity and in value. *The Economist* indicator of commodity prices is now 4½ per cent above the October trough, thanks partly to the rise in raw wool, the largest single export of the overseas sterling area. But it will take time before any recovery in producers' earnings is reflected in their imports of manufactures.

World Market for Chemicals

THE prospects of Europe, the Commonwealth and other sterling area countries, as future markets for British chemicals were given a careful weighing in an address by Mr S. P. Chambers, a deputy chairman of ICI, in a speech before the Plastics Institute early this month. Mr Chambers painted, on the whole, a fairly gloomy picture; indeed, others besides the plastics industry—for whom he held out considerable hope—and those most enthusiastic about Commonwealth trade may wonder if it was not somewhat too gloomy. He held that Western Europe, where consumption of chemicals has nearly doubled in value in recent years, was the most promising market area for British chemicals; but that the growth of Continental competition and the advent of the common market may mean that Britain will increasingly lose ground there. North America may be fenced off by its protectionists; this would leave the Commonwealth and other sterling area countries, where the bulk of British exports now go.

These countries, Mr Chambers argued, are unreliable markets, and will continue to be, owing to periodic balance-of-payments difficulties in the primary-producing countries, and the development of local chemical industries. In any case, their intake of chemicals has grown less rapidly in recent years than that of Europe. Furthermore, he argued, these countries are highly susceptible to export drives by communist countries, particularly Russia and China. He recognised, however, that Russia and China may themselves import more chemicals in the future. Two bright spots for

Britain are plastics and pharmaceuticals, which constitute a larger share of British trade than of other countries'; these are also the most rapidly expanding sections of the chemical industry and of world trade in chemicals.

Mr Chambers concluded that Britain must aim at a substantial expansion of exports to countries behind the Iron Courtain, and to the miscellaneous markets outside Europe, North America, and the sterling area. Certainly both these areas are promising for all British exporting industries, including chemicals. Chemical needs in the underdeveloped countries within the sterling area are likely to increase rapidly as industrialisation proceeds. The questions for industrial exporters are, however: how soon and how far will the requisite process of industrialisation include chemical developments to cover these nations' emerging demands?

HAWKER'S DEBENTURE

Hybrid and the Hurdles

SUB-UNDERWRITING of Hawker Siddeley's £15 million convertible debenture issue has been completed at the going rate of 1¼ per cent Philip Hill Higginson receive a gross underwriting commission of 2¼ per cent, including sub-underwriting, over-riding commission at the customary ½ per cent, brokerage at ¼ per cent and their own legal expenses. This commission is more than the 2 per cent charged on recent first-class debenture issues. But expenses in this issue may have been unusually high; the terms could not have been easy to settle and the legal definition of the security for the debenture could not have been easy to draft. It is secured by a floating charge on the assets of the parent company (which include the shareholding at book value in A. V. Roe Canada) and its British subsidiaries. The net assets of Hawker Siddeley's British interests cover the new stock and the 4 per cent debenture already in issue about three times. The interest on them is covered about 5½ times by the profits of the British group, and the directors do not expect that profits in the year to July 31st will differ materially from the £5¾ million earned in 1957-58. The trust deed has been drawn up so as not to impede the Canadian subsidiaries from borrowing from the banks or raising new money by new local issues. The debenture is to fund part of the Hawker group's bank debts in this country—the major element here is the £10 million owed by the Brush Group—and it is not intended to use the money "to provide funds for further investment in the Canadian business."

Nevertheless, the progress of Hawker's ventures into Canadian industry, especially its investment in DOSCO, will have a direct bearing on the exercise of the conversion rights. Presumably the ordinary shareholders of Hawker Siddeley to whom the £15 million 5¾ per cent debenture is offered at par will not subscribe for it with any idea of holding it until 1984. Their interest will be in the prospects of conversion into ordinary shares between 1960 and 1964 at 29s. 5d. per share, which is where the shares now stand. If the group does well in the next five years, there will be a flood of conversions capable of adding £10,200,000 to the present ordinary capital of £25,961,400. Conversion at a low price is the key to the whole issue, and it must act as a drag on the ordinary shares throughout the period in which Hawker's new interests are expected to blossom. This is not necessarily a bar to a modest premium on the

AIR FREIGHT

Competitive Rates

A SURVEY carried out by Short Brothers & Harland to sound out the market for a big specialised air freighter has produced a thought-provoking definition of what most manufacturers regard as a competitive rate for sending goods by air. It is no more than would have to be paid for sending them by sea. This, according to the overwhelming majority of the 137 companies that attempted to answer this particular section of Short's questionnaire, is the only inducement that would encourage them to send large quantities of goods air freight.

The truth of this answer is to some extent confirmed by air freight figures. Freight, carried mainly as a make-weight to passengers, has been increasing at about 14 per cent a year and will probably continue to do so. But Shorts are on sound ground in assuming that this growth is largely explained by expanding air traffic and stable air freight rates and should not be interpreted as a growing interest on the part of industry in having their goods carried by air. The bulk of goods now sent by air are samples, urgently needed spare parts, or goods that have fallen behind their delivery schedule. None of these is particularly sensitive to cuts—or for that matter increases—in freight rates. The light engineering industries are quite good customers. But in industry as a whole the airlines' argument that air freighting saves in packing, size of stocks, insurance and pilfering has fallen on deaf ears.

These conclusions are important not only to aircraft manufacturers such as Shorts, embarking on the risky venture of building a pure freight aircraft, but to the airlines themselves and not least to British European Airways, which has in the Vanguard a passenger aircraft with the biggest freight hold yet put into service. Shorts found that there is plenty of idle freight capacity available on the airlines now and that remarkably few companies complained about the limits on the size of package that airlines could accept.

The fact that the company could conclude that under these unpromising conditions there was still a market for a big freighter, and put it at 46 aircraft for this country or 1,110 for the world as a whole, is a remarkable tribute to the ebullience of the aircraft industry and the confidence of the company in its own design, based on the Britannic freighter ordered for Transport Command. Shorts calculated that although less than 10 per cent of shippers now use air freight regularly, traffic could be increased five-fold by halving present freight rates, as the Britannic might. These freight rates, like passenger rates, are incidentally controlled by IATA and subject to a good deal of controversy.

It would, however, be short-range traffic only. The halving of air freight rates to 18d. per ton mile would make air freight competitive with sea transport up to distances of 1,000 miles, but not with long-distance sea rates for cargo. The fact that Shorts believe the greatest scope for development thus lies in short- not long-haul freight cuts across the conventional view that air transport shows its greatest savings over long distances. It also throws doubts on the long-range express jet freight services now being planned by several airlines.

new debentures in early dealings if all goes well ; but it is a big load for the existing shares to carry, and some shareholders, at any rate, may not see sufficient benefit in these prospects.

PULP AND PAPER

A Break in Prices

FOR two years the prices of most grades of pulp and paper have been held remarkably steady in face of the growing world surplus of manufacturing capacity. Newsprint prices were reduced by up to £2 a ton on January 1st, and prices of some waxed wrapping papers have also fallen ; in other products selling pressure has usually taken the form of bigger rebates. Now that front of stability has been breached. The big integrated pulp and paper makers in Scandinavia moved first by cutting prices of paper ; this week British manufacturers cut their own prices correspondingly ; and Scandinavian prices of pulp—which normally are the first to change—have been forced down.

The British mills have cut prices of all grades of kraft paper by £5 10s. a ton except kraft liner, the heavy paper used for making corrugated fibre board, which has not been changed. Unglazed kraft paper in reels, in one to five ton lots, is now £91 7s. 6d. a ton. All sulphite papers, used for making paper bags and wrapping paper, have been cut by £3 10s. a ton, bringing the machine glazed product, in reels and in one to three ton lots, to £96 5s. a ton. Scandinavian sellers of pulp are now negotiating new contracts with British users ; they are offering a reduction of £3 to £41 a ton cif for kraft pulp, and a reduction of £2 for other chemical pulps, making bleached sulphite pulp £54 10s. a ton cif.

Will Scandinavian mechanical pulp, the basis of newsprint, remain unchanged at £28 10s. a ton cif ? Not all the big British consumers covered their requirements for the first six months of this year. If a buyer succeeded in obtaining a lower price for shipments in the second quarter others would get the benefit of a reduction, and prices of newsprint would presumably have to be cut again.

CHEMICAL IMPORTS

Imperial Preference ?

THE Board of Trade have announced that they are considering an application for the imposition of an anti-dumping duty on imports from Canada of " pentaerythritol containing not more than 20 per cent by weight of di-pentaerythritol." This is a chemical based on methanol-acetaldehyde which is widely used in the manufacture of synthetic resins for high-quality decorative paints ; by far the largest manufacturer of this material in Britain is the Nobel Division of Imperial Chemical Industries.

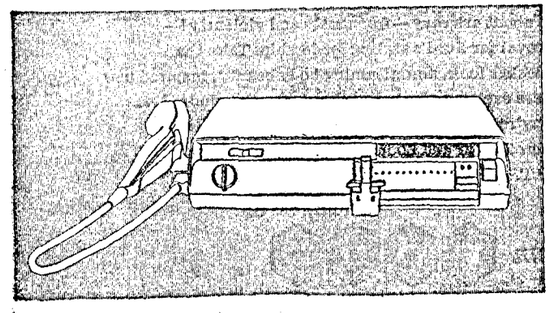
The price of this chemical in the United Kingdom has fallen from around 2s 6½d. to about 2s. 2½d. a pound, since the easing of controls on imports from the dollar area last year. The present Canadian domestic price is reported to be around 2s. 2½d. a pound. It is also made on the Continent, notably by Badisch Anilin in Germany and in Sweden ; but all imports except those from the Commonwealth, on which there is no duty, are subject at present to Key Industry Duty of 33⅓ per cent *ad valorem*. This is the first example of an appeal for protection under this Act against any import from North America.

COMMERCIAL TELEVISION

Advertising in Search of A Policy

SINCE it recently came under intensive criticism, the Independent Television Authority has held several meetings to discuss its future policy towards advertising. About a year ago the ITA decided as an experiment to allow programme contractors a certain latitude in the amount of advertising that they sold in any one hour, provided that the average for the day as a whole worked out at six minutes to every hour's transmission. This was done in part to meet the demand for peak-hour advertising, which is much greater than that for the cheaper, off-peak hours. The experiment was in any case due for review at about this time. It is beginning to look as if political pressure will make the ITA bring it to an end.

Questions about the content of the advertisements shown are not likely to be settled so easily. The law governing advertising claims, the Merchandise Marks Act, was completely revised in 1953 and is exceedingly strict. It would repay careful reading by those advertising agents who allow their clients to make specific claims that their products are X times bigger, lighter, heavier, more efficient, more nutritious, less harmful, than some standard product. Under the Act they could well be asked to justify these claims in court. The number of experts on the Merchandise Marks Act is, however, small and probably limited to the staff of the only two organisations that make it their business to bring prosecutions under the Act, the Board of Trade and the Retail Trading Standards Association. As a result, there is controversy about whether the ITA is allowing its contractors to show advertisements that sail too close to the wind for the public good. The ITA has recently taken the first timid step towards putting its house in order by refusing to take certain forms of toothpaste advertisement. But it needed an inordinate amount of pushing and prodding to move this far.



NATURAL RUBBER

A Boomlet in Shares

FOR many months the outlook for natural rubber has seemed as safe as it is ever likely to be. Consumption and production should be in close balance this year, as in 1958. The short-term risk is not a political one, nor is it competition from synthetic rubber. As Sir John Hay pointed out this week in his statement as chairman of Linggi Plantations, supplies of natural rubber were fully absorbed last year though the price was higher than that of synthetic rubber and American producers of synthetic had capacity to spare. The main risk is that buying by Russia, China and other Communist countries, which rose sharply last year to a level not far short of American consumption of natural rubber, may fall off. But some risks have to accepted, and investors have gradually awakened to the highly attractive yields that rubber shares offer.

Since the closing months of 1958 a trickle of buying has raised share prices, and this in turn has served to bring

AFRICARGO NOW SERVES ALL AFRICA

with a new, faster airfleet

West Africa and Johannesburg—as well as East and Central Africa—are now linked with the U.K. by the Africargo airfreight service. This Hunting-Clan express service is now operated with modern pressurised Douglas DC-6C 'Liftmasters' cruising at over 300 m.p.h. and with vastly increased cargo space. The all-cargo flights are supplemented by freight capacity on the scheduled Safari Viscount services. With Africargo, you get specialist care and handling as well. Cargoes are accompanied by trained flight attendants, you get firm bookings, and many other advantages an all-cargo service offers.

are now looking more kindly at a market that they have long been content to leave to the small investor. On Monday of this week the number of bargains marked rose to 1,313, over twice as many as on the previous Monday. But buyers and sellers were in better balance and the upsurge in prices seemed temporarily to have run its course.

UNION OF BANK EMPLOYEES

A Crumb from the Midland

THE banks have gone far in the past year to meet complaints that their methods are out-dated; they are still a little behind in their staff relations. The National Union of Bank Employees, which claims 50,000 members, is recognised by only two clearing banks, the National Bank, of which Lord Pakenham is chairman, and Barclays—which also recognises a staff association, and consults both bodies about salaries and conditions, but has no formal arbitration agreement with either. At all the other banks, NUBE is without recognition, even where it has more members than the internal staff association.

This union has consequently thrown its main effort behind the fight towards securing recognition (and belittling the staff associations); and when Lord Monckton became chairman of the Midland Bank in 1957 it lost little time in approaching him. According to the union—the Midland Bank makes no comment—Lord Monckton has now informed it that the bank has no objection to receiving "periodical representations" from the union; but that it has decided, after lengthy deliberation, not to disturb its relationship with the staff association. Formal machinery of negotiation exists at the Midland, and the bank does not want to get itself involved in a double set of negotiations. The union is to take the matter up further with Lord Monckton; it is pleased to have got its foot in the door at all. The other banks must be watching carefully; if the Midland swung towards recognition of the union others might find it difficult to hold out. Certainly most bank officials would be pleased to see an end to all the bickering.

LIFE ASSURANCE

Bigger Bonuses

LAST year buoyant interest income swelled the surpluses of the life offices with the result that many of the bonuses paid by these offices on their participating ordinary policies have again been raised. After this latest round of increases, however, it may be that those offices already paying high bonuses will be more anxious to consolidate them than to push them much higher; the Standard Life, for instance, has after its triennial valuation left its compound bonus unchanged at the high rate of 42s. per cent per

Used Cars at Easter

As the table shows, prices of secondhand cars have not risen seasonally this year as much as they did a year ago. This has probably been caused in part by greater expectations that purchase tax on cars will be reduced in the coming Budget. If this car-buyer's hope comes true, the reduction in the prices of new cars will naturally be reflected to a large degree in the prices of all used cars; but it is possible that used car prices will not fall proportionately, since there still appears to be considerable unsatisfied demand for cars.

The weeks just before Easter are normally among the most active times in the secondhand car market, although this year's early Easter has upset the normal pattern to some degree. From April onwards prices decline slowly, reaching their low point at about the time of the Motor Show, and remaining at generally low levels—depending on the weather—until early in the year, when they begin to rise slowly again. Completely new models bring a drop in the secondhand prices of the same make; but neither the introduction of an essentially different car—such as the Ford Consul Mark II in place of the Consul Mark I in 1956—nor certainly minor facelifting, such as has recently been applied to Ford's Mark II larger cars, makes much difference.

The table, based on figures supplied by Wm. Glass, Ltd., shows the average price that would have been obtained for a year-old car during the past eighteen months, expressed as a percentage of its original cost, including purchase tax. The prices are those ruling at the end of the quarter, except for the last column, which relates to this month.

S=Simple bonus. C=Compound bonus.
a U K business. *b* General policies.

Although there has been another fall in the proportion of the surplus allocated to shareholders in the "Pru," this time from 7.2 to 6.8 per cent, the tax-free dividend on the "A" shares (largely paid out of life and annuity profits) has been raised from 147½ to 162½ per cent. The tax free distribution on the "B" shares (paid wholly out of non-life profits) has been increased from 93¾ to 108⅓ per cent. The dividend on the "A" shares pleased the stock market. In contrast, there had been some initial disappointment with the Legal and General dividend, which was left unchanged at 100 per cent. Some investors had hoped that Legal and General would break with the custom of changing the dividend only at the end of the valuation period. But the disappointment soon wore off, for it was quickly realised that Legal and General will make its triennial valuation at the end of this year and then, presumably, shareholders will get their reward.

JUTE

The Tied Sale

PRICES of raw jute and jute goods have risen this month. The higher grades of Pakistan jute needed by foreign consumers have become difficult to obtain, and mills in Dundee, the Continent, and Eastern European countries have been buying. Firsts, for example, are now quoted in Pakistan at about £95 a ton cif for April-May shipment, £5 higher than at the beginning of the month. Prices of the lower grades are also firmer, though still on the official minima fixed by the Pakistan government. Because better grades are short and other grades are plentiful, sellers in Pakistan have adopted the technique of the "tied" sale; if a buyer will take a high proportion of lower grades he can buy firsts for about £92 a ton. Higher prices of the better grades have been reflected in an increase in some qualities of jute yarn in Dundee.

Indian jute goods have risen for different reasons. Domestic demand has improved, particularly for sacking; the mills have made a slight cut in production; and speculators have taken the opportunity to push the Calcutta market higher. The standard grade of sacking is now quoted at about 144s. 6d. per 100 bags fob Calcutta, a rise of 7s. 6d. this month; hessian cloth has risen less sharply, a 10-ounce 40-inch cloth gaining 1s. 6d. to 59s. 6d. per 100 yards fob. As it happens stocks of hessian are low while stocks of heavy sacking, though they have fallen somewhat, are still high. But in this market prices are apt to move in the unexpected way.

SHORTER NOTES

Lord Kennet of the Dene, on reaching his eightieth birthday, has retired from the chairmanship of the Union Discount Company and other City companies, and also from the chairmanship of the CIC, which he has held since the inception of the committee in 1939. He is succeeded at the CIC by Sir Thomas Frazer, who is 75. The functions of the committee were reduced in February to scrutiny of applications to borrow by overseas residents.

* * *

The Ministry of Transport's inquiry into the crash of a British European Airways Viscount a year ago at Prestwick, published this week, has produced one of the first fully substantiated cases in which a pilot misread his altimeter to the extent of believing he was at an altitude of 14,500 feet when he was in fact only 4,500 feet off the ground. Consequently he flew the aircraft into the ground three miles from the threshold of the runway. The difficulty of reading the standard altimeter has often been suspected as the cause of apparently inexplicable errors by experienced pilots: the Ministry of Transport ordered a new, less confusing design to be used shortly after the report of the investigation was received by the Minister in mid-January.

* * *

The World Bank, it is reported, will shortly make an issue of Dm 200 million (£17 million) on the German market. The coupon will be 5 per cent and the maturity up to 15 years.

* * *

The 10s. shares of Great Portland Estates which were placed at 15s. were initially quoted at 18s. 10½d. on Monday. In an active turnover, the price rose quickly to 21s. 6d., but closed at 18s. 7½d. on Tuesday evening.

COMPANY MEETINGS

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND) LIMITED

ANNUAL GENERAL MEETING

LORD SINCLAIR OF CLEEVE'S REVIEW

The Fifty-seventh Annual General Meeting of The Imperial Tobacco Company (of Great Britain and Ireland) Limited, was held at the Recreation Hall of the WD & HO Wills Branch of the Company, Regent Road, East Street, Bedminster, Bristol, on Tuesday, March 24, 1959.

The Lord Sinclair of Cleeve, KCB, KBE (Chairman of the Company), who presided, said:

The Directors' Report records certain changes that have taken place in the Board and refers to an impending change in the Chairmanship. I will deal with the former now and the other later.

Sir Wilfrid Anson retired from active work with the Company last October, after thirty-nine years of devoted and distinguished service. He was appointed Deputy Chairman in 1948, having previously been the Leaf Manager and the Secretary. He was elected to the Board in 1941. His services to the Company and, I believe, to the whole industry have been outstanding. He and I have worked closely together for a long time and I know better than most how unsparing have been his efforts for the Company and how much the Company owes to him. I am sure you will be glad to know the Board will continue to have the benefit of his judgment and great knowledge of our business.

Of the two new Directors whose appointment to the Board is referred to, Mr Fieldsend is in charge of our Central Research Department, and Mr Simpson is the Company's Chief Engineer. I have no doubt that with their specialised knowledge and experience they will prove very valuable additions to the Board.

THE YEAR'S RESULTS

The Explanatory Statement comments on the principal features in the Accounts now before you and, therefore, you will not expect me to deal with each item in detail. The improvement in the consolidated profit for the Group, after tax, is fully up to our expectations a year ago, although there was a slight decrease in sales of the Parent Company. The contribution of the Subsidiary Companies to the profits of the Group is virtually the same as it was last year. And I might here remind you that while supplying the Parent Company with most of its considerable requirements of paper, board and packaging materials, the principal Subsidiaries have a large outside trade; and in their respective fields the reputations of St. Anne's Board Mill Company Limited, Ashton Containers Limited, Robert Fletcher & Son Limited and Mardon, Son & Hall, Limited, stand high.

The items which account for almost the whole of the improvement in the financial results are, the better trading profit of the Parent Company, which has been struck after allowing for a lower charge for bank and other interest, and the larger income from trade investments.

The Parent Company's trading profit shows an increase of £2.9 million over last year's figure and about £1¼ million over each of the two previous years. For 1957, however, the figure was lower than it had been for some time because we delayed as long as possible the alteration in prices necessitated by rising costs. The improvement this year is chiefly due to the fact that we had the benefit from the small increase in prices in September, 1957, for a full year as compared with only a few weeks in the previous year. The improvement would have been greater but for the slight fall in sales and rising costs.

This fall in our sales has to be looked at in the context of a fractional increase in total consumption, and we certainly do not regard with complacency the fact that we have not fully maintained our share of the trade. On the contrary we are continuing to do everything possible to ensure that our products are as well made, as well packed and as well marketed as they can be. In terms of quality and value for money in relation to competing brands I believe they stand as high as ever. Inevitably in this trade of ours there are, over the years, varying trends of fashion or public fancy, and there always are some sections of the public who like a change for the sake of change, or who want at least to try something new. This Company with its large share of the trade must be particularly exposed to such influences. Our policy is, firstly, to continue, by research, control of quality, and utmost efficiency in manufacture, to maintain, and wherever possible improve, the quality and value of our products; secondly, to provide, by the introduction from time to time of our own new brands, ample availability of choice to those who are looking for something new and something different; and lastly, to advertise and sell our goods well. The booklet on research and the control of quality, which was sent out with the Accounts, describes and illustrates some of the work we are doing under the first heading, and it also lists examples of our products which in the aggregate may be said to provide for every taste. Through the various advertising media—press, television, posters and in the shops—the public are made aware of the new brands we have put on the market and are frequently and effectively reminded of the merits of our old established brands. Old friends are generally good friends, and in our long established brands, among which Player's Medium and Wills's Woodbine are outstanding in their respective classes, we have brands of cigarettes that can well stand comparison with anything old or new on the market. Sales of Tipped cigarettes are increasing, though in the aggregate they are only about 10 per cent of the total cigarette trade; and in this comparatively new field I am glad to say that Player's Bachelor and Wills's Bristol seem to stand highest in public favour, and we have some other very promising brands among recent introductions at various size and price levels. I mention these facts simply to illustrate how we are maintaining the high standard of our already well-known brands and by new introductions catering for changing tastes.

During the year under review some costs have continued to rise. The chief of these is that of our raw material, leaf tobacco. Tobacco is not one of the commodities of which the world prices have fallen in recent years. On the contrary, the prices of the types of leaf required for our trade have continued obstinately and steadily in an upward direction. We have three main sources of supply, USA, Rhodesia and Canada. Each in this last year had its difficulties and disappointments. In the United States there was some over-enthusiasm on the part of many growers for a newly developed variety of seed which, under the conditions in which it was grown last year, produced a predominance of tobacco that was not suitable for our needs. In Rhodesia late rains caused serious damage to a crop that up to the eleventh hour had given promise of being the largest and best crop ever grown in that country. In Canada the 1957 crop was hit by bad weather, while the 1958 crop, which is now being sold, has not yielded as much good quality tobacco as we have come to expect of Canadian crops. All this must sound disappointing, but it would be wrong to infer that such tobacco as we did buy was, on the whole, below average quality. In fact the great bulk of our purchases was up to our standard, but we did not succeed in buying in total as much as eleven months' using, and what we bought was, grade for grade, dearer than our purchases in the previous year.

The item of Stock in Trade is an important figure in our Balance Sheet, and I think I should amplify the comment in the Explanatory Statement. The principal components of this figure are, firstly, unmanufactured tobacco in bond or in transit from the country of origin; secondly, tobacco cleared from bond and in course of manufacture; and thirdly, manufactured stock. The second and third are duty paid stock; the first is not. It so happened—and this is to some extent fortuitous and not planned—that the quantity and value of the second and third taken together was greater this year than last. For this reason, and because, as I previously indicated, the additions to our stock from last year's purchases cost more per pound than in the previous year, the decrease in value of our stock as shown in the Balance Sheet does not fully reflect the decrease in the quantity of tobacco in bond and in transit.

As you will observe from the Profit and Loss Account, Trade Investments produced nearly 20 per cent of our total income before tax. The predominant investment in our portfolio and, of course, the predominant source of income under this heading is our holding in the British-American Tobacco Company which represents *inter alia* our share of the export trade in our brands. We have never thought it wise to give details of the Company's investments, and in taking that

line we are governed solely by the consideration of what we conceive to be in the interests of the Company as a whole. But in view of some statements that have appeared in certain quarters recently I think I ought to make it clear that whether we had or had not an outside investment, or investments, in the tobacco trade in this country would have no influence whatever on our own manufacturing and selling policy, since our objective is, and must continue to be, first and foremost to sell the brands of our own Branches and so maintain the goodwill of the Imperial Tobacco Company.

Although the amount which we have to keep locked up in Duty is very considerable and at October 31st was little different from that of the previous year—some £85 million—there was an appreciably lower charge for bank and other interest. This was due in the first place to our inability to buy during the year as much tobacco as we should have liked, and in the second place to the cumulative effect of our policy of building up the Company's financial resources by annual transfers to reserve. These two factors also explain why it was possible to repay the £10 million 3¼ per cent Notes which matured on October 1st last without replacing them by an issue on terms which in the circumstances of the time would have meant committing ourselves to a high rate of interest for a long period of years.

The estimated liability for UK taxation is up by £865,000 for the Parent Company and by £659,000 for the Group. We were one of the Companies which were very heavily penalised by Profits Tax in the old form which discriminated between distributed and undistributed profits, and had it not been for the change to the flat rate basis in the last Finance Act the increase in our total tax liability in respect of last year's profits would have been appreciably greater than it was. We have not, of course, in these accounts had a full year's benefit from the flat rate, so that there is still some comparative advantage to come in this regard in the current year.

RESERVES AND DIVIDEND

As you will have seen from the Explanatory Statement, the decrease in the book value of the Company's assets was more than accounted for by the temporary decrease in leaf stocks to which I have already referred. Both the Parent Company and its Subsidiaries have spent considerable sums on new buildings and, more particularly, on new plant, and this will continue in the current year.

I have already referred to the large amount of working capital we need to finance the Duty at its fantastically high rate of £3 1s. 2d. per lb which is incidentally equivalent to a purchase tax of about 400 per cent.

To meet existing and prospective competition, to continue our extensive research programme, and to restore the level of our leaf stocks as opportunity arises—all these will require further finance.

It is against that background that we have thought it right to transfer to Reserves £5½ million from the profits of the Parent Company and £1 million from the profits of the Subsidiaries, making £6½ million to the Reserves of the Group. You will observe that the transfer to General Reserve in the Parent Company is the same as it was last year, namely £3½ million, and this year we have transferred a further £2 million to Contingencies Reserve. These transfers having been made, it was possible to recommend that the rate of Ordinary Dividend be restored to the level paid in respect of 1956 and slightly to add to the balance on Profit and Loss Account.

GIFT TO STAFF AND WORKPEOPLE

As you know, it has been the practice for a long time to make a Gift to Employees in recognition of their efforts to promote the Company's interest during the year. The Gift is paid for loyal and willing service to the Company and is a tangible recognition of the good relations which undoubtedly exist among all ranks in the Company's employ. We believe that it is greatly appreciated and that it materially contributes to these good relations. This year the rate of the Gift will be 12 per cent of earnings in the year ended October 31, 1958, which is one half per cent more than last year.

CENTRAL AFRICAN FEDERATION

I referred last year to the fact that 1957 marked the Jubilee of the Company's organisation in Central Africa, and I went on to say something of the way in which our interests there have expanded since we started operations in Nyasaland in 1907. We now employ some 170 Europeans and over 5,000 Africans in our leaf handling plants and forestry estates in Southern Rhodesia and Nyasaland. Our capital investment there—including the housing and other amenities we have provided for our African employees—is a very considerable one. This Company has, in a sense, been a part of Central Africa for a long time; we have closely observed, and I believe contributed in some measure to, its development since the early years of this century; and we have a very real concern for its welfare.

For all these reasons you would, I think, wish me to say a brief word about the present disturbed situation in the Federation, particularly in Nyasaland. But first I should tell you of the latest messages from our local management about our own people and property in Limbe and district. The news, I am glad to say, is entirely reassuring in that regard and those in charge are to be congratulated. Although there has been a good deal of disturbance in that area, neither injury to Europeans or Africans nor damage to property has occurred so far in any of the Company's factories or estates. Our African labour has been completely loyal, and relations between them and the European staff are as good as ever. The leaf buying and handling season has just started in Rhodesia, and will soon be starting in Nyasaland. I hope that as the dust of the present disorders settles our operations will be able to proceed smoothly, and, if they do, I think there are reasonable prospects this year of better quality tobacco from both territories.

On the broader issue, I said a year ago that in the light of our long experience in Central Africa we have faith in the Federation and its future. Despite the events of the past few weeks we still have that faith. The Federation provides the framework within which, given understanding and goodwill, three territories capable of much benefit to each other can come together and in course of time evolve a true inter-racial partnership.

As a Company we cannot become involved in the purely political aspects of the issues at stake. Nevertheless, by continuing to further the development and well-being of our African employees in every way we can, we may perhaps make a not insignificant contribution to the attainment of the ideals of true partnership within the Federation.

TAXATION

In reviewing the Company's financial position on such occasions as this, I have frequently thought it well to refer to problems of taxation which seemed to be currently of particular relevance or importance. This Company is, after all, a considerable unit in the country's industrial economy, and like many others its prosperity is very much bound up with the soundness of the national economy and the effects of current taxation. And here may I say how greatly the Government are to be congratulated upon the success of the measures taken over the last two years to improve and strengthen the standing of the pound sterling in the eyes of the world. Secondly only to security and peace with honour, the stability of the pound must surely be the greatest responsibility of any UK government. On that depends our economic strength, our ability to maintain our export trade, and, among many other things but not least important, the best long-term insurance against unemployment.

For this Company and for this industry the supreme taxation problem is, of course, still the excessively high rate of tobacco duty and the paramount need, in the long-term interest of the industry, and of the very large contribution it makes to the national revenue, to reduce the rate of duty—if necessary by stages but on some plan which in course of time will make possible an appreciable reduction in price. This plea has been a constant theme running through all my references to taxation, but I have on occasion touched on some more general problems. There are two such points to which I would like to refer today. The first has obviously some bearing upon the rate of tobacco duty, but only incidentally; the other, although apparently of no great significance to company finance, is yet of some general importance.

There is, I think, a prima facie case for a review of the structure of that part of our tax system which is levied on purchases of goods rather than on incomes. These indirect taxes account in the aggregate for nearly half of the national revenue. Between one class of goods and another, however, the rate of tax may vary enormously, and the structure has been put together haphazardly. There has been, at times, a tendency to impose the heaviest burdens on goods which were regarded as luxuries rather than necessities. At other times—perhaps particularly in times of war or national emergency—the factor of ease of collection was given great weight. At other times again the consideration was, frankly, expediency—the need to raise more money in the way which, at that time, would be least unpopular. Even although what one generation regards as luxuries the next may look upon as conventional necessities, the relative disparities in tax rates created by temporary conditions such as I have described tend to become crystallised into permanent features of the system, and, so far as I know, there has not been any study of the economic significance and soundness of the structure of indirect taxation as it is today, nor an examination of its fairness as between one section of the community and another. There are certainly many inconsistencies (of which tobacco is one example) which result in people of particular tastes being penalised out of all reason by comparison with others. Perhaps in these days we tend to put too high a premium on planning or attempt to plan too precisely; but there is little planning of any kind in the present structure of our indirect tax system, and a review such as I suggest might well disclose ways in which it could be brought into better balance with advantage to the community at large.

The other point to which I would refer is the case for treating gifts to approved charities up to, say, five or ten per cent of the individual's taxable income as allowable deductions from that income. This, of course,

is not designed to leave more money in the pockets of the individual because the relief applies only to the extent that he gives it away for the benefit of a worthy object; and it is something which other countries have found it expedient and wise to do. The level of personal taxation in this country is so high that charities and other good causes are becoming far too dependent on finance from public companies. Where the "cause" is one which directly benefits the company, it is, of course, entirely appropriate that help from company funds should be given. Where the benefit is indirect (and there is considerable variance of degree of "indirectness") it is not so easy and I would be surprised if the amount of time occupied by boards or committees of directors conscientiously considering on the criterion of some indirect benefit whether a particular case can conceivably qualify for help and if it does, how much can justifiably be given, would not amount to something very considerable. It is, of course, true that an individual by entering into a seven-year covenant can ensure that the charity concerned recovers the Income Tax deducted, but a seven-year covenant is often more difficult for the individual than for the company, and not always easy for the company. If the Chancellor could see his way to introduce a relief of this kind, it might cost the revenue relatively little and besides easing the difficulties in which companies are placed when dealing with appeals, it would be greatly appreciated by those individuals who long to do more than they now can for really good causes.

PROSPECTS FOR THE CURRENT YEAR

I cannot say that even with all that we are doing to maintain and increase our sales our figures to date suggest that by the end of the year we will have shown an increase. There is no doubt that fogs and "flu" have affected consumption in the last two months and it is extremely difficult to forecast what the final result in terms of sales will be. Total consumption—if it continues to be held down, as it is to-day, by the excessive burden of Duty—is not likely, I think, to show any material increase. Competition remains extremely keen. Even if we are able to replenish our leaf stocks in the coming year at relatively favourable prices—and I am afraid that is a large assumption—the average cost of our leaf usings must be up this year, and many other costs and items of expenditure are likely to be higher. On the other hand, there may be some increase in our investment income; and, as I have already indicated, we should have the advantage of a full year's benefit from the flat rate of Profits Tax. *Taking all these factors into account*, the most I can say is that, while some reduction in trading profit seems probable, I would be disappointed if the results a year hence were not such as to enable us to maintain the rate of Ordinary Dividend after making appropriate transfers to Reserves.

In conclusion I will refer—and, if you will allow me, refer in a very personal vein—to the paragraphs in the Directors' Report which touch on my own resignation from the position of Chairman and the appointment of Mr Roger Clarke to succeed me. I believe that it is good for the Company—I am not presuming to enunciate a general principle applicable to all large companies whatever the circumstances, but rather stating a conviction applicable to this Company in this day and age—that a man should not continue as a whole time active Chairman after 65, and that he should be able to hand over the reins to a successor in whom he has complete confidence and who is of such an age that he may reasonably expect to hold office for a number of years. My colleagues and I have planned on that basis for some time. Too frequent changes at the top are not desirable; yet if men at the top stay on too long it can be a discouragement to others and tend to slow up promotions all down the line. Therefore, although I am reasonably active and, perhaps, not appreciably less able than I have been to discharge the duties of Chairman, I have no doubt that it is right and in the best interests of the Company that I should now hand over to Mr Clarke; and I am happy to think that as President I shall be able to keep in touch with the Company's affairs and with major policy questions. Mr Clarke's family have been connected with the tobacco industry for a very long time. He himself has a thorough knowledge of all sides of our business. He has worked in the factory; he has been an Assistant Factory Manager; a Sales Manager; a Branch Manager; a Director, and since 1949 a member of our Executive Committee. He is ten years younger than I am and he has the character and ability to make him an admirable leader. I have no doubt whatever that the Company will be very fortunate to have him as Chairman; that he can count on receiving the loyal support of everyone in the Company in the full measure in which it has been accorded to me; and that the Stockholders can rest assured that under his leadership nothing will be left undone to maintain and enhance the soundness and prosperity of the Company.

BEAUMONT PROPERTY TRUST LIMITED

The twenty-fifth annual general meeting of The Beaumont Property Trust Limited, was held on March 19th in London, Sir Cyril Black, JP, DL, MP, FRICS, FAI, chairman, presiding.

The following are the main features from his circulated statement for the year ended September 30, 1958:

The accounts will, I confidently believe, be regarded as very satisfactory and a fitting climax to a quarter of a century's work in building up the fortunes of this group of companies.

Another Scrip Issue.—In the light of our very large reserves after the revaluation of the properties of the investment companies the directors are recommending a further one for two Ordinary share bonus issue.

New Rent Agreements.—There has been substantial improvement in our revenue position partly due to our policy of reducing holdings in flat properties and re-investing in business premises, and partly to the effects of the Rent Act 1957. Practically the whole of the tenants concerned have entered into new agreements.

Dividend and Bonus.—About a year ago the Board expressed its intention of recommending a total distribution of 8 per cent, less tax, on the Ordinary shares. This has been realised and they further recommend a bonus of 2 per cent. In respect of the current year, it should be possible to recommend a total of 8 per cent, less tax, on the Ordinary Capital as again increased.

Since the end of the year the Issued Ordinary Capital has been increased by £25,000 arising from the acquisition of a further group of companies owning excellently situated shops. 25,000 Ordinary shares of £1 each were issued at 40s. per share.

The report and accounts were adopted.

At a subsequent Extraordinary General Meeting a resolution was passed approving the capitalisation of £612,500 of reserves for the purpose of distributing one new fully paid Ordinary share for every two existing Ordinary shares held.

LINGGI PLANTATIONS, LIMITED

SIR JOHN HAY'S STATEMENT

PROMISING OUTLOOK FOR NATURAL RUBBER

THE RISKS OF STABILISATION SCHEMES

The Sixty-third Annual General Meeting of Linggi Plantations, Limited, will be held on Wednesday, April 1st, at 19 Fenchurch Street, London, E.C.3.

The following is an extract from the Statement by the Chairman, Sir John Hay, which has been circulated to stockholders:

RUBBER OUTLOOK

Last year, demand for natural rubber actually exceeded supply, although only by a narrow margin. The relationship of supply to demand in the synthetic realm was reversed, but again only to an insignificant degree and in total all rubbers were approximately in balance. USA took 485,000 tons of natural rubber which was 35.7 per cent of total consumption. It would seem that notwithstanding the higher price for natural, substitution cannot be carried much further. The most interesting development was the increase in demand from USSR and Eastern Europe which rose from 166,000 to 280,000 tons. China also increased her purchases from 115,000 to 150,000. The requirements of these territories reached 430,000 tons. That purchases from these countries should approximate to the USA's represents a startling change in the general pattern of demand.

On the not unreasonable assumption that demand from these Eastern territories will be maintained there is general agreement that in 1959 supply and demand for natural rubber should be in balance and if one may be so rash as to venture beyond that period, the conclusion would be that a similar state will exist in 1960. With no interference with the normal operations of trade, the rubber outlook might well be described as set fair.

PRICE RELATIONSHIP OF NATURAL TO SYNTHETIC

The price relationship between natural and synthetic rubber is a subject of speculative opinion and the belief is expressed in some quarters that the price should be fixed according to some theory or abstract concept. The true relationship can only be determined by market factors operating under conditions of free trade and uninhibited production. In conditions of a more than ample supply of synthetic rubber providing an unfettered choice to all consumers, natural rubber has successfully withstood this severe practical test with profit and credit, a welcome proof of its intrinsic qualities and worth. Moreover, the moderate limits within which prices have moved demonstrate how well founded is the belief, long entertained by some of us, that synthetic rubber would exercise a stabilising influence on the price of the natural product. Any interference with this desirable state of affairs would indeed be misguided.

STABILISATION

The Montreal Conference held in September last gave some encouragement to price stabilisation schemes. Resort to such devices by countries dependent on primary commodities, the prices of which have fallen heavily, is naturally regarded with sympathy

although the risks inherent in all such schemes are not freely recognised or admitted. Happily, there is no need for any such supports for rubber. But where the need is not always evident the attraction of what is termed "stabilisation" sometimes persists. This may be due to a belief that the buffer stock device for stabilisation, with all its paraphernalia, is a piece of modernity which no progressive State should be without. Historically, this is quite inaccurate. The first recorded instance of the buffer stock is contained in the Book of Genesis and the events so recorded happened nearly four thousand years ago. The scheme was an undoubted success, but can hardly be cited as a precedent to be followed in modern times. Its basis was an infallible statistical forecast. Modern long-term forecasts are, alas, very fallible. Its management was committed to a young man of thirty years, wise and discreet, who was given power under Pharaoh over all the land. Our bureaucrats who are called upon to grapple with the complex economic problems of the present must regard with envy a Joseph divinely inspired and unchallengeably empowered.

PROGRESS AND COMPETITION

Since I last addressed stockholders I have visited the United States of America and Malaya. In the former country I was received with great friendliness. I am a regular visitor to Malaya and I am fortunate in having many friends there. In the United States I was privileged to visit the research stations of the large rubber manufacturers. I could not but be impressed by the scope and intensity of their researches and the extent of their technological advances and achievements. Progress is not, however, confined to one side. The natural rubber producer is alive to the benefits of research which is conducted on a quite considerable scale in Malaya and with some notable success. The outstanding development is in the field of genetics, and replanting with high-yielding stock is being carried out on a large scale in Malaya. Since, in natural rubber, we are dealing with a tree that takes seven years to mature, progress cannot be so dramatic as in synthetics, the product of a manufacturing process. But even so, much has already been achieved and as larger replanted areas become tappable the cost of producing natural rubber will decline and it will be a more formidable competitor to synthetic than hitherto. The economics of rubber production are not always clearly understood. Those who venture their capital in synthetic production should appreciate that there is inherent in natural rubber production a considerable adaptability and in the event of a price war the synthetic manufacturer may well be the greater sufferer. That, however, is an event unlikely to occur. The two products are now complementary to one another, a condition which seems likely to continue.

CLARKE, CHAPMAN & COMPANY LIMITED

COMPETITIVE TRADING

EFFECT OF LONG-TERM CONTRACTS

The sixty-sixth annual general meeting of Clarke, Chapman & Company Limited was held on March 20th at Gateshead.

The Chairman (Mr J. B. Woodeson), after reviewing the Accounts, said: Although the results for 1958 show a fall in earnings they reflect a further step in the return to more normal trading conditions. The peak results that came about in the previous years were due to long-term boiler contracts occasioned by the postwar programme of the Central Electricity Authority in their urgent demand for power. I have indicated in previous speeches that recent years have been abnormal and should not be used as standards by which to measure the trading results of your Company.

Taking into account current trading conditions, the period under review has, in my opinion, resulted in a satisfactory profit.

MARINE DEPARTMENTS

The year 1958 has been a busy one in the departments producing ships' deck machinery. As previously forecast, there has been a further move away from steam to electric drive with consequent repercussions in the works. Due to a fall in freights there has been increased caution in the placing of new tonnage and we have been fortunate in having an order book for marine auxiliaries which has suffered few cancellations.

The marine orders to be executed in 1959 will ensure that the works are nearly at full capacity. This state of affairs continues into early 1960. The prospects from then on, however, will be governed by the wider factors of world trading and confidence.

The very extensive order book of recent years is not really a normal condition. Although I consider the present state of affairs satisfactory, trading conditions are much more competitive. This means that efficient production is more than ever important, and during the later years we have been preparing ourselves to meet these conditions.

Without in any way limiting our traditional care in meeting the special requirements of individual customers it has become necessary to rationalise our design and manufacture. This increases our manufacturing efficiency and has enabled us to absorb a great deal of recent cost advances.

I have mentioned in previous reports the work that we have put into the design and development of AC deck machinery, we are now reaping the benefit of this, as the number of vessels which require AC auxiliaries has increased considerably.

There are great hopes that our latest design of AC cargo winch will more than maintain our lead in this class of work, both at home and abroad.

Throughout its history your Company has always engaged itself on work of an experimental nature in connection with its marine products. With the new Research and Development Department nearing completion this work is receiving even greater attention than in the past and I know this will ensure our pre-eminence in this particular line of business.

One of our experimental projects is the development of the turbine-driven windlass. This has been carried out in conjunction with the P & O Research Division, and whereas the application may be limited I feel its consequences could be of great importance.

As mentioned previously, the long-term prospects for marine business depend very largely on the wider factors of world trading and confidence. I am certain, however, that in the future your Company will get its full share of the orders that become available.

STEAM-RAISING DEPARTMENT

In common with other manufacturers of water-tube boiler plant we are passing through a difficult phase. Demand for power station plant occasioned by the giant postwar programme of the Central Electricity Authority created unusual conditions in the industry. Existing manufacturers were asked to increase their capacity and other manufacturers were encouraged to enter the field. The efficiency and availability of power producing plant has increased and modern designs have resulted in the units being larger. This has been followed by fewer contracts being placed. It is against this background that we have been pressing forward with our development work for boiler plant associated with nuclear energy. We are making every effort to take full advantage of the anticipated requirements, both in this country and abroad, for the steam raising application associated with this method of power generation.

NUCLEAR FIELD

In connection with this I am glad to be able to report that, as members of The Nuclear Power Plant Co. Ltd., an order has been obtained, and we are manufacturing a large section of the heat exchanger plant for Latina in Italy. As was reported in the Press, this was the first export order obtained by any country for a complete Nuclear Power Station, and great credit is due to the enterprise of The Nuclear Power Plant Co. Ltd.

Our initial experiences in the nuclear field are encouraging. I feel it is too early, however to be over-optimistic. Much new ground has still to be covered, and until we have seen our first Station fully commissioned we must be cautious.

The expenditure in recent years on new Plant and Buildings has placed us in a sound position to enter this new sphere and make the best use of every opportunity which presents itself.

It is necessary to reorganise our labour resources in the face of changing conditions and it is hoped that the goodwill which has existed in the past years will ensure full co-operation from everybody in this difficult transitional period.

It will be some time before we can be sure of our trading returns in this field; but over the long term we should be fully repaid for our interest in this direction.

RESEARCH AND DEVELOPMENT

This year we will obtain the full benefit of the research workshop completed in 1958. A physics laboratory approaches completion and we hope in a short time to provide proper facilities for all our research activities. We have built up a competent staff to handle our research and development work and already the Company is getting much assistance from this very important department.

I should like to thank the officials, staff and workpeople for their contribution to the satisfactory results attained in 1958.

In conclusion I wish to emphasise what I have already said regarding the return to more normal trading conditions. The peak figures associated with recent years may not be repeated for some time; nevertheless I consider the trading future of the Company healthy and the long-term prospects sound.

The report was adopted.

ENGLISH CHINA CLAYS LIMITED

INCREASE IN GROUP PROFITS

FURTHER YEAR OF PROGRESS ANTICIPATED

SIR JOHN KEAY'S SURVEY OF ACTIVITIES

The fortieth annual general meeting of English China Clays Limited, was held on March 19th at the Hyde Park Hotel, Knightsbridge, London, S.W., Sir John Keay, ACA, chairman and managing director, presiding.

The secretary (Mr S. Rowley, FCIS, FCWA) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts:

The profits of the Group for the year to September 30, 1958, after providing £1,292,639 for taxation, amount to £1,245,543, an increase of £160,107 when compared with last year. £20,000 has been written off in respect of Stamp Duty on the increased Authorised Capital, the Tax Equalisation Reserve has increased by £68,000 and £500,000 is transferred to General Reserve, which now stands at £3 million. Your directors have pleasure in recommending a Final Dividend of 5¼ per cent tax free, which, with the Interim payment of 2 per cent, makes a total Ordinary Dividend of 7¼ per cent tax free. The balance on Profit and Loss Account carried forward is £653,309, an increase of £220,963 compared with the balance at September 30, 1957.

The Consolidated Balance Sheet at September 30, 1958, shows that the Issued Capital and Reserves stand at £10,889,553, of which £9,611,867 represents expenditure on Capital and Fixed Assets. The balance of £1,277,686 equals the surplus of Current Assets over Current and Deferred Liabilities—an increase of £104,918 over the corresponding figure last year.

REVIEW OF SALES

Sales of China Clay show a small decrease over the year when compared with last year's record sales but the proportion of the best speciality grades continues to rise—particularly in the export markets. The successful production of these specially processed grades has contributed in no small measure to maintaining the reputation of English China Clays as the whitest and most reliable China Clays produced anywhere in the world. Competition from clays produced in other countries remains keen but the quality of our products is often the deciding factor in our favour.

Our export sales have shown a slight decrease in volume, due mainly to the short recession in the USA. The increased proportion of best grade sales, however, has more than offset the lower overall tonnage exported and our foreign currency earnings are slightly higher than last year. Difficulties associated with currency fluctuations, tariffs, import controls and similar trading restrictions continue to be experienced in the export market, and we have now to contend with the possible adverse effects of the establishment of the European Common Market. It is too early to forecast what the actual effect may be but the position is not being overlooked. There is no doubt that the China Clay trade would benefit from the establishment of a European Free Trade Area and it is hoped that some solution to the present difficulties will be found.

In the home market which has suffered from the effects of the credit squeeze, we have maintained our share of sales and the tonnage delivered to our customers was approximately the same as in the previous year.

PRODUCTION

The modernisation of pit equipment and the application of new techniques to the production and refining side of the China Clay Division of the business has continued throughout the year. The full benefit that we expect to derive from this work cannot be obtained immediately, but I am sure that the shareholders will see and appreciate that the heavy capital expenditure on work of this nature over the last ten years, as reflected in the financial results, has been well justified. During the year under review three new mechanical drying plants have been completed and further installations are now in hand. There have also been significant advances in the establishment of electronically controlled process plants—a very interesting development which facilitates the production of clays to standard specifications. In almost all the industries in which China Clay is used great advances have been made in production techniques, which in turn are dependant upon the regular quality of raw material. The aim of your Company is to contribute its share to the progress of technical and scientific development in industry by providing accurately controlled products.

MOLOCHITE

The addition to our Molochite plant referred to in my Statement last year was completed in August and came into production last September. This calciner, which is of the most advanced design, has increased our capacity for the production of Molochite by approximately 80 per cent and will enable us to take full advantage of the market potential not only at home but overseas.

BUILDING

The activities of the Building and Concrete Divisions of the Group have been depressed throughout the year by reason of the rise in the Bank Rate in September, 1957. During this period, however, they have shown their ability to compete in the keen market conditions prevailing. The position is now improving as a result of the financial measures recently announced by the Government and the volume of available building work is increasing. We have been concerned chiefly in the field of Local Authority housing and have made what we believe to be valuable contributions to the design and execution of town re-development schemes.

We anticipate an increased volume of work in school, factory, agricultural and private enterprise building. The demand for our Reformite stone has been well maintained and some fine examples of its use in both public and private buildings are to be seen over a growing area of England and Wales.

QUARRIES

The Quarries Division of the Group, reinforced during the last nine months by the "Devon" acquisitions reported last year, has also suffered from the effect of Treasury restrictions during the past year. The road building programme was severely curtailed and allocations for normal maintenance were below anticipated levels. Production in our Roadstone Quarries was accordingly well below capacity. The recession in industry was reflected in a lower demand for limestone and dolomite for blast furnaces and cement manufacture. The wet Spring and Autumn had its effect on deliveries of agricultural lime, but the demand for this product remains.

Whilst the year has not come up to expectations as far as trading results are concerned, the slowdown has given us an opportunity to reorganise our production facilities, and we are now well placed to take advantage of any increased demand as it arises. The easing of control on credit and the increase of expenditure on roads should show a marked improvement in the financial results of this Division and the returns for the current year indicate a very satisfactory trend.

TRANSPORT

The Transport Division of the Group has again made a noteworthy contribution towards the Group profit. It must be said, however, that until the main trunk road system throughout the country has been considerably improved the desirable level of efficiency of transport fleets cannot be attained.

RETIREMENTS

Mr Hart Nicholls, who has been associated with the China Clay industry for fifty-eight years, and has been an executive Director of this Company for thirty-two years, retires at the conclusion of this meeting under the provisions of the Companies Act, having reached the age limit imposed by the Company's Articles of Association. Mr Nicholls' long and loyal service to the Company is well known and has been of inestimable value and benefit to the Group, particularly with regard to our operations in China Clay, and it is with sincere regret that we have to record the end of his active association with the Company. I am sure that you will wish to join in wishing him a long and happy retirement.

Mr Samuel Rowley, who has been Secretary of the Company since 1944, retires on March 31, 1959, after forty-seven years' service to the China Clay Industry, twenty-seven years of which were as Secretary of English Clays Lovering Pochin & Company Limited. We all have cause to be grateful to him for the outstanding service he has rendered to the Company, both as Secretary and as a Director of a number of Group subsidiary companies, and wish him every happiness for a long and well-earned retirement.

CONCLUSION

It has not been an easy year but I am confident that every aspect of the Group's activities is in good heart and alert to take advantage of any further improvement in world trading conditions. We have a full programme of capital development scheduled

for the current year and look forward to a further year of progress.

There is one final thing that I am sure you will wish me to do and that is to convey to the workpeople, staff and executives, both at home and abroad, our appreciation of their loyalty to the Company and their efforts on its behalf.

The report and accounts were unanimously adopted; the proposed dividend was approved; Mr L. W. Berry, OBE, was re-elected a director; the remuneration of the auditors, Messrs Allan, Charlesworth & Company and Messrs Bourner, Bullock & Company, was fixed and the proceedings terminated with a vote of thanks to the chairman and directors.

BIRMINGHAM CITIZENS' PERMANENT BUILDING SOCIETY

STEADY PROGRESS

The seventieth Annual General Meeting of the Society was held at the Imperial Hotel, Birmingham on March 11, 1959. The Chairman, Mr W. H. Madin, presided, and in moving the adoption of the Report and Accounts said:

The year under review is one which again records excellent progress despite adverse conditions. The total amount invested with the Society from Members and Depositors during 1958 was £1,023,116, and after allowing for the withdrawals there is a balance of £5,539,722 due to Share Members, an increase of £284,262 and £985,303 due to Depositors. Interest at the rate of 3½ per cent, tax paid by the Society, has again been paid to the Shareholders, equivalent to £6 1s. 9d. per cent, where tax is paid at the rate of 8s. 6d. in the pound.

Advances during the year amounted to £1,327,886. The balance now due on properties in Mortgage to the Society was £6,264,994, an increase of £310,581 compared with December 31, 1957. Applications to finance new houses and from sitting tenants, formed a substantial part of the mortgage advances. Investments in Government Securities and cash at bank amounted to £618,297 compared with £587,766 at December 31, 1957, an increase of £30,531.

The Revenue and Appropriation Account shows that after providing for Management Expenses, Interest on Deposits, Income Tax, Profits Tax, Interest to Shareholders, and other expenditure, the balance carried down for Appropriation is: £32,100.

Add:	
Balance brought forward from last year	£19,738
Making a total of	£51,838

This amount has been appropriated as follows:

Transfer to General Reserve ...	£30,000
Transfer to Mortgage Losses Reserve	£372
Balance carried forward	£21,466
	£51,838

Reserve Fund. The Reserves, including the unappropriated balance carried forward, now amount to £311,466, an increase of £31,727. The Assets now amount to £6,891,992, an increase of £332,714.

The Report and Accounts were adopted and the retiring Directors, Messrs. H. L. Butler, J. B. Chatterley and E. S. F. Sutton were re-elected.

HARRODS LIMITED

TRADING PROBLEMS SUCCESSFULLY SURMOUNTED

SIR RICHARD BURBIDGE ON INCIDENCE OF PURCHASE TAX

The sixty-ninth annual general meeting of Harrods Limited will be held on April 20th at the Company's Premises, Brompton Road, London, S.W.1.

The following is an extract from the circulated statement of the Chairman and Managing Director, Sir Richard Burbidge, Bart, CBE:

In my statement last year I said that the outlook for 1958 could not be viewed with too much optimism chiefly because of the Government efforts to restrict home consumption, but the adverse effect of the credit squeeze on our trading was in fact more severe than I expected. This was evidenced by the rapid increase in sales during the latter part of the year as compared with the first part, the improvement commencing immediately with the easing of the restrictions and reaching its peak during the Christmas and Sale periods.

During the first six months, trade in London was also badly hit by the bus strike, which you will remember lasted for seven weeks, while a further adverse influence was the bad Fashion Season—people did not like the new fashion trends and would not accept them. The result was that the sales and profits of the Group for the first half-year were considerably less than last year, but the great improvement during the latter half of the year enabled us to recoup most of this loss so that the Gross Profit on Trading was practically the same as last year.

Differing local conditions of course affected the various stores. Harrods in Knightsbridge, responsible as you know for more than half of our Group profits, was not affected by the bus strike to the same extent as the other London Stores, and with a wider range of merchandise was able to counteract the poor Fashion Season. Trading in the last quarter was very good indeed, and, in the end, Sales for the year and Gross Profit on these Sales reached record figures. There is no doubt that Knightsbridge is becoming an even greater shopping centre on account of the building developments that are taking place in the neighbourhood. Also the shopping public are realising that in addition to the large variety of choice goods, Harrods also carry a very large range of worthwhile popular priced merchandise.

D. H. Evans in Oxford Street and Dickins and Jones in Regent Street both suffered very severely during the bus strike and while the former store did very well to get within striking distance of last year's figures, the latter store was not so successful, chiefly due to the fact that they were passing through a period of reorganisation.

There is no doubt that trading conditions in the North were not so good as those in the South; the rate of unemployment was higher, there was more short time and less overtime being worked which in particular affected the steel industry in Sheffield and our store there. Kendal Milne & Co. at Manchester showed an improvement in profit and Walsh's of Sheffield were very close to last year. Henderson's in Liverpool were severely handicapped by building operations and were not quite able to reach last year's figures.

PURCHASE TAX

I have referred to the effect that the Government's credit restriction had on our Trading results. This is a policy which was obviously necessary and against which nobody could raise any objections, but there is another aspect of their policy which is not quite so acceptable—I refer to the incidence of Purchase Tax. This, as you well know, was originally a War Tax, but whether it is the best means of raising taxation in peace time is open to argument. It certainly affects the Cost of Living and I am sure everybody would like to see this Index reduced, but I am concerned more with the adverse effect of this Tax on your companies, particularly now that the trend is to reduce the various rates of tax. Every time this happens we have to stand a very considerable loss, because, in order to be competitive, goods in stock, priced at a higher rate of tax than that borne on similar goods that can be purchased at the new tax, must be reduced in price. In the past we have charged this loss against profit, but this year the loss amounting to £66,000 for the Group has been charged against Contingencies Reserves. Apart from the actual loss incurred at the time of a reduction, trade is badly affected in the weeks immediately before Budget Day by the hope of possible reductions.

THE ACCOUNTS

The Gross Profit on Trading was £14,427 less than last year, while there was a decrease in Interest and Rents Receivable of £29,994 so that the final Gross Profit of £9,361,268 was £44,421 less than last year. Profit before taxation is £2,245,166 against £2,473,116, a decrease of £227,950, but taxation based on these profits is £231,129 less than last year and taking credit for £41,027 previously provided and no longer required, the profit after taxation is £1,117,771, an increase of £44,206 which in all the circumstances I hope you will consider satisfactory.

The Amount Retained for Reserves by Subsidiary Companies is £32,248 less than last year so that the amount of profit to be dealt with by Harrods Limited is £1,067,698 or £76,454 more than last year. After transferring £200,000 to General Reserve, £222,346 to Buildings Reserve and £50,000 to Contingencies Reserve, and after allowing for the dividend on the Preference Stock and the Interim Dividend on the Ordinary Stock, it is proposed to pay a Final Dividend of 12½ per cent on the Ordinary Stock, making a total dividend of 17½ per cent, the same as last year. The balance of profit unappropriated is £20,352 and the total Profit carried forward is now £478,318.

STAFF

Stockholders will, I am sure, wish to join with the Board in expressing our sincere thanks to the Managers, Buyers and Staff of the Group for their loyal and able efforts in a year which has not been without its problems. We already have a high standard in our selling staff today and we aim even higher for the trading of tomorrow.

PROSPECTS

Contrary to last year, 1959 would seem to be opening optimistically; the artificial restrictions in spending have been removed and I expect improvement in trade and net profit for the first six months. The second half-year depends mostly on political considerations but these apart I feel that we may expect better results to show this time next year.

ASQUITH MACHINE TOOL CORPORATION

INCREASED TRADING PROFIT

The thirty-eighth annual general meeting of Asquith Machine Tool Corporation Limited was held on March 23rd, at Halifax, Mr Robert W. Asquith, MIPE (the chairman), presiding.

The following are extracts from his circulated Statement for the year ended September 30, 1958:

The trading profit for the Group before taxation has increased from £699,569 to £815,105. The net profit, after providing for taxation, attributable to the shareholders of the Corporation is £369,017, compared with £321,460 for the preceding year. Your directors feel that this increased profit justifies them in recommending a final dividend of 20 per cent, making 30 per cent for the year on the ordinary shares of the company, leaving a balance of £185,304 to add to the revenue reserves and sums carried forward in the accounts of the Holding Company and its Subsidiaries. They now total £1,239,494. The share premium account which now stands at £1,356,123 is proposed to be utilised to the extent of £1,005,000, by making a distribution of bonus shares on the basis of one new ordinary share for each existing ordinary share.

FACTORS CONTRIBUTING TO SATISFACTORY RESULTS

The results for the year can be considered satisfactory, although there are two aspects which should be borne in mind.

Part of this increased profit is due to increased production facilities which have enabled the Group to reduce the backlog of orders which were outstanding at the end of the last financial year. Our delivery dates are now very much more normal, and indeed, for the standard quick turnover machines we are in a position to deliver certain types from stock.

Secondly, the major part of the benefits from the Durgapur contract, to which I made reference in my statement last year, are reflected in this year's results.

I feel I should stress these two aspects of the year's trading, which have contributed to the satisfactory profit figure we are able to show.

Trading conditions became increasingly difficult during the year, and whilst I continue to be optimistic for the future, I do not think this report would give a true picture of the position if I were not to indicate that such satisfactory results are not to be expected for the current year, although I believe subject to the usual proviso that we shall have no difficulty in maintaining the same dividend as paid for 1957/58.

SUBSIDIARY COMPANIES

I am pleased to report that all your subsidiary companies operated at a profit.

William Asquith Limited: This company again maintained a high volume of business and its turnover exceeded that of the previous year. The prospects for the newly designed heavy machines and Transfer Lines for the Automobile Industry remain good.

This company particularly is feeling production indigestion caused by too many special and heavy machines, and until the extensions—currently in progress—are completed lack of floor space for this type of production will remain a problem.

Drummond Brothers Limited: This company, as I indicated in my report last year, started with a backlog of orders considerably less than at the end of the previous financial year; nevertheless, the company had a satisfactory year, and the prospects for the future would seem to be good, bearing in mind the majority of their products go to the Automobile trade, which as is generally known is experiencing a particularly busy period.

The benefits from obtaining the licence for the French "Pilot" Copying Lathe are beginning to be felt, and there is no question but that this new machine will play an important part in the Group's range of products.

George Swift & Sons Limited and Swift-Summerskill Limited: George Swift & Sons Limited in particular continue to make a satisfactory contribution to the Group's results, and the additional facilities referred to in my last report should be available by the Spring of this year.

Towards the end of the current financial year the facilities now being provided by the extension of the Highroad Well Works of William Asquith Limited will become available for the manufacture of a considerable proportion of the Swift-Summerskill output, which had previously been subcontracted.

Modern Foundries Limited: This company had a satisfactory year, and should begin to feel the benefit of the installation of the Hydro-Blast Plant, which I mentioned in my last report, during the course of the current financial year.

Rotadop Limited: This company continues to operate at a profit.

Drummond-Asquith (Sales) Limited: As I mentioned last year, the more difficult orders are to obtain, the more your manufacturing subsidiaries depend on the efficiency of this organisation. I feel very confident that this company will continue to play the part for which it has been established.

Associated Machine Tool Corporation (USA): I am pleased to say that this subsidiary, in spite of difficulties due to the American recession, continued to operate at a small profit.

DIFFICULT TRADING CONDITIONS

Whilst I do not wish to indicate that we are pessimistic as to the future prospects of your company, I feel that a report of this nature should give shareholders an indication of the difficulties we have to face.

The Machine Tool Industry suffered a recession during 1958. During the year your company in common with the Industry generally began to feel the effects of the decline in machine tool orders, especially for certain of their standard machines, but, I am pleased to say, that at the time of writing this statement there are indications of an improvement in demand for standard lines. Orders received by your company during the first quarter of the current financial year are greater than in any single quarter of last year, but many of these orders are for machines of special or heavy kinds, and as the orders for standard quick turnover machines have not kept pace, an unbalanced manufacturing programme has arisen. We are dealing with this manufacturing problem, but such steps must, of necessity, take time. We are actively pursuing our policy of broadening our programme and I am confident that this policy will, in due course, be very beneficial for the Group.

EFFECT OF GOVERNMENT'S ANTI-INFLATION POLICY

I think it is fair comment to express the view that the Government's anti-inflation policy is in some part responsible for the reduction in new business in standard lines. There have been certain steps taken to ease the full force of these measures, and it is possible that the slight improvement to which I have referred is a result of them. I feel certain that if the Government could see its way to reinstate the Investment Allowances, this, more than any other single step, would encourage the buyers of capital equipment to hasten the purchase of new machinery and plant.

Another problem which has contributed to the difficulties of the Industry during the year has been the Ministry of Supply's policy of disposals of machine tools from Arsenals which they are closing down, and of machines accumulated at the time of the Korean crisis which have since been kept in store.

The appearance of these machines on the market for disposal at prices which, in the majority of cases, bear no true relation to their current cost, has complicated an already difficult problem. As the position is at the moment, this is going to be an even more serious problem during the current financial year, and the Industry has pointed out at the highest level the serious repercussions which might result if this policy is continued.

NATIONALISATION

You might expect me to say a few words on nationalisation.

As you are aware, the British machine tool industry has for some years lain under the shadow of nationalisation, which has brought in its train a whole string of criticisms, often contradictory and nearly always ill-informed. If this threat, dangerous not only to the industry but to manufacture as a whole, seems now to have receded a little, then we must in large measure thank the industry's own resolve to tell the public about itself.

For example, machine tool firms—including your own—have thrown their doors open to every type of visitor; the industry's trade association has published a considered statement concerning the production and supply of machine tools in this country, and this included statistics which utterly refute earlier charges of lagging in expansion. Recent supplements on machine tools in two national newspapers have illustrated the workings of an industry so complex that the suggestion of nationalising it must appear ludicrous except to the narrow minded doctrinaire. Certainly the last year has evinced the growing vitality in all spheres including export promotion, research and development and in the training of top-level designers. In all these aspects of a vigorous industry, your own company has at all times played a leading role.

Recently your company has made an offer for the shareholdings of Kitchen & Wade Limited.

CHAIRMAN'S ADDITIONAL REMARKS

At the meeting the Chairman said:

At the time your company issued its Annual Accounts, the result of the offer to acquire the issued Share Capital of Kitchen & Wade Limited was not known and in my

Review I promised to make a statement at this Meeting.

As you will have seen in the press, by the final closing date (March 4, 1959) we had received acceptances covering more than 90 per cent of the shares of Kitchen & Wade Limited. We propose in due course to acquire compulsorily, pursuant to the provisions of the Companies Act, 1948, the balance of the shares, but in the meantime we have advised non-acceptors that acceptances will continue to be taken.

Apart from acceptances which are still in the pipeline, up to last Saturday acceptances had been received and your company's shares had been allotted and cash payments made in respect of 93½ per cent of Kitchen & Wade shares.

Last Friday Mr Kitchen (the Chairman), Mr Walker (the Managing Director) and Mr Gaukroger resigned as Directors of Kitchen & Wade Limited, as from April 5th next. In these circumstances I am writing to Mr Kitchen asking that two persons nominated by your company be appointed Directors of Kitchen & Wade Limited, forthwith and the names I have put forward are Mr G. W. Wright, MIPE (the Asquith Group's Technical Director), and Mr J. Blakiston, MIMechE (a Director of one of your company's subsidiary companies and a Consultant Engineer with an international reputation).

It is proposed that Mr J. D. H. Horobin (the Asquith Group's Financial Director) and myself will join the Board of Kitchen & Wade Limited, on our return from an important business trip abroad to which we are already committed and which I consider will, if successful, be of great benefit to the Group: at that time further consideration will be given to the final composition of the Kitchen & Wade Limited Board.

The report and accounts were adopted.

JAMES PASCALL LIMITED

IMPROVED RESULTS

The sixty-second annual general meeting of James Pascall Limited, was held on March 25th in London.

Mr R. Ellman Brown, FCA (the Chairman), who presided, in the course of his speech, said:

The profit for the year ended December 31, 1958, shows an increase on the profit for the previous year. The net profit, subject to taxation, is £345,282, which represents an increase over 1957 of £43,186.

During the first half of 1957 we used dear sugar and I drew attention to this in my last Report. 1958 has been helped by purchases of cheaper sugar; so to an extent the increased profits are due to successful buying, which is not likely to be repeated during 1959 owing to the existing price structure in the sugar market.

Competition within the industry continues on an increasingly drastic scale, with heavy investment by the larger chocolate and confectionery manufacturers in television and other forms of advertising for the purpose of promoting one or more lines into what are known in the trade as "leader" lines. This form of promotion is very costly and the reward mainly looked for in the future, and it is necessarily hard for a Company of our size to compete extensively in such media. Your Company continues to spend as much as it can properly afford on its advertising campaigns.

In my Report for 1957 I said that sales for the first few weeks of 1958 were running above the 1957 level. This was not maintained. The tonnage sales for 1958 show a small decrease on 1957, but spread over a number of lines.

OVERSEAS DEVELOPMENTS

Our export trade continues to be sound. Our dollar sales are up on the year, and we are hopeful that the current year will show further expansion. During the year we entered into an agreement whereby our goods will be manufactured under royalty in Portugal.

The profit on trading amounted to £482,658, compared with £429,676 for the year 1957.

The estimated amount to be reserved for taxation is £190,000, and after various appropriations and adjustments, the amount added to the carry forward on Profit and Loss Account is £23,452. The surplus of current assets over current liabilities is £618,119, compared wth £528,783 last year.

A revaluation of Freehold Land and Buildings and Plant and Machinery finished during the year showed an excess of approximately £500,000 over the Balance Sheet figures. It is not proposed to alter any book values for the present.

Your Directors propose that the dividend on the Ordinary Shares shall be maintained at 55 per cent.

As I said last year, this Report is issued so early in the year that it is difficult and dangerous to prophesy future trends, so I will say no more than this. We cannot hope for increased profits unless the developments planned for 1959 are successful in promoting increased sales, and we shall suffer to an extent by having to use sugar which will cost us more in 1959 than it did in 1958. On the other hand, we have a first class team of technicians who are constantly experimenting in new methods for more economical production and the evolution of new lines, always bearing in mind the Company's reputation as a producer of quality confectionery.

The report was adopted.

GENERAL REFRACTORIES LIMITED

"WE LOOK FORWARD TO THE CHALLENGE OF NEW METHODS FROM MANY OF OUR MARKETS . . ."

Sir Ronald W. Matthews in his Chairman's Statement circulated to Shareholders with the Report and Accounts for the year ended 31st December, 1958. The following are extracts from the same statement:—

TURNOVER

The past year has in many ways been one of the most difficult experienced by your Company in the post-war era. Orders received fell sharply as we entered the second-half of the year, particularly from the iron and steel industry.

The turnover of the Group which had at one time promised to equal 1957 figures ended the year 12% lower than in 1957.

In all the circumstances, the results produced are not unsatisfactory.

EXPORTS

Despite the overall reduction, despatches to overseas markets actually increased by 6½%.

When world trade recovers there will be new and increasing markets to be won, and we have accordingly continued the intensification of activities overseas.

The Far East was widely covered for the first time in the Company's history, and arrangements made in certain countries for more direct representation than had existed previously.

FINANCE

As a result of the rights issue made in June, 1958, the Company's liquid position was materially improved. Given reasonable trading conditions, we are well placed to meet the requirements of any development plans of the consuming industries in the immediate future.

The Group Trading Profit amounted to £888,413 and the Net Profit was £303,471. The Directors recommend a Dividend of 20% in accordance with the statement made in June, 1958, relating to the rights issue.

THE FUTURE

We have seen the first steps taken by the six Common Market countries to reduce tariffs and enlarge quotas between themselves. Your Company's Belgian Subsidiary becomes favourably placed to develop further its direct sales of refractory materials in Europe.

The British steel industry intends to press on with its development projects, though these have, inevitably, been modified as a result of recent events.

Your Company should keep in a position to meet substantial additional demands and the occasion of the Annual General Meeting is being taken to increase the authorised share capital and to augment the borrowing powers of the Company.

GENEFAX HOUSE, SHEFFIELD 10

THE ENGLISH ELECTRIC GROUP

STABLE COSTS THE KEY TO SUCCESS IN EXPANDING MARKETS

SIR GEORGE NELSON REVIEWS THE ACTIVITIES OF A WORLD-WIDE ORGANISATION

The annual general meetings of The English Electric Company and its major subsidiaries in the United Kingdom were held on March 19th in London.

Sir George H. Nelson, Bart, (the Chairman), in the course of his addresses, said:

Since the last meeting, Mr Nelson, your Managing Director, has been elected Deputy Chairman of each of our principal subsidiaries in this country. I have the greatest pleasure in welcoming him back from his tour of India, Pakistan and Ceylon from which he returned only two days ago. He is much impressed with the possibilities there and feels strongly that we should collaborate as closely as possible with the development of these countries. Mr Nelson had the honour of being received by the Indian Prime Minister, Pandit Nehru.

Mr Nelson also visited the Middle East as Industrial Leader and Vice-Chairman of the Board of Trade Advisory Council on Middle East Trade and was most warmly received by rulers and leaders in many countries and is impressed with the possibilities of trade development in those areas.

THE ENGLISH ELECTRIC COMPANY

The balance on trading account is up by £800,000 to £11,036,000.

The profit of the Group after taxation and after deducting amounts attributable to minority interests has increased by £66,000 to £3,017,000. Having been able to maintain our earnings, the Board again recommend a final dividend on the Ordinary Stock of 10 per cent less tax making 14 per cent for the year.

These improved results are wholly due to the very modest profits we are able to earn on the increase in our turnover. For 1958 turnover for the Group including the overseas subsidiaries was £162 million compared with £148 million in 1957. This increase of £14 million has only brought an additional trading profit of approximately £800,000. In illustration of the small margins we earn, I will give you the following breakdown of every £100 we received for our 1958 turnover.

	£	£
Materials, including bought and finished articles		48.84
Wages and salaries		32.31
Depreciation, maintenance, power, heat, light, rent, rates, insurance, etc.		13.32

THE EXPORT POSITION

I have referred in previous years to the difficulties which exist due to intense competition from the exporting nations of the world. We in the English Electric Company have endeavoured to play our part by expanding our interests and by diversifying our products, and we have become a world wide organisation with our own manufacturing resources in the overseas field and with our own companies or agencies in most countries of the free world.

NEED FOR INCREASED EFFICIENCY

Our future success depends largely upon the extent to which we can stabilise and if possible reduce our costs. There are many important overseas manufacturers and suppliers of capital equipment of the types which we manufacture who are very active in world markets, and their number is growing as one country after another establishes an electrical engineering industry. At the same time, during the past few years the severe fall in world commodity prices, while it has brought a welcome improvement for the time being in the terms of trade and therefore the balance of payments of the United Kingdom has reduced the ability of many of our customers who have low exchange resources and inadequate finance for development to buy capital equipment here. The result has been that competition has become even more severe.

These conditions challenge us to decrease costs without losing our reputation for high quality and provide a constant spur for everybody in the organisation to increase efficiency in design and manufacture.

I feel it only right, however, to warn you that competition for its own sake or pushed to extremes can cease to be beneficial to this country and in fact can become positively detrimental.

Commenting on the prospects for overseas trade, Sir George said: I see no reason to be pessimistic about either the immediate future or more particularly the long run, provided we encourage the provision of appropriate finance. Over the years there is the possibility of great expansion in world trade and in capital development, and if we maintain our competitive power our Company will be able to secure its full share of the continually growing volume of work which will be on offer.

MARCONI'S WIRELESS TELEGRAPH CO.

The Company has had another successful year. Turnover was again at a high level although it showed a slight reduction compared with the previous year.

Progress has been well maintained in every branch of our activities. In particular our exports have reached a record level.

Ever since its formation more than sixty years ago, your Company has applied itself energetically to the discoveries of new techniques and improvements in existing radio communication practice and this research effort represents a national asset of the highest importance.

Highlights in the year's commercial achievements included in the aeronautical field the entry into service of BOAC's Comet 4 jet airliners, which have a radio system consisting almost entirely of Marconi equipment. This system is also specified for the Comet 4's ordered by both Aerolineas Argentinas and East African Airways.

There was a continued demand for our military doppler equipment.

During the past ten years the Company has completed nearly 70 major defence radar installations and has supplied radar equipment, both military and civil, to nearly 30 different countries.

Demand for sound broadcasting equipment continues at a satisfactory level.

The value of orders for television equipment received by our Broadcasting Division during the year was the highest in its history. Communications Division has had a most successful year, particularly in the sale of VHF and microwave multichannel radio link equipment.

Marconi Instruments have also had another satisfactory year despite difficult trading conditions throughout the world.

MARCONI INTERNATIONAL MARINE COMMUNICATION COMPANY

Throughout 1958 the shipping industry has been going through a period of recession and the profit of £521,194 after all charges, but before taxation, is lower by £101,698.

Prominent among new developments is a single side band radiotelephone and telegraph transmitter of exceptional quality.

We were also proud to be associated with the finest new ship of 1958, the Union Castle Line's passenger liner "Pendennis Castle," for which our latest radar, with track indicator, was supplied together with other equipment.

The English Electric Valve Company had a record volume of orders outstanding at the end of last year and the trading results were again highly satisfactory.

D. NAPIER & SON

The results of the Napier Company last year were not unsatisfactory, the profit and output of the Company being little different from that of 1957.

Orders for Eland engines have been obtained from Canada, and it is hoped to develop this business in America and elsewhere in the world. Napier engines are also used to power four different types of helicopter.

The Napier Deltic diesel engine has proved successful in a number of applications, notably as the power unit in diesel electric locomotives.

VULCAN FOUNDRY GROUP

The more favourable results which I forecast a year ago have materialised during 1958. The Group trading results show a profit of £125,780, after charging depreciation of £118,780, compared with a loss of £286,497 in the previous year.

In 1957 we delivered the first diesel-electric locomotive against the British Railways Modernisation Programme, well ahead of our competitors, and we are naturally proud of the confidence which the British Transport Commission have shown in English Electric by giving us orders for a number of types of diesel-electric locomotives.

Orders received from at home and abroad ensure that the works of the Vulcan Group will be kept fully occupied during the current year.

JAGUAR CARS LIMITED

RECORD SALES AT HOME AND ABROAD

SIR WILLIAM LYONS' STATEMENT

The Twenty-Fifth Annual General Meeting of Jaguar Cars Limited was held on March 18th at the registered office, Browns Lane, Coventry.

In his speech, which was circulated with the accounts, Sir William Lyons, the Chairman, said:

The Company has once again achieved record sales, and a record net profit of £624,337 after charging taxation of £863,644. The Directors recommend that a Dividend of 17½ per cent less Tax be paid on the Ordinary and "A" Ordinary Shares, and in addition, a special Interim Dividend of 12½ per cent less Tax in respect of the year to July 31, 1959, to be paid at the same time and on the same warrant.

The year's Accounts are adversely affected to a substantial degree by the alteration in the basis of assessment of Profits Tax to a flat rate of 10 per cent as and from April, 1958. This will be minimised to some extent by the payment of a Special Interim Dividend out of the current year's Accounts. The incidence of Profits Tax will be even more severe in the next Accounts for the year to July 31, 1959.

A substantial part of our undistributed profits has been utilised to finance capital expenditure and provide additional working capital with a result that the actual capital employed in the business is out of proportion to the Issued Capital. It is considered desirable, therefore, to capitalise part of these Reserves, and it will be proposed at an Extraordinary General Meeting following the Annual General Meeting to increase the Ordinary Share Capital to a figure large enough to allow an issue of two "A" Ordinary Shares for each Ordinary and "A" Ordinary Share held.

The year marked not only the highest output the Company has achieved, but also the greatest demand for our cars from all markets of the World, which we have ever received.

The recovery from the fire was, of course, completed in the previous year, but nevertheless many plans for expanded capacity, deferred because of the fire, were carried out, and output of cars continued to increase throughout the year, during which we enjoyed a flow of production unbroken by delays inseparable from the introduction of new models.

We are indeed fortunate in having established a range of cars which have a special appeal, all over the World, to those who wish to own a car which provides quality and performance of an outstanding kind. It is particularly gratifying that the demand in the European markets, where we face the greatest competition, has increased considerably.

Whilst the profit must be regarded as satisfactory, it is by no means greater than is required to meet the large expenditure which we have to face for tooling new models, and keeping up to date with plant and new equipment, all of which are vital to our future, in fact our plans call for profits at an even higher rate during the next three years if we are to meet the programme.

I continue to regard with concern our rising costs, for although we have so far absorbed them by increased production, indeed in this year we have been fortunate enough to have more than done so, we cannot view the future optimistically if we are to be forced continuously to increase our output to maintain our selling prices and the competitive position we hold in the world's markets.

It would be a great relief if our industry could find some stability in costs and be able to turn its thoughts to reducing selling prices. If this could be done, it would reflect a more secure outlook for the future. I have no doubt competitors in other countries have this objective well to the fore.

We continue to suffer a disadvantage against our foreign competitors in the burden of Taxation which our Industry has to carry. Our competitive ability is controlled by volume, and volume is, to a large extent, dictated by potential demand. Our Home Market demand is restricted by Purchase Tax. Car manufacturers in other countries do not have this restriction on their Home Market, so they can plan for a greater volume than is possible in this country. Freedom from Purchase Tax would undoubtedly raise our horizon in planning for the future.

EXPORTS

Our American market, which absorbs about half our World exports, has made further valuable progress in consolidating the Sales and Service organisation throughout all the States, and the new market in Mexico, where assembly was commenced last year, has shown great promise in spite of the Import restrictions imposed.

All exports have continued to make progress during the year, which confirms the hopes that were expressed in our last report. In fact, in 1958 our total exports showed an increase of 47 per cent. Of all cars produced 54 per cent were exported, whilst our American and Canadian subsidiary Companies reached a record breaking total of 22 million dollars.

The wisdom of having established a subsidiary Company in Canada has been proved by the increased business which we have achieved in that market and we have every reason to expect even better results in the future following this intensification of effort there.

In many overseas markets importations are controlled by quotas, but in all these markets we have succeeded in fulfilling our obligations to our distributors and in some cases have been granted additional import permits, which we have also been able to honour.

In Europe progress during 1958 has exceeded our expectations showing an all-round increase of 42.3 per cent over 1957. It remains to be seen what will be the effect of the European Common Market on our sales during 1959 but there is no indication of any recession at the moment and as our full quotas have been given us by those countries where they are in operation, we are confident that our position will be at least maintained and most probably improved in the foreseeable future.

Our cars have been well received in all overseas markets and there is no sign of any fall in the demand, except perhaps in the case of New Zealand where the Authorities have found it necessary, for economic reasons, to curtail rather than increase the importation of cars.

An aggressive sales policy, backed by constantly intensified after-sales service, will be maintained and we see no reason why we may not look forward to the future with confidence.

RACING AND COMPETITIONS

Although our decision, made in 1956, to withdraw from official participation in racing and other competitive events has been maintained, this has by no means resulted in the disappearance of the name of Jaguar from the lists of winners in track and road events.

Evidence of the confidence in the reliability of our Jaguar engine is provided by the fact that the Lister Engineering Company continue to use our engines for their highly successful Lister-Jaguar racing cars. These cars won no less than six important national and international races in Europe last year and seven events in America where Jaguar driver Walter Hansgen won the Sports Car Club of America Championship for the second year in succession.

Of the many successes gained by private owners, the most recent was the winning of the Nominated Team prize in the Monte Carlo Rally by three privately owned and entered 3.4 litre Jaguars, thus demonstrating the complete reliability of this very popular model.

In another field of sport, Mr Norman Buckley set up a new one-hour water speed record for 800 kilogramme boats with his Jaguar engined *Miss Windermere III* which attained the speed of 89.08 mph.

In any recapitulation of recent events in the field of motoring sport, it is inevitable that thoughts must turn to the tragic death of the first British Champion Racing Driver of the World, Mike Hawthorn. As Jaguar's No. 1 driver when the Company was officially engaged in racing, he drove our cars to many successes and was a loyal and valued friend to this Company in all that he undertook on its behalf. His loss is mourned by us all.

TRIBUTE TO STAFF

I would particularly like to express appreciation to all Staff and Workpeople for their achievement in obtaining the highest production in the Company's history. There is nothing more they could do to maintain the Company's progressive policy and their own future security than to ensure always the highest production of which the Company is capable.

The retiring Directors, Mr A. Whittaker and Mr E. F. Huckvale, were re-elected.

The report and accounts were adopted.

At a subsequent Extraordinary General Meeting the two resolutions referred to, increasing the capital of the Company to £1,460,000 by the creation of 2,840,000 "A" Ordinary Shares of 5s. each, and capitalising the sum of £720,000 by the issue of two "A" Ordinary Shares for each Ordinary or "A" Ordinary Share now held, were carried.

LEWIS'S INVESTMENT TRUST

JUSTIFICATION FOR EFFECTIVE INCREASE IN DIVIDEND

POLICY OF STORE MODERNISATION CONTINUED

MR REX COHEN ON ANNUAL PURCHASE TAX UNCERTAINTIES

The Thirtieth Annual General Meeting of Lewis's Investment Trust Limited will be held on April 21st at Liverpool.

The following is an extract from the statement by Mr Rex A. L. Cohen, OBE, the chairman, which has been circulated with the report and accounts:

Trading conditions in the different areas in which we trade have been far from uniform, and on the whole, by no means easy. The early months were as usual disturbed by purchase tax uncertainties; in the summer Selfridges were severely affected by the London Transport strike; and later in the year we were afflicted in the provinces by fog and other adverse weather conditions during our peak trading period. The figures also reflect the first full year's trading in Bristol. This ended with a small loss, although a satisfactory profit was earned in the second half of the year. In spite of all these unfavourable factors, the trading profit shown in the consolidated profit and loss account of £4,971,693 was not materially different from that of last year. On the other hand, we were not able on this occasion to enjoy to the same extent the interest content in miscellaneous revenue which we have earned in recent years. During that period we have been steadily building up liquid resources to pay for the construction of our Bristol store as well as major building developments at Selfridges. With the remunerative interest rates then prevailing, those liquid resources were able to make a satisfactory contribution to our net profit. During the past year, however, that money has gradually been applied for the purpose for which it was accumulated and with the fall that has occurred in short-term interest rates any balance remaining could not be invested on quite such profitable terms.

As against this, however, we have enjoyed certain taxation advantages.

The net result of these various conflicting factors is that we end the financial year with a consolidated net profit after tax of £2,241,494 or £3,448 above last year. In view of these results, and having regard to the broad completion of our immediate building programme for which we have been conserving resources in recent years, the board felt justified in recommending to you an effective increase in the dividend payable to Ordinary stockholders. You will remember that at the end of the first half year, and before the capitalisation of reserves on November 27, 1958, the rate of interim dividend on the Ordinary stock was raised from 5 per cent to 7½ per cent. On the Ordinary capital as subsequently increased we now recommend a final dividend at the rate of 10 per cent actual as against 12 per cent on the lower capital last year. This will involve an increase in the net final dividend paid of £16,434 as compared with last year. These increases in dividend payments to Ordinary stockholders total £98,601 on the year and are, in our view, well within the resources of the Group; and if you accept our recommendations we will carry into the new year in the consolidated balance sheet reserves and surplus amounting to £6,838,660, which is not only in excess of that available at this time last year before the capitalisation issue was made, but is within striking distance of the higher issued Ordinary capital of the Trust of £7,144,973. That concludes my explanation of the accounts, which continue to reflect a position of great financial strength.

LEWIS'S

This is the main trading subsidiary covering our stores in Liverpool, Manchester, Birmingham, Leicester, and Bristol. In spite of the Bristol result already referred to, this ended with a consolidated net profit after tax of £1,349,295 against £1,336,149 last year. All the Deferred Ordinary shares are held by the Trust, and on them a dividend at the rate of 28 per cent actual has been paid for the year as against 25 per cent last year. There are two important developments to report about our trading operations. The first is that after more than 100 years of cash trading we have now extended our activities to include deferred terms. This extension has been restricted to certain selected merchandise, such as furniture. Secondly, the provision of £500,000 which we have set aside in Lewis's balance sheet for store modernisation.

This by no means represents the measure of our total outlay for this purpose. In the first instance the bulk of this expenditure will be concentrated on our Manchester store, where an investment of some £1,500,000 is contemplated over the next five years. Although plans are in an advanced state of preparation, they were not sufficiently finalised to publish on the face of the balance sheet a figure of capital commitments in this regard. As at present advised, however, a capital expenditure of the order of £800,000 is envisaged on this project over the period mentioned. This is, of course, over and above the Trust's Group commitments of £982,000 referred to in the balance sheet, but the ample liquid resources which we have available should more than suffice to meet this outlay.

This policy of store modernisation will also be extended to Birmingham, although at present not on the same scale as at Manchester. In Liverpool the long protracted building operations for the repair of war damage, which commenced in 1946, are at last nearing completion, and we are beginning to reap the benefits of what is, in effect, an entirely new and modern store.

Our results in Leicester have also been particularly encouraging. This store will also share in our modernisation programme and we hope to reap further benefits from that expenditure.

The Bristol store has developed most satisfactorily and it is already difficult to believe that it first opened for trading on September 26, 1957. We feel that the inevitable teething troubles have now been successfully overcome, and we look forward with much confidence to the future earning capacity of a store which by common consent represents an outstanding addition to the architecture of Bristol.

OTHER SUBSIDIARIES

Our Leeds store having marked time for a year or two, has now resumed its advance, and produced a satisfactory increase in net profit. A process of modernization for bringing fixtures and equipment up to the best modern standards has already been launched, and I hope that in due course this expenditure will yield a rich return.

On the other hand, our experience in Glasgow and Hanley has not been so happy, and in Scotland, in particular, the prevailing and—I hope—temporary wave of unemployment may be the explanation of the difficult trading conditions we have encountered. Here again, however, and on the theory that it is during a time of recession that plans for future development should be prepared and carried into effect, various modernisation projects have been put in hand.

SELFRIDGES

Net profits from trading proper showed an increase, but as in the case of the rest of the Group, this was more than wiped out by a drop in miscellaneous revenue and for the same reasons, *i.e.*, spare funds which had previously been earning remunerative rates of interest, were gradually absorbed by payments for constructional work. On the other hand, the same sort of taxation advantages were enjoyed and the net profit after tax of £574,757 showed a slight increase over last year. The building programme is far from complete, and the process of modernisation has still some way to go, so that in the coming year there may be some temporary strain on liquid resources in the Selfridge Group. However, the experience of the past half year convinces us that the capital expenditure already incurred and committed will produce a satisfactory return.

What may well prove to be a landmark in retail trading in central London is the opening in the middle of March of the Lex-Selfridge garage at the rear of the store. We have every confidence that this will not only be a profitable investment in itself but is bound to prove a boon both to customers and to public in providing parking accommodation in the centre of London, thereby relieving the acute problem of traffic congestion in that area.

PRICES AND PURCHASE TAX

Like most retailers we welcomed the reductions in purchase tax, to which effect was given in the last Budget, but like the rest of our competitors, we also deplored the substantial stock losses which those reductions inflicted on the retail trade as a whole. For years now, successive Governments have turned a deaf and insensitive ear to every representation made to them by the organised retail trade, both on the effects and on the timing of these tax reductions. It is in any case quite iniquitous that these serious stock losses should continue to fall on one section alone of the trading community, but the timing of these announcements affects the whole of that community. Year after year both public and trade are disturbed in February and March by the possibility of tax variations in the Budget, and only in one year has the Government of the day, in deference to retail representations, announced these variations at or about the end of the calendar year, so that the quite unnecessary interference with the normal flow of trade could

be avoided. Once again, this year the public are persuaded that tax reductions will occur but again the Chancellor of the Exchequer has ignored all appeals to remove uncertainty by making an announcement of his intentions in January.

In spite of these easily avoidable disadvantages, we welcome purchase tax reductions, because of the effect they have on prices. We keep our selling prices under constant review and we estimate that these have fallen on average during the year by some 2½ per cent.

STAFF

I am glad to be able to report that our relations with our staff continue to be cordial and I hope you will authorise me to thank them on your behalf for the contribution they have made to the results we have been considering today.

GRAYS BUILDING SOCIETY ESTABLISHED 1880

The Annual General Meeting of the Grays Building Society was held at Grays on March 23rd.

Mr Frost, the Chairman, stated that during the year the assets had increased by £63,608 to a total of £2,643,627. The balance due to Shareholders as at December 31, 1958, was £2,405,380, showing an increase on the year of approximately £86,000. The amount paid by the Society by way of Income Tax and Profits Tax for the year was £38,424, which, the Chairman stated, was a very large sum for a Society of the size of Grays. Advances during the year amounted to £215,138. The reserves had increased to £96,585.

At the end of the year under review the Society had cash at Bank £87,931 and British Government Securities £160,374. The Chairman stated that the Grays Society was one of the very few Societies that was able to state that the Market Value of its securities was greater than the book value shown in the Balance Sheet. The total of Liquid Assets were £248,805.

Mr Frost went on to state that during the year the Shareholders had received interest 4 per cent on Ordinary Shares, 4¼ per cent on Fixed Term and Depositors 3½ per cent, 3¼ per cent Fixed Term. The Fixed Term Shares and Deposits were proving a very satisfactory form of Investment. The period for the Fixed Term on Investments and Deposits was for two years only, on all accounts of £100 and upwards.

The Report and Accounts were adopted.

REVERTEX LIMITED

(Manufacturers and Sellers of Concentrated Rubber Latex and Synthetic Resin Emulsion)

PROFITS MAINTAINED

MR T. HARCOURT POWELL'S STATEMENT

The thirty-fifth annual general meeting of Revertex Limited was held on March 24th at 51/55 Strand, London, W.C, Mr T. Harcourt Powell (chairman of the company) presiding. The notice convening the meeting was taken as read.

The Secretary (Mr H. Wiltshire) read the report of the auditors.

The following is the statement by the chairman circulated with the report and accounts for the year ended September 30, 1958:

I am glad to say that in spite of the recession in trade throughout the world the profits of your Company are approximately the same as for the previous year. Had it not been for a delay in sailing, the proceeds of a large shipment would have increased the profits by some thousands of pounds. The profit on this shipment, will of course, come in the current year and I may say that the first quarter's trading is quite satisfactory.

It will no doubt interest you to know that our sales are well spread throughout the world. Over 50 per cent of our products are now sold abroad to customers in forty-two countries.

DIRECTORATE

Mr H. E. Netherclift joined the Board in March last and you will be asked to confirm this appointment later on in this meeting. Mr Netherclift has been connected with your Company for many years through our friends and financial advisers, Helbert Wagg & Co. Ltd., and his special knowledge will be extremely valuable.

SOUTH AFRICA

You will notice that our new subsidiary, Revertex (South Africa) (Proprietary) Ltd., is included in the accounts for the first time. This Company, about which you were informed last year, began production in July and since then has been in full operation. I am pleased to say that from the outset it has turned out excellent Emultex and our trade in Africa is growing as a result. Great credit is due to all those who took part in planning, erecting and organising the factory; especially those of our technical staff. The plant was brought into production with practically no teething troubles.

PRODUCTS AND PROCESSES

Revertex (Concentrated rubber latex): Since our last report we have been reorganising our factory in the Far East and have brought our plant up to date. Much technical progress has also been made and sales continue to be satisfactory.

Emultex (Polyvinyl acetate emulsion): We continue to maintain our position in this field.

Alcotex (Polyvinyl alcohol): We are making steady progress with this material and our plant is now capable of producing any quantity likely to be required for some time to come.

Processes: We have concentrated great efforts in developing processes and compounds to be used with our own materials. Much progress has been made during the year and the outlook is encouraging. We recently expanded our compounding plant at Harlow to take care of demand and we may have to make more additions in order to cope with further needs.

ACCOUNTS

For the year under review the profit, before tax, amounted to £397,373 as compared with £406,975 for the previous year. This slight falling off is due to the fact that the charge for depreciation this year amounts to £85,729 or £13,376 more than the amount charged last year. This is principally because the new Alcotex plant was installed during the previous year and bore depreciation for only a part of the year, whereas in this year's accounts it bears the full year's charge. The net profit, after making full provision for taxation, was £178,373 as compared with £190,975.

CAPITAL AND DIVIDENDS

The Directors recommend the payment of a final dividend of 17½ per cent, less tax, making with the interim dividend of 12½ per cent, less tax, paid last November, a total of 30 per cent, less tax, for the year. The total dividend of 30 per cent, less tax, will absorb the sum of £78,272 and the unappropriated profits will be increased by £100,101 to £689,412.

The Directors feel that the time is opportune to take a further step to bring the issued capital of the Company more into line with the capital employed in the business. It will therefore be proposed at this meeting that £226,875 of the unappropriated profits of £689,412 be capitalised in the form of 907,500 Ordinary Shares of 5s. each, and allotted to existing Ordinary Shareholders in the proportion of one new share for every two shares held.

To enable this to be done it is necessary to increase the Authorised Capital, and it will be proposed that the Authorised Capital be increased from £500,000 to £1 million. After the present capitalisation issue, there will remain £319,375 of Ordinary Capital, in the form of 1,277,500 Ordinary Shares of 5s. each, available for issue.

STAFF

I am quite confident that our Company is luckier than most in our staff: Many of them were appointed to positions of considerable responsibility twenty and more years ago, at ages which were young by any standards, and they are still with us today. Their keenness and enthusiasm are as great as ever. As in any Company, it is to them that our thanks are mainly due for the progress we have made over the years.

The report and accounts were unanimously adopted and the dividend, as recommended, was approved.

The retiring directors, Mr H. K. Marsh, Mr H. E. Netherclift and Mr A. F. Baillie, were re-elected and the directors were authorised to fix the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths & Company.

Resolutions were also passed increasing the capital of the company from £500,000 to £1 million by the creation of 2 million Ordinary shares of 5s. each and capitalising £226,875 of the unappropriated profits and its allotment to existing Ordinary shareholders in the form of Ordinary shares in the proportion of one new share for every two shares held.

THE BRITISH OXYGEN COMPANY LIMITED

GROUP TURNOVER INCREASED OVER WIDE RANGE OF PRODUCTS

BENEFITS FROM GREATER EFFICIENCY

MR J. S. HUTCHISON ON OVERSEAS SALES EXPANSION

The seventy-third annual general meeting of The British Oxygen Company Limited was held on March 25th at Grosvenor House, Park Lane, London, W.1, Mr J. S. Hutchison (the Chairman) presiding.

The following is an extract from his circulated statement:

The consolidated profit of £7,224,500 is after depreciation of £4,094,653 and compares with £5,964,085 in the preceding year, when depreciation was £3,217,463.

Group turnover rose by 15.7 per cent spread over a wide range of products manufactured in the United Kingdom and overseas. The benefits were felt of greater efficiency and increased output from major installations completed in recent periods and the profit reflects a moderate but welcome improvement in the rate earned on invested capital.

Taxation takes £3,890,438 against £3,215,099 and the nett profit available for allocation or distribution is £2,876,208 against £2,440,245. Subsidiary companies retained £754,846 (£497,238) and £750,000 (£750,000) has been allocated to general reserve. The final ordinary stock dividend of 6 per cent recommended requires £588,127 and leaves £320,713 added to the balance carried forward to make a total of £1,381,450.

The Directors have also declared a special interim ordinary dividend of 2 per cent in respect of the year ending September 30, 1959, which will call for £196,042.

Our group capital expenditure programme for the three financial years 1958-61 at present totals £24 million. This we expect to be able to finance from depreciation, and reserves and other resources, without needing to issue further share or loan capital.

UNITED KINGDOM GASES DIVISION

As expected, sales of industrial gases proved less buoyant than for a number of years and their growth was at a reduced rate towards the end of the year. Nitrogen, however, has come into greatly extended use and argon has kept up its good progress. Sales of medical oxygen, nitrous oxide and other anæsthetic gases continue steadily.

In the first quarter of our current financial year industrial gas sales have been rather below those of the corresponding period a year ago and there is as yet no indication of a resumption of the upward trend experienced for so many years.

Demand for industrial user equipment has been slightly reduced in the UK market and export sales have been affected by import restrictions in a number of countries. Production of this equipment involves the manufacture and assembly of thousands of parts with complex programming and recording. A Leo II electronic computer recently ordered will be used in this connection when it is installed next year and for analytical and calculation work throughout the group.

British Oxygen Aro Equipment Limited continued mainly on development work. Production is expected to commence later this year, but the situation is still governed by changes in defence requirements and by the present uncertainties in the aircraft industry generally.

ENGINEERING DIVISION

Work on hand at Edmonton includes air separation plants and tonnage oxygen and nitrogen plants for British Oxygen Gases Limited, for the steel and chemical industries and for Government requirements.

British Oxygen Wimpey Limited continues to be actively engaged on the Government rocket research project at Spadeadam, where progress is good despite adverse weather conditions at a very exposed site.

Sparklets Limited achieved higher sales and profits mainly from the success of the new Hostmaster syphon, particularly in export markets. Sales have had a setback in the current year, but the planned extension of the Hostmaster range should stimulate demand. Activity in the diecasting section remains at a moderate level.

Woodside Die Sinking Company Limited increased its turnover substantially, although profits have still to reap the benefit of recent expansion. An excellent reception was accorded on the introduction recently of a range of jig and tool units in standard sizes and designs which are being stocked for general supply to industry.

ELECTRIC WELDING DIVISION

Quasi-Arc showed improved sales and profits last year, although import restrictions and keener competition overseas reduced exports.

Good progress was made in the sale of Ferromax, Mirrospeed and other new electrodes and with our patented Fusarc/CO$_2$ process. Development of these and other lines continues.

The automatic welding section had a busy year with higher turnover and profits. A number of novel installations were completed including the longest welding boom in the world for use in the construction of an atomic energy power station. In the shipbuilding field success has attended the introduction of a self-propelled double fillet welding machine complementary to the already firmly established gantry welding machine.

Although there was a reduction in orders for major automatic welding installations in the early months of the current financial year, recent inquiries show a distinct revival of interest. It will be some time, however, before the work reaches the production shops because of the design element in such special projects.

CHEMICALS DIVISION

British Oxygen Chemicals Limited once again substantially increased its sales and this, with increased efficiencies in the manufacture of melamine and polyvinyl acetate, resulted in appreciably higher profits. Sales are now being affected by some recession in the plastics industry and there are indications of increased competition in world markets for our products. We do not expect sales and profits next year to reach last year's levels and the tempo of future advance may be restrained.

Odda Smelteverk A/S benefiting in Norway from additional supplies of hydro-electric power, produced and sold greater quantities of carbide, cyanamide and dicyandiamide. The determination of certain countries to become self-sufficient in carbide manufacture and to supply adjacent territories affects the outlook for established manufacturers such as Odda and we cannot expect that last year's rate of growth will continue.

Carbide Industries Limited, at Londonderry, is working according to plan on the building of works for the manufacture of carbide from which acetylene will be supplied in due course to the adjacent Du Pont neoprene factory.

OVERSEAS INTERESTS

In the course of his review of the group's overseas interests, the Chairman said: In Australia sales and profits both advanced in the past year and experience this year continues to be favourable. In India sales continued to grow, although somewhat less vigorously, and profits were commensurate. Trading conditions in South Africa have been steady and a modest extension of sales gave some improvement in profit which should continue in the current year.

In New Zealand, East Africa, Ceylon and Burma progress was appreciable, but less favourable trading conditions brought some reduction in profit in Rhodesia, Malaya and Hongkong. In the very competitive market in Canada, although progress was restricted by the recent recession in trade, we have an improving position.

Pakistan Oxygen Limited had a good year despite the economic and political upsets which have so dominated the scene. Trading is affected just now by the recent drastic change in conditions and so far we do not have a balanced view of prospects.

PROSPECTS

Under-activity just now in many spheres of heavy industry and general engineering reacts on our industrial gas business in the United Kingdom and we still have increased costs to overcome. Every effort will be required to improve on last year's results and this applies also to the other divisions in the United Kingdom which have some leeway in the early part of the year to make up.

On the other hand, sales and profits overseas are on the up-grade. This trend should continue with the industrial expansion in most countries despite currency and import difficulties, and trading should improve further with any increase in prices of raw materials or produce which are basic to their economy.

I expect that this expansion overseas coupled with a gradual improvement at home will yield results bearing a favourable comparison with last year's profits.

The report and accounts were adopted.

THE BRITISH SOUTH AFRICA COMPANY

BENEFITS FROM QUALIFICATION AS OTC

STRENGTHENING OF GROUP'S POSITION FROM DIVERSIFICATION POLICY

LORD ROBINS ON GROUP'S STRENGTHENED POSITION

The sixty-first annual meeting of The British South Africa Company was held on March 19th, in London.

Colonel The Lord Robins, KBE, DSO (the President) presided and, in the course of his speech, said:

Last year I sounded a note of warning that, if the market value of copper and other base metals—especially copper—upon which our royalties are calculated remained at their then levels, our revenue for the year now under review must necessarily fall below that of 1957. *But I qualified that* by saying that this adverse situation might be alleviated considerably by the measures which the Directors had taken on March 21, 1958, to secure provisional recognition of The British South Africa Company as an " Overseas Trade Corporation " under the Finance Act, 1957.

I am now pleased to be able to report that those measures have had very satisfactory results. The taxation charge reflects a saving of tax on the profits of the year to September 30, 1958, of the order of £750,000. Although the Company only functioned as an Overseas Trade Corporation for just over six months of the year, the tax saving is greater than what it may be expected to be in a full year in future by reason of a change in the method of assessment to Income Tax, the cessation of liability to Profits Tax and the effects of Double Taxation relief.

Although the Company's exempt trading income, which is derived primarily from its mineral revenues, is no longer subject to Profits Tax, the Group's investment income will continue to be subject to that tax. Nevertheless, the tax saving is still substantial and so long as the Company continues to qualify as an Overseas Trade Corporation, and on the basis of the levels of revenue and expenditure for 1958 and current rates of taxes in the United Kingdom and Overseas, the overall estimated annual tax saving will not be less than £600,000.

THE YEAR'S RESULTS

The Consolidated Profit and Loss Account shows that the Group's net revenues from royalties, dividends and interest have dropped by some £2,947,000 when compared with the previous year. Against this, however, the total taxation charge has been reduced by £2,480,000 so that our net profit, after taxation of £4,363,000, is only £467,000 less than the corresponding figure for 1957.

Out of this profit of £4,363,000 the Directors propose to transfer £1,500,000 to General Reserve and will today recommend for approval the payment of a Final Dividend of 3s. 3d. per unit of stock or per share, which together with the Interim Dividend of 1s. 3d. already paid will make a total of 4s. 6d. for the year.

The Directors have also decided to declare a Special Interim Dividend of 9d. per stock unit or share for the year ending September 30, 1959, to be paid with the recommended Final Dividend for the year 1958. This Special Interim Dividend will not be taken into account in considering the payment of further dividends out of the results for the year ending September 30, 1959.

SOURCES OF INCOME

The Group's income comes from three sources, its mineral royalties, its real estates and its investments. As time goes on and the year 1986 approaches, when the mineral rights and revenues in Northern Rhodesia will be taken over by the Government without compensation, the investments held by the subsidiaries, and the investment policy generally will become of prime importance.

The Group's interest in mining, both in Rhodesia and elsewhere, still forms a major part of the whole portfolio—the mining sections amounting to more than 60 per cent of the total book value. Thus, the development of mineral resources and the business of mining investment may be broadly said to be the principal activity of The British South Africa Company Group. In addition, however, to the mining investments, we have in recent years achieved a considerable measure of diversification in the Group's holdings and this process is continuing.

At the date of the Balance Sheet quoted investments of the Group at £22,834,081 showed an appreciation of £5,492,424. An approximate valuation of the quoted investments at March 12, 1959, amounted to £29,975,000, showing an appreciation over book value of £9,190,000. In addition there was an estimated undisclosed appreciation on certain of the unquoted holdings at that date of £3,387,000. The book value of unquoted investments has increased by about £1,800,000 since September 30, 1958.

I feel confident that Members will endorse the policy which the Board has adopted and which will place the Company in an extremely strong position from now onwards.

FEDERATION'S PROSPECTS

The year under review has been in many ways an anxious one, both here and in Africa. During its first five months, the average price of copper was between £179 and £180 per ton. One of the great new Copper Mines —Bancroft—then suspended its production for technical reasons ; and our new financial year began with a strike in progress on the Copperbelt which lasted for 53 days and cost the Company in loss of royalty alone some £800,000.

However, since then the price of copper has improved and looks like becoming more stable ; in a few days Bancroft will have resumed production, expansion at Nchanga and Mufulira is in progress and in general the economic and industrial scene in the Federation is brighter than before.

The year 1960 will be an important one for the Federation, not only because of the Constitutional discussions but because it will see the commissioning of the great Kariba Hydro-Electric Scheme. We are proud that The British South Africa Company has contributed materially to this great project.

The report was adopted and the dividend recommendation approved.

INTERNATIONAL COMBUSTION (HOLDINGS) LIMITED

Annual Report and Accounts of the I.C.L. Group for 1957-1958

INTERNATIONAL COMBUSTION LIMITED

Complete Steam Generating Plant for Power Stations, for Industry and for Nuclear Power Application in Great Britain.

INTERNATIONAL COMBUSTION PRODUCTS LIMITED

Mechanical Stokers, Pulverising Mills, Feeders and Burners for all Steam Raising Equipment. Material Handling Equipment, Vibrating, Screening and Filtering Equipment etc., for sale in Great Britain.

INTERNATIONAL COMBUSTION (EXPORT) LIMITED

All products of the Group for sale abroad.

RILEY (IC) PRODUCTS LIMITED

Mechanical Stokers and Oil Firing Equipment for small installations, Syntron Vibratory and Feeding Equipment.

THE CLAYTON EQUIPMENT COMPANY LIMITED

Locomotives and Vertical Kiln Plants.

PRINCIPAL FEATURES :

1956-57 £		*1957-58* £
1,274,715	Net Profit for Year after Taxation	1,371,472
5,175	Preference Dividend	5,175
413,665	Ordinary Dividend (25 per cent.) In addition a Special Interim dividend of 5 per cent. in respect of the year 1958-59 has been declared.	413,665
855,905	Net Profit retained in the Group for Development, Expansion and Contingencies	952,632
1,274,745		1,371,472
5,231,332	Net Current Assets before providing for advanced taxation	5,872,603
1,102,376	Fixed Assets (*less* depreciation)	1,450,579
464,354	Investments (*less* Provision)	615,024
6,798,112	Total Capital Employed	7,838,206

EXTRACTS FROM THE REVIEW OF THE CHAIRMAN, SIR JAMES REID YOUNG

The Group Profit is £3,039,547 compared with £2,801,231 for the previous year.

Orders on hand showed a substantial increase over the previous year and the output from all the Works in the Group showed a reasonable increase.

Subsidiary and Associated Companies both home and overseas have, in the main, showed satisfactory working results.

There is at present no reason to suppose that the results of the current year's working will differ materially from those for the year 1957/58, but beyond this it would be unwise to predict.

THE SCOTTISH LIFE ASSURANCE COMPANY LIMITED

NINTH SUCCESSIVE RECORD YEAR

Mr C. R. Munro, CA, Chairman of the Board of Directors, presided at the Annual General Meeting of The Scottish Life Assurance Company Limited, held at Edinburgh on March 24th.

In moving the adoption of the Report and Accounts for 1958 the Chairman said:

The Company maintained its progress during 1958 and for the ninth successive year—indeed, for the eleventh time since the war—I can report that the new life business is a record for the Company with net new sums assured of over £11¼ millions. It is interesting to note that in 1953 the net new sums assured amounted to a little over £5 millions so that we have more than doubled our new sums assured in the last five years.

A further milestone in the Company's history was passed in 1958 when our premium income, which was just over £1 million in 1950, exceeded £3 millions for the first time. In 1955 it was over £2 millions for the first time. Thus, while it took us five years, from 1950-1955, to increase our premium income from £1 million to £2 millions, it has only taken us three years to increase it from £2 millions to £3 millions. This alone gives some idea of our rapid expansion in the last eight years.

The gross rate of interest has once again increased—to £5 19s. 8d. per cent compared with £5 18s. 2d. per cent last year. The corresponding rates after deduction of income tax are £5 4s. 11d. per cent and £5 1s. 3d. per cent.

The net interest revenue has exceeded £1 million for the first time, having more than doubled itself in six years.

Claims by death were somewhat higher in amount than in the previous two years of the quinquennium, but the ratio of actual claims to expected claims is still light.

At the end of 1957 the Bank rate, at 7 per cent, was at the highest level since 1921 and conditions of recession were apparent both in USA and this country. Even under these conditions, we commenced 1958 with our investments worth considerably more than their balance sheet figure. During the year market values have risen and the appreciation of our investments over their book value has consequently increased substantially.

While the main change in our stock exchange investments occurs in ordinary shares, in which we have continued to invest both in this country and in USA and Canada, a substantial addition has been made to our portfolio of debentures at favourable rates of interest. We have also continued our activity in mortgages—mainly confined, as before, to loans on security of house property for owner-occupation in this country.

It is not possible at this stage to estimate what will be the immediate effect of the National Insurance Bill 1959—assuming it is enacted largely in its present form—on our existing and prospective pensions business, but our Pensions Department is very well-equipped to give advice to employers on the many difficult technical problems which arise in this field.

We have recently improved substantially our terms for contracts providing a lump sum benefit and have at the same time introduced a comprehensive widows' annuity contract to be issued in conjunction with our normal group life assurance and pension contracts. These group life assurance and widows' annuity contracts are of considerable value in augmenting the provision made for widows and children under the State scheme.

The Directors recommend that the final dividend for 1958 should be 7s. per share, making the total for 1958 14s. per share against 12s. for 1957.

The report and accounts were adopted.

APPOINTMENTS

BRITISH COLUMBIA RESEARCH COUNCIL
AT UNIVERSITY OF BRITISH COLUMBIA, VANCOUVER, 8, CANADA.
requires
(a) Market Research Officer
(b) Operational Research Officer
Applications are invited from recent graduates, preferably in economics or engineering, who have had at least two years' experience in the above fields. Applicants will be interviewed in London, April 13-24, and should send details of training and experience with their application. One copy should be sent to Dr. G. M. Shrum, c/o British Columbia House, No. 1 Regent Street, London, S.W.1, and the other to Vancouver.

CHIEF ARCHITECTS: DIRECTORS OF WORKS, *WAR OFFICE. Two pensionable posts* for men at Chessington, Surrey, in (1) the Development Group, and (2) Works (Abroad). Qualifications: candidates must be Registered Architects and hold professional qualifications in architecture. Additionally, for (1) they must have experience of development work and client-architect briefing in a large organisation, and of development of building types to meet special requirements together with current knowledge of the various institutions concerned with the development of building standards, techniques, and research. They should be familiar with up-to-date *cost control and* cost analysis methods; for (2) they must have experience in the organisation of a large building programme involving the co-ordination of the *several specialist services involved. Duties:* (1) To take charge of the Development Group, which is part of an expanding organisation responsible for the design and *supervision of the Army's new building work at home* and overseas. The Group undertakes original research and development work on functional and structural problems, reviews designs of a wide variety of buildings used by the Army, and examines new building techniques and materials. (2) To direct overseas building work with support of administrative and technical services and of a development group, to enable him to organise the staff on the basis of a real programme of work with priorities and targets, both concerning cost, building time, and value for money. The type of building requirement will vary from time to time and will include housing, hospitals, barracks, amenities, industrial buildings, storage and other specialist buildings. Salary (London) £3,000. Write Civil Service Commission, *17 North Audley Street, London*, W.1, for application form, quoting S4962/59. Closing date April 14, 1959.

BRITISH TRANSPORT COMMISSION *requires* Assistant in Traffic Adviser's Department at London Headquarters to undertake long- and short-term appraisals of the effect of changes in industrial trends and to formulate estimates of traffic potential and demand. *Good* knowledge of the sources of information necessary to provide an intelligence service. Experience in responsible post in transport or industry and qualifications of *high order in field of economics and statistics essential. University degree or other appropriate qualification an* advantage. Salary range £1,815-£2,260 p.a. *Superannuation scheme.* Certain free travel facilities. Medical examination.—Write, giving age, qualifications and experience, to Principal *Establishment and Staff Officer, British Transport Commission*, 222 Marylebone Road, London, N.W.1, within 14 days. S.A.E. for acknowledgment.

THE UNIVERSITY OF BIRMINGHAM
The University will offer a number of Scholarships, value £270-£340, to graduates and to those expected to graduate this summer who wish to read for higher degrees in the Faculty of Commerce and Social Science. There will be opportunities for advanced study and training in research in all the main departments of the Faculty and also in subjects common to more than one department.
Further particulars may be obtained from the Registrar, The University, Birmingham, 15, to whom applications should be sent before June 13, 1959.

CONSUMERS' ASSOCIATION, publishers of " Which? " require project officer, male, to organise tests of consumer goods. Qualifications: intelligence, initiative, commonsense, and some technical and scientific experience. Salary according to experience. Apply: Director, 333 High Holborn, London, W.C.1.

SENIOR LECTURER
Oil Company requires Senior Lecturer in *Chemical Engineering* for the Abadan Institute of Technology in SOUTH IRAN. Age 35-50. Degree in Chemical Engineering; at least three years' teaching experience in Chemical Engineering.
Salary not less than £3,000 per annum for well qualified candidate. Two-year tours of duty followed by 72 days home leave on full pay. First-class air passages paid by the Company for employees and eligible family. Accommodation, married or bachelor, provided by Company at *reasonable rental.*—Write, with brief details, for further information to Box TE.405, c/o 191 Gresham House, E.C.2.

NUFFIELD COLLEGE STUDENTSHIPS
Applications are invited from graduates (men and women) who wish to undertake research in any branch of economics or politics (including political theory, government and public administration, and international relations); statistics; sociology; constitutional, public and international law; recent social, economic and political history. The College is also interested in the application of these disciplines to the problems of colonial and under-developed societies. The College administers grants to further the study of European politics and government and of trade union policy and industrial relations.
Further particulars and the necessary forms are obtainable from the Warden. Applications should reach him by May 11, 1959.

NUFFIELD COLLEGE, OXFORD
RESEARCH FELLOWSHIPS
Applications are invited from men or women graduates who wish to undertake research in Economics; Statistics; Politics; Sociology; Economic, Social or Political History; Industrial Relations; African Studies; Public Administration; Business Management; International and Public Law or other branches of the Social Studies. Two or three Research Fellowships may be awarded. The stipend will be according to age and appointments will be for two or three years, renewable. *Further particulars may be* obtained from the Warden.—Applications should reach him not later than May 11, 1959.

NUFFIELD COLLEGE
GWILYM GIBBON RESEARCH FELLOWSHIP
Applications are invited from men or women who wish to conduct research in the field of government and administration. Preference will be given to candidates with experience in the public service. The Fellowship will be for one year in the first instance. Further particulars and application forms can be obtained from the Warden.—Applications should reach him by May 11, 1959.

THE UNIVERSITY OF BIRMINGHAM
FACULTY OF COMMERCE AND SOCIAL SCIENCE
EDWARD WILSHAW POSTGRADUATE EXHIBITION
One Exhibition, of the order of £200, but the amount to be determined in each case by the applicant's merits and circumstances, will be offered each year from a fund founded by Sir Edward Wilshaw, K.C.M.G., D.L., LL.D., F.C.I.S., J.P. The Exhibition is open to graduates of this and other Universities who wish to prepare themselves for careers in business administration and management and who propose to read for the Graduate's Commerce Diploma in business administration. Applications (two copies) including the names of two referees, should be sent by June 13, 1959, to the Registrar, *The University, Birmingham*, 15.

ASSISTANT statistician required for Circulation Department of Tothill Press Ltd. Work is varied but mainly concerned with interpretation of readership surveys. Experience not essential but must be able to interpret statistics and report coherently. Statistical work is expanding and offers good prospects to a young graduate —early twenties preferred—male or female.—Apply Cohen, Tothill Press Ltd., 33 Tothill Street, London, S.W.1. (WHitehall 9233.)

For further appointments and other classified advertisements see page 1227

MARKET RESEARCH. We are looking for a male executive (graduate) with approximately two to three years' experience in market-research. He should be thoroughly versed in the statistical procedures employed in this field.
The man selected will be capable of initiating, planning and reporting on research surveys (mainly on consumer products). The salary will be between £1,000-£1,200 per annum according to experience.
Reply to The Manager, The Research Unit Ltd., 197 Knightsbridge, S.W.7.

CONFEDERATION LIFE ASSOCIATION has opportunities for young qualified Actuaries, or would consider those when they reach qualification, at its Head Office in Toronto. Generous salary scales and fringe benefits including substantial group insurance and a breakdown sickness benefit. Opportunities arise through business developments.—Details from Chief Actuary, 18 Park Lane, London, W.1.

A CHANCE IN A MILLION for a lady of good *education (at least G.C.E.)* to get in on the ground floor of an expanding staff agency in the City. Age 25/35. Must be a good mixer and possess an easy conversational manner at all levels. Salary £520 per annum plus commission £2-£4 per week.—Write for application form to Box 1145.

UNIVERSITY OF BRISTOL
Applications are invited for the following posts in the Department of Economics, tenable from August 1, 1959.
(a) Lecturer (Grade II) in Economics with special interest *in Mathematical Economics.* Salary scale £900 x £50—£1,300; £1,350 x £75—£1,650.
(b) Research Assistant in Economics. Salary £600—£700.
Fuller particulars of these appointments may be obtained from the Registrar, The University, Bristol 8, to whom applications should be sent by April 25th.

FOREIGN OFFICE RESEARCH DEPARTMENT: RESEARCH ASSISTANTS. Ten posts (1 in Grade I, 2 in Grade II, 7 in Grade IID for men or women at least 28 (Grades I or II) or 23 (Grade IID) on April 1, 1959, for research on historical background and current developments *in foreign countries.* Qualifications: normally at least 2nd class honours degree. For some posts, sound reading knowledge of Arabic, Chinese, Japanese, or a *Slavonic language essential. Knowledge* of other languages and peoples desirable. London salary scales (men): Grade I, £1,780-£2,000; Grade II, £1,350-£1,660; Grade IID, £610 (23) to £675 (25 or over) rising to £1,085. —Write Civil Service Commission, Burlington Gardens, London, W.1, for application form, quoting 4958/59. Closing date April 30, 1959.

THE UNIVERSITY OF HULL
Applications are invited for an Assistant Lectureship in Politics and Government, tenable from October 1, 1959. Salary scale £700 x £50—£850 per annum, with F.S.S.U. and children's allowances.—Further particulars may be obtained from the undersigned to whom applications (five copies) should be sent not later than May 1, 1959.
W. D. CRAIG, Registrar.

THE UNIVERSITY OF HULL
Applications are invited for an Assistant Lectureship in Economics, tenable from October 1, 1959. Salary scale £700 x £50—£850 per annum, with F.S.S.U. and children's allowances.—Further particulars may be obtained from the undersigned to whom applications (five copies) should be sent not later than May 1, 1959.
W. D. CRAIG, Registrar.

COMPANY AFFAIRS

ASSOCIATED ELECTRICAL INDUSTRIES

SHAREHOLDERS should be careful in their interpretation of the full accounts for 1958 of Associated Electrical Industries, just as they had to be careful in assessing the profit trends revealed in the preliminary statement, for the acquisition of Associated Insulation Products and W. T. Henley's Telegraph Works makes an exact comparison between the 1957 and 1958 accounts virtually impossible. It is not clear from the figures as they are presented in these accounts how the group really fared, either on profit margins or on orders. One difficulty is that the figures for sales and orders for 1958 include in part those of the new subsidiaries and the 1957 figures do not.

While gross trading profits have risen from £13.3 million to £16.0 million, net profits, after excluding pre-acquisition profits, have risen by only £274,410 to £4,778,485. Including the figures for the new subsidiaries, sales in 1958 are shown at £181½ million (against £150 million), new orders received at £168 million (against £177 million), and orders at hand at the end of the year at £182 million (against £180 million). Quite what contribution the new subsidiaries made to these figures is not stated but it seems clear that turnover in AEI's works was outstripping the inflow of new orders. It seems certain that excluding the experience of the new subsidiaries the order book has been contracting, and that AEI's profit margins, like those of other heavy electrical engineering groups, have been contracting as well.

Last year, the issue of a 6 per cent debenture brought in about £25 million, and this injection of new money is reflected in the improvement in liquidity: cash and money assets have risen from £2 million to £10½ million and bank overdrafts have fallen from £6.3 million to £2.8 million.

N. V. PHILIPS

SINCE 1949 the trading profits of N.V. Philips of Eindhoven have risen by more than eight times, from 67 million guilders to 557 million guilders, and its fixed assets by nearly four times, from 358 million guilders to 1,430 million guilders. Growth of this order usually generates a thirst for new capital. Eventually, this giant electronics and electrical engineering concern may wish to come to the market. It should, like other international giants, find it easy to do so, for its shares are widely dealt in on stock exchanges other than Amsterdam. Last year, for instance, they were introduced for the first time to West German investors. An application for a Wall Street quotation is not expected immediately but there have been big dealings in the shares in the over-the-counter market and American shareholders already own about 15 per cent of the equity, equalling the proportion held in France. By contrast, British investors own only 9 per cent and with 8 per cent owned in other countries, about 53 per cent is still in Dutch hands.

Philips is in no immediate need for new money for last year its liquid resources rose from 309,767,000 million guilders to 496,026,000 million guilders, reflecting a decline in the rate of installation of new capacity, the receipt of share premiums arising from the conversion of debentures, and of loans raised privately on the Netherlands market. But Philips' financial strength also stems from the upward trend of earnings, and trading profits in 1958 rose by 26 per cent, from 442 million guilders to 557 million guilders, although sales advanced by only 13 per cent, from 3,177 million guilders to 3,595 million guilders. Shareholders are to receive in addition to the customary 14 per cent ordinary dividend, a 5 per cent scrip issue. The FL 10 shares now stand at 101s. 6d. to yield just over 2½ per cent on the dividend and about 7½ per cent on earnings.

ALLIANCE TRUST

IN the last two years the declared aim of the directors of Alliance Trust has been to shift the emphasis to investment in "stable and conservative trades." This is reflected in the greater proportion of investments now held in banking, insurance, food, drink and tobacco shares and in United States public utility issues. The percentage of funds in these categories has gone from 33.5 per cent in January, 1957, to 51.1 per cent in January this year. Even so, the value of the investments of the Alliance Trust rose last year by 31 per cent to £38,346,000; this is in line with the rise in equity indices both here and in New York.

Almost half of the trust's funds are in the dollar area, and the increase from £1,765,000 to £1,800,000 in gross income for the year to January 31, 1959, is satisfactory. As with so many investment trusts this year, profits tax is much lower and Alliance's net revenue has risen by £85,241 to £961,424. The dividend is being raised from 25 to 28 per cent, and this payment absorbs about 75 per cent of net income. Funds which have till recently been held in cash and USA Government Bonds have now been reinvested and the chairman, Mr Alan L. Brown, expects the gross revenue in the current year to show a "further moderate rise."

An interesting innovation announced by Mr Brown is the directors' intention to give with future interim dividends an estimate of the rate of earnings expected for the year together with an unaudited valuation of investments. At 142s. xd., the current price of the £1 stock units is close to their break up value of 144s. 6d.—one indication of the market's high opinion of them.

ASSOCIATED FISHERIES

TRAWLING can at times be both hazardous and unrewarding and this has been the case since the autumn of 1956 when landings first began to decline due to spells of bad weather and a dispersion of the shoals of fish. Poor returns from their fishing fleets give the larger groups an added incentive to take a hand in the distributive side of the industry and Associated Fisheries, possessor of the largest trawler fleet in the country, has a turnover through its distributing network far in excess of the value of its landings. Last April Associated Fisheries feared that without an improvement in the productivity of the fishing fleet its financial results for the year to September 30th would be well below those of 1957. Landings later in the year did not improve but profits did; in fact they recovered to about the level of the year to September, 1956. Fuel costs were much lower but individual voyages have been longer, so that profits from distribution probably account for most of the increase in trading profits, from £961,086 to £1,173,550. The group handles more imported fish than landings from its own vessels, and it has recently reorganised its frozen foods business into one company.

Depreciation rose from £466,856 to £522,538 and special write-offs amounted to £107,225, against £77,219, but net profits recovered by £90,031 to £239,123, and the ordinary dividend has been increased by the payment of a special dividend of 3 per cent on top of the maintained 12 per cent total for the year. A 15 per cent dividend absorbs £112,125 and is covered nearly twice by earnings. At 8s. 9d. the 5s. units yield 8.6 per cent.

JAMES PASCALL

IN contrast to the marathon takeover struggle for *Thomas and Evans* last summer, the Beecham Group's bid for *James Pascall*, the south London confectioners, seems unlikely to meet much, if any, opposition. Beecham has made a bid for the entire share capital of Pascall on attractive terms and in cash. There is in issue 4,456,675 1s. ordinary shares for which Beecham offers 10s. per share. Already holders of 2,494,761 of these shares (of which the Renshaw and Pascall families have substantial holdings) have indicated that they will accept the offer, and the bid is strongly recommended by the directors. The two other classes of capital carry voting rights, but these are small in relation to the ordinary capital and, in fact, the bid has been provisionally accepted by holders of more than half the total votes. Holders of the 5 per cent 18s. preferred ordinary shares of which 249,900 are in issue, are offered 15s. per share, and 18s. per share is offered for each 5 per cent preference share of which 149,560 are in issue. The total bid amounts to about £2½ million for net assets of £1,372,000 at written down book values.

The directors of Pascall stated recently that increased profits in 1959 depended upon successful sales promotion. The Beecham Group, which already has confectionery interests, should be able to help here with its vast experience of advertising.

HARRODS

IN his statement with the full accounts of Harrods for the year to January 31st, Sir Richard Burbidge, the chairman, tells shareholders that the directors are carefully considering what arrangements should be made to supplement internal resources to cover the cost of the £3½ million contract placed with Taylor Woodrow last year for the construction of a new store, shops and offices in Birmingham. Although the work is being spread over three or four years, this disclosure is not a surprising one for liquid resources of £1,811,470 cover less than half its capital commitments of £3,901,185.

Sir Richard's assessment of prospects provides a suitable background for a new issue. He says that the current year opened "optimistically" and that higher levels of trade and net profits are expected in the first six months—and probably for the full year as well. Harrods' experience in the second half of 1958 lends support to this view, for following the fall in trade in the first half of the year, earnings recovered so sharply in the second that trading profits of £9,267,754 for the full twelve months were down by only £14,427. In this recovery, Sir Richard draws particular attention to the part played by Harrods of Knightsbridge, which earns more than half of the group's profits. The £1 shares have risen by 2s. 9d. to 81s. 3d. since the preliminary figures were issued and now yield only 4.3 per cent.

BRADFORD DYERS

NO doubt shareholders in Bradford Dyers will be cheered by the belief of Mr James Ewing, the chairman, that the fall in the domestic demand for woollens has at last ended and by his forecast of improved results from the wool sector in the current year. But they will be cheered even more by his disclosure that the claim for the repayment of the £1,126,021 in bank deposits sequestrated by Egypt should be settled within a few months—*subject, apparently*, to a "sequestration fee" of 10 per cent. But what will happen to BDA's claim for £2 million arising from the "Egyptianisation" of BDA's investment in Beida Dyers SAE is less clear. Under the recent Anglo-Egyptian agreement, any settlement of this claim cannot be expected in less than twelve months, and Mr Ewing argues that the total sum provided under the agreement for claims of this type is inadequate to meet all these claims in full. All Mr Ewing says of the future use of these moneys is to repeat the earlier statement that the directors will "consider" distributing "part" of the cash received when the Egyptian claims are settled as a tax free payment.

London Stock Exchange

FIRST DEALINGS:	Mar. 11	Apr. 1	Apr. 15
LAST DEALINGS:	Mar. 31	Apr. 14	Apr. 28
ACCOUNT DAY:	Apr. 7	Apr. 21	May. 5

GILT-EDGED stocks closed steady on Tuesday evening but interest was slackening before the Easter holiday and the Budget. Industrials were firm at first and on Monday a record number of bargains was marked at 20,028, but dealings in property shares alone contributed 1,521 of these. By Tuesday's close the market had turned dull following the overnight setback on Wall Street. *The Economist* Indicator fell by 1.3 to 252.4 on Tuesday evening. Glaxo fell by 1s. 3d. to 51s. 6d. and British Oxygen by 7½d. to 55s. 4½d. In Electricals, Elliott-Automation lost 1s. 3d. to 19s. on Tuesday, but by that time the stock had made a net gain of 2s. 6d. since last Wednesday. Steel shares remained strong following the by-election results, Colvilles rising by 2s. 6d. to 30s. 10½d. and Lancashire Steel by 2s. to 33s. 4½d. Motor shares were irregular on the February output figures, although BMC gained 9½d. to 14s. 10½d. Paper shares were weak, reflecting the Scandinavian and UK cuts in the price of kraft paper, A. E. Reed falling by 2s. 9d. to 50s. 6d., and Bowater by 1s. 10½d. to 46s. 10½d. Some selling of bank equities occurred on Tuesday after the National Provincial announced that its rights issue will be made at the end of April. Oils were *initially firm but later turned dull in* line with Wall Street. Kaffirs were *generally easier* but Loraine gained 10½d. to 33s. 3d. in front of its quarterly report.

EXCHEQUER RETURNS

For the week ended March 21, 1959, there was an "above-line" deficit (after allowing for Sinking Funds) of £41,502,000 compared with a surplus of £40,756,000 in the previous week and a deficit of £1,705,000 in the corresponding period of last year. There was a net receipt "below-line" of £10,030,000, leaving a total deficit of £126,866,000 compared with £187,207,000 in 1957–58.

Money and Exchanges

THE MONEY MARKET

THE offer of Treasury bills rose by £20 million to £250 million at last week's tender, while total applications fell by £13.7 million to £360 million. Thus the discount market, making its concerted bid at £99 3s. 6d. for the fourth successive week, raised its allotment from 43 to 55 per cent. Outside applicants appear to have raised their bids in some cases, and the average rate of discount fell from £3 5s. 11.05d. per cent to £3 5s. 8.95d. per cent.

Withdrawals of funds from the market were light, and fresh money was readily available over the week-end. The demand for bills was brisk, "hot" bills changing hands at $3\frac{7}{32}$ per cent. A rate of 3 per cent was paid for overnight money early in the day, although $3\frac{1}{8}$ per cent was conceded on Friday while credit was patchy. Late balances were available at the banks' minimum rate of $2\frac{1}{2}$ per cent. and funds from outside institutions commanded only 2 per cent.

On Monday calling increased and a very small amount of assistance from the authorities was required to help the discount houses to balance their books. On Tuesday funds were harder to obtain and the authorities again gave a little help. The general rate for overnight loans rose to 3 per cent, and help from the authorities was passed on at $3\frac{1}{8}$ per cent.

BERGA HOUSE, VINCENT SQUARE, S.W.1.

NORTHERN GAS BOARD

Applications are invited for the appointment of CHIEF ACCOUNTANT of the Board.

Candidates must be members of one of the recognised bodies of professional accountants and should preferably be between the ages of 35 and 50. The post is superannuable and is subject to the passing of a medical examination at the Board's discretion.

Salary will be commensurate with the responsibilities of the post, and the qualifications and experience of the successful candidate, but will not be less than £2,800 per annum.

Applications, giving full particulars of the candidate's qualifications, the names of at least two referees, and the date on which he would be able to take up the appointment, should reach the undersigned not later than April 30, 1959.

JOHN F. JACKSON,
Secretary.

30 Grainger Street, Newcastle upon Tyne, 1.

ECONOMISTS

THE BRITISH AND COMMONWEALTH SHIPPING CO. LTD. *invites applications from* ECONOMISTS with a sound knowledge of statistical method and preferably some experience in the application of economic analysis to industrial problems for the position of senior assistant in the Research Department. Applicants should have a good honours degree in Economics or Statistics and preferably at least two years' research experience *in a University, industry* or Government.

The successful candidate will be required to assist in the application of economic and statistical techniques to a variety of problems associated with shipping and to develop the results for presentation to the Management. The work is of great interest involving research in original fields.

The conditions of employment are generous and the salary will depend on age and experience. —Applications should reach the Secretary, The Clan Line Steamers Ltd., 2 St. Mary Axe, London, E.C.3.

CHIEF ACCOUNTANT required for group of British Companies in Khartoum. Applicants should be aged 24/32 and have passed the finals examinations of a recognised Accounting body. Commencing salary from £Sd.1,428 *dependent age, experience,* with annual increments plus furnished quarters, Kit allowance. Annual leave after two years, with free air passages. Provident Scheme. There is *no income tax in the Sudan at present.*—Apply with full details of qualifications, past service and copy references to Keymer, Son & Co. Ltd., Imperial House, Kingsway, London, W.C.2.

TELEVISION OFFICER

Applications are invited for new appointment to assist national industrial federations in projection of British industry. Candidates should have practical experience of broadcasting production problems and techniques as well as some knowledge of industrial affairs. Must be willing to travel extensively in United Kingdom. Salary starting at £2,000 a year.

Applications in strict confidence to Box 1143.

March, 1959. Clerk of the County Council.

P. D. LEAKE RESEARCH FELLOWSHIPS

Applications are invited from qualified members of the accountancy profession for appointment to a P. D. Leake Research Fellowship financed by the P. D. Leake Trust. The term of the Fellowship will be for the year commencing October 1, 1959, and it may be held in the University of Birmingham, the University of London, or the University of Oxford, the location of the appointment being determined by the three universities concerned, in consultation, after consideration of candidates' preference and research interest.

The object of the Fellowship is to provide university *facilities for an experienced accountant to carry out* research in subjects with which the accountancy profession is directly concerned and within the charitable object of the P. D. Leake Trust, *namely* "to benefit and advance the Sciences of accounting and of political economy, including the subject of public finance and taxation." Only accountants who are members of United Kingdom accountancy bodies which are recognised for the purpose of United Kingdom company law are eligible.

The emolument of the Fellowship will be £2,000 out of which the Fellow will be required to meet any consequential expenses of his appointment.

Further particulars may be obtained from the Registrar, University of Oxford, vith whom applications must be *lodged by April 30, 1959.*

UNIVERSITY OF CAMBRIDGE

DEPARTMENT OF APPLIED ECONOMICS

Applications are invited from economists and statisticians for *appointments from October 1, 1959.* In connection with the Department's research programme. Each appointment will be for a limitec period related to the duration of the *specific research project* to which the applicant is assigned; the projects vary greatly in character, and call for very different types of qualification. In particular, some projects involve statistical and field research into productive capacity and economies of scale due to technical factors. Applicants should normally have at least a good second-class honours degree in economics or statistics, and research experience in either field is desirable for appointments in senior grades. The pensionable stipends of the posts are on scales ringing from £650 to £1,750 a year. Applications, giving details of academical qualifications, experience, and any special research interests, together with the names of two referees, should be sent before April 10, 1959, to the Director, Department of *Applied Economics,* 7 West Road, *Cambridge.*

UNIVERSITY COLLEGE OF GHANA

Applications are invited for (A) Assistant Lectureship or (B) Lectureship In Agricultural Organisation and Economy. Postgraduate research experience in Agricultural Economics essential. Salary scales: (A) £900 p.a., (B) £1,000 x £50—£1,350 x £75—£1,500; £1,850 p.a. Entry point according to qualifications and experience. F.S.S.U. Outfit and family allowances. Passages for appointee and family on appointment, annual leave and normal termination. Part-furnished accommodation at a charge not exceeding 7.5 per cent of *salary.*

Detailed applications (6 copies), naming three referees, by May 15, 1959, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

FEDERATION OF BRITISH INDUSTRIES

A vacancy occurs in the Economic Director's Department for a *young barrister, solicitor,* or graduate in law to assist in dealing with a broad range of partly-legal problems touching the interests of industry. Experience of *professional practice is not essential.* The post is superannuable and commencing salary will accord with qualifications. There are good prospects of advancement. —Applications, with full particulars of qualifications, should reach the Secretary, F.B.I., 21 Tothill Street, London, S.W.1, on or before April 25th.

For other appointments see page 1221

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the post of Senior Research Officer in the Social Science Department. The appointment will be for three years from a date to be arranged but not later than October 1, 1959. Subject to satisfactory qualifications and experience, the salary will be £1,500 x £75 to £1,650 per annum. The appointment is in connection with an inquiry into family life and kinship in the Swansea area and will have special reference to the position of old people.

Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, by whom applications (six copies) must be received by Saturday, April 4, 1959.

Muscle is the most costly power on earth

RITCHIE CALDER, the science writer describes how atomic power may help man's muscle-emancipation . . .

A TYPICAL SCENE in tropical countries is that of the bullock-team raising water from a well. To the chanting of the drivers, the bullocks trudge backwards and forwards, under the relentless sun, lowering the buckets into the well, hoisting the water and tipping it into the water-courses to irrigate the thirsty soil, from which both men and beasts get their food. Those peasants are poor, despairingly poor, yet they use the most expensive power in the world—muscle-power. Bullocks have to be bought, tended and fed, yet even with the meagre food and pitiful earnings of the men who drive them, the energy equivalent which they produce costs twenty times as much per unit as the energy output at Calder Hall atomic energy station.

MUSCLE POWER INEFFICIENT

A great many people in the world are poor because of necessity, they use calories in their most expensive form and energy in the most uneconomical way. Although we may glorify muscle-effort—and, indeed, laud it in the performances of athletes—it is deplorably inefficient. The advance from the steam-engine to atomic power, from the pulley-belt to automation, has represented the emancipation of man from muscle-slavery.

The paradox of power is that those who are power-deficient are power-extravagant. When we go around the house switching off lights to keep the electricity bill down, we might think of the Indian villager burning cow-dung to cook his food for his muscle-power. Because he burns that dung, instead of using it as manure, his soil is undernourished, his crops are undernourished, and he is undernourished.

This is the Misery-Go-Round of poverty; because the peasant is poor he is undernourished; because he is undernourished he under-produces; because he under-produces he is poor; and because, in 'muscle-power' countries, poverty prevails, their natural resources are underdeveloped. Such countries see in nuclear energy a break-through to industrial prosperity. The problem of how to find the money to pay for it and to train the people to handle it, is the answerable challenge of our times.

The power engineers know the answers; the mechanical engineers have created the machines. The muscle-slaves are waiting to be freed and the resources of their countries are waiting to be developed. The machine is the emancipator.

MITCHELL ENGINEERING are designing and constructing Nuclear Power Plant to meet world needs in the New Atomic Age

THERMOTANK IN AMERICA

Now they can give of their best

in a Detroit Research Laboratory

In a climate which is often uncomfortably hot in summer and cold in winter, administrative workers and scientists in this Detroit plant now enjoy temperate inside conditions right through the year. Careful control of the atmosphere for the work itself is provided in the cold-vaccine laboratory. This air conditioning installation is one of many important contracts secured in the United States by Thermotank. Others include the supply of 4,800 high velocity units to the New State Department Building in Washington.

Thermotank can plan, design and instal air conditioning equipment for any requirement in any part of the world.

A WORLD OF BETTER CLIMATES WITH THERMOTANK

Here are a few more examples of world-wide service from Thermotank:
UNITED STATES Contracts for Texas Instruments, Standard Oil, American Telephone and Telegraph Company, John Hopkins University, Ford Motor Company and General Motors.
BRITAIN Full conversion of the liner S.S. 'ORCADES' to be carried out, providing an installation with a capacity of 14,000,000 B.Th.U's per hour.
MIDDLE EAST Installations include the Fao Port Control and Wireless Station Building and the Iraq Spinning and Weaving Company's mills near Baghdad.
SOUTH AFRICA Thermotank installation for the new ten-storey headquarters of the United Building Society in Johannesburg, South Africa's largest office building.

TR SERVICES provide more than STAFF LOCATION

Although TR Services provide the most comprehensive and reliable Staff Location facilities—by internal broadcast from a central microphone or direct through the internal telephone system, or by light signals—this is only one of the Services. It is also only a part of the overall story of how TR Services benefit a business.

Because they enable information to be obtained more quickly and instructions to be passed more promptly; because they reveal and diagnose inefficient machine production, encourage a better sense of time and its value, help to achieve more accurate costings and, in many other ways, help to promote a better business climate, TR Services improve the whole economy of a Company.

They cut down waste—of time, effort and money—and *that* is their fullest justification. Send for details of TR Staff Location—and any or all of the TR Services. Do it today.

TR Services include: Internal Telephones, Internal Broadcasting, Staff Location, Time Control, Centralograph Production Control, Watchman Protection, Fire Alarms.

"Something new in partitions, old chap"

"Tell me more."
"I knew you'd be interested in this, old chap. You're thinking of dividing up that big office of yours aren't you?"

"It's quite a possibility."
"Well, these new Stramit 'Movaflush' partitions really have something. It's all in the way they fit together, actually. They're ready-made panels with an L-shaped piece at each side and they simply butt up together, one after another. You put a screw through them—and that's that. They go up at simply astonishing speed. Knock pounds off the normal erection costs."

"What are they like, when they're up?"
"Eh? Oh, I see what you mean. Well, according to this leaflet I've got, 'Movaflush' partitions have all the virtues. They're over two inches thick, you know, for a start. They're strong and rigid. They deaden sound. And they're faced with hardboard so they can be decorated easily."

"How much, old boy?"
"Well, the surprising thing is, not much at all. Something like five bob a square foot, including things like timber sections, doors, screws and what have you."

"I must get one of those leaflets."
"Why not get your secretary to fill in a coupon, or something."

Please send me, without obligation, full details of Stramit 'Movaflush' partitions

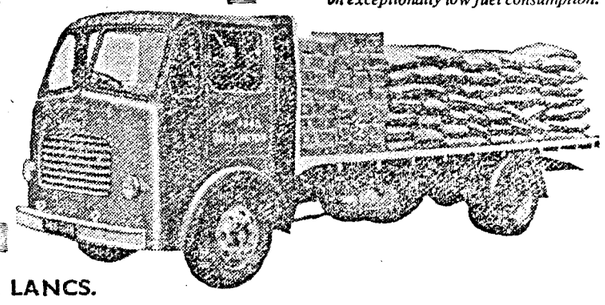
LEYLAND CUT PRICES

up to £1,000 overall saving

The 24 ton g.v.w. OCTOPUS carrying payloads up to 16½ tons is generally recognised as the leading 8-wheeler on the road today.

Yes, a £1,000 saving. That's what the basic price reduction plus the elimination of purchase tax means to the buyer of the Leyland 24 ton g.v.w. Octopus. And in the medium class range the basic price of the world famous Comet is also down.

This stupendous news means that now, for little more than the price of a mass-produced truck, you can save and earn on the lasting economy, fantastically low maintenance upkeep and the traditional long life of the quality built Leyland.



And believe us, the undoubted superiority of these Leylands cannot be questioned. Built by an organisation which has no other interests but the manufacture of the finest commercial vehicles, they represent the acme of perfection in road haulage transport. Tens of thousands of operators have proved it—and so can you. Write for details and arrange for a demonstration today.

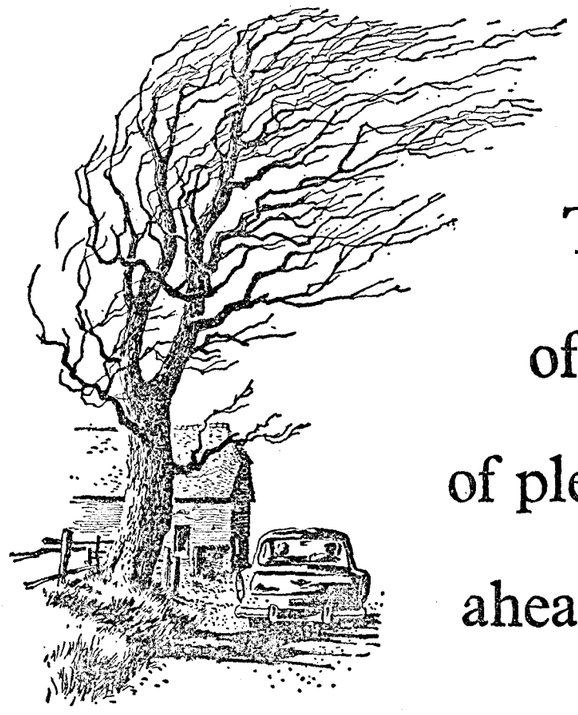
UNIVERSAL BEAMS

a good example of the simplification they effect

A new extension for Whessoe Limited of Darlington covers an area of 295 ft. by 90 ft. wide, with an eaves height of 57 ft.

The illustration shows an unusual sky-line—the main roof contour matches that of an adjacent building, the central portion being steeper to take glazing.



The portal-frame roof structure is formed throughout from Universal beams, the vertical members being 36″ x 16½″, weighing 260 lb. per foot, the central rafters of 24″ x 12″ being site-welded to the tapered elbows.

Universal beams, again 36″ x 16½″, were site-welded and support the runways for two 40-ton capacity cranes of 80 ft. span, the columns being connected by tie-beams of 12″ x 12″ in universals.

The steelwork was carried out by Redpath Brown & Co., Ltd., Edinburgh, who saved a good deal of time and labour by using universal sections which eliminated the need for compounding.

EARLY DELIVERY OF THE FULL RANGE OF SECTIONS

"Transistors" by Roy Nockolds

Gazing into the crystal

Modern crystal gazers can now foretell the future with some accuracy—if the crystals into which they are gazing are those of germanium or silicon.

These two substances—known as semiconductors—are the basis of Electronics' newest and perhaps most significant development—the transistor.

This device, which fulfils a similar function to a radio valve, is beginning to revolutionise electronics in many of its applications. Unlike the valve, the transistor needs no filament and operates at very low voltages and currents. Another advantage is its minute size—in some cases no larger than the head of a match. The transistor, in a variety of forms, is already being used in hearing aids, computers, instruments for nuclear power stations, portable radios and record players, and future applications will include radar, submarine telephone repeaters, and V.H.F. mobile radio.

The Mullard Company has played a leading part in the development and production of transistors, accumulating a great wealth of know-how on which you, as a designer or user of electronic equipment, are free to draw.

End of the Dulles Epoch

WHETHER John Foster Dulles is a great man can be left to history. That he is a brave man and a devoted servant of his country can be said now by everybody, even by those who have criticised him most sincerely. Certainly he has the quality that every great American has had, the quality of character; and to this he has added the humdrum virtues that matter as much now in democratic public life as they did in Sir Robert Peel's day, tenacity, conscientiousness, and sheer hard work in his job. Certainly, too, of all the Eisenhower Administration he will be remembered in history as the one big man.

Controversial from the outset as men of his size always are, Mr Dulles has come to personify in the eyes of the world the arduous and unaccustomed role of his country, at once the Atlas and the whipping boy of a grand alliance. Constitutionally, it is the President who determines American foreign policy; but no Secretary of State in modern times, not even General Marshall or Mr Acheson, has had so single a voice in its preparation and execution. This personal responsibility has depended first and chiefly upon the unqualified confidence, fortified by deep personal affection, which Mr Dulles has inspired in President Eisenhower on account of his tenacious grasp of the most intricate problems, the exceptional range of his diplomatic knowledge and the deep moral foundations of his judgment. It has stemmed also from his method, consciously contrived from studying what he considered to be the mistakes of his predecessor, of concentrating all the strands of the diplomatic process in his own hands. Only half a dozen close advisers, if that many, were privy to his inmost thoughts; his belief in personal contact with the foreign leaders with whom he was negotiating involved him in his phenominal stint of air travel—which he always found more restful than the hated office life of Washington.

In his public relations with the world outside America, it is true, Mr Dulles never entirely recovered from the initial ambiguity of his political situation. In effect (and this fact is important in the maturity of the United States as a world power) he was bent on carrying forward the basic policy of his Democratic predecessors—the policy of "containing" communist Russia—after his own party had made that policy the target of an exceedingly bitter campaign, a campaign to which in its last stages he had lent his name and reputation. He thus felt obliged to represent his changes of direction as being more radical than in fact they ever were. Like Sir Stafford Cripps his physical appearance and Christian vocabulary helped to convey a superficial impression of austerity amounting almost to fanaticism. Himself, too, a lawyer, trained to take a brief and make the most of it, he has pursued the foreign policy of the United States, and the interests of the West as he saw them, with the same subtle application. More than most men Mr Dulles has incurred the charge, in this unflagging quest, of inflexibility. Yet it can fairly be said that, before the final blow disabled him, he had come to see more clearly than

most other western statesmen the need to interpret afresh the means to the ends for which he broke his health.

Many close observers of the Washington scene have considered that, in his own domestic politics, Mr Dulles appeased the right wing of the Republican party more than was necessary. Posterity may well conclude that they were right ; but it must take into account the fact that Mr Dulles had lived through the period both of American isolationism and of the last two years of Mr Acheson's secretaryship, when American foreign policy was almost paralysed by the violence of the domestic revulsion against it. Believing passionately that the United States must sustain over an indefinite period its active role in Europe, and wherever else communism might threaten man's free choice, Mr Dulles has attached supreme importance to ensuring the support of Congress and the American public for American policies in the world. By his speeches, his weekly press conferences and his frequent appearances before congressional committees, which sometimes grilled him in public for hours on end, he laboured in a way that sometimes risked foreign misunderstanding to teach the American people to comprehend and accept its awesome responsibilities. The West, whatever doubts it may have had about particular policies, must always be grateful for the purpose Mr Dulles set himself.

Like most foreign secretaries of all countries at all times, Mr Dulles has been regularly reproached for lacking a guiding policy at all and drifting with events. Like some of his greatest predecessors—notably Bismarck—he has sometimes yielded to the temptation to anticipate the historian by cramming events into a conceptual pattern that gave them the appearance of flowing from his own decisions. Yet who can doubt that when the story of the last six years comes to be written a singular share of the credit for the sustained resolution of the West's awkward squads of independent states in the face of the remorseless variety of the Soviet challenge will belong to Mr Dulles's determination and intelligence ?

Mr Dulles shared the practical assumptions of the policies he inherited. They included the necessity to hang on without a major diplomatic settlement until the effective containment of Soviet expansion had produced some major changes in the Marxist reckoning of foreign relations. The tragic implication has been that he who was so well equipped to negotiate a settlement on behalf of the West has had to end his service without achieving even the opportunity to try.

Europe and the British

Feeling against Britain in Europe is something old, but its present recrudescence is taking a new form and calls for a new remedy

When Dr Adenauer's outburst on the German radio on April 8th complaining of British criticism was briefly discussed at question-time in the Commons on Tuesday, members were less concerned to express their indignation than to reassure the Germans that the British do not really bear them ill will. This does the House credit ; more to the point, however, would be an attempt to find out why it is, and how it has happened, that anti-British feelings should be so much in fashion in high places on the Continent—not only in Bonn, but still more in Paris, and only a little less in Rome. Is hostility to Britain becoming a condition of political respectability in western Europe ? Things appear to be going that way, and the repeated general assurances by British statesmen of their own good will towards the Continental allies have no effect in arresting the adverse flow.

Dr Adenauer's outburst took the form of an attack on the British for attacking him. It is easy enough to rebut his specific charge by pointing out the obvious: that there is no wirepulling and no anti-German conspiracy in Britain. His real complaint against the British, however, found no place in the broadcast ; it is that the British refuse to realise that their influence in Europe is on the decline. This was the theme that had leaked out from party caucus meetings and private talks at which the Chancellor had been airing his feelings during March, and the British press " attacks " in recent weeks have consisted mainly of reporting this and (let us admit) answering back. Painful as it is, the charge is true : that is, it is true that British influence in Europe is declining, and true that the British have not begun to adjust either their policies or their attitudes to that fact. Why it should irritate Dr Adenauer so much now is another question ; but if we look back over the story of Anglo-German relations since 1890 or so we can remember—without making, or intending, any personal comparisons that might give offence—that this has been the recurring German complaint against Britain at intervals these seventy years.

The difference now—and it is a very important difference, which Germany's habitual detractors in some popular papers overlook—is that the representative Germans of today do not suppose that Germany is going to displace Britain from its position of influence by Germany's own national weight ; to them it is the new unity of Continental western Europe that renders Britain a marginal, even a negligible, factor in European politics.

Thus the old, discredited nationalist irritation with Britain has acquired, in its present reincarnation, new depth and a fresh sense of righteousness. The new anti-British attitude in Germany reproaches the British with nationalism ; with the selfish pursuit of world-wide importance in disregard of their obligations to the alliance in Europe ; with their evident belief in their own uniqueness, and their studied aloofness from the movement for European unity. It was in the first months of 1957, just after the Suez crisis, and when Mr Selwyn Lloyd was promoting his now forgotten Grand Design for European institutions, that this attitude first came out into the open. Sterling was at that time still weak, and the British Government was pressing the Germans for support costs for the maintenance of the Rhine Army. Now that the support costs issue is closed, the British are still attacked for wanting something for nothing—this time for seeking a free trade area, which the men close to Dr Adenauer (not Professor Erhard and the economic liberals) dismiss as at best a device to insure against the economic consequences of staying out of the common market.

Until very lately, all the German complaints against Britain except the last could be, and were, applied *a fortiori* to France as well. But a change, marked by the Bad Kreuznach meeting between General de Gaulle and Dr Adenauer, the rejection of the free trade area project and the entry into force of the treaties of Rome, has come over relations between west Germany and France. The seeds of this change were to be seen earlier ; the surprise has been in the singleness of mind with which the German Chancellor and the French President have carried it out, the way in which they have set aside all the differences of purpose and concept between themselves to concentrate on the few (mostly negative) ideas on which they agree, and the speed at which the resultant working alliance has crystallised into a united front against British influence in Europe.

General de Gaulle, as the principal architect of this new united front, has brought off a miracle in harnessing two basically inconsistent sets of grievances against Britain, even within his own country. He himself gives only a severely limited adherence to the concept of a European union of the Six ; but the French partisans of European union are content for the present with the concrete gain of putting the Rome treaties into force without a hitch. Most of them did see the free trade area project as a British diversionary manœuvre and are glad to see it strangled. Some have little faith, some none, in Britain's desire for European union. In general they appear content that, as things have fallen out, Britain should now wait outside until the community has established itself. The present close partnership with west Germany suits them well ; indeed, it is essential if their European aspirations are to find fulfilment.

Such men know that they must look far ahead, beyond the day of General de Gaulle, for the Europe in which national pride will have been submerged. For the present, national pride is still there, feeding a wholly different set of grievances against Britain. Thus, side by side with the reproach of aloofness from the Continent, the French reproach Britain with its failure to support them in their own somewhat grandiose ideas of France's place in the world outside Europe ; disloyalty in North Africa ; the undermining of France's now demolished position in the Middle East ; and a habit of claiming a special relationship with the United States which leaves France out of the great-power club and works against France's interests.

Emergency repairs, such as may have been attempted in London on Monday and Tuesday in the talks with M. Debré and M. Couve de Murville, cannot really be expected to remove emotional discords of this kind. If the problem were to find solutions to differences, it would be simpler ; but the concrete differences are small compared with the disharmony of mood between London and the Paris of the Fifth Republic.

This being so, it is easy to see how General de Gaulle could combine with Dr Adenauer to resist and frustrate Mr Macmillan's personal effort to demarcate a terrain for negotiation in the east-west conflict about Berlin. In Paris, the fault in Mr Macmillan's attempt is not what he has tried to do, but the fact that he tried to do it. This feeling is certainly shared in Bonn ; Dr Adenauer, however, would probably have opposed any attempt, from any quarter, at an accommodation with the Russians as being a threat to his own policy—and, to be fair, to the interests of Germany and the West, as he sees them. In particular, the idea of limiting eastern and western forces in central Europe must appear to him as a trick to stop German rearmament—and therefore as a British act of treachery. As it has happened, the asperity of his opposition has increased the discontent at Bonn with his rigid leadership and may have contributed to his party's wish that he should move to the presidential office. This he has had to accept ; but he has made it plain that he will still oppose any move towards a change in east-west relations so long as he has the strength. The next chancellor may be a man with whom Britain could re-establish good relations, or he may not. In the best case—to speak plainly, even if it is Professor Erhard—the Anglo-German discord will not disappear of itself ; the British will have to find ways of removing it. They will not succeed if they continue to appear to be seeking to divide the Germans from their western neighbours.

This the British people and its leading men have to try to understand. Successive powers have striven to exclude British influence from the affairs of Europe. They failed because each attempt, being linked with an attempt to set up a hegemony of one nation, created resistance which Britain was able to mobilise and use. This same striving to organise a European system is today taking a different form—perhaps, as some say, because many wars have cured the western European

nations of their ancient animosities; more probably, because Soviet power overshadows all else.

In this new setting the old impulse to pull the British off their perch ought to be outmoded, too. But it is not dead; it survives, along with the ancient suspicion that Britain seeks to hold its position by creating divisions in Europe which it then exploits. These feelings can co-exist with many excellent personal relationships and much admiration for those curious institutions of which the British are proud. If not disarmed, they may lead Europe down a false path. But they are deep-seated feelings, which no simple device—much less mere friendly assurances—can remove. Somehow the British have the task of convincing the Europeans that Britain is no longer interested in dividing Europe. In the fourteen years since the war they have dismally failed to do this: perhaps because they were uncertain what they did want to do, or perhaps merely from unawareness of the problem they faced. If they can clear their minds on these questions now, when the current in Europe is against them, they will be better placed to make use of the opportunity when—as happens from time to time—events take a more favourable turn.

The New Feudalists

County councils should not be allowed to stop more working class people from living outside the big cities as incomes rise

JUST over a century ago the main political battle in England was between the thrusting industrial forces of the big towns and the crusted old Tory country landlords. Today country landlordism is regarded by most people as not only dead but decaying, its final going symbolised by the dissolution of the large private estates and the conversion of their great houses into schools and asylums or (more persistently) into flats and half-a-crown showpieces, with my lord living uncomfortably in a converted wing. But the attitudes for which the old landlords stood are carried on by bodies which are at once more powerful and more secure from emotional political attack. The erstwhile Tory feudal interest has left its heirs in the unlikely, often bipartisan but very real shape of the modern county councils. It is high time that the whole country paid some attention to the problems involved in this.

Consider the county of Sweetshire. The whole of its county area is now in a real sense the charge and responsibility of the Sweetshire county planning committee. Thumbing over its estate, and using the jargon of its profession, the county planning committee has decided that "new development" should be strictly limited and controlled; it wants to keep Sweetshire "unspoiled." There are a few straggling suburbs where a little "in-filling" will be permitted, and a drab railway junction which might profit from "town development." Otherwise Sweetshire thinks of itself as pretty well "full-up." Space is reserved for council housing estates to meet local needs, and there are a few expensive building plots that are to be competed for by the wealthiest of the commuters who are fleeing from the cities. It has a large area of "good agricultural land" (not to be touched), an "area of outstanding scenic beauty" (carefully protected), and a jealously defended "green belt" which adjoins nearby Bigtown. There are many pleasant villages and three old towns (including Sweetchester, cathedral city and county seat) which the committee is determined should stay much as they are, apart from a little local building of "appropriate character."

This is a pleasant prospect for the farmers, retired people, and contented commuters who sit on the county council. Some local businessmen are less satisfied; a century and a quarter ago they would have agitated for their point of view through the new radicals, but now they are damned if they are going to ally themselves with Labour (whose local stalwarts probably support the Tory county council on this issue anyway). In the neighbouring county borough of Bigtown, by contrast, the attitude of both the big political parties is exactly what these few Sweetshire businessmen want.

BIGTOWN has many overcrowded citizens, a large area of slums to clear, and it is full-up (literally) to the city limits. The city would like to build a "garden suburb" just beyond those limits. This has been indignantly opposed by Sweetshire county council as an infringement of its green belt scheme; Sweetshire says that it is very important to stop the city of Bigtown from sprawling indefinitely. Sweetshire suggests that Bigtown should "build upwards"—in other words, cram its houseless citizens into one-tenth the space (and at twice the cost) which would be acceptable anywhere in Sweetshire.

When Bigtown says that this proposal is both unacceptable and inadequate, Sweetshire county council next considers the possibility of an "overspill" agreement with Bigtown. All areas of "good agricultural land" (i.e., acres which farmers would probably like to sell to private developers, but which their neighbours don't want them to), and all places of distinctive "charm" (locally defined) are ruled out. But an offer is made about Goodstown. Being precariously dependent on railway employment, Goodstown is keen enough to get a modest shot in the arm from wealthy Bigtown. Provided the scheme does not burden the county financially (or threaten to make Goodstown big enough to seek the independence of county borough status) Sweetshire county council is also in favour. But Bigtown declares that the Goodstown scheme is costly and a great deal short of its requirements.

Conflicts of this kind between Bigtown and Sweetshire have become matters of everyday reporting, especially where two councils are at loggerheads about some large public housing scheme. Where Sweetshire is merely impeding private building, there is not so much publicity. But there should be. For whether local authorities or private builders are going to be the main providers of housing, this problem is going to grow. Increasing numbers of citizens will be wanting to move from the Bigtowns to the Sweetshires in the years ahead, as rising incomes bring a demand for more spacious living conditions than can be enjoyed in Bigtown's Victorian streets.

This process has been going on for a long time. Half a century ago, for instance, the county of London had 1¼ million more people than it has today. Now the area of evacuation has spread and the whole built-up area of Greater London (like that of the other great cities) is today shedding population. This is not a process that can be stopped by cramming working families into vast blocks of flats within the old city boundaries. Even if enough space (and sufficiently large subsidies) were available for the purpose, popular tastes would eventually defeat the planners' purpose and turn the vaster blocks into highly expensive white elephants. More and more of the better-off members of the new urban working-class must be expected to want to enjoy the amenities of country living, as they become able to afford to follow the stockbrokers who have been commuting by expensive daily railway journeys from the Sweetshires for these last thirty years. Decentralisation is also being stimulated by the rising ownership of cars and by the parallel migration of factories from congested central sites to more open locations. A new factor is the large flock of retired people who are contemplating a prolonged old age in the countryside or on the relatively smiling south coast. The ending of some subsidised squatters' rights under the Rent Act has increased this outflow.

THE Sweetshires of England are reluctant to face up to the prospect of these mass migrations. Undeniably they bring problems. Much modern development, either by private builders or councils, is regrettably unattractive and destructive of local charm and "character." This makes it natural for local people to object, and often none more forcibly than those former city dwellers who have already gravitated to some select retreat and do not want to be followed. Such human bias is natural enough. The danger is that it can now charge the batteries of a powerful machine of administrative control.

Planning control may also, sometimes unconsciously, lend itself to a new sort of social bias. While a little "good-class development" (which helps the rates) may be acceptable in Sweetshire, humbler folk whose pockets and tastes run to semi-detached houses or bungalows, or who must depend on council-subsidised "overspill" housing schemes, find the county a good deal less hospitable. (Those outlandish enough to like caravans will, of course, get no welcome at all.) The carefully defended green belt around Bigtown can come to look a little like a political frontier, separating new kinds of haves and have-nots.

That these dangers are real ones can be seen from many of the counties' development plans. Excluding parts of Greater London, the nine administrative counties of Kent, Surrey, Sussex, Hampshire, Berkshire, Buckinghamshire, Hertfordshire, and Essex have a present population of about five million. It seems very probable that more than another two million people will want to move into these particular counties over the next twenty years. But instead of planning to meet this considerable (though perfectly manageable) influx, the county councils are starting to display house full notices for all but small driblets of newcomers. Hertfordshire has even declared that it will have an "overspill" of its own in the fairly near future, calculated on the assumption that most of its domain ought to remain rural and agricultural.

Privately, the counties may admit that a greater amount of development is unavoidable; but they hope to check its speed by making ever more restrictive official plans. Many people think that planning should be used in this way. They argue that the drawbacks of urban spread are so great, and the threats to agriculture and the countryside are so powerful, that a strong rearguard action is necessary and commendable.

THERE can be two views about this. But even if one is temperamentally inclined to side with the Sweetshires against the Bigtowns in their aesthetic aims, common sense surely suggests that they are at present being allowed to fight their rearguard action with the bluntest and worst possible weapons. If it is true that land (at least in some areas) ought to be rationed, it would be much fairer to deter people by fiscal means from using too much of it, instead of relying on blunt administrative prohibitions which bar some people from living there altogether. For example, building plots of more than a certain size (say, one-eighth of an acre) might be surcharged for rating on an ascending scale; anybody who enclosed too many of the green fields of Sweetshire into his own private garden would then have to pay more to the community for them.

Such a device would not be popular, but it would provide greater opportunities for mobility. It would bring home the fact that in modern Britain space, quiet and privacy should be regarded as scarce commodities. It would be much fairer than the present system—under which commuter A who has managed to acquire two

Appointments, Business and Personal notices, and other Classified Advertisements pages 275 286 and 287

acres in some Sweetshire village enjoys the protection of his surroundings which planning affords (and registers a substantial capital gain thereby), while commuter B can find no site to build on in the neighbourhood. It would also be more effective in the long-term (for existing planning controls work only for a time in each area, and then suddenly cave in) and much more liberal. Modern radicals should not accept without question the present rules of the new feudalism, a century after their forefathers won the final battle with the old.

France's African Family

The French version of the Commonwealth is now going through its first test.

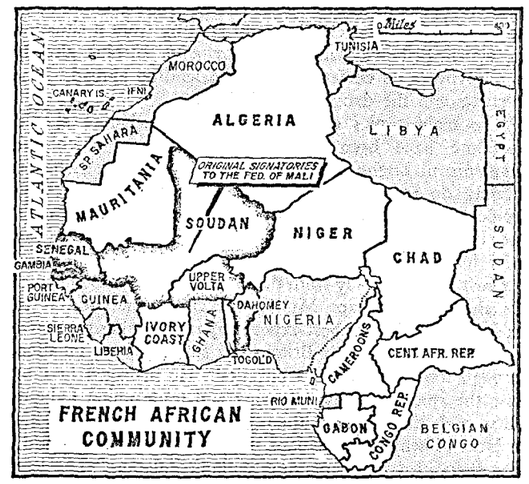
THE French Community is something new and hopeful in Africa, and in France itself. Exactly how hopeful depends on the way its governing machinery is allowed, or encouraged, to work. The community is still coming into being; its executive council of prime ministers has only had two meetings; its high court has never heard a case; its senate has still to be elected. The new African states are having to come to terms with themselves as much as with France. The partnership that replaces the colonial structure of the French Union is still all things to all men. But the hope is there, and in Africa now it is hope that matters most of all.

The importance which French policy attaches to the evolution of the community was evident in the choice of African affairs as a major topic in M. Debré's talks in London this week. It is not clear how much was said to the point. Future relationships in west Africa must eventually bring the former French and British colonies into close co-operation—although independent ideas like those of Dr Nkrumah and M. Sekou Touré, instigators of the Ghana-Guinea association last year, are anathema in Paris. British suggestions about the part that such existing enclaves as Gambia and Sierra Leone could play in a broader west African establishment are still vague. It seems sensible to await Nigeria's achievement of statehood before encouraging any bright Anglo-French ideas on how black Africa can best settle its affairs.

For France, the community is perhaps General de Gaulle's most striking political success since he returned to power. As if by an act of the general will, the referendum last September 28th removed the possibility of an "Indo-Chinese" war in black Africa from the power of any future French government. The President has been true to himself and to the promise of his Brazzaville declaration of 1944. He has joined France and its African possessions in a free and equal constitutional relationship. To demonstrate this equality he has lost no time in introducing the community's executive council to the Berlin crisis. The statement issued after the council's first working session at the beginning of March made it clear that when President de Gaulle speaks for France on Berlin he speaks for a dozen autonomous African republics besides.

Is this, then, the dream of the *patrie* of a hundred million Frenchmen come to a surprising reality? Is it the practical application of one suggested political formula for Algeria: independence with interdependence? Many Frenchmen, against the odds, dare to think so. Or is it—and this seems more likely—merely another, more genteel form of evolution for African nationalism, one that buys France a last decade as the principal Eurafrican power, paying heavily in development capital for those twelve African votes on Berlin? Even if it were, even if five years from now black Africa's sole interest in the Gaullist constitution is to invoke Article 86 permitting ultimate independence, it would still be worth while. At its best, the community could be all that its first President envisages for it; at its worst, it is a way for black Africa to emerge from French tutelage infinitely preferable to the chilling break of terrorism and war.

The community (like the Commonwealth, it should not properly be given the national prefix) has many mansions, some inevitably better appointed than others. France itself, Algeria, the Sahara, and the four overseas departments of Martinique, Guadeloupe, Guiana and Reunion inhabit one. Five overseas territories that have chosen to retain their dependent status make up another. They are French Somalia, the Comores, New Caledonia, Polynesia and Saint-Pierre-and-Miquelon. New Caledonia is the restless one among them. The third family is African: the eleven republics in west and equatorial Africa that have chosen autonomy within the community. They are Mauritanie, Senegal, Soudan, Volta, the Ivory Coast, Dahomey, Niger, Chad, the Central African Republic, Congo and Gabon. With them, although not quite of them, is Madagascar. These twelve states have accepted the community's jurisdiction in foreign policy and defence, in a common economic and financial policy, and in the supervision of justice and higher education. Their prime ministers attend, with M. Debré and French cabinet ministers, the executive council of the community in Paris. Their delegates will sit beside French parliamentarians in the community's senate. Their diplomats will work with Frenchmen, particularly in Africa itself. The community has one currency (the franc), one official language (French), one flag (the Tricolour), and one national anthem (the Marseillaise).



A fourth mansion is still empty. Article 88 of the constitution allows the community to conclude agreements with states wishing to join it "to develop their civilisation." If the Algerian question were settled, two likely occupants might be Morocco and Tunisia, both of which have taken up the idea of a non-political link with France. President de Gaulle and King Mohammed V of Morocco may have something to say about this at their expected meeting next month.

AS it enters into formal existence this month, the community proper is overshadowed by one ominous doubt. Its African members have been divided, from the beginning, on the type of African state system they want to bring about. M. Houphouet-Boigny, the Ivory Coast leader who has President de Gaulle's ear, and who sits in the French cabinet in Paris, is the champion of separate African states with no other political allegiance, or alignment, except to the community itself. Against him are the federalists, like MM. Léopold Senghor and Modibo Keita, who, with a better understanding of Dakar's place as the administrative capital of French West Africa, are reluctant to let the region slide toward balkanisation. Already there has been an open confrontation of strength over the Federation of Mali, arranged between four west African states in January but now reduced to its enthusiastic heartland: Senegal and the Soudan.

The quarrel over Mali is wide-ranging. It is, like so much of African politics, highly personal. The two major parties in the African states, M. Houphouet-Boigny's *Rassemblement Démocratique Africain* (RDA) and M. Senghor's *Parti du Regroupement Africain* (PRA), have their policies settled for them by their local leaders. It is an economic quarrel: the Ivory Coast, the most prosperous of the west African states, is unwilling to tie itself to poor relations on the fringes of the Sahara. Some of those poor relations, like Niger, think they will do better dealing direct with Paris anyway. Because of his, and the Ivory Coast's, privileged position, M. Houphouet-Boigny has been able to bring economic pressure to bear on two of the Mali signatories, Dahomey and Volta, which have now drawn back. The quarrel is also ethnic: the Islamic state of Mauritanie has rejected federation because it fears submergence in a black African society. It is even a religious quarrel as well: the Christians of Volta opposed joining Mali—particularly after Dahomey's defection—because the federation would have a preponderantly Moslem population.

M. HOUPHOUET-BOIGNY has taken the first trick in west Africa. In the four equatorial states, among which Congo and Chad have shown alarming political instability, the most the federalists have achieved is agreement on a common customs union. The ambitious design of a United States of Latin Africa may have perished with the premier of the Central African Republic, M. Boganda, who was killed in a plane crash on March 30th. Yet the federalist leaders have not given up. At a conference at Dakar at the end of March they agreed to found a new African Federalist party to propagate the cause against the local factions of the RDA and PRA. Senegal and the Soudan are pressing ahead with Mali—M. Keita, as head of the federal government, formed his cabinet on April 5th—and have told General de Gaulle that they will join the community as one unit.

The federalists are convinced that France's hand has been against them in all Mali's vicissitudes, although they still profess confidence in President de Gaulle. Mali has certainly been seen in France as a stepping stone to west African statehood outside the community. As first conceived, its population of ten millions would have given it a larger say in community affairs than many of its neighbours. Even now, the development of its institutions could ultimately end in its secession. Any suggestion of federalist complicity with Guinea is taken hardly in Paris. Although President de Gaulle no longer ostracises Guinea, he prefers to think of it as an awful warning to all other dissidents. Pious hands are now uplifted at news of Czech arms arriving at Conakry and of commercial agreements just signed with the Soviet Union and east Germany. But if Guinea survives, as it promises to do, its example may be followed elsewhere.

The best interests of west Africa seem likely to be served by encouraging regional groupings that will provide some economic and political cohesion against the forces of tribalism. The equatorial African units, as Congo's experience has shown, may not be viable in the face of tribal disorder and separatism. Although the founders of Mali may have erred in attempting too much in joining so many disparate states, their instinct to hold the French federal structure together in west Africa may be proved right in the long run. The issue is whether Paris will encourage them to build properly now, or whether the tactic of divide and rule really governs Gaullist policy. If trust in French intentions is once shaken, the good that France has it in its power to do in Africa south of the Sahara will once more be in jeopardy.

NOTES OF THE WEEK

BUDGET DEBATE

In Political Blinkers

THE principal features of the budget debate were that neither side came to grips with the main issue that really needs to be debated, and that Labour has decided to play the most blatant sort of Eatonswill politics with the topic of old-age pensions. Few economists are suggesting that Mr Amory's reliefs, amounting to just under 2 per cent of the national income, are likely to impose too great a strain upon Britain's under-utilised domestic resources. But no politician should be allowed to forget that every odd-numbered year since the war, except 1953, has seen some autumn strain on sterling, even when there has been no obvious over-demand at home. 1959, an odd-numbered year, is now scheduled to be a period of industrial re-stocking, taking place under the shadow of an approaching general election, and starting from a situation in which Britain's balance of payments surplus already barely covers its current rate of net lending abroad. The portents and the dangers are obvious.

The main topics of debate before the House should therefore have been the short-term policy which the Government ought to follow if some signs of strains on sterling do reappear this summer (the wisest suggestion would be the promptest possible increase in interest rates), and the long term policy that is needed to make the way safer for re-expansion without currency crises or inflation.

Most MPs ran away from these topics as from the plague. On the right, perhaps Mr Thorneycroft came nearest to one of them, with the best exposé any member has yet dared to make of the ills that Britain has suffered from inflation through too pliant wage arbitration. He managed first to raise the spirits of some left-wing and trade union Labour MPs, and then render them almost apoplectic, by his analysis of why the Russians, almost alone in the world, have succeeded in "expanding *without inflation.*" The key to their success, he said, is controls (murmurs of Labour approval) on wages (Labour consternation). "They have kept their money wages well *within* an increase in production." On the left, Mr Roy Jenkins made the best attack on Mr Amory, with a reasoned analysis of why it might have been safer to start re-expanding last year instead of this.

Otherwise the contributions from both sides, and especially from both front benches, were disappointing. The Labour front bench's considered recipe for the budget seemed to be that it would have preferred:

(a) *a restoration* of subsidies for council houses (and apparently also for bread and milk);
(b) higher government expenditure all *round*;
(c) no purchase tax cuts for "luxuries" but more reliefs for particularly raucous pressure groups (which Mr Wilson calls those industries that are "having a harder time"); and
(d) no income tax cuts for companies (the assumption here being that tax reliefs that will go largely into savings are interchangeable with reliefs that would encourage more spending).

Mr Wilson has not increased his attractions as an alternative chancellor by the compilation of this list.

For All Pensioners Too?

THE centrepiece of Labour's assault on the budget, however, is its demand that all old age pensions should be increased immediately by ten shillings a week. It really is necessary to look at the figures of this, the more so because attempts are being made to swamp all reasoning discussion by calling every appeal to the statistics "cruel and callous." At present there are 5.3 million pensioners, so that an increase of ten shillings a week for each of them would cost some £140 million a year; if all other national insurance benefits (e.g. for the sick, unemployed *and widows*) were raised at the same time, the total cost would be over £200 million a year. The former sum would necessitate an immediate average increase of about 2s. 2d. a week in the stamp paid for all the 24.7 million present contributors to the scheme, the latter sum would necessitate an increase of 3s. 1d. in the weekly stamp. The additional amount needed to be laid on the stamp would increase considerably in later years because the ratio of pensioners to working *contributors is now rising.*

There is a good economic case for increasing some national insurance benefits: for example, it would help to increase industrial mobility if payments to the unemployed, especially during the first month when they are looking for a job, were substantially raised. There is also always a good humanitarian case for raising the minimum weekly income of the poorest section of the community; if economic re-expansion succeeds, many people will feel that national assistance payments made to the neediest pensioners should be increased later in the year—and if this increase were accompanied by a change *in the whole* nomenclature of national assistance, designed to emphasise that all those who can show need can claim supplemental benefits as a right and not as a charity, so much the better. But any decision to spread benefits across the whole army of pensioners would automatically mean giving smaller increases to the most needy; now that the national insurance scheme has been in operation for ten years, be it remembered, every managing director as well as every labourer can become an old age pensioner on reaching retirement age.

If the Government is steamrollered into granting a flat rate increase for all these pensioners right across the board, this will be the third successive general election which has been immediately preceded by such a step. As the pensioners got their last increase at the beginning of 1958, and as the real value of the pension has recently increased slightly more than in step with the real income of the rest of the community, everybody knows that there would not be so furious a campaign for another flat rate increase if this were not an election year. Does the country really want to establish a firm tradition of automatic pre-election log-rolling in the social services, in an atmosphere where the main concern of politicians will never be to maximise the real incomes of those in most need but always to maximise the number of electors who will get some more money? This tussle between those who want to be discriminate and those who are merely fishing for votes should be the main consideration to weigh when a debate is held on Labour's censure motion. One of the most interesting points to watch will be the vote of the Liberal party; this is a prime test of whether it wants to portray itself as an independent party that seeks the support of reasoning electors, or as a me-too party that is mainly concerned to climb on to every popular bandwagon which rumbles along.

GERMANY

Bowls before Battle

JUST as the great events in Bonn last week were related to Dr Adenauer's failure to push Dr Erhard into the presidency, so the struggle for the succession to the chancellorship can be regarded, in part, as a further bout in the duel between the two men. As our Bonn correspondent reports on page 242, Dr Erhard has already begun to give his speeches a new political colour, making it plain that he is out for the crown. The chancellor, on the other hand, evidently sees Herr Etzel, the present finance minister, as the man to carry on his policies. Herr Etzel not only is close to the Ruhr industrial interests. After five years as vice-president of the European Coal and Steel Community, he is steeped in the chancellor's European policy.

The chancellor, who showed last week that he is not averse from springing a surprise on the world, has not yet shown his hand. While Dr Erhard has put to sea and is firing his pre-election salvoes, Dr Adenauer, on holiday in sunny Cadenabbia, is, like Sir Francis Drake, enjoying a quiet game of bowls. Dr Adenauer, however, is not neglecting to make plans. Both the candidates are to visit him—separately—in his retreat. He has already received some key party men, none of them on Dr Erhard's side.

Dr Adenauer is naturally anxious to ensure that the new chancellor is not chosen until he himself is president. The Bundestag has the ultimate power of choice, but the president could exert a powerful influence, especially if the Christian Democrats were divided. *It was with this in mind* that the chancellor agreed to step upstairs. Last week, however, President Heuss is believed to have upset the calculation by suggesting that Dr Adenauer would have to resign his present office once he became president-elect (in July or August). That would enable President Heuss himself to appoint the new chancellor, before his own term of office ends on September 12th. Only last month, however, a new law regulating the details of the presidential election was passed by the Bundestag. Under it, as Dr Adenauer's supporters point out, the new president would not take office until September 13th and Dr Adenauer could remain chancellor until then.

CHINA

Peking's Parliament

THIS has not been an ideal week for opening a parliamentary session in Peking. But China's National People's Congress, whose function is similar to that of Russia's Supreme Soviet, does not expect to be told more than is good for it. The big news for the delegates will be who succeeds Mao Tse-tung as chairman of the republic. The choice was made at the party central committee meeting at Shanghai on April 2nd-5th, but no word of it has passed beyond the top hierarchy. The expectation is that if a military personality like Marshal Chu Teh takes on the job, Chairman Mao's authority will not be unduly diminished. The communiqué after the Shanghai meeting remarked that the session was held "under the guidance of Chairman Mao Tse-tung," who "made an important speech on the question of the methods of work at the meeting." He is also reported to have addressed party leaders in Peking on the international, domestic and Tibetan situations on Wednesday. This is believed to be his first visit to the capital since November.

The other business on the congress's plate concerns a report on governmental activities, followed by approval of this year's economic plan and budget. The central committee has professed its belief that the economic draft plan can be overfulfilled, although some of its earlier expectations may have been tempered by "sober consideration" of the "objective possibilities of the material and technical conditions in our country." There are signs that, instead of local blast furnaces, the emphasis this time is being put on simplified coke ovens and small synthetic oil refineries in the countryside. A vote of continued confidence in the people's communes is expected, although these (as an article on page 248 indicates) are now being overhauled.

Tibet was not on the original agenda of the congress, but even Chinese parliamentarians may expect to be told something. Peking has now admitted that the Tibet rising followed disturbances in Sikang, once part of Tibet but now incorporated in the Chinese province of Szechwan. If, as some sources in Delhi believe, the Chinese have still not given up hope of an eventual reconciliation with the Dalai Lama, the congress is likely to hear more of the distinction which Chinese official statements draw between him and the "reactionaries" who brought him to India.

GALLOWAY BY-ELECTION

Liberal Buffet to the Tories

THE Liberals did very well indeed to win 25½ per cent of the total vote at Galloway. The result there confirms that in these remoter areas of the country many people now feel that their rather distinctive interests are likely to be better served by voting to put a distinctive sort of MP into parliament, rather than by voting simply to help keep out of power whichever of the two big parties they most dislike. There are at least four constituencies at present held by the Conservatives (Inverness, North Cornwall, North Devon, Denbigh) where this feeling of remoteness is combined with a fairly strong recent Liberal tradition, and which the Liberals should therefore probably be regarded as favourites to win in any early general election; there are perhaps half a dozen others which the Liberals must have at least a chance of winning. This renewed excitement in the Liberal ranks seems likely to keep in the field most of the more than 200 candidates whom the Liberals say they have already adopted for the next election. It may even add to their number.

This is almost bound to harm the Conservatives—not, perhaps, as dramatically as some commentators have been

saying, but their race with Labour looks so close that every little blow hurts. Even at Galloway the victorious Conservative candidate (50¼ per cent of the vote) had more reason to feel damaged by the Liberals than had the unfortunate Labour candidate who was relegated to third place (24 per cent) in the poll. Compared with 1955, just over 2,400 of the Liberals' 6,721 votes at Galloway appeared to come from people *who did not* bother to vote last time, but just under 2,700 can be counted as coming from people who voted Conservative then and just over 1,600 from people who voted Labour then. Perhaps a better comparison is with the 1951 general election, which was the last occasion when there was a three-cornered contest at Galloway. Compared with 1951, the Liberals' share of the vote last week went up by 13½ per cent, of which just over 11 per cent came from the Tories and just under 2½ per cent from Labour. And in that 1951 general election, be it remembered, the Conservatives won a majority of only 26 seats over Labour in the House of Commons. In Galloway, at any rate, there seems to have been a greater movement of opinion against them since then than there has been against Labour. The main implication of this by-election is, therefore, that Labour should probably still be regarded as very slight favourites to win any early general election.

CENTRAL AFRICA

On Going It Alone

SIR ROY WELENSKY'S personal statement in the Federal parliament this week did not greatly clarify what he meant when he told a BBC television interviewer recently that "in certain circumstances we would be prepared to go it alone." He probably did not intend to. The truth is, as all reports from Salisbury suggest, that Sir Roy is dominated at the moment by a great personal bitterness with the British Labour party. There wells up within him all the anger of a working class trade unionist towards other Labour leaders whom he feels have stabbed him in the back. His main concern in every message to this country is to serve notice to Labour that the Federation will not surrender the powers given to it under the act which constituted it in 1953. If a Labour government repealed that act, or amended it without federal agreement in such a way as to cut down the federal powers then granted (and which constitutional precedents suggest were irrevocably granted), it might find itself facing a refusal to obey. Sir Roy implies that that could end with an independent Federation outside the Commonwealth, although in the same breath he has assured loyal white Rhodesians that allegiance to the Queen would be maintained. Whether the Gilbertian anomaly of a kingdom outside the Commonwealth is possible is dubious, but also not overwhelmingly important. For nobody can be in any doubt that the real last act of the tragedy would be that the Federation, in whole or in part, would end up inside the Union of South Africa (which might or might not be in the Commonwealth).

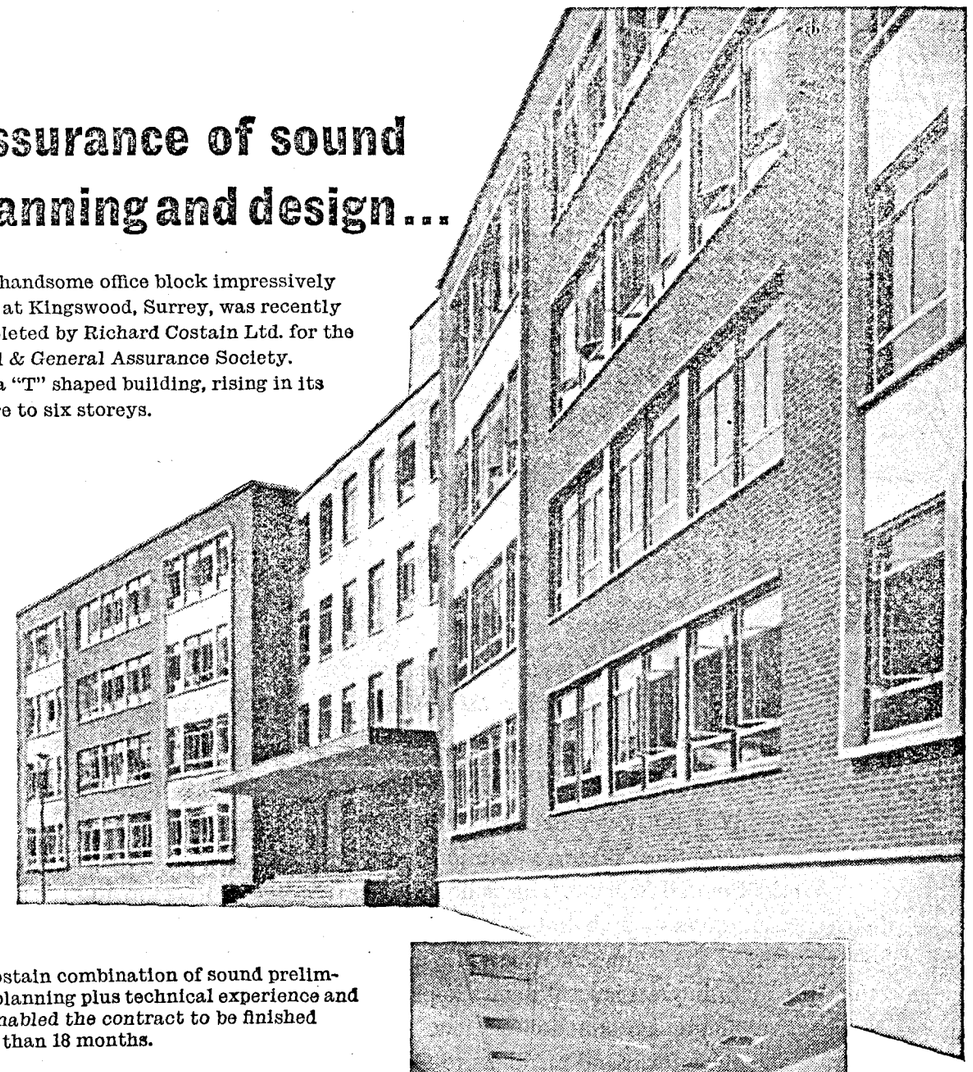
This would be the worst possible ending for everybody—for British Conservatives, British Labour, black Africans throughout southern Africa, and for Sir Roy himself. How to avoid *it*? The British Government's chosen contribution at the moment is to move slowly on the scheme to convene a constitutional commission or committee to prepare for the 1960 talks with Sir Roy; it plans to wait until feelings have simmered down and until the Labour members on that constitutional body (there have got to be some) are *persona grata* in Salisbury once more. Whether the present Devlin commission of inquiry will help feelings to simmer down (or make them boil up again) is a moot point. The understandable controversy about how evidence should be taken before it confirms again that the decision to send a semi-judicial commission opened up risks of more friction, and offered only slender hopes of doing good; the one great and saving mercy is that so sensible a person as Mr Justice Devlin is leading it.

Here at home Labour MPs would do well not to concentrate on simply slogging balls into Sir Roy's court, as they seemed to be wanting to do at question-time last week. Nobody in Britain doubts that Sir Roy, more perhaps than anyone else, will have to make concessions in 1960; he has got calmly to realise that his Federation can, in reality, only be preserved if it is adjusted in such a way as to make it more tolerable to the Africans who live in it and who outnumber the whites by twenty to one. But Labour, in its turn, has got to understand that the best way to bring Sir Roy to that state of calmness will not be to hold over his head a quite inoperable threat of total legal liquidation.

MIDDLE EAST

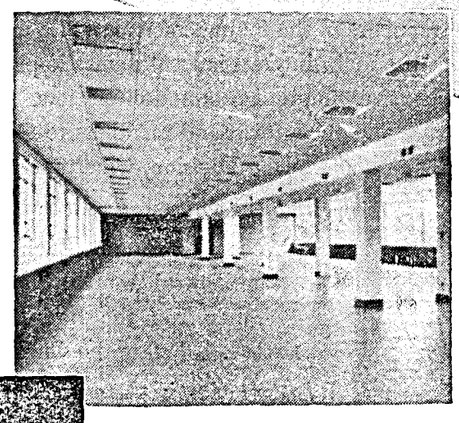
Un-Arab Activities

THE tameness of the Arab League's resolution last week shows how little Arab support President Nasser can count on in his duel with Iraq. The resolution condemned foreign interference in conventional terms, but did no more than appeal to the absent Iraqis to "come into harmony with the Arab states." At a moment when the United Arab Republic is being rude, not only to Iraq, but to both the western and the Soviet Goliaths, the rest of the Arab world, showing perhaps more prudence than valour, is keeping at a safe distance. President Nasser is out on a bit of a limb, but in this uncomfortable situation he can take comfort from the thought that there is still no other pan-Arab leader in sight.



The Soviet Union, in public at least, sticks to the line that President Nasser is a hot-headed young man who is making a mistake. It is less reserved about some of his champions, notably Sayed Mustapha Amin, who, with his twin brother, edits the Cairo daily *El Akhbar*. The Amin brothers were outspokenly anti-communist even in the halcyon days; they are now calling upon Arab nationalists to prepare for the decisive battle against communism.

Iraq has become for the United Arab Republic the focus of all un-Arab forces, an unholy alliance of communism, imperialism and zionism. It is not enough for Baghdad to be holding a giant "peace" rally; it must also be accused of having invited a delegation from the Israeli Communist party. This is the second conference of "peace partisans"; the first, held at Mosul a month ago, triggered Colonel Shawwaf's abortive revolt. While the junketing goes on in Baghdad, the British ambassador, Sir Humphrey Trevelyan, has taken the chance of slipping back to London for talks at the Foreign Office; he may have something to say about Cairo's claim that it has "irrefutable evidence that Iraq is sunk up to the ears in the well of British influence."



Every sign from Iraq still points left. The four National Democrats, who took over when the Baath and Istiqlal parties were eliminated from the government in February,

Assurance of sound planning and design...

This handsome office block impressively sited at Kingswood, Surrey, was recently completed by Richard Costain Ltd. for the Legal & General Assurance Society. It is a "T" shaped building, rising in its centre to six storeys.

The Costain combination of sound preliminary planning plus technical experience and skill enabled the contract to be finished in less than 18 months.

...secured this 'Legal & General' contract for

the things they say!

Most of the troubles in industry today arise because, in the big firms, the men at the top know nothing about the chaps at the bottom.

Well, that's not true of my outfit — I.C.I.

Why not? I.C.I. is one of the biggest firms in the country —

Yes but we've been conscious of this problem for years, and we realise there's no easy solution to it. One thing that does help is our Works Council Scheme. This is how it operates. The workers in I.C.I.'s factories elect their representatives — by ballot — to their Works Council, to which members of the management are also appointed. At their monthly meetings the main interest is local domestic problems, including accident prevention and production matters. The Works Councils in their turn send members to Councils representing each manufacturing Division, which meet twice a year.

But how do the workers meet the top men — the Board of Directors?

I'm coming to that. Each Division Council sends representatives to a Central Council that also meets twice a year. There the men from the shop floor put their point of view on all sorts of topics before the Chairman himself and the Directors.

What sort of topics — rates of pay, perhaps?

No, those matters we negotiate with the Trade Unions. These Councils deal with other features of the Company's labour policy.

The interest they showed in the idea of Profit-Sharing for example, helped to bring our I.C.I. scheme into being. I.C.I.'s 1,300 Works Councillors are an important link between top management and workers, because they do a lot to ensure that the Company's policies are understood by everybody.

I.C.I.

appear still to be in the cabinet (although Hussein Jamil, the minister of propaganda, is taking an unconscionably long time packing his bags in Delhi), but their influence can be measured by the fact that the National Democrat organ *Ahali* has now joined forces with the communists in demanding a purge of the administration. The return of several hundred Kurdish families who escaped from Iraq to Russia during the unsuccessful Kurdish revolts between 1943 and 1946 may not be the foreign army of occupation that Cairo claims it is; still, it is unlikely to add to peace and quiet.

BELGIAN CONGO

Nationalism Spreads

WHILE M. Kasavubu, the leader of the proscribed Abako party in the Belgian Congo, studies political institutions in Belgium with some of his colleagues, new leaders and new nationalist parties are arising in the Congo itself. This has disconcerted some Belgian observers, who, not having studied form in British and French Africa, innocently supposed that after the riots, deportations, banning of political parties, and declarations that the Congo would move without undue precipitation towards independence, a peaceful breathing-space would follow. On the contrary, the announcement that independence was the goal has led to the feverish formation of more political parties, of which two, the Congolese National Movement (MNC) and the Congolese Unity Party (PUC), now lead the field.

Of the two, Belgian officials prefer the PUC, which has declared itself a non-violent independence movement, and, while denouncing the reactionary statements of some of the white settlers, has called on Africans of all ethnic groups as well as European residents to join it. The party claims—probably boldly—more than 200,000 adherents; and its general secretaries, MM. Kalonga and Iyeki, have held the first press conference ever called by Congo Africans.

The MNC is led by M. Patrice Lumumba, who was elected Congolese representative on the steering committee set up in Accra after the conference of African nationalist parties in December. Though the MNC is allied to the right-wing Catholic Congolese Union in Elizabethville (the mining centre) it is modelled deliberately on British African parties. It is demanding independence by January, 1961; it scouts the possibility of a "Belgian-Congolese community" or union, and it has called for the intensive training of African understudies for all senior administrative posts. M. Lumumba has attacked the Belgians for procrastination, warning them that the Léopoldville riots were an expression of country-wide Congolese resentment, and not merely the work of Abako, the party of the Bakongo people only. He claims that many former Abako organisers are now working for him.

There is thus a considerable incentive to the Belgians to try to come to terms with M. Kasavubu, and send him back to Léopoldville as the moderate leader-elect of the Congo (or of one state in a Congo Federation). But so far M. Kasavubu has stuck to his theoretical studies. The real issue now is whether tribal parties (like Abako) are going to solidify, or whether a man like M. Lumumba can emerge as a non-tribal leader on the Nkrumah model.

SEATO

The Price of Alignment?

MR SANDYS, the Minister of Defence, returned this week from Wellington, where he had attended the annual meeting of the south-east Asia treaty council. Mr Selwyn Lloyd, a faithful attender of earlier Seato councils, was occupied with the more urgent preparations for next month's rendezvous with Mr Gromyko at Geneva. So were his French and American colleagues, whose countries likewise sent second strings to New Zealand. But if the Big Three fielded, in effect, a second team, the lesser five—Pakistan, Siam, the Philippines, Australia and New Zealand—sent their star forward line, and the meeting was far from dull.

The public sessions tended to sound like a confrontation between the three Asian members and their richer allies. With varying degrees of subtlety, the Asians put the case for greater economic benefits in recompense for the sacrifices of membership. The donor nations countered with the argument that the Colombo Plan and the United Nations economic commission for Asia and the Far East were the best agencies for the distribution of economic aid in the treaty area. (The United States, nevertheless, offered £143,000 to fight cholera.)

The secretary-general, Nai Pote Sarasin, rightly pointed out in his annual report that the latest communist advances have been achieved by economic and subversive means. Information about subversion, and measures to counter it, can be and are being co-ordinated. But it does not follow that Seato ought to be turned into an agency handling free gift parcels to its three Asian members; communism has made greater inroads in countries like Indonesia and Burma, which are outside the pact, than in the Asian member countries. Yet the lengthy final communiqué from Wellington read more like the report of a philanthropic and cultural society than of a defensive military alliance.

The more powerful members may have to consider whether this is the kind of price they want to pay to keep their Asian friends in line. Enlightened self-interest ought to be enough. But the Americans who heard last week's speeches may have doubted it. And some may have recalled that one of the speakers, Nai Thanat Khoman, the new Siamese foreign minister, said at his first press conference a few weeks ago: "We should be neither pro-west nor pro-east." These words may have a disturbing sound to other members of an anti-communist organisation.

EDUCATION

Technical and Clerical

MR GEOFFREY LLOYD is determined to keep the programme of the Ministry of Education in the news. In what ought to be an age of educational reform, it is proper to sound the bugles for each advance. A welcome should therefore be given to the announcement that, two years before the conclusion of the existing five-year plan for the expansion of technical education up to 1961, a building programme up to 1964 is to be approved. It will enable local authorities and technical colleges to plan ahead on the assurance that they will continue to get an aggregate of some £15 million a year to spend. This, admittedly, is no more than they are spending now; it does not imply any speeding up of the plan to double Britain's output of technologists by 1970, which is the accepted objective. But it is encouraging to know that the Colleges of Advanced Technology will now be able to plan for the provision of sufficient facilities and teachers to enable them to give their students a grounding in the humanities and to aspire to become true universities built around applied science. This raising of the quality and prestige of the trained technologist is very necessary if the "dip. tech." is to have anything like the same standing in the eyes of the world as the university degree. (The time may indeed come when the difference in nomenclature, born partly in donnish snobbery, will have to be removed.)

While these technological triumphs are being trumpeted, nearer home the minister is treading gingerly round a clerical hornets' nest. He has stirred up all the trouble that he had feared by his promise to help the Churches to bring their voluntary schools up to the level required by his policy for improving secondary education. The Free Churches have recently lobbied backbenchers of both parties against any provision which would permit the Roman Catholics to build more *new* schools from public money, though they accept the fairness of raising the improvement grant from 50 per cent to 75 per cent for all Church schools. The Roman Catholics are standing out for a "package deal" in which the state would help them to build more schools. Each political party is anxiously calculating the relative cost of offending the Roman Catholic and the Non-conformist vote. The Government, it is plain, has no intention of making a unilateral decision; it has been holding discussions with Labour to try to form a bipartisan front against one or other group of churches, but it is not yet decided against which. Meanwhile the clerics are gradually getting up steam, and dusting off their copies of Fox's *Book of Martyrs*.

COUNTRY-TOWN INDUSTRIES

Employment off the Land

AT a time when agricultural policy is belatedly growing more rational, which means tougher towards the "non-viable" farm, it is especially important that more should be known about the means of livelihood other than farming available to country-dwellers. Rural depopulation cannot be considered by anyone to be a good thing in itself; the collapse of a living community is always a loss to be set against whatever gain results from the changes which have brought it about. There is thus a particular appositeness about the publication of a report on the country-town industries of south-west England* (covering Cornwall, Devon, most of Somerset and an adjoining strip of Dorset). The inquiry on which it is based was financed by public money under the Development Fund and carried out by members of the Agricultural Economic Research Institute at Oxford, whose terms of reference were "to inquire into the present position and probable future development of small industries in country towns in their relation to agriculture and to the welfare of the rural community."

The west of England has some particular disadvantage for industrialists. The most severe is its remoteness, not only absolute, but in the sense of not being on the way to anywhere. Many of its towns are too cramped in narrow valleys or estuaries to expand industrially. And the common seasonality of the tourist trade, horticulture and fishing makes these occupations awkward neighbours for year-round industrial enterprise. Many of the problems of west country industry are, however, those of any predominantly rural area where towns are small. They are, broadly speaking, those of scale and balance. One specialised large firm in a small country town is unlikely to provide, for that town and its rural hinterland, employment openings proportionate to the different types of labour locally available—of men, women, young people, the skilled and the unskilled. Several specialised large firms, providing between them the desirable balance, add up to a different sort of town altogether. Small specialised firms, and medium-sized multi-product firms, are far more satisfactory. But these can only succeed, given their generally higher unit costs, by dint of seeking out and adapting themselves to special, highly specific markets to which mass production is unsuitable. How much room—how much more room—is there in the economy for such firms? The evidence from the west country is, on the whole, encouraging. But it does not justify complacency. Much depends, the report makes clear, on an enlightened training policy and on co-operation between farmers and industrialists in local affairs. This is a report which several ministers in Whitehall should study.

The Economist

APRIL 16, 1859

THE APPEAL TO THE COUNTRY

Lord Derby has set the country a difficult if not an impossible task,—to send back to the House of Commons a powerful and united party, bound together by no intelligible party tie. . . . Left to themselves, different constituencies are of course apt to choose the men who most nearly represent their own vague and floating views. But if they do this, they are certainly not likely to respond successfully to the exhortation to secure a strong and united party organisation. It is the office of a statesman who desires to remodel parties to give them some new principle of combination,—to utter some watchword which may unite the constituencies in a common impulse, and elicit from them some spontaneous unity of action in testing the views of their representatives. To tell constituencies that a Parliament of close organisation is required of them, without giving them a single hint as to the nature of the party-tie an assent to which they should require from their representatives . . . is to impose on them an impossible task. . . . We quite agree with Mr Disraeli and his friends that the complete absence of any clear lines of principle determining the party combinations in the House of Commons is a very great evil. But we are sure that only time, and the gradual evolution of new political issues, can remedy that evil. The spasmodic effort to bid parties strengthen themselves only ends in greater weakness. Men cannot command close political sympathies at will. 'I will have my party-trumpets give forth no uncertain sound,' says the Premier; but uncertain sounds come from the country as before. This is a time of disorganised political individualism. Lord Derby's rebuke may be deserved, but it will be in vain. Until some genuine struggle between conflicting principles ensue, no appeals to the country will bring what the country has not got to give,—unity of political conviction in large bodies of men. Lord Derby has dissolved the rope of sand in the hope of getting a tie of closer fibre. He will only get a rope of looser sand than before.

TRADE WITH RUSSIA

Credit for the Seven-Year Plan?

THE British trade mission to Moscow, which is to follow up Mr Macmillan's visit, may not have an easy task, for the economic circumstances that govern Anglo-Soviet trade have not changed enough to justify the political ballyhoo with which the mission may be surrounded. Russia, with its expanding planned economy, has virtually limitless import demands and its leaders are in a position to quote enormous figures for prospective orders. Russia's actual purchases, however, both before and after the easing of the western strategic embargo, have been limited by its export earnings, and these show no signs of spectacular growth. Grain exports have been limited by home needs. Other primary products, especially oil, in which the Russians place high hopes, have poor prospects when western markets are so weak.

The one major new element that might bring a significant growth in trade is the Russian request for credits. That may be a good sign politically as well as economically. The traditional Russian habit of paying cash, though very welcome to western exporters, was also one facet of a siege mentality. Orders for western goods tended to be of an emergency or sporadic nature, marginal to autarkic plans. The new interest in medium-term credit arrangements to finance complete plants may perhaps reflect a rather greater willingness to fit western orders into plans over a period of time. It is hardly surprising, however, that talk of credit from Britain to Russia has caused some disquiet in other western countries. There are plenty of undeveloped countries outside the Soviet world that would also be delighted to increase their imports of capital goods if they could do it on tick. The grant of normal medium-term commercial credits to Russia does not seem unreasonable. But when the demands of the undeveloped countries are so pressing, there seems no call to give a high priority to extensive finance for Russia's seven-year plan.

EASTERN EUROPE

Private Farmers in Retreat

MR GOMULKA'S steady refusal to dragoon the Polish peasants into collective farms is in increasingly glaring contrast to the drives that are going on elsewhere in eastern Europe to extend and consolidate the collective farms. In Hungary an energetic campaign over the last few months has brought at least 40 per cent of the arable land into the "socialist sector"; before the October rising in 1956, the comparable figure was less than 20 per cent, and after the rising most of the collectives were disbanded. There are signs that even the regime itself, faced with increasing disorganisation and peasant resistance, fears that the pace may have been too fast. Mr Kadar has denied that there is forced collectivisation in Hungary, but he admitted in the next breath that there had been coercion in some districts; he went on to make soothing noises to the peasants, while maintaining that a socialised agriculture remained the goal. Some slowing down in the present breakneck pace of collectivisation in Hungary seems likely.

In Rumania, about 60 per cent of the arable land is now "socialised." Towards the end of March the Rumanian government made it illegal for peasants to hire labourers or to rent out land, and decreed that all land that a peasant and his family could not farm themselves should be expropriated and transferred to a collective or state farm. This move is evidently designed both as a crippling blow at the kulaks and as a device to increase the area of collectivised land without further antagonising the majority of peasants. There have been reports of violent peasant resistance to collectivisation in eastern Rumania; these are not yet confirmed, but there were peasant disturbances in the same part of Rumania early last year.

Czechoslovakia now has more than 77 per cent of the land "socialised," and the process is expected to be virtually complete (as it already is in Bulgaria) by next year. The Czech rulers are now planning to do away with compulsory deliveries at low prices; this will not relieve the peasants of their obligation to supply the state, but it should encourage increased production and discourage the collective farmers' tendency to concentrate on the more profitable cultivation of their private plots at the expense of the collective land. Increased output is, indeed, the first priority

AIR SUBSCRIPTIONS TO THE ECONOMIST
22 Ryder Street, London, SW1

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/43 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

	Airmail	Air Freight

throughout the block, where in Hungary, Rumania and Bulgaria crop production actually declined last year. But the direction in which the communist regimes are moving seems to be dictated more by political than by economic motives.

INTERNATIONAL LABOUR ORGANISATION

Communist Employers

THE International Labour Organisation, like so many other international institutions, has recently been split down the middle by disagreement between delegates from the communist countries and elsewhere. The split, which has caused constant acrimony ever since Russia and the eastern European countries rejoined the ILO in 1954, centres upon the status of the communist employers on the various sub-committees through which the organisation's work is really done. The western employers (backed by the American and Chiang Kai-shek governments) have refused for two reasons to allow the communists to vote on these committees. They say, fairly enough, that the communist employers are only agents of their governments and not fit to put the employers' viewpoint in committee; secondly, and still more important, they resent the fact that the communist employers and governments always vote together on the workers' side. This completely upsets the delicate balance of voting power that is fundamental to the ILO's constitution.

The conflict, which came to a head last year when the communists threatened to walk out unless they were given full rights, set the ILO's permanent staff a knotty problem. They had to devise a procedure which reconciled the ILO's tenet that "equality of treatment must be accorded to all conference members" with a voting system which, where necessary, masked the communist employers' pro-worker vote. The result is an ingenious, if not wholly satisfactory, compromise. Under the new scheme, which will be put before the conference in June, a maximum of two communist delegates who want to sit and vote on any committee, but who are excluded by their group (e.g., by other employers), will be able to appeal for instatement to an outside board; but, against that, it will be possible for a two-thirds majority of the employers' group to decide how their group's total voting power should be cast. This block vote system (which has suitable safeguards built into it) would go some way towards nullifying the effect of the committee's new communist members.

The British Employers Confederation has now issued a bulletin heavily criticising these proposals; but there are signs that if the conference approves them (as is very likely) the employers will quickly accept the verdict. Little is to be gained by further wrangling, which in any case only provides more grist for the communists' propaganda mills. Agreement would also leave the ILO more time to concentrate on what many people regard as its most important current task: that of providing technical assistance to help raise labour standards in the under-developed countries.

Europe and Your Business

The EIU European Service keeps you abreast of events in the movement towards freer trade in Europe, and shows how these events are likely to affect business. Combined subscriptions at reduced rates are now available. Particulars from:

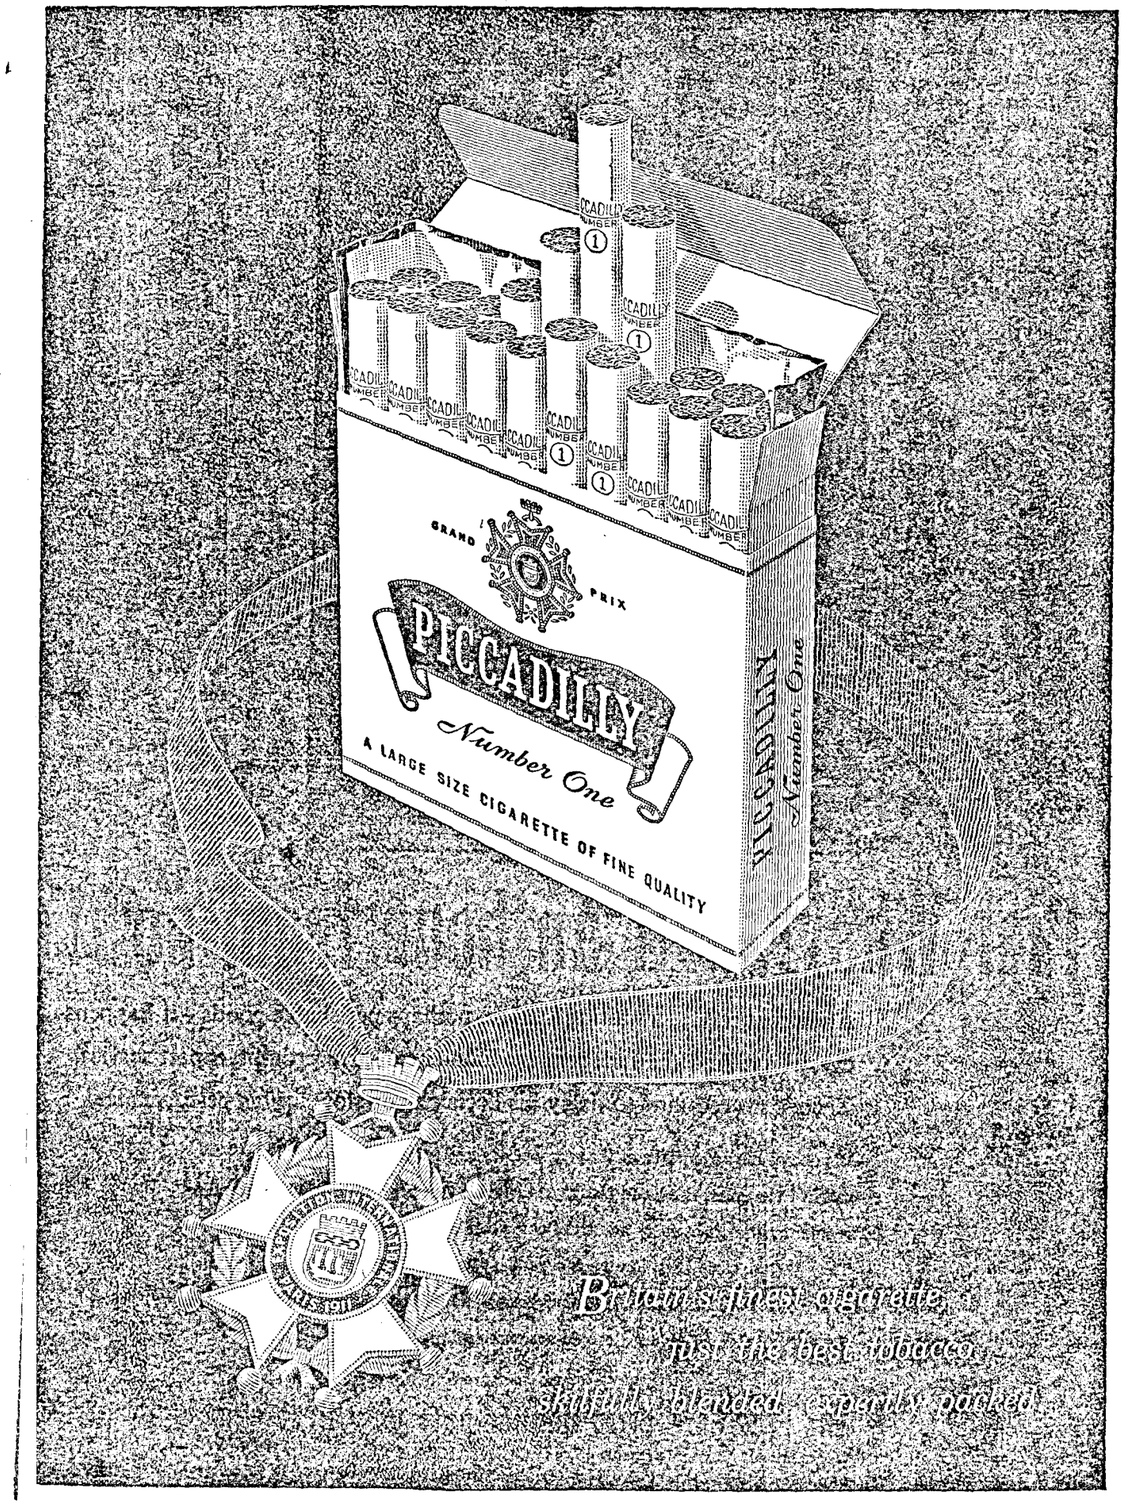
SHIFT WORK

One Man's Meat



BRITISH industry, by and large, fights shyer of shift work than industry in most countries abroad. It thus misses many advantages—in economy of equipment, more rapid amortisation, and consequently lower overheads—which could mean lower unit costs and higher earnings. The main reason for this conservatism is the workers' unwillingness to depart from the normal pattern of work and leisure—an unwillingness accounted for partly by inadequate pay differentials, but more by a general fear that shift work will dislocate and impoverish domestic and social life.

How well-founded is this fear? A recent paper published by the Yorkshire Bulletin of Economic and Social Research * sets out the results of a small-scale but intensive enquiry carried out by interview with a number of employees of firms working on various shift systems. The enquiry was too limited for statistical significance; but its main lesson is the unsurprising one that shift work can be anything from an impossible nuisance to a positive blessing—according to the skill and sympathy with which it is organised and to the personal circumstances, temperaments and tastes of the individuals concerned.

Very few liked night work, but the dislike varied enormously according to the respondent's highly personal ability or inability to sleep by day and digest unconventionally-timed meals. Workers of both sexes and all ages who were engaged on the more habitual double-day shift—6 am-2 pm, 2 pm-10 pm—often actually preferred it to normal day work. The balance of advantage and disadvantage, however, varied widely. Many young bachelors disliked having their evenings obliterated on one shift and curtailed, by the prospect of early rising, on the other; the married, on the other hand, were apt to appreciate the daylight leisure which allowed them to garden, potter, see more of their children, and possibly earn something from odd jobs. Working wives similarly found shopping and housewifery easier; but difficulties over children could be either less or forbiddingly greater than with normal day work according to a whole range of ungeneralisable family circumstances. In every sort of family grouping, and with every type of shift, much depended on the works' welfare arrangements, but more on individual psychology—especially on the amount of co-operation between man and wife.

The practical moral can be summed up in one word: flexibility. Given imaginative organisation, shift work can offer positive gain to the right people; others cannot comfortably adapt their lives to it however excellent the organisation may be. To ban shift work means wasting not only productive power but social and domestic advantages; to apply it universally would be a tyrannous imposition. The ideal course is to make room, preferably

* Yorkshire Bulletin of Economic and Social Research. Obtainable from Department of Economics and Commerce, The University, Hull). 54 pages. 10s.

'Pier Wharf, half an hour from now!'

An urgent call... a waiting load... perhaps perishable goods – it happens every day. And the Independent haulier can give prompt, expert service. There's no red-tape to delay his decisions or slow up his performance.

It's one of the advantages of the *personal service* you get when you call in Free Enterprise Road Haulage... service that has won many long-standing regular customers in every branch of commerce and industry. They like the close attention the Independent haulier always pays to their special instructions. And they know it's his keen competition that has held down the price of Road Haulage since de-nationalisation.

The Free Enterprise Haulier puts *you* first

within each firm, certainly within each industry, for individuals to choose (with whatever balancing factor may be appropriate in the shape of an earnings differential) the type of working day that suits them.

FIRST WORLD WAR

Germany and the Bolsheviks

THE last files of the German Foreign Ministry documents, captured by the Allies in 1945 and flown to Britain during the Berlin blockade, have been moved to Bonn. A number of "revelations" from them made news during the publication of the official volumes on German foreign policy; but not all the work done on these papers was official—a number of historians were let loose among the four hundred tons of documents and miles of microfilm. Of the controversies occasioned by their publications, one has not yet been concluded; it concerns the relations between the German imperial government and the Russian revolutionaries—the Bolsheviks in particular—during the first world war.

The publications of the German Foreign Ministry papers bearing on this question, and showing that Imperial Germany's leaders gave substantial help, financial and otherwise, to the cause of revolution in Russia, were followed by controversy in the British and American press; the Russian historians had nothing to contribute. Nevertheless, an unexpected, and indirect, contribution appeared in Moscow at the end of last year. This is a revised compilation (the first edition appeared in 1929) of the proceedings of the Bolshevik central committee, covering the period between August, 1917, and February, 1918—just after the abortive Bolshevik rising in July, and shortly before the conclusion of the Brest-Litovsk peace between Germany and Russia. On page 250 of this volume there appears a note to the effect that those parts of the protocols, dealing with the "controversial affair" of Hanecki and Kozlovski, which were dealt with by eight sessions in all of the central committee, have not been printed. Both these men have often been mentioned in connection with the German subsidies to Lenin's party. Hanecki was a good friend of Lenin; he was also employed by "Parvus" (Alexander Helphand), the main adviser of the German Foreign Ministry on Russian revolutionary matters. The omission of the records dealing with his affairs from this publication is significant; it is even more curious that its editors decided to draw attention to such omission in a special note. These records might establish the facts once and for all.

LETTERS

America's Inflation

SIR—I have read with interest the article "Inflation's New Culprit" in the March 28th issue of *The Economist*, which questions the validity of some of the current reasoning concerning oligopolistic and administered prices.

I was struck with an entirely different line of thought as to the economic soundness of Mr Means *et al.* No recognition is given to the comparative effects of administered prices by the Office of Price Administration during the period 1942-1947. To a large extent the variation of prices and the adjustment during 1953-1957 are a reflection of tight OPA controls on one segment of the economy, and loose OPA controls in another segment. A study of the price trends through the entire period will show that the very industries most criticised (such as metal and metal products, machinery and motive, etc.) have moved up less than the average change for all products.—Yours faithfully,

JOHN W. BOATWRIGHT

Paris

Liquid Gas

SIR—In your issue of February 21st you published an article entitled "Methane sails to Market." It has occurred to me that it may be of interest to your readers to learn of a proposal for the exploitation of natural gas on a European scale, which has been put forward by the Consultative Assembly of the Council of Europe.

This proposal is based on work by a sub-committee of the assembly's economic committee. The chairman of the sub-committee was M. Maurice Lemaire, a former director-general of the French Railways, minister in several former French governments and presently chairman of the production and trade committee of the French National Assembly.

On the basis of a report by M. Lemaire presented in the name of the economic committee, the assembly adopted in October 1958 a recommendation on the exploitation of the natural gas resources of the Northern Sahara. The main idea behind this proposal is that for the time being the enormous gas reserves in the Northern Sahara cannot be fully utilised in North Africa alone, while the funds necessary for the exploitation of these resources are so large that the co-operation of all interested governments will be necessary if rapid headway is to be made.

The matter is, of course, one which is in the first place solely within the responsibility of the French government, but a study of the technical aspects of the proposals is now being made in the Organisation for European Economic Co-operation, and the committee of ministers of the Council of Europe will decide, in the light of the OEEC's report and of whatever views the French government may put forward, what further action is called for.

As regards the profitability of the operations proposed in the economic committee's report, figures given there indicate the cost price of the gas on delivery in London as 98 centimes (one fifth of a penny) per US therm if transport is provided by methane tankers, or, if feeder pipe-lines are used, as little as 72 centimes (.1469d.) per therm.—Yours faithfully,

DUNSTAN CURTIS

Council of Europe, Strasbourg

Faster Traffic

SIR—The Minister of Transport said in the House recently that he would welcome suggestions from any source as to how to prevent the road bottle-necks into and out of big cities from frittering away the advantages obtained by the great new highways beginning to appear in the countryside.

It seems to me that a substantial contribution to the solution of the problem could be made by the reorganisation of city outlets on a triple carriageway basis: two of these always being used by the heavier flow of traffic. For example, there would be two carriageways available for the in-coming morning traffic, and one for traffic travelling in the opposite direction, and vice versa at the evening rush hour. Statistics from a traffic census should readily supply the time when the in-coming tide begins to recede and the change over needs to be made.

I suggest that this triple tracked traffic system be tried. The same principle, of course, applies to more than three tracks. If it had been used on some of the recent improvements to the exits from London, it would have provided the same facilities at considerably less expense.—Yours faithfully,

D. G. B. DUFF

Brockworth, Gloucestershire

BOOKS

Faces of Liberalism

The Liberal Future

By Joseph Grimond.
By The One Nation Group of MPs.

The Responsible Society

By The One Nation Groups of MPs.
Conservative Political Centre. 63 pages. 2s. 6d.

New Orbits

By the Joint Political Committee of the National League of Young Liberals and the Union of Liberal Students.
70 pages. 2s. 6d.

THE liberal future, as discerned by the leader of the Liberal party, bears at many points a distinct family resemblance to the responsible society foreshadowed by the liberal wing of the Tory party. This is emphatically not, as some Tories would gleefully claim, a conclusive argument against the value of having an independent Liberal party. Any unprejudiced observer of the House of Commons would surely agree that with his refreshing style of challenging established ideas Mr Grimond makes more public impact as the captain of his own band of freebooters than he could possibly do as one more signature on the pamphlets of the progressive Tories who claim to be boring from within.

It may be, of course, that Mr Iain Macleod is to become the next leader of a Tory Government, with the One Nation Group supplying his Ministers and the Bow Group his Under-Secretaries. In that event those liberals who decided that the Liberal party was not an effective vehicle of reform and that they would take over the Tory party instead, leaving it conservative in nothing but its name, will feel they were right. But one can beg leave to doubt whether things will work out quite like that. For one thing there are inevitably large legitimate conservative interests in society and a great many people who have a reverent and cautious turn of mind. They will always be found primarily in the Conservative party, and any liberal element within it, however strategically placed in the hierarchy, must accommodate itself to them to a degree that will frequently blunt the sharp cutting edge of its social analysis. Mr Grimond's *franc-tireurs* can in fact help their brothers-under-the-skin by constant public needling; a few extra hell-raisers on his benches in the House might do wonders in spurring action towards a responsible society.

Both Liberal liberals and Tory liberals are anti-uglies and want far more attention paid to town planning and the design of public buildings. Both want to give the worker more status, have his wages negotiated at a more local level, guarantee him redundancy pay and protect his democratic rights within his union. Both try to find ways of tackling the problem of old durable rented housing without modern amenities that will avoid municipalisation. Both want to rearrange the burden of the social services, so that as the country gets richer there will be less subsidising of people who can partially look after themselves. Both are very seriously bothered about excessive materialism in the affluent society of mass culture and make rather tentative suggestions for preparing people to face their leisure.

The appearance of Mr Grimond's book and the One Nation pamphlet should be some reassurance to those who have been recently depressed about the quality of our active politicians. One doubt which they both leave with the sympathetic reader is whether many of the new questions which they ask are really answerable at all in terms of political action, at least by parties which are temperamentally opposed to overmuch interference with the individual by the state.

Mr Grimond's book has a much wider scope than "The Responsible Society," which is exclusively concerned with social policies. In less than two hundred pages the Liberal leader takes on economics, foreign policy, and constitutional reform as well. It is a courageous encounter—undertaken in the midst of an extremely busy political life—and Mr Grimond emerges from it with a good many trophies and only honourable wounds. He has a brilliant but sometimes perilous gift for aphorism. Some of them in this book make a great deal of sense, a few make no sense at all, and many are difficult to assign to one category or the other without much more amplification. The economics needs looking at again. If it is true that the government should not concern itself with the inflationary implications of wage levels (p. 62) and should rely on credit policy exclusively to iron out the trade cycle (p. 63) what is the use of complaining on p. 93 that reliance by the Tory and Labour governments on the credit squeeze has had the inevitable effect of discriminating in favour of big corporations that can finance themselves internally? It really does not sufficiently square this circle to advocate co-ownership, lower taxes and the rearrangement of the nationalised industries. There is no evidence that low tax economies are necessarily more stable and the significance of a policy of making nationalised industries "the responsibility of those who are more or less directly concerned with them" is elusive. Mr Grimond also seems to think erroneously (perhaps because he is generalising from the eccentric example of Glasgow) that house building is normally more heavily subsidised on the fringes of cities than at the centre.

Nevertheless the important fact that emerges about Mr Grimond from this book is that his is an eager, restless, questing mind that is forever asking important, embarrassing questions and wrestling for radically worthwhile solutions. In their own attractive glossy, "New Orbits," the Young Liberals have marshalled their answers to the common charge that Liberals have no policies of their own but are merely the undistributed middle of British politics.

Technique and Meaning

The Art of French Fiction

By Martin Turnell.
Hamish Hamilton. 388 pages. 30s.

"THE critic's first duty"—so Michael Roberts wrote in his "Critique of Poetry"—"is neither to condemn nor to praise, but to elucidate technique and meaning." Mr Turnell, in this series of essays, might almost have taken this saying as his motto; with the rider that having accomplished his "first duty" the critic faces at least optionally the further task of assessment and appraisal. It is by his emphasis on technique that Mr Turnell distinguishes himself from most critics of a literature not their own; for he deals not only with those questions of mass and emphasis, of tempo and choice of standpoint, that are independent of the strictly linguistic element, but also with the minutiae of language, from sentence construction to the use of tenses and moods and the choice between abstract and concrete nouns.

It must hastily and emphatically be added that this is not a dry grammatical dissection for linguistic specialists only; no reader with a spark of interest in what C. E. Montague called "the writer's trade" could fail to be fascinated by it. For one thing, these considerations of craft are given a psychological and social setting; a particular way of handling words, a particular vocabulary, emerge as the products—not inevitably, since Mr Turnell is no crude determinist, but comprehensibly—of a certain *Zeitgeist*, a certain experience of life and a certain temperament. That hackneyed old generalisation that "style is the man" has rarely been more illuminatingly illustrated and justified. For another thing, "technique" and "meaning" are closely related; stylistic analysis is balanced and accompanied by the wider interpretation of each writer's personal vision, by an account of his subject matter and by penetrating biographical sketches.

The seven novelists dealt with, at varying lengths, are Prévost, Stendhal, Zola, Maupassant, Gide, Mauriac and Proust. Close on two-thirds of the book is devoted to Zola, Gide and Mauriac; the others are considered either comparatively sketchily (Maupassant is an intermediate case) or in relation to a single early work. Of the three main essays, that on Zola is likely—despite Mr Turnell's detection of a "modest but unmistakable" recent revival in his reputation—to appeal more to a historical than to a strictly literary interest; it is a superb guide-book, appreciative, discriminating, comprehensive, to a country that few nowadays wish to visit. Gide and Mauriac are another matter. In the original or in translation, their works are part of the contemporary landscape. Like other writers, they yield an enjoyment greater or less, an experience deeper or shallower, according to the reader's capacity to tune himself to their special wave-length—a capacity which even for the bilingual is always likely to be diminished by the absence of a shared national tradition. Mr Turnell does almost everything that can be done to put text and reader *en rapport*.

"Almost"—one must thus qualify his brilliant success, because one element is lacking; that of the ideal critic's wholehearted sympathy, transcending approval or disapproval, for his subjects. That Gide was a deplorable destroyer of himself and of others, that Mauriac was poisoned by his spiritual inheritance from Pascal, should surely at this level of interpretation prompt a sense of "the pity of it" rather than censoriousness. That this lack should be felt at all is, however, itself a tribute to Mr Turnell's power. In a lesser critic it would be—like its opposite, a total indifference to absolute standards—taken for granted and unnoticed.

New Farmers in Japan

Land Reform in Japan

By R. P. Dore.
Oxford University Press for the Royal Institute of International Affairs. 524 pages. 55s.

OF all the major groups in Japan's society, the tenant farmers derived least benefit from the economic and social progress of the country in modern times. Their standard of life remained very low by comparison with that of the city-dwellers; they were oppressed by debt; and their social position bore many traces of the "feudal" past. When the Occupation authorities, by what turned out to be an act of confiscation, decided to transform the tenants into owner-occupiers, they embarked upon certainly the most sweeping and probably the most enduring of all the reforms undertaken in the period from 1945 to 1951. While this measure left some of the most perplexing problems unsolved, notably the problem of rural over-population, it brought about a fundamental alteration in the distribution of agricultural income and in the economic status of the farmer. Furthermore, it prepared the way for a profound change in the social and political outlook of what had previously been regarded as the most conservative class in Japan.

Mr Dore has now exhaustively examined the land reform and its economic, social and political consequences. His book, based not only on printed sources in the Japanese language but also on first-hand experience of living in Japanese villages, is both authoritative and comprehensive. Although the outline of the story is not always as firm, nor the analysis of economic effects as taut, as could be wished, there is in compensation a wealth of detailed information and a sympathetic understanding that will surely make this book the standard work in English on the subject.

In his early chapters Mr Dore describes the development of Japanese agriculture in the modern era, the prewar tenancy system and the various types of landlord. He shows that the agricultural organisation had long been out of tune with the rest of society, and he discusses with insight the part that peasant discontents played in the rise to power of the military cliques during the nineteen-thirties and in the "totalitarian" solutions proposed for the country's economic troubles. A conviction that it was an important part was one of the chief reasons for the Occupation policy. The author's account of the effects of the reform on the organisation of agriculture, and on the income, social status and political outlook of the farmers, is illustrated with many examples, or case-studies, which, if at times they interrupt the development of the general theme, add considerably to the vividness of the narrative. He asks the crucial question: will the reform survive intact? So far, the prospects appear favourable. But should agriculture become depressed, the defence of the new system will urgently require the introduction of improved facilities for farmer-credit and the determined maintenance of legal restrictions on the transference of land-ownership.

One of the most interesting chapters deals with the social organisation of the village as it has been influenced by the withering-away of privilege. The democratisation of rural life, though it has altered the pattern of power, has not necessarily conferred greater independence on the farmer; indeed, it may well have "increased the constraint on individual choice exercised by the hamlet community" and "the pressure on the individual to conform."

The Social Encyclopaedist

Staatslexikon

Sixth Edition. *Vol I: Abbe to Beyerle. Vol II; Beziehungslehre to Erbrecht.*
Freiburg: *Verlag Herder.* 1231 pages. DM 76 each volume.

"ALL big discoveries and inventions in the fields of technology and natural science make necessary a jurisprudential ordering of the facts of life which they create." True—indeed, on reflection, self-evident; but who, if not the compilers of a German encyclopædia, and a special kind of encyclopædia at that, would think of saying it? The statement occurs in the article *Atomenergie* in the new edition of Herder's *Staatslexikon*, now in course of publication.

Ah yes . . . I know the shippers . . .

Know your shippers, know your wine, any wine drinker will tell you that. Bouchard Aine are well known as reliable shippers with a fine list of wines to their name. Enjoy good wine tonight with Bouchard Aine who strongly recommend :—

Chateau Haut Marbuzet 1952
a wine from a smaller chateau of exceptional quality

Dry Pouilly Reserve
a gracious white Burgundy

Order from your wine merchant or write to:

BOUCHARD AINE*

**Aine denoting the eldest son of the family*

3 HALKIN STREET, LONDON, S.W.1.

Another characteristic of scientific discovery is that it tends to flood encyclopædias, edition by edition, pushing the arts, the social sciences, and the whole picture of humanity into ever more confined corners. Herder's *Staatslexikon* is by its basic conception better equipped than most to resist this trend, since it sets out to cover not the whole field of human knowledge, but the branches that concern the relations of people among themselves: law, economics, sociology, politics. This limited but still gargantuan task is tackled from a specifically Christian point of view—of earlier editions, one would have said without hesitation a specifically Roman Catholic point of view, but the sixth edition for the first time makes use of a substantial number of Protestant contributors.

The six editions represent a publishing activity of seventy years, and the origins of the work go back to the foundation of the Görres Society (still the sponsoring organisation) in 1876, the centenary of the birth of the polemist of the Catholic Rhineland in Napoleonic times, J. J. von Görres. Like the work of Görres himself, the society's work has been in part responsible for the persistence through such vicissitudes of a specifically Rhenish Catholic German view of the nature of society and the purpose of politics. Dissolved by the Gestapo in 1941, the society reconstituted itself in 1948; in certain ways it has come into its own with the creation of the west German Federal Republic, a republic which corresponds fairly closely to one of the various models of German states which Görres himself played with at different times. The eight volumes of the sixth edition of the *Staatslexikon* are obviously going to be something of a monument to that fact. They will inevitably, too, be a standard working tool for a large group of the lawyers, civil servants, politicians and administrators who flourish in Federal Germany. It is 27 years since the fifth edition, which Hitler's rise to power quickly rendered useless to such people for practical purposes.

To return to atomic energy, one of the new subjects that have forced themselves in those twenty-seven years on the attention of encyclopædists, whether interested in the natural sciences *per se* or not. Atomic energy has had and is having effects on law, economics and politics. Herder gives 22 thorough columns to the subject, starting with Rutherford's atomic model, finishing with the organisation of Euratom, and contrasting, on the way, the concepts underlying Anglo-American and German legislation. Various attempts at an international regulation of atomic energy are noted, but there is a curious near-omission: the atomic bomb. Although the existence of nuclear weapons is mentioned in passing once or twice, they are nowhere in this longish essay given specific consideration—either for their forcing effect on nuclear science, or for their impact on world affairs.

This may be accidental. Occupational hazards do, however, arise for the *Staatslexikon* from the fact that it is a product of a country advanced, indeed, in social, economic and political studies but prone to cataclysmic political changes, as Germany's history since J. J. Görres has shown at frequent intervals; and at almost any given moment the encyclopædists have been grappling with the problem of presenting to their readers a new order, which has soon proved impermanent. As they themselves say, the present west German federal republic, though a fully-grown state in practice, is in principle merely a provisional arrangement; and this thought is not far absent from the reader's mind in most of the 86 columns in the second volume on words beginning with *Bundes-* (federal) or, indeed, much of the 206 columns under *Deutschland*. When they take sides they can hardly avoid taking the side not only of the German Federal Republic, but of the particular regime that prevails there under Dr Adenauer's paternal guidance. It is remarkable how often they manage to avoid taking sides; but there are times when this is achieved at the expense of coming to grips with the subject.

Adventure in OIL

BY HENRY LONGHURST

*

Foreword by the Rt. Hon. Sir Winston Churchill, K.G.

This is the thrilling story of the men who began and built up the British Petroleum Company, now one of the greatest commercial enterprises in the World. It originated with the dramatic events of the night of the 26th of May 1908, which were to change the course of Middle East history and the shape of the oil industry. Alive today are men who marked out with scraps of calico the route for the first pipeline in the Middle East or sailed in a boat over the water-logged island of Abadan, where later they built the biggest refinery in the world with a community the size of Brighton or Salt Lake City. Their successors in the last half-century have spread their business over all five continents and sail the seas in a tanker fleet rivalling in tonnage that of the Company's first really big customer, the Admiralty, in 1914, when its First Lord was Mr. Winston Churchill.

Illustrated with 50 pp. of photographs. Map end-papers in four colours. Price 21/-.

Prolegomena to Science

The Logic of Scientific Discovery

By K. R. Popper.
Hutchinson. 480 pages. 50s.

THERE are certain contributions to the philosophy of science that may be called classical. Among these the contribution made by Karl Popper deserves to be rated extremely highly. He has continually insisted that the progress of science depends upon the making of bold conjectures. Science is not a body of firmly established fact but a body of hypotheses or theories. Explanation of a phenomenon may be provided by reference to those theories together with the initial conditions. But perhaps Professor Popper's most important idea is that the satisfactoriness of a theory—what he calls its degree of corroboration—is determined by its success in surviving falsification. Only if a theory survives the most stringent tests can it be said to be corroborated or confirmed to a high degree. This property—capability of being tested—Professor Popper makes the criterion of whether statement is scientific, as opposed to metaphysical. The opposing thesis—that science should and does stick close to the observed facts—Professor Popper calls "inductivism," and much of his writings constitute a crusade against it.

Like most important ideas, these ideas are essentially simple, and, perhaps for that reason, easily open to misinterpretation. They were originally published in 1934 in a book entitled "Logic der Forschung." The book has remained untranslated until now, and it has, in any event, not been easily accessible. This, in part at least, explains the slight aura that has tended to surround Professor Popper's views and also the misinterpretations to which they have been subject. The book has now been translated by the author with a great number of additions in the shape of extra footnotes and appendices, giving, for the most part, changes of opinion. Nor is this all; a further volume is promised, giving in detail his present views. The policy of making additions to the original text is questionable, since the result is vastly increased untidiness. It might have been better to print the translation of the text as it was originally published, leaving both commentary and changes of opinion to a second volume. Even so, the second volume will be awaited with impatience.

"The Logic of Scientific Discovery" makes interesting but also somewhat irritating reading. Professor Popper's important ideas were presented in the context of positivism—a movement to which he did not belong, but which was nevertheless very much his concern. This preoccupation with positivism and the consequent polemic give the book a slightly old-fashioned look. And despite the clarity of the writing some of the central ideas may be lost for that reason. Instead of contenting himself, for example, with the important point that the method vital for the progress of science is to put forward bold hypotheses for subsequent testing, Professor Popper also insists in an exaggerated way that "there is no such thing as induction." This can only produce an air of paradox, seeing that we use inductive inferences every day of our lives.

A large section of the original work and many of the new appendices are devoted to a discussion of probability—a field that raises problems for the falsifiability criterion. Professor Popper's technical ability here is amazing. His construction of a formal system of probability, which is capable of interpretation in different ways, is a very considerable achievement But it is doubtful whether his adherence to the "frequency theory"—which says that the probability of an event is equivalent to the relative frequency of occurrences of that event—will satisfy many philosophical critics of that theory. Although assessments of probability may depend as often as not on estimates of relative frequency derived from statistics, it is scarcely satisfactory to maintain that "probability" means the same as "relative frequency." The second volume will provide further thoughts on this subject

That the book is important there is no doubt. Although it is a pity that it has been necessary to wait twenty-five years for it to appear in English, it remains a classic in the philosophy of science.

Philosophy and Society

Positivist Thought in France during the Second Empire. 1852-1870

By D. G. Charlton.
Oxford University Press. 251 pages. 35s.

THE Provost of King's has recently reminded us in his Hobhouse Memorial Lecture of "the curious strength of positivism in English political thought." By this he implies a persisting commitment to a belief in politics dominated by the increasingly rational and harmonious choices of individuals, and to a political science that neglects sociology. Dr Charlton's erudite work will serve to remind us that at least in its Comtian origins positivism and sociology go hand in hand.

Dr Charlton's view of positivism is, however, restricted in this work to its strictly philosophical aspect—positivism as a theory of knowledge—and his main purpose is to dispel the idea that it was a unified creed dominating the thought of the period with which he is concerned. Comte, as he shows, was inconsistent in that he was more interested in altering society than in learning about it: "Comte is a reformer before he is a scientist, and it is small wonder that, sharing the preoccupations of his age, he should have ended as an archbishop." Of the thinkers of the Second Empire itself, only Emile Littré and Claude Bernard qualify as *vrais amis du positivisme*. Renan and Taine, like Comte, end up with something very different from positivism: "scientism." The book concludes with a study of the effect of positivist thought upon two literary figures of the Parnassian school, Louise Ackermann and Sully Prudhomme.

For the specialist, Dr Charlton's detailed examination of the effect of German philosophy on the French thinkers of the age will no doubt contain much of interest; for the student of the French intellectual scene, the insistence on the purely philosophical aspects of the outlook of such men as Renan and Taine may seem an unwelcome limitation. But at least Dr Charlton is aware that, as would not be true of positivists of a later school, it was the big perennial questions that occupied the minds of the thinkers of the mid-nineteenth century:

> all these thinkers, whatever their intellectual persuasion, regard philosophy as deeply relevant to the world in which men live and act.

Sleeping Beauty

The High Court of Chivalry

By G. D. Squibb.
Oxford University Press. 327 pages. 42s.

FIVE years ago the curious were electrified by the reappearance of the Earl Marshal's Court, after two centuries of dormancy, to decide a case between the Manchester Corporation and a cinema company. The more curious, reading the reports, were fascinated by the unfamiliar procedure and vocabulary of the civil law. Mr Squibb, in this very interesting book, gives us the history of the court. It started in the middle ages as the equivalent on land of the Court of Admiralty and, as a result, it adopted the civil law, which was internationally accepted. Under the Tudors it ceased to function, but the Stuarts twice revived it to deal with heraldic matters and some other questions relating to honour. The court did not flourish for long, and after the 1730s it did not sit. When, in the nineteenth century, the remaining civil law tribunals were abolished, it was thought to be dead and so escaped notice; but the kiss of the City Fathers of Manchester revived it.

This learned treatise makes use, for the first time, of such records of the court as have survived in the College of Arms. It owes its origin to Dr Wagner's admirable campaign to bring the archives of the College into the open, and it was he who persuaded Mr Squibb to undertake this task. The book is primarily for the specialist, but there is much in it to delight the amateur. One plum is the demonstration that in the seventeenth century, when it really mattered whether one was a gentleman or not and one went to law about it, the definition was as vague and pragmatic as it is today. Indeed, the concept hardly seems to have changed.

Fifty Years On

Adventure in Oil: *The Story of British Petroleum*

By Henry Longhurst.
Sidgwick and Jackson. 286 pages. 21s.

THIS book worthily celebrates British Petroleum's fiftieth birthday last Tuesday. The story is of men (and some remarkable women too) who from that strike at the very last minute in May, 1908, went on to create the biggest external asset that Britain has ever had. All this is within a lifetime; indeed the pioneers in the Fields in Persia and builders of original pipelines look little older now than most of this week's birthday hosts and guests. Mr Longhurst's fascination has been with the people who made BP possible, and if he glides rather smoothly here and there over some of the rockier parts of BP's history, that is understandable in a book of this kind. To have brought together so interestingly and comprehensively all the range of BP's work and to have conveyed such a sense of its *persona* is an achievement. This half century march—from Masjid-i-Sulaiman by way of the Rockies to Nigeria—has been a march of people. The pioneering of Reynolds, Jameson, Young "the little doctor," and the many others who toiled with them, has been brought in these fifty years to fruition in an enterprise that prospects, drills, produces, ships, refines and sells oil in every part of the western world. It is an absorbing story (too few people in this country knew about it in 1951 when BP had to get out of Persia), and Mr Longhurst has told it well.

OTHER BOOKS

THE ATOM RUSH. By Harald Steinert. *Thames and Hudson.* 183 pages, 18s.

This is a lightweight account, translated from the German, of the search for, and development of, deposits of minerals needed for the atomic energy industry. One or two scarce "non-atomic" minerals, such as titanium and wolfram, are thrown in for good measure. Since this is one of the most poorly documented aspects of atomic energy, almost any contribution is welcome, but it seems incredible that a book on this subject should be published without a single map. Someone should also warn Herr Steinert before it is too late that if he tries to use beryllium in a nuclear reactor in the way he describes, he is due for an unpleasant shock.

THE POPULATION AHEAD. Edited by Roy G. Francis. *Minnesota University Press.* London: *Oxford University Press.* 160 pages. 30s.

This symposium on the world's demographic prospects consists of the papers contributed to a conference held in 1957 at the University of Minnesota, together with excerpts from the discussion—its merit is to bring into focus the expertise provided by a number of different disciplines, sociology, economics, statistics, geography, anthropology, zoology, genetics; this in pursuit of a deliberate policy of "desegregation of ideas." Its corresponding disadvantage is that each paper is rather sketchy. There is nothing here to equal in thoroughness the proceedings of, say, the successive International Conferences on Planned Parenthood. And it is a pity that the editor, who contributes a deft but rather bonhomous introduction, should not have preferred to provide a final summing-up, an assessment of the experts' total impact and of their mutual correction—or perhaps have enrolled someone else for this admittedly very difficult job. These criticisms apart, "The Population Ahead" can be recommended as a pioneer bridge-building exercise in a field of studies where any single approach—biological, social or economic—is almost certain to yield misleading results.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Speculation— Thirty Years After

NEW YORK

THIS month Wall Street has embarked on a concerted drive against excessive speculation. The New York Stock Exchange is supplementing its traditional advertising theme—"own your share in American business"—with a special appeal stressing the virtues of sound investment and, not to be outdone, the American Stock Exchange is pointing out the perils of investing in unseasoned issues. Brokerage houses have joined the chorus, advising their clients to "investigate, then invest" and cautioning them against buying shares on tips and rumours. Moreover, the Securities and Exchange Commission, which is charged with protecting the shareholder, took full advantage of its independent capacity to issue a surprisingly strong statement which not only warned the public against speculating but also went on to declare flatly that manipulative activity was on the rise in the country's stock markets.

While it is difficult, if not impossible, to establish just how much actual manipulation is taking place, there is no doubt that there has been a big increase in speculation over the past few months, to a level that is causing concern to the entire financial community. Before its public appeal, the NYSE had asked the managing partners of all its member firms to re-examine their policies and recommended them to supervise their selling operations more carefully. The decision to carry on a public campaign against speculation was not taken lightly. It was opposed by some members of the exchange on the ground that, if the appeal is successful, it will rob the market of the liquidity and stability which speculation normally provides. But a majority of the members is convinced that there is little danger of reducing speculative activity to the vanishing point; on the contrary the fear is that, unless the fever now gripping the public is brought under control, the entire market will be threatened with collapse. While there is as yet no mass flight from reality such as Wall Street experienced in 1929, yet the violent movements in the prices of some speculative favourites are considered to be sufficiently reminiscent to warrant action.

Stock prices, as recorded by such measures as the Dow Jones industrial index, have been moving much more slowly and sedately lately than they did during last year's hectic advance. But these yardsticks fail to reflect the very rapid swings in a wide variety of equities, particularly low-priced issues and those having some connection, no matter how tenuous, with developments in electronic, missile, or other technological fields. One index measuring a representative group of low-priced shares—issues selling for $5 or less—has gone up by 98 per cent in the past year, compared with a rise of 35 per cent in the Dow Jones index; and since the beginning of the year the low-priced stocks have climbed just over 20 per cent, while the Dow Jones index has had a modest increase of 5 per cent. The rise in prices has been matched by expanded trading in low-priced shares, which accounted for almost 35 per cent of total volume on the NYSE last week, compared to 8 per cent a year ago.

Low-priced shares were never in very strong demand during the 1953-57 bull market, nor was there then anything approaching the current interest in shares of companies involved in technological developments. Some of these issues may well justify the high prices that eager purchasers are willing to pay, but the investing public has been buying indiscriminately, apparently expecting that every company owning an electronic device will turn out to be another International Business Machines Corporation. The speculative appeal of electronics is also reflected in over-the-counter trading and in the new issues market; there many recent offerings have been snapped up despite the fact that, in conformity with SEC requirements, they are candidly labelled as risky and, in many cases, represent nothing but patents or a laboratory process which the promoters hope to exploit.

THE warnings against speculation appear to have had little effect on investors. Trading volume declined in some of the most active stocks, bringing a drop in prices, but it proved a very limited reaction that did not extend either to low-priced issues or, fortunately, to investment grade shares. Brokers are doubtful whether the speculative fever can be materially reduced by an advertising campaign; at the same time, they disapprove of the attempt of the Federal Reserve Board (the central bank) to contract the amount of credit in the stock market by tightening up on margin requirements—the regulations fixing the amount of cash which a purchaser must put up when buying shares. The brokers' own remedy is to try to steer clients into buying better grade issues while imposing stricter regulations of their own on questionable equities and accounts.

A number of firms have already insisted on more stringent rules, even though they run the risk of thus alienating customers. One brokerage house published a list of equities on which it is requiring higher margins explaining that

> we view with great concern the fantastically wide fluctuations in certain stocks listed on the American Stock Exchange. In many cases, current prices are 300 per cent or more above the 1958-9 lows, and daily price changes have often amounted to 25 per cent or more of some stocks' market prices.

But working against this commendable approach is the army of stock salesmen, whose livelihood comes from commissions based on the buy and sell orders which they can produce. Salesmen are pouring into Wall Street at a rate of over 3,000 a month and their competitive desire to make good may lead them to ignore the current counsels of restraint.

Wall Street may be accused of promoting specula-

tion, but without a receptive and susceptible public its efforts would have been unavailing. It took a long time for the public to regain its confidence in equities, and many factors contributed to this—the continued expansion of personal incomes, the increased stability of the economy, the sales campaigns of mutual funds and stockbrokers. The recent upsurge in speculative activity seems to date from the boom, and subsequent collapse, of the government bond market in the summer of 1958, when speculators bought huge amounts of Treasury securities on little or no margin, and piled up large profits in the space of a few months; others, including many amateurs, overstayed the boom, and were badly burned. Both groups are now buying equities, trying either to add to their winnings or to recoup their losses.

The public's enthusiasm for speculation has been an open invitation to promoters and manipulators. It is significant that the SEC's charge that there is "evidence of increasing manipulative activity" was not denied on Wall Street, where the usual attitude towards the SEC is that it engages in fishing expeditions. Some brokers feel that tips and rumours are being inspired, to incite public demand for certain issues, by operators who own a pool of these shares and unload them as prices rise. It is also suspected that a number of new issues, which are heavily over-subscribed and promptly go to a handsome premium, are being manipulated.

Such activity, which was winked at in the nineteen-twenties, is now illegal; this makes it difficult to detect and even more difficult to prove. The SEC has charged a number of individual operators with fleecing the public, the most notorious being Mr Alexander Guterma who, it alleges, used securities in bankrupt companies he headed as collateral for loans from money lenders, who then sold the shares to unsuspecting investors. This particular form of manipulation may be peculiar to Mr Guterma, but the SEC thinks that other manipulators are also using money lenders, domestic and foreign, who are prepared to advance funds, with no questions asked, provided they receive adequate collateral. With the Federal Reserve insisting that the banks and brokers must require cash margins of 90 per cent, the money lenders are practically indispensable to market operators.

Both the SEC and Wall Street seem to agree that the amount of manipulation going on today is very minor when compared with the nineteen-twenties, and the financial community hopes, somewhat wishfully, that it will fade away if speculation does not run riot. Certainly, manipulation cannot flourish unless the public is in a gambling mood. Thus there is logic in the belief that excessive speculation is the root of all evil, and it is a sign of progress that Wall Street recognises that it, as well as the public, will be the loser if faith in equities is shaken.

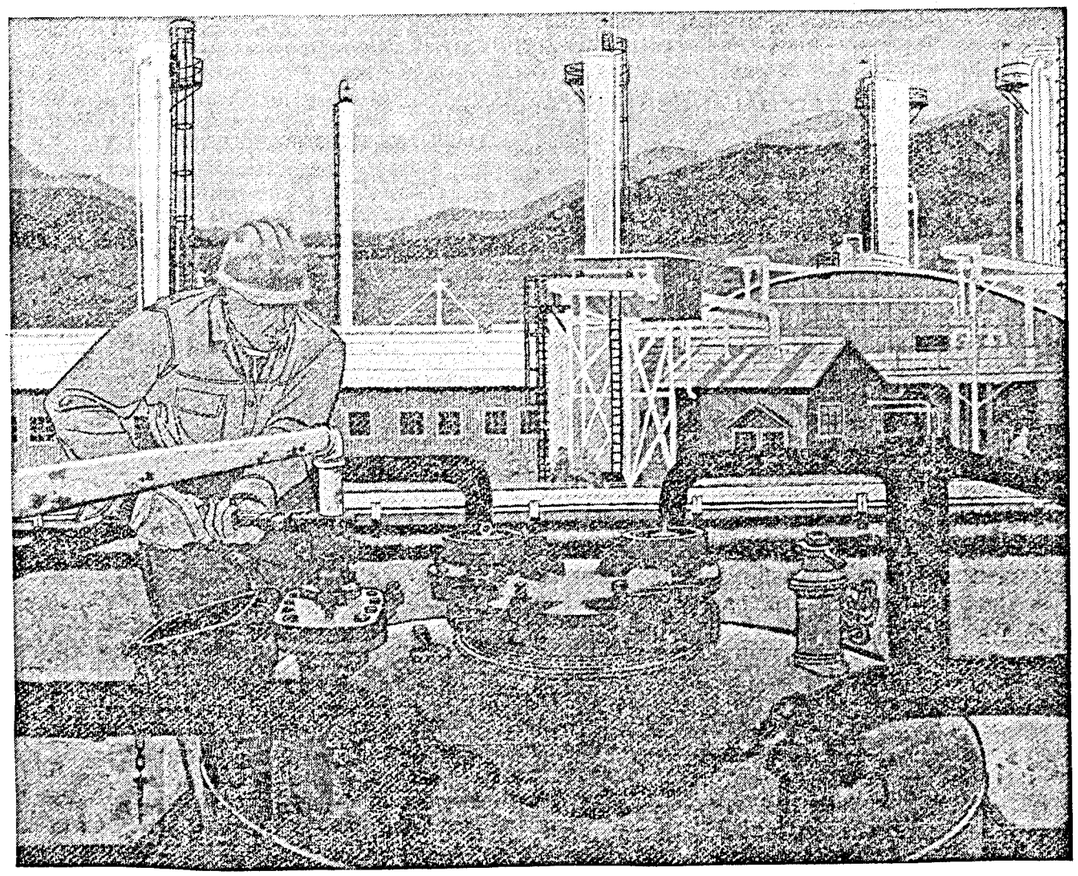
Republicans Get Ready

THIS was a nostalgic week for the Republican party; ending with the tragic resignation of its great statesman, Mr Dulles, the week began with the dedication of a bell tower in memory of the epitome of all Republicans, Senator Taft. Whether the new bells will toll for his party next year will depend to some extent on what is done by the presidential nominating convention which was fixed last week for Chicago, to begin on July 25, 1960, a hundred years after the Republicans nominated Abraham Lincoln in the same city—a good precedent for the politicians, perhaps, but hardly for the peace and prosperity on which they hope to win the 1960 election.

Their chances of winning it, or at least of holding the Presidency, have improved recently, not only because both peace and prosperity look like reaching a peak in 1960 but also because the many rival Democratic candidates are already wearing themselves out competing against each other, while the Republicans' two outstanding young potential Presidents are both resolutely refusing to demean themselves by admitting that there is a contest at all. Chicago was chosen for the convention partly because it is uncommitted territory as far as these two men are concerned, half way between Vice President Nixon's California and Governor Rockefeller's New York, partly because, being central, it is comparatively cheap for the delegates to get there, but mainly because the city's offer of financial help, $532,000 altogether towards the convention expenses, was better than any other.

The Republican National Committee also chose a new chairman last week, to organise the convention, to prepare for the campaign and to replace Mr Meade Alcorn, who has resigned not because his efforts were so unsuccessful in last autumn's election but for unavoidable personal reasons. His successor is Senator Thruston Morton of Kentucky, youngish, well-liked, energetic, balanced, with experience in both Houses of Congress and in the State Department, slightly right of centre but always an Eisenhower supporter. He should be able to hold together the two wings of the party if anyone can. He is an old friend of Mr Nixon's, put in, many people believe, though the party chairman is supposed to be neutral, to ensure that Mr Nixon will be the presidential nominee in 1960. On the other hand the conservative Republicans are sufficiently suspicious of Mr Morton to reassure the liberals who favour Mr Rockefeller. These conservatives tried to oppose Senator Morton's nomination on the grounds that the chairmanship should be a full-time job, even though it is unpaid. Mr Morton would hardly be allowed to resign from the Senate, even if he wanted to, since he would almost certainly be replaced by a Democrat. But in any case the opposition to him collapsed as soon as President Eisenhower's pronounced preference for him was known.

Michigan Goes Begging



A MINOR reason for the Republicans' optimism at their meeting in Washington last week was the bouquet of flowers that has blossomed in Michigan's spring election—*three Republican victories, the first in any statewide election* in Michigan since 1955, and a satisfactory rise in the number of Republican votes cast in various other contests. Admittedly all that was won were three seats on the governing bodies of the state universities, posts which it hardly seems suitable to fill by general election at all, certainly not by one on party lines. But both Governor Williams, the Democrat who has run the state for the unprecedentedly long term of ten years, and the Republicans who seem to be in equally permanent control of the State Legislature, used these elections to bring home to Michigan's citizens the fact that the state is virtually bankrupt and to condemn each other for this plight. The Democrats accuse the Repub-

DOW CHEMICALS *for industry*

Industry's vital partners in growth are industrial chemicals. Around the globe, industry progresses because of chemicals which help to increase yields, cut processing time and costs, aid in making new and better products. Chemicals from Dow play an important part in this progress.

Dow chemicals lend a powerful hand in wresting metals from raw ore. They help purify water to quench man's thirst, save citrus groves from dying of iron starvation, aid in fractionating rare earths, assist in making textiles stronger and more colorful.

Chemicals from Dow are at work around the globe, assisting industry in every type of processing operation. For more information on how Dow products can aid your operations, contact your Dow representative or the branch office in your area.

TEXACO
...CONSTANT PROGRESS
IN OIL'S FIRST CENTURY

licans of refusing to pass new taxes and of obstructing the Governor, while the Republicans blame him for over-expanding the state's welfare services under pressure from his main supporter, the automobile workers' trade union. Since this situation is roughly paralleled in the federal government, at least as far as the Republican attitude is concerned, that party has naturally been heartened by its good showing in Michigan.

In fact, of course, the state's difficulties are only an extreme form of those which most other states, especially the heavily industrialised ones, are facing: rising costs and growing populations have meant a steady increase in regular expenditures, accentuated this year by the recession, which has also brought a decline in revenues. In Michigan, particularly hard-hit by the falling-off in automobile output, city welfare funds in Detroit and elsewhere are being exhausted and the state has had to take over responsibility for many of these programmes, while the 3 per cent sales tax, the state's main source of revenue, has been bringing in less than was forecast. As a result Michigan, which ended its last fiscal year with a deficit of $21 million, expects one of $110 million next July.

Meanwhile, the Governor has already weathered one crisis this year only by begging the automobile companies to pay $30 million of taxes in advance, by forcing the universities to finance themselves by borrowing up to the limit of their capacities and by various other expedients to reduce the state's expenses. Now he is trying to get permission from the Legislature to borrow $50 million from the ex-servicemen's trust fund, in order to pay this month's state wages. He has long realised, and at last the Legislature is also prepared to admit, that additional taxation is the only solution. But the Governor refuses to accept the increased sales tax, a levy on even the poorest automobile worker, which the Republicans offer. He is holding out for a tax on profits and a graduated income tax which would fall most heavily on the better-off—the automobile manufacturers, for example.

Conflicts in Court

FROM A SPECIAL CORRESPONDENT

MR JUSTICE FRANKFURTER remarked once that great constitutional cases seldom involve a single principle. They reach the Supreme Court of the United States, he claimed, just because they present conflicting principles between which the court must choose. No recent cases have demonstrated this truth more tellingly than the court's two decisions last month permitting consecutive state and federal prosecutions of the same defendant for the same criminal act. The principal case concerned Mr Alfonse Bartkus, who was accused of assisting in the robbery of a bank in Illinois. Because the bank was insured by the Federal Deposit Insurance Corporation, it was a federal as well as a state crime. Mr Bartkus was tried in a federal court and acquitted by the jury. Federal officials then helped the State of Illinois to prosecute him, seeking out new evidence and preparing witnesses for the state's use. In the state trial Mr Bartkus was convicted. The second case decided by the Supreme Court went in the opposite order—a state conviction, then a federal trial, conviction and longer sentence for the same defendants.

To the layman it clearly came as a shock that the Constitution could possibly permit such double prosecutions. After all, the Fifth Amendment provides that the federal government shall not put any man "twice . . . in jeopardy of life or limb." And the Fourteenth Amendment forbids state governments to "deprive any person of life, liberty or property without due process of law." Editorial writers and columnists, among them some who have criticised the Supreme Court recently on occasions when it has ruled against assertions of power by governments and in favour of individual rights, expressed at least uneasiness at the court's decisions. The layman's reaction seemed to bear out the comment of Mr Justice Black in his dissenting opinion about the "fear and abhorrence of governmental power to try people twice for the same conduct." He said "few principles have been more deeply rooted in the traditions and conscience of our people." The difficulty, of course, was that abhorrence of double prosecutions was not the only principle at issue. It had to contend with the powerful theory, on which the American system is based, that state and federal governments co-exist, each sovereign in its own sphere of affairs.

MR JUSTICE FRANKFURTER, writing for the majority in the Bartkus case, found this principle of federalism the more compelling. In a federal system, he suggested, one sovereignty cannot be prevented from protecting its interests because of another government's possible incompetence or even corruption in the handling of a case. He noted also that the Constitution gave the federal government only limited powers. To let the exertion of those powers operate as a bar in every case "would be a shocking and untoward deprivation of the historic right and obligation of the states to maintain peace and order," he said. Mr Bartkus's conviction was affirmed by 5 to 4. Chief Justice Warren and Mr Justice Douglas joined Mr Black's dissent, arguing that successive prosecutions were barred by the Constitution whether or not different governments were involved.

The division between Mr Frankfurter and Mr Black is a familiar one in the Supreme Court's history during the last decade and more. They have been, and remain, the leaders of deeply opposed schools of judicial thought. Mr Frankfurter's guiding star is respect for the two political branches of government and a reluctance to deprive it of powers by sweeping interpretations of a necessarily indefinite Constitution. Mr Black's central concern is with individuals, not governments. "Looked at from the standpoint of the individual who is being prosecuted," he said in the Bartkus case, the majority's notion of "two sovereignties" is "too subtle for me to grasp." Differences are inevitable on the Supreme Court, but differences so long and so vigorously maintained, and felt so deeply as these evidently are, may poison the process of decision. Justice Frankfurter's opinion in the double jeopardy cases seemed sometimes to view federalism as an end in itself, not as a means to a better life for individuals. Justice Black was surely engaging in unnecessary exaggeration when he feared that officials would use consecutive prosecutions "to make scapegoats of helpless political, religious or racial minorities and those who differ, who do not conform and resist tyranny."

An extraordinary footnote was added to the cases by the United States Attorney General, Mr William Rogers. He issued an order to all federal enforcement officers instructing them to avoid double prosecutions except for "compelling

reasons," and then only after obtaining his approval. For those who agree with Mr Justice Black, the Attorney General's order could be interpreted as showing official reluctance to use a power because of deep-rooted feelings against it. But for Mr Justice Frankfurter and his adherents the order shows that wise restraint by a court may encourage wise and principled exercise of power by those who have the responsibility to govern.

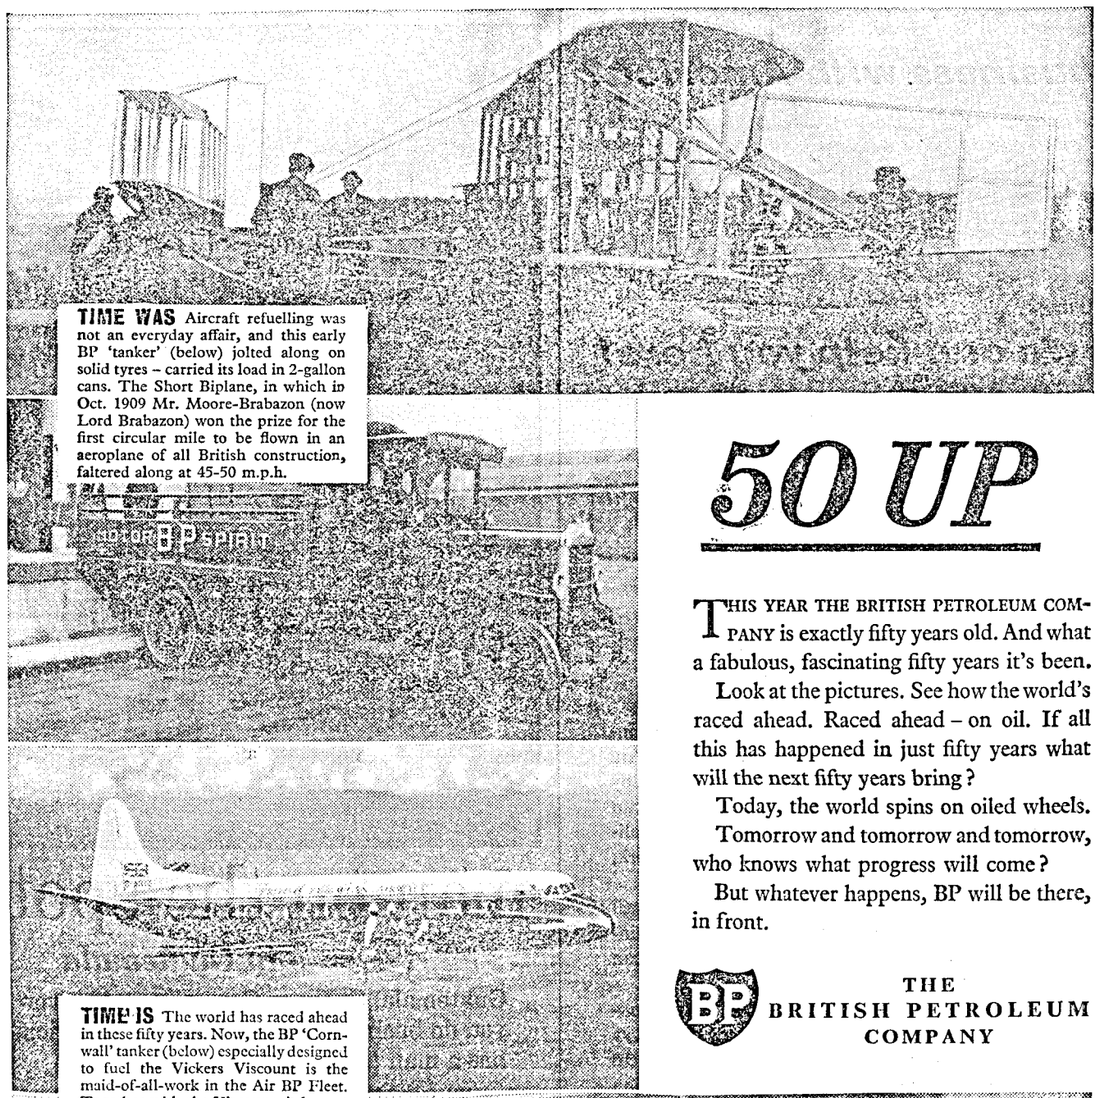
Tax Cuts Never?

THE tax cuts announced by the British Chancellor of the Exchequer arouse a wistful envy in American hearts. It is true that both President Eisenhower and his Director of the Budget have held out hopes that, if government spending can be kept down in fiscal 1960, the financial year which begins next July, some relief might be in sight. But there is no real possibility that Congress will fulfil the condition and, indeed, it seems much more probable that spending will continue to increase every year. So may tax receipts, but a Harvard economist, in a recent study for the Committee on Economic Development, as organisation of progressive businessmen, argues that revenues from the present tax structure are unlikely to exceed outlays by enough for a general cut in taxes until 1964.

The committee itself, in a statement strongly supporting Mr Eisenhower's demand for a balanced Budget in the coming financial year, says that, if more money is needed for defence or for foreign aid, it should be met by raising taxation. This is exactly what the President has told the Democratic majority in Congress it ought to do, if it votes to spend more money than is provided for in the 1960 Budget. But only two liberal Democrats—Senator Neuberger and Senator Clark—responded to this plea for fiscal responsibility. Instead, Congress has already more than wiped out the President's theoretical surplus of $70 million by refusing even to consider the relatively minor increases in taxes on which it rests.

The loss of a few hundred millions here and there may not matter if, as it now appears, the Administration was too pessimistic about the rate at which corporate profits are recovering. Last January the budget experts put them at $47 billion in 1959, but it now looks as though they would be a good deal higher—certainly $50 billion and perhaps more. This would bring in an unbargained-for $1.5 billion or so in revenue. However, such optimistic calculations, which would permit the Budget to be balanced even though spending exceeded the President's $77 billion, do not appeal to Congress's Joint Committee on Internal Revenue Taxation, which is usually extremely accurate in its forecasts of receipts and expenditures. It insisted recently that the President's January estimates were too hopeful on both sides of the ledger: spending might be as much as $3 billion higher and receipts probably would be $1.2 billion less, partly because lower revenues from taxes on personal income would offset a rise in corporate tax revenues, and partly because Congress would turn down Mr Eisenhower's tax proposals. The Administration itself, when it looks beyond next year to fiscal 1961, sees little that is cheering to the taxpayer; revenues are likely to grow by $3 billion, but "built-in" increases in non-defence spending will absorb about two-thirds of this, quite apart from any new spending proposals from either the President or Congress.

Life at Uncle Sam's Expense



FROM A CORRESPONDENT IN NEW YORK

THE maximum tax that an American could be charged by the federal government on his income this year would be 87 per cent, but few are so rich and so ingenuous as to be caught in that top bracket. The minimum he could pay depends less on the actual income he receives than on his deftness in charging items off against the expense account allowed him by his employer (who then deducts it from the cost of doing business) or in seeking his own loopholes in the tax laws and ordering his life so as to take advantage of them. Many people do both. Living on an expense account is a recognised technique, loopholes in the law are many; and at the moment they are being explored in detail, since this is the season when some sixty million Americans are filling out a federal tax form. Does the taxpayer own his house? Then he should sell it, and buy another for the selling price; there will in this case be no capital gains tax on any profit he makes, and he may acquire a better house. Or it might be cheaper to invest in a co-operative apartment; that part of his monthly payments which represents interest and taxes can be deducted from taxable income. Or should he become a farmer? He can then deduct business costs and have fun damming fish ponds or planting acres of trees, both of which come under the head of soil conservation. Does he drive a car? Licence fees are deductible, so is any damage suffered in an accident. How about giving a party? If he is careful to invite clients or customers they become a business expense.

Trade union dues and initiation fees to a society, the rental of a safe deposit box or the fee of a financial adviser, a bad debt, an expert's charge for preparing the income tax return can all be subtracted. Is the tax-payer blind? It may be a misfortune, but it gives him a $600 deduction. Is he divorced? Why not? It might be cheaper than paying his wife's housekeeping bills, especially if he is frequently out of town on tax-deductible business trips. He gets no tax allowance on their joint household expenses, but if they lived apart he could deduct the alimony he would be paying her. These examples do not concern the majority, whose taxes are paid by their employers under the withholding process or who fill in a standard, simplified form, but the economic minority, the relatively prosperous ones who earn $10,000 a year or more and who must itemise their tax deductions.

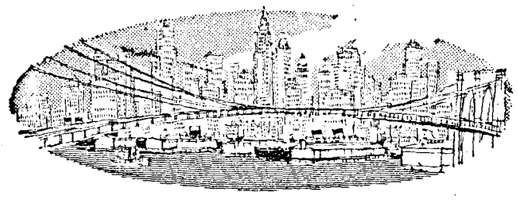
WITH variations, the same group prospers under the expense account. Worldly wise and tax conscious, these people work for firms which authorise them to travel and to entertain in the firm's name. The man who dines only at the best restaurants, and takes his clients to see only the most popular plays might, were he paying the full bill himself, persuade his wife to cook supper and then take his guests around the corner to the cinema. But the privilege of writing these gestures off, either on the company's expense account or from his own taxable income, makes a different man of him. He becomes a free spender, bigger than life-size, and head waiters bow, while the bill is ultimately delivered to Uncle Sam.

The effect is felt by more than the individual taxpayer. Critics charge that the interaction of expense account habits and income tax rules distorts the price system and

50 UP

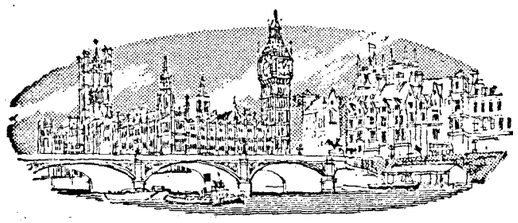
THIS YEAR THE BRITISH PETROLEUM COMPANY is exactly fifty years old. And what a fabulous, fascinating fifty years it's been.

Look at the pictures. See how the world's raced ahead. Raced ahead – on oil. If all this has happened in just fifty years what will the next fifty years bring?



Today, the world spins on oiled wheels.

Tomorrow and tomorrow and tomorrow, who knows what progress will come?



But whatever happens, BP will be there, in front.

THE BRITISH PETROLEUM COMPANY

business with America?

we can help you here!

THE AMERICAN MARKET AT YOUR FINGERTIPS—IN LONDON

MONTH BY MONTH business with America is increasing. But are you getting your share of it? Are you taking advantage of the possibilities offered by this valuable trading area? If not, perhaps we can help. Get in touch with American business by calling on The First National City Bank of New York, right here in London.

In either of our two London branches you will find qualified American banking experts maintaining close contact with every aspect of American business life.

Through our Head Office in Wall Street (connected with a network of branches all over New York City and correspondents throughout America) we can provide you with up-to-date information specially tailored to suit your needs. We can put you in touch with reliable importers and exporters and arrange banking facilities wherever they may be needed to expedite your business ventures.

Pay a call on The First National City Bank. Find out *for yourself* just how much we can help you.

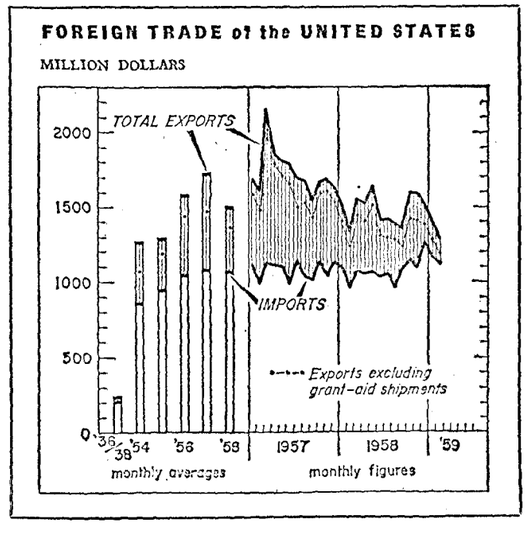
weakens the moral fibre of the country. The evidence offered includes such trends as the climbing prices of beefsteaks and theatre tickets, the sea-going convention, and the recently disclosed business interest in ladies whose telephone numbers can be bought.

Beefsteaks have been a sore point ever since the last war, when an economist discovered that New York lacked this popular food because all the beefsteaks were being eaten in Chicago by business men attending conventions on expense accounts. For years it has been a byword in the theatrical world that the most popular New York plays are sold out weeks in advance because corporations in Detroit and Pittsburgh buy up blocks of seats and issue them to officers making business trips to New York, or to salesmen needing to entertain important customers there. The annual convention is of course no novelty. For years these holiday jaunts, masked as educational meetings and therefore properly chargeable to the costs of doing business, have helped to support big resort hotels with convenient golf courses. This year, however, the Furness Bermuda Line reports that 26 per cent of its cruise booking in 1959, as compared with 18 per cent in 1958, will be convention business. The growing popularity of holding conventions at sea is said to be due to the fact that more members attend educational meetings on board ship just because there are no golf courses attached. Here, too, of course, the final bill is paid by the government in the form of tax money which it does not collect.



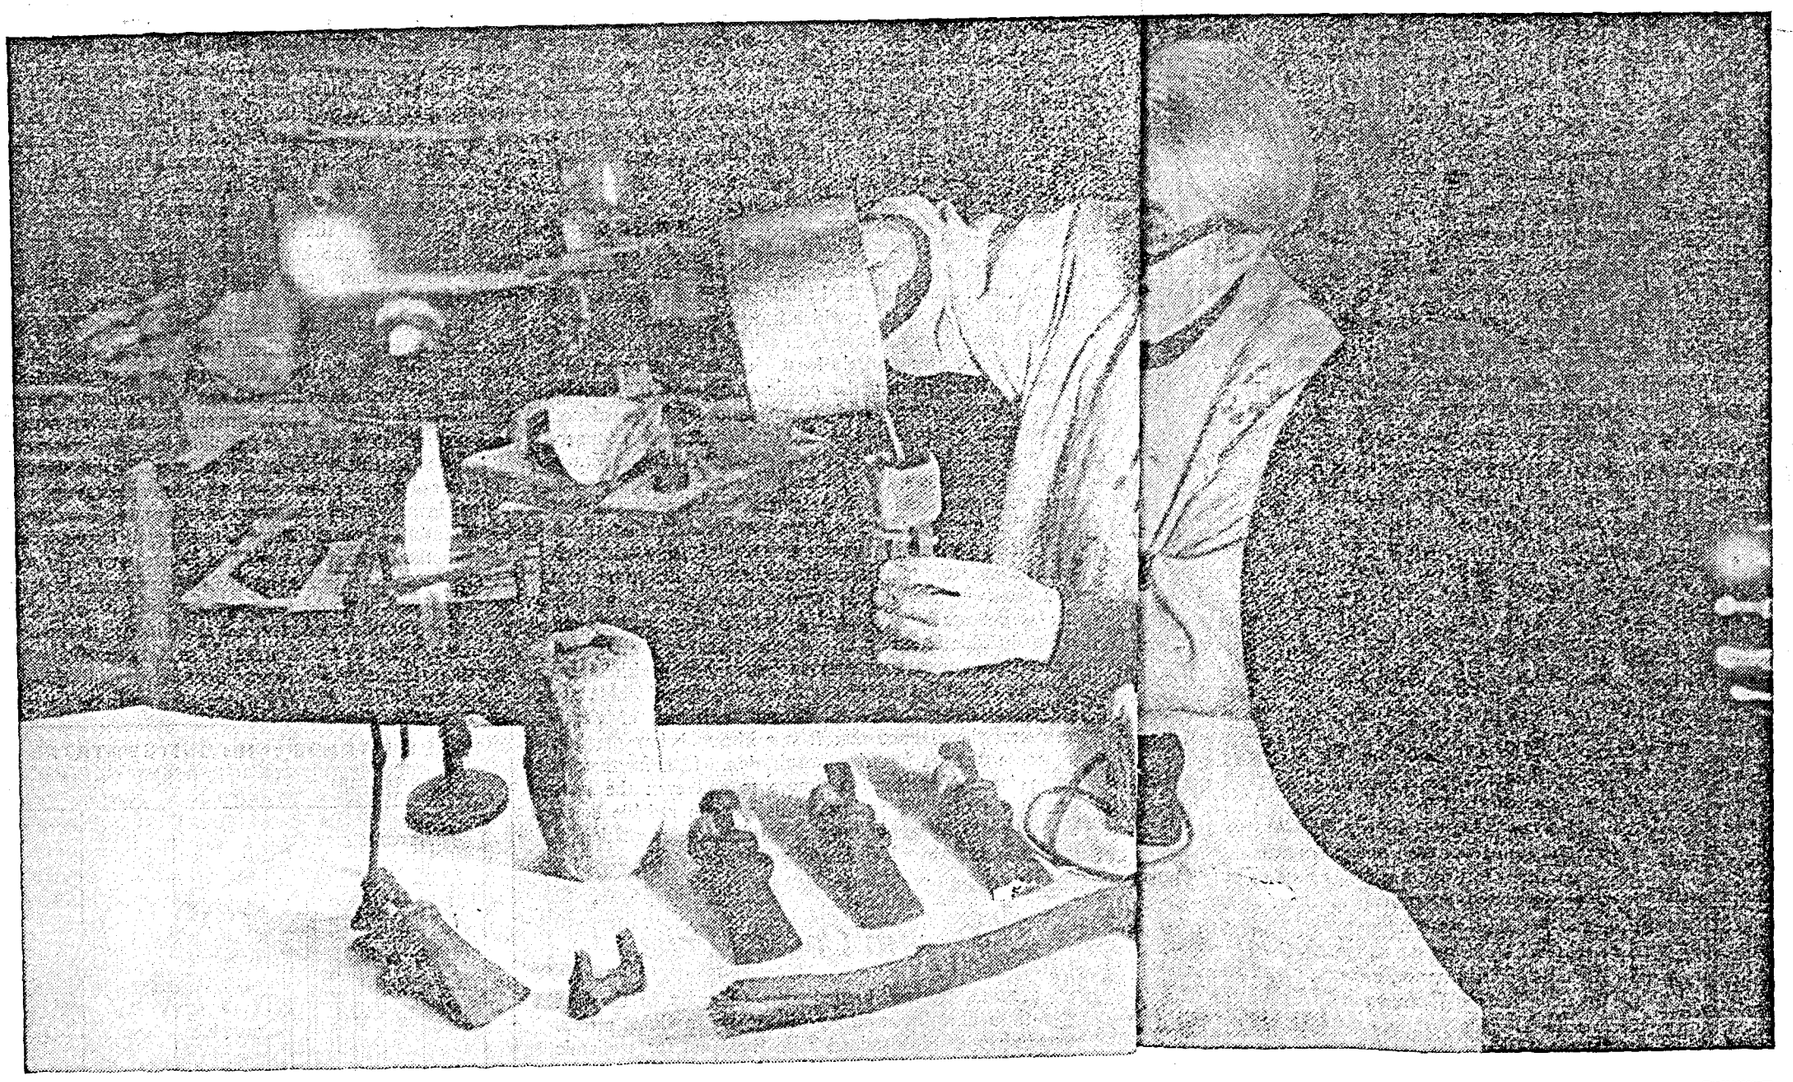
Very few eyebrows have been raised at these practices; they are, of course, entirely legal. Two further extensions have, however, nudged the public conscience. The Ohio State University School of Journalism recently questioned six hundred presidents of big industrial, insurance, commercial and banking firms on their tax-deductible Christmas giving; under promise of anonymity nearly a quarter of them responded and, with considerable acrimony, some of them described the custom bluntly as "blackmail" which they could neither approve nor escape. In their world, such gifts ranged from trinkets to Cadillacs, and on to the "loan of a yacht, liquored, fuelled and girled." How commonly the last delicate item is provided in this expense account and tax deductible economy as a part of business entertaining emerged not long ago from an hour-long television programme of the kind called "documentary," which led to indignant denials from the National Association of Manufacturers who claimed that it was hitting below the belt to accuse them of fostering prostitution. Thus far there is no evidence of a concerted move to end even the most flamboyant of these practices; indeed, no reliable study exists to tell the whole story or to clear the reputation of the business firms which keep free of purple fringes.

Dream Comes True

DR FIDEL CASTRO, invited to Washington in the first flush of enthusiasm for his victory in Cuba, arrives this week with bloodstained hands held out for economic aid which his record so far shows little to justify. Luckily for his embarrassed hosts, he is coming only unofficially. Luckily for him he is coming at a time when the new American policy of demonstrating inter-American solidarity economically as well as politically and militarily has just been confirmed by the initialling of the charter of the Inter-American Development Bank. This is a Latin American dream, regularly spurned as unrealistic by the United States until Vice President Nixon's unfortunate experiences last year made the Administration realise that it might be a good thing to make a dream come true.

The new institution is supposed to promote the investment of public and private capital for development purposes and to encourage economic growth and the better utilisation of resources. The difficulty of how to help countries which are not good credit risks is circumvented by the establishment of two complementary agencies: one, with a capital of $850 million, to make loans in hard currencies, mainly dollars, on regular commercial terms; the other, with $150 million, to make loans on easy terms for projects that are desirable but not self-liquidating, to be repaid in soft currencies. The agreement must be ratified by the end of the year and the contributions are to be in instalments, with $450 million of the amount for hard loans remaining callable as backing for ordinary bond issues. The United States is to contribute $150 million of the paid-up part, $200 million of the callable sum and $100 million of the special fund for soft loans; the rest will come from the twenty Latin American republics. Borrowers will be free to spend the money in any country they choose. But how much some of the most hopeful backers of the new institution will get from it is doubtful; those who have already borrowed heavily from other international agencies may find themselves overburdened with debt.

That some stimulus for capital for Latin America is needed, however, is clear from last year's balance of payments figures. While the outflow of US government long-term capital to the area in 1958 was $468 million, compared with $300 million in 1957, private direct investment fell to $411 million from $1,104 million in the previous year. With Vice President Nixon himself coming out this week in favour of the much-talked-of special tax plan to encourage private investment abroad, there is a prospect of overcoming the Treasury's opposition to this proposal, long advocated by both the State and Commerce Departments. It would permit companies to set up special foreign business corporations which would only pay American taxes on their profits when these were returned as dividends to the parent company in the United States. With Administration backing, this proposal has a chance of getting through Congress.



THE ECONOMIST APRIL 18, 1959

Monsanto Reg.

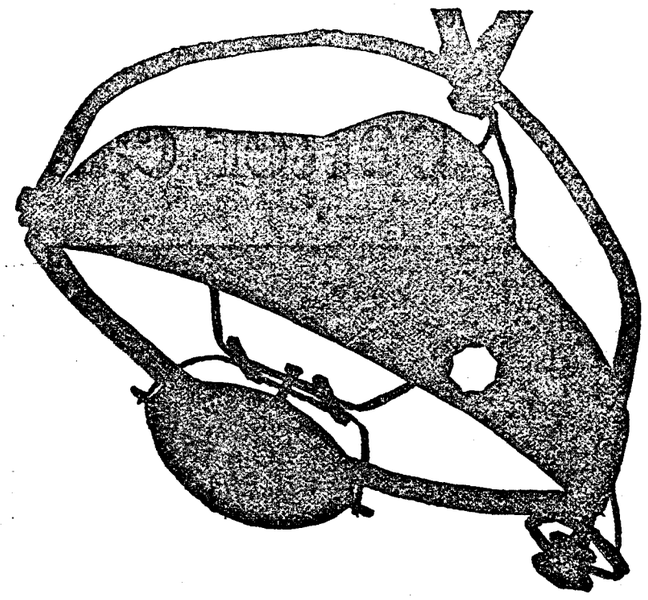
Through creative chemistry, Monsanto turnsterday's dreams into present-day realities

Back to the Bronze Æ for better castings!

TODAY, added scope and greater productivity are being given to British industry by investment casting—a process following principles used by Bronze Age metal workers.

The use of investment casting allows designers greater freedom in their choice of metals. For any alloy that can be melted can be shaped by investment casting—frequently without expensive machining. The system also cuts costs in other ways: in the accurate production of large numbers of small parts; in the formation of complex shapes; in short runs and prototype work. There is no wastage of metal, and components consisting of several parts can be cast in one piece.

The mould material used in investment casting faithfully reproduces every detail of the original pattern. To do this, it must fulfil exacting requirements—all of which are met by a binder or bonding agent. The most efficient bonding agent by far is ethyl silicate, sold by Monsanto under the trade name of Silester O. This chemical has the added advantage of giving great strength to the mould.



Investment casting reduces production costs. And Silester O plays a vital part in this economy. It's another way Monsanto brings a better future closer.

Silester is a Registered Trade Mark.

If you, as a manufacturer, are interested in chemicals or plastics, it will pay you to get in touch with Monsanto.

GRANADA presents

SURGEON

Every day lives are saved by surgery. In this programme a leading surgeon is seen at work in the operating theatre of a hospital performing a major operation on a girl of seventeen. It shows the skill of British surgery as upheld by the great tradition of the Royal College of Surgeons of England —the wealth of experience and knowledge which is brought to bear in the day-to-day fight against disease. The courage and hope of a teenager and her family also play their part in saving a life.

Made with the help of
A LONDON HOSPITAL
A HAMMERSMITH FAMILY
THE ROYAL COLLEGE OF SURGEONS OF ENGLAND
and seven members of the College Council:
Sir James Paterson Ross, K.C.V.O., F.R.C.S. (*President*)
Mr. Lawrence Abel, F.R.C.S.
Professor Ian Aird, F.R.C.S.
Sir Archibald McIndoe, C.B.E., F.R.C.S. (*Vice President*)
Sir Arthur Porritt, K.C.M.G., K.C.V.O., C.B.E., F.R.C.S.
Sir Reginald Watson-Jones, F.R.C.S.
Mr. Arthur Dickson Wright, F.R.C.S. (*Vice President*)

THE WORLD OVERSEAS

Persians Salvage Their Dreams

FROM OUR SPECIAL CORRESPONDENT LATELY IN TEHERAN

For better or worse, the Persians have thrown in their lot with the West. In the parliament early last month the only opposition to the newly signed economic and military agreement with the United States came from a wealthy, land-owning deputy who said the Americans were ruining Persia. They were, he lamented, encouraging the government to increase taxes, undermining the authority of the tribal leaders, upsetting the established social pattern all over the country, and, what was worse, they were not giving Persia enough money. When the parliament voted on the agreement, only half its members had found time to attend the special session ; all but five deputies rose to indicate approval of it. There were no cheers. The Teheran government regards the term "indirect aggression" as a guarantee of the *status quo* in Persia. The Persians' own translation of the agreement attempts to make this point more clearly than does the original English. Thus the United States has spread its protecting wings over Persia as it is today. In doing so it may have effectively removed any chances it would have had of retaining the friendship of Persians if there should be an internal upheaval.

The Persian government, ever sensitive to any kind of criticism, has still not recovered from the embarrassment of the Russian negotiations in February. These discussions were initiated by the Shah without the knowledge of his western allies and they were broken off by the Russians when the bargaining got too tough. By the time the Russians stalked out in a huff, word of the negotiations had been revealed to the rest of the world and to the Persians themselves. The government's only defence of its action was to warn Teheran newspapers and politicians that they should not say anything to antagonise the Soviet Union or give the Russians grist for their propaganda mill. The fear of Soviet ambitions is genuine and deep but many Persians feel that their government sometimes uses this fear to prevent the from criticising its actions. While the newspapers were being polite about the Russians in deference to the government's wishes, the government plastered the town, including the high wall around the vast Russian embassy compound in downtown Teheran, with anti-Russian posters.

The institution of monarchy is not an unpopular one amongst the Persians. They regard the Baghdad butchery of last July as further proof of the barbarous ways of the Iraqis who, after all, murdered Imam Ali, the son-in-law of the Prophet in the year 661. The Shah is complete master of Persia today. His position is, however, dangerously and narrowly based on the support of a few hundred land-owning families. A recent law forbids members of the royal family to engage in business or contracts for the state. So far as it goes, the law is a good one but it does not go far enough and apparently the in-laws of the royal family are free to carry on as before. The Shah firmly holds control over the army. This may make his position more secure; but it hardly augurs well for the national security, or encourages his allies to provide him with the weapons he wants, that the high command of the army is composed of quarrelling generals picked for their jobs with the one idea that if they cannot get along with each other they will not be able to band together to stage a *coup d'état*.

There are Persians who say they are hoping for a revolution. But the apparent failure of the Iraqi revolution to solve any of Iraq's problems has made even the most desperate Persians realise that, as in Iraq, a revolution in Teheran would be useless to them and that only the Soviet Union would gain anything from it. There is no sign of revived Tudeh party activity or communist propaganda in the country. The Shah's closest advisers tell him that there are no communists in Persia. Nuri es-Said thought all his communists were dead or in gaol.

Desperately anxious to be modern, the Persians show themselves uncertain or confused about what modernity means. The Teheran municipality seems to believe modernisation to consist of the building of large ornate fountains and squares. The sad thing about the fountains is that, while the bronze sea-horses spew forth streams of purified water, around them the women of the neighbourhood may be doing the family washing in the filthy open drains. The city fathers of Teheran need not fear that their metropolis will be thought backward by foreigners. True, some people claim that a whole country is being destroyed to build Teheran. But houses and buildings are going up everywhere, land values are soaring, and the traffic in the broad avenues is more congested than in any western city.

The show-window of progress and modernisation in Persia is the Plan Organisation, established in 1956 to succeed the former one which had withered away with the country's oil revenues soon after nationalisation in 1951. Until a few weeks ago it was headed by Mr A. H. Ebtehaj, a former head of the national bank, who made the mistake of seeming to become more powerful than all the rest of the government put together. There is little doubt that Mr Ebtehaj would have been able to change the face of Persia if he had been allowed to carry out his kind of planning for fifteen or twenty years, and if he had received, from Persia's oil revenues, as much money as was necessary to do the job. But Persia cannot wait fifteen or twenty years to reap the harvests promised by orderly planning, and there is never enough money to do everything. The future benefits of economic planning and construction did not favourably impress the heads of other government departments who had to contend with the political realities of the present. Not unreasonably did the minister of roads think that roads were the responsibility of his department. The minister of defence thought that topographical surveys were his busi-

ness. The minister of agriculture wanted to control loans for agricultural machinery. But the Plan Organisation was doing all these things. In the end, a position was reached in which either Mr Ebtehaj or the prime minister, Dr Eqbal, had to go. The palace and influential Persians were not ready for what seemed the only other way out, that of making Mr Ebtehaj prime minister. The thought of his riding rough-shod through the over-staffed and inefficient government offices, crossing swords with one vested interest after another, and being cheered on by those whose toes he did not step on was enough to make the Shah decide that the country was not in such desperate straits that he had to produce a strong man. For the time being only the Shah is to be the strong man in a country full of very weak ones.

The Plan Organisation is slowly recovering from the shock of losing its head. The ministers have been promised that they will be allowed to carry out some of the operations that normally fall within their responsibilities, but the prime minister insists that the organisation built up by Mr Ebtehaj with such care and skill will not be destroyed. Meanwhile, in the neat offices of the Plan Organisation, the bright young men of Persia, educated in the West, and impatient of the age-old bumbling and corruption that have become accepted features of government operations, hope to salvage their dreams even if Mr Ebtehaj is not there to fight their battles.

Favourite for Chancellor

FROM OUR BONN CORRESPONDENT

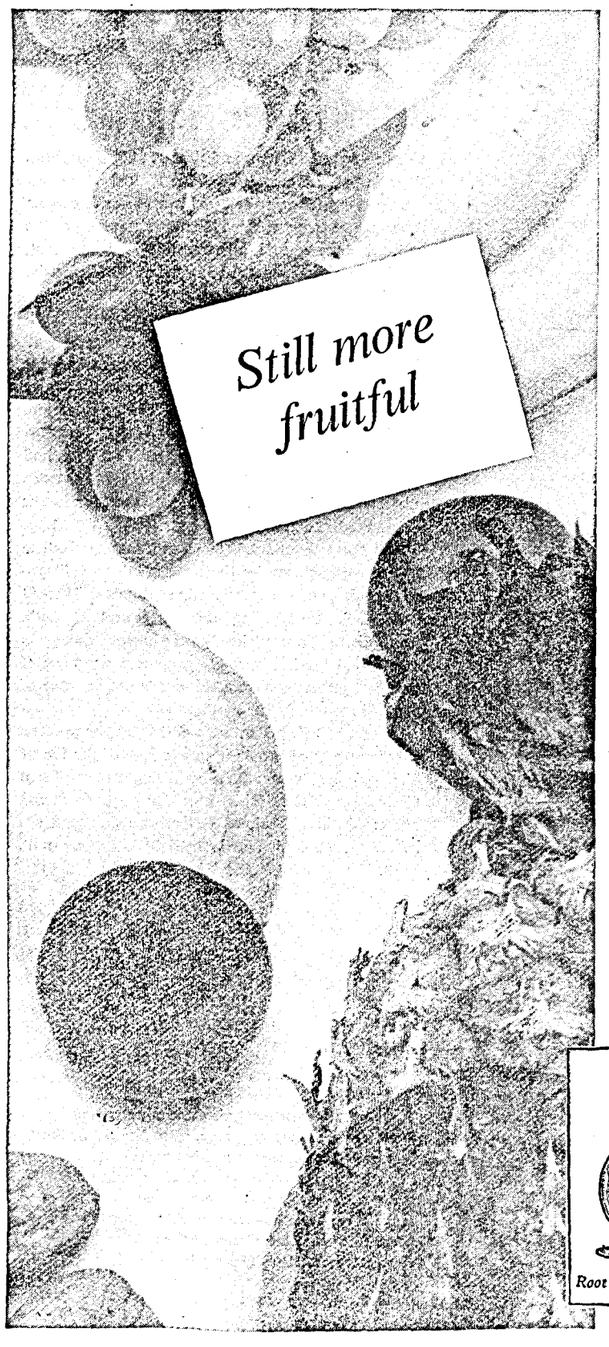
IT is not only Humbert Wolfe's city financier who this April is looking

> . . . importantly about him
> while all the spring goes on without him.

According to credible reports the holidaying Chancellor is much more deeply engrossed in the paragraphs of the Basic Law of the Federal Republic of Germany pertaining to the president's powers than in the natural beauties of Lake Como ; and many a Bonn deputy can hardly see the cherry blossom by the Rhine for the smoke of pipe dreams.

Herr Erhard is noticeably assuming the air of chancellor-designate. It is said he has threatened not to serve as economics minister under another chancellor. After all, he is, and has been for nearly two years, the present chancellor's deputy. In the several public speeches which he has delivered since April 7th (when Dr Adenauer was prevailed upon to stand for President) he seems to have made a point of demonstrating that his interests are by no means confined to economics. At the Christian Democratic Union's economic conference at Hanover last week he dwelt fondly on the close inter-relation of a modern state's economic and foreign policies. At a Rhineland-Palatinate election rally at Mainz he gave resounding assurances of federal Germany's unfaltering loyalty to the western alliance. To the Foreign Press Association in Bonn this week he spoke cautiously but suggestively of possible developments in the technical organisation of society that would require new attempts to reach international understanding.

There is not the slightest doubt that at the moment Herr Erhard is the public's favourite for the chancellorship. He has served in the cabinet for ten years. His audacious policies, tempered by earthy common sense, have borne prize-winning fruit. He has taken the trouble to explain them to the layman in comprehensible terms, from time to time chartering whole newspaper columns to do so. He has a personality that strikes the mind's eye. He exudes decency and confidence. He has kept closely to his electioneering promises, and he has fought for his principles against sizeable opposition from whatever quarter, whether it has been the chancellor himself, the cartel-minded industrialists, or the trade unions.



These admirable qualities may not commend Herr Erhard to an ambitious president looking for an amenable chancellor. If Dr Adenauer is as reluctant to let go the reins of power as he is widely assumed to be, he will have to marshal Herr Erhard's opponents quickly and set about establishing another candidate. According to the generally accepted interpretation of the federal basic law, Dr Adenauer, after being elected president in July, would continue to act as chancellor until he took over from Dr Heuss. So he has until September to mobilise opinion against Dr Erhard, if he wishes to. Strong objections to Herr Erhard are to be found chiefly among those who fear the competition inherent in his liberal " free market economy," both at home and in the European free trade area which he would still like to see. They have lately been voiced with considerable vehemence by Herr Carl Neumann, president of the textile manufacturers' federation.

There are some Christian Democrats who object that Dr Erhard lacks administrative experience and is not sufficiently versed in the niceties of party affairs. But, in addition to strong public and party support, Herr Erhard will also have the backing of many who see in his sturdy independence the assurance of a corrective, if it should be needed, to presidential trespassing. It would not be altogether easy now for Dr Adenauer and the anti-Erhard group in industry to persuade the Bundestag to vote Herr Etzel, the finance minister, into the chancellorship in preference to Herr Erhard. Capable as he is, Herr Etzel is comparatively little known outside parliament, and it is questionable whether he will make a national leader who could win the 1961 elections.

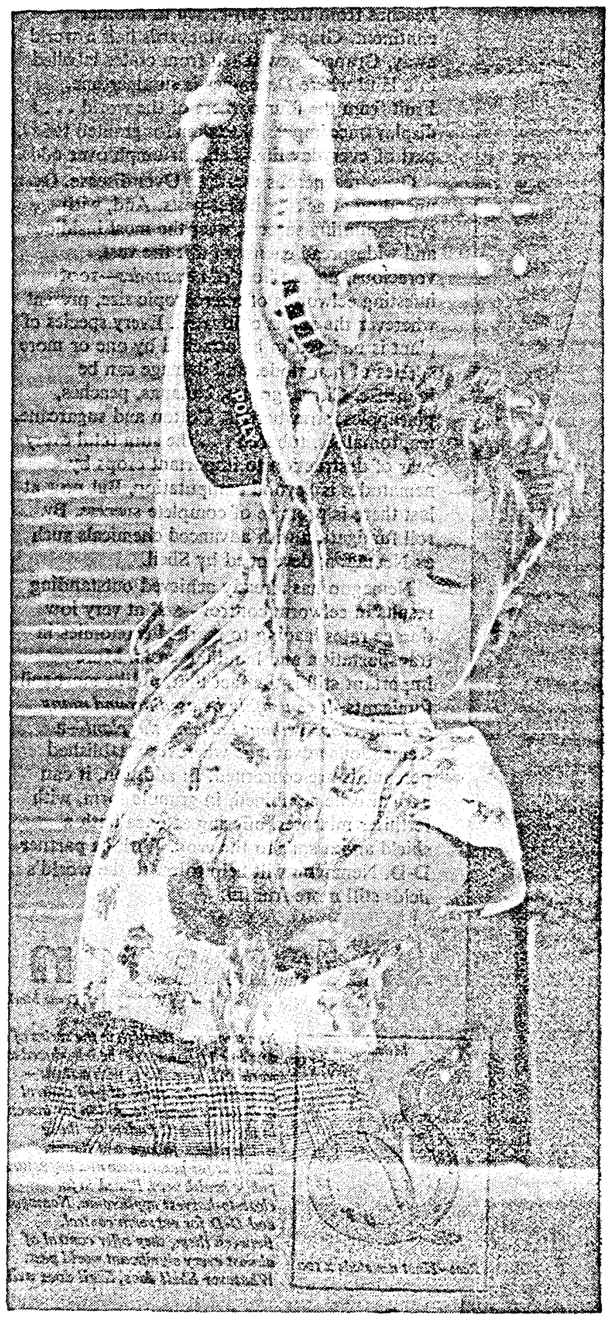
Yet in appraising possible candidates it should not be taken for granted that the next chancellor is going to be as irremovable a piece of the political scene as Dr Adenauer has been. It will no longer be considered sacrilegious to press for another. A change in western Germany's political or economic circumstances might well bring new men to the fore—if not Social Democrats, then at least Christian Democrats less deeply committed to the traditional party line. There is talk in Bonn of possibilities of coalition, both big and little, now that the opposition's Great Insufferable is departing and that intensifying Soviet pressure on Germany calls for greater unity. But the Christian Democrats do not require a coalition to keep themselves in power until 1961, and it is unlikely that decisions will be made until the new chancellor is there and the demands of the hour are more clearly known. The Christian Democrats are planning to hold an extraordinary party conference in October to elect a new chairman and generally sort themselves out.

The Gagged Press

MUCH the best way to gag the press is to run it yourself. There is then no need to use such methods as censorship, seizure, suspension, withholding of newsprint, imprisonment of editors, wrecking of the presses by gangs of thugs or discrimination in giving out official news—methods which sound bad to people who can read about

Peaches from trees sun-kissed in another continent. Grapes from vineyards half a world away. Oranges new taken from crates labelled in a land where December is summertime. Fruit from the four corners of the world . . . a display once impossible, taken for granted today, part of everyday life. Yet, a triumph over odds.

Over treacherous weather. Over disease. Over unending attack by insect pests. And, with ever-mounting success, over the most insidious and widespread enemy of all: the vast, voracious, unseen host of *nematodes*—root-infesting eelworms of microscopic size, present wherever the soil is cultivated. Every species of plant is believed to be attacked by one or more species of nematode, and damage can be immense. Citrus, grapes, bananas, peaches, pineapples, strawberries. Cotton and sugarcane, tea, tomatoes, tobacco . . . the sum total every year of destruction to important crops by nematodes is beyond computation. But now at last there is promise of complete success. By soil fumigation with advanced chemicals such as Nemagon, developed by Shell.



Nemagon has already achieved outstanding results in eelworm control—and at very low dosage rates leading to marked economies in transportation and handling costs. More important still is the fact that, unlike most soil fumigants, *it can safely be used around many growing crops without harming the plant*—a tremendous advantage wherever established perennials are concerned. In addition, it can now also be combined, in granule form, with fertiliser mixtures, offering at once both a shield and a spur to the crop. With its partner D-D, Nemagon will help to make the world's fields still more fruitful.

Nemagon
Trade Mark

Nemagon was the fifth in the series of new Shell pesticides to be introduced to world markets. Now, with a sixth—Phosdrin—the circle of pest control is virtually complete. Aldrin for insects in the soil itself. Endrin for those which attack foliage and flower. Dieldrin for persistence and important public health uses. Phosdrin for close-to-harvest application, Nemagon and D-D for eelworm control. Between them, they offer control of almost every significant world pest. Whatever Shell does, Shell does well.

you can be sure of SHELL chemicals

All ship shapes

Ships come in all shapes and sizes . . . big ships, little ships, in-between ships.

Ships for a fellow to sail on his own—or to carry a thousand passengers; ships for the seven seas—or the bath-tub ocean. And all, even the very smallest, provide excellent examples of the use of Shell industrial chemicals.

Solvents, detergents, additives for fuels and lubricants, corrosion inhibitors, plastics and resins—all these Shell chemicals find important uses in ships and shipbuilding. *Epikote* resins, for example, give an unequalled combination of flexibility, adhesion, toughness and chemical resistance to high performance paints. Paints for the top-mast and the hull bottom, paints for the tanker and the tug—for extra protection against weather and corrosion, for longer life and reduced maintenance costs.

And not only afloat. Ashore too, many industries find important uses for these remarkable *Shell* synthetic resins, and many articles in the home will benefit from their outstanding durability and strength. Domestic appliances with *Epikote*-based finishes will still delight the houseproud eye after many years of use. *Epikote* resins have a shining future in front of them—in many ways.

Other Shell chemicals are well in the picture. The washing-up bowl provides an example of the use of *Carlona* polyethylene; the sun-blinds and floor-tiles of *Carina* polyvinyl chloride. Even the photograph was processed with the help of *Shell* ethanolamines. If *you* have a process calling for industrial chemicals, call on Shell. *Whatever Shell does, Shell does well.*

Epikote *Trade mark*

Epoxy Resins

The Good Ship Polly is made of polystyrene. The *Carinex* polystyrene range, manufactured by Shell, is one of the most comprehensive available, and the three main groups of basic polymers, toughened grades and styrene acrylonitrile copolymers cover the widest range of applications—from model ships to refrigerator parts. Ask your Shell Company for full details. Shell chemicals serve virtually every industry.

them in other papers. Instead, all is harmony and peace, with the newspapers dutifully carrying out the role so aptly defined by Herr Herrnstadt, the former editor of East Berlin's *Neues Deutschland*:

> They are a political institution which assumes the form of a newspaper for reasons of convenience.

Generalissimo Trujillo, the ruler of the Dominican Republic, Mr Khrushchev, and Mao Tse-tung have all reached, by this route, the point where they can and do claim that their press is free and uncensored. The Dominican government, the Trujillo family and its friends own all the newspapers in the republic. The communist parties, wherever they rule, control the entire press by more complex but equally effective means, and pursue the same ends: the prostitution of the press, "for reasons of convenience," into a means of buttressing the rulers' power.

"The Press in Authoritarian Countries," a report just published from Zurich by the International Press Institute (and obtainable in this country from Bailey Bros. and Swinfen, West Central Street, London, W.C.1), surveys both these total forms of press control and the almost total forms applied in Spain, Portugal, the United Arab Republic, Formosa, South Vietnam, Paraguay and Bolivia, as well as those lately used in Argentina, Colombia and Venezuela—three countries where press freedom has been reborn. This report is complementary to the Institute's "Government Pressures on the Press," which studied the various kinds of pressure used in states that in general accepted the principle of freedom. The new report is not all-embracing—it does not, for instance, cover the latest developments in Iraq or Pakistan—but it is by far the best thing of its kind yet available.

It is also grimly entertaining. It records how, during a recent period of intense restriction, the Nicaraguan *Prensa Libre* "replaced all items cut out by the censors by photographs of Ava Gardner." It quotes Mr Dedijer's remarks, of the Prague *Rude Pravo,* that "even the typographical arrangement of its articles seeks to be a complete imitation of *Pravda.*" When Major Salah Salem, as first minister of national guidance in revolutionary Egypt, appointed young officers as censors, one of them ordered a newspaper: "Do not include anything about cotton. I don't know a thing about it and I prefer to avoid errors"—and was faithfully obeyed; this in a country which lives by cotton.

The Nasser government's actions have included the suppression of independent papers, the taking over of some by state organs, the repeated purging of the journalists' union, the launching of three new dailies edited by ex-officers, and the swamping of the formerly independent Damascus and Aleppo newspapers, over a third of which have disappeared. In South Vietnam, censorship has been replaced by new legislation which involves heavy penalties for publishing any "anti-national" news or comment; 25 papers have been suppressed—though in 1958 several new ones appeared, including one edited by a distinguished dissenter, Tran Van Do; two papers were attacked in 1957 by pro-government mobs, and *Thoi Luan,* which not only survived this treatment but actually became more critical, was shut down a few months later; distribution was handed over in 1955 to a monopoly headed by the chief of police; and the official news agency also has a monopoly, as papers are not allowed to subscribe directly to any foreign agency. (This last point, it is noted, applies also to the otherwise free press of India.)

In Portugal, thirty years of controls of many kinds have not quite reduced the press to complete subservience. Five independent dailies, notably *Republica,* still have to be closely watched. Some relaxation of censorship took place in the last two election campaigns—and the more critical papers have increased their circulations despite official attempts to disrupt distribution. In Spain, despite similar restraints and pressures, the Institute finds that

> the breath of freedom continues to permeate editorial offices . . . journalists, many of whom favour the regime, are . . . anxious to secure a much greater freedom. . . . Attempts to defy the censorship have become more and more frequent and audacious.

In Formosa there are still a few papers "in more or less open opposition"—although a new press law was passed last June, despite violent protest.

The major part of the report is given to the more familiar story of the communist states' misuse of the press. Its special interest lies in the different forms and durations of the recent temporary "thaws" in these states. The east German "thaw" came first—as a result of the revolt of June, 1953, but amounted to little more than the reporting of accidents, the admission that even readers' letters had previously been falsified, and a lighter touch with the dogma. In Poland things had gone much further long before 1955 was out. The Czech "thaw" came, and went, in early 1956; so did Russia's, as far as it was perceptible. China's "thaw" lasted right up to June, 1957, when, as it apparently neared a climax, iron control was suddenly reimposed. In each case reaction has followed, even in Poland. But the Institute finds that everywhere, even in Russia, a spirit of revolt survives—not only among journalists, but among the public, which has joyfully hailed the reappearance of a free and dependable press whenever and wherever tyranny has been brought down.

Press Versus Parliament in Canberra

FROM OUR CORRESPONDENT IN AUSTRALIA

MR MENZIES was in fine fighting form last Tuesday when he introduced legislation to increase parliamentary salaries, providing a climax to a row that has blazed ever since a three-man independent committee recommended these increases last month. Several reactions characteristic of the Australian public then emerged: resistance to authority, contempt for politicians, and resentment against anyone who gets ahead—unless he be someone of obvious merit such as a jockey, swimmer or tennis star. Two leading newspapers, the *Sydney Morning Herald* and the Melbourne *Herald,* chose to ride on this tide of ill-feeling and at the same time to whip it up still more. The *Sydney Morning Herald,* indeed, has thought of nothing else for weeks, bolstering its obsessive leaders with readers' arguments such as that Shakespeare, Milton and Emerson were paid less than Australian MPs and that Gandhi was not paid at all. Meanwhile Labour MPs, sensitive to remarks about priority for pensioners and for restoring the quarterly adjustments of the basic wage, were reluctant to advocate the coveted rises and anxious to earn good marks by an opposition that happily could not be effective.

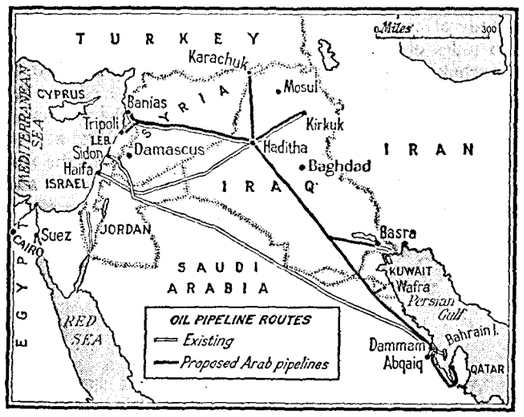
Mr Menzies set out to spoil that little game and to show his Labour opponents who their allies were. He rubbed it well in that in the view of the critical newspapers, MPs were not worth a penny more ; he implied that these newspapers were trying to usurp parliament's right to decide ; and that they were owned and managed by bloated plutocrats anyway. Dr Evatt could not but agree and contented himself with moving (like a true Australian leveller) that increases for ministers should be scaled down. Mr Menzies, by nonchalantly dropping the least important and least defensible of the benefits proposed by the Richardson Committee, had left the opposition little to attack.

The proposals as they stand would raise an MP's salary from £A2,350 to £A2,750 and his electorate allowance from £A600 to £A800 for a city electorate and from £A800 to £A1,050 for a country electorate with larger proportionate increases for ministers. These figures may seem large by British standards even when one fifth is deducted to convert them to pounds sterling ; and, moreover, a free secretary is thrown in. But in Britain it is possible, indeed desirable, that members should have interests and resources unconnected with their parliamentary duties. Australia's distances make this impossible ; and although parliament may sit for as few as sixty days a year, the job of an MP is fairly arduous and unattractive. It has certainly failed so far to attract enough men of ability and the government is right to try to remove a possible deterrent. Newspaper critics would answer that money alone will not attract better MPs—and this is true: prestige also is involved, the image of the MP in the public mind. But there are two answers to that. First, prestige in Australia is not unconnected with money and, second, the image in the public mind will certainly not acquire glamour from press campaigns such as those of the last month.



A Pipeline on Paper

FROM OUR SPECIAL CORRESPONDENT IN THE MIDDLE EAST

THE first Arab Oil Congress opened in Cairo on Thursday under the auspices of the Arab League. It remains to be seen whether the congress will be as non-political as its sponsors hope ; now that the Iraqis, who were expected to provide any fireworks, have refused to attend, all may go smoothly.

Foremost among the projects to be discussed is the proposal for an Arab oil pipelines company. The secretariat of the Arab League sent a circular on February 14th to all member states, plus Kuwait and Qatar, asking them to appoint representatives to a meeting on February 28th, in Cairo, to consider the Arab pipeline project. When only Kuwait answered at all, regretting that its representative was otherwise engaged on that day, the chairman of the Arab League Petroleum Bureau, Muhammad Salman, notified the other Arab states that the meeting was postponed. On the appointed day, however, without prior notice, representatives from the United Arab Republic, Saudi Arabia, Iraq and Lebanon turned up at Salman's office and the meeting was held as planned.

Shaikh Abdullah Tariki, director general of petroleum affairs in the Saudi government, declined to serve as chairman, but it was clear that his was the driving force behind the whole affair. The Saudi delegate offered a paper on the economic advantages of pipelines over other means of transportation for Middle East oil. By 1967, he said, the Middle East would have to produce 11.5 million barrels of oil a day and, by 1975, 16.8 million barrels a day. He added that the Trans-Arabian Pipe Line, completed in 1950

at a cost of $173 million ($161,686 a mile), had made a profit of $329 million in seven years. Since the TAPline was built, construction costs had increased by 40 per cent but, he said, all but $84,000 of the cost of TAPline had been borrowed from banks and repaid in four years. Profits from pipelines were, he added, immense, quick and certain. He proposed that the Arab countries should build an Arab-owned pipeline, with a capacity of not less than a million barrels a day, to supplement the company-owned lines.

The petroleum administration of the United Arab Republic was then asked to draw up a plan for an Arab pipeline from Qatar to the Mediterranean. Several days later it presented its proposal. This suggested that an Arab Pipe Lines Company should be established, with headquarters in Baghdad, for the transport of oil and with the intention, eventually, of buying the existing company-owned lines. The capital stock of £E5 million, in 50,000 shares of £E100 each, would be divided among Iraq, Saudi Arabia and Kuwait (20 per cent each) and the transit countries (10 per cent each), the remainder to be allocated later. The capital would be redeemed in 20 annual instalments of £E9,430,000. The annual maintenance costs would be £E 3,350,000 and the annual cost of operations £E24,250,000. According to the UAR petroleum economists, the pipeline should show an annual profit of £E28.3 million ($58.3 million). The proposed system of pipelines is illustrated in the accompanying map. The total cost of construction is estimated at £E127.8 million, plus £E60 million for the terminal in either Syria or Lebanon.

The oil companies may not be in complete agreement with the figures offered by the Arab petroleum experts but individual oilmen say that, as a practical proposition, the Arab oil pipeline makes sense. What the Arabs have not considered adequately, however, are the legal and political aspects of the undertaking. First the money must be raised to build the line. Who will pay for it? Among the Arab countries, only Kuwait could afford to do so ; but the ruler's astute financial advisers would have to be convinced that it was the best possible investment for Kuwaiti funds, not just a political gimmick. Actual construction would probably be the least difficult stage. There are any number of companies with the skill and experience needed for such pro-

jects. Then come the questions which country, or company, is to use what percentage of the line's capacity and how the tariff will be determined.

The Arabs know that such a gathering system for Arab oil is technically possible. Their plan, however, shows signs already of catering to political expediency. They include 200 miles of pipeline from the improved Syrian field at Karachuk, and they hold out the carrot of a terminal at Tripoli for the Lebanese. They probably underestimate the ability of the Suez Canal Authority to keep the increasing tanker traffic moving through the canal. But, at the moment, it is the growing isolation of Iraq from the rest of the Arab world that may frighten away the investors and leave the Arab Pipe Line Company just a dream on paper.

Overhauling China's Communes

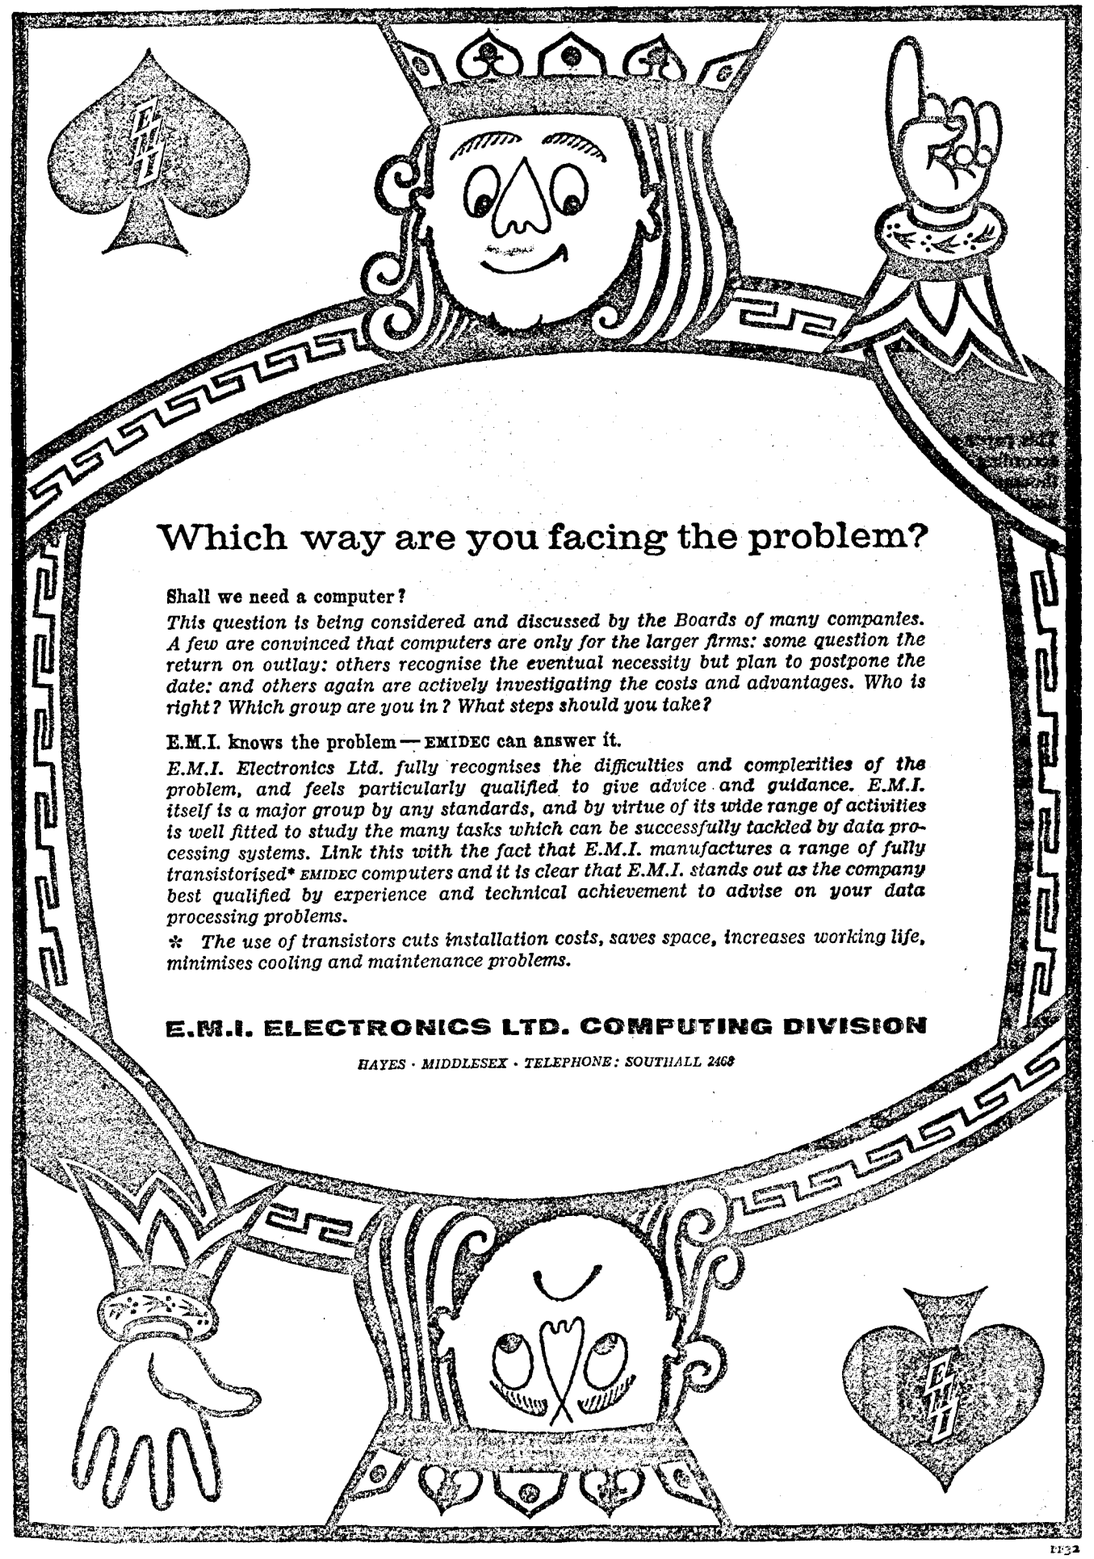
ALTHOUGH the programme, launched last summer, to organise China's population in "people's communes" was swiftly completed—by the end of the year, 26,000 communes covering 99 per cent of all peasant households had been established—the system is still being overhauled. There are even signs that some of the fundamental questions concerning these institutions have not yet been settled. Teams of production experts are now touring the countryside ; new scales of rewards are under consideration ; some officials and party workers are being demoted while others, grouped in "production cadres," are dispatched to do their thirty or more days of manual labour either in the communes or in industry. A plenary session of the party central committee, held in Shanghai early this month, decided that the work of overhauling the communes had been "well and fruitfully done" over the past three months but indicated that the process was by no means completed.

The Chinese propagandists have also toned down the martial aspect of the communes : no more pictures of their members at work, with rifles stacked beside them, appear in the press. Equally significantly, the communes have withdrawn to the countryside. This confinement was decreed by a meeting of the Chinese party's central committee in December. Since the Soviet agreement to lend 5,000 million roubles to Chinese industry—signed by Mr Khrushchev and Mr Chou En-lai on February 7th—no more references have been made to the city and town communes, with which the Chinese had experimented. By word and deed alike, the Chinese authorities are now indicating that the commune system has been found workable, though wasteful, in agriculture but quite unsuitable for the running of already established heavy industries, and for the further development of China's industrial potential.

The Peking daily *Jenmin Jih Pao*, in a leading article on March 25th, referred to people's communes in several places as "peasants' communes." Although it did talk of the communes as operating a wide range of productive enterprises, not confined to agriculture, the article emphasised the fulfilment of "greater, better and more comprehensive forward leaps in agricultural production." It announced that now that the building of the communes had been concluded,

> our agricultural production force has grown to unprecedented proportions Many tasks which could not be carried out properly by agricultural co-operatives can now be fulfilled by the people's communes.

The article pointed out that because of the size of the new units, all errors of judgment and calculation were writ large ; it exhorted both the planners and the peasants to avoid waste and extravagance, of which it gave examples.



Perhaps the greatest cause of waste accompanying the organisation of the communes—particularly wasteful in terms of mental energy expended by party ideologues—was the original ambition "to give to everyone according to his needs." Since this principle becomes operative, according to Marxist utopiology, only in a fully communist society, it was consistent with the leap toward full communism that the Chinese planned last summer. (This ambition was indirectly, but sharply, condemned by Mr Khrushchev at his party congress in January.) Now, according to an editorial in *Hung Chi* on March 15th, "for a considerable period to come, people's communes will continue to be socialist in nature and not communist," and therefore rewards will have to be calculated in terms of work done.

> According to this method, people's communes issue wages to production brigades according to the wage scale already set up. The brigades then assess the work of each commune member, credit him with a number of work points and pay him according to his work each month.

The rediscovery of this principle is expected to facilitate the control of production, the rational distribution of work, and systems of accounting and budgeting ; at the same time, it will eliminate the "mistake of egalitarianism."

QUESTIONS of the proportion of productive to non-productive forces within the communes, and the temporary employment of non-productive people in manual work, have also been given much attention. The Liaoning party committee decided that, of the total manpower available in the commune, 1 per cent for administrative and between 5 and 10 per cent for servicing personnel was enough ; officials in municipal and provincial administration should perform manual labour for at least 30 days every year, those at county level for not less than 60 days, and administrators in the communes for 120 days. Finally, frequent criticism appeared of the communes' industrial efforts. As late as October, the New China News Agency triumphantly described how molten steel flowed from furnaces in such unlikely places as barbers' shops, laundries, and photographic studios ; but a month later *Jenmin Jih Pao* devoted a series of articles to the poor quality of backyard pig iron. The paper argued that the communes' efforts should not divert raw materials from the steel combines which manufactured all the high-quality steel for China's basic industries and 80 per cent of its total iron and steel output.

The initial outburst of official enthusiasm for the communes last summer has been replaced by a duller, more workaday attitude to them. In making them more efficient, the Chinese leaders hope to use the profit that may result for investment in heavy industry ; but this industry will be organised independently of the communes. Agriculture will again be used, in the Marxist-Leninist tradition, to subsidise industrial development. But although the peasants are driven hard, Mao Tse-tung seems, so far, to have avoided the worst of Stalin's excesses. The rulers in Peking are now developing two kinds of communism concurrently: the new type, based on the peasant population and operating in agriculture, and a more traditional communism, run on the Soviet pattern and with Russian help. Both seem to have their powerful protagonists among China's leaders.

This sack is always in fashion

This paper sack could be styled for *you*, according to your needs. For many thousands of manufacturers, farmers and distributors it is the ideal container—inexpensive, hygienic, weatherproof, easy to fill and seal, strong enough for the roughest handling and stacking. The Reed Paper Group makes multi-wall sacks by the million—one of the many products made *better* because of *4 extra assets* shared by the many individual Reed companies.

THE 4 EXTRA ASSETS ARE THESE:—

REED EXPERIENCE The know-how of men who have pioneered many of the great advances of modern paper making . . . who today make a vast range of paper and paperboard products, from wrapping papers to corrugated cases, printing papers to pitch-fibre piping, horticultural packs to laminated plastics, paper sacks to all types of cartons.

REED RESEARCH Exhaustive market and scientific research both at Group and company levels.

REED RESOURCES The great modern machines and abundant raw materials which make it possible to standardise quality and "deliver the goods" in *any* quantity.

REED INITIATIVE Each Reed company is free to think and act for itself and for you the customer.

Reed PAPER GROUP

"YOU profit from the initiative of each Company backed by the resources of the Group"

THE BUSINESS WORLD

Oil Congress in Cairo

NOBODY in the West—and hardly anybody, perhaps, in the Middle East—yet knows how seriously to take the Arab League oil congress that opened on Thursday in Cairo. Iraq and Bahrain are not represented there ; Iran (not an Arab country) is represented only by observers ; on the other hand, Venezuela, "host government" to the world's other largest oil exporters, has sent observers, too. The Arab League countries which are attending include more of the "have-not" oil transit countries than of the oil producing "haves." The prime movers in (finally) getting the congress organised have been the Arab "oil experts," who themselves might be said to be a different set of "have-nots." President Nasser's interest in the congress, by now, is said to be lukewarm ; and there are no signs that any formally concerted "Arab policy on oil" will immediately emerge from it. Nevertheless, this is the first time that the international oil industry's most important host governments have got together ; and the implication, whether immediate or eventual, is that they are getting together to ask for more.

More, over the last decade at least, is what they have become used to getting ; it is also what they might not, as certainly, get for the next few years on the present showing of the oil business. Governments in the Middle East and Venezuela had an income of perhaps $2,200 million from oil last year, which compares with about a tenth of that in 1946. During the decade to 1958 output in the Middle East grew almost fourfold, to 215 million tons, and in Venezuela had nearly doubled to 140 million tons. But demand is no longer rising as strongly as it was. There is a margin of surplus capacity at all stages of the oil business, and protectionist attitudes in the United States are now finding some echoes in Europe. Russian oil and American coal are now cheap fuels in the world market—and there to stay. Export prices are being cut, with little prospect that the volume of exports from Venezuela or the Middle East will rise sufficiently to guarantee these governments a continued increase in their revenue from oil. The Venezuelans have come to Cairo, it appears, to propose restriction of exports to check an incipient price war. They would like some voluntary "prorationing" scheme among producers. This is a colder-blooded business proposition than many which may be heard at Cairo, but politically, for the moment, simply inconceivable.

Also present in Cairo, in a somewhat ambiguous stance, are the oil companies: those operating in the countries represented (the Iraq Petroleum Company, on tenterhooks, in the end decided not to uncrate its exhibit) and most of their parent companies among the "majors" of the West. They were asked to offer technical papers and exhibits, which they have arranged in impressive profusion. They have also laid on, of necessity, their "diplomats": high-powered spokesmen prepared to operate in the *couloirs* to win friends and influence critics, to meet whatever arguments and demands may be levelled at their industry on and off the floor of the congress. For despite all scepticism about the calibre and backing of this congress, and any optimism about the sweet reasonableness of its nationalist spokesmen, the oil companies can prudently assume only that new claims upon them, now or later, will flow from it.

BROADLY, the nature of those claims is already clear. They will be for fuller Arab participation in the development of Arab oil. This demand for participation is managerial and technical as well as financial ; it is not simply the desire for an adjustment of profit-sharing formulae to give the governments a bigger rake-off. That desire is already manifest: in Venezuela, in the new basis of taxation that has raised the host's share of profits (already in many cases over 50 per cent) to about 60 per cent, and in the Middle East, in the ostensible financial effect of the terms under which some new concessions have recently been granted. But the Arab nations—or at least some of the Arab nationalists—aspire to more: to share in the management of production and movement of oil in the Middle East (for example, in their plan for an Arab oil pipe line company to develop new lines and eventually to buy out existing ones, referred to on page 247). Their ambitions, moreover, reach out to

overseas transportation (Saudi and Kuwaiti tankers already exist) and to claims upon the "vast refining and marketing profits" which, they argue, the companies earn upon what they make out of Arab oil.

These newer and farthest-reaching ambitions are being supported by some commercial arithmetic about these profits at later stages that the "Arab technocrats" (of whom more below) have put up as a cockshy, hoping to provoke the companies, in refutation, to get the sums right for them. This is a time-honoured and legitimate technique; it was used, for example, with some success 18 months ago in Britain, when outside critics provoked the Treasury into providing estimates of the invisible earnings of the City of London which until then it had solemnly maintained could not be calculated.

Briefly, this Arab figuring begins from the point that the profit on production of Middle East oil, at the 1958 fob prices of roughly $1.80 to $2.05 a barrel, was of the order of $1.60, of which the host governments, sharing fifty-fifty, got 80 cents. But on tankers and pipelines, the Arab technocrats continue, about 20 cents a barrel of further profit was made; on refining another dollar a barrel; and on the marketing of refined products "an assumed figure of $2 net profit a barrel." And of this further profit—on their figuring $3.20 a barrel—the Arab governments got nothing. *Ergo*, they feel entitled to half of this too—another $1.60 a barrel, which "would triple the Arabian oil income without upsetting the principle of equitable sharing with the foreign concessionaire."

No sources have ever been quoted for these cockshy figures, nor is there any firm pretence that they are accurate. Their purpose, evidently, is to require the oil companies to put up or shut up. To explain the financial and commercial pattern of their operations in this degree of detail, as the Arabs well know, would be inconvenient for the companies—which conduct world-wide operations interlocked in a most complex fashion, and pay taxes to many other governments as well as their oil-rich hosts. This kind of knockdown argument is all right if it works. So far, most of the major oil companies have not seen fit to answer the Arab arithmetic in its own terms, publicly; they may or may not be prepared to do so privately in Cairo.

No outside observer, obviously, is in a position to substitute the actual figures for these Arab cockshies. But it is possible, from the outside, to draw broad conclusions about the rough order of magnitude of "profits after production." And it should be said at once that these conclusions suggest the Arab guesses, in sum, are wildly wrong. There is not much doubt that their initial figures of profits on production are broadly acceptable; the figures of output and revenue for the host governments are in the public domain, confirming their half share at about 80 cents a barrel. The figures of profits on the operation of pipelines and tankers, on averaged freight rates, do not look exaggerated. But the refining "profit" they allege even after recent cuts in crude prices, is probably far larger than gross refining margins which have to cover all operating costs and capital charges in Europe. And the guess at "marketing profits" is fantastic (understandable only, indeed, on the assumption that the Arab calculations have counted into these "profits" some of the sales taxes and duties charged in European countries.

Various independent calculations regarding these "later profits" are being made upon the basis of published accounts of oil companies to answer these Arab figures. It has been shown in a study by the First National City Bank of New York, published this week, that for the seven biggest international companies the final net profit on all operations in the Eastern hemisphere in 1957 came to some 80 cents a barrel; this compares with the Middle East government's share of 80 cents or more on production, which does not argue that there is any great profit in the later operations. The Royal-Dutch Shell group in 1957 and 1958 realised no more net profit per barrel on total sales than would theoretically be thrown up on production in the Middle East. But for Shell and the other majors Middle East crude is but one among many others, mostly higher in cost; so to set average final profits against Middle East production profits does not conclusively demonstrate what later profits may be made upon oil from this particular source.

One major company, however, selects itself as most nearly approaching a "typical operation on Middle East oil, from well to market": British Petroleum. Even in 1957, when it began the year buying crude elsewhere to supplement what it could bring round the Cape, BP got 90 per cent of the oil it sold from the Middle East; in a more normal year such as last year, the percentage was probably about 97 per cent. In 1957, at its normal rate of tax and royalty revenue to host countries of about £2 5s. a ton, it might theoretically have paid about £110 million to its hosts. In fact, it paid £94 million, the difference reflecting large bulk sales of crude at discount prices under long-term contracts to Jersey and Socony, upon which the royalty payments are presumably shared by the major customer. Its own net income, after paying £10 million in taxes to other governments and setting aside £43 million for depreciation, was £55 million. BP's gross take after tax, basically on producing, transporting, refining and marketing Middle East oil, thus some £98 million, was of the same order as the revenues obtained by the governments of the countries from which that oil came. And BP retained £39 million of its net profits to help provide for its capital expenditure, upon exploration, production and the transport, refining and marketing operations that are required to give Arab oil a market, of no less than £100 million.

For BP, 1957 was a bad year; dislocation of supplies from the Middle East forced it to buy in more oil from elsewhere, reducing its profits (relative to those of companies less dependent on this source of crude). But for 1958, a more normal year, the pattern does not appear significantly to have altered. On 60 million tons of oil, practically all from the Middle East, again allowing for bulk sales at a discount under long-term contracts, it probably paid the host governments about £120 million; its net profit after taxes elsewhere and depreciation amounted to £63 million. A pound a ton on oil sales is effectively about 40 cents a barrel, against the governments' 80 cents. "Toss it any way you like," as an Arab technocrat might say, BP was making no gross profit on what happened to the oil after it left the Gulf; net, on the later stages of oil operations taken together with current costs of exploration elsewhere, it was showing a loss that about halved its share of the theoretical refining profit. From that net income, it will presumably go on ploughing back 70 per cent or more.

Even BP, certainly, is not a theoretical "ideal Middle East oil company"; it refines in its own and associated refineries much less oil than it produces, selling a substantial amount to independent refiners as well as to the other majors under its long-term contracts and buys in some other oil. Experience in 1958, moreover, reflects a market in which a good deal of crude oil was being sold at substantial discounts. The governments' share of profits is almost always calculated at the official posted prices, but BP and all other companies producing in the Middle East were selling for markedly less than that, and getting an accordingly shrunken "fifty per cent" of actual profits. But BP is the real Middle East company living within the real world oil market into which the Arab technocrats would like to enter. These are the facts of life in the oil business.

The more realism that can be injected into this Arab figuring, the better. It would not dispose of Arab aspirations. But if the oil companies have then to consider the Arab claims, sooner or later, for fuller nationalist participation in oil development, then the Arabs likewise have to consider what that fuller participation would have to involve. This is not the issue of principle that it may appear in heated nationalist senti-

Arab Oil Objectives

WITHOUT "a handful of Arab oil technocrats," among whom Abdullah Tariki, the Saudi director-general of petroleum affairs, is the best known, the Arab oil conference would never have opened in Cairo this week. These men are highly intelligent and technically competent; they are nationally—and personally—ambitious. In the shifting politics of the Arab nations, they occupy an exposed, and somewhat isolated position. But this may well increase their desire to achieve some dramatic advantages for Arab nationalism out of the status quo *of Middle East oil.*

The views—and claims—of these technocrats were summarised, long in advance of the conference, in a document known as "the Haliq paper." Omar Kamil Haliq was a Saudi Arabian delegate to the United Nations. His document is not "official"; nor are its arguments, passionate, over-simplified but by no means naïve. But its main points are worth picking out:

1. Western oil concessionaries manipulate their "very privileged" position in the Arab countries "in a way which leaves the host nations as virtual economic vassals to an alliance between alien business giants and native vested interests."

2. "It becomes imperative to secure serious Arab participation (substantially gradual if you wish) in their integrated oil industry and trade, not only in the receipt of cash royalties on the produced crude oil, but in the business of refining, transporting, marketing and industrialisation of oil and its products."

3. "... the calculated objective of the Arab oil economists is not so much to secure more cash income to the already contented patricians, but to finance a purposeful scheme by means of which a large portion of the existing and contemplated oil revenues can be utilised in viable basic industries that bring about a more substantial productive development."

4. Comparing the present status—and stance—of the oil companies in the Middle East to that of the Suez Canal Company before nationalisation, the document argues that the companies give relatively little direct employment. The small middle-class of native contractors and sub-contractors that they have developed is dismissed as "miniature feudal aristocrats"; all real decisions are taken by "absentee landlords," and the companies give the impression of supporting "those forces in the Arab East which do not conform to . . . genuine Arab objectives."

5. The document to some extent distinguishes American from British companies in its criticisms. The Americans, "can well afford to conduct their business free from the provocatively cramping colonial influence in those areas": yet too often they support the British "politico-economic" stake in Arabian oil—"one of those agonising hangovers of a vanishing imperial status fighting a hopeless rearguard action."

6. Any "international authority to safeguard Middle East oil supplies" would be politically objectionable in Arab lands and economically disruptive: oil, as the major Arab economic asset, must be "fully utilised through normal business transactions." But United Nations participation with the Arab League, in an Arab development authority to mobilise local resources, might be acceptable.

7. Practically (in Haliq's eyes), the Arab technocrats should implement their doctrine that "Arab oil must be run from its point of origin" by declaring the pipelines "public utilities"; by participating in tanker operations; by developing local refining and petrochemicals industries: by joining in marketing operations: and by getting more Arab executives on to the boards of the operating companies.

These arguments and demands centre upon a desire for fuller recognition and participation in this industry of international abundance that the Arabs see on their doorsteps, remunerative to them but also remote. This desire to be "on the inside" is no doubt personal as well as nationalist. It is supported by an economic assertion, considered above, that there are further rich financial pickings in the parts of the oil industry where host nations do not participate. But it is not simply an economic ambition; to dispose of the economics would not dispose of the ambition.

ment; it would become straight commercial bargaining about a business in which both parties are vitally interested. The only principle that it would be fair (and unpopular) to evoke is that once you have sold something to somebody, you have no right to any share in the profits that he gets on what he makes out of it—though it is understandable that your estimate of that eventual profit should condition the price you ask of him. The Arabs have no "right" to participation in the subsequent transport, manufacturing, and marketing operations applied to the crude oil they sell the companies. If they like to invest their money in such operations rather than in social and economic development inside their own countries, they are perfectly entitled to do so (and one does not imagine, somehow, that even in a world tanker slump Saudi and Kuwaiti vessels would be among those laid up earliest). Further participation in oil is a legitimate aspiration; but it would mean supplying a commensurate share of the huge capital requirements of this industry, as against enjoying the fruits of the most profitable part of it without supplying any capital at all.

Some of the economic ambitions of the Arab countries and their "technocrats" are as illusory as some of their figures, as bitterly wrong-headed as some of their prejudices. They are also entirely understandable ("not without cause, but without reason"). The oil industry, in a generation, has jerked their ambitions—and their chances in life—forward by centuries. It is natural that they should be thinking, within their larger Arab political hopes, of sharing the control as well as the rewards of oil development, and of hastening the industrialisation that this might bring to their countries. Pipeline projects and the purchase of tankers are enterprises that the oil companies should be prepared to encourage and help with advice, where there are chances of commercial viability. The balance of economic considerations—and of political instability—is shifting against more refining in producing areas (though a quarter of Middle East oil is even now refined locally), and petrochemical developments, for the most part, appear even more dependent upon proximity to developed markets. No enterprise into which the Arabs might enter in their territories, or in ordinary international trade—providing the capital as well as the managers—should be ruled out, at least by anything but the hard facts of commerce. But participation in terms of capital—as the countries may find out in some of their new deals with fresh concessionaires—would be a more exacting role, and not necessarily a more rewarding one.

Godot in the Building Societies

For two and a half years the rates recommended by the Building Societies Association—6 per cent on mortgages and 3½ per cent net on shares—have remained unchanged. They were unmoved when Bank rate went up to 7 per cent, and when it was lowered in five successive stages to 4 per cent. Here, indeed, is some sort of consistency. They will not be altered for at least another three months, but Mr Alexander Meikle, the chairman of the association, thinks the odds are that the rates will then come down.

The association will then recommend "appropriate reductions" in mortgage and investment rates if in the meantime the inflow of funds to the societies had continued at a "satisfactory level." "Appropriate" can be taken to mean 5½ per cent on mortgages and 3¼ per cent net on shares, unless the rates on national savings come down. A "satisfactory level" presumably implies that the net inflow of funds to the societies would match the level it reached in the first quarter of this year—about £30 million of new money a month.

This decision by the council of the association bears all the marks of a compromise. But there were good reasons for one. Three days before, the budget had reduced the standard rate of income tax and so there will be a cut in the composite rate paid by societies on behalf of their members—perhaps by 4d. to 5s. 3d. in the £. But there was no reduction in the interest rates paid on national savings media, which are the building societies' biggest competitor for the public's savings. Reductions to 3 per cent net on shares and to 5½ per cent or 5¼ per cent on mortgages were out. The larger societies who have their eyes on trustee status under the new Government regulations hoped to adjust the rates in this way to leave a wider margin to strengthen their reserves. The Chancellor's evident wish to ensure the level of national savings has upset their calculation.

The other possibility is a combination of 3¼ per cent net on shares and 5½ per cent on mortgages. Such a reduction, given the new tax levels, would leave about the same margin for reserves as the present rates of interest and the former levels of tax. The opposition to immediate cuts in the rates seems to have come mainly from the small and medium sized societies; they depend more directly on local support and funds have not been flowing into them so quickly as into the big societies; and they were apprehensive about the effect of lower rates on their receipts and withdrawals when their mortgage lending would be rising in the summer season.

Like all compromises, the "wait and see" line can be criticised. Building societies, after all, have a good base for expansion this year. Last year, as the table shows, they lent slightly more on mortgages than in 1957, because they received higher repayments. Their liquidity ratios had been improved and there was the promise of Government funds for house purchase (put by the Chancellor at £25 million in the current fiscal year) and the prospect of trustee status for the deposits of most of the bigger societies. The background, then, might have been thought to justify a firm decision.

But there were arguments the other way. Money is flowing in freely at 3½ per cent net, and the demand for mortgages at 6 per cent is strong and not wholly satisfied. Nearly half of outstanding mortgages are at 6 per cent and to reduce them by one half of one per cent does not represent much of a saving to the borrower, allowing for tax relief. The societies, too, have administrative reasons for keeping changes in rates as few as possible. Yet the council could not quite accept the logic of the situation and risk censure by leaving the rates alone. That would have ignored the principle of mutuality that sways the thinking of many members of the movement. Even more important, it would have been no reply at all to the psychological impact of the reductions that the Halifax (free to do what it likes because it is not in the association and is the biggest society of all) made last December to 3¼ per cent on shares and 5½ per cent on mortgages. So the council temporised, fearful of "doing a Halifax" because of the possible impact on receipts and withdrawals and hinting illogically that it may be safe to bring rates down in three months' time but not now. Does this do better than postpone the day of reckoning? The council's four arguments—the undiminished attractions of national savings; the improbability of cheaper long term money; the recent decline in investment receipts; and the heavy weight of mortgage business in the summer season—all these may be good arguments for not lowering the rates.

What advantages flow from this postponing of the decision? First, if any reduction were made in rates in July it would be immediately effective for new mortgages but most societies would not extend it to old mortgages until three months later. Six months' grace should enable the societies to get through an active lending period without stringency and to get more into reserves. Secondly, nods and winks about share interest enable the societies to test the market. There are fears that some of the recent money has been "hot"; if so, hints may send it away without scaring ordinary investors. If share money still comes in at a reasonable rate and withdrawals are moderate under the threat of a reduction to 3¼ per cent net on shares, then the actual reduction should be made with comparative safety. If not, then the council, though with some loss of face, can still recommend no change. Such a test of the reactions of lenders after two and a half years of 3½ per cent net is not unreasonable.

The deferment of the decision has an important, though incidental, effect, for it will test the strength of the association. Without a firm lead from the council, some societies may be tempted to break away from the recommended rates or to jump the gun, as the Leicester Permanent and the Newcastle upon Tyne Permanent have done. But the association is strengthened by the house purchase bill which ties the Government loans to the association's recommended rate on mortgages. Potential rebels, no matter how big, will not want to miss the hallmark of trustee status. If shareholders and depositors remain loyal, the independence of the movement will again be strengthened. Then, in all probability, rates will come down. But it may be only to usher in another period of inflexible rates, for a reduction to 3¼ per cent net on shares and 5½ per cent on mortgages will make a further reduction to 3 per cent net and 5¼ per cent more difficult and more unlikely.

BUSINESS NOTES

IN THE MARKETS

LCC's Hard Bargain

SUB-UNDERWRITING of new issues, Lord Kindersley admitted at the Parker tribunal, is a sort of club. This week the Labour leaders of the London County Council can be thankful to its members. On Thursday the LCC came to the market for £25 million, the largest issue ever made by a local authority in Britain. The coupon is 5 per cent, which is the lowest new gilt-edged coupon, other than on short bonds, since May, 1957. Even at a price of 95½ for the 1980-83 maturity, the terms are hardly attractive. The flat yield of £5 4s. 9d. is about 2s. 3d. below that on 5½ per cent Funding 1982-84; in gross redemption yield, the LCC issue at £5 6s. 8d. to latest date has a margin of less than 1s. per cent in its favour; though the big discount offers taxpayers at the standard rate 3s. 3d. more than the Funding stock in net redemption yield.

On these terms no one in the City expected the LCC issue to be taken up by the public—which is difficult enough in any case for an issue of this size. In the event, about 94 per cent was left with the underwriters. The brokers, Mullens and Company, take an overriding commission of ¼ per cent; the sub-underwriters get 1 per cent of the amount they have underwritten, plus in effect ¼ per cent on any stock they have to take up themselves. Thus the City houses that are sub-underwriters get the stock for 94¼, which gives them a gross redemption yield of £5 8s. 7d. per cent. They will be able to break even if the discount does not exceed one point and no doubt they will be glad to do so. On Thursday it was being guessed that dealings on the following day would open at a discount of around 1¼ per cent.

Why did the Bank of England and the City accept these borrower's terms? The answer lies in a blend of politics and ordinary commercial goodwill. The LCC was very conscious of the stiff price it had paid for its money in February, 1958, and of the success the stags made of its 6 per cent issue. It had made enquiries about the possibilities of borrowing on the Continent; it was deterred not by the Bank of England but by the exchange risk it would have had to shoulder. So the City agreed to terms that ensured that not a single stag should embarrass the finance officers of County Hall. It is a gesture that could only be made by a club, but one that members could not be induced to accept too often.

Investors Take their Profits

THE LCC issue, not surprisingly, cast a cloud over the gilt-edged market. Few people were prepared to read the terms as an indication of a general lowering of yields. More attention was paid to the size of the issue—a reminder of the heavy demands that may be expected this year from both local authorities and the Government itself. Accordingly, gilt-edged have been dull, though sales have not been large and the mark-down in prices has been modest. The Treasury bill rate at the tender on Friday last week actually fell sharply, by 2s. per cent to £3 4s. per cent, but the move by the discount houses was a tactical one and had no effect in the gilt-edged market.

Equities encountered a sharp bout of profit-taking before the weekend by investors who had counted on the budget reliefs. This appeared to have come to an end by the beginning of this week, though from Wednesday to Wednesday *The Economist* indicator still showed a fall of 4.2 from its peak of 262.7. The new £15 million Hawker convertible debenture, oversubscribed seven times, touched a premium of 5 on Monday, though this later fell to 3½. The allotment, on the basis of applicants' holdings of ordinary shares, was favourable to small shareholders, and the institutions have bought from the stags.

STEEL

Demand Improves Slightly

STEEL output in the first quarter of this year was 15 per cent down on a year before, but March production figures did at least show a slight improvement upon those for February: 362,700 tons a week against 347,400 tons a week in the month before. This reflects some improvement in the inflow of new orders, and the fact that a larger proportion of these orders are for immediate delivery. There

are indications that those steel consumers who began running down their stocks earliest in the cycle are at any rate running them down no further, and may be doing a little re-stocking. The steelmakers themselves have undertaken so far as possible to avoid running down their own stocks of scrap any further, and scrap from shipbreaking is being stocked by the industry's central organisation. As a result, deliveries of home-bought scrap have now increased by about 10,000 tons a week—which may console merchants for the ending of their short-lived freedom to export scrap.

THE PRESS

A Bid for Newnes

SINCE the Daily Mirror-Sunday Pictorial group made its bid for Amalgamated Press, there have been rumours of a bid for George Newnes, whose £1 ordinary shares have climbed this year from 76s. to 107s. The bid has now been made and from the expected quarter—the *News of the World*, which a month ago secured a Stock Exchange quotation for its ordinary shares. Against the current price of 107s., holders of the 1,762,500 ordinary shares in George Newnes are offered 110s. in cash. The directors of George Newnes have said that they are considering it. If the bid were accepted in full, the *News of the World* would have to hand over about £9,700,000 in cash for a business that is bigger than its own. It is not clear how the bid would be financed, for the *News of the World* has no such sum in cash and the Carr and Jackson families that still control the company are manifestly reluctant to have their equity interests diluted much further.

The bid resembles the *Daily Mirror* offer for the Amalgamated Press more closely than the recent bid of Odhams for the Hulton Press, for through it a massive circulation newspaper would be taking a wide-ranging magazine group under its wing. Among its host of popular and trade magazines, George Newnes controls *Woman's Own, Woman's Day, Homes and Gardens, Country Life, Tit-Bits, Amateur Gardening, The Smallholder, Men Only, The Motor* and *The Aeroplane*. It is thus a major competitor of the Amalgamated Press and Odhams. The bid provides another instance of the concentration of the periodical press in answer to the popularity of television and it is evidently a countermove to the recent strengthening of these rival magazine groups.

INSURANCE DIVIDENDS

A Handsome Issue

SIX months or so ago, the interest of stock brokers and investors in insurance shares revived. The market has remained strong, for anticipatory hopes of bigger profits and dividends have proved justified. Prices faltered momentarily when Legal and General announced an unchanged dividend of 100 per cent but this week investors were quick to take the point made by the chairman, Lord Harcourt, that one reason for the dividend decision is that at the end of this year the company will make its first triennial valuation. Two other dividends have also cheered their hopes: Guardian Assurance has raised its payment from 45 per cent to 52½ per cent and, in conjunction with a rights issue, the directors of Royal Exchange have foreshadowed an even bigger increase.

Royal Exchange Assurance has raised its dividend from 16 to 18 per cent and this is to be followed by a handsome rights issue which will bring in about £5,700,000 of new money. This issue is of two new £1 shares at 30s. each for every £3 of capital stock now held. In the autumn the directors expect to declare an interim dividend of 8 per cent on the present capital and to follow it with a final of 8 per cent on the enlarged capital. The potential gain in income arising from this issue was immediately reflected in the marking up of the £1 shares by 13s. 9d. to 95s.

AIRCRAFT INDUSTRY

Douglas on Douglas

THE American aircraft manufacturer, Donald Douglas, gave a transatlantic view of the trials of the aircraft industry to a meeting of the Royal Aeronautical Society on April 8th. These deserve to be studied by any intending competitor of Mr Douglas and his colleagues. As in Britain, the American aircraft industry has contracted from its peak peacetime employment of 878,000 in 1957 and 128,000 men have left the industry since then, a fact that may seem surprising in view of the size of the American defence programme. The average cost of the 1,610 aircraft that will be built for the American services between this summer and next is now working out at £1.5 million apiece and one manufacturer recently spent more than £200,000 making an unsuccessful bid for a contract.

Of most relevance to the British industry were the comments made by Mr Douglas on changing production techniques. The aerodynamicist, once the linchpin of the industry, has dwindled in importance until he is merely one among several different specialists, including physicists, metallurgists, chemists and electronics engineers, each one of whom is essential to the success of a project. As the industry becomes more scientific and less purely mechanical, so its manufacturing methods also change. Mr Douglas spoke wistfully of the advantages that would follow the replacement of steel by beryllium in aircraft construction, reducing the need for such high accuracy in missile guidance systems, reducing the weight of a 2,000 mph fighter by as much as 7 tons and increasing its range by 16 per cent. The fact that beryllium happens not to exist in tonnage quantities, costs the equivalent of more than £4 an ounce, is lethally toxic and ruins the cutting edge of machine tools was dismissed as "just one of the hundreds of problems faced by the industry today." The impression was conveyed that Mr Douglas expects, indeed intends, to build beryllium aeroplanes just as soon as he can and that he has the same attitude towards machining techniques that are in some cases still laboratory curiosities but hold out the prospect of reducing the inordinate amount of machining time required to build high-performance aircraft.

This intense effort, conducted along a broader front than any British company could contemplate, is needed just to keep pace with the normal evolution of aircraft design; it does not allow for any radical break-through such as that which followed the development of the jet engine. British manufacturers may comfort themselves with the thought that radical break-throughs of this kind do not usually originate in the American industry in spite of its huge research effort. But if they cannot match the American effort in scale, they can learn a great deal from its patient thoroughness, a virtue less common in British aircraft factories than it should be.

OVERSEAS TRADE

A Bigger Deficit

IN March imports recovered more sharply than exports from the seasonally low level of the previous month, and the apparent trade deficit rose by £8½ million to £39 million. Imports rose by nearly £31 million to £322½ million cif and were £5 million higher than a year ago. Taking the first quarter as a whole imports were 1½ per cent higher in value than a year ago and probably about 2 per cent higher in volume. British exports in March rose by nearly £20 million to £271 million fob, but were £4 million lower than a year ago. In the first quarter exports were 2½ per cent lower in value than a year ago and probably showed a similar fall in volume. With the seasonal help of furskins, total re-exports increased by £2.4 million to £12.8 million; the average for the first quarter, however, was £2.4 million less than a year

ago owing to the fall in shipments of natural rubber to Russia.

The increase in the apparent trade deficit brought the average deficit in the first quarter to £39½ million, nearly £14 million higher than a year ago. It is unlikely that Britain can this year repeat its 1958 surplus, on a true payments basis, on visible trade alone. The extra demand

injected into the economy by the budget is officially expected to bring an increase in imports of roughly £60 to £70 million, and import prices are more likely to rise than fall. And for some time, at least, exports are expected to lag behind the growth in imports.

Encouraging Exports

WHAT positive and proper action can the Government take to encourage exports? And what facilities are now offered to British exporters by the Government of which more use could be made? These two questions formed, in essence, the basis for a working party set up last year by the Federation of British Industries to survey the export facilities available to British firms, and to report on any gaps in export policies, such as in education and training facilities, export trade promotion, market investigation, and public relations. The ten-member working party, headed by Sir Cecil Weir, has published its report; it has not considered direct financial measures, such as credit and insurance, but has covered the broad range of special facilities available to British exporters, and made several recommendations about the directions in which those facilities could profitably be increased.

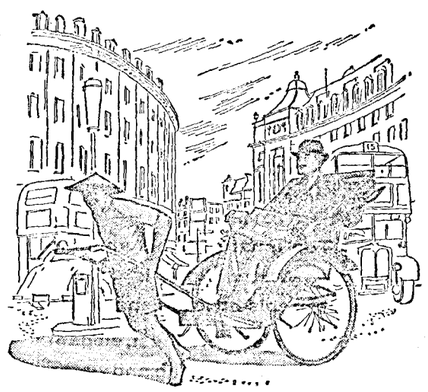
Not surprisingly, the working party's report says little that is startling or revolutionary: it recommends that industry should release more of its sales-staff for daytime lecturing (in salesmanship); that British exporters should make fuller use of official sources of information and advice, at home and abroad; that British firms should make fuller use of market research facilities; that employers should increase the inducements for their salesmen to learn foreign languages; and that greater care should be given by industry to translations.

Two broad conclusions emerge from the study: first that increased facilities for information and assistance to exporters can and should be provided; and second, industry should make far more use of the underpublicised existing services than it does now. The working party found that official statistics and other information about foreign markets already extensively supplied by the Board of Trade could well be supplemented by a guide to available statistical data, such as is published now in Germany. The report summarises the facilities now available to businessmen for market investigation, advertising, and education and training, many of which are not now used to their fullest advantage. It repeats the FBI's often-expressed preference for specialised international trade fairs and all-British fairs rather than international prestige events. It also calls for the provision of a British exhibition site, larger than Olympia or Earl's Court, in which specialised trade fairs could be held.

CABLES

Combining to Compete

THE proposed merger between Enfield Rolling Mills and Enfield Cables is the latest of many recent amalgamations in the cable industry. In this case the child is taking over the parent business. Enfield Cables and other cable interests founded Rolling Mills after the first world war, and it became an independent company soon afterwards. It has now made a bid for the whole share capital of Cables, which has had a poor profit record over the past six years. The directors of the two companies state that the re-grouping that has taken place in the industry makes the creation of stronger units in the interests of both companies; the appearance of Associated Electrical Industries as one of the largest units in the industry, by adding W. T. Henley's Telegraph Works and the London Electric Wire Co. and Smiths to their original cablemaking subsidiary, Siemens Edison Swan, has been the chief feature of this re-grouping. Perhaps a more significant factor in encouraging the weaker companies to amalgamate is the impending end of two of the four main price-fixing agreements of the Cable Manufacturers' Association on April 30th, those covering chiefly domestic electric wire and mains cables.



These agreements are being abandoned voluntarily by the industry, before they have been referred to the Restrictive Practices Court. Crompton Parkinson left the CMA several years ago, and with the smaller non-members it has been gaining an increasing share of the market by undercutting the prices set by the CMA. British Insulated Callender's Cables and AEI, as the two largest firms in the industry and members of the CMA, are no doubt anxious to be able to compete freely. The industry fears that the ending of the price agreements may mean sharp price competition, and it has been suggested that the remaining small companies may be forced to amalgamate. Hit by the cuts in the capital investment programme of the nationalised industries, this industry should now benefit from its expansion and the Chancellor's encouragement of capital investment in private industry. So the novelty of price competition should come to an industry enjoying a more normal state of prosperity, though perhaps not a boom.

RAW WOOL

Sharp Rise in Prices

WOOL is the largest single export of Australia and New Zealand, and these are two of Britain's largest markets. The further recovery of wool prices is therefore good news. In the middle of January, most grades of wool

Industry's Earnings

THE 421 companies whose accounts were analysed last quarter ended their accounting years in many cases at September 30th or December 31st. Their earnings and financial condition, given in the usual tables on pages 282 and 283, reflect the typical experience of much of British industry last year: new capacity installed in earlier years was not fully employed. For all the companies combined, trading profits rose by about 2 per cent, by £10 million to £541 million. By far the biggest increase occurred in the "motors, cycles and aircraft" group where profits were as much as 23½ per cent higher, but the motor industry was the exceptional case, recovering from recession when other sectors of industry were declining. The rest of British industry did nothing better than to mark time—as earlier profit analyses over the last year had already shown.

New capacity costs more in depreciation and in loan interest and it has brought an increase in the gross value of fixed assets by £272 million to £2,415 million. Under expansionary conditions, this increase would have been accompanied by an increase in working capital, but neither stocks nor debtors have shown any significant rise. And the rate of equity return, expressing net ordinary earnings as a proportion of net assets attributable to the ordinary captial, has declined from 10.2 per cent to 9.4 per cent. But net ordinary earnings remained practically unchanged in amount, at £194 million, and although net ordinary dividends appear to have fallen by £2 million to £70 million, they would show a slight increase if the special dividend paid in 1956-57 by Steel Company of Wales on denationalisation is excluded from the reckoning. The gross rate of return on ordinary capital is only slightly down from 15.8 to 15.6 per cent. In addition to the dividends reflected in these statistics shareholders have also received in many cases special "profits tax" interims payable out of the current year's earnings.

Among the groups to achieve advances in profits those closely in touch with consumers did well—except for clothing and footwear which reported a decline of 7½ per cent in profits. But elsewhere in these trades profits were up: breweries by 4½ per cent; food by 20¼ per cent; shops and stores by 4¼ per cent; and tobacco by 3 per cent. In these industries, too, the rate of return on net assets improved. These results are not surprising, given the further increase in consumer expenditure last year. Nor is the advance in profits and in the rate of return on employed capital in the "motors, cycles and aircraft" group; the rate of return in this group improved from 12.5 to 12.8 per cent.

Other groups less closely in touch with consumers achieved higher profits. Thus, the profits of the engineering group rose by one per cent, of the chemical group by 9 per cent, of the electrical manufacturing group by 12¼ per cent and of the miscellaneous manufacturing group by 5 per cent. But all these industries showed some decline in the rate of return on net assets: in engineering it fell from 11.0 to 10.2 per cent; in chemicals from 8.1 to 6.8 per cent; in electrical manufacturing from 6.4 to 4.3 per cent; and in miscellaneous manufacturing from 10.1 to 9.2 per cent. Having invested heavily in new capacity in earlier years, in 1958 they had to make provision for higher depreciation and capital charges when it was not being fully utilised.

Where profits have fallen, the rate of return on net assets is more sharply affected. The group with the biggest statistical weight in this quarter's analysis is iron and steel, which shows a fall of one per cent in trading profits and a much bigger relative decline in the rate of return, from 12.3 to 11.0 per cent. Shipping profits fell by as much as 24¼ per cent and there the rate of return came down from 6.5 to 3.5 per cent. The other big declines occurred in the textile industries: in cotton, profits fell by 36¾ per cent; in wool by 29¾ per cent; and in other textiles by 30 per cent.

These varying rates of return cannot be compared between one industry and another, but they ought to be representative as indicators of trends. On that basis they suggest that the equity stocks in many British industries are more highly geared than they were thought to be only a year or two back. The dip in production of some sectors of industry has had a sharp effect on earnings, and even those industries where recession has meant nothing more than a check to expansion have felt some reaction in earnings. When production revives and these industries bring their capacity more fully into employment, net equity earnings must gain and some could gain quite sharply. This is an argument that should favour capital goods shares in the longer run.

(*Continued from page 258*)

were at their lowest level for over seven years; since then prices of merinos have risen as much as 25 per cent and crossbreds—which had been held up by the New Zealand reserve price scheme—have risen 15 per cent. So prices now are back to the levels ruling before the season started in July. More than half of the advance has occurred since sales were resumed after the Easter holidays. By then buyers had confidence in the recovery and were covering their future requirements and also increasing their stocks. Demand rose sharply, and prices followed suit. The advance is now slowing down, but prices seem in little danger of a relapse. There are no signs of any halt to the recovery in wool consumption, and only two-and-a-half months of the selling season to go.

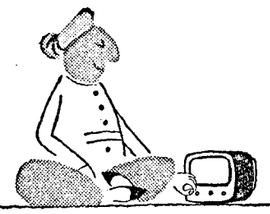
The latest sales returns from Australia and New Zealand do not reflect the full improvement in prices. In the first seven months (July to February) of the season Australia sold 919 million lb of wool, 28 million lb more than in the same period of last season, but its total receipts dropped by £56 million to £144 million. New Zealand's sales rose by 20 million lb to 258 million, and receipts dropped by £8 million to £37 million. Both countries are now more confident about their exchange reserves. Higher prices for wool helped to give Australia a surplus on visible trade of over £6 million in March, and the deficit in the first nine months of the financial year was nearly wiped out. And New Zealand has decided to increase import quotas for private goods by some £18 million this year. The increase covers mainly materials and producer goods, but some consumer goods as well, and is expected to bring total "private" imports to about £210 million in 1959.

INTERNATIONAL MONETARY FUND

Mr Jacobsson's Warning

THE increases in quotas in the International Monetary Fund that are now being ratified by member countries are larger than was originally foreshadowed. Seventeen countries, including besides Germany, Japan and Canada a number of Latin American countries, are being granted increases in quotas bigger than the standard increase of 50 per cent. This was announced last week by Mr Per Jacobsson, managing director of the Fund, in a careful survey of recent financial and economic trends to the Economic and Social Council of the United Nations at Mexico City. Mr Jacobsson said that the Fund's resources of all currencies will be enlarged by $5.8 billion; a straight 50 per cent increase all round would have produced $4.6 billion. The Fund's holdings of gold, US dollars and the five other currencies that have been drawn in recent years will be increased by 75 per cent. Even so, the increase will not do much more than restore in real terms the resources granted to the Fund at its inception in 1944.

But the lines of credit available at the IMF are not the only sources of additional international liquidity; and Mr Jacobsson places great importance on the recent modest revival of banking credits. He regards market sources as a natural and desirable replacement of the official facilities made available through the European Payments Union. The Fund, like the World Bank, has recently given more of its assistance in conjunction with other agencies, including private banks. The climate for such ventures has undoubtedly been improved by the lessening of inflation throughout the world. The recession in industry has intensified the problems of primary producers; but Mr Jacobsson attributes the weakness of many commodity prices largely to deep-seated structural changes in production, and warns the producers that they should not expect world industrial recovery to pull them out of their difficulties.



The solution is a diversification of their production and exports; and in financing them, these countries must avoid recourse to inflation, which, Mr Jacobsson says, will make them less attractive not only to private capital but also to public and international agencies, in using their not unlimited funds. In the context of fixed interest loans and credits he is undoubtedly right. But Sir George Bolton is fond of pointing out that in Latin America, financial instability may be as small a deterrent as political instability to the investor putting his money into real assets. His only concern is to be permitted to remit his profits.

USED CARS

Prices after the Budget

THE reduction in new car prices in line with the reduction in purchase tax from 60 to 50 per cent has had a less than proportionate effect on the prices of secondhand cars. Retail prices of new cars were reduced, following the Budget, by about five per cent—roughly £35 on a £655 Morris Minor, and £45 on a £820 Ford Consul. The immediate effect on used car prices has been that a car one year old, in good condition, has dropped by about four per cent in price; two or three year old models have fallen by only about two and a half per cent, and older models have remained substantially at their pre-Budget prices. There are two main reasons for this: first, while seasonal fluctuations have been less marked in the motor trade this year than in previous years (aided by the unseasonal fillip last winter when the hire-purchase restrictions were lifted), a great many buyers appear to have been holding back until after the Budget, and this sudden release of demand has tended to keep prices firm. Second, there is still a sizeable unsatisfied demand for new cars in Britain, and supplies have been affected by the strikes which have plagued the motor industry in recent months; this is reflected in both the length of dealers' waiting lists for new cars and in high prices for late models of used cars.

This situation may be expected to correct itself in coming months, as the present high level of demand tapers off and supplies of new cars become greater. Eventually, the prices of used cars should fully reflect the cut in purchase tax,

Manufacturer's exports
multiply 26 times in 10 years!*

From an export turnover of £81,000 to over £2,000,000 in just ten years!
That's the success story of a manufacturer in the radio industry who went after the world markets in 1948 with the right sort of backing—ECGD insurance.
In fact, had it not been for ECGD cover during these past ten years, a number of unforeseen losses might have cost him £236,000. What a good thing he was insured! For although £82,000 of this money has since been recovered, these are the sort of losses that no exporter, however big, can afford to face alone.
There's money, big money, to be made in the export markets. But a few bad debts or a suddenly blocked currency could bring serious financial loss.
If you're all set to launch out overseas, *first have a talk with your ECGD man.*
With ECGD behind you, you get your money whatever happens.
For consumer goods the cost averages less than 10/- for every £100 insured.

* This is a true story, but because business between ECGD and exporters is strictly confidential any details which could identify the exporter have been left out.

re-establishing a more or less normal relation between new and secondhand prices. But this may not take place for some time to come. Owing to the high prices obtainable for secondhand cars, trade-in values have remained consistently high ; but they may well fall more rapidly than secondhand prices if waiting lists for new cars stay long. This stimulation of demand (costing about £25 million this year) in a market where supplies are already short may thus bring the greatest benefits, at least in the short run, to motor dealers.

NATURAL RUBBER

A Buoyant Market

NATURAL rubber prices are at their highest level for over two years. In London the top grade of sheet rubber on the spot is now about 27½d. a lb, having risen by 3d. a lb. since the beginning of the year. Production is seasonally low and demand has increased. Last year a fall in consumption in the free world, especially in the United States, was offset by bigger purchases by the Communist countries, especially Russia and China. This year consumption in the United States is rising, and Russia is also buying more. A part of the increase in American demand anticipates—as in steel and copper—the possibility of a strike in the manufacturing plants when the labour contracts expire in the summer. But this does not affect American consumption of natural rubber over the whole year, which is expected to rise by at least 50,000 tons, or 10 per cent. Consumption in the rest of the free world should be at least as large as last year, and if there is no sharp decline in the current rate of purchases from Russia and other Communist countries, demand for natural rubber could exceed two million tons. Production amounted to about 1,950,000 tons last year, and higher prices should bring out more rubber. But supply and demand may well be finely balanced.

The big premium that natural rubber now commands over synthetic cannot harm its prospects this year, for the immediate scope for further substitution of synthetic is small. But the bigger the premium the greater the incentive to accelerate expansion of synthetic rubber facilities, particularly for the manufacture of polyisoprene, the "synthetic natural" rubber. For the next few years, indeed, there is likely to be too little natural rubber, rather than too much. Is it not time for the British Government, in full consultation with Malaya, to start preparing a programme for the orderly disposal of its strategic stock ? Having disposed of its strategic stock of copper and certain other materials the government cannot claim that rubber is a special case—strategically, at least. The disposal problem cannot be shelved indefinitely, and it is not in Malaya's real interest that it should continue to be ignored. It would also seem wise to consult with the United States, whose own strategic stock of natural rubber is known to exceed its needs.

LEAD AND ZINC

More Help for American Mines?

WEAKNESS in lead and zince prices persists. Prompt lead in London has dropped by over £4 10s. to about £68 a ton this year, and the surplus is reflected in the premium of £1 a ton for forward metal. Zinc has fared a little better. Zinc became dearer than its sister metal towards the end of 1958, and it still is. Forward zinc has dropped by £2 this year to about £71 10s. a ton, but the premium on prompt metal has almost disappeared. Weakness in London has been accentuated by the import quotas imposed by the United States last October, when imports of both metals were restricted to 80 per cent of the 1953-57 average. The metal kept out of the United States is now sold through London, the residual world market. But London's loss has not been America's gain. Stocks in the United States remain high, and the American price of lead has dropped by 2 cents to 11 cents a lb this year, and is now barely above the 1958 trough ; zinc has fallen by half a cent to 11 cents a lb, which is one cent above the 1958 trough. As the quotas do not apply to manufactures of lead and zinc, foreign producers have been shipping more manufactures to the United States.

Though world consumption of both metals should increase this year it is not likely to match production. American bartering of agricultural commodities for lead and zinc can hardly mop up the whole surplus, so any appreciable improvement in prices depends on further cuts in output. Restriction of output among mines outside the United States will be discussed again by the next United Nations conference on lead and zinc, which opens in New York on April 28th. With lead now at its lowest price for many years, opposition to an international restrictive scheme may have diminished. But as the fall in prices has been less severe than some countries expected, their enthusiasm for a scheme may have faded too.

In the United States, where producers feel that they have already done their share in cutting output, there is growing pressure for more effective action against imports. A bill has been prepared which seeks to restrict imports to the amount necessary to bring domestic prices up to 15½ cents a lb for lead and 13½ cents a lb for zinc, a level that American producers commonly regard as "reasonable." The major American producers, however, do not like protection by quotas ; most would prefer higher tariffs instead. The Administration, which brought severe criticism on itself from foreign countries for imposing quotas, might be happy to drop them in favour of higher tariffs. It is understood that the Reciprocal Trade Agreements Act, as amended last year, permits the existing tariffs of 1.06 cents a lb on lead and of 0.7 cents a lb on zinc to be raised by several cents. Foreign producers in principle regard tariffs as the lesser of two evils, but the new legislation apparently opens the door to much larger increases than they had been prepared for.

DEXION BUILDINGS

Houses in a Hurry

THE need for rapid, efficient, low-cost building is often of great importance in underdeveloped countries, where it may be hampered by the lack both of capital and—particularly—of a skilled labour force. These difficulties may be at least partly overcome by a new building system recently developed by two British companies, Dexion Ltd., and Cheecol Processes, Ltd. Known as Chee-Dex, the system combines the "slotted angle" iron framework already marketed on a worldwide scale by Dexion with aerated concrete wall panels developed by

Cheecol Processes. The makers claim that a small Chee-Dex house can be built in a week by two unskilled workers under a skilled supervisor ; the framework can be erected in three days, and the wall panels can be produced on the site. The system is designed for use in Africa, the Middle and Far East and Latin America ; designs are available for houses, hospital installations, schools and light industrial buildings, and it is believed that in the majority of cases these buildings will be cheaper to build than their brick equivalents.

In practice, Dexion slotted angle framework is simply cut to length and bolted together on the site to form a light-weight framework of uprights and roof trusses ; the concrete wall panels are fixed to the frame by clips that bolt to cast-in sockets, and either a flat or pitched roof, of any convenient material, is then added. The walls may be painted, or faced in aggregate, and internal walls can be finished to any desired standard. In Jamaica it has been found that this type of construction reduced the cost of a simple two-bedroomed house by 25 per cent ; similar results have been obtained by the companies with petrol stations in Rhodesia.

While Dexion has been used in a wide variety of similar building installations in the past, this is the first time the company has marketed a "package" building system in co-operation with another company. First developed in 1947 by Demetrius Comino, an Australian engineer of Greek extraction then living in London, Dexion consists of sheet iron punched with slots and holes, bent lengthwise to a right angle. Supplied in several sizes, it is simply bolted together, much like a giant "Meccano" set. It is used in a wide variety of industrial and constructional applications, and is now made under licence in fourteen countries outside Britain ; the latest factory to make it will open shortly in New Zealand.

STOCK EXCHANGE

Bearer Shares Again

ANOTHER sign has been given this week that the attitude of the authorities to bearer shares is becoming a little more flexible. Last autumn, they agreed that the firms participating in Aims of Industry should be allowed to sell shares to workers in bearer form, provided no stock exchange quotation was sought, thus lessening the risk of sales to non-residents. Early this year, the ban was lifted on repatriation of bearer shares held by foreign investors—which immediately narrowed the premium of bearer over registered stock to the equivalent of the stamp duty, and encouraged an increase in arbitrage between London and Paris in ordinary shares such as "Shell" bearer. Now the Bank of England has given permission to Liebig's in its forthcoming one-for-one bonus issue to offer bearer shares to holders of existing bearer shares (which make up about one-third of the company's total ordinary capital of £2 million ; an unknown portion is held abroad). It will be intriguing to see how many bearer holders take their new shares in bearer form—they have the option of taking registered stock. While stamp duty is not levied on transactions in existing bearer shares, it is levied at triple the basic rate, i.e., at £6 per cent, on new shares ; and the company charges 2s. 6d. for each share warrant (of £5, £20 or £50) to cover the cost of printing this negotiable instrument.

Counting Britain's Architects

STATISTICAL information about some British professions has necessarily been made available by law or circumstance: this is true of doctors, for example, owing to national health legislation. In many other professions, however, a traditional British reserve—not to say secrecy—still operates to keep this information hidden from the general public, and sometimes from the members as well. Until recently, architects fell into the second category; now, however, the Royal Institute of British Architects has published some of the results of a survey for 1957-58 which lifts this cloak of anonymity, and gives a picture of the structure of the profession—as well as showing how important architects are to building construction in Britain.

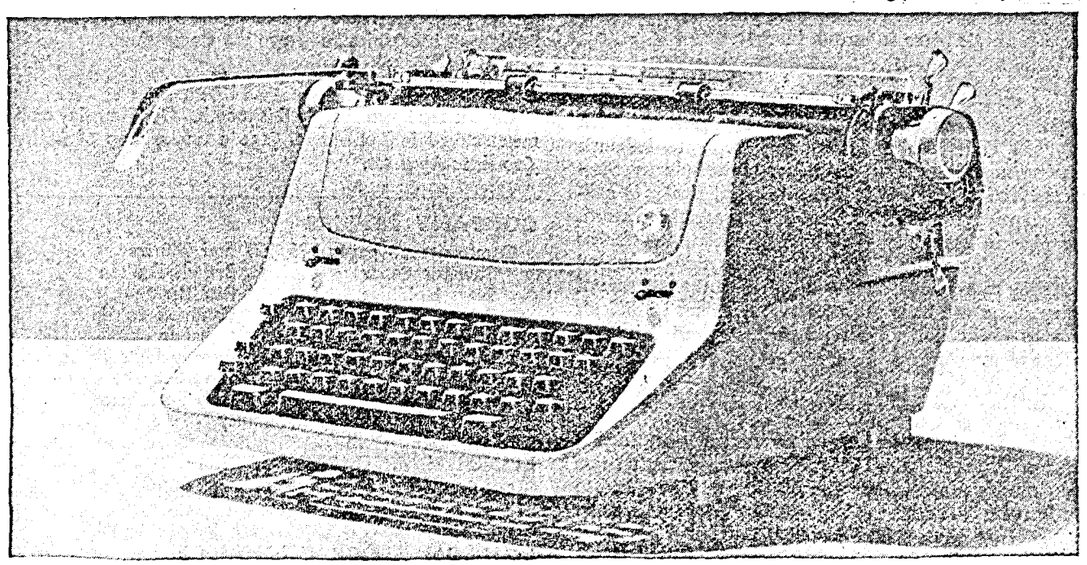
At least half of the country's architects are still in private practice. In 1958, there were about 3,000 private architectural practices in Britain, employing some 9,000 architects and 5,500 unqualified assistants ; these firms were responsible for the design and supervision of at least one-third of the new building work done in Britain in the previous three years. The small firm still predominates in architecture: in 1957-58, three-fourths of all practices in Britain had five or fewer architectural staff. Forty per cent had one principal and no architectural assistants ; twenty per cent consisted of one man working entirely on his own, with no architectural assistance—qualified or unqualified—whatever. These small firms accounted for 39 per cent of the volume of building work certified by an architect in 1955-57. Firms with eleven or more architectural staff, on the other hand, accounted for almost as much of the nation's building work during that time, although they represented only ten per cent of the number of firms in the profession.

There are few really big private firms of architects in Britain ; only about 40 firms—mainly concentrated in the London area—employed 25 or more staff. By contrast, there are nearly 80 firms in America employing more than 50 qualified architects or assistants—one firm has a staff of over 1,000. The proportion of architects working entirely on their own, however, is about the same in both countries (in Canada, by contrast, only three per cent work on their own). The average practice in Britain probably contains about the same number of architects as its American counterpart—about 5—but gets along with less than half the number of draughtsmen, specification writers, administrators, and other hangers-on.

Work certified by private architects rose in value in 1957 to over £400 million, out of a total of £1,230 million worth of new building. This does not include buildings—particularly private housing—designed by architects but supervised by the builder. About 77 per cent of all commercial building is certified by an architect ; but only 34 per cent of all industrial buildings and about 17 per cent of all housing, are. Of all new building done for private owners during 1955-57, 44 per cent was certified by an architect ; but this was true of only about one-fifth of new work done for public authorities.

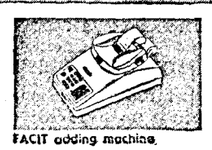
The Institute is expanding the survey in an attempt to find out the volume of work being done by the architects' departments of public authorities and industrial firms—in other words, the half of Britain's architects not in private practice, and not covered in the present survey. It is believed that when this group's work is considered, architects will be found to be handling between 60 and 70 per cent of all new building work in Britain—a considerably higher proportion than has previously been assumed to be the case.

turn your typist into twins



give her a FACIT T1

Aren't there times when you wish your secretary had a twin sister in the office? Another girl of her efficiency and accuracy to lend a hand when typing jobs of various kinds start piling up? ● Most likely your secretary has no twin, but the FACIT T 1 typewriter *does* have a "twin tabulator" to help you out. The T 1's unique "mechanical memory" actually "remembers" the standard forms of your letters and invoices, while the regular tabulator takes care of the jobs in-between.



Calculators, adding machines, electronic computors, typewriters, duplicators.

Factories in Sweden and West Germany. Literature from nearest local agent or Atvidabergs, Stockholm, Sweden.

PLASTICS

A New Material

A NEW reinforced plastic material called "Resnit" has been introduced by Leicester, Lovell and Co. Intended for uses where the quantities involved are too large for economical hand production, it consists of a knitted cotton fabric in which a heat-setting phenolic resin is incorporated, and can be shaped on a press basically similar to that used for forming sheet metal. The makers claim that the fabric used in Resnit is cheaper and easier to shape than the glass fibre cloths normally used, and that it will be some 30 per cent cheaper than glass fibre/polyester laminates for quantities large enough to justify the tooling costs—say 5,000 to 10,000 pieces a year. It is not so strong as glass fibre reinforced materials, but it could be made with glass fibre instead of cotton where strength is more important than cost. It is expected to find useful applications in general engineering, and where moderately large numbers of a light and corrosion-resistant product are needed. Tooling costs are lower than for sheet steel, and the cost of finished parts made of Resnit may be competitive with steel pressings.

SHORTER NOTES

ICI have announced that they will begin commercial production of polypropylene, which they will sell under the brand name "Propathene" beginning June 1st. The company's pilot plant at Wilton will be enlarged, and a new plant will be built there to bring capacity to around 10,000 tons a year. Polypropylene is a high-density polyolefin plastic having superior properties in many respects to conventional polyethylene, and a wide range of potential new uses; it is also produced under licence in Britain by Shell Chemical Company, who have announced plans to have a full-scale plant on stream in 1961.

* * *

Steel: Fact and Fiction, produced by the British Iron and Steel Federation this week as a reply to Labour's pamphlet supporting re-nationalisation of the industry, *Steel and the Nation—Labour's Plan*, has little difficulty in nailing down with pretty hard facts most of the arguments worth answering in that wildly tendentious document. It has considerably more difficulty in finding anything new and interesting to say about the issue. Vital as the outcome of this argument will be to the steelmakers, it must be difficult for even them not to become rather bored with the content of it.

* * *

Applications by United Kingdom residents for foreign exchange for education or maintenance abroad may now be dealt with by authorised banks; hitherto they have had to be referred to the Bank of England. An allowance may be granted of £700 for one full year at school and of £1,250 at university; up to £50 a month, for not more than six months, may be approved for education "en famille"; and an annual allowance of up to £150 in North America and £75 elsewhere may be given for children going abroad for not less than one scholastic year under reciprocal "au pair" arrangements.

Two further big foreign loans are expected shortly in Switzerland. The Danish Government is to raise 50 million Swiss francs, and the International Standard Electric Corporation of New York 60 million francs. This brings total foreign loans in Switzerland since the autumn above 500 million francs. It has been reported from Luxemburg that the High Authority of the European Coal and Steel Community expects to raise a loan in Germany this year of 150-200 million marks.

* * *

In an interim statement to shareholders, the chairman of A. C. Cossor, the Marquess of Exeter, announces that the company is to pay the dividend on the six per cent £1 preference shares for the year to March 31st, thus making good the previous arrears for the six months to September 30th 1958, but that the question of paying an ordinary dividend must await the preparation of the full accounts. The sale of the radio and television subsidiary has placed the company on a profitable basis; activities are being concentrated on the electronic engineering field. The precise figures of the sale of the radio and television subsidiary to Philips Electrical Ltd. cannot yet be ascertained; these will no doubt be published when the results of the further reorganisation now proceeding are announced.

* * *

Crude oil production in the Consortium Agreement area of Iran reached a record level of 39.8 million tons in 1958, according to the Iranian Oil Operating Companies' annual review of operation, published this week. This compares with 34.8 million tons in 1957; payments to Iran totalled £88.2 million in 1958, against £76.4 million in 1957. The two operating companies, the Iranian Oil Exploration and Producing Company and Iranian Oil Refining Company, operate in the Agreement area in southern Iran on behalf of the National Iranian Oil Company and the seventeen foreign oil companies known as the Consortium.

* * *

Copper has fallen sharply this month. On Thursday cash metal closed in London at £230 a ton, a drop of nearly £20 since April 1st.

COMPANY MEETINGS

SCOTTISH WIDOWS' FUND & LIFE ASSURANCE SOCIETY

HIGHEST EVER NEW BUSINESS

RECORD COMPOUND BONUSES

MR F. H. N. WALKER ON SOCIETY'S IMPRESSIVE GROWTH

The one hundred and forty-fifth Stated Annual Meeting of the Society was held in the Society's Head Office, Edinburgh, on Tuesday, April 14, 1959.

In the absence through illness of Mr F. H. N. Walker (Chairman of the Ordinary Court of Directors), Mr Alastair C. Blair, CVO, WS, presided.

In moving the adoption of the report and accounts, which were taken as read, Mr Blair submitted Mr Walker's remarks as follows:

New life assurance business in 1958 exceeded £35 million, the largest ever reported for a single year and over £9 million more than in 1957—an increase exceeding one-third. New annuities were arranged for about £5¼ million per annum—nearly 25 per cent greater than in the previous year—and almost all relating to group and other pension schemes.

These are indeed impressive figures which show a marked advance even on the record results we were able to report for the previous year. It is therefore not surprising that the Revenue Account shows a premium income about £900,000 higher than in 1957 and more than 60 per cent in excess of the figure of five years earlier.

Income from investments is higher, not only in absolute terms owing to growth of our assets but also as a rate of earnings on our funds—£6 4s. 10d. per cent as against £6 3s. 3d. per cent last year. It should be remembered that these rates would have been about 6s. higher had it not been for the transfer—to which I shall have occasion to refer later—of £5 million from inner reserves to the funds in 1955 to provide a special additional intermediate bonus till the end of the quinquennium and a special vested bonus now.

QUINQUENNIAL VALUATION

I come now to the quinquennial valuation and distribution of surplus. Our total assurance funds, including the Capital Redemption Fund, were just over £115 million—about £12 million greater than a year earlier and as much as £49 million in excess of the figure of five years ago, an increase of 74 per cent during the quinquennium. This is another measure of the growth of the Society and of the net savings we are attracting to life assurance with such benefit to the policyholders and to the community.

The liabilities under our large assurance and annuity business have been valued on the stringent bases set out in the report and a special contingencies reserve of £1,600,000 has been made. Deducting the value of the liabilities and the contingencies reserve from the Life Assurance and Annuity Funds, a surplus is disclosed of over £13,800,000 including £692,000 brought in from the previous quinquennium.

Out of this surplus the Directors have declared a compound reversionary bonus, i.e., a bonus calculated on the sum assured and existing vested bonus at December 31, 1958, and payable in the same event, at the rate of 50s. per cent per annum—the highest rate of compound bonus ever allotted by the Society—on all ordinary with-profits policies in force on January 1, 1959.

SPECIAL REVERSIONARY BONUS

In addition there is a special reversionary bonus to with-profits policies which were in existence at December 31, 1955, on a with-profits basis and were still in force on January 1, 1959, on that basis. This special bonus is at the rate of 30s. per cent compound for each year's premium due on the participating scale on or before December 31, 1955, with a maximum of £7 10s. per cent. It will be remembered that at the end of 1955 the Directors considered it only fair that the holders of with-profits policies then existing should receive some benefit from the capital profits arising from our holdings of ordinary shares in addition to such higher bonuses as might be allotted to all with-profits policyholders in future on account of the increased income resulting from these holdings. They would have declared a special vested bonus then had the time been appropriate. This, however, would have involved a full valuation of assets and liabilities and, as only two years had elapsed since the previous valuation and distribution of surplus they decided instead to intimate their intention of declaring at the end of the quinquennium a special vested bonus on the lines I have indicated and to allow on claims and surrenders arising in the meantime under policies affected a special intermediate bonus at the same rates. Now that the quinquennium has ended they have carried out their intention. The sum of £5 million was transferred from reserves in 1955 to meet the estimated cost of the special bonus, and you will be interested to know that this sum has proved to be almost exactly the amount required to provide the special vested bonus and the special intermediate bonus in the meantime. The exceptionally large surplus of over £13,800,000, which I have mentioned, includes the balance of that sum of £5 million which remained at December 31st last after providing for the special intermediate bonus in the meantime.

The combined effect of the ordinary and special bonuses now declared is that the compound bonus for the quinquennium on ordinary with-profits policies ranged from a minimum of 50s. per cent per annum to as much as 80s. per cent per annum for ordinary with-profits policies entitled to the full special bonus.

That so many of our with-profits policyholders—those who have held with-profits policies for eight years or more—will receive an addition of 20 per cent to sums assured and previously existing vested bonus is an outstanding result even on present-day standards.

GROUP PENSION SCHEMES

Our with-profits group pension policyholders also share in the Society's success, and we are pleased to be able to declare a bonus at the rate of 12s. 6d. per cent as set out in the Report of the Directors. This bonus is at a higher rate than we expected to declare when we launched our with-profits scheme in 1954 and augurs well for the future.

With-profits group pension schemes now form a large and important part of our business, and we are confident that employers who have entrusted their pension arrangements to the Society should have every reason to feel that their decision was a wise one.

You will naturally ask yourselves what the future is likely to hold. Well, the contingent intermediate bonus has been fixed for the time being at the rate of 50s. per cent per annum compound—the highest rate of ordinary compound intermediate bonus ever allowed by the Society—and, whatever may be the changing economic and financial conditions of the future, the Directors feel confident that the Society will continue to give outstanding value for money to its members and maintain its leading position as a with-profits life assurance office.

The Directors' report and the accounts as audited were adopted unanimously.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

MOST SUCCESSFUL YEAR

The 118th Annual General Meeting was held on April 7, 1959, at Birmingham. Mr A. H. Sayer, MC, JP, the Society's Chairman, said: I am pleased to be able to point out that the Society's declared bonuses have increased in successive years from 32s. per £100 sum assured to 36s. and now 40s. Similarly in the Industrial (Home Service) Assurance Department, where premiums are collected at the homes of policyholders, allocations for their benefit have been increased in successive years from £110,000 to £160,000 and now to £180,000, so that Home Service policy holders may reasonably expect, in the years to come, larger additions to the contractual sums payable on death or maturity. A with-profits insurance policy responds to the effects of inflation to the advantage of the policyholder with a flexibility with which it is not always credited.

The year's operations during 1958 were favourable. The Assets increased by over £1,300,000, which was invested to yield favourable rates of interest. The gross rate of interest earned on the total funds was £5 0s. 6d., notwithstanding that the rate of interest charged on over 6,000 House Purchase Loans has not been increased above the original rates of 4 per cent and 4½ per cent. The total income at over £6 million showed an increase of over £250,000.

The Valuation Surpluses totalled £1,052,000 compared with £973,000 at the actuarial valuation a year ago, and it has proved possible to increase the Bonus on Ordinary Department Policies.

New business was buoyant during the year with increases in all Departments. Indeed from nearly all points of view the year 1958 was one of the best ever experienced in the long history of the Society.

THE BRADFORD DYERS' ASSOCIATION LIMITED

NEED FOR REORGANISATION

MR JAMES EWING ON THE POSITION

The sixty-first Annual General Meeting of The Bradford Dyers' Association Limited was held on April 14th at the Midland Hotel, Bradford.

Mr James Ewing (Chairman), who presided, in the course of his speech said:

The Company reached its 60th anniversary in December last, and I regret that in submitting our 61st Annual Report we are not in a position to lay before you much better figures. We have had two difficult years, and I have already given you reasons for the adverse results in my statement which accompanied the Accounts.

In 1958 output of cotton and man-made fibre cloths was at its lowest level since 1947. Imports were substantially bigger than in most years during the past decade and exports much less, and the balance for home consumption was not reduced to a degree likely to cause a shortage sufficient in itself to bring about a revival in demand.

GOVERNMENT ASSISTANCE

In the statement accompanying the Audited Accounts I made reference to the existence of redundant capacity in all Sections. The Prime Minister at the Cotton Board Conference in Harrogate last October indicated that if the industry would produce plans for reorganisation the Government would be willing to assist. If this means—which I believe it does—that the Government is prepared to assist financially in removing excess capacity, I hope all Sections of the industry will respond immediately and grasp this opportunity of reorganising the industry.

It is the responsibility of the industry sectionally to produce plans which will meet their differing needs. At the same time it is equally important that the Government should reconsider its policy in relation to the domestic textile industry. In my view we now have the opportunity to re-shape our industry, but if we fail to do so we can only expect a continuation of the slow and wasteful erosion that has been going on for so long.

POSITION IN USA

The problems facing the USA textile industry are not unlike those of the United Kingdom. Measured from the base period of 1947-49, industrial production in the United States has gone up by 45 per cent, whereas during the same period the production of domestic textile mill products declined by 2 per cent. There was a modest decline in the production of cotton fabrics, a relatively large decrease in the production of fabrics made from rayon and acetate fibres, and a very substantial decline in the output of woollen and worsted goods. The only fabrics to show an increase are those made from the newer man-made fibres. A report has just been published by a special sub-committee of the US Senate Committee on Interstate and Foreign Commerce (Report No. 42 dated February 4, 1959). The report urges that "it would not be wise national policy to allow conditions in the domestic textile industry to continue to deteriorate . . . there can be no disagreement that it is imperative to national security for this Nation to maintain sufficient capacity to satisfy its military and civilian needs in the event of a national emergency."

This is a pertinent factor, which I consider our own Government should weigh very carefully. There is a well-established precedent for the maintenance of a live and efficient textile industry in the United Kingdom for purposes of national security. In the case of the Dyestuffs Industry, after the first world war, when this country produced less than 20 per cent of its dyestuff requirements, an Act was placed on the Statute Book—the Dyestuffs (Import Regulation) Act—and under the shelter of this Act a virile and progressive dyestuffs industry was established in the United Kingdom. This enabled the British makers to produce the whole of the country's requirements in the more exacting period of the second world war and to obtain a commanding position in overseas markets. That Act was placed on the Statute Book because of National Security.

BEIDA DYERS SAE, EGYPT

There is little I can add to the statement which accompanied the Directors' Report. The mechanics for settlement of the claims will doubtless be proceeding in the normal way, but we have not yet been put in touch with the accredited body for dealing with the detailed settlements. We cannot see that there should be any delay in effecting settlement of our sequestrated assets, which comprise balances in the National Bank of Egypt and Bank Misr, Cairo, aggregating £E1,099,560. A settlement of our Egyptian property claim, embracing our holdings in Beida Dyers SAE, should be facilitated inasmuch as our main claim comprises our holding of 54,240 shares which are quoted on the Egyptian Stock Exchange. This claim will be met out of the amount of £27,500,000 which the Government of the United Arab Republic has agreed to provide in full settlement of all claims for Egyptianised property. We should have welcomed an opportunity to continue to hold this investment, because of our long term know-how agreement with the Company, but in arriving at the settlement we were not consulted.

Our claim has been based on the Stock Exchange value at the date when the shares were sequestrated and later Egyptianised, and so far as we can ascertain the Stock Exchange value of the shares has increased since that date. The total amount provided for the settlement of such claims strikes us as being far short of what will be required. We were, therefore, glad to learn that the Government, as expressed by the Prime Minister during the recent debate in the House, does not exclude the possibility of a further contribution from public funds to ensure a fair settlement. We wish to add that we have full confidence in the Foreign Office negotiators who are looking after our interests in this unfortunate and unprecedented affair.

DIVERSIFICATION OF ACTIVITIES

Because of restricted scope for investment in textiles owing to the continued shrinking in volume during the past decade, your Company had surplus funds available and, in keeping with this general trend, after careful analysis it invested in several smaller companies, of which I have furnished full details in my previous addresses. The amounts invested in Bradford Dyeing Association (USA), Dominion Dyeing & Printing Company (Canada), Davies Coop & Company Limited (Australia), and Beida Dyers SAE (Egypt) aggregate £2,073,064, whereas our investments in Companies in the United Kingdom, most of which are in fields outside textiles, amount to £612,447 apart from sums on loan amounting to £630,650.

It is not our intention to spread our activities in fields that are too diversified unless we can acquire the skill in management to make such enterprises show an adequate return on the amounts invested. We give this information because we understand that some of the big investment companies are somewhat sceptical of companies diversifying in fields outside their own particular experience. In any broadening of our base of operations your Board has full regard to the Company's financial position, not only in making the original purchase, but in foreseeing likely demands for development.

The Report and Accounts were adopted.

TWINING CROSFIELD & CO.

CAPITAL AND SCRIP ISSUE PROPOSALS APPROVED

The Forty-second Annual General Meeting of Twining Crosfield & Co. Limited was held on April 16th, Mr H. W. Backhouse, chairman and managing director, presiding.

The following is an extract from his circulated statement: Our good results are due to a considerable extent to the fact that the Tea Markets have on the whole been favourable to Distributors during 1958.

The Coffee Market has been easier for most grades throughout 1958 and the reduction in the cost has been passed on to the consumer whenever possible.

The Group Profit for the year amounted to £138,860 which compares with £106,999 for 1957. We propose an increase in the Ordinary Dividend from 18 per cent for the year to 21 per cent.

We are proposing the issue of bonus shares in order to bring the issued capital of the Company more into line with the capital actually employed.

We are also proposing an increase in the authorised capital to £700,000. There is no intention at present of issuing this increased amount but we have found in the past that it is useful to have unissued capital for the purpose of acquiring other businesses as opportunities arise.

Although there is nothing that appears imminent, we can visualise circumstances in which it would be desirable to introduce more permanent capital into the business. This could take the form of a "rights" issue to existing shareholders.

Competition is as strong as ever. The current year has begun well and we are better equipped than we were a year ago to cope with the changing pattern of the trade.

The report and accounts were adopted.

At a subsequent extraordinary general meeting resolutions were passed sub-dividing the 10s. Ordinary Shares into shares of 5s. each, and increasing the capital to £700,000. The proposed issue to shareholders of one new 5s. Ordinary Share for every two 5s. Ordinary Shares held was also approved.

NATIONAL PROVIDENT INSTITUTION

RECORD NEW BUSINESS

The Annual Meeting of the National Provident Institution for Mutual Life Assurance will be held on April 21st in London. The following are extracts from the address which will be submitted by the chairman, Mr L. E. D. Bevan:

One hundred years ago 95 per cent of our new business was represented by whole life assurance, and the vast development of life assurance over the intervening years, and particularly during the present century, has resulted from the increasing popularity of the endowment assurance. This type of policy is an ideal way of saving for many purposes—for covering the repayment of a house purchase loan, for children's education, for investment, and so on. Another development is in the use of endowment assurance for the specific purpose of making provision for retirement by the inclusion of an option to take the proceeds of the policy in the form of an annuity, and many pension schemes have been arranged on this basis—combining life cover during the working years with a suitable pension on retirement.

A good many employers have preferred to base their pension arrangements on deferred annuities instead of endowment assurances, but until recently the Institution only offered these contracts on a non-participating basis. Since 1956, however, we have been prepared to issue deferred annuities on a with-profit basis for the self-employed and others who are not in pensionable employment, and we have received a substantial number of proposals from those of them who wish to take advantage of the tax concessions now available. The rate of bonus declared on these policies at our last valuation—the first after this class was introduced—has undoubtedly established the Institution as an office which must be considered by all interested in this provision.

WITH-PROFIT PENSION SCHEMES

That brings me to an important new development in the classes of policy we are able to offer to the public. In 1956, you will remember, the income tax law was altered so that premiums paid to life offices for pensions, under schemes approved by the revenue under the Income Tax Act, 1952, section 379, could be accumulated at interest without deduction of tax. Since then we have been applying our efforts towards the preparation of a new type of policy which would make available, not only the advantages flowing from the Finance Act, 1956, but also the benefit of participation in the profits of the Institution. I am very glad to tell you now that we have recently been able to introduce a policy which has all these advantages. Bonuses will be allotted to these contracts in the form of a reduction in the premiums which would otherwise be payable during the currency of the contract. Our scheme has also been designed so that it will be simple and flexible to operate: I am sure those virtues will be most valuable when we come face to face with the new State graduated pensions. We believe we have produced a policy which is the most up-to-date in all respects, and I commend it to any employer who has not yet made satisfactory provision for the retirement of his staff.

Moreover in a mutual office like the Institution such contracts are very attractive, since the holders of with-profit contracts are entitled to the whole of the profits available for distribution according to their respective rights. There are no shareholders to claim any share in those profits, and the record of this Institution for excellent bonuses is well known. Our pensions department is ready at all times to give the benefit of our experience and knowledge in arranging a scheme to suit individual requirements.

INTEREST YIELD

Our investment policy has continued to yield satisfactory results. During 1958 we took advantage of the favourable terms on which British Government and fixed interest stocks generally could be bought to put the greater part of our new money into such investments, our equity portfolio remaining at about 30 per cent of the total.

Our funds are at present increasing at a rate of about 10 per cent per annum; while for several years the average return which we have been able to obtain on new investments has been less than the high rate of interest earned on the existing fund. Nevertheless, up to 1957, the overall yield continued to rise due to increasing income from the existing investments, particularly the Ordinary share portfolio. The overall yield could not be expected to continue to rise indefinitely and in 1958 there was a small reduction, although the current level of nearly 7 per cent is still very satisfactory. The strength of our financial position remains very great and at the end of 1958 the market value of our assets as a whole was substantially in excess of the figure at which they stand in the balance-sheet.

INTERIM BONUS RATES

The rates of bonus declared at the distribution of profits at the end of 1957 resulted in general satisfaction among our members, and we received many congratulations. I explained a year ago that we were then able to include in our declaration a special rate of bonus as a result of the success which had attended our investment policy, and added a warning that we must not assume that the rate of interest earned would continue at so high a level.

GROWTH OF BUSINESS

Life assurance represents saving, and saving is a counter to inflation. The new annual premiums of £360,000 on our business last year are a valuable contribution to the nation's savings, and our total annual premiums of over £3,200,000 from old and new business, apart from sums received by way of single premiums, show further growth.

The growth of our business continues steadily, and I am glad to say that a pronounced increase in the amount of personal policies taken out by individual members forms the mainstay of this growth. Five years ago I reported that our funds had just passed the £20 million mark. Now we have comfortably passed the £30 million milestone. Nearly every year brings a fresh record in the amount of new business and the growing total of business naturally affects all branches of our work.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

INTERMEDIATE BONUS INCREASED TO 55s. 0d.%

The One Hundred and Thirty-fifth Annual General Meeting of the Clerical, Medical and General Life Assurance Society was held on April 15th at the Society's Chief Office, 15, St James's Square, London, S.W.1.

Sir John Hathorn Hall, GCMG, DSO, OBE, MC, the chairman, presided and, in moving the adoption of the report and accounts, said:

The business of life assurance was transacted, during 1958, against a background of increasingly keen competition and of changing financial conditions which served to illustrate the strength and resilience of our organisation for, once again, the Society successfully showed its ability to maintain the steady progress that we have now come to expect. To our policyholders the most satisfactory evidence of the Society's success will, no doubt, be the increase in the rate of Intermediate Bonus payable on claims and maturities, and to this I shall refer in more detail later.

NEW BUSINESS

The new sums assured in 1958, after deduction of reassurances, amounted to a record figure of £11,018,000, representing an increase of some 9 per cent over the comparable figure for the previous year. In addition, new deferred annuities for a total of £490,000 were underwritten by means of our Pension Contracts. This compares with the previous year's rather larger figure of £564,000, and I shall have something to say later regarding the influence on this class of business of public doubt as to the Government's precise intentions regarding state pensions.

CLAIMS

The claims by death at £682,000 showed an increase of £157,000 over the previous year, but remained well within the provision made for them in our reserves. The continued growth in the sums we have at risk must naturally lead to an increase in the claims by death, although this increase is subject to yearly fluctuations.

INVESTMENTS

The recovery in market values of securities during 1958 increased, very substantially, the margin of value of our assets over the figures at which they appear in the balance sheet. To the extent to which this recovery was due to a fall in the general level of interest rates, the terms for new investment became less favourable; but we were able in the course of the year to make substantial long-term investments while the higher rates were still ruling. Our considerable holdings of equities are proving particularly profitable, and have made an important contribution to the year's interest income. The gross yield on our Life Assurance Fund for 1958 was £6 6s. 4d. per cent, and the corresponding net yield £4 12s. 7d. per cent.

INCREASED RATE OF INTERMEDIATE BONUS

Our next full actuarial investigation and bonus distribution are not due until early in 1961, but the continuance of high interest earnings justifies, in the opinion of the Board, an immediate increase in the rate of Intermediate Bonus, payable on claims and maturities under with-profit policies, in respect of premiums due and paid since December 31, 1955.

Accordingly, in respect of claims and maturities arising from such policies on and after to-day we are increasing the rates of Intermediate Bonus by one-tenth. For policies in the current series, this means that the new rate will be 55s. 0d. per cent of the sum assured for each annual premium in respect of which it is paid.

PROGRESS OF FUNDS

The combined Life Assurance and Annuity Funds increased by nearly £2½ million to £32,431,000. This increase of just over 8 per cent presents, perhaps, the best measure of the Society's progress, and of the extent to which we have contributed to the application of savings to investment.

STATE PENSIONS

It would not have been surprising if uncertainty over changes in State Pensions had held up the institution of new staff pension schemes, in spite of the Government's expressed view that private schemes are a national asset and that their expansion is to be encouraged. Natural anxiety on this subject was probably in large measure responsible for the slightly reduced total of new business secured under this head. I am however happy to say that, in addition to the business that actually passed through our books in 1958, the Society had at the end of the year a substantial volume of pension business impending.

Employers who have schemes in force or who contemplate the institution of new schemes, will naturally look to us for advice on the difficult problems presented by the new legislation and particularly on the question of whether or not to "contract out." We are very willing to advise to the best of our ability on the highly complex questions involved, and to indicate the precise points upon which a decision will have to be taken and the factors which, in our opinion, should influence that decision.

The report and accounts were adopted.

VOSPER LIMITED

(Shipbuilders and Engineers)

MR OWEN R. GUARD'S REVIEW

The twenty-second annual general meeting of Vosper Limited will be held on April 22nd at Portsmouth.

In the course of his circulated statement, the chairman, Mr Owen R. Guard, dealing with the financial results said that they had earned a net profit of £93,878 during the 16 months under review compared with £64,181 for the 12 months ended August 31, 1957. The final dividend of 12½ per cent made a total distribution of 20 per cent for the extended period which was at a rate equivalent to the 15 per cent paid for the previous 12 months.

Referring to the very remarkable performance results from the initial running of the BRAVE class of Fast Patrol Boat, an entirely new class of small Warship for which they were awarded a contract for the design and construction of two such craft by the Admiralty, Mr Guard said that on the second day of trial running 51 knots was exceeded over the measured mile, which as far as they were aware, was the highest speed ever recorded for craft of that type and size. They had very great hopes that the good work touched upon would yield orders from abroad from where there was considerable interest.

Since his last statement to them they had completed what was acknowledged by the Shell Company to be a very successful and outstanding design of high-speed craft for passenger carrying in their oil fields in Maracaibo. From this work they looked forward to the possibility of further orders.

Their order book for the Vosper Roll Damping Fin Development showed a very considerable growth in the popularity of that equipment and the indications were that that growth was still taking place.

In their Research and Development Section, in which was incorporated the Electronics Department, they had received interesting work from various Atomic Energy Authorities.

The chairman pointed out that in their main line of business, which was the construction of small craft generally, they were not as fully occupied as was desirable. It was their constant endeavour to find new markets, but in common with a large number of other firms, they were finding it difficult to maintain the volume of orders to which they had been accustomed in recent years.

Mr Guard concluded: We expect this situation to be restored when the full merits of the BRAVE class of Fast Patrol Boat and other similar types come to be appreciated.

LEGAL AND GENERAL ASSURANCE SOCIETY LIMITED

TOTAL PREMIUM INCOME INCREASED BY MORE THAN £5,500,000

VISCOUNT HARCOURT ON NEW TRIENNIAL VALUATIONS

The One hundred and twenty-second Annual General Meeting of Legal and General Assurance Society Limited will be held on May 6th at Aldwych House, Aldwych, London.

The following is an extract from the circulated statement by the Right Honourable Viscount Harcourt, KCMG, OBE, DL, the chairman:

REPORT AND ACCOUNTS FOR 1958

In submitting to you the report and accounts there is one important matter, already announced, which calls for special mention. In the past, a full valuation of the assets and liabilities of the Society, including an actuarial investigation of the life assurance and annuity fund, has been carried out once every five years. With the growth of the Society's business, however, it is thought that a shorter period between valuations is desirable, and it has accordingly been decided that a valuation shall be made every three years instead of every five years. The first of such triennial valuations will be made as at December 31, 1959.

LIFE ASSURANCE AND ANNUITY FUND

Record new life and annuity business figures were again achieved by the Society in 1958. The total new life sums assured amounted to £183,889,659 after deduction of the amounts re-assured with other offices. If this figure is compared with the corresponding total for 1957 of £143,868,799 it will be seen that there was an increase last year of 28 per cent.

The premium income in respect of all life and annuity business on the books of the Society amounted during 1958 to £44,656,270, including £2,232,144 as consideration for immediate annuities. The total premium income for all classes of business written by the Society amounted to £51,200,195, compared with a figure of £45,657,466 in 1957. I should like to draw your special attention to the last two figures which I have quoted, from which you will see that there has been an increase of £5,542,729 in the total premium income of the Society.

MORTALITY

Each year we investigate the mortality experience of both the life assurance and annuity sections of our business and we have done so as usual for the past year. Once again the experience has been very satisfactory in the case of life assurance and it has also been favourable in respect of annuities.

RATE OF INTEREST

The life assurance and annuity fund, excluding the amount invested in the purchase of reversionary interests, earned in 1958 a gross rate of interest of £5 3s. 11d. per cent compared with £5 2s. 9d. per cent in 1957. After deduction of tax, the net rate of interest for 1958 was £4 10s. 4d. per cent compared with £4 9s. 11d. per cent in the previous year.

EXPENSES OF MANAGEMENT

The world-wide expenses of management of the life assurance and annuity business, including commission, amounted in 1958 to 11.77 per cent of the premiums received, excluding from the latter figure, however, the considerations paid for immediate annuity contracts. This is an increase on the corresponding figure of 11.38 per cent in 1957 but is still very moderate.

FIRE INSURANCE ACCOUNT

The net premium income increased by £202,793 to £2,748,766.

After provision for unexpired liabilities there was an underwriting surplus of £199,667 which has been transferred to profit and loss account. There is retained in the account an amount of £465,150 which is additional to normal reserves. The total fire fund at the end of 1958 was £1,564,657.

ACCIDENT INSURANCE ACCOUNT

The net premium income increased by £319,613 to £2,487,321.

After provision for unexpired liabilities there was an underwriting surplus of £120,908 which has been transferred to the profit and loss account. There is retained in the account an amount of £268,758 which is additional to normal reserves. The total accident fund at the end of 1958 was £1,849,731.

MARINE ACCOUNT

The marine account has not entirely escaped the difficulties with which this class of business has been beset in recent years. The underwriting year, 1955, now closed, has resulted in a negligible loss, as was anticipated when reporting at the end of last year.

The uncertain conditions in marine insurance have led our underwriting agents to pursue a conservative policy of acceptance which has naturally led to a restriction of premium income, which amounts this year to £813,631 compared with £939,930 in 1957.

This conservative policy, coupled with light early claims in the four-year settlement period which commenced with 1958, has increased the ratio which the fund bears to premium income from 127 per cent to 148 per cent. The amount of the fund, however, has remained almost unaltered at £1,205,004 after provision for taxation.

ASSETS

The total assets of the Society increased during the year by £36,762,000 and now amount to the sum of £355,768,000.

So far as the life department balance-sheet is concerned, it will be seen that the assets are represented as to £152,294,000 by Stock Exchange investments, as to £90,809,000 by freehold and leasehold properties including rent charges and ground rents, and as to £71,466,000 by mortgages and other loans.

PROFIT AND LOSS ACCOUNT

It will be seen from the profit and loss account that, to the balance of £1,564,762 brought forward from the previous year, there has been added £375,809 in interest and dividends as well as £320,575 in transfers from the fire and accident insurance accounts.

Finally, I am sure that, at the end of a review of such a successful and eventful year for the Society, every shareholder and policyholder will wish to be associated with me in expressing our thanks and gratitude to the management and staff of the Society throughout the world for the magnificent work which they have done.

GRESHAM LIFE ASSURANCE SOCIETY LIMITED

RECORD INCOME

The One Hundred and Tenth Annual General Meeting of the Gresham Life Assurance Society Limited was held on April 9th at 188 Fleet Street, London, E.C.

The Right Honourable Viscount Harcourt, KCMG, OBE, DL, the chairman, said in the course of his speech:

DIRECTORS

Certain changes in the composition of the board of directors since our meeting a year ago are mentioned in the report, and I must take advantage of this meeting, the first at which I address you as your chairman (to which office my colleagues did me the honour of electing me as from July 1st last), to pay tribute to my predecessor, the Honourable W. B. L. Barrington. Mr Barrington became chairman in 1934, and your Society has had the benefit of his guiding hand for close on a quarter of a century. The strength of the Society's position today is due in large measure to Mr Barrington's great experience and his close personal interest in all matters concerning its progress and its welfare. At the same time he has built up for himself an enormous fund of respect and affection on the part of all who have had the privilege of serving under him. We are indeed fortunate that Mr Barrington has agreed to continue as a member of the board, notwithstanding his relinquishment of the chairmanship.

We welcomed the appointment during the year of two new directors, Mr P. R. Cahill, OBE, and Mr Gordon Richardson. I am sure you will join me in wishing Mr Cahill well in the discharge of his added responsibilities as managing director in succession to Mr G. W. Bridge, FCII, who retired from that position on September 30th last and, I am glad to say, was thereupon elected deputy chairman.

INCOME

The Society's premium income in 1958, net of reassurances, amounted to £3,881,781; the total income from all sources, including consideration for annuities, for the first time in our history exceeded £5,000,000. After deducting income tax a net rate of interest of £4 15s. 5d. per cent was realised in respect of the life assurance and annuity fund, an increase of 7s. 9d. per cent compared with 1957, and I know you will, with me, welcome this improvement.

As a result of the year's operations the life assurance and annuity fund increased by nearly two and a quarter million pounds during the year to £24,626,858, an increase which I consider to be most satisfactory.

NEW BUSINESS

In the United Kingdom, the new sums assured of £8,591,626, after deducting reassurances, represented a small increase over the previous record figures attained in 1956.

Our foreign branches, particularly in France and the Near East, have had to operate under difficult conditions throughout the year and it is not surprising to find a diminution in the volume of new business abroad. It seems right that we should acknowledge these difficulties, and at the same time express our confidence in the ability of our representatives overseas to meet and overcome them.

MANAGEMENT AND STAFF

The encouraging picture presented by the accounts owes a great deal to the work of the manager and secretary, Mr W. H. Chapman, and I am very glad to be able to express our thanks to him, to his colleagues at head office, and to the staff throughout the Society's organisation.

The report and accounts were adopted unanimously and the other formal business having been transacted the proceedings terminated with a vote of thanks to the chairman.

NATION LIFE AND GENERAL ASSURANCE COMPANY

The thirty-fourth annual ordinary general meeting of Nation Life and General Assurance Company Limited was held on April 10th at Teddington, Mr H. Cox (the chairman) presiding.

The following is an extract from his circulated statement:

The Income of the Company has increased by £14,000, which is an increase above our average. The Life Funds have increased by £65,000, and our Industrial Life Fund now exceeds £1 million.

Our Subsidiary Company, TAMAS, has expanded its Sales by 55 per cent during 1958. A maiden Dividend is being declared on the TAMAS Shares.

The Company's Income for 1958 totalled over £350,000, and the Premium Income from our two Life Branches amounted to £293,423, showing an increase of nearly £11,000 for the year.

The Interest Income, which shows an increase of some £3,000, amounts to over £55,300 for the year.

There has been an increase in New Business production. In the Industrial and Ordinary Branches, the number of policies and New Sums Assured show increases over last year.

The Company has extended the Ordinary Life Branch during the year, and now issues all types of Life Assurance Policies in addition to Retirement Annuity policies.

The Directors have recommended a final Dividend of 6d. per 5s. Stock Unit, free of tax, making a total Dividend of 9d. per 5s. Stock Unit, free of tax, for the year ending December 31, 1958, as compared with 8d. per 5s. Stock Unit for 1957. The Directors further recommend that the payment of an Interim Dividend of 3d. per 5s. Stock Unit, free of tax, be made for the year ended December 31, 1959.

The report was adopted.

BROWN BROTHERS LIMITED

ANOTHER YEAR OF PROGRESS AND EXPANSION

The sixty-second Annual General Meeting of Brown Brothers Limited was held at the Great Eastern Hotel, Liverpool Street, EC2, on Wednesday, April 15, 1959.

Sir Richard Yeabsley, CBE, JP, FCA, the Chairman, presided. The following is an extract from his circulated statement:

I am pleased to report for the fifth consecutive year that the sales of the Company and its Subsidiaries have exceeded those of the previous year.

The trading profit of the group for the year 1958 amounts to £1,136,397 (£1,103,359 for the previous year).

The net profit of the group, after charging taxation, is £397,791 (£379,672).

Of this group net profit £64,504 has been retained in the Subsidiary companies, leaving a net profit for the year of £333,287 (£309,374) to be dealt with in the Profit and Loss Appropriation account of the Parent Company.

It is recommended that £150,000 (same) should be transferred to General Reserve.

The Directors propose a final payment of 11½ per cent, less tax, on the Issued Ordinary Capital, which with the interim distribution of 3½ per cent, less tax, already made, makes a total of 15 per cent, less tax, for the year (12½ per cent, less tax, in respect of the year 1957).

TRADING CONDITIONS

The increase in the number of cars and commercial vehicles on our roads must inevitably bring an increasing replacement market. We have developed within our Motor Departments at our Branches throughout the country specialised sections dealing with motor accessories, replacement components, paint and refinishing processes, tyres, garage equipment and tools. Specially trained personnel are in charge of these departments and technical representatives are available.

In the cycle section there has been a small decrease in sales during the year, but results are considered satisfactory in view of the general recession in the Cycle trade. Sales of complete bicycles are still running at a relatively low level. Specialised stocks of motor cycle and motorised bicycle components are available and continued progress has been made in this field.

In the early months of the year radio and television sales showed a considerable decline when compared with the very high rates of sales achieved in earlier years as new television stations were opened. The relaxation of Hire Purchase controls, however, gave a much needed tonic to this Industry and our sales in the last few months of the year were running at a very high level. Our Electrical departments have continued to make remarkable progress, demand having been stimulated not only by the relaxation of Hire Purchase controls but also the reduction in Purchase Tax on electrical domestic appliances.

Another satisfactory year's trading can be reported from our manufacturing subsidiary, Brown Brothers (Aircraft) Limited.

As will be seen from the Directors' Report, your Directors have elected Mr J. T. Masterton, our Managing Director, as Deputy Chairman.

The report was adopted.

THE MONOTYPE CORPORATION LIMITED

VERY SATISFACTORY RESULTS

The fifty-first annual general meeting of The Monotype Corporation Limited was held on April 14th in London.

Brigadier Sir George Harvie-Watt, Bart, TD, QC, MP (the chairman), presided and, in the course of his speech, said:

I am glad to report that the Trading Profit is the highest for seven years. This is due partly to increased sales in our export markets, and partly to the strenuous efforts which have been made in all sections of the business to improve efficiency.

During the latter part of the year there was a slight falling off in orders. The net result was a slightly lower balance of orders in hand than at the end of the previous year. Since the end of the financial year, however, orders have shown an improvement.

The Group Trading Balance amounted to £590,510 compared with £452,907 in the preceding year. The net profit, subject to taxation was £486,350 compared with £338,623, an improvement of 43 per cent. All companies in the Group contributed to this result. Taxation takes £270,785 of this sum, leaving a balance of £215,565, an increase of £93,021 on the previous year.

The disposable balance amounts to £305,376. In view of the improved results for the year, your Board feel justified in declaring a final dividend of 4 per cent on the increased capital of £2 million, making a total dividend for the year of 8 per cent, compared with 9 per cent on the capital of £1,500,000 for last year.

Our financial position is satisfactory, Net Current Assets, after taking into consideration Minority Interests and Future Taxation, amount to £1,738,739. In common with other companies, we are conscious all the time of the heavy liability for future taxation which has to be met out of our liquid resources. These, however, have improved during the year and amount to £542,329, an increase of £146,529 on the previous year.

Turnover has increased in the export markets, particularly in Australia. Our Australian subsidiary, in which we are associated with Seligson and Clare Limited, is to be congratulated on the excellent results achieved in the second full year of our working arrangement. Turnover has been almost doubled. Our turnover in India, which is severely restricted by Import Licensing, has somewhat improved.

In the Middle East improving prospects suffered a temporary setback as a result of the revolution which took place in Iraq. Machines were supplied, however, to Kuwait, Jordan and Syria. In Nepal and Cambodia, "Monotype" machines were installed for the first time.

As regards the Home market, taking into account the restrictions on credit which were only lifted in the autumn of 1958, and the falling volume of printing, business done during the year was reasonably satisfactory. Results so far this year are encouraging.

In the Continental market we have consolidated our position, particularly in Germany, both West and East, and other Eastern European countries. For the first six months of the current year, our turnover is running at a slightly higher level than that of the same period last year. We regard this as satisfactory, and given more stable conditions we have every confidence in our ability to increase our share of world markets.

The report and accounts were adopted.

CALEDONIAN INSURANCE COMPANY

The one hundred and fifty-fourth Annual General Meeting of the Caledonian Insurance Company will be held in Edinburgh on May 12, 1959.

The following is an extract from the Statement by the Chairman, Mr W. H. McGregor, FCIS:

LIFE DEPARTMENT

I am pleased again to report record New Business figures. After deducting reassurances the new Sums Assured, including Group Life business, amounted to £6,888,819. Annuities, including Pension Annuities for £532,787 per annum were issued. The Assurance premium income increased to £1,258,022 and the Annuity premium income, including single premiums, increased to £840,125.

The interest income increased by about £67,000 to £898,615, the rate of interest earned on the Funds for the year being £5 18s. 11d. per cent. After deduction of tax the rate was £4 12s. 10d. per cent.

Claims paid amounted to £934,248 and surrender values, of which an appreciable proportion was in respect of withdrawal benefits under Pension Schemes, amounted to £236,644.

The Life Assurance and Annuity Fund increased during the year by £1,288,792 and now stands at £16,111,969. The market value of our Stock Exchange Securities substantially exceeds the value at which they appear in the Balance Sheet.

FIRE DEPARTMENT

The premium income for 1958 was £2,350,753, which was £23,830 higher than the figure for the previous year.

In the Home Department our good underwriting experience continued, but abnormal circumstances in certain countries affected our Overseas results. In Canada whereas there was a general improvement we still had an adverse underwriting experience. In Cuba, following the political upheaval, we sustained heavy riot losses which seriously affected our hitherto profitable results. Apart from the results in Canada and Cuba, however, our results in territories overseas were satisfactory.

We have been able to transfer a sum of £149,284 to the Profit and Loss Account.

ACCIDENT DEPARTMENT

The premium income for 1958 was £5,183,439, a small increase of £50,488 over the record figure of £5,132,951 for 1957.

At home the major problem was Motor Insurance which, notwithstanding increased premium rates, continues to prove unprofitable. Overseas we had an adverse experience in Cuba, but I am pleased to say that we have been able to make a transfer to the Profit and Loss Account of the sum of £36,836.

MARINE DEPARTMENT

The sum of £70,000 has been transferred from the Account to the Profit and Loss Account. The Fund at £976,560 represents 163 per cent of the Premium Income.

TOTAL PREMIUM INCOME

The total Premium Income for all Departments was £10,180,294 compared with £9,811,808 for 1957.

PROFIT AND LOSS AND APPROPRIATION ACCOUNTS

The amount of interest, dividends and rents (less tax) on Shareholders' Funds was £227,398.

The balance for the year transferred to the Appropriation Account was £251,614 after providing for taxation.

The Directors' recommendations for dealing with the surplus are stated in the Report, and, if approved, the balance carried forward will be £629,199.

APPOINTMENTS

THE UNIVERSITY OF LEEDS

DEPARTMENT OF MATHEMATICS

Applications are invited for appointment as Lecturer or Assistant Lecturer in Statistics at a salary on the scale £900 x £50-£1,350 (efficiency bar) x £75-£1,650 a year for a Lecturer or within the range £700-£850 a year for an Assistant Lecturer, according to age, qualifications and experience. Applications (four copies) stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained) not later than May 2, 1959.

UNIVERSITY COLLEGE OF GHANA

Applications are invited for 2 posts of (A) Resident Tutorship or (B) Assistant Resident Tutorship in the Institute of Extra-Mural Studies. Candidates must have qualification in Economics, Politics, Public Administration, Modern History, International Affairs or Industrial Relations and Trade Union Studies. Secondment will be considered and there are opportunities for research. Salary scales: (A) £1,000 x £50—£1,350 x £75—£1,800; £1,850 p.a., (B) £900 p.a. F.S.S.U. Outfit and family allowances. Passages for appointee and family on appointment, annual leave and normal termination. Part-furnished accommodation at a charge not exceeding 7.5 per cent of salary. Detailed applications (6 copies) naming 3 referees by May 30, 1959, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

UNIVERSITY OF TASMANIA

AUSTRALIA

PROFESSOR OF APPLIED ECONOMICS WITH SPECIAL REFERENCE TO ACCOUNTING

The University of Tasmania has established a Chair of Applied Economics, with special reference to Accounting. Applications are invited for appointment to this Chair. Preference will be given to candidates who have training and experience in accounting and are interested in those fields of study in applied economics and business management in which an understanding of accounting is necessary or desirable.

The salary will be £A3,500 per annum.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on June 30, 1959.

UNIVERSITY OF BRISTOL

Applications are invited for the following posts in the Department of Economics tenable from August 1, 1959.

(a) Lecturer (Grade II) in Economics with special interest in Mathematical Economics. Salary scale £900 x £50—£1,300 : £1,350 x £75—£1,650.

(b) Research Assistant in Economics. Salary £600-£700. Fuller particulars of these appointments may be obtained from the Registrar, The University, Bristol, 8, to whom applications should be sent by April 25th.

AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

RESEARCH SCHOLARSHIPS

Applications are invited from post-graduate students with capacity for research for scholarships in Anthropology and Sociology including Oceanic Linguistics, Demography, Economics, including Economic History and Economic Statistics, Geography, Modern History (particularly in the fields of Australia and the British Commonwealth). Far Eastern History (China and Japan)*, Pacific History, International Relations, Law, Political Science, including Public Administration, Philosophy, Political and Social Philosophy and Statistics including Mathematical Statistics.

*A substantial knowledge of the relevant language is a pre-requisite.

The scholarships are tenable for an initial period of two years and may be extended for a third year. Scholars are expected to enrol for a Ph.D. degree.

The present value of a scholarship is £A833 per annum. Married scholars with dependent children may be granted an additional allowance of £A225 per annum in respect of the first child and a further £A75 per annum for each other child.

A grant will be made towards a scholar's fares to and from Canberra at the commencement and expiration of his scholarship.

Application forms and further information may be obtained from the undersigned*, to whom applications should be submitted, or from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1. The University regularly considers applications in June and November, but special consideration may be given to applications at other times. Scholarships may be taken up at any time after award including vacation periods.

*R. A. HOHNEN, Registrar,

Box 4, G.P.O., Canberra, A.C.T.

For further appointments and other classified advertisements see pages 286 and 287

COMPANY AFFAIRS

BOWATER PAPER

IN the face of a recession in newsprint and paper, the Bowater Paper Corporation has done well—some observers of its expansion programme (which has been financed largely by prior charge capital) would say remarkably well. The explanation seems to be that the cuts in newsprint production were made at the older mills at Corner Brook (reflected in the drop in the trading profits of Newfoundland Pulp and Paper from $7,353,000 to $6,512,000) rather than at the newer ones in Tennessee; and that some capacity in this country has been switched from newsprint to other types of paper where profit margins are higher; and that any cuts in production have been taken at older plants so that the newer ones should not be underemployed. In the preliminary statement the directors draw attention to "an appreciable easing in the demand for newsprint," which reduced production both in North America and in this country. But they add that production and sales of other kinds of paper in this country were higher and they mention "a further substantial increase in the volume of sales" of packaging papers by Bowater-Eburite. These sales were made at lower margins of profits, but nevertheless the trading surplus of Bowater-Eburite advanced last year from £1,416,000 to £1,631,000.

For the group as a whole the trading surplus last year rose from £17,152,000 to £18,145,000. Over the last four half-yearly periods, the gross trading surplus has run thus: £8,303,000; £8,849,000; £8,795,000; £9,350,000. No one can cavil at this trend, for it suggests that the group was not slow in adjusting its operations to changing market conditions. The net surplus, shown before deducting loan interest, has risen from £5,316,000 to £5,825,000 over the year. After loan interest the net surplus has risen from £4,846,000 to £5,093,000.

The ordinary dividend is left unchanged at 2s. 6d. per £1 stock, or 12½ per cent. On that dividend the stock at 47s. 9d. yields 5.2 per cent. The directors' comment on their dividend decision is interesting. They view the latest results with "some satisfaction" but they "have come to the conclusion that having regard to the uncertain trading conditions that still persist in relation to some of the industries in which the Organisation is engaged, the moment has not yet arrived when they should recommend any increase in the rate of the dividend." The reference to trading conditions is bearish, but the conclusion about the dividend is bullish—at least for the longer run.

BRITISH TIMKEN

THE minority ordinary shareholders in British Timken should jump at the offer by the Timken Roller Bearing Company of the United States, which controls just over 53 per cent of the British Timken equity, to acquire their shares. Timken Roller Bearing is offering 83s. 9d. per share in cash (ex the ordinary dividend of 10 per cent) for the 2,337,500 shares of £1 in British Timken, compared with a market price of 70s. 6d. Indeed, the bid is on a dividend yield basis of only 2.4 per cent. If the offer goes through, Timken Roller Bearing intends to redeem all the 1,000,000 of 4 per cent preference shares of £1 each in British Timken at 22s. 6d. each. In all, the deal could bring in about $30,500,000 to the exchange reserves. The directors of Timken Roller Bearing, headed by the president, Mr William E. Umstattd, would have preferred to exchange Timken Roller shares for British Timken shares. But the Bank of England indicated that it would not give permission for such an exchange.

Why is Timken Roller Bearing willing to pay such a high price for the minority shares in a company which it already controls and in which it intends to preserve the existing British management and staff? Competition in the roller bearing industry is growing more acute; the German, Swedish and Italian industries are already formidable and the Japanese industry may become so. Complete control of British Timken will give Timken Roller Bearing a freer hand to compete effectively with these concerns. There will be a complete interchange of ideas, technical knowledge, research and development between the British and American companies and there will be a consolidation and coordination of sizes and processes. Moreover, a vigorous sales campaign will be mounted. In planning the selling and pricing policies of British Timken with regard, for instance, to the Common Market, Timken Roller as 100 per cent owner would not have to be concerned with the reactions of another board of directors or of minority shareholders.

SEARS HOLDINGS

SEARS HOLDINGS, the empire built and controlled by Mr Charles Clore, has not in the last two or three years been very active in making takeover bids. A period of consolidation has occurred in which money has been spent on modernising and developing the assets that Mr Clore and his associates acquired. Last year there were no great gains in income stemming from new acquisitions but there was a further improvement in trading profits, by 7 per cent, from £7,669,328 to £8,239,428. Despite a rise in depreciation from £996,039 to £1,115,133, net profits showed a far greater advance—jumping 28 per cent, from £2,378,096 to £3,045,809.

Part of this rise is attributable to a fall in the charge for taxation, which declined by £233,050 to £3,574,232. The company has taken full advantage of the technique of paying a special profits tax interim dividend out of the succeeding accounting year's profits. The dividend for 1958 of 7½ per cent on the ordinary and non-voting "A" ordinary shares compares with a dividend of 22½ per cent for 1957. But to this a special interim dividend of 17½ per cent is added, effectively raising the total payment by 2½ per cent to 25 per cent. On this dividend, covered about 2½ times by earnings, the 5s. "A" rose to 19s. 1½d. to yield 6¾ per cent. But the directors have also announced a 25 per cent scrip issue, without giving any indication of what the dividend will be on this enlarged capital. During the consolidation phase there were periodic rumours that Mr Clore was interested in making new acquisitions for the Sears group in North America. The increased dividend and the scrip issue must set investors wondering whether Mr Clore is set towards expansion again.

RIO TINTO

INVESTORS had already discounted the fall from £3,900,000 to £3,156,000 in the gross profits of Rio Tinto in 1958, for they knew that dividends from the investments in the Rhodesian copper producers, which contribute a large part of Rio Tinto's total earnings, had been reduced. They also knew that profits from Kern Oil and from uranium production in Canada could not be expected to offset the fall in income from copper.

Nevertheless, the decision to cut the ordinary dividend effectively from 26 per cent to 20 per cent (which includes a "profits tax" interim of 5 per cent), comes as something of a surprise, especially as a sharp fall in tax has left the group's net profits £253,000 higher at just over £2 million.

Are the directors taking a cautious view of prospects, even though some recovery is to be expected this year in Rio Tinto's dividend income from copper? Most of Rio Tinto's Canadian uranium mines were in production by the beginning of 1958, and the Mary Kathleen mine in Australia came into production in the later months of the year. Investors will note that Rio Tinto of Canada earned a profit of £722,000 (against £379,000) last year. But these sums cannot be distributed as a dividend to the parent company until the big prior charges that have financed the development of the uranium mines have been paid off.

Rio Tinto's 10s. ordinary shares recovered most of their immediate loss of 1s. 3d. on the dividend announcement. They now stand at 51s., to yield only 3.9 per cent. This yield puts a big discount on the future in which only a few years have to elapse before uranium is sold, admittedly from mines where the capital cost has been written off, in a free and competitive market.

PRESSED STEEL

AS the biggest independent manufacturer of steel bodies for motor vehicles in this country and as a supplier of a comprehensive range of refrigerating equipment, Pressed Steel was bound to please its shareholders with its 1958 preliminary figures. Last year the motor industry forged ahead and consumer durables began to prosper again after the purchase tax cuts in the spring and the freeing of hire purchase from controls in the autumn. Even so the company has done well, for gross profits have risen by 24 per cent, from £3,508,051 to £4,360,377, and net profits by 32 per cent, from £1,527,121 to £2,017,598. These advances justify the directors' decision to raise the ordinary dividend again by 5 per cent to 25 per cent, and the earnings cover of 2½ times on this increased dividend shows that the directors can afford to be liberal. The 5s. ordinary shares at 26s. 3d. yield 4.7 per cent.

CAMMELL LAIRD & SWAN, HUNTER

MANY of the large shipbuilders still have a comfortable order book, but new orders are few and far between. Indeed, Mr J. C. Mather, the chairman of Cammell Laird, referred to the paucity of new orders a year ago. Mr E. J. Hunter, the chairman of Swan, Hunter and Wigham Richardson, in his latest statement with the full accounts is more specific:

> Work on hand will keep the shipyards and engine works of the group employed at a reasonably high level for the next two years but with freight rates depressed the demand for new ships has practically disappeared and any resurgence of demand on a significant scale cannot be expected until there are indications of an improvement in this direction and such an improvement seems unlikely while the large volume of tonnage now laid up is available for service.

Swan, Hunter suffered a fall of £369,892 to £2,311,557 in trading profits last year but the ordinary dividend was raised from 18 to 20 per cent. Cammell Laird's trading profits fell more abruptly, from £1,839,448 to £1,388,464. Depreciation and interest doubled from £236,247 to £471,998, but taxation was reduced by £407,436 to £704,208 so that net profits fell from £1,091,795 to £843,201. Effectively, the ordinary dividend has been left unchanged. After paying an interim of 4 per cent, as in previous years, the final dividend of 11 per cent has been divided between a 3 per cent final for 1958 and an 8 per cent profits tax interim for the current year. Earnings cover a total dividend of 15 per cent dividend about 1¾ times. The 5s. ordinary units were steady at 8s. 6d.xd. after the results, and yield 8.8 per cent. Swan, Hunter's £1 shares stand at 61s. 9d.xd. to yield 6.5 per cent.

BICC

LAST November, the directors of British Insulated Callender's Cables were not expecting earnings in 1958 to differ materially from those for 1957 when the group earned a trading profit of £7,832,872. The preliminary statement now reveals a rise of 13 per cent in trading profits to £8,808,610 and of 24 per cent in net profits from £2,670,051 to £3,292,969. Profits have not fully recovered to the 1956 level, when they benefited from the high price of copper, but the directors have raised the ordinary dividend from 12½ to 13½ per cent, covered, as the 1957 payment was, about 2½ times by earnings. No doubt the steadier price for copper has played its part in this result. But BICC should also by now be reaping the benefits of its re-equipment programme. Certainly the improvement in profit margins is striking, for the jump of nearly £1 million in trading profits is associated with a slight fall of £1 million to £110 million in the value of the group's sales. Gross profits as a percentage of turnover rose from 7.5 per cent in the six months to June 30th last to 8.5 per cent in the six months to December 31st, and over the year as a whole they went up from 7 per cent in 1957 to 8 per cent in 1958.

If the price of copper remains stable, shareholders can reasonably expect even better results in 1959 as BICC's markets in the primary producing countries expand again. The yield of 5½ per cent on the £1 ordinary shares at 50s. reflects this prospect as well as the fact that this year BICC will take into its accounts a full year's earnings from Telegraph Construction and Maintenance Company which it acquired last December.

UNIT TRUSTS

SINCE its first offer of one million units at 10s. each, **Crosby Unit Trust** has sold nearly 4 million units to more than 9,000 investors. It has now made a block offer of a further one million units at 11s. per unit or the current selling price whichever is the lower. Interest often slackens in a new trust after its send-off and the managers of many rapidly expanding trusts have advertised extensively to keep in the public eye. A block offer is not favoured by some management groups, but this method has proved very successful in attracting an immediate response and is not likely to be abandoned by the more thrustful of the unit trusts.

Crosby Unit Trust has already purchased the securities underlying the million units offered, and the yield on these securities is 3⅜ per cent at the offer price, which is among the lowest offered on any trust unit. Crosby has introduced a savings scheme on thrift plan lines and a scheme for re-investing the half-yearly dividends in new units.

Unicorn Trust has made its fifth block offer since the trust was launched in 1957, of 1¼ million units at 14s. 2d. or the current selling price if lower to yield about 4 per cent. Unicorn's trust deed provides that when the selling price varies more than 2½ per cent from the block offer price the offer will be terminated, although the managers might accept further applications and meet any further difference in price out of the management charges. This method is an attempt to ensure that new unitholders come in on almost an equal footing with existing ones. But the difference in price which the managers are prepared to meet must obviously be limited.

GALLAHER

WHEN they made a one-for-four rights issue in January the directors of Gallaher forecast gross profits of £7,500,000 and net profits of "not less than" £3,300,000 for 1958. In fact, last year the group's trading profits went ahead by 18 per cent, from £6,562,896 to £7,754,578, and net profits by as much as 35 per cent, from £2,887,179 to £3,910,292. The ordinary dividend has been raised, as the directors promised at the time of the rights issue, from 20 per cent to 25 per cent and is covered well over twice by earnings. Since January the 10s. units have risen from 42s. 3d. to 45s. 1½d. At that price they yield 5½ per cent, which is below the return offered by the general run of tobacco shares. Gallaher raised £8¾ million through the rights issue to finance the continued expansion of the business and the directors should have no difficulty in keeping to their promise that a dividend of 25 per cent will be paid on the enlarged capital.

ODHAMS

ODHAMS has now made its formal offer to Hulton Press of one 10s. Ordinary share for every five 2s. 6d. ordinary shares and for every seven "A" non-voting ordinary shares in the Hulton Press. Success is assured, for the directors of Hulton, who own 59 per cent of the equity, have already accepted the offer. The formal offer discloses the detailed conditions of the deal. Odhams is granting to Sir Edward and Lady Hulton separate options to buy from Hultons "at a fair value" the issued capital of E. Hulton and Company, and Hulton Educational Publications, besides the copyright, goodwill, records, and equipment pertaining to several technical publications. These include *Production Equipment Digest, Garage and Transport Equipment*, and *Shipbuilding Equipment*. In addition, Odhams has undertaken not to use the name *Picture Post* or claim any proprietary right to it. For their part, Sir Edward and Lady Hulton have agreed to sell the Odhams shares due to them "as soon as practicable," and that they will not sell more than 100,000 of them to any single investor. Finally, the Hulton directors have promised to resign if called upon to do so and without any compensation for loss of office.

It is also disclosed that trading by Odhams in the first three months of this year was "at least as good" as in the same period last year and that the ordinary dividend will be left unchanged at 17½ per cent.

LAND SECURITIES

WHEN Land Securities Investment Trust made a public offer of £3½ million of a 6 per cent debenture stock at 95½ a year ago, shareholders and holders of the existing 4¼ per cent debenture stock were given preferential treatment in the allotment. Land Securities, whose policy has been described by its chairman, Mr Harold Samuel, as "continued expansion," has now announced the creation of an even more attractive debenture—£6 million of a 6½ per cent stock with conversion rights. But all of this debenture will be taken up by Legal and General Assurance. The stock will rank behind existing mortgages on the group's properties and its terms are extraordinarily complicated. The rate of interest can be brought down to 6 per cent in certain unspecified circumstances; repayment of one quarter of the stock, less any portion converted, can be made at a rate of 1 per cent per annum, rising to 1½ per cent in the 20 years preceding the redemption of the remaining stock in 1979-84; but no very onerous restriction on the raising of further capital has been instituted.

The option granted to Legal and General gives it the right to convert up to £1 million of the new stock into 10s. ordinary shares at 22s. 6d. each, of which 2s. 6d. will be payable in cash. The option can be exercised from 1961 to 1964. Institutional investors are well aware of the earnings potential of property companies and some of them have taken an equity interest in those companies that are expanding quickly. It is also clear from this placing that they can obtain good terms on any fixed interest capital they subscribe.

GENERAL MOTORS

SALES of cars and commercial vehicles in the United States fell heavily last year, and the vehicle manufacturers struggled hard to maintain their relative share of the market and to cushion the impact of falling sales on net earnings. General Motors achieved some success on both counts. Its domestic output fell 22 per cent, but that compares with a fall of 29 per cent for the American motor industry as a whole. The value of sales fell 13 per cent and net earnings per common share fell by 25 per cent, from $2.99 to $2.22 per share. Nevertheless, the dividend on the common stock was left unchanged at $2 per share.

An important contribution was made by the overseas subsidiaries of General Motors, for Holden in Australia, Opel in Germany and Vauxhall in Britain all increased their output substantially. The group's plants overseas increased their total production from 466,866 to 597,623 units and its Canadian plants also pushed up their output a little. Thus, taking world wide production by General Motors' plants as a whole, total output of cars and commercial vehicles fell by only 15 per cent.

Demand began to pick up in the United States towards the end of the year, but then strikes held back production. General Motors entered 1959 with a complete range of new cars for the American market. It has an indirect interest through its subsidiaries in importing cars to the United States, but it is prepared to exploit the American market for small cars itself if that market promises, in the directors' words, to be "permanent and profitable."

ESSO PETROLEUM

SALES of oil and refined products by Esso Petroleum rose by more than 30 per cent in volume to a new record level last year, but lower selling prices and keener competition narrowed profit margins. Esso's sales and other operating revenue rose in value by 5¼ per cent, from £246,016,806 to £259,389,648, but its gross profits fell by 21 per cent from £15,498,335 to £12,237,437. The group's net profits fell by as much as 37 per cent, from £11,630,790 to £7,329,886. But this reflects a change in accounting for taxation, for last year a tax equalisation reserve was set up.

The directors justify the non-payment of a final ordinary dividend on the equity (which is wholly owned by Standard Oil of New Jersey) by pointing to the need to conserve funds for the development programme, even though nearly £15 million has recently been raised through a debenture issue. Following a total expenditure of £32,225,000 in 1958 on the Fawley refinery, on the new one at Milford Haven, and on tankers and marketing, Esso plans to spend another £35,599,000 this year—of which £27,027,000 relates to Ocean Tankers. The directors seem to be taking an optimistic view of the long term demand for oil. In the short term, they expect that sales will rise this year and barring a sharp decline in prices, that earnings will be favourable, as they believe that the fall in the price of crude oil should lead to "a more normal return" on Esso's large investments in refining.

TRADE INDEMNITY

WHILE Trade Indemnity hopes that there will be substantial recoveries from claims paid last year, it is expected that they will be much smaller than the 85 per cent stated in a note in last week's issue. The turnover of transactions underwritten last year was just over £1,000 million; premiums received for the first year of the 1958 account were just under £1 million.

London Stock Exchange

FIRST DEALINGS:	Apr. 1	Apr. 15	Apr. 29
LAST DEALINGS:	Apr. 14	Apr. 28	May 19
ACCOUNT DAY:	Apr. 21	May 5	May 26

GILT edged stocks were a little dull after the announcement of the LCC's £25 million issue. Among the irredeemables, 3½ per cent War Loan lost ½ to 67⅛ and among the longer dated issues 3 per cent Transport 1978-88 weakened by 1/8 to 68¼ in the week to Wednesday's close. Corporation and dominion loans were in line with Government Funds, and the 6 per cent Rhodesia 1978-81 (£35 paid) lost ¾ to 31¾.

Profit taking continued in leading industrials following last Thursday's sharp falls and 18,966 bargains were marked on Monday—compared with the record 20,451 recorded on the previous Monday. But following the start of a new account on Wednesday prices again went ahead although closing below the best at the close. Over the week *The Economist* Indicator fell by 4.2 to 258.5. However, several sectors scored good gains. Among electricals, Johnson and Philips rose by 1s. 3d. to 26s. 3d., AEI 2s. to 61s., and Elliott-Automation 2s. 9¾d. to 23s. Machine tool shares continued their earlier advance, and Asquith gained 2s. to 17s., and Alfred Herbert 1s. 3d. to 40s. 6d. Selected building shares were strong, Associated Cement gaining 9d. to 59s. 9d. and Wallpaper Deferred 1s. to 91s. 9d. Stores in general remained firm. Marks and Spencer "A" gained 1s. 4½d. to 58s. 7½d. GUS at 41s. 1½d. were unchanged following the rumoured plan to rationalise its preference capital.

Commercial vehicles shares failed to hold their earlier gains; ACV lost 1s. 9d. to 45s. 3d., and Leyland 6d. to 51s. 3d. In an otherwise quiet motor section Jaguar voting ordinary shares shot up from 47s. 6d. to 63s. 1½d. after touching 64s. 1½d. But the outstanding feature of the market was the rise in Australian pastorals following the advance in wool values. Dalgety gained 4s. 7½d. to 38s. 3d. and Australian Mercantile 4s. to 32s. Woollen textiles also improved, Patons and Baldwins gaining 3s. to 39s. 10½d. Elsewhere in the textile sector, Tootals rose by 10½d. to 29s. 9d. and Fine Spinners by 2s. 9d. to 23s.

Oils hardened following the start of the new account but turnover remained small. BP fell by 2s. to 53s. 9d. following the results, and closed at 51s. 3d. on Wednesday. Royal Dutch Shell rose to 16⅜ on American buying but closed on Wednesday at 15⅞.

Kaffirs were quiet pending the quarterly reports, but following the confirmation of rich values, FS Geduld went ahead to close 8s. 1½d. higher at 18s. 10½d., and Western Holdings rose by 9s. 4½d. to 150s. 7½d. Coppers were dull following the setback in the metal price.

Money and Exchanges

EXCHEQUER RETURNS

For the week ended April 11, 1959, there was an "above-line" deficit (after allowing for Sinking Funds) of £14,339,000 compared with a surplus of £19,793,000 in the previous 4 days and a deficit of £5,469,000 in the corresponding period of last year. There was a net expenditure "below-line" of £12,059,000 leaving a total deficit of £28,030,000 compared with £24,436,000 in 1958-59.

THE MONEY MARKET

AFTER making its concerted bid at £99 3s. 6d. for six successive weeks, the discount market raised its bid sharply at the tender after the budget. The market correctly anticipated a rise in outside applications; total applications increased from £381 million to £434 million, but by increasing its basic bid by 6d. to £99 4s. the market nonetheless raised its allotted proportion at the minimum price from 50 to 65 per cent. The average rate of discount fell by ⅛ per cent to £3 4s. 0.89d. per cent.

Credit has continued to be tight in the market. Although the discount houses avoided borrowing on penal terms, a very small amount of assistance had to be provided by the authorities on two occasions. The rate for fresh loans remained above 3½ per cent and touched 3¾ per cent.

A moderate amount of business was done in Treasury bills at 3½ per cent for July maturities, and at one stage banks seemed keen to buy bills rather than lend to the market. Business increased on Wednesday, when money was in more plentiful supply owing to Government disbursements of about £22 million.

At the latest tender of United States Treasury bills the average rate of allotment for 91-day bills rose from 2.948 per cent to 3.075 per cent.

APPOINTMENTS

Vacant 9/- a line; Required 6/- a line.

Applications are invited for a position as

SENIOR ACCOUNT EXECUTIVE

This is a responsible post for a seasoned and capable advertising man (probably in his mid-thirties). He will have had some years of successful agency experience as an account executive handling advertising directed to the housewife. Thorough insight into the marketing and promotional aspects of campaign planning will be an important advantage.

This is *definitely not* a post for which a less experienced man could be considered. Qualifications and experience *must* be suited to the responsible nature of the job and to the good salary we expect to pay the man we want. Please write in confidence to

The Managing Director,

LINTAS LIMITED,
Hesketh House,
Portman Square, W.1.

TRAIN AS TECHNICAL TEACHERS

Applications are invited from men and women for TRAINING as

FULL-TIME TEACHERS OF GENERAL, COMMERCIAL AND PROFESSIONAL SUBJECTS AND/OR OFFICE ARTS.

(Shorthand, Typewriting, Secretarial work)
in
TECHNICAL COLLEGES AND SCHOOLS.

The next course of training will begin in September 1959 and end in June 1960.

Applicants should normally

(1) be between about 25 and about 45 years of age,
(2) have good commercial experience,
(3) possess one of the following:—
Professional qualification or degree.
Hither National Certificate in Commerce,
Advanced Certificates in English, Shorthand and Typewriting.

SUBSTANTIAL GRANTS AVAILABLE FREE OF INCOME TAX AND NORMALLY FREE TUITION, BOARD AND LODGING.

Write for details and an application form to one of the colleges:

The Director (S/2/11), Bolton Training College, Manchester Road, Bolton.	The Principal (S/2/11), Garnett College, 83 New Kent Road, London, S.E.1.

The Director (S/2/11),
Huddersfield Training College,
Holly Bank Road,
Lindley, Huddersfield. (769)

GRADUATE (preferably, but not necessarily in Economics or Statistics) wanted as General Research Assistant in Economics Department; work involves collection and processing of statistics and helping to run a trade journal. Commencing salary £550-£600.—Please write to the Secretary, International Wool Secretariat, Dorland House, 18-20, Regent Street, London, S.W.1, and mark envelope "Confidential EC."

LONDON COUNTY COUNCIL

BALHAM AND TOOTING COLLEGE OF COMMERCE
TOOTING BROADWAY, S.W.17

Required, September, 1959, three tutors grade "B": graduate or professional qualifications; also teaching and/or commercial experience.

No. 1: Management studies especially organisation and method, work study, or production control.
No. 2: Accounting and related studies.
No. 3: Geography—with other subjects an advantage.

College provides full-time, part-time day, evening and short courses for professional and business students; work expanding.

Burnham (F.E.) salary scale within the range £720 6s. x £26 5s. to £1,336 13s.

Point of entry and maximum according to age, qualifications and experience.

Application forms from Secretary at College to be returned by May 15, 1959. (668)

EXPORT MANAGER

PATONS & BALDWINS LIMITED, manufacturers of Beehive Knitting Wools, and of woollen, worsted and synthetic yarns for further manufacture, require at head office in DARLINGTON, Co. Durham, a manager for the Export Department.

Previous experience of textile industry desirable but not essential. Applicants must have knowledge and experience of Continental, Commonwealth and World markets and be thoroughly familiar with all aspects of export trade and procedure. Knowledge of languages will be an advantage and post involves periodical visits to overseas markets.

Salary, which will be fully commensurate with the responsibility and seniority of the post, will be negotiated having regard to calibre and experience of applicants.

Applications, which will be received in confidence, should be made in writing giving full details of career, experience, present position and of salary expected to:—

The Secretary,
PATONS & BALDWINS LIMITED,
P.O. Box 22, DARLINGTON, Co. Durham.

ADMINISTRATIVE CLASS, HOME CIVIL SERVICE. *About 6 posts for graduates (men or women) at least 24 and under 26 on 1.8.59 (extension for Forces service).* First Class Honours normally required, but candidates with Second Class Honours may also be considered. Selection by tests and interviews in July. *Starting salary* (London) £655 (plus increments for National Service). Promotion prospects to Principal (Minimum £1,500) within seven years and thereafter to the highest posts in the Service. Write Civil Service Commission, Burlington Gardens, London, W.1. for application form, quoting 531/59. Closing date *May 14, 1959.*

ANTHROPOLOGIST FOR U.S. UNIVERSITY. Must be interested in theoretical problems and have knowledge of Far or Near East. Terms of appointment variable with candidate's experience. Send brief outline of experience and possible references to:
Professor Alvin W. Gouldner,
1204 W. Oregon Street,
Urbana, Illinois, U.S.A.

DUTCH/ENGLISH TRANSLATIONS.—Spare time work is offered in translating Dutch accountancy texts into English. In addition to fluency in the two languages, a thorough knowledge and understanding of Dutch and English accounting terminology is essential for the acceptable execution of this task. *The work is not continuous* but applicants must be prepared to carry out translations of varying volume at intermittent times and with reasonable speed. Personal contacts necessitate applicant to be domiciled within easy reach of Central London.—Please apply, in writing, to the Employment Officer, PHILIPS ELECTRICAL INDUSTRIES LIMITED, Century House, Shaftesbury Avenue, W.C.2, quoting ref: 168.

RESEARCH OFFICER required to assist study group on project on "Public Relations of Public Authorities." Duration two years. Research experience important; interest in public affairs desirable. Salary in range of £750-£900 according to qualifications.—Royal Institute of Public Administration, 76a New Cavendish Street, London, W.1.

DEPUTY SALES RESEARCH MANAGER
and
MARKET RESEARCH MANAGER

Applications are invited from suitably qualified men for the following positions in the Sales Research Department of a Company engaged in the manufacture of consumer durables in North London.

DEPUTY SALES RESEARCH MANAGER

The person appointed will assist the Manager in planning and controlling the work of the department and will have a special responsibility for economic forecasting and sales budgeting. The position calls for a man with the following assets:

(a) 1st or 2nd class honours degree in economics, with either economics as special subject and subsidiary statistics, or vice versa.
(b) At least 3 years' experience in industry or commerce, preferably in the sphere of business economics or statistics.
(c) A quick analytical brain and sound judgment, with the ability to apply his technical know-how to practical business problems.
(d) Age 28-35.

This post is not "backroom" but offers scope for contributing to the determination of Company sales and marketing policy, with corresponding scope for advancement for a man prepared to identify himself closely with the Company's future progress.

A starting salary, according to age and experience, in the region of £1,250 per annum is envisaged.

Write Box D.S.421, Austin Knight Ltd., 212a Shaftesbury Avenue, London, WC2

MARKET RESEARCH MANAGER

To take charge of this side of the department's activities. The man appointed will be expected to initiate and plan, as well as carry out, research projects, which will include both retailer and consumer surveys, product testing and some desk research. He will maintain liaison with research agencies and will control the work of the research staff (including interviewers). He should preferably satisfy the following requirements:—

(a) Degree in economics, preferably with statistics.
(b) At least two years' experience in market research (with field research as a main function). This must include definite experience in initiating and planning field surveys, including questionnaire compilation and sample selection. Experience of internal analysis or report production only will not suffice.
(c) Good grounding in statistical techniques applicable to field research.
(d) Ability to relate the planning and results of market research to practical Company problems.
(e) Age preferably 26-30.

Starting salary according to age and experience and will be in the region of £1,000 per annum.

Write Box M.R.423, Austin Knight Ltd., 212a Shaftesbury Avenue, London, WC2

The Company operates superannuation and life assurance schemes.

THE POLYTECHNIC
309 REGENT STREET, W.1

SCHOOL OF COMMERCE

Applications are invited for a full-time appointment as Grade E teacher to teach English as main subject and French to students taking secretarial, commercial, professional and G.C.E. advanced level courses. Ability to teach also some German or Spanish would be an additional recommendation. Duties to commence on September 1st next.

The salary scale for a graduate rises to £1,155 per annum, plus London allowance of £37 16s. or £50 8s. Additional allowances are payable for a good honours degree and training where appropriate. The commencing salary will depend upon qualifications and experience and may include up to twelve increments in respect of industrial experience. The post is subject to *superannuation and some* concession in this respect may be made for previous industrial employment.

Application forms, to be returned within two weeks of the publication of this advertisement, may be obtained by sending a stamped addressed foolscap envelope to the undersigned.

J. E. RICHARDSON,
Director of Education.

OPERATIONAL RESEARCH, AIR MINISTRY.—Senior Scientific and Scientific Officers required in Scientific Adviser's Department. Qualifications: 1st or 2nd Cl. Hons. Degree in maths., statistics or physical science such as Physics, Engineering. Hons. Degree in natural or social science if candidate possesses at least mathematical knowledge at G.C.E. Advanced Level. Appointments offer great scope and interest to versatile scientists capable of working well with Service officers and of adopting methods suited to Service environment. Work is mainly Operational Research in variety of subjects of concern to R.A.F. including tactics, technical development and logistics and offers S.S.O. and S.O. Grades valuable *experience in principles* of Operational Research. Salaries London S.S.O. £1,233 to £1,460. S.O. £655 to £1,150. Outside London slightly lower. Salaries for women being raised by stages to men's rates.—Forms *from* M.L.N.S. Technical and Scientific Register (K), 26 King Street, London, S.W.1 (quoting A.163/9A/PC).

GRADUATE ASSISTANT

COURTAULDS LIMITED require a man or woman GRADUATE ASSISTANT in their London office. The work will be concerned with import tariffs and other questions *affecting international trade in man-made fibres* and related products. Candidates should be able to marshall facts and figures and to present complicated data concisely and clearly. Only candidates with a good Honours degree will be considered.

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 16, St. Martin's-le-Grand, London, E.C.1, quoting reference number E.92.

THE ECONOMIST wants a young man (not over 30) for its investment and companies section, who has experience of company accounts and the Stock Exchange. Previous experience in financial journalism is highly desirable, though not absolutely necessary. The important qualities are a good analytical mind and clear writing.—Apply to the Deputy Editor.

MANAGER wanted for University Bookshop (Nigeria) Ltd., leading educational and mail order book business in Nigeria. Managerial experience (preferably in textbook and cultural field and office management), drive, initiative, and above all hard work essential to deal with large, rapidly expanding turnover. Salary according to *experience.* Generous allowances, including overseas leave. Applications in triplicate by April 27th to G. J. B. Allport (Chairman), University College, Ibadan, 40 Gordon Square, W.C.1. Tel.: EUSton 8948, from whom further particulars may be obtained.

For other appointments see page 275

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

Applications are invited for a Lectureship or an Assistant Lectureship in Economics. Salary scale for Lectureship £900 x £50-£1,350; then, subject to review, £1,425 x £75-£1,650; plus £60 London Allowance; for Assistant Lectureship £700 x £50-£850; plus £60 London Allowance; with superannuation benefits and family allowances in both cases. In assessing the starting salary due consideration will be given to age and experience. Candidates are invited to indicate their special interests in the field of Economics.

Applications, with the names of three referees, should be received not later than May 15, 1959 by the Secretary, London School of Economics and Political Science, Houghton Street, London, W.C.2, from whom further particulars may be obtained.

THE UNIVERSITY OF MANCHESTER

RESEARCH FELLOWSHIP IN ECONOMIC STATISTICS

Applications are invited for the above Fellowship tenable for one year with a possible extension to two years. The Fellowship is of a value within the range £1,100-£1,400 per annum, together with approved expenses involved in the research. Regulations governing the award of the *Fellowship* and application forms may be obtained from the Registrar, The University, Manchester, 13, to whom all applications should be sent not later than April 27, 1959.

THE MANCHESTER COLLEGE OF SCIENCE AND TECHNOLOGY

(FACULTY OF TECHNOLOGY IN THE UNIVERSITY OF MANCHESTER)

APPOINTMENT OF BURSAR

Applications are invited for the post of Bursar of the College. The Bursar is the executive officer responsible to the Principal for all financial matters including the preparation of estimates and participation in negotiations with the University Grants Committee, for the development and maintenance of the estate and the buildings of the College and for legal matters arising therefrom. *Candidates must, therefore,* have a wide experience in these fields, must possess suitable qualifications and managerial capacity of a high order.

The salary will be in the range £1,800 to £2,300. The appointment will be subject to the Federated Superannuation System for Universities and family allowances will be payable.

Application forms and further particulars may be obtained from The Registrar, The Manchester College of Science and Technology, Manchester, 1, to whom applications must be forwarded by Monday, May 25, 1959.

AIC

Executive Selection Service *is advising on the following appointment*

OPERATIONAL RESEARCH LEADER

for an important Company. Applicants should be between thirty and forty years of age and be fully qualified in Higher Mathematics and experienced in the practical application of Operational Research techniques to industrial problems. The development of the department will receive the enthusiastic support of the Board and Management, and the applicant's role will be to select and train the necessary staff required to meet this development. The initial salary will be around £2,600 per annum, with generous allowances regarding superannuation and the usual expenses. Prospects for future increase in salary to £4,000/£5,000 per annum would be good. The offices from which the successful applicant will operate will be in the London area.

As this is a confidential service, the names of applicants will not be disclosed without their agreement. A brief statement of qualifications and experience should be sent to Mr. R. A. Manthei, marked OR(LC) 1 at Associated Industrial Consultants Limited

BUSH HOUSE LONDON W.C.2

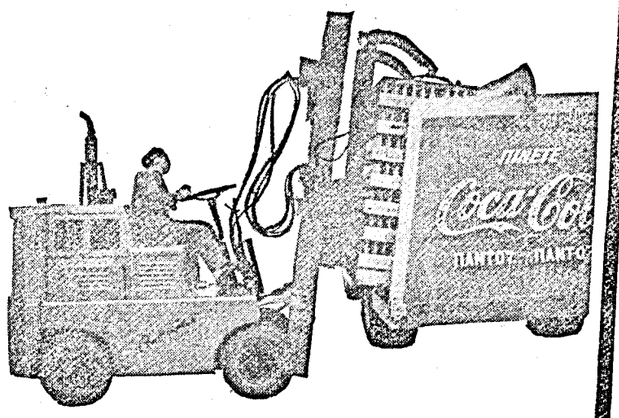
A fifty-seven million pound contribution toward trade within the Commonwealth

IMPORTANCE OF THE MARGARINE INDUSTRY IN MAINTAINING A HIGH LEVEL OF TRADE BETWEEN GREAT BRITAIN AND OTHER COMMONWEALTH COUNTRIES

In the three years to 1958 Britain imported Groundnuts, Palm Kernels, Soya Beans, Cotton-Seed and their oils, Palm Oil, Copra and Coconut Oil from Nigeria, Ceylon, New Guinea, Papua, Malaya and the British Pacific Islands to the average value of fifty-seven million pounds a year.

BRITISH EXPORTS — A £130M MARKET. These imports paid for two-fifths of British exports – excluding re-exports – to these Commonwealth countries which, during that period, averaged £132,000,000 a year.
This figure is a substantial one. It represents not only an important contribution to the standard of living in these Commonwealth countries, but also a significant percentage of our own industrial output for export.

MARGARINE INDUSTRY A MAJOR USER. One of the largest single uses for Groundnuts, Palm Kernels, Soya Beans, Cotton-Seed and their oils, Palm Oil, Copra and Coconut Oil is, of course, the manufacture of margarine.



It is clear that quite apart from providing a useful addition to the nutritional larder of this country, the margarine industry plays a vital part in the maintenance of a high level of trade within the Commonwealth.

(All figures quoted are from Board of Trade "Trade and Navigation Accounts" of the year concerned)

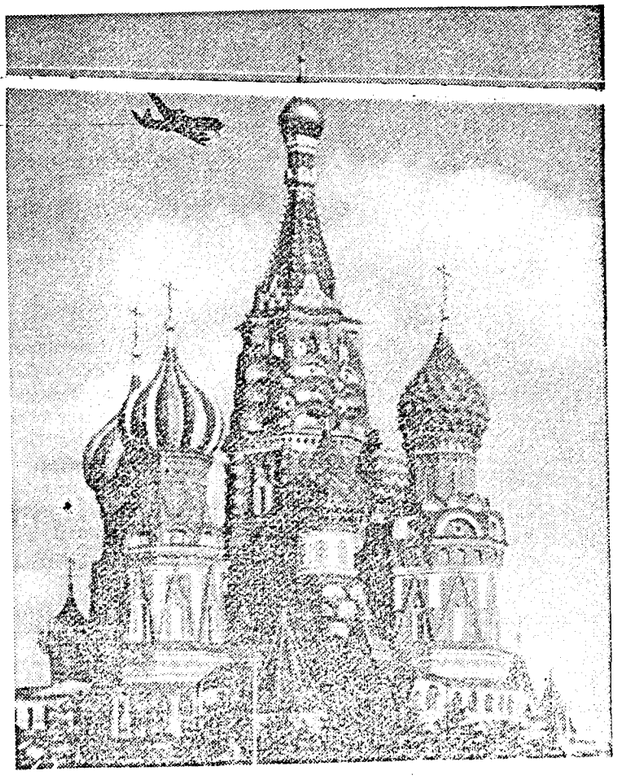
Conveyancer and CYPRUS

Conveyancer T.C.4 Fork Trucks are engaged in the daily loading and unloading of the 80 vehicles used in the distribution of Coca-Cola in Cyprus. In addition, they feed bottles to the washing and filling machines as well as into store.

Fitted with torque converter drive, eliminating clutch and gear change, the Conveyancer Fork Trucks have proved ideal for the local drivers and the high speed production required.

Important factors which contribute to the efficient handling provided by Conveyancer trucks are the side shift units for accurate positioning of the load on the vehicles and 10° forward tilt masts with stabilising clamps to present the loads at the same angle as the load bays on the vehicles.



Free illustrated literature is available on request, giving full details of the Conveyancer range of Electric, Diesel and Petrol models with capacities from 2000 to 8000 lb.

TO WORK ON

CHEMICAL ENGINEERING PROBLEMS

Literally this scene took place only [illegible]. Figuratively it has occurred many times. An increasing number of executives in the chemical industry are learning that Kellogg House often has the best solution to their chemical engineering problems.

Technically Kellogg is often able to offer a complete new approach to a chemical manufacturer's problem. The engineering staff at Kellogg House is backed by the world-wide experience of the Kellogg organization and by the research laboratories and pilot plants of The M. W. Kellogg Company in the United States.

Economically the Kellogg staff is in a position to help chemical firms reduce their capital investments in new production facilities. This is accomplished by improvements in design and stringent cost controls during construction. By incorporating all the necessary services for creating new plants under one management and assuming full responsibility for completing a new plant, Kellogg is able to deliver new plants at an optimum capital investment.

Kellogg welcomes the opportunity to work with clients at any point from the time the process is first conceived through the construction of the final plant. Inquiries concerning the co-ordinated KIC services of engineering, procurement and construction are cordially invited.

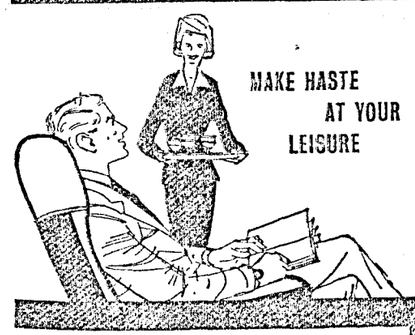
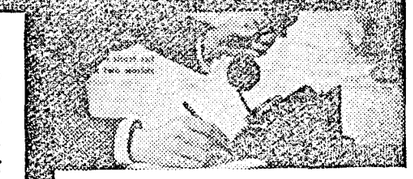
SAS SHRINKS A CONTINENT INTO A COUNTRY

with the fabulous CARAVELLE jet



The Caravelle launches SAS on a flight service that shrinks continents into countries with near-sonic speed of 515 miles per hour. And it fills those miles with quiet travel comfort that's never been known before. You literally 'fly away from noise' because the unique position of the engines—to the rear of the cabin—throws noise to the winds. You arrive refreshed as never before—and so much sooner, too. SAS Caravelle flights are providing pure-jet services to more cities in the world than any other airline.



Jet power at the double

The twin Rolls Royce engines of the SAS Caravelle jet are so powerful that one alone can power the plane from take-off to touch down. Each develops a thrust of 11,700 lbs. In travelling terms that means a speed to cut flying time from Copenhagen to Rome... to Paris ...or to Beirut by more than a third. And the journey's more comfortable now than it has ever been.

MAKE HASTE AT YOUR LEISURE

As fast as the Caravelle speeds you on your way, you still have time to sample the pleasures of Scandinavian hospitality. SAS menus are as international as their timetables—including over 2,000 different kinds of hors d'oeuvre. SAS cellars provide the finest in wines, champagnes and liqueurs. Luxuries like this make time fly even faster.

SAS moves fast—even on the ground

SAS time-saving starts at your travel agency. Within half an hour the SAS world electronic reservation system can book your flight from anywhere to anywhere on the SAS world routes. Your booking is made and checked along the line by a service that reaches round the world in half an hour.

FLIGHT INTO TOMORROW

The DC8—first jetliner to be designed for non-stop ocean flight—will soon be operating on SAS Intercontinental and Polar routes. This giant of the future is undergoing stress and strain tests far beyond the limits encountered by an aircraft in normal service. It will carry SAS passengers at over 600 m.p.h. This means arriving in New York only an hour or so by the clock after you left Europe.

SAS HOLIDAY IDEA SAVES YOU MONEY

Fly to Scandinavia at special all-in holiday rates, e.g. Norway for a fortnight for as little as £19 all-in for a family of four! Your Travel Agent can arrange it all—hotels, plane reservations, everything! Write to us today for full details of fares and address of your local SAS Travel Agent.

But I'm only a little man

"Television for us? Phooey!" says somewhat inelegantly, Mr. Horatio Golightly's nephew (the bald one, not the Wiltshire hockey-player) who inherited and runs a smallish knitwear factory in Leicester.

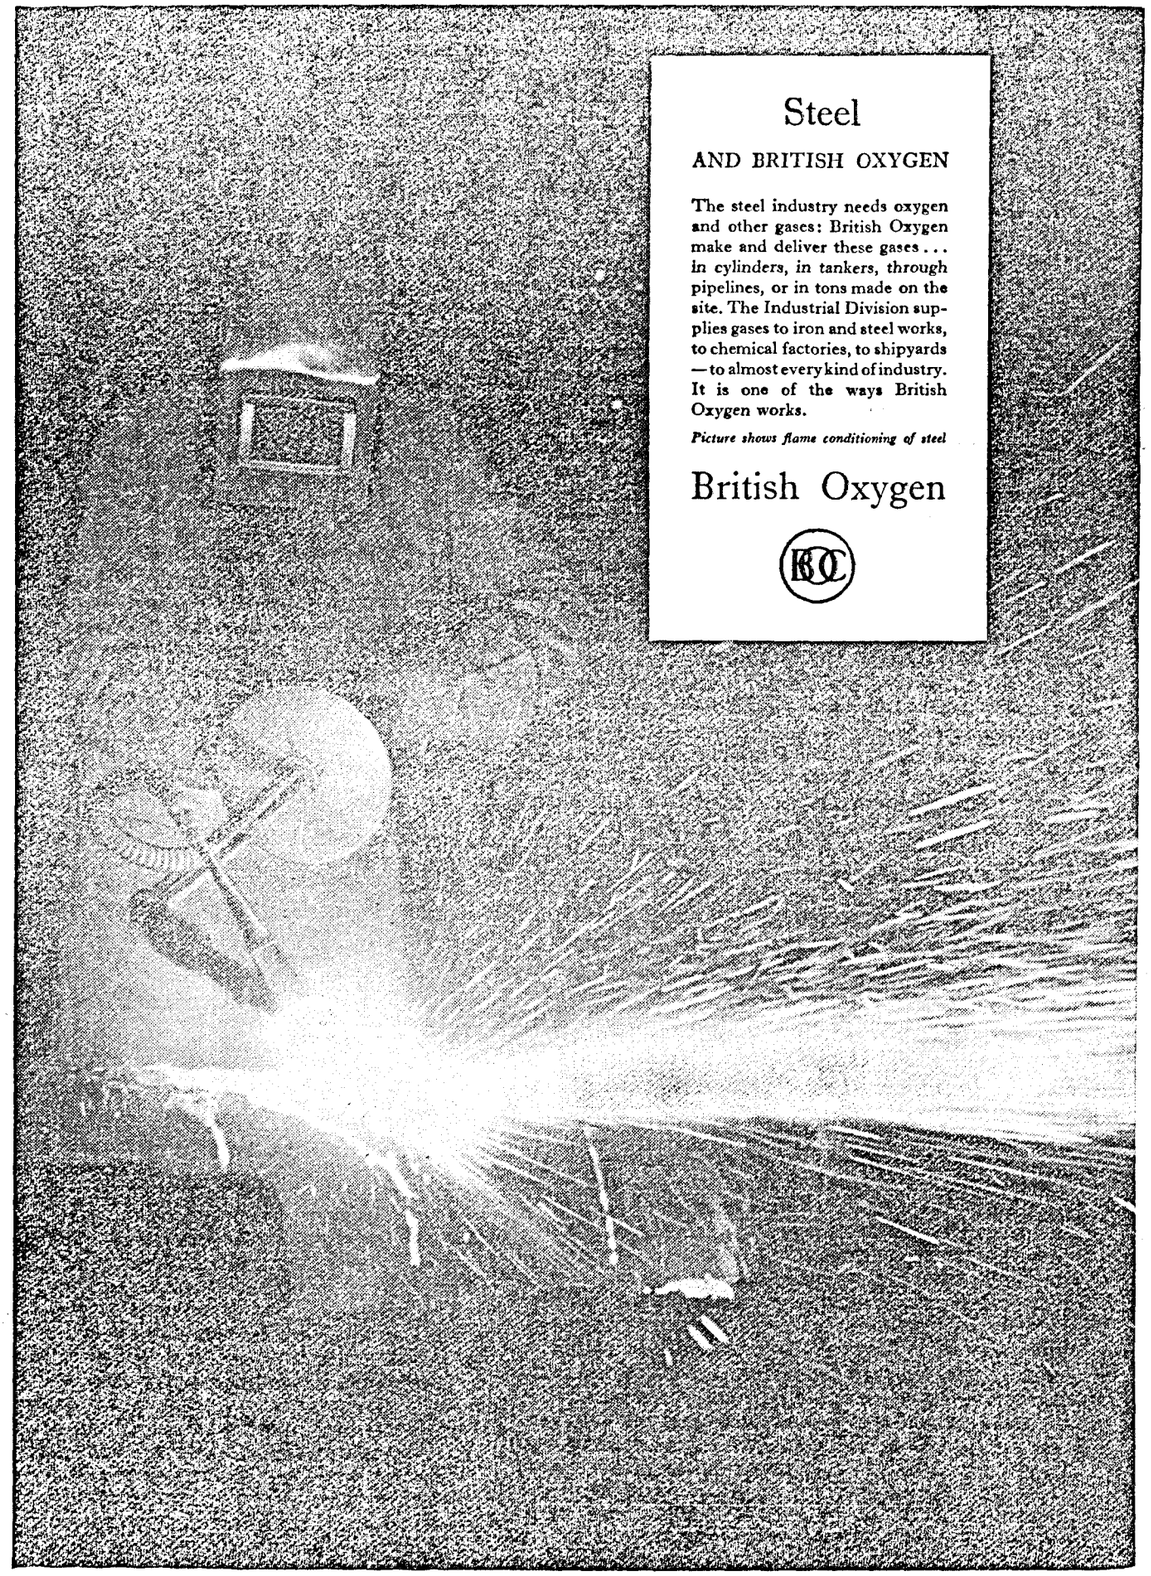
"Television's only for the big boys, all those detergent fellas. No good for the little man like me."

And that's what lots of other people like him say—in Leicester, in Leeds, in Lincoln, in Lambeth. They're wrong; and he's wrong (as his wife is often telling him).

Television advertising can work, does work, *is* working for the small advertiser as a lot of brighter, smaller firms have already found out. And there are these people sitting at the end of a telephone *now* at ATV just waiting to tell you how and with what and to whom.

The reason is that *each commercial* has so considerable an impact on *each person* who sees it that a few can go a long way to make even the Golightly Knitwear and Light Cardigan Company of Leicester (1903) Ltd. into a bigger, bouncier, better baby.

Call these ATV chaps who know all about it at ATV's Sales Department—at any of those addresses below—or write for some of their frightfully impressive case-history type of booklets.



"Can't afford to advertise on television unless you're a sort of Greek shipping fellow" says Mr. Golightly's nephew. "Which is why there are so many commercials for Greek ships I suppose?" says his rather nasty wife.

LONDON: Television House, Kingsway, London, W.C.2. *Telephone: Chancery 4488*

BIRMINGHAM: 59 Cornwall Street, Birmingham 3. *Telephone: Birmingham Central 5191*

MANCHESTER: 66 Mosley Street, Manchester 2. *Telephone: Manchester Central 4606*

ATV *At home to 11 million viewers in London and the Midlands*

Field-work

Advertising is a waste of money, any manufacturer will tell you, unless you know what's going on at the consumer end of the business. And to know that, you've got to organise some field-work.

Your man goes into the field and starts asking questions. Such as 'Do you use I.C.I. Silicones?' The other party may be a bit slow and say something like 'No. They seem to do best on Pearlyman's Patent Pig Pellets.' But your man is trained to be persistent and goes on: 'Have you no experience in the use of I.C.I. Silicone Rubber in high-flying aircraft, where its tolerance of both very high and very low temperatures makes it invaluable?' And there are a lot more questions, heavily loaded, about the use of I.C.I. Silicone Fluids as anti-foam agents and as water-repellents for clothing and buildings and about I.C.I. Silicone Resins for non-stick papers, mould-release agents, etc. By this time it's probably getting a bit cold in the field and your man wraps up the interview and goes home.

Next day, he turns in his data and it all has to be reconciled and subjected to weighting factors and you note down the result, whatever that may be. Having done this, you can waste your money on advertising with a perfectly clear conscience. You can even take space in a paper to say . . .

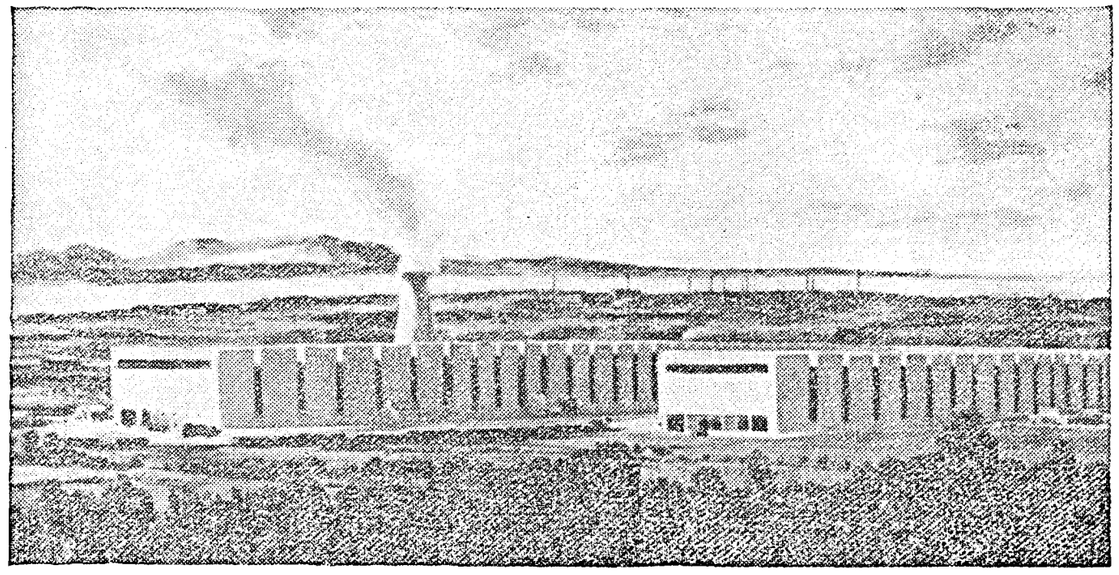
Nearly everyone uses

(whether they know it or not)

IMPERIAL CHEMICAL INDUSTRIES LTD., LONDON, S.W.1

NEW INDUSTRY FOR WALES

The Development Corporation for Wales is telling the world about the country and the opportunities that exist there for new industry



Wales today is a land of opportunity. For years prosperity has depended on the fortunes of too few industries. That is why the Development Corporation for Wales has been set up by the established companies to create a stronger, more balanced economy. It will do this by attracting new industries, by expanding existing ones and by seeing that the natural resources of Wales and the skill of her people are fully employed. It has an office at 15 Park Place, Cardiff. Telephone 21200.

City of Steel's especial concern

The Steel Company of Wales is playing a big part in Britain's economy. Already the City of Steel produces over two-thirds of Britain's tinplate and over one-third of her sheet steel. It is therefore right that we should be especially concerned with the development of Wales and the prosperity of its people.

Opportunities for industry

Our experience warrants the fullest support for the new Development Corporation. There are magnificent opportunities here for new industries of all kinds. Whatever these industries are, we know that the people of Wales will give them a warm welcome and loyal service.

Trostre tinplate works *From an original painting in oils by Charles Cundall, R.A.* These works, situated eight miles west of Swansea, came into production in 1951 and cost £16,000,000. They are here seen against the background of the Gower Peninsula, with the town of Llanelly three miles away.

PAN AMERICAN

WORLD'S MOST EXPERIENCED AIRLINE

Chemical that boils at below-freezing temperatures supplies the "push" to many of today's new aerosols for household and industrial use. The liquid, one of Allied Chemical's fluorinated hydrocarbons, is also used in air conditioning and refrigeration

THIS CHEMICAL "BOILS" ON ICE

It's one of more than 100 inorganic and organic fluorine chemicals made by Allied Chemical, world's largest producer of fluorine, hydrofluoric acid and compounds derived from them

Fluorine chemicals are pacing developments throughout industry. The rocket and missile field, for example, is evaluating elemental fluorine and halogen fluorides.

The story is the same in less glamorous areas:

Plating. B&A metal fluoborates are vital to plating of metals, alloys and plastics.

Chemical Processing. Boron trifluoride is a versatile catalyst for petroleum, synthetic rubber, plastics, dyestuffs and other industries.

Light Metals. B&A alkali fluoborates help produce superior aluminium, simplify and improve magnesium casting.

Electrical Equipment. Many improvements in electrical and electronic equipment are made possible by sulfur hexafluoride, an inert dielectric gas.

The Safety Net

ONE of the potentially useful consequences of the Prime Minister's decision to defer the election is that the Conservatives should now have at least the whole of this summer in which to work out their manifesto. In 1955 they went to the country on a manifesto which was a fairly eloquent expression of sweet nothings; they could do this because they felt pretty certain that they were going to win. In 1959 they are unlikely to feel any such certainty, so they may feel under some compulsion to be more specific.

This could be either a great misfortune or a great opportunity. It will be a great misfortune if it induces the Tories to become (as Labour now seems bent on becoming) ever more specific in proffering patchwork promises to particular pressure groups. But it will be a great opportunity if the Conservatives use these next few months, as they used their years in Opposition from 1945 to 1951, to think out a coherent philosophy for the next stage of advance. Nowhere is a new philosophy more obviously needed than in the social services. This may therefore be the time for outsiders to offer some suggestions. The prospectus recommended below is a left wing prospectus. It is a bit strange that it should have to be proffered to a Conservative party; but given the present state of the other two parties there does not seem to be a cat-in-hell's chance that either of them would take it up.

The first objective in social policy during the next Parliament should be to spend less on current account in the indiscriminate social services, but more on discriminate relief of real need and much more on capital account across most of the field of government investment expenditure. The obvious specific method of relieving real need is through national assistance payments; every shilling a week increase in these rates costs only £4 million a year, while every shilling a week increase in old age pensions and other national insurance benefits costs nearly £20 million a year. If British governments would stop these latter indiscriminate increases, and concentrate on increasing national assistance payments, a great new vista of social reform could be opened up; it should then become economically possible to look forward to doubling the real weekly spending money of the poorest section of the community within the next ten years. Succour the needy is the proper social service slogan. One difficulty of such an advance might be that some people of working age might then find it more profitable to give up work; perhaps therefore there is a case for making some of the future increases in national assistance apply only to the elderly (for separate proposals about the unemployed, see below). The other problem which is so much talked about—that of getting proud poor people to apply for national assistance, under its needs test—is not really insurmountable; those who are worried about it should clamour first for a national campaign of poster advertising, designed to bring in the just claimants to get their rights.

Towards the two obviously indiscriminate social services—old age

pensions, which are now paid to Field Marshal Montgomery as well as to Joe Bloggs, and housing subsidies, which are paid to anybody who gets on to a council list —the proper progressive attitude should be a desire to ease the government out of these fields altogether. Obviously, that cannot be done completely. Existing contractual obligations to people who have paid pensions contributions will outlast this century. But at least the present pensions rates should not be put up for everybody indiscriminately again ; and if the government's present Pensions Bill can induce more firms to contract their workers out into private superannuation schemes, so very much the better. In housing, the Tories, having rightly abolished the general subsidy for new council houses, should not go any further along their new road of subsidising people who buy their own houses instead ; the government's only concern here should be with a mounting programme of slum clearance.

In the national health service, the Tories should not be afraid of charging more to the public on current account, either by higher weekly contributions or by specific charges. The really urgent need here is to build more new hospitals. In the " bad old days " of private philanthropy Britain led the world in the modernity of its hospitals ; in the " progressive days " of public control since the war it has built only two new hospitals, and its standards of comfort for in-patients are falling far down the international list. New hospitals should be put beside new schools as the top priorities for public capital expenditure, with roads only a little way behind ; more should also be spent on those electorally unromantic capital appurtenances, better prisons and more modern sewage.

So much for the non-industrial social services. In industry, a principal need for the next government will be to get out of the habit of always protecting dying industries and towns, especially by the method—ridiculous in an inflationary age—of keeping up the prices of their products either by permitting restrictive agreements or by banning cheaper imports from abroad. A quick clean resort to the surgeon's knife—with generous temporary subventions, by way of anaesthetic, to individuals who suffer during the period of operation —is vastly better than encouraging decaying industries to spend an unconscionable time a-dying. The Government's planned surgical operation and anæsthetic for the cotton industry, which was announced on Thursday, will deserve to be carefully scrutinised, either as a model or as an awful example of how not to do it. It is quite possible that during the next Parliament similar schemes will need to be devised for some other at present unsuspecting industries as well.

In the employment field, Britain is likely during the next five years to have to tolerate a higher ratio of transiently unemployed than it has averaged until recently, both because national unemployment ratios down to one per cent have proved impossible for a dynamic economy to sustain without also incurring inflation, and because the policy of trying to move work across the country to unemployed workers is plainly not succeeding. The Tories are now stuck with their policy of giving subventions to any firms which will migrate to scheduled areas ; the best way for them to get unstuck would be gradually and deliberately to proceed to schedule the whole country (so that the scheduled areas policy would eventually become merely a general investment subsidy). But as schemes for moving work to unemployed workers are failing, there is a strong case for doing more to help unemployed workers to move to find work.

The Tories should consider very seriously whether a sensible proposal for their manifesto would not be to raise unemployment benefit substantially during the first month after any man has been laid off work (perhaps the period should be extended to longer than a month when the total of unemployed exceeds the number of unfilled vacancies by more than a certain amount—i.e., at times when job-hunting is harder and when general policy can also afford to be more reflationary). Alternatively, there might be a great deal to be said for making unemployment contributions and benefits proportional to each man's previous income, as is being done with pensions, and letting employers contract out of this additional part of the national insurance scheme if they enter into generous redundancy agreements with their men.

This would be a controversial programme. It would arouse a storm of protest from people who think that the only sensible system of electioneering is to hint that one will scatter taxpayers' money as widely as possible among any groups where some people are having a hard time, and then call oneself humanitarian because some people who have a good case for assistance will gain along with the rest. Unfortunately last Monday's debate on old age pensions, following upon the Jay report on unemployment areas and Mr Wilson's post-budget speech, has made it only too likely that it is in that traditional Eatanswill way that Labour intends to fight the election. To their discredit, the Liberals last Monday tagged along with Labour on this line.

Realistic Tories ought to resist any temptation to compete in this auction—partly because they would probably be outbid anyway, but mainly because they must know that their next period of office, if it were won on a platform of expensive and indiscriminate jobbery of this kind, would be destructive of everything that has made their renaissance as a thinking party since 1945 at least reasonably worthwhile. Moreover a social policy of this sort would make it possible for the Conservatives to proceed with logic to what should be the second part of their manifesto. With some suggestions for this second and more exciting section, which could stop looking downwards towards the safety net for the unlucky and could start looking upwards towards the stars, a subsequent article in *The Economist* will be concerned.

In or Out?

Sooner than expected, the European common market is facing the British with the question of their future in Europe

When the House of Commons discussed the European common market on February 12th Mr Maudling stated two difficulties that stood in the way of any British attempt to join it: the unwillingness of the British public to take the political plunge, and the commonwealth tie. On the face of it, the commonwealth problem is in fact capable of a variety of solutions ; one possible approach was discussed on page 17 of *The Economist* on April 4th. Mr Maudling's stress on the political plunge touched the heart of the matter.

If the failure of the free trade area negotiations had any one single cause, it was the lack of a sense of common political purpose among the negotiators. The intentions behind the British plan were in part constructive. Indeed, some of its sponsors saw in it an opportunity to fulfil a long-cherished aim, giving Britain its proper place in the movement towards unity in Europe. But the immediate purpose of the project was more defensive: not a desire to break up the common market, as has been freely alleged, but rather a wish, which was natural enough, to mitigate the disagreeable consequences that the common market might have for British political and exporting interests. With its different institutional structure, inspired by a different purpose, yet performing some of the same tasks, the free trade area would have been likely to exert a weakening influence on the common market ; and it was not surprising that people on the Continent, looking at the scheme in the light of their traditional views of British policy, saw it as yet another device to keep them divided and prevent European unity from going too far. Mr Maudling was right to emphasise that Britain would have to join the community whole-heartedly, or not at all. What would joining, in fact, involve ?

The institutions of the Rome treaty, too, were designed to serve an economic purpose first. Free movement of labour, capital and services, the arrangements for financing development in the backward areas, and for exerting a pressure on governments in favour of common policies, were seen as an economic complement to the creation of a single European economy through the removal of trade barriers. In themselves, these economic measures need present no insuperable obstacles to Britain. Similar arrangements would have been necessary in a free trade area, or would have followed logically later on. The one major piece of domestic legislation required would be equal pay for women. To bring this in quickly would cause difficulties in Britain, but no greater than in, say, Germany.

Economic unions tend to put a premium on deflationary policies ; for they at once remove many instruments of national economic policy from the hands of the governments, and subject the foreign payments of the members to new strains. This indeed is one of the objections voiced on both sides of British politics to the common market, though it would have applied to the free trade area with at least equal force. But the creators of the common market see their new institutions as a counterpoise to that pressure—as a source of pressure, instead, for expansive economic policies. That is not an objective that need cause alarm in Britain.

But the institutions of the community were designed not only for these direct economic ends but also for more ambitious purposes as well. A step with such profound political implications as the common market could not have been originated except by men who believed in political integration. As Mr Maudling pointed out in the debate, it would be both disingenuous and self-defeating for Britain to seek membership without sharing that objective. At present, he felt, public opinion did not.

This political issue is so vital that it is important to be precise about what is involved. Some of the community's creators do undoubtedly hope, one day, to see a tightly knit European federation. But federation is not a possibility in the life of the present French regime, and the Treaty of Rome leaves the more ambitious objectives to the future. Adherence to the common market would not imply that Britain must commit itself to federation, even though it might be on the cards one day. What membership would imply today would be a serious intention to work for common European policies on a variety of matters. That is going a good deal further than the old principle of the Organisation of European Economic Co-operation—retaining separate national policies but endeavouring, with only limited success, to reconcile them from time to time. Key British civil servants and politicians would have to participate at the European headquarters, as members of the commission and the other bodies, in the formulation of policy before separate national policies took shape. The British political parties would have to get used to seeking to exert influence on policy at Brussels and Strasbourg as well as Westminster.

In the political field, there are, of course, many matters, domestic and international, in which the national policy-forming function would remain unaffected ; and others where even the European framework is too narrow. West Germany does not share French policy in Algeria. Western Europe's policy

towards Russia must march in step with America's. If the somewhat spurious and defensive solidarity that has been engendered among the Six by the exclusion of Britain could be removed by British membership, the appearance of a close-knit block that the community has taken on would fade. Still, a look at the economic field alone makes it obvious that the new kinds of collaboration that would be involved—in the fashioning of budgets, the gradual devising of a common energy policy, and a common policy towards the undeveloped countries—imply a far-reaching if only gradual change in political organisation.

IT is not surprising that there should be reluctance in Britain to take part in so far-reaching a political process. Yet it is the political character of the union that presents the strongest argument now for Britain to be in it. With a speed that must have astonished even expectant Marxist observers the, as yet, relatively slight difference of economic interest between the Six and the rest of western Europe has been reflected in political division. Ever since the war Britain, like the other European states, has had an interest in seeking greater influence and economic strength by closer association and co-operation with its European neighbours. The creation of the community has painfully rubbed home the limits within which the British acting independently can exert influence in Europe. Today every British political initiative in Europe automatically encounters resistance merely because it comes from Britain. And it is becoming increasingly clear that there is no way of getting an equal say in the formation of policy, on economic as well as political matters, except by undertaking the same commitments as the Six do. Thus, if the British do not join in the rationalising of air transport arrangements, or in common agricultural policies, then *ipso facto*, they cannot have a say in these things, and will repeatedly find the Six taking action that may damage British interests.

The room for manœuvre for British policy is indeed small. Across the Channel a new, potentially powerful political grouping has appeared. In the days when western Europe was the centre of world power Britain would have tried to gather a rival grouping and break up the continental group. Today such a policy is politically unthinkable, for the new *rapprochement* between Germany and France is, in itself, in the British interest. Yet it hurts to be left out. It is difficult to see what course is open except to try and get in.

WOULD British opinion accept this far-reaching step? Two years ago the answer would have probably been No. It was not only the obvious new common predicament of living in the shadow of Russia that brought the Six so far, but a certain emotional disillusion with the idea of the nation, the result of war, defeat and occupation. No such reorientation was imposed by events on the British—or, for that matter, on the Swiss or the Swedes. What is remarkable is the extent to which the free trade area project, and the problem posed for Britain by the creation of the common market, seem already to have educated British opinion to look towards Europe, so that today it can contemplate a further step.

Plainly there is no unanimous view in Britain about what to do next—even in the narrow circle of people who have followed the problem closely. The greatest readiness for a further political move forward can be found in industry, where interests are evidently affected, plans have been knocked awry and the common market has been studied and understood by a broadening circle of men. Opinion in the trade unions has not moved as fast as it has in management. The trade unions accepted the idea of a free trade area because they saw that the common market on its own might endanger British exports and the jobs of their members. Yet for a long time the British union leaders continued to hanker publicly after the continuance of national full employment policies even in a free trade area. It is only gradually that some of them have perceived that in an economic union of this kind full employment may have to be preserved by common—as distinct from national—expansive policies, and that an institutional set-up of the common market type can help towards the objective. Among the political parties, opinions are also divided and various, with the Labour party on balance rather more cautious than the Conservatives, as in the past. But as the Commons debate showed, the hesitations of British opinion seem to be the product less of insular reluctance than of sheer bewilderment. There is a great deal of uncertainty, but if a lead were given there might by now be more support than opposition.

COULD such a lead be given with confidence? The question whether a new British overture to the Six would have a fair chance of success remains, perhaps, crucial. Many of those who have been involved in the frustrating free trade area negotiations have come to feel that the French would simply obstruct any British initiative, whatever its nature. Painful experience may have obscured for them the fact that technical negotiations can be coloured, and differences of economic interest aggravated, by the differences of political attitude that underlie them. To many people on the Continent concerned with the common market, a serious British commitment to political integration still seems no more likely than a visit from the man in the moon; special interests and small-minded political conceptions have been able to shelter behind that barrier of scepticism. A British proposal to join the communities, if it were part of an unqualified policy of collaborating with Europe, would by contrast be very difficult to turn down. Then at last, quite plainly, the negative political and economic interests on the Continent that have sought to keep Britain out would stand opposed to the broader interest of the unity of Europe. French opinion, particularly, might be profoundly affected.

No assessment of the common market problem can disregard the political evolution that is taking place in west Germany. It would be unwise to count too much in London on the hope that Dr Erhard may succeed Dr Adenauer as chancellor and relieve Britain of its choice. For one thing, the succession is by no means a settled thing. Then, even if Dr Erhard does succeed, he will be deeply concerned to retain the backing not only of Dr Adenauer himself, but of the powerful group in his party that has pinned its hopes on the community of Six. No German chancellor, in any case, can force the French to swallow a pill which they find so unappetising as the free trade area. Nor can he afford, whoever he is, to abandon the close French connection which Dr Adenauer has so painfully forged. It would, therefore, do no service to anyone if Britain were once more to seek to bring pressure on France through the Germans in favour of a scheme the French dislike. In short, the European common market has come to stay. Where the ending of the Adenauer era might have helpful effects is in bringing to the fore men who are in principle interested in enlarging the European community and in making it look outward. That might possibly help to smooth the way for British membership; but first, the British have their own decision to make.

Beacon on the Himalayas

With a direct appeal to Asian nationalist sentiment, the Dalai Lama has brought India face to face with the hard truth about China

WHEN the Dalai Lama reached Tezpur, the biggest cat yet was let out of the communist bag in Asia. His statement there ought to put paid to any idea that the Chinese had deliberately allowed him to escape, calculating that he would be less of an embarrassment to them in exile. That theory, which has found credence only among over-subtle minds, recalls the legendary diplomat who, when a Russian plenipotentiary died during a long-ago conference, muttered thoughtfully: "I wonder what his *motive* was"; it reflects the almost superstitious awe with which free men too often contemplate totalitarian "supermen"—as if their blunders were not written large in history. It is clear that the Dalai Lama will be a much graver embarrassment to Peking now that he is in free India and can speak freely than he could possibly have been in isolated and Chinese-garrisoned Lhasa. And it is no consolation to Peking that he will also be something of an embarrassment to his Indian hosts.

He has now stated publicly and, to use his own word, "categorically," that he escaped to India "of his own free will, and not under duress." That in itself is awkward enough for the Chinese. Worse still is the way his statement begins with an uncompromising assertion of Tibet's separate national personality. He declares that the Tibetans have always sought independence; that even when China has "imposed" suzerainty, Tibet has in the past kept control of its internal affairs; that the Chinese conceded full autonomy in the agreement made, "under pressure," in 1951; and that, despite that agreement,

> after the occupation of Tibet by the Chinese armies, the Tibetan government did not enjoy any measure of autonomy. . . . In practice, decisions in all important matters were taken by the Chinese authorities.

The Tezpur declaration could profoundly affect Asian attitudes towards China's communist regime. Quite apart from the evidence it gives of Peking's breaches of faith, and of its attempts to conceal them, there is the fundamental point that the acknowledged leader of the Tibetan people has made a straightforward appeal to the feeling for national independence which is the most powerful force in free Asia today.

He could not have chosen a more effective approach. To have emphasised the communists' drive against religious authority would have lost him the sympathy of the many young Asians who share in some degree the Marxist identification of clerical establishments with reaction. To have dwelt on the sacrilegious way the Chinese have treated his own person would have restricted his appeal to Buddhists (among whom the Hinayana Buddhists, who prevail in South East Asia, do not fully share the Lamaist Tibetans' reverence), and at second remove to devout Hindus (Mr Nehru, said on April 5th that: "The Buddha is the greatest Indian that ever lived, and we in India are still under the umbrella of this feeling for the Buddha"). But to strike the chords of nationalism is to evoke a general response throughout Asia. And the Dalai Lama—who is a young man, and more attuned than might be thought to the trend of the modern world—also lays stress on the mass nature of the people's resistance in Lhasa, and their loyal help in his escape.

His presence in India is bound to reinforce the new suspicions there about the true nature and intentions of the Peking regime. Mr Chou En-lai is admittedly going out of his way just now to pay compliments to Mr Nehru, and he said on Saturday that there was no reason why Sino-Indian friendship should be affected "on account of a handful of Tibetan rebels." But Indians cannot very well take lying down the Chinese nonsense—reiterated in Peking even after the Dalai Lama had issued his Tezpur declaration—about "abduction"; to do so would be to confess that the Indian government is both the accomplice of his alleged captors and, there-

fore, a party to the charges against China which, Peking persists in saying, his captors have uttered against his wish.

If the Tibetans continue to resist, India will reluctantly have to make up its mind on several painful issues. Can it conceivably seal the frontier and urge the rebels to surrender and be satisfied with the economic blessings and political reforms which Peking now proposes to offer them ? That is very doubtful. Morocco and Tunisia, two much weaker states, have resisted demands that they should break with the Algerian rebels —whose "government" in fact operates openly on Tunisian soil, and is recognised by its Arab neighbours. India is most unlikely to recognise the rebel "government" in Tibet ; it does not recognise the Algerian one. But it is evidently going to treat the Dalai Lama even more respectfully than it recently treated Mr Ferhat Abbas. "We accepted Chinese overlordship of Tibet, and we stand by it," Mr Nehru said in Madras on April 14th ; but the Tibetans were not Chinese, and "I cannot imagine any feasible or practical or happy solution without the autonomy of the Tibetan people." And he reiterated that the first thing his government had to bear in mind was the security of India itself.

The red glare on the Himalayas has indeed roused India to a more watchful wakefulness ; even the coincidence of the alarming affair of the shooting down of a Canberra bomber near Rawalpindi has not turned Indian eyes back to their customary exclusive concern with Pakistan. But it would be a mistake to suppose that official Delhi has only just noticed the heavily armed and ruthless neighbour on the other side of the mountains. The security of the Himalayan frontiers strongly influenced, for example, the reshaping of administrative boundaries that was embarked upon shortly after the 1954 agreement with China about Tibet—the agreement in which the famous *panch shila*, the five principles of friendship and non-interference, first appeared.

Public opinion in general, however, has until now been much more complacent than departmental Delhi. That has been only partly due to Mr Nehru's past practice of excluding China from his otherwise general strictures, in the hope of keeping the line to Peking open. The prime minister has hardly ever been criticised in the Indian press or parliament for this policy, which corresponded to a very general Indian belief that the Chinese communists, as fellow Asians, were really brothers in the Bandung countries' struggle for freedom.

Now that the fugitive Dalai Lama has brought a new enlightenment to Sarnath, much is changed. In Burma, Ceylon, Indonesia and Japan newspapers inclined to left and right alike have drawn comparisons between Tibet and Hungary. Cairo radio has joined in the shocked chorus ; and President Nasser himself has denounced communist imperialism at length in an interview given to the Bombay *Blitz*, a journal with a strongly left-wing reputation. The general Indian reaction was voiced by Mr Jaiprakash Narayan, the widely respected former leader of the Socialist party:

> Tibet may be a theocratic state, and backward economically and socially. But no nation has the right to impose progress, whatever that means, on another nation. Every nation, small or big, has the right to choose its own way of life, and the least we can do is to stand unwaveringly by this right.

Few Indians will go as far as the writer in the *Indian Express* who has suggested that "mere neutrality between the power blocks will no longer serve as a protective shield for the nations of south-east Asia" and that India may now need to reach "understandings of a limited scope" with America. No question arises of India throwing itself into the arms of the West. But Indians are going to be more understanding, in future, about westerners' preoccupation with defence. And unless China can find something better than a jackboot policy for Tibet, the distinguished exile in Mussoorie will continue to remind his hosts of the deep gulf that divides their concept of small nations' rights to independence from that of Peking. The beacon on the Himalayas sheds a revealing light on China's attempts, tirelessly maintained ever since the Bandung conference just four years ago, to pose as the champion of all "national liberation struggles."

SPURIOUS LIBERALISM

No doubt it would be a good thing if the national representatives could be elected, not by any distinct class-interests at all, but by those members of society in whom all the deeper antagonisms of class-interest had been eradicated or worn away. But scarcely even will the most democratic organ maintain that the household franchise, or the £6 franchise, would give us such a class. Indeed, such a class does not exist, though there may be a large number of isolated individuals in the nation who successfully resist selfish motives even on political questions vitally affecting their own interest. As a nation we have long ago exhausted the hope that any single class, intrusted with absolute legislative power, would exercise it impartially for the whole nation. The aristocrats did not do so. The middle classes do not do so. The working classes will not do so. Such a spectacle as that of Mr Bright at Manchester, denouncing the aristocracy and challenging their "order" to a struggle with his "own", ought alone to be enough to warn us that no class can safely be trusted with the power to tyrannise over another. The experiment of throwing the whole electoral power into the hands of any one class has been tried and failed. The temptation to abuse such power is too great for the virtue of any class. We ought to have learned by this time, from our own history, and from the history of democratic America, that the best security for just legislation is to prevent the possibility of any one class overriding all the others. The conscience of society, as well as the conscience of individuals, is depraved by absolute power. We, at least, can never cease to protest against that spurious Liberalism which measures the rights of representation by mere numbers, instead of seeking to reproduce in the Legislature some reflection of every distinct social energy which is essential to the political welfare of the nation.

NOTES OF THE WEEK

ELECTION

No Spring Meeting

It is good news that the election is unlikely to be held in the early future, even although Mr Macmillan appears to have intimated to Tory MPs that he took the decision for what were surely the wrong reasons. The strongest national argument against an early election was that it would have seemed dangerously likely to return either major party to power with only an anxiously small majority ; nothing would be more disastrous for Britain than to be saddled for an uncertain period to come with a nearly deadlocked House of Commons and Government.

There seems less substance in the argument that it is essential that Mr Macmillan himself should take part in this summer's international negotiations. Recent developments in America mean that the western side of the stage is being set very awkwardly for these negotiations—like preparing to play Hamlet with only the ghost. But the British people is going to have to be given its opportunity to add to the confusion, if it wishes to, by swapping Mr Gaitskell for Mr Macmillan at some stage in the negotiations anyway. The whole of the world's diplomatic problems are not going to be solved before May, 1960. It hardly seems to be an advantage that Britain's initial representative at these talks should be a man with some incentive to be in an electoral hurry for quick results.

But if an election now had returned a nearly deadlocked House, election considerations would have weighed as heavily in a new Parliament as in the present one ; an early dissolution is never wise when the indicators point towards stalemate. Some people believe that Mr Macmillan never had any real intention of going to the country this May ; quite possibly his personal inclinations have always been against an early election, but in recent weeks there has been no absolute certainty that he would not change them. For some time government policy has been drawn up on, so to speak, two sheets of paper—one labelled "if it is May" and the other "if it is later." Even the new Finance Bill—despite some snap judgments to the contrary —is in a form in which it could still be rushed quickly through the House. That is why, if Mr Macmillan has now definitely made up his mind, he should at once announce the fact publicly ; the leaked reports of his speech at the private lunch with Tory MPs this week were not a good vehicle with which to dispel the last lingering doubts, because everybody recalls a previous occasion when he made jocular remarks at such a meeting which were immediately misinterpreted.

Parliament itself can make good use of the full term of the current session. For example, the Government should be urged to provide some of its own time to facilitate the passage of Mr Goodhart's liberalising Night Baking Bill, which this week has fallen foul of Conservative carelessness and a cunning Labour resort to the quorum rule in standing committee ; and there ought to be no excuse for the law officers to use steamrolling tactics against Mr Jenkins's Obscene Publications Bill (see page 317).

FOREIGN MINISTERS

Lowest Common Denominator

On Wednesday in Paris the American, British, French and west German foreign ministers will have before them not only the findings of their own official study group on Germany, and the Nato council's comments thereon, but, almost certainly, a new statement of Soviet policy—issuing from the meeting in Warsaw on Monday of Mr Gromyko and the other communist foreign ministers, including Mr Chou En-lai. They will have to be braced for surprises. Mr Khrushchev has changed his tune on Germany so often since November that almost anything seems possible—though not quite anything, for the Warsaw meeting is billed to discuss the removal of allied occupation troops from Berlin.

What can be safely predicted is that Warsaw will yield an outwardly united position. Behind it, there may be some interesting divergences ; Warsaw radio this week told the Poles that things might go better now than in 1955, when "two stubborn, angry old men"—Mr Molotov and Mr Dulles—proved mutually uncompromising over Germany. But the Soviet block will certainly present a monolithic front, in contrast to the irregular order of battle in which the western governments are now advancing to meet it.

True, the four-power official group in London is reported to have reached agreement on several points of substance—in addition to the fundamental point, which has never been in question, of maintaining the freedom of west Berlin. But the agreed points now cited amount to the dropping, from the project for a central European zone of mutual military inspection, of all idea of setting an immediate limit to arms in that zone (though a limit might be set at a later stage): and the tying of the inspected zone project directly to German reunification. This represents a lowest common denominator. The next few days will show whether the Nato council and the ministers in Paris can still build any sort of agreed superstructure on to it. One hopes that, if their differences should turn to hasty recriminations as the diplomatic deadlines close in on them, they will be restored to a sober sense of proportion by this week's most revealing news item: the public opinion poll that showed that three Britons in every ten had never heard that there was a dispute over Berlin.

NUCLEAR TESTS

In the Atmosphere

When the Geneva talks on halting nuclear tests, which began last October, got going again a fortnight ago after a break for Easter, the American and British delegates

made a new move to break the familiar deadlock. They suggested that, if Russia could not modify its rejection of a control system effective enough to pin down clandestine tests of all kinds, a start might at least be made with a ban on all tests elsewhere than underground and outside the earth's atmosphere—that is, at heights of more than 50 kilometres (about 31 miles). Tests above ground and within the atmosphere would be relatively easy to detect, and a simplified control system for this limited purpose could be devised without the need for automatic investigation of every earth tremor to see if it was a natural phenomenon or a subterranean weapon test.

On the face of it, this project would not merely help to break the deadlock; it could make it possible to get an inspection system into being so that practical experience of this tricky work would begin to accumulate; and it would take care of the fall-out menace, for it is of course explosions in the atmosphere that build up radio-activity. It would also set aside for more leisurely treatment the difficulties posed by the discovery, after the October tests in Nevada, that underground explosions are less easy to detect than had been assumed during last summer's discussions.

This week, after a perhaps inadvertent Soviet leak, it was revealed that the new western proposals had been accompanied by personal messages from Mr Eisenhower and Mr Macmillan to Mr Khrushchev, underlining the point that the new proposals were not a retreat from the goal of a total test ban, but an attempt to get started toward that goal. Officially, there has been no Soviet reaction yet. Semi-officially, Tass and Mr Tsarapkin have both given the proposals a pretty cold shoulder. But an early response from a higher Soviet level is to be expected—perhaps at the Warsaw meeting of the eastern foreign ministers on Monday.

ISRAEL AND THE ARABS

Competition in a Cold War

PERSISTENTLY accused by the United Arab Republic of being in collusion with the Jews, the Iraqi government was bound sooner or later to make some anti-Israeli gesture. It has chosen to revive an old Arab grievance by announcing a ban on the import of Imperial Chemical Industries' products. The Arab League's boycott committee has often complained of the activities of ICI in Israel, which include a share in the state's expanding fertiliser industry. Undeterred by Arab protests, the company has rightly continued to do business with all willing customers regardless of politics. But other firms are not so bold and Arab demonstrations of this kind increase Israel's difficulties in attracting foreign capital.

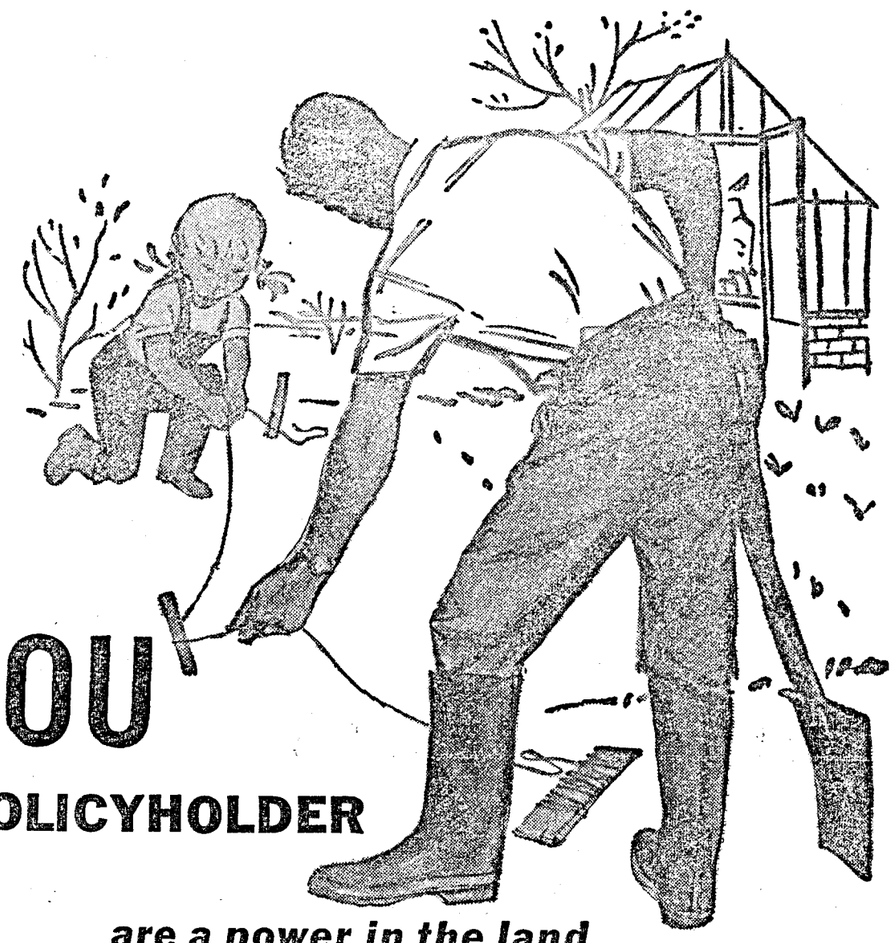
This episode comes at roughly the same time as other rebuffs to Israel. When Arab states fall out with one another, accusations of zionism tend to fill the air and to produce countervailing shows of anti-Israel resoluteness. Last month the Egyptians confiscated the Israeli cargoes of two ships passing through the Suez canal, thus jeopardising Israel's hopes of trade with Asia and the Far East. Whether this is an isolated gesture or a sustained policy is uncertain, since no ship has since attempted to pass through the canal with Israeli goods on board.

The most serious of Israel's recent setbacks has mixed causes. In its efforts to raise money to sustain the flow of Rumanian refugees, Israel gave such publicity to the new immigration that Cairo eventually reacted and in February made representations in Bucharest. (On the other hand, it is possible that President Nasser was thinking less of Israel's publicity than of stiffening his attitude to Moscow.) Whatever the reasons, under Arab pressure the Rumanian government has now put rigorous—if possibly temporary—limits on the migration. This decision has inflicted very great hardship on the Rumanian Jews who were on the verge of departure; it has also put the Israelis in no temper to disregard pinpricks.

ANGLO-EGYPTIAN AGREEMENT

First Swallow

AFTER a rather dispiriting delay, the Egyptian government on Tuesday signed the release of the four affiliated companies of the Royal Dutch-Shell group that operate in Egypt; they are expected to be handed over within a month. Shell sensibly jumped the gun by coming to a private agreement with the Egyptians in December, although the implementation of this depended on the general financial agreement that was not signed until February 28th. Thus the company was especially well placed in the long queue of 4,500 claimants to property sequestrated in Egypt.



Although the Foreign Office representative, Mr Colin Crowe, is still officially unrecognised in Cairo, this does not necessarily mean that nothing is being done about the rest of the sequestrated property. Claims have to be made direct to Cairo, and Egyptian sources report that the sequestrator-general has so far received 277 applications, of which 55 are from firms and the remainder from private individuals. Since the terms allow for three months' grace between receiving the application and releasing the property, it is too early to suggest that the Egyptians are not carrying out this part of the agreement.

Mr Crowe's job is to help the claimants, but until his position is officially recognised by the United Arab Republic he does not have automatic access to any ministries and cannot formally take up a case. When he secures recognition (as he should under the terms of the agreement), he is expected to have a mission of about 20 to help him; until then he is on his own. Egyptian reluctance to allow a British mission into Cairo is partly an understandable determination to demonstrate that anti-communism has not swung Egypt into the western camp; less reasonably, there is pretty clearly an ineradicable suspicion in President Nasser's mind about the wirepulling (to take a word from another context) that a British mission might get up to.

WATERS CASE REPORT

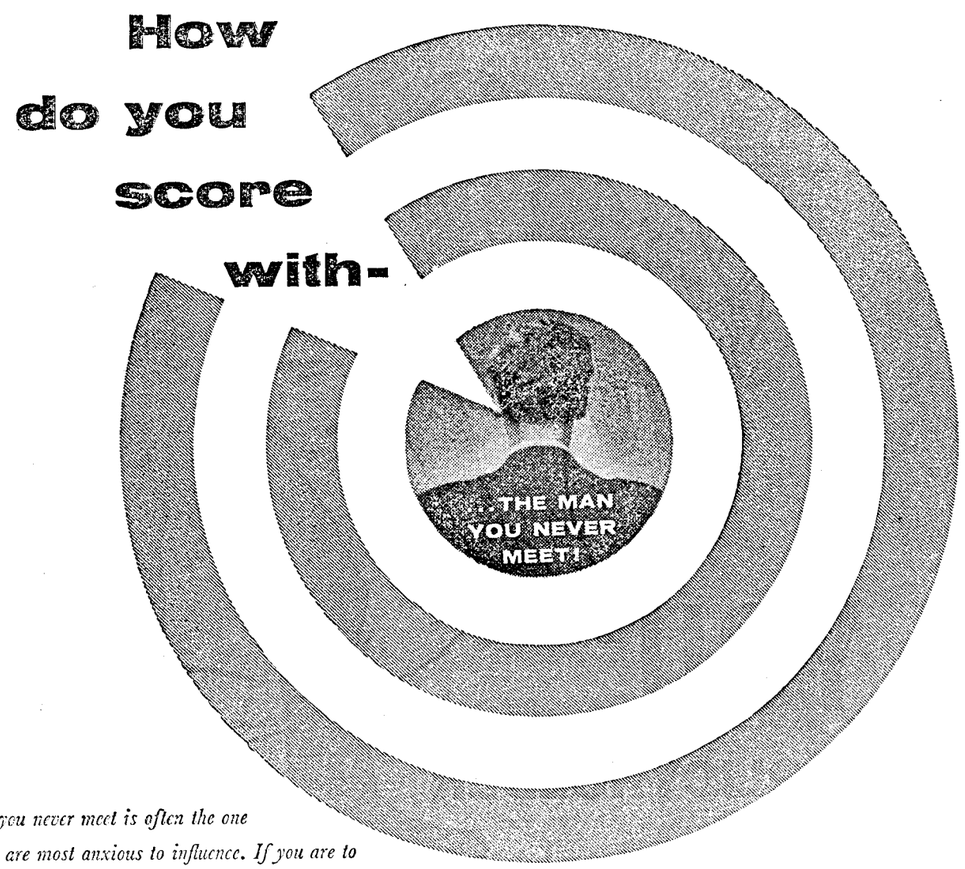
Trifles that Matter

IT is all very well for critics to claim that the Sorn Report on the John Waters case confirms that tribunals of inquiry are clumsy sledgehammers. But the inescapable fact is that Lord Justice Sorn and his colleagues found that the young policeman did cuff the cheeky lad when he should not have done; and they also established that under Scottish law nothing could have been done about it, given the circumstances, through a regular court. The onus is therefore on the critics to show how else than by a tribunal the danger of

YOU

MR. POLICYHOLDER

are a power in the land



It's not likely that you took out your life assurance policy with the idea of becoming a big noise. You took it out for down-to-earth reasons: because it's a good way to save, because you believe in looking ahead, because—when all's said and done—the unexpected *can* happen and you wanted to protect your wife and children. It gives you a feeling of independence as well as a feeling of security.

All the same, through Life Assurance you are helping Britain's economy. Money from Life Assurance provides finance for industrial expansion, for new factories, for government and municipal projects. Our standard of living benefits directly from these. Life Assurance not only looks after tomorrow—it makes for a better today.

Through LIFE ASSURANCE

— a better life for you and for everyone

Issued by The Life Offices' Association, London, and Associated Scottish Life Offices, Edinburgh

The man you never meet is often the one whom you are most anxious to influence. If you are to reach him at all one of the most effective ways is through the medium of print. But then you are faced with the problems of seeing to it that what you put into print gets read—and by the right reader. This is where we can be of help.

A new way of looking at Print & Public Relations

The new Greenaway Advisory Service offers guidance to Greenaway clients on print in its public relations aspect. This service—which represents an entirely new development in the printing industry—is under the direction of a well-known public-relations expert, Ian MacPhail. He and his creative team undertake very varied responsibilities. For example, they see to it that all print-work done for a particular client reflects that client's personality and is unmistakably his. They advise clients who want to reach a limited group on the easiest and most economical means of doing so. They consider what form each job should take, and when this has been decided on, they see it through the press. This is the most comprehensive service of its kind ever offered, and it is unique amongst printers.

A big name in printing

Daniel Greenaway & Sons Ltd., who have been printers in the City of London for three generations, already offer many specialist services to their clients. These include a day and night service and a dispatch-rider system—both of which contribute to a reputation for remarkable speed and punctuality joined to very high standards of quality. The new Greenaway Advisory Service will have the full backing of the considerable resources of the Greenaway Group.

Write now for a descriptive booklet.

IAN MacPHAIL

has been for the past five years Public Relations Officer to Dexion Ltd. His career has included extensive experience of print-design, journalism and broadcasting.

69 OLD BROAD STREET, LONDON, E.C.2. LONDON WALL 7565

loss of public confidence in the police could have been averted. The very extent to which Sir David Robertson's account of the incident to the House of Commons went beyond the boy's own version before the tribunal shows how easily such doubts, once they contain any kernel of truth, become magnified. Every police force in the land will note the tribunal's findings (and the recent conviction of a constable in Birmingham in connection with a similar incident) and draw the necessary conclusions. This is not a bad return for the £8,000 spent on the inquiry.

The tribunal has been able to present reassuring findings about the conduct of the Caithness police (and, by implication, that of the Lord Advocate) after the Waters family had complained of the injury done to their son. Because Scottish law differs from English law in this respect, as in so many others, there would not have been sufficient corroboration or evidence of identification of the assailant to have made possible a successful prosecution of the two policemen for assault. Some people will say that that provides a case for the Scots taking a fresh look at their law; but, in existing circumstances, the Procurator Fiscal and the Lord Advocate were clearly right not to institute proceedings. Their decision was based on an inspector's report which, so far from being a cover up, is described by the tribunal as a model of its kind; it included substantially all the material on which Sir David Robertson had relied.

The most worrying question is whether the Waters family would have had as much opportunity of airing their case if the member for Caithness had been a more complacent supporter of the Government than Sir David. It is said that the Secretary of State for Scotland could not have taken a look at the complaint, because his intervention might have prejudiced his position as the appellate authority in matters affecting police discipline. Does this perhaps strengthen the case for adopting the Scandinavian practice of establishing an *Ombudsman*—a "grievance man"—who, independently of the departments, can take up citizens' complaints against the conduct of the authorities?

OBSCENITY BILL

Writing on the Wall?

It seems possible that Mr Jenkins's bill on obscene publications is about to fall victim to a mean parliamentary trick. Unsubtle rumours of a circumstantial kind have been busily flying to the effect that this Friday all manner of amendments will suddenly spring up out of nowhere to the Landlord and Tenant (Functions and Fittings) Bill, which has priority over the Jenkins bill during this week's private members' time. If as the result of such a filibuster the Jenkins bill comes on so late that it is talked out, its supporters will be delivered hand and foot to their sardonically courteous enemy, the Solicitor-General, who would then be able to avenge himself for being consistently out-argued and outvoted in the Standing Committee. Government time would probably be offered, if only because the bill's sponsors, as a gesture of appeasement, agreed to incorporate stiffer penalties and greater police powers against genuine pornography. This, however, would be subject to the condition that the bill be made "uncontroversial" by incorporating the amendments which the Solicitor-General put forward in Standing Committee, and which that committee rejected.

It is difficult to understand why the Government should make all this fuss, unless it just is that it is constitutionally incapable of shaking itself free from the conservatism of some members of the legal profession, or of admitting that private members may be right. The most important issue is whether there is to be any explicit provision for the admission of expert witnesses when an author, publisher or bookseller charged with publishing obscenities avails himself of the new defence that publication is "for the public good" because it "furthers the interests of science, literature, art or learning or of other objects of general concern." The Solicitor-General's objection to this was that in his opinion the courts would admit expert opinion anyway, but that it would violate good practice for Parliament to direct a judge on how to do his own business. But why run the risk that the courts may not interpret an inexplicit Act as nullifying the "Well of Loneliness" case, in which thirty-nine expert witnesses were all excluded?

The second dispute is over a provision to avoid ludicrous prosecutions by requiring that the Director of Public Prosecutions should have to sanction the launching of every obscenity case. The law officers, having first of all resisted this on the ground that it would cause the director much extra work and then having discovered this was not so, are now taking: (*a*) the high ground that it is a great civil liberty for a citizen to be able to prosecute anyone responsible for what he thinks is a dirty book; and (*b*) the low ground that the director might be forced by public opinion to launch more prosecutions than at present if he cannot fob off irate puritans by telling them that they are at liberty to go to law at their own expense. This last argument sounds fanciful in logic and discreditable if true. But the danger is that Mr Jenkins may have to drop this part of his bill in order to get something from the Government on expert witnesses.

UNEMPLOYMENT FIGURES

Unwarranted Delay

There is an unnecessary delay in the publication of one piece of vital economic information, and this is an appropriate time to make a fuss about it. This month the count of unemployment was taken on April 13th. By now the Minister of Labour must know the main results. Yet, if he reverts to the normal procedure of his department, these figures will not be released until around or after May 7th, when they can be given in the fullest detail and—the chief reason for the delay—when they can be accompanied by the employment statistics. This hold-up is all the sillier because the employment figures do not even relate to the same date (they are for the end of the previous month), and in any case—as they are based on a sample count—are of a shaky character liable to later revision which may alter their whole import. By contrast the unemployment figures, which are the direct tally of registrations at the employment exchanges, are reasonably hard and fast figures from the very beginning.

Last month Mr Macleod released the unemployment figures nine days after the count was taken, during the course of a debate in the House of Commons on an Opposition vote of censure. There is no debate on unemployment this month, which may disappoint Mr Macleod (if the figures are again good) or be a relief to him (if they are now bad). But these figures should not be political straws in the wind; they should appear as a routine statement from the Ministry

of Labour. At a time when other departments, notably the Board of Trade, are making strides in the publication of quicker estimates, it is ridiculous that there should be any delay in the one official key statistic that is capable of being more up to date than any other.

CENTRAL AMERICA

Our Girl in Panama

To the world, Dame Margot Fonteyn is a dancer; but in Panama it is more to the point that she is the wife of a public figure who is at odds with the regime. Dr Roberto Arias and his wife sailed out into the Gulf of Panama on April 14th in a fishing launch, the *Nola*; a week later, when the *Nola* returned to Balboa without Dr Arias but with his wife, warrants were out for the arrest of both of them. Dame Margot was apparently tricked into leaving the Canal Zone (which is governed by the United States) and spent a couple of nights in jail before being released on condition that she left the country.

Dr Arias is a member of one of Panama's wealthiest and most influential families. He was ambassador in London from 1955 to 1958, when he resigned at the same time as one of his brothers lost the office of Foreign Secretary. Their father, an ex-president, is a newspaper owner who has been courting trouble by his criticism of the present government under President de la Guardia.

The Panamanian government has been especially sensitive to criticism since Señor Fidel Castro's victorious rebellion in Cuba turned Havana into a centre of subversive movements; although the main targets are the dictatorships in the Dominican Republic, Haiti and Nicaragua, there is also a band of Panamanian hopefuls, who appear to include some of Dr Arias's relations. Such is the atmosphere in Central America that stories of imminent rebel expeditions to Panama and of sunken launches packed with arms are not so implausible that they cannot easily be used, and at need invented, in order to justify the rough usage of opponents.

While he was still ambassador, Dr Arias complained that his president was being too soft with the United States over the Panama canal. This is the common coin of Panamanian politics (something like old age pensions in Britain) that every ambitious politician uses more or less frequently. It is also an increasingly live issue. There is the long-standing dispute over the interpretation of the original 1903 treaty which, in American eyes, conceded full sovereignty over the canal and five miles each side of it, but to Panamanians granted something less. Then there is irritation over Washington's dilatory implementation of some provisions of the supplementary agreement of 1955. And, on top of all this, there is the pervading Panamanian feeling that the Republic ought to be getting more than it does out of its principal asset. Such conflicts with their neighbours large and small condition the lives of Central American statesmen —and their wives.

SOVIET UNION

Birthday Greetings

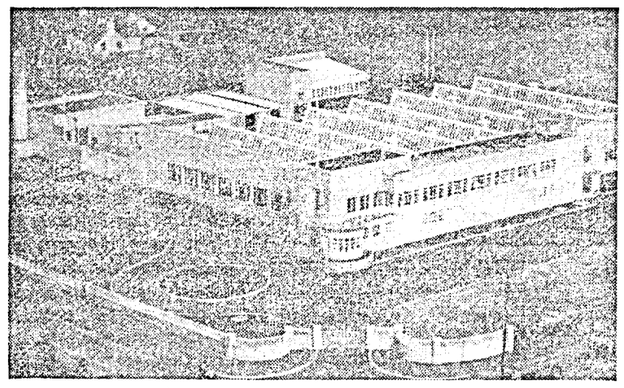
Russians are great believers in anniversaries. Evidently Nikita Sergeyevich Khrushchev, resting in the Crimea, had quite a post-bag on his sixty-fifth birthday; Sunday's *Pravda* devoted two-thirds of its front page, the whole of the second and half of the third to the messages of greeting. The telegrams were published in order of precedence, beginning with the Soviet party presidium (a group of signatures from which the name of Mr Pervukhin, ambassador in Berlin, was significantly absent) followed by greetings from China, Poland, and other countries of the Soviet block as well as communist parties *in partibus infidelium*. A brief message from Marshal Tito was included among the 28 published texts.

Soviet custom approves the celebration of landmarks in the lives of prominent men with medals and publicity. Mr Khrushchev was thus honoured for his sixtieth birthday, and Mr Malenkov for his fiftieth. But the present pomp is exceptional. The message from the party presidium describes Mr Khrushchev as their "elder comrade." It pays tribute to "his seething energy, rich political experience, wisdom and bold initiative. . . ." What is more important, it credits him with having prompted all important steps in home affairs and foreign policy alike.

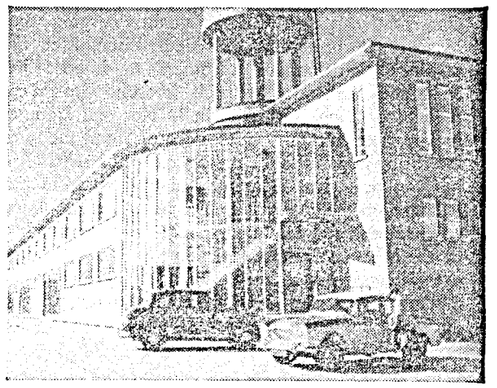
References to Mr Khrushchev as "a faithful disciple of Lenin" or to his speeches as "models of creative enrichment of Marxist-Leninist theory" may raise an eyebrow. The whole parade smacks of that cult of personality which, not so long ago, was being piously rejected. But before jumping to conclusions it is worth remembering just how extreme was the cult that surrounded Stalin till his death. Each of his birthdays was the occasion for litanies and hymns echoing throughout a prostrated country. After his seventieth birthday, Soviet papers went on for weeks publishing panegyrics, in prose and verse, to the glory of the leader of genius, the father of the people, the living demigod. Mr Khrushchev clearly overshadows the "collective leadership." But he has not appropriated Stalin's Byzantine cult, or not yet. Lenin's birthday was celebrated on Wednesday with more ceremony than Mr Khrushchev's; and Lenin is dead.

TARIFF ON FLOWERS

The Fault of the Dutch



The increase in the import duty on cut flowers is a minor piece of economic illiberalism. No consumer's standard of living will be dislocated by it The Government can fairly argue that it merely restores a level of protection which inflation had whittled down from that originally intended. In a world so familiar with quotas, licences and embargoes, moreover, a mere straightforward tariff can almost figure as a shining example of commercial good neighbourliness. This, however, is about all that can be said for it.



It is depressing to recognise, paraded on this admittedly minor occasion, all the old familiar fallacies. The main justification offered for the increase is that imports from the Netherlands are growing: inference, the proper response to an export drive is to block it as fast as possible. Behind the increase in imports there is cited a "rocketing" increase in Dutch production: inference, the prosperity of any neighbour's industry is a threat to be promptly countered. In matters of commerce the fault of the Dutch is (nowadays) charging too little and selling too much. Moreover in last week's debate every MP who spoke supported the Government's action, except those who wished that it had gone further. "It would be a tragedy," said one Government supporter, "if we were to allow the various

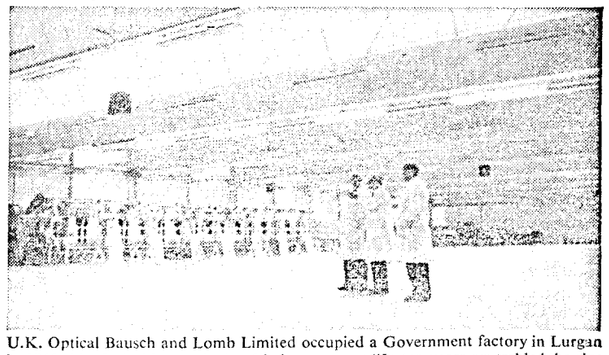
With low-rent Factories, substantial Capital Grants and a Government eager to help

YOU CAN CUT OUT A LOT OF WORRIES

When you Expand in Northern Ireland

When you plan expansion or the production of a new line in Northern Ireland you can *cut* the cost of factory building, *cut* the cost of new and second-hand machinery, *cut* the cost of training labour and *cut out* costly delays because . . .

. . . Northern Ireland is building standard factories of from 2,000 to 70,000 sq. ft. to rent from as little as 9d. per sq. ft. and may also build one for you on a site of your own choosing or provide a special purpose factory on a long term repayment basis.

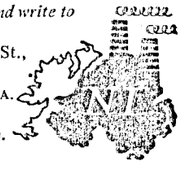


. . . legislation in Northern Ireland makes it possible for financial assistance to be tailor-made to speed the establishment of worth-while projects, particularly those that employ men. Financial aid can include substantial capital grants toward the cost of new and second-hand plant and machinery; grants for the removal of plant and the training of work-people and loans.

. . . in Northern Ireland you have the wholehearted backing of Ministers, Government departments, local authorities and people—they all want you to get into production quickly.

Since 1945 Northern Ireland has proved successful for over 130 new firms.

Left. Lotus Limited moved into this 33,000 sq. ft. Government factory at Banbridge in 1951. It has since been doubled in size.



Above. This factory, now leased to Light Alloy Construction Limited, is typical of the standard factories built without a tenant in view by the Ministry of Commerce. Advance standard factories are built in various sizes: 2, 5, 18, 30, 50 and 70 thousand square feet. **All have room for at least 100% expansion.**

U.K. Optical Bausch and Lomb Limited occupied a Government factory in Lurgan in 1946. Mr. J. A. Moore, Acting Chairman, says: "In ten years we trebled the size of our original plant and it is now one of the largest and most modern spectacle lens and frame factories in the United Kingdom. Our workers have responded admirably to training, absenteeism is very low, labour turnover is negligible and production is excellent."

GO TO NORTHERN IRELAND — AND GROW

political factors, especially European politics, to weigh too heavily when considering these matters," while another urged that tariff proposals should be considered "without too great a regard for what some countries may feel if their wishes are not adhered to." Tariffs, moreover, are not enough ; the cunning foreigner may either so lower his costs as to make a profit even across the tariff barrier, or, with otherwise unsaleable goods on his hands, may prefer a smaller to a greater loss. What the home grower really needs, said one Tory MP, is "a Government ready to operate, at any time, a direct embargo when it is seen that too much is coming in "—and if for practical reasons they cannot have it, they should be devising supplementary blocking tactics of their own.

A few weeks ago the same House of Commons, the same Conservative party, was indignantly urging the Prime Minister to protest to President Eisenhower about his administration's undue readiness to impose just such embargoes, demanded by special interests who are convinced that "too much is coming in." Not one argument used in the horticultural duties debate, from the menace of increasing imports to the unimportance of political goodwill, but can be swivelled round and trained, from across the Atlantic, on the enterprising British exporter. A few pence on anemones and carnations may not matter much one way or the other. The principle that our friends become our enemies, as soon as they succeed in selling us anything, matters a great deal. It is certainly not a principle conducive to the building of a "Britain Strong and Free."

PASSPORT

Out for a Pound

A DEAL of bitter criticism has been directed against the Foreign Office's decision to double its charge for renewing passports. The critics should think out carefully what they are complaining about. It would be an excellent thing if passports could be abolished altogether ; unfortunately, whatever changes were made in Britain's own illiberal laws about them, the laws of most foreign countries would still oblige British travellers abroad to carry the beastly things.

The old charge of ten shillings for a five year renewal of a passport had remained unchanged since the early 1930s, since when most other prices have trebled. This ten shillings clearly did not (indeed even the new charge of £1 still does not) cover the real total costs involved—i.e., not only the clerical cost of renewing the passports but also the cost of that part of Britain's overseas consular and diplomatic establishment which would not be required but for the need to stand ready to help British travellers abroad. Admittedly, many other services provided by the Government are not specifically charged for in this way ; probably they ought to be. Again, a case could be made for laying less of the real cost of these services on travellers, and more on the general taxpayer, if travellers as a class could be shown to be very significantly poorer than taxpayers as a class—in the same way, for example, as recipients of national assistance are significantly poorer than the average of the rest of the community. But any such contention would obviously be untrue. The welcome fact that a greater number of relatively impecunious students nowadays travel abroad may justify the Foreign Office's present forbearance ; it still has not increased the charge to the same real level as before the war. But to argue against any adjustment at all in the payment for this service is surely to argue the case for subsidising foreign travel to illogical extremes.

SMALL COLONIES

What is Viability?

MEMBERS of Parliament were in a genially bipartisan mood when they discussed the thirty or forty "smaller colonial territories" last week. It was agreed that a line had to be drawn somewhere between those that could become fully independent countries within the Commonwealth (or outside it), and those that can hope only for some degree of autonomy under British protection. But nobody knew where the line between the "viable" and "non-viable" colonies actually lies. It is supposed that Sierra Leone is marginal. But, on certain conditions, "viability" could surely go a lot lower than Sierra Leone in terms of size and resources. The conditions are, of course, that the locals should, for the sake of independence, be ready to vow themselves to poverty—and even to deepening poverty—depending on how sparse their resources may be, and how much they propose to pay their delegates to the United Nations. The liberal, it may be suggested, ought to be ready to recognise the right of a few far-flung communities to independence if they are resolutely ready to live the simple life in order to possess it ; in practice there are always complications for small countries trying to live on their own. Even when they compromise by accepting protection on a basis of autonomy (like the Maldives), there is always a tendency for the protecting power to feel that it must intervene to save them from starvation, earthquakes or a total absence of university education.

The choice, therefore, really depends on the economic expectations of the people of any given small territory. If these are at all considerable (as they usually are) they can only be met either by tacking the territory on to a larger unit (not necessarily, of course, a British unit) federally or integrally, or else by its remaining in a dependent status on Britain. The right thing to do is to face the local people, when the time comes, with the facts and let them choose—even if they choose to listen to some Mr Mintoff. They must realise that they are in much the same position as a remote parish, which enjoys electricity, water and national health at a far greater cost than the rates and taxes it pays ; it runs its local affairs but is otherwise part of (and a deficiency part of) a larger community. And when it strikes oil, it should in theory pay back what it has had before it says "now we can afford our own flag and *corps diplomatique*."

EUROPE

Two Assemblies

THE tenth birthday of the Council of Europe seems an occasion for melancholy as well as celebration. The council of sixteen has been the seed-bed of many new ideas and an invaluable meeting place for European politicians ; but its discussions have appeared more and more academic in recent years, as it has been left behind by the political efforts of the Six. One crumb of encouragement, however, has just been provided to those who cherish a broader conception by the election of a Labour MP, Mr John Edwards, to be President of the Assembly. The choice is a personal tribute to some years of patient work.

The contrast, however, between the activities of the assembly of the sixteen and the animated discussion in the assembly of the Six in the same place a week earlier is only too apparent. This week's discussions were interesting but without significant political effect. Last week's had an urgent political bearing on a major question of policy in the economies of the Six countries. The High Authority of the European Coal and Steel Community was seeking political backing from the Assembly for the coal policy which it is urging on the six governments. It won a qualified support from the assembly which should help it when it next meets the Ministers in May.

The proposals from Luxemburg are far-reaching. Last year some 257 million tons of coal were taken by consumers in the community. With production at 247 million tons and imports at 31 million, stocks at the pithead rose by some 17 million tons. Both the German and Belgian governments have begun to meet this situation by restricting imports on a national basis. But this breaks away from the conception of a single market with a common policy towards the outside world, and also places the whole burden of the crisis on imports, which it is in the long-term interest of the community to maintain. The High Authority therefore wants instead a community-wide policy of restrictions both on imports and on production. Governments have been resisting this idea partly from a general desire not to surrender their freedom of action, partly for more specific reasons. The issues involved in this significant political test are examined further by our special correspondent in Luxemburg on page 346.

ITALY

Dilemma for Catholics

THE belief that the new Pope might introduce a greater flexibility into the Church's relations with the Italian Left has been somewhat upset by the latest decree from the Holy Office. This forbids Catholics to vote for candidates and parties who, although they may not themselves deny Catholic principles, are allied with Communists or "assist them by their course of conduct." The ruling is in effect an elucidation and amplification of the decree issued in July, 1949, which forbade Catholics to vote for Communists. But its own wording is open to so many differing practical interpretations that there has already been a great deal of argument about it in Italy.

The new ruling will have its first practical application in Sicily, where a group of dissident Christian Democrats led by the chief minister, Signor Milazzo, leads a coalition ranging from the Communists to the neo-fascists, with the main body of the Christian Democrats in opposition. Signor Milazzo proposes to fight the regional elections early in June at the head of this motley array, and does not appear to have been deterred by the Holy Office's ruling. The neo-fascists are trying to square their circle by both approving the papal pronouncement and continuing to support Signor Milazzo. The Communists, as might be expected, are fulminating against the ruling. They maintain that the moral of the Sicilian affair, valid for the whole of Italy, is that economic and social progress is impossible without communist help.

Many people in Italy, including Christian Democrats, who would not agree with the Communists, would like to see an Italian government somewhat further to the left than Italian governments usually are. Popular fronts are dangerous because the Communists manipulate them to take power. This particular danger has receded in Italy since those Nenni Socialists who oppose an alliance with the Communists won the day at the party congress in February—although the two parties may still combine over specific issues, as they are now doing over missile bases. But if the moderate non-communist Left in Italy were to act literally on the Vatican's ruling in all its actions everywhere, it would have to watch the Communists stealing its own progressive thunder. People who believe that Italy should have a left-of-centre alternative to Communism will regret that the Pope should have made it more difficult for devout Catholics to help forward its development.

PAKISTAN

Do-it-Yourself Dailies

"MUCH the best way to gag the press is to run it yourself." These opening words of an article in *The Economist* last week (page 242) seem to have been already in the mind of General Ayub Khan, Pakistan's military president. The new ordinance he has issued empowers the government not merely to shut down any paper regarded as endangering "defence, external affairs, or security," but actually to appoint new editors and managers so that the paper shall continue to appear—with its editorial policy directed by the government. The president lost no time in demonstrating that this was no mere warning gesture. The moment the ordinance was out, an official administrator was appointed to take over the Lahore company which publishes the *Pakistan Times*, the Urdu daily *Imroz* and the weekly *Lailo Nahar*. The editors have been replaced, and the *Pakistan Times*, in its first leading article under the new order, has disavowed its previous policies ; it adds, interestingly, that "independence" will be a keynote of its new policy, and that "freedom of thought and expression is dear to us. . . ."

The government appears to be acting on the findings of the commission which it set up, after the military coup last

October, to investigate the common belief that certain Pakistan newspapers, and specifically this group, had for some years been receiving material support in various ingenious forms from the communist powers. The commission's report has now been submitted, but has yet to be published. If and when charges are brought against Mr Mian Iftikharuddin, the chairman of the group, whose home was searched last Saturday, more details may come to light. But meanwhile the affair has a deeply disquieting look to all who are concerned with the independence of journalism. The best way to deal with a paper that pretends to be independent but is in fact discreetly subsidised from abroad is, surely, to expose its deception—in the columns of other papers that really are independent. But how to deal with a paper that is nominally independent but in reality an official gramophone? The only real sanction—and an effective one—is in the hands of the readers, who can, if they choose, stop buying it. Perhaps they will.

CHINA

Aiming High

THE People's Congress opened in Peking last Saturday; Mr Chou En-lai, the prime minister, was in the chair and reviewed the government's past achievements and future plans. His oration was later described as a "book of history and poetry summing up the success of China's great leap forward." It was punctuated by the usual ambulatory images, such as "learning to walk on two feet" and leaping along a variety of roads.

The Chinese, Mr Chou En-lai said, had learned a lot during the first five-year plan, which laid the foundations for last year's rapid advance on the economic front. Compared with 1952, the total value of agricultural and industrial output was 68 per cent higher in 1957; capital investment in this period exceeded the planned figure by 15.3 per cent. In 1952, only 58,000 engineers and technicians were employed in China's industry; five years later, their number was increased to 175,000. At the same time, the number of industrial workers rose by nearly four million. There followed the inevitable comparison with Britain, which in 1880 produced roughly the same amount of steel—just over a million tons—as China in 1952. In 1935, Britain produced ten million tons; by 1958, China's output of steel had increased to over 11 million. "It took us only six years to achieve in steel production what took Britain more than fifty years," Mr Chou En-lai commented, and he went on to paint a similar picture of coal output. It is the intention to raise steel output to 18 million tons, and coal output by 110 million tons to 380 million tons, in 1959.

Mr Chou En-lai's report was certainly ambitious; but at the same time, it struck a sobering note. Inflated ideological claims have disappeared from Peking speech-making; the Premier concentrated on concrete economic problems. Electric power, transport, fertilisers, agricultural machinery and "important materials" were among Chou En-lai's specific complaints; more ominously, he said that socialist economy had not made much headway in "certain minority areas." Though the Chinese have found out that industry and agriculture can be developed at the same time, heavy industry will receive preferential treatment; unlike the agricultural communes, it will be more centralised. Although Mr Chou En-lai could describe the achievements of his country as "phenomenal," he added: "for a country with a population of over 600 million, the industrial and agricultural levels we have now reached are still very low."

INDUSTRIAL LOCATION

Pull of the South

A RECENT study* has pointed out that three of the twelve regions of Great Britain—the London and South-Eastern, the Southern, and the Eastern—accounted for half the expansion in the number of insured persons between 1949 and 1957. The Eastern and Southern regions in particular had far faster rates of growth than anywhere else, and it is significant that most of these regions lie within the general influence of the capital. A double movement of population is going on. The London and (to a lesser extent) the Birmingham conurbations are continuing to attract new growth, but the economy of these areas is also expanding outwards into towns up to about 75 miles away from them. These towns share the big cities' economic advantages of industrial linkage and access to the largest consumer markets; those near London also share the unrivalled cultural, sporting, and social attractions of South-East England, its reputation of having a superior climate (to those knowing no better), and the newer gain of easy contact with government departments.

Two lessons for government policy seem to emerge. One is that inducements to industrialists to go (or to stay) North, which are at present associated with the development area programme, would be much more likely to succeed if the apparently strong reasons behind these trends in internal migration were more closely studied. The development area programme would be improved were less emphasis laid on the political aim of mopping up unemployment wherever it occurs, and more attention paid to siting developments in places where the best working and living conditions can be provided.

The second lesson is that advantage should be taken of the willingness of employers to move out to towns within an hour's or so journey of London. To do this the Government should plan some effective sequel to the new towns programme, whose end is now in sight. Despite the considerable volume of industrial dispersal, employment in London itself (much of it in offices) is still growing steadily, while population is almost static; in consequence, increasing numbers are commuting long distances to work. To retain a balance of development in the region, and to minimise congestion at its heart, more firms (offices as well as factories) should surely be encouraged to move to places beyond the new towns and in the outer parts of the enlarged London region. The expansion of such places is also generally less costly than building a greater number of houses or flats in the capital itself. Town development schemes of this kind hinge at present on the laborious and conscientious, but frequently unpopular, efforts of the London County Council. Would it not be much better to set up an independent agency, with the job of attracting firms to suitable towns and with the power to give technical assistance in their development? To adapt the concept of the new town development corporation to this new task would seem both practicable and desirable.

*In a paper read by Professor J. Sykes to the Town Planning Institute.

LETTERS

Arab Oil Objectives

SIR—The Arab does not dispute your concluding remarks last week on the oil congress in Cairo:

> But participation in terms of capital—as the countries may find out in some of their new deals with fresh concessionaires—would be a more exacting role, and not necessarily a more rewarding one.

This was implicit in the so-called "Haliq paper," which was extensively referred to in your article. But how could it be feasible, with the present politico-economic structure and behaviour of the oil producing states, who (with the exception of the tiny principalities of the Gulf) are beset with grave economic ills, to furnish "a commensurate share of the huge capital requirements of the industry"? While the Arab economist is fully cognisant of the advantages of "enjoying the fruits of the most profitable part of the industry [the crude oil revenue] without supplying any capital at all," he is equally (and sadly) aware of the disturbing fact that such enjoyment has presently no economic merits in terms of basic national and regional development, without which the Middle East will always be a hotbed of trouble. To quote the "Haliq paper":

> . . . The calculated objective of the Arab oil economist is not so much to secure more cash to the already contented patrician, but to finance a purposeful scheme by means of which a large portion of the existing and contemplated oil revenues can be utilised in viable basic industries that bring about a more substantial productive development.

This is not a matter of Levantine mercantilism, but of a pressing *political* economy, within the context of which no Arab problem could be discussed.

The limitations imposed on the concessionaire's ability to effect a direct participation in such a desirable course of action are understandable. Not only his contractual obligations and his commercial policies restrict his involvement in sound national and regional development schemes; his very status as an alien business giant is enough to dramatise Arab suspicion. And suspicion is not peculiar to the Arab. Permit me as the author of the paper to pick out some of your own. The "commercial arithmetic" and "cockshy figures" supporting the document were not meant "to provoke the companies, in refutation, to get the sums right for them" or "to require [them] to put up or shut up." The figures were meant merely to indicate the assumptive and speculative nature of the Arab economist's search for facts. *The Economist* itself confessed that "no outside observer is in a position to substitute the actual figures." One in fairness should accept the solemn contention of the least subjective of the industry's spokesmen that the real scope of profits in the integrated oil trade could not be accurately calculated. Even your effort to cite British Petroleum as a demonstrative example was, I am afraid, rather ambitious.

Speaking of "ambition," which was a recurrent needling of the Arab "technocrats" in your article, it was not quite fair to state that "the desire [of the Arab oil technocrat] to be 'on the inside' is no doubt personal. . . ." There are few Arabs, very few indeed, who, like the writer, while holding no elective office, or seeking no political rewards in the fluid loyalties of the latter-day Arab experimental politics, have attempted over the past decade to familiarise themselves, at close range, with the oil industry's problems, commercial, bureaucratic and what-have-you. The term "technocrat" was used in the paper to denote that tiny minority of the much needed specimen of an Arab, who, while deeply conscious of the crucial eminence of oil in the inter-Arab and international relations in the area, subscribes to no political demagogy. If he chooses to speak his mind, his position becomes precarious and uncomfortable. The hazards of expressing a "non-official" or a personal opinion, regardless of its technicality, under the present political institutions, are sometimes calamitous. My paper, for example, met with patrician displeasure, with the resultant unsporting, unscrupulous, and unpleasant "correctives"! As for the politicians, they considered it too mild and compromising, born out of my long personal association with the industry abroad. Then there are those in the industry who believe that such thoughts as the paper projects instigate trouble among the happy potentates or the excitable masses. The only ambition a "technocrat" has, in my part of the world, is to be able to hold his own and feed his family. How true is your description of those who speak with a native heart and a western terminology:

> In the shifting politics of the Arab nations, they occupy an exposed and somewhat isolated position.

The only way justly to describe the Arab "technocrat's" ambition is to classify him as a "middleman of ideas" (irrespective of their shortcomings) in the confused and perplexing Arab state of mind. He stands in hazard between the two dominant native forces—demagogy and autocracy, provoking though misunderstood by both. At present only the industry can profitably read his mind. An Arab "technocrat" is a somewhat polished raw material of the shape of things to come, or that should be made to come, in the galaxy of contemporary Arab life and thought. The industry can well afford to dispel what suspicions it might entertain of his efforts. He is neither a dilettante nor a doctrinaire—he should be made useful on both sides of the fence.—Yours faithfully,

OMAR HALIQ

Geneva

Kenya Politics

SIR—The remark in your issue of April 11th that my decision to accompany an all-race delegation to England has been "publicly disclaimed by [his] constituents" is in the circumstances a wicked distortion of the truth. Two small associations composed mainly of people who opposed my election (just as though Labour voters had passed a vote of no confidence in their Conservative member) passed a vote of censure—the third, Kikambala, had been dissolved some months previously and the few people who assembled had no *locus standi* (see the *Mombasa Times* of April 10).

The big majority of my constituents had no comment to make except a few who wished me good luck. The Coast constituency which I have represented for twenty-one years is noted for its good race relations and moderation and this makes your paragraph all the more unfortunate.—Yours faithfully,

S. V. COOKE

Parliament Buildings, Nairobi

SIR—Your special correspondent, in your issue of April 11th, writes that "The communal roll system is the curse of Kenya politics (for it is one cause of the racialism which Mr Blundell himself specifically terms a curse); and this move away from communal rolls is welcome," he must be ignorant of the fact that the British Government is now patting itself on the back for having achieved in Cyprus a governmental symposium based on exact arithmetically calculated communal lines. Whereas Greeks and Turks have been mingling with one another in the very cradle of civilisation for a few thousand years, in my lifetime in East Africa Kenya was a land of undiluted savagery even if today a remarkable and likeable young African, son of a naked fisherman, is under the ægis of a widow of a president of the United States asking for "undiluted democracy today."

Kenya despite its economic advance is still substantially a motley medley of folk ranging from retired colonial governors; banking, insurance, *mercantile* tycoons; peripatetic boffins; Masai, whose standard diet is milk laced with blood tapped from the neck of their oxen; Kikuyu, who in moments of tribal hysteria pep themselves with spoonfuls of baby's brains; to Somalis and the northern cattle people who regard the Bantu tribes as sub-human.

To reduce the consequent discordant arpeggio of political chatter to harmony is obviously some problem. When therefore you describe a caveat as to the immediate applicability of the principle of the common roll to Kenya conditions (*vide* your comment on page 113) as a "silly reservation," I, with the privilege attaching to having derived mental nourishment from your paper for fifty years, in all deference would pray "Mr Editor, be your age"!—Yours faithfully,

EWART S. GROGAN

Muthaiga Country Club, Nairobi

BOOKS

Economics in Action

Principles of Economic Policy

By Kenneth E. Boulding.
Staples Press. 440 pages. 30s.

IT takes a good deal more than an economist's specific expertise to write a book on the principles of economic policy ; a fact of which many economists are only dimly aware. It takes knowledge of the world, as it is and has been ; it takes an intuitive insight, supplementing all sociological observations, into human nature ; it takes a living as distinct from a merely schematic set of ethical standards ; it takes a sense of limits, which is almost the same thing as common sense. It takes, in fact, a good many of the qualities of the Philosopher-King.

Professor Boulding would not claim to be a Philosopher-King ; but his book deserves to be one of the best thumbed manuals in such a monarch's library—or at least in that of a studious heir bent on qualifying himself adequately for the succession. His first six chapters investigate what may be described as the preconceptions of policy : the objectives of progress, freedom, justice and stability and their interrelations. They are remarkably effective exercises in the disentangling of aspects and meanings, the gentle prising apart of contradictions, the isolation of those areas where, in the last resort, temperament and the political tug-of-war must be the only arbiters. To reduce those areas, to extend that of objective agreement, is the proper role of reason ; and Professor Boulding's success is the greater because he recognises its practical limitations.

The rest of the book surveys in more down-to-earth detail the particular fields of policy: fiscal, monetary, commercial, agricultural, and so forth. Its level is fairly elementary, but like any really good elementary work it is sustained, iceberg-fashion, by a great deal of expertise below the waterline. This is the kind of easy reading which is the fruit of hard writing and hard thinking. It is rare for a warning to be omitted when simplification unavoidably means oversimplification. In this respect the later chapters—on the economics of war and peace and the relation between communism and development—are less satisfactory than the others ; it is probably no accident that in these same chapters one is rather less conscious of a submerged nine-tenths of iceberg.

With the last chapter of all, Professor Boulding reverts to the wider theme, already treated in his "The Skills of the Economist," of human values as the economist sees them ; and repeats his warning that the prudential ethic, the economist's ethic whether directly related to £ s. d. or not, is incomplete. It has no room for the saint, the poet and the hero, whose ethic leads them "to give and not count the cost, to labour and ask no reward," and without whom mankind, even in a prudentially achieved Utopia, would be hopelessly subhuman. Not least among the economist's duties, however, is to steer heroism away from fields where prudence is more appropriate ; and to point out, too, the difference between the heroic and the merely unheroically, muddle-headedly imprudent. There is a place in human affairs for desiccated calculating machines ; but not for calculating machines, whether desiccated or oozing with the milk of human kindness, which do their sums wrong.

Brittain on the Budget

The British Budgetary System

By Herbert Brittain.
Allen and Unwin. 305 pages. 25s.

FRIENDS of the Treasury have long known that Sir Herbert Brittain is the greatest living expert on the technique of British governmental finance. Over the years he has studied, and worked on, every aspect of the subject. No one is better qualified to write a handbook on the subject, and all students of such matters must be grateful to him. Rather surprisingly, no such book exists at present. "The System of National Finance" by Lord Kennet and Mr Norman Young, admirable as it is, was never so detailed and is now out of date.

Sir Herbert's book is confined into narrow limits. He defines them in his preface : "This account is primarily descriptive and expository and it is written by an ex-administrator . . . I have normally confined my comments to what I conceive to be the justification for existing practice." His comments, therefore, are hardly stimulating ; and he scarcely criticises at all. It is the nearest thing that one can find, outside a publication by the Stationery Office, to an official statement. This is not a criticism ; by keeping to this narrow path Sir Herbert gives a clear and unmixed picture of how the machine works and what it is officially intended to do.

Within these limits, it is extraordinarily thorough and complete, and its accuracy cannot be faulted. It covers the whole financial and parliamentary machinery of the budget and the estimates, the mechanism of the national debt and the financing of Britain's exchange reserves. It deals rather briefly with the control of expenditure by the Treasury.

There are three respects in which the book might be improved when it is next revised. First, there is too much detail about particular Acts. Irish Land Purchase was not long dead when Kennet and Young wrote, but it is not mentioned in their index. It appears three times in Brittain, plus a mention in an appendix. Second, Sir Herbert has deliberately kept his book short on figures ; it would be clearer if he inserted more tables. Third, the book is not always easy to read without documents beside one. It would help if examples were given of such documents as the weekly Exchequer return.

These are details, and do not detract from the excellence of the book. It supplies a real need, and one may hope that Brittain on the Budget will go through as many editions as Byles on Bills.

"... Forthright Craftsman's Hand ..."

Somerset Maugham : *A Candid Portrait*

By Karl G. Pfeiffer. *Gollancz.* 214 pages. 18s.

MR SOMERSET MAUGHAM, CH, strongly objects to having his biography written and has done everything possible to discourage aspiring biographers, even to the length of requesting correspondents to burn his letters. So Dr Pfeiffer explains, with a mildness remarkable in one who eighteen years ago was personally told by Mr Maugham that he should be the authorised biographer. This "candid portrait" is a matter of personal recollections (extending with intermittent intimacy over half a lifetime), plus common knowledge, plus the autobiographical elements in Mr Maugham's novels. It is lively, shrewd if cautious in its literary judgments, sometimes penetrating, sometimes reflecting (probably to Mr Maugham's satisfaction) an entire bafflement ; it contains some excellent anecdotes (one of which, concerning H. G. Wells and an unnamed lady met in embarrassing circumstances, would have delighted Saint-Simon) ; and it leaves, along with an impression of genuine sympathy, a faintly nasty taste in the mouth.

The fact that this is very much the flavour of Mr Maugham's own writings encourages the surmise that the candour is genuine and not a euphemism for malice. On balance, indeed, sympathy predominates ; Dr Pfeiffer's evidence suggests that anyone who did, so to speak, a "Cakes and Ale" on Mr Maugham would have to aim at a rather wry tragi-comedy, not a satire. The crux of such a story would undoubtedly be, as it is not in "Cakes and Ale," the relationship of the writer's personality to his craft. Is Mr Maugham's work undervalued because there is so much of it, because it has made so much money for him, because it is so uneven, because the tide of literary fashion is against the entertaining story-teller—all inadequate reasons ? Or is there a deeper flaw and lack ; an atrophy of the wisdom, passion and innocence found at the core of all great writing, a substitution of mere knowingness ?

The knowing, of course, know among other things just how silly a man may look whose reach obviously exceeds his grasp, whether in matters of art or in matters of conduct ; they refrain, accordingly, from reaching too far ; and they do not look silly. But what turns curiosity and a zestful appreciation of human idiosyncrasies into knowingness, what gives the distaste for possibly looking silly its crippling pre-eminence? Perhaps the Browning who wrote "Andrea del Sarto"—though the limitations of Andrea's "low-pulsed, forthright craftsman's hand" had nothing to do with knowingness and a fear of looking foolish—might have supplied the explanation. Dr Pfeiffer does not ; and Mr Maugham assuredly never will.

Fact and Tract

Syria : *A Short History*

By Philip K. Hitti.
Macmillan. 271 pages. 21s.

The Catholic Church in the Middle East

By Raymond Etteldorf.
Macmillan Company of New York.
184 pages. $3.75 and 46s.

SYRIA, in the pre-1914 sense that embraces Lebanon and Palestine, has for millennia been the world's major meeting place between civilisations—Greek and Persian, Hellenistic and Ommayad, Ommayad and Seljuk, Crusader and Saracen and, in our own times, nineteenth century European liberal with early Arab nationalist. For those who do not need Professor Hitti's full history, this abridgement by Dr Harry Hazard of Princeton serves well. The knowledge that it imparts is indispensable to any westerner working in the area; without it, he cannot start to understand the outlook of the Syrian with whom he has to deal today. It is brief and accurate, though its chapter on independent Syria underrates that country's sturdiness as an economic unit.

Accuracy is not a quality of Monsignor Etteldorf's book, which is rather a tract for Roman Catholic missionary endeavour among the schismatic Christians of the Levant than what it claims to be: an "informal introduction" to "little known aspects" of the area. Writing, presumably, for the Middle West, he exclaims that "Iran is definitely not an Arab country" and that deserts are not necessarily flat. But these truisms are punctuated with statements that are often misleading and at times plain wrong; the Roman Catholic missionaries in the Middle East are among the best informed of local foreigners, and some will blush to see what he has made of his notes on their formation. Some of these are so ill-digested that the end product is a reminder of a sweeping little book that used to grace Victorian schoolrooms and was called "Near Home, or Europe Discovered." The price is far beyond the book's worth and those who wish to study the nature and vigour of the Christian communities in the Middle East had much better do so in Colonel Pierre Rondot's excellent *Les Chrétiens d'Orient,* published by Peyronnet in 1955.

The Hero of Quebec

Wolfe at Quebec.

By Christopher Hibbert.
Longmans. 192 pages. 21s.

PUBLISHERS seem to be warming the bell for the celebration of the bicentenary of the death of General Wolfe, which does not fall until September 13th. This is the second book on the subject to appear within a month. It is better planned and better produced than its predecessor. Narrower in scope, since it is limited to the story of the Quebec campaign, it strikes a more authentic note because Mr Hibbert has studied his military, if not his naval, sources carefully. It cannot fail to be a colourful story, though hardly (as its author fondly hopes) an unfamiliar one ; nor does the portrait of Wolfe differ materially from what we already know. "Touchy, imperious, moody, vain and heroically brave" is a just summary of that temperamental genius, even if one would prefer to see the word "vain" replaced by something less pejorative, such as "ambitious."

The General is always in the foreground of the picture, which results in a certain lack of perspective about the campaign in relation to the war elsewhere. The battle itself is overdramatised in the idiom of another war. Wolfe appears to be scaling a mountain with his "second wave of troops" as he drags himself up "ledge by ledge" over what was really only a difficult path, and there are far too many "exploding shells" for an age that preferred solid shot to carcases. The most original, though unverified, suggestion in the book is that the landing was effected with unexpected ease because of treachery on the part of the defenders. In war, as in love, fortune favours the brave: it in no way detracts from Wolfe's honour that accidental circumstances favoured the surprise attack by means of which he crowned a somewhat fumbling campaign with sudden victory and the immortality of a hero's death.

Poor Little Rich Girl

Daughter of France

By V. Sackville-West.
Michael Joseph. 392 pages. 25s.

"MADEMOISELLE, the Grande Mademoiselle, daughter of the late Monsieur, Mademoiselle, granddaughter of Henri IV, Mlle d'Eu, Mlle de Dombes, Mlle de Montpensier, Mlle d'Orléans, Mademoiselle, first cousin of the King, Mademoiselle, destined to the throne . . ." thus Mme de Sévigné played her carillon upon the titles and expectations of Miss Sackville-West's subject. Born in 1627, the daughter of Gaston d'Orléans and the richest heiress in France, eligible for a spectacular marriage, the Grande Mademoiselle remained a spinster, her life a mixture of public amusement and private pathos. Plain, gauche, hoydenish, impulsive and narrow-minded, she played a brief but colourful part in the Fronde, was considered as a bride for Louis XIV, Charles II of England and Alfonso VI of Portugal, before falling in love at the age of forty-three with a dapper, arrogant courtier, the Comte de Lauzun. For Lauzun the proposed marriage meant ten years of captivity ; for the Grande Mademoiselle ten years of frustration. Finally she parted with some of her richest lands in exchange for Lauzun's freedom, only to be disillusioned by his coldness and his cupidity.

Miss Sackville-West tells the story vivaciously and with considerable sympathy for "dear Mademoiselle." She draws largely on Mademoiselle's memoirs, but these are disappointing material. Miss Sackville-West herself says of them that "her endless weaving and unweaving of petty situations lack the tang which alone can redeem so empty a monotony." Mademoiselle, the spectator of France's greatest century, was indeed unappreciative of anything but petty court intrigue. Miss Sackville-West disarmingly remarks of her own biography that "this was never intended to be a scholarly work." Mademoiselle, we are told, had "a very sharp sense of business," but Miss Sackville-West justifies her avoidance of the tiresome details by saying that "as I can never understand my own finances in 1959, I don't see why I should be expected to understand Mademoiselle's in 1660." There are a few slips. The war between France and Spain did not end in 1648, but in 1659, and to describe the little town of Richelieu as the "wood-ash coloured village in Poitou" is unfair to a splendid example of seventeenth-century town-planning.

Hungarian Patriot

The Undefeated.

By George Paloczi-Horvath.
Secker and Warburg. 288 pages. 25s.

SO many books have been written about the experiences of those who have suffered in totalitarian gaols that it is difficult not to develop a resistance to reading any more. In the case of this book at least, this inclination should be resisted. The author is remarkably unemotional about his five years as Rakosi's prisoner and admirably reticent about his sufferings; moreover his story as a whole is an illuminating commentary on the development of Hungary from the first world war until the October rising of 1956.

Mr Paloczi-Horvath comes from the Hungarian Calvinist nobility, but through the circumstances of his upbringing he took an unusually detached view of the society into which he was born. His discovery, at the age of fifteen, of the callous way in which his uncle's estate servants were treated was the first of the influences that gradually pushed him farther and farther to the left until on his return to Hungary after the last

war, he eventually joined the Communist party. Before that, during the ten years before the outbreak of war in 1939, he worked in a variety of capacities on the famous liberal Budapest newspaper *Pesti Naplo*. He became the paper's principal foreign correspondent and later its foreign editor and watched at close quarters the victorious progress of fascism throughout Europe. At home he was an active member of the "Western-democratic camp" which tried to oppose the advance of fascism inside Hungary. In November, 1939, the Horthy regime forced his newspaper to close down. In April, 1941, he escaped from Hungary and spent the rest of the war working for the British in the SOE Branch.

If you manage to survive, there are, it seems, few better ways of investigating the murkier recesses of a communist regime than through the international communist prison grapevine. If, like Mr Paloczi-Horvath, you were in a communist prison from 1949 to 1954, you learnt a great deal about how the great show trials of that period were rigged—with the Russian General Bielkin and his bevy of MVD experts travelling round from capital to capital in order personally to supervise the show. You also gathered such esoteric pieces of information as the actual names of the two Security Police thugs who perpetrated the "suicide" of Jan Masaryk.

Mr Paloczi-Horvath was a sincere and convinced communist when he went into gaol, and, in spite of all he learnt and underwent, he did not shed his communist beliefs easily. It was not until he came to share a cell with a number of workers who firmly held that, whatever the mistakes and excesses, the communist system remained the "rottenest of all the conceivable rotten systems" that he finally lost his faith. By the time he was released he believed that communism without terrorism "is the most impossible of all impossible propositions." This conviction remains with Mr Paloczi-Horvath, who, after taking part in the October rising, escaped to the West with his wife and child when the Russian tanks rolled back into Budapest and now describes himself as a "stateless person without fanatical convictions" who has "come to suspect that fanaticism is the original sin."

Japan Goes West

The Origin of Modern Capitalism and Eastern Asia

By Norman Jacobs
Hongkong University Press. London: *Oxford University Press.* 243 pages. 28s. 6d

DR NORMAN JACOBS, who worked at allied headquarters during the post-war occupation of Japan, and now holds a post at the American University, Washington, DC, has written this book to develop a thesis of Professor K. A. Wittfogel: that the economic and social development of Japan, even before the period of "westernisation," had closer analogies with Western Europe than with other parts of Asia. He draws a series of contrasts between Japan and China with regard to the relations of a central bureaucracy with independent centres of power, the autonomy of merchant associations, freedom of the market and monetisation of the economy. He concludes that the preponderance of the scholar-gentry and imperial officialdom in China and the regulation of Chinese society on Confucian principles were more obstructive to the growth of capitalist enterprise than the feudal fragmentation that prevailed in Japan, and that in the early nineteenth century Japan was already well ahead of China in the development of capitalism. In particular, he argues that "true banking" had by then emerged in Osaka, but nowhere in China.

Dr Jacobs supports his argument with a wealth of detail and makes a strong case for his main contention. Unfortunately the value of his study is marred by an extremely cumbrous schematic mode of presentation—which is apparently designed to give it an impressively scientific sociological look—and by some selection of facts which, as given, are very misleading. It is, for example, rather perverse to claim that the Tokugawa ban on overseas trade—the self-seclusion of Japan from the seventeenth to the nineteenth centuries—was a "failure" because there was a certain amount of smuggling between Kyushu and the mainland; the volume of this was not sufficient to afford a basis of comparison with the overseas commerce of the European maritime nations during the same period. It is likewise a false analogy with Europe if emphasis is laid on the temporary independence of certain Japanese towns in the sixteenth century without showing how far the Tokugawa rule based on the Kanto was an effective reaction against these tendencies. The constant bracketing together of Western Europe and Japan in contrast to China obscures the fact that neither self-governing cities nor large-scale overseas trade were successfully established in Japan; Japanese official policies in the seventeenth and eighteenth centuries remained fundamentally inspired by a Chinese outlook on economic matters. Nevertheless, a combination of circumstances did promote a remarkable development of finance in the city of Osaka, and this factor was of decisive importance both in the political revolution in Japan in the 1860s and in the subsequent industrialisation of the country on Western lines.

No Policy for Raw Materials

Raw Materials: *A Study of American Policy*

By Percy W. Bidwell.
Council on Foreign Relations. London: *Oxford University Press.* 403 pages. 48s.

THE late Harold Ickes, when Secretary of the Interior, told a Congressional committee in 1942 that the United States had no oil policy. The author of this study finds that statement still true today—and not only of oil, but of industrial materials in general. The American government has a policy for the stockpiling of strategic materials, though procurement has been vastly overdone, partly because it has at times been subordinated to political ends. But one searches in vain for a general policy that recognises the increasing dependence of the United States on foreign supplies and the often very high dependence of foreign countries on the American market; and which relates these facts to economic goals at home and to American policy abroad. Instead American action tends to move in fits and starts, seeming at times to be contrived to produce the maximum cost at home and the maximum offence abroad. After examining government action towards a number of commodities (lead, zinc and copper, nickel, materials for the iron and steel industry, wool, rubber and oil), Mr Bidwell concludes:

> Congress and the President often failed to adapt measures affecting supplies of raw materials to the changed economic conditions which had made the country increasingly dependent on foreign sources. They failed, also, to bring raw materials policies into agreement with the changed position of the United States in world affairs and with the new objectives of American foreign policy.

(Incidentally, for one conscious of the need to preserve American goodwill among under-developed countries, it is strange that Mr Bidwell should dismiss their suggestions for international commodity schemes in a single sentence.)

The author attributes these failures "neither to ignorance nor to stupidity, but rather to certain characteristic defects of the democratic process . . .", particularly the dead weight of tradition, and the pressure brought by special and local interests. An extreme example of the latter is the bloc of sixteen senators from eight western states, whose influence on mining policy is out of all proportion to the population they represent, as foreign producers of lead and zinc know to their cost.

The clash of interests, and the contradictions within official policy, are well illustrated in oil. The independent domestic oil producers are at loggerheads with the American international companies over imports. Domestic oil production is encouraged by liberal federal tax concessions, but state agencies restrict production, under the guise of conservation, in order to bolster prices; the federal government supports that policy but accepts no responsibility for it. Again, Washington has actively encouraged American investment in foreign oilfields, and helped the companies to obtain concessions. Yet in the sacred name of national security Washington has also restricted imports of oil, at first by "persuasion" and now by formal quotas.

Mr Bidwell is a liberal; he knows that America's economic interests would be best served by sweeping away all restrictions on imports; this would not, he thinks, greatly harm domestic producers nor greatly benefit foreign suppliers. He also knows that politics rules this out. But he does not quite accept the logic of his own analysis of American needs in the atomic age: this is surely that, with an adequate stockpile of most materials, national security can no longer be used to justify preservation of domestic primary producing industries by artificial means. If such industries are held to deserve protection on these grounds, he favours direct subsidies to high-cost producers rather than tariffs or import quotas. His study of policy, in general and toward individual commodities, is most useful; it is hardly his fault if he is no more successful than others in suggesting how reforms can be pushed through against "the characteristic defects of the democratic process."

Irish Commons

Representative Government in Ireland: *Dail Eireann, 1919-22*

By J. L. McCracken.
Oxford University Press. 229 pages. 30s.

MODERN Irish historians have deserved well of their country. They inherited a notoriously tangled subject in which the myths had almost strangled the facts. They have gradually cut back a great part of the lush growth of legend and let in the light. Dr McCracken's achievement is especially notable because it concerns a period in which passions were aroused that have not yet been worn out. The civil war of 1922 can still sway votes in Irish politics. That indeed is largely because nothing much has happened in Ireland since then—which is of course an advantage from some points of view.

The theme of this book is the evolution of the elective house of the Irish legislature, its composition and procedure, its institutions and the constitutional arrangements which it has developed. The survey is prefaced by an admirably dispassionate account of events in Ireland in the twenty years during which the application of Home Rule became impossible and the emergence of a fully self-governing Irish state, though limited in area, became inevitable. This is an account of the institutions which the Irish adopted in the period of struggle against British government between 1916 and 1921, in their civil war in the two succeeding years and in the long period of rather torpid existence since them.

The reader will be impressed, to borrow a remark of Professor Mansergh's, by the extent to which the Irish have neglected their own Burke in favour of Rousseau. Symbols and conventions have been discarded in favour of a written constitution. The first constitution, in 1922, experimented unsuccessfully with the referendum, the initiative and the appointment of non-party ministers. Mr de Valera's constitution, in 1937, retained only the referendum; and the electorate will try it out in next June on the issue of whether proportional representation should be retained. But the sovereignty of parliament is restricted by a written constitution and the courts have intervened to declare legislation to be against the constitution.

This is certainly not in accordance with British practice. It might not have been adopted if self-government had come in the shape of Home Rule and had been initially developed by the members of the Nationalist party who had served at Westminster. On the other hand, the cabinet system and the supremacy of the government have taken firm root. Since 1922 there have been thirteen general elections but only five changes of government, and only three prime ministers. Moreover, the tendency (in spite of proportional representation) has been towards the party system, and towards the two main parties. But Dr McCracken shows clearly that the line of party division is vertical, not horizontal; it resembles American rather than British practice. Most Irishmen are probably well content that it should be so.

One is impressed by the degree to which these institutions have worked successfully and maintained the rule of law. They have been strained only where they have been faced with older and intractable problems such as the activities of the IRA. They have given good service to a generation. But, as this useful book points out, it is a generation that is ageing. Over one-third of the members elected to the Dail in 1921 were aged under thirty-five; the proportion in 1948 was less than one-tenth. A period of change in Irish politics is imminent; but this study gives grounds for hope that the spirit of parliamentary government will be preserved.

OTHER BOOKS

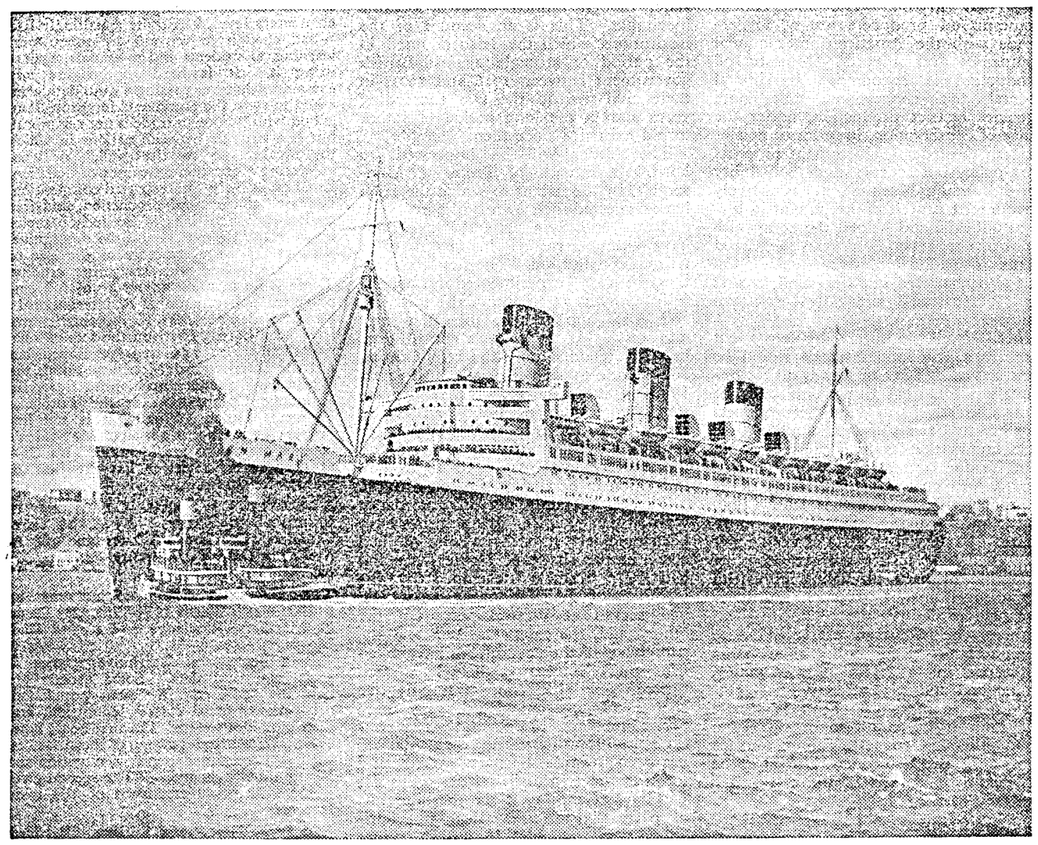
EVERYDAY ECONOMICS. By Edward Sladen. *Pitman.* 231 pages. 10s.

This is an extraordinarily uneven book. Had Mr Sladen stuck to his last, which is strictly institutional, he could have produced something really useful. On "how the City works," on the mechanism of public finance, on the organisation of business, on the statutory framework within which economic affairs are conducted, "Everyday Economics" is decidedly good; but on economic theory, even at the most elementary level, it is quite appallingly bad—bad enough to warrant an unequivocal warning, to students and to schools, against using it. It is hard to imagine any examiner whatever passing a candidate who, asked to state the arguments for protection, led off with "Foreign trade is not reciprocal, but is a struggle between nations in which the weaker go to the wall," or who, answering a question on causes of deflation, listed exclusively "unrestricted competition, increased efficiency of production, and free trade between nations." Borderline topics between the theoretical and the descriptive, such as the wage structure or the size of firms, are treated with staggering crudity. There is no mention anywhere of full employment policy, national or international; for Mr Sladen's readers, Keynes might never have been born. Even on the institutional side there are gaps; Gatt is mentioned, but not the International Monetary Fund, the World Bank, the Organisation for European Economic Co-operation or the European Payments Union. Finally, it is not improper to remark that not all of Mr Sladen's copious quotations are identified as such—as the present reviewer has the best of reasons for knowing.

A SURVEY OF SOCIAL CONDITIONS IN ENGLAND AND WALES. By A. M. Carr-Saunders, D. Caradog Jones and C. A. Moser. *Oxford University Press.* 302 pages. 25s.

THE CHANGING SOCIAL STRUCTURE OF ENGLAND AND WALES 1871-1951. By David C. Marsh. *Routledge and Kegan Paul.* 266 pages. 28s.

Both books are descriptive studies of social statistical data. Some aspects are naturally covered in each—population, occupations, social classes, education, and distribution of wealth. The first book, however, takes a broader sweep of social factors, including consumer spending, nutrition and leisure-time occupations. The second gives a more historical treatment of the main features.



FLORENCE. By Sylvia Sprigge. *Batsford.* 43 pages and 24 illustrations. 27s. 6d.

This is a delightful book, whose superb colour photographs and elegant text will bring back happy memories to the many lovers of Florence in this country. Mrs Sprigge gives first a brief history and then comments on many of the city's most notable works of art, including the Baptistery, the Palazzo Vecchio, the Bargello and San Lorenzo. It is unfortunate, however, that the commentaries on two of the photographs were transposed during printing.

DEBT SERVICING CAPACITY AND POSTWAR GROWTH IN INTERNATIONAL INDEBTEDNESS. By D. Avramovic, assisted by R. Gulhati. *The Johns Hopkins Press.* London: *Oxford University Press.* 240 pages. 40s.

This is a fairly heavily statistical analysis, by a member of the economic staff of the World Bank, of international movements of capital between the end of the war and 1955, and of the capacity of recipient countries to service the debt. There is much useful material, though the attempt to be comprehensive within a modest space makes the work more of a record for the specialist than analysis of interest to the general reader.

Correction: We regret that owing to a printing error, "The Liberal Future," by Joseph Grimond, which was reviewed on page 224 of *The Economist* last week, was said to have been published by The One Nation Group of MPs. The publishers are *Faber and Faber*, and the price of the book, which has 198 pages, is 12s. 6d.

would you enter without a pilot?

Foreign trade requires special skills. Entering a foreign port requires the services of a pilot who knows the local waters intimately.

So, too, with the banking requirements of trade abroad. The branches of The Chase Manhattan Bank in London are equipped to provide the businessman with personal, interested attention to his banking needs in the United States.

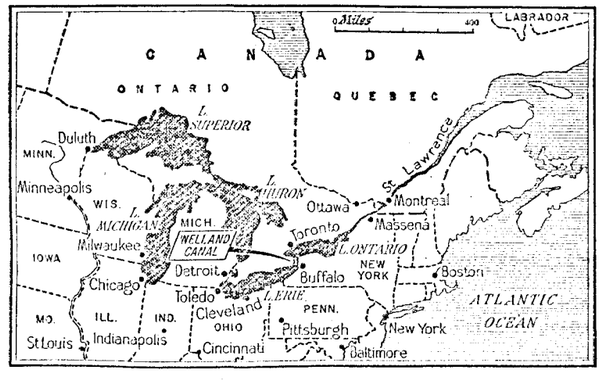
AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Mist over the St Lawrence



CLEVELAND, OHIO

THE St Lawrence Seaway, which President Roosevelt once called the "master project of the North Atlantic continent," is at last due to open to shipping this weekend. Unseasonably icy weather, fighting a rearguard action on behalf of the commercial interests in the eastern United States which have long feared the seaway's competition, has kept a lengthening queue of ships cooling their rudders outside Montreal since mid-April. Now, however, forty years of political controversy and nearly five years of actual construction—which has cost Canada $340 million and the United States $131 million, not counting the even larger sum spent on a joint hydro-electric scheme near Massena—are about to bear fruit. The enthusiasts who have predicted that the seaway will turn the Great Lakes into the world's "eighth sea" and their shoreline into the "fourth coast" of the United States will soon see whether the facts realise their hopes.

It is noticeable that the hopes have grown more modest as the seaway has neared completion. The deepening of the channel in the St Lawrence River from 14 feet to 27 feet, so that more capacious ships with deeper draughts can come up the river, will certainly bring a substantial increase in traffic in and out of the Great Lakes. But some of the earlier ideas about both the size and the composition of this increase will have to be revised. The table on the next page shows how wide a range there has been in the estimates of the tonnage which the seaway will carry when it is in full operation in about ten years' time. The fairest guess seems to be that about 50 million tons of cargo will eventually move along it each year. The one-way locks on the St Lawrence proper and on the Welland Canal between Lake Erie and Lake Ontario impose a physical limitation at about this level. Since it would more than double the cost of the project to insert two-way locks on these stretches, the limitation is likely to last for some time.

But there are uncertainties about even this amount. For one thing, the full benefit of the new depth will not be felt by some of the most important ports, such as Chicago and Detroit, until the channels which connect the lakes west of Lake Erie have been deepened to match. This task falls to the United States government and, at the present rate of progress, it will be 1962 before most of it is completed. Even then, the eight-month season to which the seaway is confined by ice will make many shippers hesitate before shifting their business away from the east coast ports. Nor has Washington yet announced how much it is willing to spend in federal subsidies in order to encourage American shipping lines to use the St Lawrence for foreign trade. Half a dozen American companies are interested in this overseas business, which has hitherto been carried entirely by foreign ships, provided they can get operating subsidies to cover the difference between their costs and those of their competitors; but so far only one, the Grace Lines, has been granted such a subsidy.

What many importers and exporters find even more perplexing is the difficulty of making an accurate comparison between transport costs through the St Lawrence and through the ports on the east coast. The tolls to be paid on the seaway, which will enable it to cover its costs by the year 2008, were announced only last month. At roughly half a dollar a ton for bulk commodities, and a dollar for general cargo, they strike most observers as modest enough, but some shippers of bulk commodities are complaining that the differential is too small. It is still impossible to tell whether the railway companies, which, with the east coast ports, were the bitterest opponents of the project, are now going to fight the seaway or co-operate with it. Last month they suggested a cut in the relatively expensive rates they charge on grain to the east coast, but they have not yet made any move on the vast range of other goods which they carry on east-west routes in competition with the seaway. Nor is it clear whether, as an alternative, they will attach themselves to the seaway's pull by easing their rates on the north-south routes between the Great Lakes ports and the industrial hinterland. The shipping companies, for their part, have shown little zest for anticipating the economies of larger-scale operations, which the seaway will presumably bring to them, by reducing their own charges. But, if the seaway does nothing else, it opens up the vast middle western economic no-man's land away from the lake shores to the benefits of competition between the two forms of transport.

In these circumstances it seems likely that the first clearcut result of the seaway will be a negative one. It will at least prevent the steel industry of the Middle West, whose native supplies of iron ore in Minnesota are rapidly dwindling, from migrating towards the east coast. If iron from the alternative sources which are being developed in

Labrador, Venezuela and elsewhere overseas had to be hauled on the costly rail route from eastern ports, the industry would inevitably have gravitated in that direction. It was when the steel manufacturers decided to support the seaway that Congress finally turned in its favour, and they seem likely to be responsible for about two-fifths of its total traffic in the shape of ore moving inwards, largely from the expanding Labrador mines. Indeed, if the ore trade on the seaway rises above the present estimate of 20 million tons a year, there may be serious bottlenecks at the canal locks; in this case those cargoes for which time is as important as the money saved on the sea route might return to their old love, the railways.

Substantial gains are also expected for two other bulk commodities that move down the seaway, grain and coal. The ships which bring in the ore will not want to return empty, and it is thought that the big sea-going cargo vessels will "bottom up" with grain, at least in the early years until they can find enough general merchandise to fill their holds. Estimates of the amount of grain which the United States might export through the seaway still vary from 30 million to over 200 million bushels a year, but most of the shipping contracts that have been signed so far this year are for Canadian grain. Moreover, since the coal trade consists largely of exports to eastern Canada, it is hard to resist the conclusion, reached by some of the best academic observers, that the chief impact of the seaway will be on United States-Canadian commerce.

ST LAWRENCE SEAWAY TRAFFIC
('000 short tons)

	Actual 1955	Expected 1959	When in full operation* Minimum	Maximum
Ore	1,789	7,138	20,000	37,700
Grain	3,719	8,362	6,500	12,100
Coal and Coke	1,409	2,569	4,000	6,000
Petroleum and Products	1,483	1,590	1,100	20,000
General Cargo	2,002	4,435	5,700	11,000
Other	243	506	...	...
Total	11,445	25,000	37,300	86,800

* Estimated

Of the general cargo—the cream of the trade—which will eventually pass through the St Lawrence, the best guess now is that 5 or 6 million tons will go to and come from places outside the American continent. Roughly a quarter of this, on past performance, will be Canadian. The portion left to the United States will still represent eight or ten times as much as the current volume of overseas trade to and from the Great Lakes. It is this which has made New York and Baltimore, Boston and New Orleans speak gloomily of the amount of business which they fear will be filched from them. But it is unlikely that the dollar value of the overseas trade moving through the St Lawrence, even including bulk commodities, will exceed a tenth of the present United States total.

Even these figures are subject to the uncertainties which still befog the outlook for the seaway. They hardly support the dream of a massive shift of the American economy to the Great Lakes, and the growth of a vast new megalopolis along their shores. In any case it is expected that the next ten years will witness a general expansion in both the economy and the foreign trade of the United States. Probably the principal effect of the seaway will be to direct most of this new growth towards the Middle West, rather than to bring a decline to rival ports and railways.

(A second article on the St Lawrence Seaway will follow.)

Mr Herter Takes Over

THE unusual speed and the enthusiastic unanimity with which the Senate approved the nomination of Mr Christian Herter as the new Secretary of State has, it may be hoped, repaired the damage done to his prestige by the President's fumbling hesitation in appointing him. The welcome which Mr Herter received from Senators of both parties underlined one of his main assets, particularly valuable since he must present the policy of a Republican Administration to a Democratic Congress: he is an experienced, intelligent and successful politician, with long service in Congress and in state government, known and admired in both houses as a liberal internationalist.

By the time Mr Dulles finally resigned it was unthinkable that anyone should succeed him except Mr Herter, his deputy for the last two years and a man with a lifetime of training for the job. As long as Mr Dulles was able to conduct his personal diplomacy Mr Herter kept discreetly in the background; but the last few weeks of allied discussions in Washington, when Mr Dulles was tied to his hospital room, have given his deputy opportunities both to learn the details of past negotiations and future plans, and to make himself known to other western statesmen. It is understood that they were most impressed by his ability. Another change in the State Department, when the meetings in Paris and Geneva were so near, would have been almost as disastrous as Mr Dulles's illness.

The real reason why Mr Herter's appointment was delayed was to enable the doctors to confirm, as they have now done, that his very noticeable arthritis would not hamper him in his work. It may mean that he will travel less than Mr Dulles; but that would probably happen anyway since he is accustomed to making full use of his official advisers. Moreover, Mr Herter will have less authority to make decisions on his own than did his predecessor, who was given almost unprecedented independence by Mr Eisenhower. The President, who is constitutionally responsible for the conduct of America's foreign relations, has been exercising that responsibility since Mr Dulles's illness and will continue to do so, at least until he has established a closer relationship with Mr Herter. It is doubtful if anyone can ever replace Mr Dulles in Mr Eisenhower's confidence; but, having chosen Mr Herter, the President will certainly support him loyally.

The new Secretary of State will not bring any basic change in America's policy but he seems more ready than was Mr Dulles, at least until recently, to adapt that policy to changing conditions. It remains to be seen, however, whether the new boy at the international conference tables will be able to persuade such hard-bitten intransigents as Dr Adenauer and General de Gaulle to follow his example. But those who know Mr Herter say that beneath his charm and courtesy is a steely toughness once his mind is made up.

Woolly about Woollens

THIS week's announcement about the 1959 tariff quota on imports of woollen and worsted fabrics into the United States had long been expected. The quota is based on 5 per cent of average American output in previous years

Original and Provocative Investment Letters From America

The Monthly Letters published by J. R. Williston & Beane have proved to be of interest and investment benefit to serious investors around the world. These original and stimulating essays are prepared by the partner in charge of our Research Department. They attempt to define current business and economic trends and estimate their probable effect on the stock market and specific issues.

The following headlines illustrate the wide range of subjects dealt with in our most recent Monthly Letters:

"Is It Too Late To Protect Yourself Against Inflation?" . . . "Does Pan Arabism Make It Dangerous To Own Mid-East Oils?" . . . "Is Moscow Determining Your Investment Future?" . . . "Your Basic 1959 Investment Policy"

If you would care to receive a current copy of this unusual investment publication, without cost or obligation, write to Mr. H. Thomas Osborne, Foreign Department.

and last year was the worst the American industry had ever known; it was therefore practically automatic that the amount of wool textiles that may be imported before the duty goes up from 20 or 25 per cent *ad valorem* to the almost prohibitive level of 45 per cent should be reduced by 700,000 pounds this year, to 13.5 million pounds. Under the President's proclamation 350,000 pounds of exceptionally high-grade fabrics, after the basic quota comes in, will be liable to a duty of only 30 per cent. This was evidently intended to soften the blow of the general reduction but in fact, as far as British manufacturers were concerned, it only added insult to injury. The concession affected too small a quantity to be of any real help and in any case, high as is the quality of Britain's textile exports to the United States, it is not that high; the main benefit will probably be felt by French luxury fabrics.

It is, however, because British textiles are carefully styled to meet seasonal demands that the impact of the quota system falls mainly on British manufacturers—a poor reward for the successful efforts which they have made to adapt their output to American demand. The high rate of duty becomes payable as soon as the year's quota is exhausted, usually about midsummer and certainly before British fabrics specially ordered for autumn delivery can be ready. Other foreign textile manufacturers, particularly the Japanese, can rush their mass-produced products into the United States in the early months of the year. These, not the British goods, are the products which compete with the American textiles supposedly protected by the quota system. While the British share of textile imports into the United States has fallen from 63.5 per cent in 1955 to 38.1 per cent in 1958, the Japanese share has risen from 9.3 to 31.8 per cent; total imports of textiles have also increased from 14.3 million pounds in 1955 to 16.4 million in 1958.

The British remedy was that the quotas should be allocated on a country-by-country basis; American manufacturers have no objection to this proposal but it has been rejected officially, apparently because its legality is doubtful and because it would discriminate against Japan and Italy (as the present system does against Britain). So now the best chance of improving the situation seems to be to replace the unsatisfactory quota provisions by a higher tariff on all imported textiles, which would at least enable foreign manufacturers to know definitely how they stood. Meanwhile next year's quota may profit from the improvement in the American textile business this year, particularly noticeable in the wool mills as compared with those using cotton and synthetic fibres. It is in fact competition from these fibres, rather than from foreign textiles, which accounts for the depression in the American wool industry.

Recovery's Quickening Rate

THE index of industrial production shook off the last vestiges of recession last month by breaking into new high ground; it rose two points, to 147 per cent of the 1947-49 level, compared with the previous record of 146 in December, 1956, and a pre-recession figure of 145 in August, 1957. The recession low was 126. The index has also been revised to show a two point increase in February, so that the rate of gain in the last two months is twice what it was in the preceding two. There is no longer any basis for the fear that the pace of recovery is slowing down, even though some of the impetus comes from purchases of steel which would not be made until the third quarter if it were not for the risk of a strike in July. What is particularly welcome is the widespread recovery in the production of durable goods, the sector in which output and employment have been slowest to turn up. Here the index is only 3 per cent below the previous high in 1956.

The figures for industrial production capped a whole flock of cheerful statistics in March. Personal income rose by $3 billion to a new record annual rate, seasonally adjusted, of $368.5 billion, the largest increase in any month of the recovery except for one affected by special government payments; the number of new houses put in hand continued high; and the annual survey conducted by the McGraw-Hill Department of Economics suggests that the government may have underestimated the increase in the plans of business firms to invest in new facilities and equipment. This would be a natural consequence of the bigger profits now being made. An unusually high proportion of such investment, however, will go on replacement and modernisation, rather than on expansion, a reflection of the fact that, although some observers are beginning to talk about a new boom rather than recovery, it has not gone far enough to absorb excess capacity, which persists even in industries that are doing better than they did before the recession. Two uncertainties still cloud the horizon: the possibility that if there is a steel strike it might go on for more than four or five weeks and begin to affect output, employment and wages; and the fear that all the talk of Detroit's new small cars may spoil the relatively cheerful outlook for this year's big models by convincing buyers that they ought to wait and see what the manufacturers have up their sleeves.

Mountains of Poverty

FROM A SPECIAL CORRESPONDENT

IN eastern Kentucky, where violence has just broken out at the strike-bound coal mines, and throughout the Appalachian South economic distress persists in the midst of an affluent society. From Harlan County (the Bloody Harlan of the labour troubles a generation ago), where one mine after another has closed down without any prospect of reopening, to the rural slums of Leslie County, where the average family income last year was $400, there are no signs of recovery in the mountains. Here population is pressing on inadequate natural and industrial resources, and overflowing into the Ohio Valley, where it forms a pool of unskilled labour which industry simply cannot absorb fast enough. The backwardness and isolation of these unfortunate Americans is cruelly immortalised in the subhuman "hill-billies" of Dogpatch, the mythical village that is the home of L'il Abner in one of the most popular syndicated comic strips.

The Appalachian South, which is a slim parallelogram of some 80,000 square miles occupying parts of nine states (the shaded area on the map) contains from six to eight million people, depending on how the boundaries are defined. Almost three-quarters of the population is rural, compared with 34 per cent for the country as a whole, and the median family income is close to $2,000 a year, or less than half the national average. Income is increasing, but more slowly

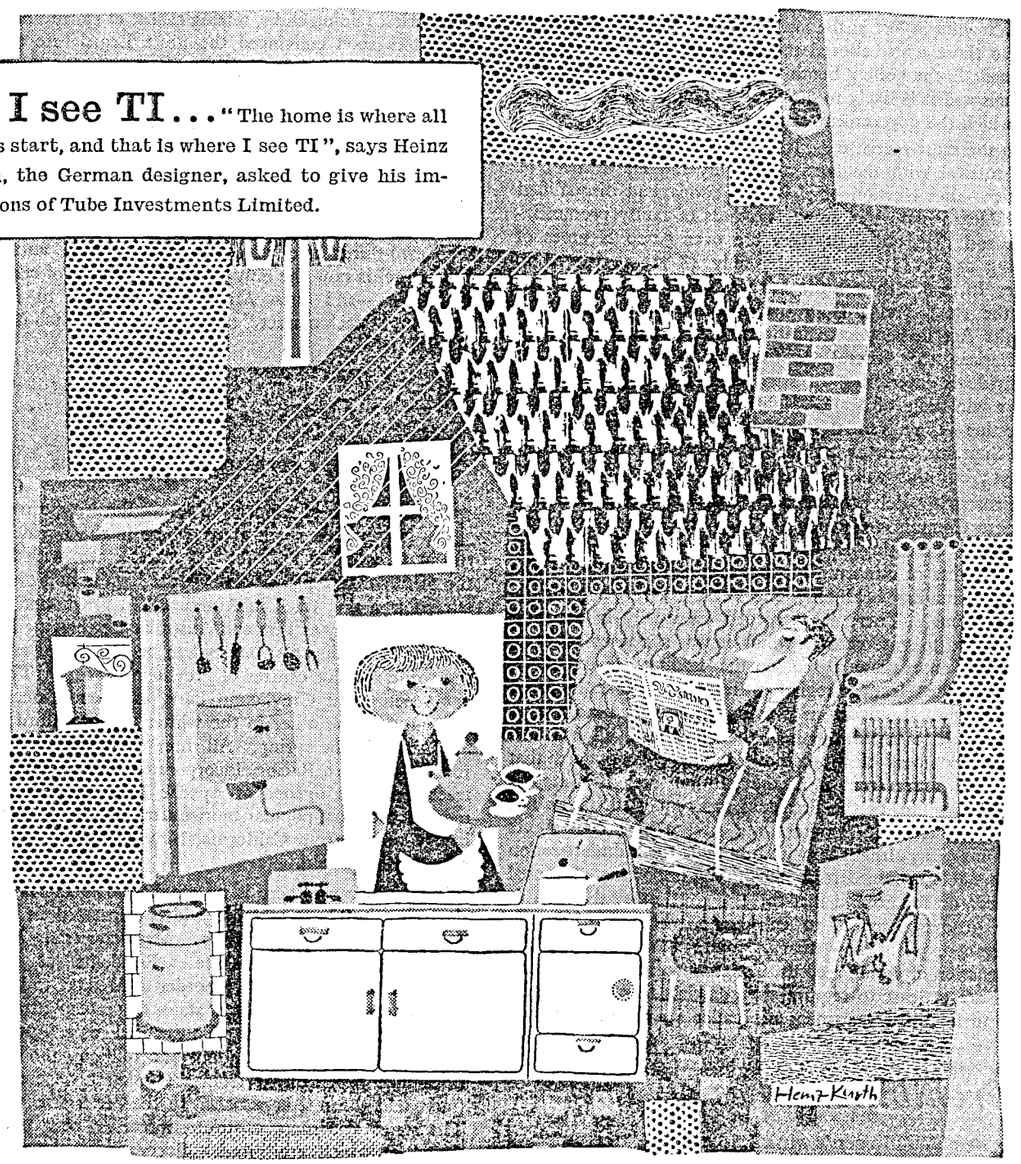
than elsewhere, so that the region is being left further and further behind. Most farming is of a subsistence type, since the terrain is too mountainous, the soil is too poor, and the individual holdings are too small to permit competitive commercial operations. There is still some lumbering, but the resources of timber are being depleted ; there are rich seams of coal, but the industry is declining because modern machinery has not been adapted to the characteristic local coal formations. The mining areas are particularly hard hit, since miners are traditionally unwilling to shift to other kinds of employment, or to eke out their earnings with subsistence farming. There is very little manufacturing, and what there is often employs only girls and women.

That the mountain woman should often be the breadwinner of the family illustrates the social disorganisation that accompanies economic distress. Until the last war the mountaineer eked out a precarious existence in a backward but remarkably stable society. Now that jobs, particularly for male workers, have become increasingly scarce, some men have simply left the labour market. Frustration seems to paralyse initiative. Many families in the region are living almost entirely on the rations supplied by the Federal Surplus Food Distribution Programme ; some 600,000 Kentuckians, 20 per cent of the state's population, have established their eligibility for this form of relief, which is available only to those totally unemployed, although it furnishes only about a third of the minimum needed for proper nutrition. The breaking up of families is encouraged because government help is available for dependent children when there is no able-bodied male in the household. The common attitude is summed up by the woman who asked, as she stood on the porch of her unpainted shack and surveyed her barren acres: "What would you do if you lived here ? "

For the most ambitious and energetic, the answer has been to leave home and try their fortunes in the city. Net migration during the last decade is estimated at a million people, enough to offset the natural increase even in a region that has one of the highest birth-rates in the country. In some areas, like Letcher County, Kentucky, the net loss of population has been more than 25 per cent in the last seven years. These migrants, however, find a cold welcome in Cincinnati, Columbus, Detroit and South Bend. They huddle together in rooming or boarding-houses where they can share their ignorance of city ways and insist that their exile is only temporary even though it may have lasted for ten years. Almost all of them are unskilled or semi-skilled; they are hired in busy seasons and let go in slack times, and automation is a growing threat to their employment at any time.

There is apparently some evidence that the children of the earliest wave of migrants have been assimilated into urban industrial society. But as the flow of migration increases, the problems of absorption are complicated, and the loss of human values becomes significant. Children of migrants are poorly equipped for city schools, both because the mountain schools are inadequate and because they find no support for their studies at home. The mountaineer's child can eventually escape the stigma of his background, as the Negro cannot, but in the process he gives up his birthright in an ancient and valuable strain of American culture.

The people who continue to live in the region cannot, however, exist on their traditions. The most promising of the public and private efforts to help them seems to be that of the Council of the Southern Mountains. The council takes a realistic attitude towards the prospects for economic development. It recognises that there is only a limited number of potential industrial sites in the region because of the difficult terrain and the inadequacy of road and rail communications. (A state-sponsored survey found only eleven such sites in eastern Kentucky.) However, as long as there are people living in the region the council insists that they must be assisted to make the most of their economic resources. "A low-productive field," observed a member of its Economic Development Committee, "is better than a washed-out gully." The staff member assigned to deal with the problem is not expected to attract industry to the Appalachians, but rather to work with local leaders in drawing up plans to develop the resources of each community.



The greatest need, both for those who stay behind and for those who leave to become industrial workers in cities outside the region, is more education. The three or four years of schooling, which is all many mountain children now receive, leaves them nearly illiterate ; one quarter of the mountain population cannot read or write. School officials in the mountain counties say that their greatest problem is the early age at which many children leave school. Sometimes the cause is economic—10,000 children were reported to have stayed away from school in Kentucky this winter for lack of shoes—but the principal reason is the parents' apathy or actual hostility to education beyond the primary classes. This must be overcome if the problem is to be solved.

The region has no lack of educational institutions which are alert to its needs. They range from Berea College, which has preserved a no-tuition-charge, work-and-study policy since before the Civil War (when it was a station on the underground railway) to Clear Creek Baptist School ; this serves the untrained "called preachers" from mountain settlements, who come with their wives and children often to learn the three R's, as well as to study the Bible and church history, while they support themselves by working in the school's church-furniture factory. Some of these institutions, working through the Council of the Southern Mountains, are beginning to develop a simplified reading programme which is intended to bring into the homes of the mountain people leaflets about health and conservation—and about life in the cities—which they can read and understand. The supporters of the programme argue that until the parents discover the uses of literacy, ignorance will perpetuate itself.

Rights Set Back

HOPES that the Civil Rights Act, passed nearly two years ago, would bring a speedy increase in the number of Negroes able to vote in the South have been disappointed. So far the Department of Justice has brought only two suits under its new power to seek court injunctions against persons interfering with the voting rights of others, and

As I see TI... "The home is where all things start, and that is where I see TI", says Heinz Kurth, the German designer, asked to give his impressions of Tube Investments Limited.

Where the heart is...

Many housewives will agree with Heinz Kurth. Electric cookers with the fastest boiling plates, spin driers, water and space heaters—all under the familiar name of "Creda"—come from one TI company, as do switchgear. From others come Pel taper tube furniture ; Phillips, Hercules, Norman and other bicycles and mopeds for the family ; Drynamels decorative paints ; vitreous enamel ovenware ; Mersey electric cables ; roller skates, Apollo sports goods ; and parts for refrigerators, vacuum cleaners, pressure cookers, venetian blinds, roofing . . . Soon perhaps there may be a TI home : Metal Sections already designs and erects prefabricated buildings.

STEEL TUBE DIVISION • ENGINEERING DIVISION • ELECTRICAL DIVISION
ALUMINIUM DIVISION • IRON AND STEEL DIVISION • GENERAL DIVISION • CYCLE DIVISION

TUBE INVESTMENTS LIMITED *The Adelphi, London, W.C.2 • Trafalgar 5633*

both have been lost in the lower courts. This is disheartening to those who believed that more rapid progress could be made in the polling booth than in the more controversial schools and it is likely to discourage complaints by Negroes on which the government can act.

In the most recent case, last week, a federal judge chose not to deal with the facts alleged by the Department of Justice—that election officials in Georgia had disqualified four Negro graduates on the grounds of faulty pronunciation and that, although there are over 5,000 Negroes of voting age in Terrell County, only 48 are registered to vote. Instead, although the suit was directed against agents of the state, Judge Hoyt declared the central provision of the Act to be unconstitutional because, in his view, it authorises the federal government to proceed against individuals interfering in state elections and this would be a violation of states' rights. Since a constitutional question is involved, the appeal is being carried direct to the Supreme Court, which is not expected to uphold Judge Hoyt; but this will take time.

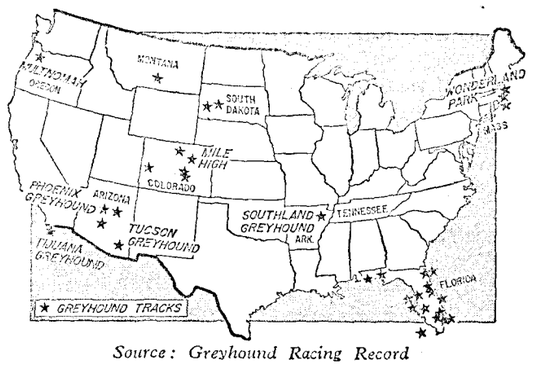
Frustrating delays have also been the lot of the Civil Rights Commission which the Act created to investigate violations of voting rights and to report on the status of other rights of minorities, in housing and education. The commission has held only one hearing on voting rights, in Alabama. There it succeeded eventually in securing the access to state records which it was supposed to have, but the court case based on its findings broke down because the election registrars resigned before it could be brought. Louisiana is proving an equally hard nut to crack. Discouraged by their thankless task, all but one of the members of the commission have announced that they will retire from it in the autumn even if Congress extends its life, as the President has requested. It is not at all certain that Congress will pass a new civil rights Bill this year, although in its proposals the Administration deliberately refrained from demanding important additional powers, on the ground that these might destroy the South's new grudging moves to co-operate where education is concerned. But now that Alabama has authorised the destruction of voting records, Congress will be under strong pressure at least to require state officials to preserve them and to let the Department of Justice see them.

Prohibition Dies of Thirst

ONE of Will Rogers's witticisms was that "the people of Oklahoma will vote dry as long as they can stagger to the polls." They did so six times—the state has been constitutionally "dry" ever since it was admitted to the Union in 1907—but early this month, deprived of the steady flow of bootleg gin and whiskey to which they had been accustomed, sobered Oklahomans voted, by 385,000 to 305,000, to repeal Prohibition. The new Governor, Mr Edmondson, who took office in January, realised that only by enforcing the law could he rally enough voters to get rid of it. Up to now, although in theory Oklahoma bowed to the demands of its strong "Bible Belt" and the churches' United Dry Association, in practice spirits have often been cheaper than in other states where they are taxed; and consumers could count on an eager round-the-clock delivery service from bootleggers, whose sales were estimated at anything up to $100 million a year.

A few weeks of searching cars as they crossed the state boundaries, raiding clubs, seizing caches of spirits and fining ditributors soon convinced the State Legislature and the voters that the comfortable old ways were gone—for better or worse. Under the new dispensation, which comes into effect this summer, it will be legal to sell spirits by the bottle in privately-owned shops but, in deference to the still strong dry sentiment in the state, they will not be allowed to advertise or to operate outside restricted hours and there will be no cocktail lounges. The state, however, will have a much-needed new source of tax revenue, of which it will keep two-thirds and give the rest to local authorities. Mississippi is now the only remaining bastion of state-wide Prohibition—and even Mississippi manages to levy an ingenious "black market" tax on the spirits which it refuses to make legal.

Dogs' Bad Name



FROM A CORRESPONDENT IN ARIZONA

IN the autumn of 1960, the Phœnix Futurity, a race open to greyhounds whelped anywhere in the world, will be run at Greyhound Park for a $50,000 stake, with $20,000 the prize for first place. This is the largest sum ever to be offered at a dog track in America, and greyhound owners from as far away as Eire and Australia are showing interest. Arizona is making a strong bid to be recognised as one of the world's major centres of greyhound racing. There are two meetings at Greyhound Park, in Phœnix, one in the autumn and the other in the winter, while a third is held at Tucson in the spring. All three are under the management of Western Racing, Incorporated, and an independent track has been opened at Apache Junction. Dog racing today is the most popular tourist attraction in the state, and brings people from California, New Mexico, Nevada, and even further afield.

This is because there is no greyhound racing in most of the states. The tracks are widely separated in Arizona, Arkansas, Colorado, Florida, Massachusetts, Montana, Oregon and South Dakota. Residents of southern California can go across the border to Mexico, to bet at the Tijuana track. In these eight states dog racing attracted last year about 10 million fans who wagered some $500 million, of which the states took about $20 million; the state and track take a percentage from the amount wagered at any track, and the rest is returned to the punters as winnings. The states also exercise strict supervision over tracks and the dogs which are raced. Every racing greyhound is registered at birth with the National Coursing Association, its four paw prints are recorded, and it wears an identity disc. Dogs are taken away from their owners several hours before a race, and are inspected on the track by a state veterinary officer.

In spite of these precautions greyhound racing is still banned in forty states. It was universally outlawed in the nineteen-twenties, when it came under the control of gangsters. The first state to revive the sport was Florida, in 1932, and since then it has become a major attraction for winter holiday-makers. There are now 16 tracks in Florida. In 1957-58 their season was affected by bad weather, but in 1956-57 some 3.5 million fans wagered a total of about $135 million. The state took about $9 million of this, putting about $5.4 million into the old age pension fund, and using the rest for schools, roads and other public works.

Dog racing has also been approved for a good many years in Massachusetts and Oregon. The most successful track in the country is Wonderland Park on the outskirts of Boston, where the annual attendance is about 1.5 million and the bets add up to around $40 million a year. The Multnomah Kennel Club in Portland, Oregon, has been operating since 1933, and attracts bigger crowds every year. Arizona has adopted dog racing only since the early nineteen-forties, but it has become an important local sport. Colorado has come to the fore in the past few years. The state now has

Source: Greyhound Racing Record

five tracks, the others having been established following the success of the first, the Mile High Kennel Club, of Denver.

Those who are working to have greyhound racing made legal where it is still prohibited point out that where it is allowed the states supervise the tracks and share in the profits—no mean consideration for harassed state governments. They also argue that the charge of 25 cents for general admission ($1 is charged for entry into the club section), and the $2 betting unit provide popular low-cost entertainment for people of limited means. For example, when Memphis, Tennessee, refused a licence for a track, one was built across the Mississippi River, at West Memphis, Arkansas, and is well patronised by the residents of Memphis.

But persuading a state to legalise dog racing is hard work. According to the backers of the sport, resistance comes chiefly from operators of horse racing tracks and the clergy, sometimes in concert. It will be a long time before the majority of Americans will have a chance to "go to the dogs" every evening as the people of London and Manchester do. Even in big cities such as New York and Chicago there are no dog tracks, though every other kind of sport flourishes in them and there are blueprints in existence for a mammoth track at the Polo Grounds, in New York City, left vacant by the removal of the New York Giants baseball club to San Francisco.

Taxes on Taxis?

NEW YORK

FOILED by the state in its plan to legalise and tax off-track betting, and in its alternative attempt to place a tax on bank cheques, the city of New York has turned—in its somewhat frantic search for new sources of revenue—to the taxicabs. Its proposal for a flat surcharge of 10 cents on all journeys, long or short, has received the necessary assent of the state. If approved after public hearings the taxi tax would bring in $20 million a year, according to the city's optimistic estimates. To the casual eye, the streets of New York appear crowded with big colourful taxis, but in fact today's total of 11,778, which is fixed by law, is little more than a third of the number a generation ago. This limitation gives taxi licences—like seats on the New York Stock Exchange—a rapidly appreciating market value; a licence which changed hands at about $3,500 at the end of the war now fetches $18,000.

New York taxis claim to charge the lowest fares in any American city. There has been but one increase in rates, in 1952, in the last 25 years. This is due largely to the unusually high density of potential customers. The earnings of taxi-drivers fluctuate with the climate and with the generosity of their clients. Drivers operating company cars receive 44 per cent of the daily takings as well as tips. According to their own testimony their combined take home pay averages about $85 a week. The 5,000 or so owner-operators retain all the fares but their overhead costs are heavy; a taxi may clock up as much as 60,000 miles a year and has a life expectancy of only eighteen months. Certainly the taxi-driver gives little apparent thought to husbanding this capital investment. To offset the frustrations of a city closely criss-crossed with traffic lights and other obstacles to progress, he has perfected the art of maximum acceleration and braking to a point which, together with the prevalence of potholes in the streets of New York, makes a journey up Fifth Avenue often feel like a rough Atlantic crossing.

Taxi owners and drivers are mobilising both themselves and public opinion against the proposed tax. They argue, with some reason, that it is an unfair imposition on a single industry; that it will rob them of many of their short-ride passengers, against whom it discriminates; that it will therefore cut the volume of business on which their relatively low fares rest; and that the $20 million will in practice be financed to a large extent by smaller tips. But their prospects of frustrating the city's designs are not bright.

SHORTER NOTES

Only now, three months after Dr Dale Alford was seated temporarily in the House of Representatives, has a committee been appointed to inquire into charges that he was elected by fraud. A strong segregationist, he defeated Representative Brooks Hays, a respected southern moderate, last November by a write-in campaign. A federal grand jury is already investigating whether this violated the election laws.

The President has appointed Professor Henry Wallich, a banking expert from Yale University, to his three-member Council of Economic Advisers. Mr Wallich has been on loan to the Treasury since last year.

* * *

Recently *The Economist* stated that Mr Erwin Canham was the first newspaperman to become head of the United States Chamber of Commerce. A correspondent now informs us that in 1914 and 1915 the chamber was headed by Mr John Fahey, who was publisher of a number of well-known newspapers, mainly in New England.

Shell expands its world-wide service to industry.

SHELL advances into a new sphere of activity.

SHELL introduces **Cariflex**, styrene-butadiene rubber, Shell-made.

SHELL offers a sure source of supply to a world which now demands more rubber than natural resources can provide.

Cariflex is general-purpose synthetic rubber, but with the extra stamp of quality intrinsic in all things Shell. Now available in twenty different types of dry rubber and latex—hot and cold polymers, oil masterbatches, carbon black masterbatches and hot and cold latices. The **Cariflex** range covers a very wide group of applications from tyres to latex foam, from battery cases to footwear. Ask your Shell Company for details.

Gentleman pleased at the prospect of obtaining general-purpose rubbers made by Shell and therefore backed by Shell facilities, organisation and experience is, by the way, himself made from Cariflex S2105, which is the latex designed for the manufacture of foam rubber. Manufacturers today in many parts of the world are looking to Shell for supplies of synthetic rubber.

Taylor Woodrow chose Holman

Reliability pays at Hinkley Point

The world's largest atomic power station, with a capacity of half a million kilowatts, is taking shape at Hinkley Point, Somerset. The contract, for the Central Electricity Generating Board, is being carried out by the English Electric, Babcock & Wilcox and Taylor Woodrow Atomic Power Construction Co. Limited.

Compressed air equipment plays a very important part in its construction; Taylor Woodrow chose Holman for the job. Batteries of compressors, rock breakers and chipping hammers with the well-known Holman reliability built into the design are taking shift after shift of rigorous work without faltering, beating construction schedules and slashing operating costs.

In major projects all over the world Holman units are proving their reputation over and over again. For sheer reliability and low running cost, you can't beat Holman.

THE WORLD OVERSEAS

The Deadlock of Arabism

FROM OUR MIDDLE EAST CORRESPONDENT

THE struggle between President Nasser and General Qasim has set back in two directions the movement for that Arab unity to which both say they aspire. Directly, it has raised the quarrel between Cairo and Baghdad to a pitch seldom reached in the "worst" days of Nuri es-Said and the Baghdad Pact. Indirectly, it has driven the other Arab states into their own particular (and sometimes peculiar) forms of neutrality. The Arab League meeting in Beirut to try and patch up the quarrel showed that the uncommitted states were determined to remain uncommitted, but that they could not agree among themselves on a common policy to preserve their detachment. Thus the Lebanese delegate voted for the League resolution on April 7th—which advocated a policy of non-alignment, deplored all foreign influence, and appealed to the Iraqi government "to come into harmony with the Arab states by strictly observing the resolution"—because it was in line with traditional Arab policies of neutrality; the Sudanese delegate abstained because it was not.

The sad truth is that the Arab League resolution has already been pigeon-holed in the department of utter confusion. Doubtless the sub-committee appointed to recommend ways and means of implementing the resolution is hard at work in Cairo. But neither the resolution nor the existence of the sub-committee has had the slightest effect in softening the asperities of the situation. Propaganda from Cairo and Damascus is as strident as ever in accusing Qasim of submitting to communism, and in introducing wherever possible the British, the Americans and the Jews as collusive elements in a strange pot-pourri of evil. Cairo concentrates on the passage through the Suez Canal of Russian arms shipments and "Soviet Kurdish volunteers" bound for Basra; Dasmascus on lurid accounts of heavy fighting between nationalist and communist elements in Iraq. General Qasim, for his part, makes regular appeals for moderation and turning the other cheek; he is as regularly ignored by the communist-controlled press and radio of Iraq, which repay President Nasser in his own coin.

At the moment, it looks as if President Nasser, in his drive to bring down General Qasim, has reached a dead end. The aftermath of the Mosul revolt shows clearly that Colonel Shawaf, the rebel leader, enjoyed considerable support in the Iraqi army. Since his death, two divisional commanders, several brigadiers and more colonels have been arrested, put under house surveillance, or had their property impounded pending "judicial" investigation. But the failure of the revolt gave the communists yet another opening in their drive towards power. Intensified purges of the army and the government apparatus created more vacancies for communist nominees. The moral of this seems clear: the harder Nasser rails at Qasim, the more Qasim leans on the communists for support.

Undeterred by the disturbances that followed the rally of the peace partisans in Mosul, General Qasim sanctioned another, even bigger, rally in the capital itself. It was a field-day (or days) for the communists. But the most important communist gain in recent weeks was the formation of the first Federation of Peasant Unions in Iraq. For many months General Qasim resisted the drive towards peasant organisation, hoping first to put the land reform bill into orderly execution. The fact that he has now bowed to communist demands in this matter shows how far the events in Mosul have driven him towards the left. The resolutions adopted by the peasant federation at its first meeting—which included the hanging of traitors "old and new," the formation of popular resistance units among the peasantry, the representation of the peasantry on the land reform agencies, and the "arming of the people"—point clearly to communist inspiration.

The deadlock in which the disputants now find themselves has created an uneasy feeling that something must crack soon. Some foresee a crack in Iraq, developing from differences between the National Democrats, who supply most of the government, and the communists. In the days immediately following the July revolution, both these tendencies favoured an early return to party activity. But the communists, more flexible and better disciplined, sensed Qasim's reluctance to experiment in that direction, and turned instead to the formation of industrial, professional and "front" associations—now extended to embrace the land. These organisations are an adequate substitute for party activity. The communists cannot call a communist party congress; but they can call a meeting of the Partisans of Peace, of the Lawyers' Association or of the Students' Union, complete with chairmen, secretaries, debates and resolutions—all manipulated by a communist faction operating "unofficially."

Alarm at the success with which the communists have evaded the ban on party activity is seen behind growing National Democrat calls for removal of the ban. At the moment, the National Democrats control little beyond a few newspapers, parts of the bureaucracy, and the government—whose voice (muffled by the dominance of the prime minister) is rarely heard. If they were to clash with the communists on the issue of resuming party activity, there is little doubt what the outcome would be. The National Democrat ministers would follow their Baathist predecessors into limbo, leaving General Qasim with only two choices: a military dictatorship (if enough officers are left to run it), or a new government, communist in fact if not in name. The only serious doubt is that Iraq might founder in the process; for whereas much of the turmoil now prevailing is communist-directed, much of it also is sheer anarchy. The communists have a firm hand on Qasim; but how far do they really control the city mobs and the peasantry?

It is always just possible that the crack, if there is one,

may come not in Iraq but in the United Arab Republic. The thought has been fathered partly by President Nasser's own allegation that General Qasim is aiming at a Red Fertile Crescent embracing Iraq, Syria and Jordan. The concept of the Fertile Crescent is an old one, and as long as the Hashemites ruled in Iraq it had some substance—if never too much. The royal houses of Iraq and Jordan were intimately related, and they could lay a shadowy claim, through King Faisal I, to a throne in Damascus. Now that the Hashemite dream has been dissolved in blood, the Fertile Crescent has vanished with it. General Qasim's only hopes of detaching Syria from the UAR must rest on one or other of two assumptions: that the communists in Syria are very much stronger than any nationalist would admit ; or that there was a serious slump in President Nasser's prestige. Of this, *despite grumbling in Syria, there is no sign.*

If the crack comes neither in Iraq nor Syria, then, it is argued, President Nasser must soon change his tactics. He has long since laid claim to leadership, if not control, of the Arab world. Having suffered a series of defeats in Iraq—without much present prospect of reversing them—he must make up for them elsewhere. This argument suggests a new packet of fireworks involving the uncommitted states.

On May 8th, Lebanon will celebrate , or rather mourn, the anniversary of last year's outbreak of civil disturbances. The attitude of the Lebanese to current Arab conflicts is determined largely by memories of that grim period. The majority of Muslims, together with the many Christians who fear communism above all things, take President Nasser's side in the dispute ; sympathy for General Qasim is limited to communists and to die-hard Chamounists, who, having been discomfited by Nasser's friends, want Nasser's discomfiture at any cost. The Nasserist current is the stronger one. But there is enough opposition to it to justify the Lebanese government's refusal to take sides between Cairo and Baghdad. President Nasser himself is said to have acquiesced in Lebanese neutrality when he met President Chehab last March on the Syrian-Lebanese border.

The four-man Lebanese government headed by Rashid Karami, which was formed after the civil conflict last autumn, has done much to conciliate Nasser. It withdrew from the United Nations the complaint laid against the UAR by the former regime, negotiated the withdrawal of the American Sixth Fleet, repudiated the Eisenhower Doctrine, and in many other ways showed its readiness to follow Nasser's lead. In return, it has pressed for a modification of the autarkic policies followed by the Syrian authorities, which are prejudicing the Lebanese economy and threaten to prejudice it further in the future. Its representations in Damascus have met with little response, and President Nasser so far has been either unable or unwilling to exert his authority to meet Lebanese wishes in this matter.

As long as this situation continues, the Lebanese government can have little incentive to change its policy of neutrality in the Cairo-Baghdad quarrel. Indeed, if it did so without something substantial to show in exchange, it might well run into serious internal difficulties. On Nasser's side, there seems little he can do without jeopardising the sympathy and basic support he already receives. In short, the scope for action in Lebanon seems severely limited.

The same, for different reasons, is true of Jordan. The present regime there has bitter memories of Nasserist pressure in the past, still bitterer ones of the Baghdad bloodbath on July 14th. In the dispute between Cairo and Baghdad, the Jordan government demonstrated its neutrality by refusing even to attend the Arab League meeting in Beirut. Samir Rifai, the prime minister, gave a technical reason for that refusal: namely, that the Arab League secretariat had sprung the meeting on the Arab world overnight without adequate preparation. But the truer reason was the political one advanced by King Hussein when he declared flatly that the meeting would serve no useful purpose. The event proved him quite right.

Any movement by President Nasser against the regime in Jordan is blocked by two difficulties that look, for the moment, insuperable. The first is Israel. Whatever the Israelis may say, the Arabs are convinced that they are awaiting only a pretext to invade the west bank. Disturbances in Jordan would give them that pretext. The only safe way for Nasser to gain a firmer foothold in Jordan would be by orderly change ; and that could only come through the initiative of the Amman government.

The second difficulty is the heavy unbalance of the Jordanian budget. The King and his prime minister have recently held economic talks with the West, and both profess themselves highly pleased with the prospects. The figures for aid in the coming year have not been released pending approval by Congress and the House of Commons ; but they can hardly be less than last year, and may well be higher. Where could President Nasser find anything of the order of £20 million ? The conclusion must be that, in the economic as well as in the military field, the initiative lies with the Amman government, which, on the road towards better relations with Cairo, would have to take western funds along with it.

The prospects of Nasserist action in Saudi Arabia, the Persian Gulf or the Sudan seem even more remote ; and the above analysis leads to the thought that Nasser's method of attacking Arab governments while appealing to Arab peoples has brought him up against a series of brick walls. It is not all his fault ; he has been handicapped by the mistakes of his friends, notably in Jordan and Iraq. But the fact is there. Can President Nasser abandon his drive for revolution tomorrow, and invite the " sister Arab states " to peaceful co-existence—and competition ? If so, he might in time achieve the undisputed leadership that so nearly eludes him now. It would mean an abrupt break with past policies, and the adjustment might well take time. Meanwhile, the Arab world presents a sad spectacle of disunity verging on despair.

The Press in Germany

FROM OUR BONN CORRESPONDENT

THE approaching involuntary retirement of the fifty-seven-year-old editor-in-chief of the German Press Agency is attracting a good deal of public attention in Germany. Dr Fritz Sänger is a member of the Social Democratic party. The German Press Agency's supervisory board, which recently decided to dispense with his services after May 31st, is composed of three Social Democrats and seventeen supporters of anti-socialist parties.

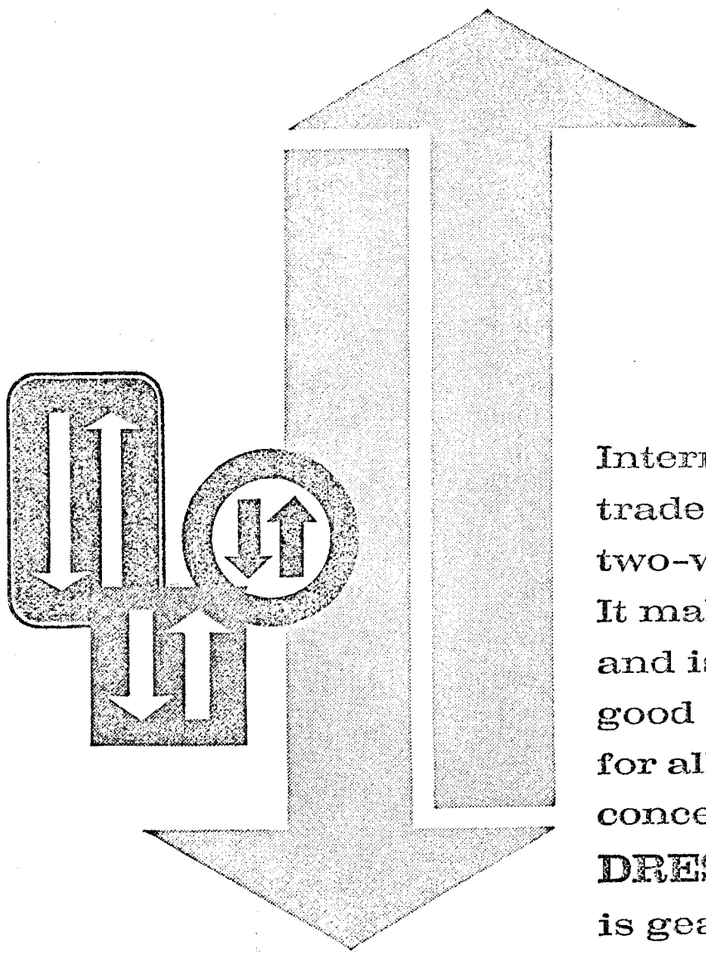
Dr Sänger has been in his present job continuously since the German Press Agency crystallised ten years ago out of the German agencies operating in the three western zones of occupation. Intrigues with the object of getting rid of him have been afoot since 1952. Those who have now had their way maintain it is time for a change. They may be right. But the manner of his going has revived suspicions

How, indeed? Or even choose a career until he has some practical experience of what it involves. How can a man say with certainty "This is for me" until he knows what it is all about?

When a man decides on Unilever, he does not choose a career: he chooses a wide area in which to find it. The Unilever Management Development Scheme allows a man to change direction as experience sharpens or develops his ambition. In fact, the diversity of Unilever demands that a man has breadth of outlook rather than a narrow knowledge of a particular job.

But the aim is specific. It is to develop men to the status of professionals in the art of management, men who can move easily from one particular sphere of activity to another with complete confidence in their ability to succeed in any of the 400 separate companies in Unilever. In short, they will be professional managers.

The confidence of a professional, which distinguishes the man trained in management from the man who 'just manages', is obtained in Unilever. The very scope of our organisation enables a man to advance through a variety of experience, instead of merely repeating one experience several times.



Arts man or scientist, the potential manager is the man who accepts the fact that the rewards in industry (and they are many) come to the man who is prepared to become a 'professional' at his job. In Unilever, that job is management.

* * * * *

"Six Men on Business" is a book which describes how the Unilever system of training for management works in practice. Perhaps it could help you decide on the next step towards a career. You are invited to write to the address below for a copy. If you are at a University your Appointments Board or Committee can provide one.

that Dr Sänger's critics may be activated more by political than by business motives. The Social Democrats are alleging bluntly that the Christian Democrats want a kindred spirit to be in charge of the German Press Agency well before the 1961 federal elections. On April 9th the Federation of German Journalists passed a resolution deploring the obscurity surrounding Dr Sänger's dismissal and remarking that, until it was dispelled, there were grounds for fearing that the independence of the German Press Agency might be threatened by political and industrial interests. The independent daily *Die Welt*, acknowledging that Dr Sänger has performed his duties with irreproachable impartiality, has reminded its readers of the not-so-far-off days when the official German news agency, *Deutsches Nachrichtenbüro*, was "no more than a mouthpiece of the National Socialist government."

WHATEVER the rights or the wrongs of Dr Sänger's leaving, the reaction of the German press and public has been on the whole encouraging. For there is little doubt that efforts, witting or unwitting, on the part of industry and the state to bridle reporters and editors are increasing. Since it is so much more covert, it is industry's thrust that at the moment is the more insidious. The government's heavy-handed attempts to restrain sensational journalism by precipitate recourse to the existing laws, and by introducing a new one that could be used also to stifle awkward criticism, are being energetically exposed and resisted. It has already been compelled to scrap the first draft of a too sweeping libel law, and if the newly-established press council (not unlike its British counterpart) has its way, the second draft is destined for the waste-paper basket, too. Defenders of the freedom of the press have found a surprising sympathiser in the chief prosecutor of the federal supreme court. Dr Güde recently told a gathering of journalists that conscientious editors who sometimes unavoidably ran the risk of prosecution in the course of performing their duty to the public ought to have the assurance that there were judges capable of appreciating ethical as well as strictly legal issues.

The story of industry's encroachments on press liberties is largely the old and simple one of the power of the man who pays the piper. As in other countries, newspaper production costs have increased formidably in Germany since the war. Today roughly 42 per cent of these costs are covered by sales and 58 per cent by advertisers. Before the war the ratio was 65 to 35. Since most of the go-ahead newspapers require new plant and reckon that they must instal it within a year or so, managements are constantly urging editors to bear in mind the advantages of placating the chief sources of revenue. This consideration is largely at the back of the intense competition now to be noted in the industrial, commercial, and financial reporting of several leading newspapers. For some three months the *Frankfurter Allgemeine Zeitung* (circulation 200,000) has been publishing a daily economics supplement called *Blick durch die Wirtschaft*. In reply *Die Welt* (circulation 220,000) is expanding its economic coverage, the thrice-weekly *Handelsblatt* is publishing a stock market supplement on intervening days, and the similarly thrice-weekly *Deutsche Zeitung und Wirtschaftszeitung* is about to appear in full daily. It need not automatically follow that because industry is providing more of the staple diet and more of the money, the newspapers are tailoring their policies to suit industry's wishes. But industry in Germany has traditionally played a definite part in German politics, usually well on the right and sometimes with disastrous consequences. People are prone to assume that it is playing such a part again, and in some instances they may be right.

Yet considering its past vicissitudes and present handicaps, the profession of journalism in western Germany maintains remarkably high standards and is properly watchful of its freedom. Twice within a single generation the German press has been reorganised and restaffed under the pressures of political revolution. Powerful and prosperous newspapers have vanished. The individual casualty list runs into thousands. Some 60 per cent of the 10,000 journalists working today have entered the craft since 1945. The 630 daily newspapers published in western Germany alone have between them a circulation of 16.3 million copies daily—some five million more than were sold throughout the whole of Germany in 1932. In addition there are more than 5,000 periodicals ranging from the popular illustrated weeklies to the journals of the learned societies.

The fecundity of the German press is another of its perils. The 630 dailies are produced by as many as 580 separate publishing houses, many of them very small and more interested in keeping their heads above water than in making the most of their opportunity to produce a good independent newspaper. In consequence of this dispersal of effort, few newspapers have the resources to engage and deploy the most suitable talent. Not more than 150 German journalists are working abroad as foreign correspondents. Of the 10,000 accredited journalists at work in the Federal Republic only about half are wholly employed by one newspaper. On the average they earn DM 800 a month (£68). The other half are free-lance journalists, or "stringers," whose average monthly income runs from DM 500 (£42) to DM 600 (£51). The underpaid journalist naturally tries to make a little money on the side, and is dangerously exposed to temptations of venality.

The inadequate and unrepresentative federal capital is justly blamed for many of the shortcomings in west German public life. But Bonn is only partly responsible for the defects of the contemporary German press. Because of ubiquity of production, there never has been a German newspaper capital in the sense that London is. By 1933 Berlin had become near to being one. But with the Berlin press nowadays out of the running, the big west German papers, each securely dominating its own provincial terrain, lack even more than before the stimulus of competition. Most of the German journalists stationed in Bonn—their position is roughly equivalent to that of the lobby and diplomatic correspondents of the British press—admit, some of them regretfully, that for want of competitors and a critical public their "misses" are seldom noted in Frankfurt, Hamburg, or Munich.

Bonn's peculiar act of subversion is to foster uniformity of news and views. As accommodation is scarce, the majority of journalists are compelled to set up their headquarters within one or another of three adjacent lines of temporary buildings little better than huts. Unavoidably they see too much of each other and influence each other's output. They are a sitting target for a stupefying barrage of hand-outs from government departments, political parties, industrial organisations, cranks, and foreign embassies militant. Three times weekly they troop into the Parliament building across the road to hear what spokesmen from the various ministries have to say on this or that issue of the day. To make matters worse, even the Bonn Press Club is officially subsidised and used day after day for official entertaining. The degree of individualism that survives is astonishing and encouraging.

European Coal Crisis

FROM OUR SPECIAL CORRESPONDENT IN LUXEMBURG

FOLLOWING the qualified approval that the High Authority of the European Coal and Steel Community won from the European Assembly at Strasbourg last week for its plan to restrict coal imports and production, the German government this week suggested a "private" meeting of the economic ministers of the member governments, with the president and vice-presidents of the High Authority, before the formal meeting of the Council of Ministers on May 4th. This was the council meeting to which the authority was asked to present its detailed plans to deal with a "state of manifest crisis." The plan was then supported by the three Benelux countries, broadly accepted by Italy, on the understanding that production inside the ECSC would be cut as well as imports from outside, and opposed in principle by Germany; France was entirely non-committal. In Strasbourg, after one day of debate on a resolution that suggested that the Christian Democrats were lining up with the "Liberals" and against the Socialists, a substitute resolution, supporting what the high authority proposed to do but not specifying what article of the ECSC treaty it should act under, was finally passed with Christian Democrat and Socialist support. M. Jeanneney, who had represented France on the Council of Ministers, spoke at Strasbourg: his speech underlined the gravity of the long-term structural problems facing the coal industries of the community, but did not make much clearer what France's attitude was towards the high authority's "European" solution.

These proposals were outlined in detail, though not fully published, in Luxemburg this week. The authority considers that a state of manifest crisis exists in the coal industries. Under Article 58 of the ECSC treaty, it is in such circumstances obliged to make proposals (which, however, need the consent of the Council) to alleviate the crisis conditions. It is now proposing

- *limitation of coal imports,* in the year from April 1, 1959, to the 1954 level, plus 25 per cent;
- *restriction of coal production,* in general, to the average of coal production and sales for each enterprise in the community in 1958. Collieries that produce more would have to pay a steeply progressive levy on "excess" production—$1 a ton on the first one per cent extra, $2 a ton on the second one per cent, and so on. This levy would obviously choke off much extra production even for the lowest-cost mines. Control at the "reference level" would represent 237 million tons of output, against 247 million tons last year;
- *virtual freezing of stocks:* collieries would be allowed to add up to one per cent of their 1958 production to stocks, but for "quota" purposes this would count in the total of sales. Mines with stocks below 7½ per cent of their 1958 sales-and-production average would be allowed to put 3 per cent of this "reference" tonnage into stocks. Selling of coal from existing stocks would count against the production "quota";
- *compensation,* reckoned at 20 per cent of basic earnings, for workers put on short-time as a result of this control of production. This special compensation would start after the first two days and cease after the ninth day.

The proposals, if adopted would cover the period to April next year, but would be reviewed at the end of this year.

This is not a rigid quota system. Broadly, it means that each producer can mine as much coal as he can sell; but it limits the extent to which efficient producers can gain at the expense of the less efficient. Even with these restrictions Belgium's highest-cost mines would need a continued subsidy from the Belgian government if they were to go on producing. Italy, main beneficiary of the low landed price of American coal, would suffer: but it has recently concluded an agreement to buy nearly a million tons of coking coal from the Ruhr, presumably at the knockdown prices that ECSC producers are allowed to concede to meet immediate competition from outside. Freights from Hampton Roads to Genoa now cost hardly any more than from Hamburg to Genoa, so the Ruhr producers are having to bid against the fob price of US coking coal, $4-5 a ton. Italy, moreover, can readily turn to imports over which the ECSC has no authority: oil, of which it is recently said to have been getting some marginal imports at fantastically low prices, of the order of $6 a ton landed in Rome. No coal—from anywhere—could compete with such prices.

OBJECTIONS to this plan, voiced mainly by representatives of producers' countries, were mainly on the ground that it represented *dirigisme.* To the Germans this is an especially dirty word, signifying what anybody else does to control coal imports and production: what Germany does, such as the prohibitive import duty beyond certain duty-free quotas, the setting up of cartel arrangements between oil and coal companies, and the *Notgemeinschaft* procedure for re-negotiating the long-term import contracts into which Germany had ventured so far, counts needless to say as economic liberalism. Producers in general may feel uneasy about arrangements to restrict production that could become a good deal more than temporary. Many speakers at Strasbourg showed they understood that the problems of coal production in ECSC (as in Britain) are structural rather than temporary, though recession or the levelling off in growth has uncovered and exacerbated them. Whether resumed economic expansion would necessarily banish the manifest crisis by April next year, even if the high authority's measures are adopted, is none too certain, though the measures ought to prevent any deepening of it. Would the supra-national control be required for only one year?

From the point of view of the high authority, this decision represents a test for the whole idea of a "European solution." It has often been criticised—and was again by implication in the report of the Assembly's market commission at Strasbourg last week—for not working actively enough towards such a solution in coal during its palmy early years of the seller's market. Now, at least, it feels determined to act—though M. Finet did emphasise that it is concerned to achieve a policy for the coal problem, rather than to establish a principle about the use of particular articles in the ECSC treaty. What it is insisting on is one common policy and not a series of national policies; and the adaptation of internal resources to needs, and not merely restrictions on imports. Whether some compromise can be arranged in Paris this week—or at the Council of Ministers in a fortnight's time—depends mainly upon the eventual attitude that France reveals: in the present political situation of western Europe, the Germans will not be anxious to come out on the other side of any "European" argument.

Trade Unionism in Russia

SOME 1,300 delegates who, on March 23rd, gathered in the Kremlin for the twelfth congress of trade unions could boast that they represented almost the whole of the Soviet urban labour force. There are now nearly 53 million trade unionists in the Soviet Union out of a total number of 55 million employees. The unions are mighty in numbers. But are they acquiring an importance in Soviet society that corresponds more closely to their numerical strength or are they remaining, as in Stalin's time, merely an auxiliary branch of the administration? Neither the debates of the congress nor the lengthy report of Mr V. V. Grishin, chairman of the All-Union Council of trade unions, provided a clear answer to these questions.

Questions about the changing role of the unions in a changing society began to be asked last May after the introduction of two measures aimed at instilling some life into the practically moribund local union organisations. Through these reforms the powers of the factory or shop committees—the lowest branches of trade unions—in the management of their enterprises were greatly increased, at least nominally. The committees are now supposed to have more say not only in the production plan and its fulfilment, but also in the running of the firm and the computation of wages. Officially, their agreement is needed for the introduction of overtime, the sacking of an employee, the distribution of bonuses, or the allocation of housing accommodation.

The reforms are in keeping with the economic decentralisation introduced by Mr Khrushchev. As long as direct control from Moscow was the rule, local initiative was relatively unimportant. But the complexity of a highly diversified modern economy, which drove the government to divide the country into economic areas with their own regional councils, compelled it at the same time to make greater efforts to harness local initiative. The granting of increased powers to union branches was thus dictated not by abstract considerations of democracy but by the search for greater efficiency in a less centralised framework. Naturally, too much importance should not be attached to paper changes alone. Factory committees existed as relics of the revolution, even under Stalin; but their function, like that of the whole trade union movement, was turned inside out.

After the revolution the membership of the unions was only just over a million; now it is nearly 53 million. But numbers are not all. In Stalin's time, the unions were used as mere tools in the drive for higher production. When the time came to restore the country's economy after the ravages of war and civil war, the managers had to be given increased power as well as responsibility. The military principle of unified command was applied to the management of industry, and in the period of rapid industrialisation, when millions of raw peasants flocked into the towns, it was applied with military discipline. In principle, the party and trade union representatives in the factory could act as a check on the manager. In practice, they could not.

With production and wage levels dictated strictly from above by the planners, managements and trade unions worked together to apply the disciplines and the incentives needed to extract increased output from a raw labour force. The margins were so narrow that the system left no scope for collective bargaining. Thus, on one hand, the unions were the allies of management, advertising labour "norms" and promoting "emulation" among workers. On the other they acted as welfare societies, watching over safety regulations, distributing the funds of social insurance and, during the period of the great migrations, recruiting rural labour and helping in its assimilation.

The peculiar functions of the unions are the outcome of political decisions and not of any structural atrophy. The unions are organised vertically by trade and, since 1948, they have also horizontal links through town, regional and provincial councils. The ladder runs from the shop and factory committee up to the All-Union Council. In theory, "all trade union bodies from bottom to top are elected by the members . . . and are accountable to them." In practice, as in the party, the chain of command runs only downward. Thus, to obtain a measure of greater democracy, what is required is not a change in the statutes but a change in their application, causing the elected members to represent the views of their electors and to defend them at all levels: in the factories, in the regional economic councils and, at the very top, in the central planning board.

The idea that such a revolutionary change might happen suddenly can be ruled out. But steps in this direction are not unlikely because of changes which have taken place since Stalin's day. In the last few years real wages have gone up substantially. Technological change and the growth of the national income have given the planners more room for manoeuvre. The government has been able to reduce the hours of labour; and a 35-hour working week is the official aim for the late nineteen-sixties.

BUT the biggest change has probably been in the human element. Gone are the days of unlettered peasants come to town. For some time now, all the new recruits to the labour force have first completed seven years at school; many workers of urban origin have been at school for ten years or even more. The spreading of education, and consequently of skill, has compelled the authorities to level off the highly differentiated scale of wage-norms, because the proportion of workers reaching the higher brackets was so large as to make the system too costly. Sporadic efforts to resurrect Stakhanovism have not been successful. Above all, the social and educational gap between workers and management has narrowed considerably. Conditions may have seemed ripe for a partial revival of traditional trade union activity.

A social transformation on this scale will not take place smoothly or at one go. Though wage differentials have somewhat decreased, the slogan of equality of pay—the once famous *uravnilovka*—remains heretical, and piece rates are still the rule. And yet mechanical advance and the introduction of automation give strength to the inarticulate pressure for weekly wages not based on piece rates.

In a one-party dictatorship, and when the state is the universal owner, the trade unions cannot perform the classical trade union function of representing their members' interests against the owners' interests. Communists will argue that this dilemma will disappear together with the "withering away of the state." In the meantime, the unions have to strike a balance in their dual allegiance. Their twelfth congress has confirmed that the trade union bosses have no intention of giving in easily to any pressures for greater equality or democracy. At the same time, they continue to deplore the workers' failure to take a sufficient interest in the production conferences of the factories or the

In 1958 three British publishers alone printed 22,000,000 paper-backed books. In 1948 they produced less than 10,000,000. Despite counter-attractions the appeal of paper-backs continues to grow at an astonishing rate. And not only here. In the U.S.A. paper-backs have been described as 'probably the real growth industry of the past ten years'. Print on paper continues to be the world's principal medium for instruction, for the exchange of ideas, for entertainment. The flourishing paper-back industry symbolises the trend towards more reading – particularly more serious reading. For Bowaters, makers of many different kinds of printing papers, such trends show the way ahead.

union activities of their branch ; and there are signs that the search for labour co-operation is gradually inducing them to concede to labour a slightly greater say in union affairs. Planners, with wider margins to play with, may allow trade unions a limited bargaining power. The unions may be given some real say in management, the elaboration of plans and the distribution of resources. The process will not go through without friction, but it is worth watching for its significance for the future of Soviet society.

Frondizi Seeks New Friends

FROM A CORRESPONDENT

THE clue to the present situation in Argentina is the government's decision to industrialise the country as rapidly as possible, regardless of the social cost. In order to do this, Sr Frondizi has turned his back on the trade unions and Peronistas who elected him president and sought new alliances. He knew he could not rely on trade union support for a policy of austerity for the wage-earner and incentives for industrialists, and he also knew that there would be nationalist opposition to his plan for bringing in large quantities of foreign capital. He therefore turned to others: the armed forces, the Church, the landowners and the business community.

The armed forces have been given salary increases, an aircraft carrier, and a privileged position as a pressure group to be consulted before any important decision is taken. The Church has been mollified by the law ending the State monopoly over higher education and allowing the opening of the first Catholic universities. The landowners and industrialists have been pleased by the stern policy towards trade unions and by the general freeing of prices to provide greater incentives for investment. The government is acting in close consultation with the large business groups through their unofficial representative, Sr Rogelio Frigerio, who holds no official post but is the president's most important and influential economic adviser.

The same reasons that inspired the president's choice of allies within the country have prompted his change of course in foreign policy. He has decided to go all out for friendship with the United States since he is convinced that it is the only country that can effectively assist Argentina at present. If foreign capital is to be imported in large enough amounts to make a difference, it will have to come from the United States and whatever stands in the way of this will have to disappear.

So far the president has the support of the armed forces, but within the army there is concern lest his enthusiasm for foreign capital should end by putting too much of the national resources in the hands of foreign companies. The army is as nationalist as ever and although it approves the government's policy in principle—largely for the strategic advantages of having national resources of steel and fuel—among the officers there is an increasingly powerful movement called the *Dragon Verde*, which opposes any further concessions to foreign investors.

Intrigues and pressure groups in the army and the Church are the more important because the political parties are ineffectual. The parties have almost no internal discipline, not much weight in public affairs, and certainly no power to shake the government. Although Sr Frondizi campaigned as the candidate of the Intransigent Radical Party, once in power he asserted his complete independence of this organisation. Any measures that might encounter opposition he puts into effect by decree. No part of the new economic policy, not even the granting of contracts to foreign oil companies, has been sent through Congress. The president and his cabinet have only met twice since they took office on May 1st last year.

With his cabinet relegated to a secondary position, it is all the more important that the president's personal advisers should be good. But he has not been altogether lucky in his choices. For instance, the commission of rationalisation and austerity which was supposed to eliminate redundancy, investigate corruption, and cut down needless expense, was headed—unofficially—by Sr Ulises Pologna, the president's own representative on the commission. Sr Pologna worked energetically for a few months and earned the nickname of Mr Austerity until he himself was accused of being deeply involved in a real estate fraud ; he had to resign under fire.

SR FRONDIZI has promised that he will have much to show within two years as a result of his austerity programme. The general opinion is that parts, but parts only, of his economic plan will be fulfilled. Few doubt that Argentina will produce enough oil to satisfy its domestic needs, but the premise that the mere opening of the door to capital imports will be enough to industrialise a predominantly agricultural nation like Argentina is viewed with concern.

Sr Frondizi has introduced one element of planning into his programme. During his American trip he talked with Dr Lilienthal, once of the Tennessee Valley Authority, and arranged for him to supervise the development of a similar scheme around the huge hydro-electric plant of El Chocon, in northern Patagonia. But most of the capital coming into Argentina is directed either into the mineral industries or into the manufacture of consumer goods. According to the joking comment of ministry of finance officials, Argentina will either become a second Venezuela or end up with half a dozen factories producing Cadillac spares while cart-wheels have to be imported from Paraguay.

Sr Frondizi's policies are now meeting serious trade union opposition. During his electoral campaign, the president promised the trade unions that he would stop government interference in their internal affairs. The Aramburu regime had tried to stifle trade union opposition by replacing the old Peronista leadership with officials selected under government supervision. Once in power, Sr Frondizi tried to carry interference still further. The trade unions, squeezed between a record-breaking rise in the cost of living and the government's austerity over wage claims, opposed the attempt to bring them under more direct State control. A railway strike was put down by army and police ; over three hundred strikers were arrested and are still being held on various charges. Another partial stoppage called for April 3rd ended in violent street fighting between strikers and police. Evidently worried about the uneasiness that such blatant industrial unrest might cause among potential investors, Sr Frondizi accused the Soviet Embassy in Buenos Aires of "organising and participating in" the riots. He went on to declare a number of embassy officials *personæ non gratæ*. This he hoped, would show the United States that Argentina was truly in the western camp. Your correspondent saw enough of Buenos Aires during the riots to be

sure that the rioters did not need help or inspiration from any foreign embassy—and, further, that they enjoyed popular sympathy.

The president's strength in the coming struggle is based on the support that he hopes to receive from the armed forces against the trade unions. He knows that the discontented mass is powerless against him for lack of leadership, of organisation and—most important—of a clear alternative to his rule. The return of General Perón is out of the question ; his supporters are utterly divided among themselves. If, for one reason or another, the nationalist groups in the armed forces were to decide that Sr Frondizi was going too far in letting in American influence, and were to join forces with the trade unions, it would not take them long to bring the government down.

Industrial Ghana?

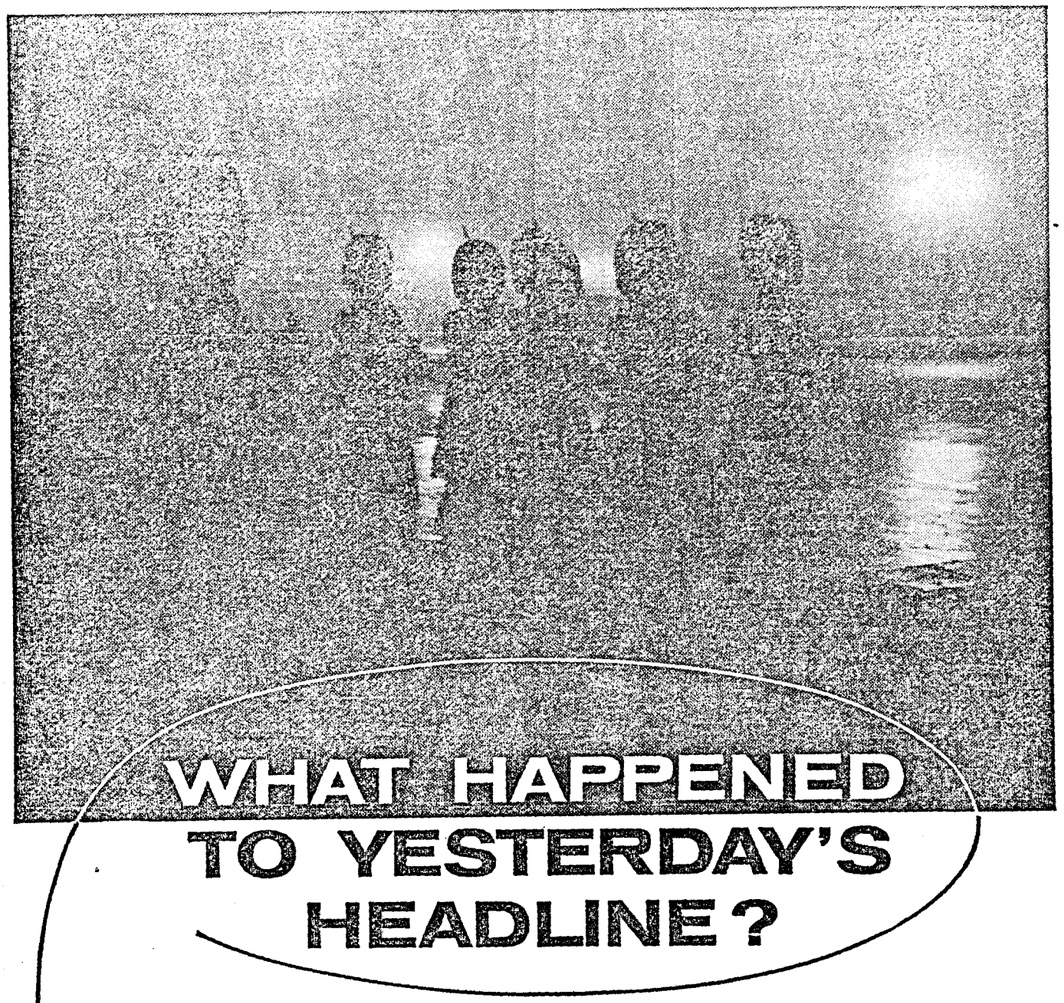
BY A CORRESPONDENT LATELY IN ACCRA

IT would be interesting to know how far Ghana's second development plan, which has recently been issued, embodies the ideas of Professor Arthur Lewis, until early this year Dr Nkrumah's adviser on economic policy. It seems an ambitious plan for an economist to approve, though its priorities seem right. It is to run to 1964 and proposes an expenditure of £342 million against available resources of £90 million. The planners admit that " the task set is a formidable one, and the financial picture will not be clear for some time."

Wisely, they distinguish between immediate projects, which will only cost £124 million, and the remainder which clearly require foreign aid. The immediate projects sensibly concentrate on productive works. These include much increased expenditure on improved cocoa farming ; but they also include large investments in other crops, like pineapples, plantains, groundnuts and palm oil, to lessen Ghana's dependence on cocoa. Rubber and tobacco are being planted on a small scale and there is talk of cotton. In the northern territories poor grasses and lack of water inhibit the growth of a healthy cattle industry which could reduce Ghana's dependence on imported meat and milk ; Ghana's bill for imported food is growing with rising living standards. But former attempts to diversify the economy have foundered on the difficulty of weaning the cocoa farmers from the easy life of cocoa-growing with migrant labour.

Still more controversially, the plan aims at establishing at least 600 factories turning out more than 100 products, including textiles, worked steel, chemical and building materials and assembling motor cars. This industrialisation, backed by a plan for hydro-electric development costing £100 million, is known to be close to Dr Nkrumah's heart. It also has some bearing on his political ambitions ; for he feels that a purely cocoa state cannot sustain the leadership in Africa to which Ghana aspires. For this reason, if for no other, he is ready to forget his marxism and offer inducements to investors. There will be no nationalisation ; capital is sure of a fair return—the only condition is a progressive " Africanisation " of the staffs of enterprises established with foreign aid.

The foreign entrepreneur in Ghana, satisfied on this point, may ask about industrial relations. He is now faced with a very different type of trade union organisation from British days. Trade unions grew up in Ghana on the British model, and if they were less efficient and more graft-ridden than any British unions, they were sometimes more troublesome. They have now been strictly subordinated to the government in the Industrial Relations Act, which, passed during the Accra conference, attracted little attention from the world's press. But the British Trade Union Congress, which in the past had advised Ghana unionists on organisation, was severely pained. Sir Vincent Tewson wrote to Dr Nkrumah before the act was passed, to protest that " such legislation would be in conflict with our basic operation as a movement free and independent of government, irrespective of party."



But Mr Tettegah, the general secretary of the new Ghana TUC, has gone his own way, wholeheartedly backing the Ghana government, and subordinating the unions to the requirements of the Act. This establishes the Ghana TUC as " the representative of the trade union movement in Ghana " and gives it powers to organise the other unions ; but the government must approve its rules, audit its accounts, and may freeze its funds if it " has taken any action not conducive to the public good." Unions are only recognised when they have organised 40 per cent of the workers concerned, and unions for government employees and teachers are forbidden. The right to strike is circumscribed.

One object of the act was to tidy up existing confusion and create proper machinery for industrial relations. The multiplicity of small unions, organised on a " house " basis, undeniably led to abuses. Mr Tettegah, indeed, wanted to reduce them to 16 in number ; 24 are now listed. In his book, " A New Chapter for Ghana Labour," he asks, " Will the Labour movement accept the challenge and release our minds from the slavery to the British way of doing things . . . to develop our own African personality and the African way of organising workers ? " He said that he learned more about trade unionism from ten days in Israel than he would have done from ten years in a British university.

His aim now is to " build a gigantic labour organisation co-ordinated and centralised with a general staff," which will clearly put political support for the government before its functions with regard to wage bargaining. A few of the long-established unions in Ghana, such as the locomotive men and the United Africa Company's house union, are resisting this scheme, no doubt because of ingrained slavery to traditional British ideas.

The incoming industrialist must make up his own mind about this set-up. It looks as if he can expect union restraint—so long as he is in favour with the government. His concern is less to consider the course of industrial relations in Ghana than to calculate how well he will get on with a government that will brook no political, industrial or trade union rivals in political appeal—in short, with the African political personality.

Reflation Discounted?

THE British economy is about to receive a record injection of budget reliefs—£366 million in the current year. There will be more money to spend on industry's products and more money to invest in industry's shares. Yet in Throgmorton Street buyers are still chary, even though an early election now looks less likely. Ordinary shares edged to a peak on the morning after Budget day, but the day after they had one of the sharpest falls since Bank rate was raised to 7 per cent in 1957. Buyers with an eye to selling after a good budget were quick to take profits and though the market improved later, prices are no higher than on budget eve. Is this profit-taking of real significance ? Has the big rise in equity prices in the past twelve months already discounted industrial recovery or are prices now poised for a new lift ?

The central doubt is not whether the degree of reflation that the Government has decided on will give industry a boost, but whether it can do so without involving financial troubles ; this doubt is intensified by thoughts of a coming election and the possibility of a Labour government, a prospect that would hold other and different threats to investors. Inflation helps equities in the long run ; but that has not proved a completely dependable maxim in the short run. The long run drift to equities continues—the latest converts include the Women's Institutes and the first London borough council—but investors have learned that a rise in ordinary shares that is accompanied, and perhaps prompted, by doubts about stability of the currency can undergo a severe reaction when the authorities are forced to take counter-inflationary measures.

Investors today keep a careful eye on the "yield gap"—the margin between dividend yields on ordinary shares and long term rates of interest set by the yield on irredeemable Consols. In 1951, in 1955, and in 1957 inflation or fears of inflation narrowed the yield gap almost to extinction ; in each case, official measures taken or anticipated by the market, restored the traditional margin. During 1958 the gap was again reduced quite sharply. This, however, was a result not of a slide in gilt-edged prices, which were themselves rising, but of the steeper rise in equity prices, which more than offset increased dividends. Yet the market remembered its historical lesson ; after gilt-edged began to show their first weakening since 1957, under pressure of bank selling, equity prices, too, stopped rising, and this year the yield gap has remained steady, though low.

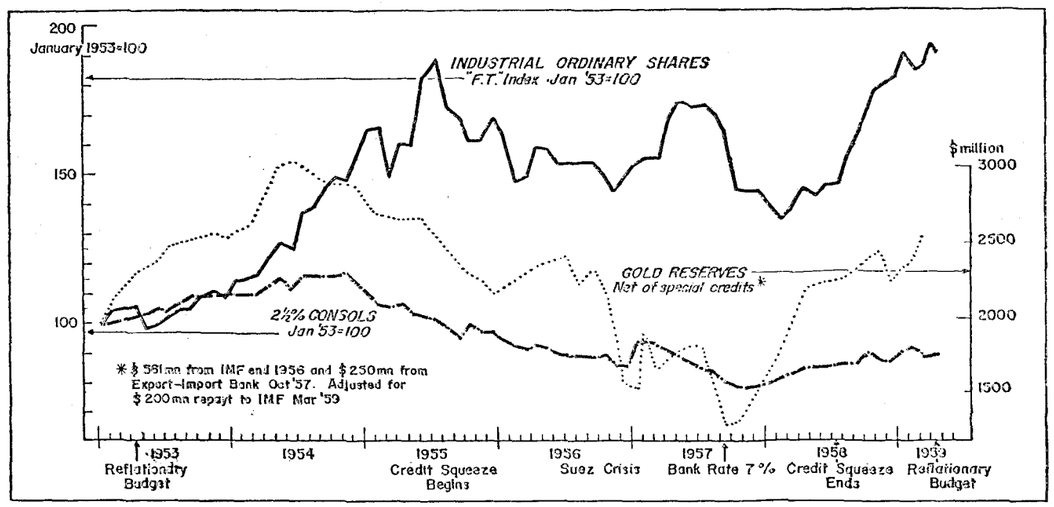
What is in store for gilt-edged in this year of reflation and perhaps, a general election ? Externally, there must be a reduction in last year's bumper current surplus, and some increased capital commitments. But capital is flowing inwards, too, and foreign confidence remains firm. The election will provide a major test ; it was argued here four weeks ago that the authorities ought to be able to hold the line. Domestically, there seems little reason to fear a quickening of price inflation in the months ahead ; wage demands do not look too threatening and expanding production should absorb them. On the other side, pressure will be exerted on the gilt-edged market by demands for new money. This year, despite the continued surplus in the ordinary budget, the Government has to borrow for capital outlays below-line no less than £721 million, against £182 million last year.

The Bank of England will not be keen to see too much of this overall deficit financed by Treasury bills ; it would hardly like to lose control of bank liquidity (and perhaps be forced to invoke special deposits) in this period of credit expansion. The Chancellor has intimated that there will be "some increase" in floating debt held in the market. Since advances are still rising, in line with general economic policy, this may simply lessen the banks' need to unload gilt-edged (they sold another £44 million in the latest

month), and liquidity ratios will not necessarily get out of hand. National savings are not expected to do so well as last year's £300 million, but another substantial contribution is hoped for. Sales of government stock in the market will certainly have to be considerable. But funding sales need not necessarily be larger than in 1958; they then had to finance the large external surplus (expected to decline this year) and yet they were still sufficient to cut down the floating debt. Thus the gilt-edged market need not be unduly frightened by the dramatic rise in the overall deficit. Financial opinion overseas, too—which has shown some signs of un-Keynesian alarm about the size of the deficit—might be reassured if the authorities explained that no inflationary financing need be involved.

More money is also likely to be needed by local authorities, which have been encouraged to advance their capital projects into the current year. Last week's record issue of £25 million for the London County Council was a portent, and not a happy one for the market, with 94 per cent left with the underwriters. But given proper handling, the weight of new money ought to be manageable so long as retail prices at home and sterling abroad remain satisfactory. If they do, gilt-edged need not necessarily suffer from reflation. Gilt-edged have shown little response to the monetary relaxations; for what past experience is worth, current returns are generous in relation to 4 per cent Bank rate.

On the assumptions that sterling and gilt-edged do provide a stable base, and that there is no change of government—both big assumptions at this stage—one can be reasonably optimistic about equities. It is true that the rise in *The Economist* indicator, of 60 per cent, from its low point fifteen months ago shows how generously the expected industrial recovery has already been discounted. It is also true that the impact of the recession on the profits of industry has not been unduly severe. Above all, the equity indices today are only a little above the peak levels of mid-1955, when industrial production was about the same as now. Vast investment programmes have been completed since then, and industry should be able to earn good money on them.



In general, therefore, equity prices do not appear to have discounted all the expansion that we have not yet had. The rise of the past year looks almost restrained in comparison with Wall Street. In the United States, too, industrial production has risen little since 1955; but Standard and Poor's index of Wall Street industrials shows a rise of 25 per cent above its plateau of 1955-57. Yields on the leading stocks—not the speculative favourites—average just over 3 per cent. That is well below the yield on US government bonds and compares with blue chip yields averaging 5 per cent in Britain. It might be argued that because America is much less dependent on external trade and has much greater capacity to absorb any weakening of external confidence about its currency, it is the better able to carry inflation. But Wall Street cannot advance for ever on that reasoning.

The increasing interest that American investors are showing in European securities is motivated primarily by strict calculations of comparative yield. Once the election is come and gone, and if the Tories win, overseas buying of British equities is likely to increase considerably, from the Continent as well as America. Steel shares will be obvious favourites.

While the election shadow remains, with its tormenting range of possible eventualities from controls and capital gains tax to dividend limitation and inflation, large scale net buying, domestic or foreign, can hardly be expected in the stock markets. But selective buying is active. Which sections of the market are likely to gain most from reflation? Obvious favourites are producers of capital goods, which have been hit hardest by recession and the long pause in expansion. Their shares, correspondingly, have lagged behind the recent rise; and for the most part, unlike shares of producers of consumer goods, they stand below their peaks of a few years ago. Many concerns are making better use of their working capital and with their improved liquidity could expand their business appreciably without the need to seek new finance from the market. The spurt in capital issues in the first quarter of this year was in large part attributable to businesses that had previously been deemed ineligible by the Capital Issues Committee—including the banks, which have still to complete their round of rights issues, for sizeable amounts.

Otherwise the equity market may not be over pressed, especially if sales and profit margins revive quickly. The best prospect is probably for firms supplying the needs of the increased capital programmes of the public sector—such as building, heavy electrical manufacturing, and industries concerned with road making. But in a year when private investment is not likely to be better than steady on balance, by no means all the capital goods industries can look forward to a quick revival. The course of exports may be a critical factor, both in the business of individual firms and in governing the extent to which re-expansion can be afforded by the nation. *It is not exactly a clear prospect before the investor*; but then, it never was.

NEW TAKE OFF FOR EQUITIES?

Court Report

The Restrictive Practices Court sat for the first time exactly a year ago. What has it accomplished?

THE Restrictive Trade Practices Act of 1956 made mandatory the registration of collective agreements relating, *inter alia*, to prices, conditions of supply, and processes of manufacture, and the subsequent defence of them before the court against the presumption of being contrary to the public interest. When the Act was passed some people hailed it as the death-knell of restrictionism in British business; others noted more sceptically that the scope of the Monopolies Commission had been curtailed and individual price maintenance had been made legal, at the same time.

There is room, too, for different opinions about the accomplishments of the court in this first year. Measured by the number of restrictive trading agreements that have formally gone out of existence the court seems to have had considerable effect. But the effect of the court's judgments in the market place is perhaps another thing: cynics might wonder whether the one tangible result is the promise of a Government-sponsored rationalisation scheme for Lancashire. The question remains: How far have the court, the registrar and the Act gone towards eliminating uncompetitive practices from the conduct of British business?

In this first year, the court has issued final orders on twelve agreements. Only four of those cases have in fact been argued before it: they concerned agreements of the Chemists' Federation, the Cotton Yarn Spinners' Association, the Constructional Steelwork Association, and the Blanket Manufacturers' Association. In each, the court's decision has been that the agreement in question was contrary to the public interest, and hence must be abandoned. The other eight agreements, which it formally ordered to be scrapped, were actually abandoned or modified by their makers—dead, if not wholly buried, when the *coup de grace* was administered. But two of the four cases which reached the court intact were certainly complex in nature, involving many documents, much testimony and considerable pleading; there was no precedent for these hearings, and the procedure followed was unlike that of any other British court. It is remarkable that the court got through them with such despatch.

These few decisions, however, have had a significant effect on other cases on the register, and in this wider context, the court's first year has had impressive results. About 2,200 agreements are now on the register; and this is probably about as many as will ever be on. Of this total, 205 have either been abandoned or revised so as to remove any registerable restrictions in them, and another 150 are known to be on their way out. Thus, roughly one-sixth have already gone by the board or will soon have done so. But the ultimate test of the efficacy of the Act is the degree to which greater freedom to compete becomes a reality to both businessmen and consumers, this freedom has not been greatly increased by the court's judgments to date. Stripped of its price-fixing clauses, the structural steelwork agreement was found to be of no economic significance, removed from the register, and hence carries on. The blanket manufacturers' agreement, while restrictive and wholly unnecessary, was found by the court to do the public no great harm. The yarn spinners' price ring is broken, and the tax burden of the Government's reorganisation scheme may or may not weigh less heavily on the public than did the cost of the industry's self-protection. And a number of manufacturing chemists are now behaving independently as they had behaved before collectively and there is little indication here that the court's decision has made any difference to the public.

Within the narrow framework set up by the Act, the court has undoubtedly been as effective as most observers could reasonably expect. Parliament decided to set up a court and a registrar with no discretionary power (and not to set up a discretionary authority, as exists in the United States and West Germany). Their decision has both good and bad points. A court is free from the political pressures to which a minister is so often subjected. But its terms of reference must necessarily be narrower, and its decisions less responsive to changing economic circumstances.

The court, then, not only had to evolve a satisfactory

procedure; it also had to make decisions in a field which lacked any substantial body of precedent in British law. In both respects the results have been impressive. Within the wording of any act, there is usually room for judicial decision, and that is certainly true of this Act. The court might have taken the view that the blanket manufacturers' "harmless" but rigid restrictions might be allowed to stand, or that local unemployment in Lancashire could be held to be contrary to the public interest. But it has taken a stricter interpretation of the statute as its guide. The conduct of these unprecedented cases has been carried out by Mr Justice Devlin and his colleagues with great skill and efficiency, and the first decisions of the court must have a crucial importance for the practical effects of the Act.

THE Restrictive Trade Practices Act made collective price maintenance illegal, but at the same time it strengthened individual price maintenance, making it enforceable through the courts. It also cut the Monopolies Commission down to a much smaller size, changing it from a body whose findings were ignored in practice to a body whose restricted powers have yet to be put to any test. It is difficult to tell whether the exchange of individual for group agreements has benefited the price-fixers on balance; certainly a number of group agreements have been replaced by individual arrangements having the same effect. An outstanding example of this "no change" is the replacement of the Motor Traders' Association's agreement by a limited version (due to be considered by the court) and a set of bilateral agreements between manufacturers and agents that are beyond the reach of the registrar. On the other hand, the past year and a half has seen the decline of resale price maintenance in a number of areas, particularly in food retailing. The Act has had nothing to do with this: supermarkets have been the chief agents. Price maintenance may have become no more widespread, since the passage of the Act; and in some places it may well have become much less important.

Many of the agreements on the register are interrelated—some directly, like the 200 agreements in building or the 150 in co-operative trading, and others because they concern the same type of goods, as did the yarn spinners' and doublers' agreements, or the agreements on black bolts and bright bolts. An adverse finding by the court in one of these cases will mean the almost automatic abandonment of the others. Moreover, it is common for agreements in quite different fields to make use of similar arguments, or to contain similar clauses. The degree to which parties to such agreements become discouraged by an adverse judgment in another field is difficult to assess. The registrar now has about 170 cases in various stages of preparation; about half of the agreements remaining on the register are fairly obviously connected with one of these 170 cases, and thus will stand or fall accordingly.

Of the 1,800 remaining agreements, then, more than half will certainly be affected directly or indirectly by cases now in progress; many of the remainder may prefer to abandon their agreements rather than pay the not inconsiderable costs of defending them. Another 150-200 agreements are of no substantial economic significance, and it may be assumed that they will be removed from the register on this ground under section 12 of the Act. This could leave a "hard core" of, say, 300-400 agreements to be brought before the court; in fact, the number is likely to be much smaller.

This "hard core" may present the court with much more sophisticated "economic" arguments than it has heard so far. Most of the parties concerned had a shot at modifying their agreements with the aim of making them easier to defend, before they registered them. This revision has continued to some degree; and cases of this sort tend to be in the hands of a few large City law firms, who are fast gaining experience in Anti-Monopoly Laws and How to Beat Them. They will certainly make the court's work in future more arduous and protracted. On the other hand, the cases already heard or now in preparation broadly cover the main types of registerable agreements (e.g. distributive arrangements in the chemists' case, and minimum price-fixing in the yarn spinners' case). The range of arguments available to defending lawyers is being quickly and clearly defined, and—so far—is being as quickly narrowed by the court.

WHAT, then, of the future, assuming that Mr Harold Wilson is not given the chance to carry out his threat to abolish the court and return to a stronger monopolies commission? The court is permitted to split into two sections to accelerate the hearing of cases, but it was felt last year that this procedure should not be followed, at least during the early stages. Such a division might be made in the future; but no such plans have been announced, and it now seems unlikely that the court will sit continuously throughout this year, since some of the agreements scheduled to come before it have been or will be abandoned before the hearings. Eventually, all agreements on the register will be disposed of, one way and another, and the only agreements openly in operation will be those found to be in the public interest, and those of no great economic consequence, which will have been taken off the register. Only problems of enforcement will remain.

Even if the court were to disapprove of every agreement on the register, the effect on the public might not be overwhelming; there is nothing to stop firms from behaving individually in a restrictive way, as some members of the former Chemists' Federation appear to be doing. Lord Chandos is no doubt right that "The Act will lead to amalgamations and larger units to face keener competition." But each agreement which the court finds contrary to the public interest and which is then abandoned increases at least the possibility, if not the reality of competition—and thus the possibility of tangible public benefit from the Act.

BUSINESS NOTES

2 - MAY 1959

COTTON TEXTILES

Another Scheme for Lancashire

THOSE few stalwarts in the cotton textile industry who thought that elimination of surplus capacity was best left to "natural forces" have not been heeded. The majority wanted the maximum subvention from public funds—and they have got it. The President of the Board of Trade announced on Thursday that the Government will pay two-thirds of the cost of removing surplus capacity among the various sections of the industry under schemes to be approved by the Board of Trade. The other third will be raised from the industry by statutory levy. A firm which now scraps machinery will qualify for subsidy, subject to conditions, but a "severe" time limit will be set. The subsidy is being granted on the clear understanding that the industry will compensate displaced workers.

If the Government is satisfied that enough capacity will be eliminated, Sir David Eccles continued, it is also prepared to pay one-quarter of the cost of modernising existing machines or installing new ones. New orders for machinery, and modernisation and re-equipment completed during the next five years will be eligible, provided that surplus capacity is sufficiently reduced. Sir David said that the total cost to public funds might well be of the order of £30 million. A special agency is to be set up under the Cotton Board to carry out both schemes in accordance with directions from the Board of Trade. The Government has "no doubt," he said, "that the circumstances of the cotton industry ... justify the exceptional course of direct financial assistance from public funds."

It is probably true that surplus capacity could not be removed quickly enough without Government aid of this kind. It is much more open to question whether the Government should help the remaining firms to modernise and re-equip. It has been tried before.

Failure to Compete

IN 1958 the Lancashire cotton textile industry suffered two further reverses in world markets. Its share of world exports of cotton cloth shrank further, and for the first time for over a century it ceased to be a net exporter by volume. It is difficult to believe that Lancashire's troubles are not partly of its own making. In the free market of the Belgian Congo the Dutch textile industry, which certainly does not pay "rice-standard" wages, has increased its share of the trade from 16½ to 21½ per cent in the last three years, while Britain's share has fallen from 38½ to 36½ per cent and even Japan has lost ground. In Nigeria, Holland has doubled its share to 9 per cent, while Britain's share has dropped from 24½ to 17½ per cent in the last three years. In Britain's biggest—and preferential—market, Australia, Holland has made no headway, but Japan and India have, at Britain's expense.

INTERNATIONAL INVESTMENT

Old Politics and New Facts

THE Chancellor of the Exchequer gave the obvious reasoned answers to Labour's stereotyped complaints about American investment in British industry in the House of Commons this week; and Mr Amory added some useful bits of new information too. He has confirmed that the sales of big companies to American interests in the past six months, which are reckoned to total some $100 million, has brought nothing like that sum into the official reserves; these have gained by about £15 million, or $42 million. The difference represents mainly purchases made through security sterling, though some dollar proceeds may still be due to be transferred.

Mr Amory's second revelation, elaborating the point that Britain's investment abroad vastly exceeds foreign investment here, was that even with North America the balance of new investment in recent years has been roughly all square. But one Labour MP could not accept comparison of Britain's investments, which are "widespread" and "benevolent," with America's machinations in "strategic" and "key" industries.

Mr Amory was also asked why the Treasury had refused permission for the American company to acquire British Timken through an exchange of shares. He replied bluntly that it is policy to require a cash payment across the official exchange in such cases; and that the Treasury does not allow portfolio investment in foreign securities except through reinvestment dollars, acquired from the existing pool of securities (which are now in fact at no premium in the market). While this restriction remains, the Treasury's practice has a certain grim logic: it may be thought unfair to allow someone to acquire dollar securities at the official exchange rate just because he happens to have securities

that an American wants. Exporters, after all, are not allowed to buy Cadillacs with their dollar earnings. Presumably, too, the Treasury still thinks that the first priority for receipts of dollars is the liquid official reserve. But the whole question of restrictions on international investment needs re-thinking.

Seeking the Dollars

KLEINWORT SONS & CO., the London merchant bank which last year established a dollar investment trust in Bermuda, has sponsored a new closed-end trust fund, Transatlantic Fund, for investment in Western Europe, the United Kingdom and the Commonwealth. This will be subscribed mainly by Americans, but the Bank of England has agreed to the use of reinvestment dollars for subscriptions by British investors. The venture is being made on a modest scale; the initial offer, which should be placed in minimum allotments of $100,000 each to satisfy the Securities and Exchange Commission, is being limited to $5 million; doubtless Kleinworts have noted the fate of the sponsors of Eurofund, who asked for $50 million and have had to postpone their issue.

A distinctive feature of Transatlantic Fund is that it will aim primarily at growth; distributions are to be very small. The attraction to the investor is capital gain; and because of the tax on such gains in the United States, the fund has been registered in Toronto. Kleinworts are the investment advisers, and an advisory panel to assist with the Continental portfolio has been formed by Kredietbank of Brussels, R. Mees & Zoonen of Rotterdam and de Neuflize Schlumberger of Paris.

CANADIAN EAGLE

Bid From Royal Dutch-Shell

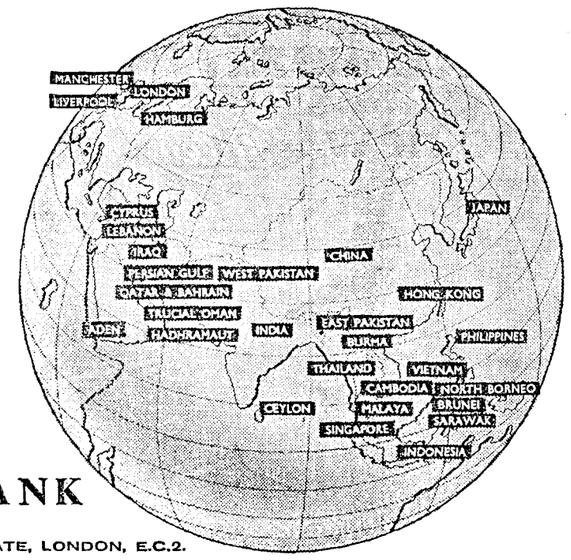
IN one of the biggest take-over bids ever made, the Royal Dutch-Shell group has made an offer worth around £100 million for the equity stock in Canadian Eagle that it does not already hold. The group already owns 6,304,059 of the ordinary npv shares of Canadian Eagle (that is about 21 per cent) and there have been periodic rumours that it would make a bid for the remaining 23,826,071 shares. But when the bid came on Wednesday, the stock market was taken completely by surprise. The offer is of two Royal Dutch Fl. 20 ordinary units and three "Shell" Transport £1 ordinary units for every twelve Canadian Eagle npv shares. On the basis of current market values, at £15⅝ for Royal Dutch and 131s. for "Shell," the offer preserves the 60/40 relationship of the two partners and puts a value of about 85s. 9d. on Canadian Eagle shares. As soon as the bid was announced "Caneagles" were marked up to 81s. 3d., to record in a single day of trading a gain of 25s.

If the bid goes through, Canadian Eagle will be completely absorbed by Royal Dutch-Shell, leaving no minority shareholders. Canadian Eagle will be "dissolved." Through Venezuelan Eagle, Canadian Eagle has a share in Shell Venezuela's crude oil production and it also participates in Shell's contract with Gulf Oil in Kuwait. Canadian Eagle has a 20 per cent share interest in Shell Mex and BP in this country and supplies crude to that marketing organisation. It is also associated with the Royal Dutch-Shell group in marketing in South and Central America. In addition, it owns 21 tankers, has another 21 on period charter and has eight more under construction. Royal Dutch-Shell is now bidding for absolute control over these operations and assets. If its bid is successful Canadian Eagle's independence as a buyer and supplier of crude oil will disappear and Royal Dutch-Shell will be able to conduct Canadian Eagle's affairs in a manner that is to the greatest advantage of the group as a whole. A cousin, related by marriage, will become a son under strict parental discipline. The bid has come at a time when the Royal Dutch-Shell group is actively re-organising its own structure and it suggests that it wishes to knit its interests even more closely.

WALL STREET

Yet Another Peak

WHILE the British industrial ordinary share market has been nothing more than steady, the market in common stocks in Wall Street has been strong. Eight successive days of gain carried the Dow Jones average to a new peak of 629.23 on Tuesday. The market then boiled over and on Wednesday a revival of selling brought the average back to 625.15. But, though there is some uncertainty about the Federal Reserve's attitude towards margin requirements, a confident belief that the market will climb higher persists. Heavy trading has taken place in stocks that are about to be split, railway stocks have been bid up to a new peak and interest has switched away from the more speculative counters towards the better known and better quality stocks. Earnings reported by companies in the first quarter of this year have made an excellent showing and there is the prospect that they will do so again in the next few months.



INSURANCE

Commercial Union and North British

THE bid by Commercial Union Assurance for all the share capital of the North British and Mercantile Insurance should please everybody. The directors of both companies are satisfied that the offer is fair and they anticipate substantial benefits, especially in North America, from the combination of the two businesses. The preference shareholders in North British will gain both in income and security, for they are offered £1 5 per cent cumulative preference stock in Commercial Union for £1 4 per cent non cumulative stock now held. The ordinary shareholders in North British will also gain; they are offered five Commercial Union 5s. ordinary shares plus 20s. in cash for four 5s. ordinary shares in North British. On the eve of the offer, Commercial Union ordinary stood at 46s. 3d. and North British at 45s.; the bid thus put a value of 62s. 9d. on North British shares. Following the increase in the Commercial Union's dividend from 1s. 10d. to 2s. per share, North British shareholders have an effective gain in dividend income from 2s. 3d. to 2s. 6d. per share.

If the merger goes through, the group will control assets worth about £200 million excluding the life funds, and about £300 million including them. The group's non-life premiums will exceed £100 million, rivalled in size only by the Royal Insurance of Liverpool. Commercial Union and

British Banking in Asia

These are the territories served by THE CHARTERED BANK and its wholly-owned subsidiary, The Eastern Bank Limited, through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by expert knowledge and long experience of Eastern trade, finance and industry. In London an effective credit information service and skilled assistance and advice are available to merchants and manufacturers seeking new business connexions in Asian markets.

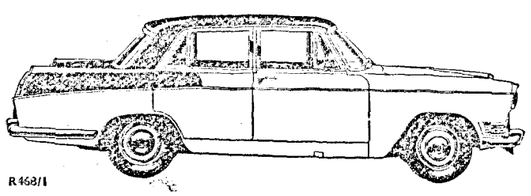
For the man who really cares

—the new Riley 4 SIXTY EIGHT



Every RILEY carries a TWELVE MONTHS' WARRANTY and is backed by Europe's most comprehensive service—B.M.C.

£725

plus £303.4s.2d. P.T.
Duotone Colours extra

Here's news for the man who really cares about motoring! A superb new Riley with the long, low, elegant lines of a new era in body design. Spacious, luxurious. With instant surging power from the sports tuned twin carburetter 1½ litre engine. Effortless high cruising speeds—yet running costs that are remarkably low. There's finger-tip gear control through the short, stubby floor mounted gear shift. And suspension, steering, brakes—all are designed and built to the traditional standard of Riley perfection.

Just look at the new Riley 4 Sixty Eight. Explore its score of features. Drive it. This car has been created for the man who really *cares!*

North British will continue to be run as separate entities, but economies in operation can be expected to emerge in time.

Commercial Union's dollar premiums are about $70 million (making 35 per cent of its total premiums) and North British, which underwrites a good deal of fire business, has dollar premiums of $50 million, representing as much as 56 per cent of its total premiums. The recent experience of both offices in the United States market, as with other British insurers, has been adverse. British insurance offices have been faced with the prospect of getting out of this market (as Yorkshire Insurance has done), or of building their strength within it. A merger between Commercial Union and North British would enable their offices to underwrite business that as smaller independent concerns they were ineligible to accept and to be more selective in the business they underwrite. The merger, in fact, will put them on a more equal footing with their American competitors at a time when the American market promises to be a little steadier than in recent years.

The Prudential's Figures

IN 1958 the Prudential added another £58½ million to its assets, which have risen to £965 million. A new fashion in insurance balance sheets may have been started by the Pru, which made a move a year ago towards disclosing the actual stake in each class of assets. The figure for equities at the end of 1958 includes a book writing up of £35 million; though this leaves the book total "substantially below current value." The converse of this operation was to write down other groups of assets (for the most part fixed-interest securities) "to values broadly in line with current values." In addition to the hidden reserve in equities, there were unhypothecated contingency funds of £36½ million. The 1957 figures shown in this year's balance-sheet have been adjusted correspondingly. Two-thirds of last year's

Profits from Oil

BRIEF reference was made in last week's article on the oil congress in Cairo to a calculation of oil profits made in a study by the First National City Bank of New York.* This document (which is the National City's first venture into a field largely occupied until now by the Chase Manhattan Bank) was timed, no doubt, for the Cairo congress. In it are assembled from the published figures of the major oil companies that operate in the Middle East some useful data on the financial aspects of these operations. The First National City Bank's sifting of these figures supports the conclusion reached by most recent students of the problem: that since the effects of the Suez affair subsided, at any rate, the level of oil prices actually realised on products refined from Middle East oil has been so low as to wipe out any profits on the operations of transporting, refining, and distributing the oil. The majors have indeed been making a loss on bringing their oil to market, though mostly not to the very sharp extent that British Petroleum has, as was shown last week.

This is not a healthy state of affairs, for an integrated company in any business would ordinarily aim at an adequate rate of return on all the capital employed at each different stage of its business (and possibly two-thirds of the huge capital expenditure involved in oil operations relates to these post-production stages). It is not at all easy for the outside observer to understand how it came about: prices in the last two years certainly reflect a world surplus of oil, but this followed on a decade of expansion in which the major companies surely seemed capable of keeping their margins on refining and marketing remunerative. Presumably the world pattern of product prices, following the United States and hence penalising refineries in Europe which had to serve a market needing relatively much more fuel oil, had something to do with this. Did the different incidence of taxation at various stages, in countries that have only in recent years completed double taxation treaties, also play a part?

The figures, whatever the reasons behind them, seem clear. Recent cuts in crude prices, not followed by cuts in product prices, will have improved post-production margins somewhat, but not much. Their implications, for the American investor to whom they are primarily addressed, are not favourable to oil operations outside his own hemisphere—particularly since the reinforcement of restriction upon American imports. Profits on crude production have up to now been substantial, but rather more than 50 per cent of them, under profit-sharing formulas, has recently been going to host governments (who generally get 50 per cent of the profits that would be shown on posted prices, whereas a large proportion of their oil last year was sold at discounts below posted prices). Owners of new crude production outside the United States without marketing outlets, especially in Venezuela, face an awkward situation until oil demand begins rising again at a much faster rate; few can afford the further big risky investment of breaking into a sated world market, and the low crude and product prices offer a "considerably longer payout" than these new producers had hoped for. Hence one development at the Cairo congress: the Venezuelan proposal, now apparently made direct to BP, for restriction of production to avoid a price war.

increase in balance-sheet values after these adjustments was in ordinary shares and in property; fixed interest securities and mortgages each rose by £10 million. Bumper yields on money stocks have not tempted the Prudential to change its investment policy; no net addition was made to the gilt-edged portfolio as a whole.

Premium income in the Ordinary branch rose by £5 million to £61½ million, of which the fast growing overseas business (nearly all in the Commonwealth) accounted for more than a quarter. Industrial branch premiums at £53¾ million were up by £2 million. Including the unconsolidated American subsidiary (which is 99 per cent owned by the Prudential) premiums for fire, accident and marine insurance totalled £18¾ million (£17 million in 1957) of which one half came from overseas.

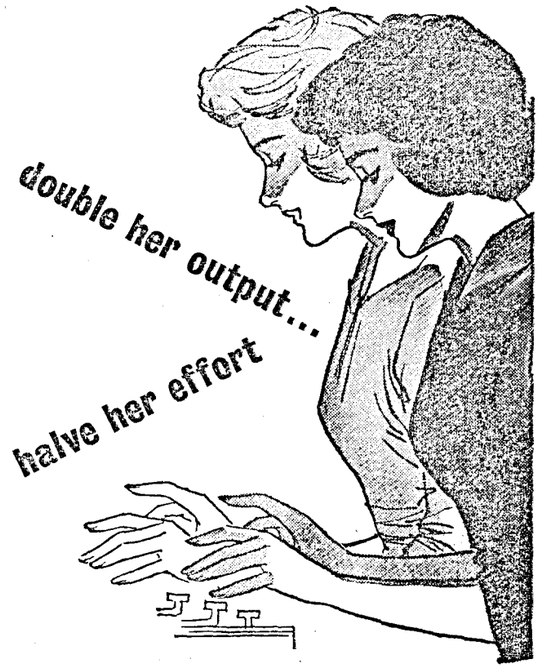
After allocating 93.2 per cent of the surplus in the life branches to policy holders, compared with 92.8 per cent in 1957, the tax-free dividend on the "A" shares—which is paid largely out of life and annuity profits—has been stepped up from 147½ per cent to 162½ per cent. The tax-free distribution on the "B" shares has been increased from 93¾ per cent to 108¼ per cent. Non-life profits, out of which dividends on these shares are paid, again handsomely exceeded the amount disbursed, a fall in underwriting profits being offset by an increase in the general branch interest income.

HIRE PURCHASE

At the Bank Counter

An event of far reaching possibilities for consumer credit business in Britain was announced quietly at the end of last week. The Midland Bank has agreed to handle at its local branches hire purchase contracts on farm machinery manufactured by International Harvester (which is a customer of the Midland) and financed by Forward Trust, the Midland's wholly owned HP subsidiary. The Midland will in effect act as a forward agency of the finance house. Its managers together with a dealer for International Harvester will be able to complete documents on the spot with the buyer; they will refer to an office of Forward Trust whenever they are in doubt, but they will openly use their special knowledge of their customer in connection with the HP deal.

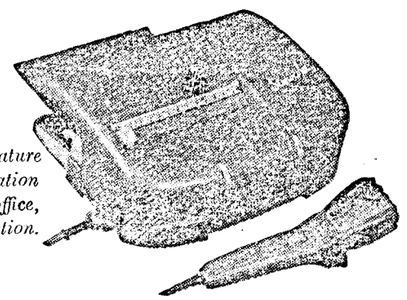
This new facility is at present available only for the products of the one manufacturer; the Midland doubtless wants to feel its way carefully to avoid overburdening its managers with extra work. But the innovation is a sign of the closer integration of business between banks and their associate finance houses. So far no parallel arrangement has been announced by other banks in England; in Scotland at least one bank offers similar facilities. It will be especially interesting to see the reaction of Barclays, whose chairman, Mr Tuke, has been the leading exponent of the "arms length" principle between banks and HP houses. But there have been increasing signs in recent months of working co-operation between banks and these subsidiaries, for which natural opportunities abound. Forward Trust, for example, will now have less need to increase its overheads by spreading branch offices, given the help of 2,600 branches of the Midland and its subsidiary banks in Scotland and Northern Ireland.



The public is benefiting from this relation. Service charges have been squeezed further; the charge on the International Harvester scheme is very competitive, at 5¼ per cent for twelve months. Finance houses without a bank association, which mostly have to pay appreciably more for their money, have been feeling the pinch on their profit margins, at the same time as they have felt the banks' influence in competition for business. The surprising thing is that so many of the small houses survive and grow; and new ones are still appearing. That may be a result of the great boom in hire purchase business, which is more than half as large again as a year ago and has been carried to record levels by the budget boost. When hire purchase business becomes harder to find, the smaller concerns may have difficulty in standing their ground.

ATOMIC ENERGY

The Price of Pioneering



LORD CHANDOS has told shareholders of Associated Electrical Industries that AEI will "incur substantial losses" over the building of the Berkeley nuclear power station on the Severn. This is the first of two nuclear power stations being built for the Central Electricity Generating Board; the second is at Bradwell, being built by the Nuclear Power Plant Company. Two years' building experience by AEI has provided valuable pioneering knowledge, but at a cost. As Lord Chandos said, "It was impossible at the time the contracts were entered into to assess the difficulties or the modifications entailed by this entirely new adventure into the unknown."

This experience is not likely to be confined to the AEI-John Thompson group. The Nuclear Power Plant Company, which is also building a nuclear power station in Italy, may do rather better, but it would be surprising if any of the other four consortia did. The rapidly growing size of nuclear power stations now means that the 6,000 megawatt nuclear programme will be completed with fewer stations —perhaps another five or six in addition to the four already under construction. Yet each of the five consortia capable of building big base load power stations could start two new stations each year, and needs to start at least one new one each year to keep out of the red. That still leaves development costs to be recovered and they are heavy; the Atomic Energy Authority has done the basic design work on the Calder Hall type of power stations, but a great deal of engineering development has been left to industry. Of the five consortia, two have received two orders during the past four years, the Nuclear Power Plant Company and more recently General Electric. Two have one order, AEI and English Electric. The last group to be formed, Atomic Power Constructions, has no work as yet although it is in the running for the contract for the CEGB's first Welsh station to be awarded later this year. It will be a long time before the nuclear divisions of these groups begin to earn a profit. Their experience is not unique. For example, in Italy, where industry is planning to build power stations under licence from the United States, the companies have discovered that claims about the "simplicity" of nuclear reactors are greatly exaggerated when it comes to engineering them and they are radically revising their estimates of the effort and money to put the production of nuclear plant on a commercial footing.

"Got that . . . ?" She's got it 'all right' on a Stenocord. It's accurate. She doesn't have to depend on her own transcription. She doesn't have to waste valuable time taking dictation . . . sitting idly while you answer 'phone or query. *Her time is spent typing* from your stenocorded voice . . . played back at *her own* speed, typing as she listens. A Stenocord doubles your typist's output . . . and better work too. The girls love it. Carry your Stenocord around with you. It's neat, light and goodlooking. Take up the microphone anywhere and *talk business*. No tapes: no re-winds. Twelve minutes dictation on a continuous belt that can be posted in an ordinary envelope. It's as easy as that.

Emergency call!

He's 25, and he's just been called out of bed to cope with a cable fault that's cut off supply. Tough on him? Well, he was needed urgently at the substation (to isolate a section of the mains and to organise repairs to it), and responsibility at an early age was one reason he joined the Electricity Supply Industry. He came straight from school, and qualified while training. He likes the idea of playing a really important part in keeping a vital public service going, and he's getting ahead fast.

WHAT ABOUT YOU?

Because the demand for electricity doubles every 10 years, the opportunities for promotion in Electricity Supply are outstandingly good. That means that positions of responsibility are held by young men. Careers are really secure, too, and the work is varied and interesting.

You can join as a student apprentice straight from the science sixth form of your school, or as a graduate with an engineering degree. For full details please write to the address given below. Tell us your age and what exams you've passed – that will help us to give you advice that is really personal.

THE FINANCE BILL

Parvum in Multo

THE finance bill proves, once again, that the only fiscal change a Chancellor can effect with simplicity is a change in the standard rate of income tax. Anything else involves a flood of technical drafting which stuns the layman and humbles even the experts. If this year's finance bill causes fewer headaches than usual it is because it is largely confined to a comparatively small group of matters which have already been explained in straightforward language in the budget statement.

The bill adds little to what is already known about investment allowances: they are reintroduced by the simple expedient of annulling the provisions of the 1956 Act which in turn annulled those sections of the 1954 Act which first introduced the allowances. After a few more years of box and cox things should get tougher. Surprisingly, no particular drafting difficulties seem to have arisen in running the investment allowances in double harness with the initial allowances but the allowances for dredging have been given a schedule to themselves to ensure that the work has been of a capital, and not of a revenue nature. Similarly, the provisions increasing the amount of controlling directors' remuneration which is allowable for profits tax will be clear to anyone who has read the financial statement.

The only new light on the Chancellor's intentions is in the clauses dealing with bond-washing. The means of the attack is to remove any advantage which would otherwise accrue to the person who buys securities full of dividend or interest and shortly afterwards sells them ex interest. If the buyer is a dealer in securities (other than a discount house or stockbroker) this object is attained by providing that for tax purposes the cost of the securities shall be reduced by the net dividend accrued at the time of the purchase so that any tax loss he may make on re-sale will be correspondingly reduced. If the buyer is a charity, pension fund or other tax exempt body the dividend or interest actually received will only qualify for repayment of tax to the extent that it accrued after the date of purchase. If, finally, the buyer carries on a trade but does not come within the previous categories a similar restriction will be imposed where the dividend received could otherwise be used to sustain a repayment claim in respect of a loss, or a subvention payment. All in all the intention of the clauses appears no more than a reasonable attempt to protect the Revenue from a growing loss—the more so as they do not apply if the resale takes place more than six months after the date of the original purchase.

Not in the Book

SATISFACTION with the main lines of Mr Amory's proposals has been coupled with regret at his neglect of tax reform. In recent years the pattern of the finance bill has become well defined. There have been the main changes dictated by fiscal, economic or political considerations. Then there have followed the clauses thought necessary to plug up loopholes—sometimes new ones, and sometimes old ones which have become too flagrant. And finally for good measure there has been a dose of tax reform based on the reports of the Tucker Committees or the Royal Commission. This year the first two ingredients are as before, but there is not a whisper about reform.

The disappointment is greatest on two counts. In the first place there had been hopes that the Revenue had been steeling itself to grasp the nettle of the basis of Schedule D assessment. The absurdities and inequities of the commencement and cessation rules and the "previous year" basis have been so fully ventilated and examined that it seemed that all that was lacking was the will to make the change. The will is not yet there, and another year has been lost.

The second regret is that nothing has been done to implement the Royal Commission's recommendation that the provisions for charging surtax on the undistributed profits of controlled companies should be modified. With the closing of the Cripps umbrella for accounting periods ending after August 1, 1957, the uncertainties of such companies have multiplied. No one knows what is the "reasonable dividend" which will satisfy the Special Commissioners at Thames Ditton—smoking room gossip varies between dividends absorbing from 25 per cent to 50 per cent of the available profits. It is true that the circumstances of different companies vary widely and that it is usually possible to pay a belated dividend to put matters right if the amount originally declared is deemed inadequate. But the crux of the complaint is not that the Special Commissioners are themselves unreasonable but that their ideas (which may well vary from individual to individual) are not subject to appeal and must be accepted unless the taxpayer is prepared to face the penal alternative of having a direction made on the whole of his profits. A *droit administratif* of this character is no credit to British fiscal machinery.

FOREIGN EXCHANGE

M. Rueff for Spain

COMMERCIAL demand for sterling has again been very much in evidence this week. It has come from most Continental countries, as well as the United States. The rate against the dollar has forged ahead as fast as the Exchange Equalisation Account has allowed it to go. It has risen this week from $2.81\frac{1}{2}$ to $2.81\frac{3}{4}$. In the process of holding it back the control must have acquired substantial amounts of dollars. Sterling has also been strong against most Continental currencies, gaining against French francs, D-marks and guilders. A small part of the demand for sterling has been on capital account though the greater part of this has been satisfied in the market for security sterling, where the discount against the official rate has fallen to $\frac{1}{4}$ per cent.

Considerable speculative interest has developed in the exchange market this week in the Spanish peseta which, following the visit of an International Monetary Fund mission to Spain, is said to be ripe for a devaluation and for the removal of the present confusion of multiple rates. The present official rate is 118 pesetas to the pound; there is a tourist rate of 156, while Spanish notes can be bought in the London market at 166. The French expert, M. Jacques Rueff, fresh from his success with the heavy franc, is proceeding to Spain as adviser on monetary reform in that country. The general belief is that if the devaluation is to be realistic it will have to be at least to the basis of the present tourist rate—and underpinned by severe monetary and fiscal measures.

RUSSIAN TRADE

Mission to Moscow

SIR DAVID ECCLES in the House of Commons last Tuesday described the purpose of the British Trade Delegation he is to lead to Moscow next month as "to negotiate an agreement affording increased scope for the trade between our two countries." The Board of Trade has pointed out this week that the level of direct British exports to Russia seems to depend mainly on the amounts of sterling that the Russians can earn, and the amount of sterling area raw materials that they need to buy. Expansion of British exports to Russia can thus be obtained only by increasing Russian exports to Britain or by our granting the Russians credit, if the expected further Russian orders for capital goods and other products follow those recently placed. Recent orders show the interest of the Russians in ordering complete plants or even complete factories, and their insistence on getting the most modern plant.

Few Russian exports to Britain are subject to import licensing; most are industrial materials which enter freely. The Russians may be hoping to expand their exports by offering consumer goods, but what do they think they can persuade the British public to buy? In many cases the expansion of Russian exports has been the result of agreements with state trading organisations in other countries; similar arrangements could not be imitated here. No doubt such British restrictions as there are on imports of consumer goods will be a subject for negotiation in Moscow, but there does not seem to be great natural scope for them in the British market.

Credit facilities for Russia are available under the normal facilities of the Export Credits Guarantee Department on the same terms as to other non-Commonwealth countries. Little use seems to have been made of the ECGD so far. Trade with Russia is not so desirable that it needs fostering on special terms not offered to other countries. The market and the credit facilities are the same for everyone; all the Russians can expect is the removal of such few restrictions as there are on their exports.

HIDES AND LEATHER

Less Meat, Dearer Shoes

THE rise in prices of hides has left all other commodities far behind. Since a long period of stability ended at the turn of the year they have risen by roughly 75 per cent. An Argentine ox hide (for sole leather) is now 26½d. a lb landed UK, 10d. dearer than at the end of December, and a New Zealand cow hide (for upper leather) is 14d. dearer at 32d. a lb. This remarkable advance has been caused almost entirely by a fall in supplies much more severe than was expected, and aggravated by the generally low level of stocks in consuming countries. Argentina, the largest exporter of hides, had been consuming and exporting meat at the expense of its stock of cattle, and slaughterings have had to be cut back sharply this year in order to rebuild the herds. In the United States farmers were forced to slaughter more cattle during the long years of drought; since it ended they have been rebuilding their herds and slaughterings fell last year by 13 per cent. But consumption of leather there has lately increased and the United States, in recent years a large exporter of hides, has been forced to buy on the world market. Slaughterings in New Zealand and other countries have also declined. Demand has now eased and the advance has slowed down. But as supplies cannot quickly be increased a sharp relapse in prices seems unlikely.

World demand for hides has increased in recent years, mainly because the Communist countries and Japan have been buying more. But it is hardly fair to blame soaring prices on the Communist countries, who appear to have been buying less heavily this year than last, though they are often prepared to pay more than other countries. The tanning industry in Britain has not welcomed this sharp change in the market. Just as beef faces competition from other forms of meat, so leather faces competition from rubber and synthetic materials which have won about half of the British market for soling materials. Imports of leather have also increased. And the tanners' ability to pass on increased costs has been restrained by the growing power of the big groups of shoe manufacturers and retailers. So far prices of leather have not fully reflected the current cost of hides. In time shoe manufacturers will also raise their prices or use lower qualities of leather or more substitute materials in their lower-priced lines.

SOUTH AFRICA

Gold for Millionaires

THE South African Reserve Bank announced this week that it is now ready to sell gold bars to private buyers outside the sterling area, but subject to the surprisingly high minimum of 25,000 ounces or about £310,000 for each individual purchase. There are few investors who will be able to come up to this starting point. The South African initiative appears to have been primed by the reasoning that if gold is being sold at a premium in various parts of the non-sterling world, that premium should accrue to South Africa. There is little substance in this contention. Where the premium is appreciable, as for example in Maçao, the traffic calls for a very high degree of discretion and no direct sales of South African gold could be made in such a market on the terms suggested by the Reserve Bank. South Africa may receive some direct orders for gold on the part of large investors and institutions that are prepared to allow their gold to remain in South Africa. On any other basis, shipping costs would make South Africa unable to compete with the London market. Nor is there in Johannesburg or Cape Town the kind of foreign exchange market in which gold could be readily converted into the foreign currencies that might be required by the holder. The new move by the South African Reserve Bank may have some prestige value, but it is unlikely to attract an appreciable amount of business.

OIL FROM COAL

"Gentlemen, Let's Re-examine . . ."

ABOUT 15 months ago the Ministry of Power received from Constructors John Brown Ltd. a "pre-project" report upon the possible economics of a synthesis plant designed to make oil out of coal, using a gasification process that seemed likely to be much simpler and cheaper than those employed in the few major oil-from-coal plants already operating in the world, such as SASOL in South Africa. The technique developed in it had come originally from the

Ministry's own scientific division: CJB, as a chemical engineering organisation, had taken this over under a development contract, and in co-operation with the British Coal Utilisation Research Association had brought the gasification forward to the pilot plant stage, in which trials are continuing. The Ministry mulled the question over, seeking opinions from outside, during most of last year; on several occasions it seemed on the verge of committing itself to financing development of a first full-scale synthesis plant.

This, in late 1957, was reckoned to cost some £30 million for a unit capable of turning about 2¼ million tons of coal into about 600,000 tons of liquid petroleum products, 30,000 tons of liquefied petroleum gases, and 80 million therms of town gas a year—and offering a gross 20 per cent return on the investment. The Ministry, however, never quite took the final step: and last week, rather than decide itself, it passed the whole question of new processes for gas and oil production over to a committee representing scientific, coal, gas and oil interests, under the chairmanship of Mr A. H. Wilson, deputy chairman and managing director in charge of research and development for Courtaulds.

Most of the people who know anything about this project are fairly partisan, one way or the other. The enthusiasts are wholly committed to developing this as a British process that may happen to meet Britain's need to use surplus small coals, but is most impressive in that if it could make liquid fuels economically from coal at British prices it would be a vast bargain in many other parts of the world: it would, equally, vie with some fairly similar processes that the Gas Council is developing as a way of making gas cheaply out of coal. They have aroused much scepticism inside the Ministry and also in the established gas-making and coal-processing plant industry. Any such process, in a wider sense, encounters two dangers: its immediate importance in Britain's fuel problems could be grossly exaggerated, or on the other hand the long-standing, and so far justified scepticism that the oil industry manifests towards synthetic oil processes could be evoked to write it off in advance as hopeless. When Sir Alexander Fleck was appointed to head the minister's scientific advisory council, many people in the argument hoped he might settle the question whether to go beyond the pilot stage. It is presumably on Sir Alexander's advice, however, that Lord Mills has decided to ask some other experts.

SHORTER NOTES

British export prices remained steady in March at 109 (1954=100) while import prices fell by one point to 97 owing to the decline in foods and fuels.

* * *

The Trades Union Congress has modified its opposition to the archaic Truck Acts, which permit payment of wages only in "coin of the realm." Accordingly, the Minister of Labour has set up a small independent committee to review the Acts and investigate the question of paying wages by cheque. Meanwhile, the minister hopes to introduce early legislation to circumvent the starkest anomalies, so that, for example, workers who are ill can be paid by postal order.

* * *

The directors of George Newnes have recommended shareholders not to accept the offer by the *News of the World* to acquire their ordinary shares at 110s. each.

The Austrian National Bank has lowered its Bank rate from 5 to 4½ per cent. This follows prolonged agitation for the move, inside and outside official circles. For reasons that were never very clear, the Finance Minister, Herr Kamitz, appeared to make "no change" a matter of principle. The interesting question now is whether he will agree to cut the rate on new government loans—which at 7 per cent is high for a country that has experienced some years of price stability and rising external reserves.

* * *

In the year to January 3rd last the consolidated trading profits of Home and Colonial Stores fell from £4,100,496 to £3,701,919 and its net profits from £1,660,997 to £1,637,459. Its ordinary dividend has been left unchanged at 10 per cent.

* * *

Encouraged by the example of banks in Britain, the big German banks are introducing personal loans on very much the same lines.

* * *

The European Investment Bank, which serves the six common market countries, is making its first investment, totalling the equivalent of $20 million, to the Cassa per il Mezzogiorno, the development fund for southern Italy. As reported earlier, this is part of a combined operation, in which the Cassa is also borrowing $20 million from the World Bank and $30 million on the New York market. Interest on the European Investment Bank loan is 5⅜ per cent, compared with 5¾ per cent on the World Bank loan.

* * *

Sales of raw wool from the British strategic stock are to be resumed at the London auctions beginning on May 27th. Limited quantities will be offered at an even rate over the year ending March, 1960. Sales were suspended in May last year owing to the weakness of the market; prices have recovered sharply this year. The strategic stock now amounts to 65 million lb, equal to about 1½ per cent of world consumption.

COMPANY MEETINGS

BANCO DE MEXICO, SA

(MEXICO DF)

The thirty-seventh General Ordinary Stockholders Meeting of the Banco de Mexico, SA, was held recently, and the following is a summary of the Report submitted by the Board of Directors with regard to economic conditions of Mexico for the year 1958:

ECONOMIC ACTIVITY

During 1958, gross national product showed an increase in real terms—after adjusting for price rises—of 4 per cent, so that real production per capita continued to rise, although at a lesser rate of growth than in normal years. The advance was achieved in the face of a worldwide decrease in economic activity and a drop in prices of our main export products.

Total investment, public and private, registered a sustained high level of 14.5 per cent of gross national product, thus contributing substantially in raising both overall and per capita production.

Production increased in the various fields of economic activity as follows: agriculture, forestry, livestock and fishing, 9.7 per cent; petroleum industry, 14.0 per cent; electric power generated, 7.6 per cent; manufacturing, 3.9 per cent; and, transportation and communications, 3.0 per cent. Mining decreased by 2.2 per cent and construction *industry by 1.7 per cent.*

Agriculture.—Favourable weather conditions stimulated agricultural production, although heavy rains in some areas caused floods and the loss of crops.

An increase of approximately 11.0 per cent in the area devoted to the cultivation of cotton allowed the production of 2,304,000 bales. The 1957-58 sugar cane crop rose 10.3 per cent, yielding an unprecedented sugar production of 1,123,000 tons. The coffee crop rose 12.4 per cent and reached 1,324,000 bags. Outstanding corn and wheat crops during 1958 ensure an ample supply of grain without resorting to imports, as has been the case in previous years. Wheat production was 1,300,000 tons, which is more than enough to cover all domestic requirements. Ceimsa has stored 1 million tons of corn and wheat, a figure never before attained in the history of our country. In view of the heavy rains, the nation's storage dams are full and the level of well water has also risen

Livestock.—Grazing lands were improved by the heavy rainfall, without causing any *serious flood within the* cattle raising areas. Cattle exports were increased and the production of fresh meat rose sharply.

Poultry.—Poultry production rose, and the importation of eggs was reduced to almost one third of the 1957 figure.

Fishing.—The fishing industry, measured by the volume of catch by the nation's fishermen, showed some increase, as is apparent by increases of 17.6 per cent in the volume of fresh and frozen shrimp exports, and of 15.1 per cent in the exports of fresh fish and shell fish.

Forestry.—There was no increment in the production of forest products for national consumption, and the exports of both common and precious woods declined.

Mining.—The drop in metal prices provoked by unbalanced supply and demand in the world markets and by the import quotas set on lead and zinc by the US contracted overall mining activities. Nevertheless, the total reduction amounted only to 2.2 per cent as compared to 1957. Production of precious metals dropped by 0.4 per cent and of industrial metals by 5.3 per cent. The production of nonmetallic minerals, on the other hand, rose by 15.5 per cent.

World prices of metals, particularly copper, lead and zinc, suffered a sharp drop in the early part of the year which was sustained until close to the year's end, when a rising trend was established, especially with regard to copper.

Petroleum.—Both the production of crude and refined petroleum rose. The increase in *crude petroleum production* was 9.2 per cent. Refined petroleum production resulted in a considerable reduction in imports from abroad. By-products increased by 15.2 per cent, among which the more outstanding were: high octane gasoline, 170.4 per cent; mid-octane gasoline, 67.3 per cent; crude kerosene, 83.8 per cent; and refined kerosene, 26.7 per cent.

During 1958 proven oil reserves rose to 3,500 million bbl., and refining capacity expanded from the 1957 figure of 324,000 bbl. daily to 336,000.

Manufacturing.—In the course of 1958, the volume of production of the nation's manufacturing industry increased 3.9 per cent. This figure, although below the 1957 rate, may be considered satisfactory in view of the fact that in 1958 the lowest point of the worldwide economic recession was reached.

Foodstuffs, beverages, and tobacco showed an aggregate rise in their activities of 6.0 per cent. Textile production fell off by 1.0 per cent. The production of soap and detergents rose 19.0 per cent, and the match industry increased 7.6 per cent.

In the field of production goods, the iron and steel industry advanced 5.0 per cent, in which the production of iron ingots increased 16.0 per cent. The production of nonmetalic mineral products rose slightly, due largely to increased glass and cement production. There was a remarkable increment of 17.9 per cent in rubber goods. The production of fertilisers dropped 7.5 per cent, and the figures for paper and cellulose paste also showed a decline.

Electric Power.—Electric power generated rose by 7.6 per cent during 1958, and imports by 13.0 per cent, indicating an 8.0 per cent increase in apparent consumption of electric power. New generating capacity installed during 1958 represents a 10.0 per cent increase over the preceding year, with the public sector providing the major contribution.

Building and Construction.—The production volume of the building and construction industry during 1958 was 1.7 per cent below 1957. Public construction was slightly higher than during the previous year, and private construction decreased by 3.1 per cent.

Transportation and Communications.—Activity in the field of transportation and communications expanded by 3.0 per cent, primarily due to a 5.0 per cent increase in motor vehicle transportation as indicated by gasoline consumption, and to the increased activity of commercial airlines, which rose at a rate of 7.2 per cent. Railway transportation decreased by 1.0 per cent; freight movements fell off slightly, but there was a large drop in passenger traffic.

Commerce.—Commercial activity remained at a stable level, with no particularly outstanding increases.

Prices.—The average wholesale price index for 210 items in Mexico City rose by 4.4 per cent in 1958, as compared to the 1957 average. The primary cause was an unusual rise in the price of vegetables and fruit—caused by unfavourable weather conditions in certain areas—and of other foodstuffs, with the result that consumer goods prices in 1958 increased 5.6 per cent over 1957. Comparing the figures for December, 1957, with those for December, 1958, wholesale prices showed a 3.6 per cent increase.

MONEY, BANKING AND SECURITIES

The authorities directed monetary and credit policies toward similar objectives as in previous years; that is, maximum channeling of credit funds—in a manner compatible with monetary stability—toward satisfying the needs of production activities and legitimate trade, support of the banking system, and of the sound development of the securities market.

Money Supply.—As a result of measures taken during the course of the year and those which were adopted during previous years and still in effect, it was possible to attain an increase of 7.6 per cent in the total means of payment along with an increase of 17.9 per cent in total financing granted by the banking system. This rate of expansion is higher than those of previous years. It is four times greater than the volume of production of goods and services during the year, and twice as great as the total increment in the value of such production.

Loans.—In absolute figures, total loans granted to the private and the public sectors, by all official and private banks, rose by the extraordinary amount of 4,032.2 million pesos during 1958 to reach a record level of 26,498.8 million pesos.

As was to be expected, there was an unusual increase in requests for loans from both commerce and industry, stemming more from difficulties in sales and increased inventories than from any real increase in private investment plans executed during the year.

In spite of the considerable resources supplied by official and private banks during 1958 to meet the demand for loans, interest rates continued high, and there was a scarcity of peso resources in private banks for productive activities, due to the extensive deviation of funds by the public for hoarding made in foreign currency. The major part of the additional resources received by deposit and savings banks, and by private investment banks, was in dollars. The main contributing cause was the fear—not yet overcome during 1958—of a change in the parity rate of the Mexican peso with the dollar. There was a continued flow of resources into private investment banks in the course of 1958, as a consequence of the higher interest rates which they offer on funds received both in pesos and dollars.

The following figures clearly reflect the policy of channelling credits towards production. As of December 31, 1958, the loans granted by the banking system showed these increments: to industry, 1,449.2 million pesos, which represents a 17.6 per cent increase; to agriculture and cattle raising, 569.6 million pesos, which represents a 14.1 per cent rise; to commerce, 738.6 million pesos, which represents a 15.7 per cent growth.

Securities.—The volume of both stocks and bonds outstanding continued to rise during the year. The total number of transactions also rose, both on the securities exchange and over-the-counter, increasing 6 per cent over the previous year. The Banco de México and other official institutions supported the market firmly through their own transactions. At the same time, the policy of diversifying the securities available was accelerated in order to give them the features which the investors require for long term investment.

As of December 31, 1958, the volume of bonds outstanding reached the level of 12,534.1 million pesos, which is 1,524.2 million, or 13.8 per cent greater than the figure for December 31, 1957.

Bond quotations remained at a steady level; the average monthly index of Nacional Financiera (base: buyers 1947-49) was 102.4.

The average monthly index for stocks (base: buyers 1947-49) calculated by Nacional Financiera showed a drop of 8.5 per cent.

Gold and Silver.—During 1958 the Banco de México continued its domestic purchases of newly mined gold. As in previous years, the Bank followed its policy of observing the world silver market, in order to avoid excessive fluctuations in silver prices.

BALANCE OF PAYMENTS

It was highly satisfactory that in a year of world economic crisis, the unfavourable result of the balance of payments for the country was only 20.7 million dollars. The gross reserve of the Banco de México as of December 31, 1958, was 413.8 million dollars. On the other hand, the Bank's net reserve dropped 85.1 million dollars—from 441.2 million dollars on December 31, 1957, to 356.1 million on December 31, 1958—largely due to an abnormal increase in the net dollar and gold assets of private individuals and enterprises, and particularly of private banks. In the case of the banks the increase was the consequence of measures taken by the Banco de México to maintain the liquidity of the banking institutions in support of their internal liabilities in foreign exchange. The latest available figures indicate that during 1958 the public made use to a great extent of its capacity for converting pesos into dollars and gold, for hoarding.

It is worth noting that exports of goods did not fall, while imports of goods decreased, which helped maintain a sound position in our balance of payments.

Exports.—Total income from exports of goods and services—including tourism, remittances of Mexican agricultural labourers abroad, and others—amounted to 1,386.3 million dollars in 1958, slightly below the 1957 figure of 1,405.3 million; that is, a decrease of 19.2 million dollars. This small decline in income from the exports of goods and services was due to a somewhat reduced per capita expenditure by tourists visiting *this country, though the actual number of* tourists did not decrease.

The greater diversification and higher volume of our exports compensated for the reduced price of our main export items.

The value of our sales abroad of the following products decreased: coffee (80.5 million dollars, down 28.4 million); lead (34.9 million dollars, down 17.0 million); copper bars (24.9 million dollars, down 4.3 million); manganese ore; copper wire and cable; lead wire and sheet; peanuts; barium sulphate; vegetable wax; manufactured iron and steel; and molasses. Exports of crude petroleum and fuel oil declined in the face of increased national demand, of enlarged domestic refining capacity, and of improved distribution networks.

The value of our exports rose with regard to many products, particularly the following: cotton (190.2 million dollars, up 20.0 million); cattle (38.4 million dollars, up 17.4 million); fresh and frozen meat (12.4 million dollars, up 1.9 million); tomatoes (22.7 million dollars, up more than twice the 1957 figure); sulphur (23.2 million dollars, up 1.2 million); sugar (12.0 million dollars, up 4.5 million); fresh shrimp (32.0 million dollars, up 9.9 million); cotton linters; animal feeds; refined mercury; henequen yarn; processed and preserved vegetables; and natural and synthetic hormones.

Imports.—During 1958 imports of goods and services dropped 3.1 million dollars as compared to 1957, from 1,566.4 million to 1,563.3 million. Imports of merchandise alone were 1,128.6 million dollars, which is 26.5 million dollars below the 1957 figure of 1,155.4 million. This decrease is significant indeed, in view of the abnormally heavy corn imports. The total decrease in our purchases abroad—particularly in petroleum and its by-products—is an indication of the substitution of imports by national production. On the other hand, a moderate increase was noted in tourist expenditures abroad, in border transactions, in interest payments on official debt, and in yields of direct foreign investments.

Production goods again constituted a very high percentage—approximately 80 per cent —of total imports.

Tourism.—According to available estimates, income from tourist expenditures and border transactions declined from the 1957 figure of 590.5 million dollars to 565.0 million; this is 25.5 million less, or a reduction of 4.5 per cent. However, the number of tourists entering the country rose 2.6 per cent.

Direct Foreign Investments.—The flow of foreign resources into Mexico by way of direct foreign investments continued during 1958, accounting for a total of 100.2 million dollars. Nevertheless, this figure is 39.4 million dollars less than the amount invested in 1957.

Gross direct foreign investments represented 7.7 per cent of the nation's gross investment during 1958, as compared to 11.3 per cent in 1957.

Foreign Loans.—Medium and long term loans obtained abroad by Nacional Financiera and other institutions, to foster economic development, yielded a net income of 107.4 million dollars, which is 31.6 million more than the income obtained in 1957. Loans utilised rose from 143.2 million dollars to 230.6 million, while amortisations increased from 81.7 million dollars to 135.5 million.

Of the total loans utilised, amounting to 230.6 million dollars, 29.2 per cent was for the petroleum industry, 16.0 per cent for railways, 8.0 per cent for electric power generation, 8.1 per cent for the construction of transportation equipment, 7.1 per cent for the iron and steel industry, and the rest for agriculture, manufacture of machinery, fertilisers, and other items.

PUBLIC FINANCE

The fiscal policy of the Federal Government contributed to sustain domestic economic activity and the foreign markets of our export products. Through its public investment the government also contributed to increase the productive capacity of the nation.

Revenue.—Total cash revenue of the Federal Government—including budget and non-budget items—advanced 359.1 million pesos—from 8,485.0 million to 8,884.1 million—which represents an increase of 4.7 per cent over 1957. This increased revenue was achieved in spite of a lower income from export taxes and the reduced rate of increase on returns from the income tax.

The increase in revenue was due especially to higher yields in the following items: *import duties*, by 31.9 per cent; sales tax, by 17.4 per cent; and taxes on production and commerce of industrial goods and services, by 22.8 per cent. The one item of fiscal revenue which suffered the sharpest decrease was the export tax yield, which declined 144.0 million pesos during 1958, or 13.8 per cent under the 1957 figure. This reduction can be attributed largely to a drop in the international prices of our main export products, which forced the Federal Government to reduce export taxes to safeguard our foreign markets.

Expenditures.—Total cash expenditures—excluding debt amortisations—rose 882.6 million pesos, from 8,894.8 million to 9,777.4 million. This 10.0 per cent increase exceeded the rise in fiscal revenue, and therefore the Federal Government incurred a deficit of 893.3 million pesos, according to preliminary fiscal data. The growth in Federal expenditure was largely due to increased subsidies granted to various semi-official institutions and government enterprises, to cover increased current expenses, and a rise in salaries paid to government employees.

Public Investment.—In order to continue to stimulate the nation's economic development, total public investment during 1958—5,512.2 million pesos—was maintained at a level similar to 1957.

HENEKEYS LIMITED

The thirty-ninth annual general meeting of Henekeys Limited was held on April 22nd in London, Sir Bernard Docker, KBE, JP (the Chairman), presiding.

The following is an extract from his circulated statement: I consider the general position satisfactory, especially when you remember that I reported last year that we had lost the Hammersmith Branch.

Our profits before taxation at £157,214 are down by £8,912. I estimate that £5,000 of this was the inevitable loss which follows a reduction of duty at the budget. However, we are not complaining about the cost, as we regard the reduction as a step in the right direction. The profits after taxation are up by £7,088, compared with 1957-58, by reason of the reduction in the rate of Profits Tax, lower provision for Income Tax this year, and also by bringing in £10,000 past provision for taxation no longer required.

Since the end of the year we have opened new branches at Wandsworth and Southwark, both of which should show satisfactory profits.

As to the future, the swing from bar to off-licence trade continues, and we are actively engaged in the modernisation of our off-licence departments.

The report was adopted and at a subsequent extraordinary general meeting resolutions were passed changing the denomination of the existing Preference Stock, increasing the capital of the company, altering the *Articles of Association, and making* a free issue to the holders of the "A" Ordinary stock and Ordinary stock of the company of three 7 per cent Cumulative Second Preference shares of £1 each for each 16 5s. units of stock held.

THE EAST ASIATIC COMPANY LIMITED

(Aktieselskabet Det Østasiatiske Kompagni)

COPENHAGEN, DENMARK

The following is a summary for the financial year 1958, presented by the Board of The East Asiatic Company Limited, at the Company's Annual General Meeting in Copenhagen on April 10, 1959 :

The general uncertainty which was so pronounced in 1957, persisted in 1958. Both economic and political factors are manifesting themselves and world trade is marked to an increasing extent by Government interventions and ordinances which must naturally influence the activities of a company with a structure such as the East Asiatic Company.

Endeavours have constantly been made to adapt the activities of the Company to these new conditions and to find the equilibrium between the various forces, gradually as they have solidified. The recently established common market and the negotiations about a free trade area are essential elements in this process of adaptation. It is hoped that agreement will be reached on a combination of these two constructive trends of thought which will be of great importance not only to Denmark, but also internationally. A conflict may have unfortunate consequences to Europe in many ways and may affect the possibility of establishing a useful and lasting collaboration with overseas countries which, quite naturally, in the building-up of their new economy, will hesitate to attach themselves to a territory which does not display a higher degree of stability and harmony.

The established convertibility of the currencies of a number of countries may also exert a great influence, but it is too early to express a final opinion on this point. As long as a number of provisions governing the movements of goods are still to remain in force, the rules introduced in respect of convertibility will have no thorough-going effect. It is also necessary to wait and see whether the common market will fully operate according to its purpose, for in that case it may, also in the monetary field, involve the creation of a common coinage.

SHIPPING DEPARTMENT

The freight market was extremely dull throughout the year, first and foremost on account of a marked recession in the demand for space, and, secondly, in consequence of the increasing world tonnage.

The Company finds it satisfactory that all its ships have been employed in the well-established routes, and that the working results have enabled the Company to make further provision for depreciation on the ships in accordance with the wish for continued consolidation.

In the course of the year delivery has been taken of the MS "Beira" from Burmeister & Wain and of the MT "Annam" from Nakskov Shipbuilding Yard, while the two oldest ships, the MS "Asia," built in 1919, and the MS "Java," built in 1921, were sold to shipbreakers. The difference between the booked value and the sales proceeds of these two ships, kr. 2,588,849.67, has been transferred to a Ships' Newbuilding Fund II.

The Company's fleet at the end of the year consists of 37 motor vessels of a total carrying capacity of 384,432 tons ; the average age of the ships is 9 years and their book value is kr. 436.26 per ton dw.

At the close of the year seven ships were under construction or on order: two 10,200 tons cargo vessels from Burmeister & Wain, three 18,500 tons tankers and two 12,200 tons cargo vessels from Nakskov Shipbuilding Yard ; they will be delivered in the course of the next three years.

In 1958 the ships were written off by kr. 18,382,022.62.

The two turbine-tankers of 35,000 tons each ordered by Nordic Tankships I/S (Partnership) have been launched ; they were named "Nordic Hawk" and "Nordic Heron." These new ships will be put into service in 1959.

THE TRADING DEPARTMENTS

The world trade is passing through a period of recession with declining demand for raw materials and falling prices.

The Trading Departments of the Head Office have, nevertheless, been able to maintain turnover and profits, *inter alia*, through an increased participation in the grain trade and in the export trade from the home country and the European supplying countries.

The Wood Department has also experienced increased activity.

The Company's business in the pharmaceutical line is being developed in a satisfactory way by the subsidiary company "Dumex" in co-operation with Danish and international pharmaceutical enterprises.

THE COMPANY'S OVERSEAS BRANCHES AND ASSOCIATED COMPANIES

In several countries in which the Company is working the world market prices of raw materials exert a strong influence on the development, and the resultant adversity has influenced the import trade and the economic expansion.

The trading conditions in Thailand, the Federation of Malaya and Singapore were affected thereby, and adequate depreciations have been made on the stocks-in-trade.

The markets were rather dull in Burma and Indo-China, while activities in Indonesia were influenced by political unrest.

The consolidation of the activities in India and Pakistan has continued.

On the African continent the Company's working result as a whole has been satisfactory.

Several of the South American states in which the Company has offices have passed through economic crises with a resultant devaluation of money, but the volume of business has been maintained.

As to Canada a satisfactory result of the forest and sawmill activities of the Talsis Company may be emphasised.

In other overseas fields of operation the business activity has been maintained on lines previously laid down.

PARTICIPATION IN OTHER COMPANIES

With the addition of new investments these interests stand in the Balance Sheet at kr. 84,565,870.50 against which there is a Security Fund showing a reserve of kr. 6,215,585.95.

The participation in Nordic Tankships I/S (Partnership) amounts to kr. 17,992,131.08 as at December 31, 1958.

RESULTS

From Shipping	Kr.	38,604,880.43
From Trade	„	10,527,349.19
Overseas Branches	„	55,043,469.90
Dividends from Investments in other Companies	„	4,926,858.15
	Kr.	109,102,557.67
Less : Interest and Financing Expenses	„	3,631,189.29
	Kr.	105,471,368.38
From which is to be deducted:		
Administration Expenses at Head Office and Overseas Branches	Kr. 55,512,774.51	
Allocation for Taxes	„ 7,966,351.00	
	„	63,479,125.51
	Kr.	41,992,242.87
Less : Depreciation	„	21,893,021.99
	Kr.	20,099,220.88
Balance brought forward from last year	„	8,367,500.36
at disposal	Kr.	28,466,721.24

which it is proposed to apply as follows : to pay to the shareholders a dividend of 14 per cent, to distribute an amount of kr. 3,871,823.60 to the Board, Managing Directors and Employees as bonus, to allocate kr. 3,000,000.00 to the Extra Reserve Fund, kr. 3,000,000.00 to the Pension Fund, kr. 1,000,000.00 to the Insurance Fund, kr. 1,000,000.00 to the Extra Depreciation Fund for Buildings and Furniture, besides kr. 500,000.00 to the Benevolent Fund, kr. 500,000.00 to the Research Fund, leaving kr. 8,594,892.64 to be carried forward to next year.

A VIRILE AND PROGRESSIVE ORGANISATION

"Important new acquisitions add greatly to overall strength . . ."

Lord Chandos

IN the course of his extensive review of the Group's activities and interests, Lord Chandos, Chairman, at the Annual General Meeting of Associated Electrical Industries Limited, said:

In 1958 the total value of electrical apparatus shipped and invoiced to our customers amounted to £181,500,000 and surpassed the previous record of 1957 by £31,500,000. The profits, however, did not increase in step with the increased output. The main cause why profits were not more buoyant is that they are still affected by the heavy initial cost of starting new plants.

Commenting on what he described as perhaps the outstanding feature of the year, viz. the addition to the A.E.I. Group of two new companies, Associated Insulation Products and W. T. Henley's Telegraph Works Company Limited, Lord Chandos said: They add greatly to the strength of the undertaking, which is at once balanced and comprehensive. We cover automatically the whole range of electrical products, from the largest machines for the generation of power, such as turbine generators and water wheel alternators, down to the smallest devices used in its application, such as miniature lamps and transistors.

At the end of the year we reached an agreement with the Directors of London Electric Wire Company & Smiths, and we are very much gratified that this famous and long established Company should have joined the A.E.I. Group.

From its new factories, from its improvements in organisation, from its very large educational facilities and from its efforts in research and development, your Company is well placed to take its part in the further expansion of the electrical industry which, both from the experience derived from its history and from its apparent prospects, appears assured.

Associated Electrical Industries Limited AEI

THE NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

HIGH BONUSES MAINTAINED

MR KENNETH MOORE'S STATEMENT

The Annual General Meeting of The National Mutual Life Assurance Society was held on April 21st at the head office of the Society, 39 King Street, London, E.C.

Mr Kenneth A. E. Moore, FCA, the chairman, who presided, said that as things had turned out the recession, of which there were so many disquieting symptoms when he had addressed the Society's members a year ago, had not been allowed to degenerate into a slump. In the event investment values here and in North America had improved and the Society had reaped substantial benefit from the recovery in stock markets. The appreciation in the past year had enabled the Reserve Fund to be brought up to £1,500,000, representing about 12½ per cent of the Society's portfolio, or nearly 40 per cent of the holding in equities. Mr Moore then went on to give some figures of the movement during the year between fixed interest stocks and ordinary stocks, both sterling and dollar. These showed that the percentage of ordinary shares had risen during the year from 17 per cent to 23 per cent of the Society's total assets.

There was, however, still need for caution in investment policy since although there had been a definite change in Government policy from deflation to reflation, the world was not yet out of the recessionary wood, many international problems remained to be solved, and moreover there was the growing shadow of a General Election in this country.

GROWTH OF NEW BUSINESS

The chairman then dealt with the Society's affairs, which revealed that New business was up by 25 per cent on the previous year and had reached nearly four times its prewar level. Interest earnings at £5 5s. 1d. were slightly lower than in the previous year, partly due to the rise in security prices and partly to the fact that of the investments in ordinary stocks many were of a growth type with low interest yield. In general, however, these were the very stocks which showed the highest appreciation. Mortality profits had again been satisfactory.

The biennial valuation of the liabilities at December 31, 1958, had shown a surplus which had enabled the Board to allot reversionary bonuses for the years 1957 and 1958 at the same high rates as for the previous biennium—52s. 6d. per cent per annum compound for whole life and 47s. 6d. per cent per annum compound for endowment policies. Examples were given of the growth of a policy for £1,000 taken out forty years ago which, with the addition of bonuses, was now worth £2,315 for whole life or £2,124 for endowment, in spite of all the crises which had bedevilled the world since 1919.

Mr Moore placed on record the thanks of the Directors to Mr M. H. Oram, the Actuary and Manager, to the officials and to the staff both at Head Office and at the branches for their contribution to the continued success of the Society.

Mr Moore also paid a sincere tribute to Mr Oswald T. Falk, who, after serving over forty years as a director, including eighteen years as Deputy Chairman, was not seeking re-election.

The report and accounts were unanimously adopted.

TELEPHONE AND GENERAL TRUST LIMITED

PROGRESS OF OPERATING COMPANIES REVIEWED

SIR ALEXANDER ROGER'S STATEMENT

The Thirty-third Annual General Meeting of Telephone and General Trust Limited will be held on April 28th at Strowger House, 8 Arundel Street, London, W.C.

The following is an extract from the statement by the Chairman and Managing Director, Sir Alexander Roger, KCIE, which has been circulated to shareholders:

The net profit of the Trust—the holding Company—at £198,633 is £12,783 more than in 1957. Taxation amounted to £186,600—a decrease of £15,350, of which £13,250 was in the charge for profits tax.

We have again transferred £50,000 to general reserve, bringing the balance thereon to £300,000.

We are recommending for your approval a final Ordinary dividend of 9 per cent, making with the 5 per cent interim paid in October last 14 per cent for the year, which rate is also to be paid on the "A" Ordinary stock—as against 13 per cent paid for 1957.

The balance carried forward on profit and loss account is increased by £9,368 to £197,950.

BALANCE SHEET

A transfer of £125,000 from investment suspense account to capital reserve—general—increases the balance thereon to £499,250, which together with £300,750 on share premium accounts makes a total of £800,000 in capital reserves.

Revenue reserves increased by £59,368 to £597,950.

A market value of £4,486,456 for quoted investments represents an appreciation of £2,470,208 on the net book cost of £2,016,248—a very satisfactory position again emphasising the strength of our general investments.

Interests in subsidiary companies have increased by £118,932 to a total of £3,195,570.

CONSOLIDATED ACCOUNTS

The consolidated reserves attributable to the holding company total £2,203,933—an increase of £220,722.

Interests of minority shareholders have increased from £1,931,010 to £2,166,676, mainly due to a successful local issue of Ordinary capital by one of our overseas subsidiaries, and to some changes in our holdings in another subsidiary.

TELEPHONE OPERATING COMPANIES

Portugal.—The Trust has been a co-partner of The Anglo-Portuguese Telephone Company for over 31 years.

During this time the Company has steadily expanded and developed the telephone systems of its Concession which cover the city and suburban areas of Lisbon and Oporto.

This has necessitated a constant flow of fresh capital and in fact, since June, 1950, £8,825,000 of new money has been raised in Great Britain and in Portugal to provide the plant and equipment to keep pace with the requirements of the telephone public.

The Trust has played an important role in the financial operations of The Anglo-Portuguese Telephone Company, not only in connection with new issues but in the provision of temporary loans on a day to day basis until such times as cash was available to the Company to refund the loans.

There is an unceasing demand for additional service and over 20,300 new telephone stations were connected during 1958, increasing the total number at December 31, 1958, to over 229,800.

West Indies.—I told you last year that the telephone operating companies in which we are interested in Jamaica, Trinidad and Tobago and Barbados spent collectively during 1957 some £835,000 on the expansion and improvement of their systems. During 1958 a further £1,227,000 was similarly expended, which is an indication of the contribution being made by these companies with our assistance towards the industrial, commercial, and social development in these territories. Stations in service increased during the year by 6,250 to a total of 68,800.

In Jamaica and Barbados where development and operating are proceeding satisfactorily the financing of the above expenditure was helped considerably by local issues of debentures and Ordinary shares respectively.

We had hoped it would also have been possible to raise new capital locally in Trinidad but circumstances arose which made this impracticable for the present.

An application for a revision of telephone tariffs, as provided for in the Trinidad Telephone Ordinance under which the Trinidad Company operates, was made in January, 1958.

Since then representatives of the Company in Trinidad and from London have, on several occasions, seen representatives of the Trinidad Government in an endeavour to get their approval to the Company's application.

Unfortunately, these approaches have not so far been successful and it appears at this date that the Company will require to obtain a legal ruling of the Ordinance, and a Writ towards this end has been filed. The Company, of course, is ready at any time to enter into further talks with the Government if there is any possibility of progress being made.

Because of the delay in obtaining a tariff revision, the Trinidad Company has been unable to obtain the finance it needs for expansion of its network and, consequently, telephone development in Trinidad and Tobago has virtually come to a standstill. This has already begun to affect the Company's earning capacity and in turn the dividends receivable by the Trust.

The present position must be viewed with concern by all interested in the overall development of Trinidad and Tobago, where the Government is making every endeavour to attract new industries and capital in furtherance of its economic aims, and in which telecommunications must play such a vital part. We remain hopeful that a settlement will be reached without further undue delay.

GENERAL

Our portfolio of general investments together with the revenues from our Telephone Operating interests, encourages us to anticipate another satisfactory year.

LAMBETH BUILDING SOCIETY

The One Hundred and Seventh Annual General Meeting of the Lambeth Building Society was held on April 21, 1959, in London, Mr J. C. Crofts, the Chairman, presiding. The following is an extract from his statement to members: There have been satisfactory increases in your Society's Assets and its Reserve Funds. The Liquid Funds have been maintained at a high level.

The total assets now amount to £7,126,232 7s. 3d., the highest in your Society's long history, having increased by £946,928 5s. 7d. during the year. No less a sum than £1,356,509 18s. 9d. was received from Investors for the credit of Share Accounts during the year and the total balance due to Shareholders at January 31, 1959, had increased to £5,840,365 19s. 10d.

Your Society advanced during the year the sum of £1,253,463 almost entirely upon the security of private dwelling houses purchased or being erected for owner-occupation. The sum owing on Mortgages at the end of the financial year increased to £5,621,450 2s. 2d.

I would like once again to pay tribute to the regularity with which all but a minute fraction of the Society's Borrowing Members have punctually and fully met their commitments to it. For the seventh year in succession no loss whatever has been sustained by your Society on the rare occasions when it has been necessary to dispose of any mortgaged property by a sale, and in the fourteen years since the end of the war in 1945, a sum of only £295 18s. 6d. has been lost by the Society on the realisation of mortgaged properties. This is a remarkable record and is evidence of the care shown by your Directors in the selection of Mortgages on which your Society's funds are advanced. It will be observed that no Mortgages whatever appear in Parts II, III, IV and V of the Schedule to the Accounts.

After providing for all expenses, interest to Depositors and Shareholders for the period ended January 31, 1959, Income Tax up to April 5, 1959, and Profits Tax for the year ended January 31, 1959, the Society has an available surplus of £17,728 7s. 4d., to which is added the balance brought forward from last year, namely, £12,336 6s. 9d. The Directors have appropriated £20,000 to the Investment Reserve leaving £10,064 14s. 1d. to be carried forward to next year.

The total Reserves and undistributed surplus at January 31, 1959, has increased by £17,728 7s. 4d. to the substantial total of £460,164 14s. 1d., which is equivalent to 6.97 per cent of the total sum due to Shareholders and Depositors, to 8.19 per cent of the amount of your Society's Mortgage Assets and to 6.46 per cent of its Total Assets. These percentages are well above the average for Building Societies as a whole.

Despite the substantial volume of advances made by your Society during the year, an adequate level of Liquid Funds was maintained at all times and at the close of business on January 31, 1959, the Liquid Funds totalled no less than £1,477,940 9s. 1d., representing 22.39 per cent of the total sum due to Shareholders and Depositors and 20.74 per cent of the Total Assets, which latter percentage is nearly three times the 7½ per cent prescribed by the Building Societies Association as a required minimum for membership. All the Society's British Government Trustee Securities consist of Stocks with fixed dates for redemption at par and have a book value of £555,479 12s. and all stand in the Society's books at or below their par redemption value. The accounts were adopted.

COMPAGNIE D'OUTREMER POUR L'INDUSTRIE ET LA FINANCE BRUSSELS

EXTRAORDINARY GENERAL MEETING

ACQUISITION OF PARTNERSHIP INTEREST IN BANQUE LAMBERT, BRUSSELS

At a meeting of this important Belgian holding company, held in Brussels on April 10th, it was unanimously decided to increase the Capital from Bfrs.1,300 million to Bfrs.1,750 million, by the creation of 450,000 new Ordinary Shares, which will qualify for dividend from October 1, 1959.

The new shares, which are augmented by a cash sum of Bfrs.13,893,000, will replace the partnership interest in the Banque Lambert, a partnership with a nominal capital of Bfrs.200 million.

According to the announcement made at the Meeting on April 10th, the net value of the Banque Lambert has been estimated at Bfrs.464 million. The weighted annual profits stand at Bfrs.41.75 million.

The acquisition of the partnership interest by the Compagnie d'Outremer in no way alters the private character of the Banque Lambert and henceforth the Compagnie d'Outremer-Banque Lambert Group represents an organisation similar to the finance houses already existing in France, Germany, Switzerland and Holland.

This operation lends a definitive character to the already close ties which exist between the Compagnie d'Outremer and the Bank. The Lambert family holds now, and will maintain, a controlling interest in the Compagnie d'Outremer and consequently in the Bank.

The evolution of the latter since 1953 is characterised by a short, very rapid progression. The yearly balance sheet total has moved from Bfrs.2,059 million to Bfrs.4,482 million, Deposits have increased from Bfrs. 1,660 million to Bfrs.3,014 million. The volume of credits recorded has swollen from Bfrs.700 million to Bfrs.2,408 million and the value of shares on deposit has risen from Bfrs. 3,866 million to Bfrs.14,427 million.

On numerous occasions, the Bank has taken the initiative in the field of international credit and in the placing of loans on foreign markets. It figures among the founders of the Syndicat Européen d'Etudes et de Financement, the fruit of which has been the formation of the European Unit Trust, *Eurunion*, which has met with great success on the markets of the Continent.

Furthermore, the Bank has reopened the Belgian Stock Exchange to foreign securities by the creation of Bearer Certificates in representation of Registered Shares. It has already obtained the quotation of 21 foreign stocks and the certificates currently in circulation represent an overall value of Frs.4,500 million.

Munich, April 1959

Board of Management: Wilhelm tom Dieck, Munich; Albin Hartlig, Munich; Jürgen von Köller, Munich; Dr. Werner Premauer, Munich; Dr. Gorman Schweiger, Nuremberg; Dr. Franz Steffan, Munich; Dr. Werner Teichmann, Munich; Dr. Hans Christoph Freiherr von Tucher, Munich; Elmar Warning, Munich.
Board of Directors: Dr. Ludwig Mellinger, Munich, Chairman; Dr.-Ing. E. h. Karl Butzengeiger, Kommerzienrat, Munich, Vice-Chairman.

Abridged statement by the Chairman, Mr. P. S. Henman.

Through twenty-three trading subsidiaries the Group now operates almost 500 road haulage vehicles, 330 barges, 30 wharves, 80 warehouses, and 5 cold stores, providing transport and storage services in many different fields, and to a diversity of trades and industries.

Group profit for the year ended 31st December, 1958, before tax and including profits earned by subsidiaries prior to acquisition, totals £413,578, which is £76,376 more than the corresponding figure for 1957. The profit for the year after tax attributable to the Group is £208,580, an increase of £58,302 over the previous year.

In addition to recommending a final dividend of 7½%, making 12½% for the year, the Directors have declared a special non-recurring interim dividend of 2½% in respect of 1959. This will not be taken into account when consideration is given to the payment of further dividends for 1959. The Directors also propose that a distribution of 1% free of tax be made from accumulated capital profits and that Reserves amounting to £294,560 be applied in paying up in full, 1,178,240 Ordinary Shares of 5s. each, such shares to be distributed in the proportion of one new Share for each three Ordinary Shares held on 3rd April, 1959.

The most important Group development during the year was the purchase at a cost of £363,000, of the Cardiff Pure Ice and Cold Storage Co. Ltd. and Welsh Cold Stores & Ice Co. Ltd. Cold storage will make a substantial contribution to Group profits in the future. New warehouses were built at Trinity Wharf in London and at Homco Wharf in Hull. The vehicle fleets were increased and the haulage service to Western Europe, inaugurated in 1957, was extended. A new canal barge, the first of a number designed to replace barges of smaller capacity, was constructed in the company's yards at Millwall, and in Hull a new power vessel was launched.

DEVELOPMENT If the future of the Group can be summed up in one word, then the word is 'Expansion'. Expansion of existing facilities and the acquisition of additional companies, but expansion and development to an ordered and cohesive pattern. We welcome approaches from companies which might fit into the Group pattern, for we have much to offer such companies. We seek from them a sound profit record, and a virile management wishing to continue in the service of the Group. In return we offer them all the benefits of a large scale organisation, with capital for development and expansion, without any loss of their individual identity, goodwill, or traditions.

FUTURE PROSPECTS In the first six months of 1958 trading was ahead of the same period in 1957 and then in the last six months the position was reversed. This year, so far, the pattern of the last six months of 1958 has continued but there are signs that there may be a general revival of trade in the latter half of this year which will enable us to continue the progress of past years. I therefore hope that, when I come to give an account of 1959, shareholders will have reasons for satisfaction.

SNIA VISCOSA

SOCIETA' NAZIONALE INDUSTRIA APPLICAZIONI VISCOSA

(Manufacturers of Man-made and Synthetic Fibres)

PROGRESS IN RESEARCH

The Annual General Meeting was held in Milan on March 21st, with Mr Franco Marinotti in the Chair.

The Directors' report begins by reviewing the situation of the man-made fibre industry throughout the world. Italian output during 1958 amounted to 351 million lbs compared with 365 million lbs in 1957. Generally speaking, however, production increased in the course of the year and at the end of 1958 prospects were decidedly better. Exports both of fibres and of finished goods maintained a remarkably steady level. The report further reviews the situation of the Snia Viscosa Group itself which produced a total of 212 million lbs of fibres in 1958 as against 230 million lbs in 1957. There was a redistribution of stocks, however, in the course of the year so that invoiced deliveries in the home market as well as abroad dropped to a lesser degree, amounting to 223 million lbs, as against 227 million lbs in the preceding year. During the period under review the Snia Viscosa Group considerably developed the production of synthetic and protein fibres, especially of Lilion and Rilsan, which were also sold in the form of plastic materials. Progress was also made in strengthening the plants for the production of the raw materials needed by the Group, as well as in research into the production of new polyamide, polyacrinolitrilic and polyester fibres. Glass fibre yarn production was also developed during the year. The situation of the Group's asociated companies in Italy and abroad proved satisfactory.

Cisa Viscosa continued its efforts to cut production costs and upgrade the quality of its products. Work is proceeding at the Naples factory on setting up a plant for the production of cellophane.

SAICI. Output of its various products (cellulose, alcohol, soda, chlorine, sodium hypochlorite, electric power) continued at the same rate as in the previous year.

Novaceta, a Company manufacturing rayon acetate, continued to make a name for itself in the face of keen competition through the quality of its product and the efficiency of its sales organisation.

In Spain, *Sniace* managed to maintain its rate of production in spite of the critical time through which the Spanish economy is passing. The financial year 1958 closed with satisfactory results.

In Argentina, *Sniafa* made satisfactory progress, and increased both production and sales.

Fibra in Brazil pushed ahead with its programme according to plan in spite of various difficulties and a complicated market situation.

Cechisa and *Vischisa,* the Company's two Mexican subsidiaries, did well during the year and showed satisfactory financial results.

The Balance Sheet closed with a net profit of Lit.2,138 million compared with Lit.1,965 million for the preceding year. As a result it has been possible to allocate funds for dividend payments of Lit.100 in respect of each Lit.1,200 nominal share. During the Extraordinary General Meeting which took place on the same day it was proposed to increase the Company's capital from Lit.21,000 million to Lit.27,450 million by a share issue with a nominal value of Lit.5,250 million, to be offered to shareholders at face value, and by means of an issue of bonus shares amounting to Lit.1,200 million.

In the course of the discussion the Chairman, Mr Marinotti, further developed certain points already touched on in the Report itself. He drew the Meeting's attention to the intense efforts made in the research sector which had contributed to increasing the technical efficiency of the Snia Viscosa Group and to extending its activities both in the field of raw materials and in regard to new products. As regards the integration of the Italian man-made fibre industry in the European Common Market, the Chairman declared that this development had not found the Group unprepared, both on account of its long tradition in export markets and because of the excellent relations it had maintained for some considerable time with the major European companies in this field.

In conclusion the Chairman referred to the Company's efforts abroad and said that the Group was anxious to be present wherever there was a concrete possibility of undertaking projects which were economically attractive.

The Chairman's statement was unanimously approved by the Meeting, which thus underlined its confidence in the Snia Viscosa Group's promising future.

Gestetner

LIMITED

TOTTENHAM, LONDON, N.17

The Company sells the world-famous Gestetner Duplicator and accessories, the electronic Gestefax and the Gestelith office offset duplicator. It has branches throughout the United Kingdom and subsidiary companies or representatives in all parts of the British Commonwealth, in the Americas, the Far East, and many countries in Europe. Extensive servicing facilities are available throughout the organisation.

THE RHEOSTATIC COMPANY LIMITED

RECORD EXPORT SALES OF "SATCHWELL" TEMPERATURE CONTROLS

The twenty-second annual general meeting of The Rheostatic Company Limited was held on April 22nd at Slough, Mr M. J. Gartside (chairman and managing director) presiding.

The following is an extract from his circulated statement for the year ended December 30, 1958:

Last year it was necessary for me to strike a warning note because at that time the company was suffering from a reduction of demand due to credit restrictions, with the consequent necessity of reducing the level of production and operating expenses accordingly. Prior to the end of the financial year credit relaxations, coupled with an unprecedented seasonal increase of demand, resulted in a rapid rise in the incoming order rate. The greater part of this increased demand was met from stocks of finished goods and by increase of production, and as a result the accounts show an appreciable improvement in profit. Export sales contributed valuably to the results and once again advanced to a level higher than ever before.

Trading profit was £228,836, showing a gratifying reversal of last year's downward trend. After tax the net profit was £119,452 (£110,960 last year). Your Board recommends the same final dividend as last year, i.e. 7½ per cent.

Your company continues to devote a high proportion of its revenue to its Technical and Research Departments. The order book is satisfactory and, subject to no unforeseen circumstances arising, I believe that the current financial year will show satisfactory results.

The report and accounts were adopted.

JAS. WILLIAMSON & SON

THE END OF A THREE-YEAR RECESSION

OUTLOOK MORE OPTIMISTIC

LORD PEEL'S STATEMENT

The twenty-eighth annual general meeting of Jas. Williamson & Son Limited was held on April 15th at Lune Mills, Lancaster, The Right Honourable The Earl Peel (chairman of the company) presiding.

The secretary (Mr J. Dunnington) read the notice convening the meeting and Mr R. G. Gorman, of Messrs Viney, Price & Goodyear, the company's auditors, read the report of his firm.

The following is the statement by the chairman circulated with the report and accounts:

Our net profit for the year to December 24, 1958, before taxation was £746,647 compared with £714,629 in the previous year. I might describe this as a modest, or partial, recovery, but it would I believe be more true to regard 1958 as marking the end of a three-year period of relative recession after the prosperous and rapidly expanding trading conditions of 1954 and 1955. Our business in 1958 began slowly; it recovered substantially during the spring and summer, and although the year ended and 1959 began with two poor months, the general outlook of the industries in which we are engaged was a good deal more optimistic at the end of the year than it was at the beginning. With this in mind your Board recommends the payment of a final dividend of 6 per cent on the £1,996,272 Ordinary and £665,424 "A" Ordinary Stock which with the interim dividend already paid makes 10 per cent for the year 1958 as in the previous year. In addition a special interim dividend of 2 per cent for 1959 has been declared.

DOMESTIC TURNOVER MAINTAINED

During the year we added substantially to our plant for manufacturing linoleum and towards the end of the year began to feel the benefit of this in increased production, particularly of the heavier qualities. This combined with close attention to good design and finish, enabled us to improve our turnover in the contract field and we should reap more benefit from this in a full year. Our turnover in the domestic field where we have long had a good reputation was well maintained.

On our coated fabrics side we have continued to make good progress both in vinyl leathercloth and in oil-coated wall coverings and table coverings.

Turnover in oversea markets declined, in spite of continued and increased time and effort expended on export markets during 1958. There was no lack of interest in our products on the part of customers and the buying public abroad, and the decline was due rather to artificial restrictions by quota, permit or duty in the importing countries. Some of these are doubtless necessary and until there is a general improvement in the economic position of the countries concerned we can hardly hope to achieve the high level of export business which we experienced in some previous years.

EUROPEAN COMMON MARKET

I welcome the formation of the European Common Market, an act of foresight and confidence on the part of its six members which cannot fail to benefit their trade in future years. I regret exceedingly, however, the failure to form a European Free Trade Area in which this country could participate. In its absence manufacturers in this country attempting to export to Europe will be at a progressive disadvantage compared with those in the main European manufacturing coun-

tries, and in the long run this can only lead to one thing, counter discrimination against them. This will result in both loss of trade and loss of goodwill and be no benefit either to us or to the members of the Common Market.

In the linoleum industry we have much goodwill in Europe both with customers and in our relations with competitors. We have nothing to fear from straightforward competition on equal terms, nor do we possess any hidden advantage which would make our competition unfair to them. I would welcome therefore reciprocal reductions in import duties and their eventual elimination and if this results in the public having a wider choice of design and types both in this country and in Europe, and in competition becoming even keener in quality and service, everyone will benefit.

CANADIAN SUBSIDIARY

Since the last General Meeting a subsidiary Company, Jas. Williamson & Son (Canada), Limited, has been formed with head office in Vancouver, to hold stocks of finished goods in Canada so that we can more readily develop our sales in that country. Although this subsidiary Company showed a small loss on the year its effect in increasing our business in Canada was considerable.

It is always dangerous to prophesy and conditions in the building industry are not sufficiently certain to predict the future a year ahead. I see, however, no reason for pessimism. I do not expect a spectacular recovery in 1959, but provided there is no sudden crisis in this country's economy, I would expect the better trend in our Company's business to continue, while if there were a marked improvement in the country's economy we are well placed to take advantage of it.

CHANGES ON THE BOARD

In August the Board suffered the loss of Mr L. Beswick, who died suddenly at his home. He had joined the Company in 1946 as Personnel Manager and undertook the additional work of Secretary to the Company in 1948, being appointed to the Board a year later. Much of the success of our Joint Consultative machinery since the war is attributable to his efforts and I should like to acknowledge here the work he did for the Company.

The loss of Mr Beswick so soon after the retirement of two Directors last year left your Board somewhat depleted, and I am happy to tell you that as from January 1st this year we have secured the services of Mr J. M. H. Grey, who, whilst primarily concerned in the Cotton Industry, has considerable business experience, and who I am sure will contribute much to our counsels. You will be asked to confirm his appointment at the Annual General Meeting.

TRIBUTE TO EMPLOYEES

As I have already implied, our labour relations have remained excellent during the year, and I would like to thank all employees of the Company for the way in which they have worked together to maintain the high tradition of service which exists in our organisation.

The report and accounts were adopted and the dividend, as recommended, was approved.

The retiring directors, The Right Honourable The Earl Peel, Mr I. D. Taverner and Mr J. M. H. Grey, were re-elected and the remuneration of the auditors, Messrs Viney, Price & Goodyear, having been fixed, the proceedings terminated.

THOMAS TILLING LIMITED

A FAMILY OF FIRMS

Insurance, Textiles, Engineering, Building Materials, 'Pyrex' Glass, Car Distribution, Electrical Equipment, Publishing and many other interests

"WE ARE POSITIVE EXPANSIONISTS AND NATURAL OPTIMISTS"

MR W. LIONEL FRASER'S REVIEW

The Sixty-Second Annual General Meeting of Thomas Tilling Limited will be held on May 14, 1959, at Crewe House, Curzon Street, London, W.1.

The following is an abridgement of the review by the Chairman, Mr W. Lionel Fraser, CMG, which has been circulated with the Report and Accounts for 1958:

NEW DIRECTOR

We welcome to the Board as an Executive Director, Mr Kenneth H. Chapman, who has been on the staff at Crewe House for over 10 years. His wide experience and legal knowledge will be of the greatest value.

EXPRESSION OF THANKS

It is with a special depth of gratitude that I pay tribute to the great and invaluable work of the men and women in all the member Companies of the Group. They have shown themselves to be efficient, courageous and resilient. With the Headquarters Staff at Crewe House, whose support and guidance is ever with them, they form a strong team and we have much to thank them for.

FINANCIAL COMMENTS AND RECOMMENDATIONS

The proportion of the 1958 profit before tax of £2,607,723 attributable to Thomas Tilling Limited was £1,831,300. This compared with £1,984,311 for 1957. The consolidated profit after tax of the year 1958 attributable to Thomas Tilling Limited, is £829,690, which is a decrease of £70,152 from 1957.

Preference Dividends of £79,990 have been paid and an Interim Dividend of 6¼ per cent on the Ordinary Stock was paid on November 24, 1958. Your Board recommend the payment of a Final Dividend of 7 per cent making a total of 13¼ per cent for 1958 (1957, 13¼ per cent).

ORDINARY CAPITAL TRANSFERABLE IN 4s. UNITS AND CAPITALISATION OF RESERVES

At a Meeting to be held immediately following the Annual General Meeting, it is proposed to subdivide the existing Ordinary Stock into Units of 4s. each, and to capitalise part of the Share Premium Account by the issue of new fully-paid capital to Ordinary Stockholders in the ratio of one new 4s. Ordinary Share for every £2 of Ordinary Stock held on April 21, 1959. Our reasons for proposing that the Ordinary capital should be transferable in 4s. units are threefold:

(1) To conform with modern investment thinking.

(2) To make it easier for the smaller investor, should he be so minded, to participate in our future progress, and

(3) To improve marketability on the Stock Exchange.

FUTURE DIVIDEND

Provided no unforeseen circumstances arise, your Board would hope to be able to recommend for the current year, interim and final dividends on the Ordinary Stock (as increased by the issue to which I refer above) at rates not less than those for 1958.

The Chairman, having given reports on the various Companies, then continued:

GENERAL REVIEW AND PROSPECTS

I must admit to some disappointment that we did not beat our record profit figure of last year, but it is a fact that some companies had a remarkably fine year and some achieved wonders in maintaining the 1957 level. Others, mostly for causes beyond their control, perforce had to bend to the wind, but all the same I do not hesitate to say that 1958 will prove to have been a year of outstanding work throughout our Group. Not only was every opportunity taken to institute measures to improve efficiency, reduce costs, eliminate waste, establish better procedures, produce better goods and give better services, but these steps were effected with a rhythm and a determination which showed more clearly than ever that our conception is right; that in the joining together of so many varied, yet vital, interests there has developed a unity of purpose which constitutes a firm basis for the further success which we are striving to achieve.

I have said before that we have fine men and that we have fine businesses. I am more certain of this now than ever. We are positive expansionists and natural optimists, who have confidence in the British people and in our own efforts. This is a true "Family of Firms," constructive but competitive: tough, too, but never ruthlessly so. In favour of this new title, we have discarded that of "Industrial Holding Company"—which we invented for ourselves some ten years ago—as being an unsuitable description of our functions. Part of our strength comes from diversification—an overburdened, hackneyed word these days—but in Tillings we know that diversification is ineffective without inspiration and co-ordination. Our objective is to extend the activities of our present member Companies, where a pattern is already unfolding, as much as in further partnership with carefully selected newcomers for whom we always have room.

What of the future? Against the background given above and knowing what I do of the possibilities of our Group, it is not in me to be other than confident. All our plans are long term, for our destiny cannot be shaped quickly. We have a vigorous, alert and buoyant organisation, and your Directors intend to uphold your Company's progressive record.

If you are interested in obtaining a copy of the full Report and Accounts please write to: The Secretary, Thomas Tilling Limited, Crewe House, Curzon Street, London, W.1.

COMPANY AFFAIRS

CUNARD STEAM SHIP

After the passing of the interim ordinary dividend last October, shareholders in Cunard Steam Ship must now feel relief that the preliminary profit statement for 1958 is no worse. The falls in the group's operating surplus from £6,230,030 to £5,670,919 and in net income from £1,287,620 to £899,479 are not so serious as had at one time been feared. Moreover, the final dividend is being left unchanged at 8 per cent, so that the total distribution has been cut only from 10 to 8 per cent—which again is less than the market had feared.

Cunard's North Atlantic passenger services, on which the directors last October reported "a satisfactory increase," in profits have stood the group in good stead. The directors in fact attribute the fall in the operating surplus to lower cargo freight rates and to the reduced volume of cargo traffic. They add that results from passenger traffic showed their "anticipated resilience." Nevertheless, Cunard is seeking a subsidy from the government for the replacement of the "Queens" and investors cannot fail to note that the long term trend in Cunard's profits is downwards.

UNITED DRAPERY STORES

United Drapery Stores is still intent on expansion, but its decision to raise another £3 million in new money by a rights issue of one new 5s. ordinary share for every ten held at 20s. per share came as a surprise. UDS may have been one of the companies whose plans to raise fresh capital were frustrated by the CIC, but only a year ago it created a 6 per cent unsecured loan stock specifically designed for issue to vendors of any businesses it purchased. So far only £1,300,000 of this stock has been issued, in connection with the acquisition of Allders Limited. Whether the new issue of ordinary shares is to provide the cash for further acquisitions instead of issuing more loan stock is not clear. It may be that the directors wish to broaden the equity base. The revival in HP trading must have added to UDS's working capital commitments and the modernisation and development of the shop properties it already owns cannot yet be complete.

Ordinary shareholders in UDS will not, however, be dissatisfied with the terms. The ordinary dividend for 1958-59 has been raised from 32½ to 35 per cent by a special interim of 2½ per cent and the directors intend to maintain 35 per cent on the increased capital. Thus the new shares are being offered at a yield of 8¼ per cent. The existing shares at 39s. 1½d. cum rights yield 4½ per cent.

The preliminary statement also suggests that the advance in profits was gaining momentum after the removal of the HP restrictions last autumn. Over the first six months of the financial year, trading profits rose by only £146,268; over the full year to January 31st they rose by £781,050 to £7,912,927. That profit lies partly in the future, for from it the directors deduct £503,832 (against £72,579) as a "provision for unearned profit on hire purchase debts and for debt contingencies." After providing for unearned profits and for more in loan interest, but for less in tax, net profits have risen by £542,840 to £3,252,973.

VICKERS

In contrast to the interim figures for the first six months of the year the preliminary results of Vickers for the whole of 1958 reveal a decline in profits. After making the necessary adjustment to the figures for Powers-Samas, which is no longer a subsidiary, consolidated gross profits have fallen from £13,198,371 to £12,650,634. Turnover in the first half of the year was only £1½ million below the level of the corresponding period of 1957. But over the full year the group's sales declined by £19½ million to £177 million and by the end of the year orders in hand had fallen from £376 million to £312 million.

The company has adjusted its tax provision to allow for the reduction in the standard rate of income tax and the sharp fall in the total tax charge from £6,995,742 to £6,058,377 has left net profits £389,628 higher at £6,592,257. The total ordinary dividend is left unchanged at 10 per cent, covered just over twice by earnings. The £1 ordinary units at 34s. 4½d. yield 5.8 per cent.

NUCLEAR POWER PROFITS

The boom in atomic power shares is now history, but it left as its legacy low yields on the equities of the companies that are members of the nuclear power groups. The only continuing justification for these slender yields is the high earnings. Nuclear power contracts have not produced any sizeable increases in profits so far and the future profits that will be earned from them look limited. In the meantime the business of the companies in this field in their traditional lines, such as switchgear and boilers, has taken a knock.

A. Reyrolle manufactures switchgear and is a member of Nuclear Power Plant Company. Its trading profits fell slightly from £2,593,061 to £2,524,639 last year, but a higher charge for depreciation was more than offset by a decline in taxation and an increase in its income from trade investments, from £305,454 to £348,615, resulted in a rise of £5,171 in net profits to £1,358,257. Turnover was at a record level last year, but the value of new orders received fell and the chairman, Mr H. H. Mullens, anticipates a fall in production this year. On the unchanged dividend of 17½ per cent its £1 units yield 3.9 per cent at the current price of 89s. xd.

Reyrolle holds 40 per cent of the equity capital of **C. A. Parsons**, which manufactures turbines and is a fellow member of Nuclear Power Plant Company. Parsons' gross profits fell in 1957 and again in 1958, this time by £713,173 to £3,381,738. But taxation fell even more steeply by £760,809 to £1,240,454, and so net profits were slightly higher at £2,091,284. A special interim dividend of ⅛ per cent has been added to the unchanged 7½ per cent total ordinary dividend for 1958. This is a modest increase indeed, for the dividend is covered about five times by earnings. The £1 ordinary units at 49s. 6d. yield 3.3 per cent.

Simon-Carves has interests in the construction of nuclear power stations, but it also has a wide-ranging business elsewhere in heavy engineering and construction. Last year its gross profits rose by £53,229 to £1,461,814 and its net profits by £16,334 to £686,301. The interim dividend was raised from 7½ to 10 per cent and though the directors specifically said that this was to reduce the disparity in the two payments, their decisions to cut the final payment by 2½ per cent to 15 per cent, leaving the total unaltered at 25 per cent, somewhat disappointed the market, for this dividend is covered about three times by earnings. The 5s. ordinary shares fell back a little and at 30s. 9d. yield only 4.1 per cent.

Babcock and Wilcox are the boiler-making members of the nuclear power group headed by English Electric. Results for 1958 are disappointing. Gross profits have fallen from £4,589,990 to £3,277,626 and despite a sharp reduction in tax, net profits are down from £2,420,903 to £1,761,400. After a rights issue on bonus terms at the beginning of 1958 a total dividend equivalent to a payment of 13 per cent on the larger capital was paid. This rate has been maintained for 1958 but it is now covered only just over twice by earnings. At 49s. 9d. the £1 units yield 5.2 per cent.

WEST RIDING WORSTED AND WOOLLEN

The offer by West Riding Worsted and Woollen Mills for the share capital of Lister and Company is a further step towards concentration in the woollen trade. It follows the successful bid last October by Illingworth Morris for a majority equity holding in Salts (Saltaire). The acquisition of Lister, if it goes through, will give West Riding a footing

Continued on page 379

ICI Through Recession

IMPERIAL CHEMICAL INDUSTRIES again revalued its physical assets at the beginning of last year and this has resulted in even more massive changes in the consolidated balance sheet at December 31, 1958, than occurred on the 1950 revaluation. This process is not a mere book-keeping matter, interesting to shareholders only in that it reveals the true strength of ICI. The reasons lie deeper. ICI is an enormous employer of capital and its continual aim has been to make its operations more capital-intensive. No sensible policies can be planned by such a business unless it has an accurate assessment of the assets it employs and hence of the true rate at which these assets should be written down. ICI charges depreciation against profits on the basis of the replacement cost of its physical assets so shareholders can see clearly what the directors are doing to keep the undertaking's capital intact. This is preferable in all ways to the kind of bland assurance by some companies that an up-to-date valuation of the assets has shown that sums put to replacement reserves over and above depreciation are adequate.

From the revaluation a net book value of over £492 million emerges for the group's physical assets; the book surplus on this new valuation of over £68 million is transferred to capital reserves. The assets were valued at their replacement cost on January 1, 1958; this gross value was then reduced by taking into account the expired life of the assets and their estimated future life. This gives the net figure, after depreciation, of £492 million in the balance sheet. The full present-day replacement cost of the assets would exceed that figure by about £230 million, but the directors consider that depreciation and replacement provisions in the past adequately cover the need. Depreciation was calculated on the new asset values last year and this, rather than new investment in plant, explains the increase in the provision from £24½ million to £29½ million last year; it is less than might have been expected because the revaluation revealed that many plants had a longer economic life than had been previously assumed. Depreciation on the new basis, plus the transfer to replacement reserves against any further rise in construction costs, should fully allow for replacement of the assets in the future.

The revaluation has greatly reduced the ratio of gross income to total assets employed—from 11 to 8 per cent. But the rate of return would have fallen even without the revaluation because last year new capacity was still being installed and ICI was earning lower profits. There has, in fact, been a fall in the gross profit margin to sales over the last four six-monthly periods: 12.8 per cent, 10.9 per cent, 10.5 per cent and 8.6 per cent. Over last year as a whole, the margin fell from 11.9 to 9.6 per cent. Turnover last year showed no apparent change at £462½ million, but in fact alterations in the group's structure affected this figure and there was a real increase of about £10 million over 1957.

Price changes last year, some up and some down, had little effect on turnover, and sales both in value and volume remained practically unchanged even though new plants came into production. Increases in wages, salaries and transport charges were less than in previous years and they were offset to some extent by the fall in the prices of raw materials consumed by ICI. Costs rose and profits fell because a number of plants were being operated "at levels appreciably below their full capacity," and initial expenditure to bring new plants in also added to costs.

NOT even ICI could opt out of the recession. The effect on total sales was slight, because some of the divisions continued to boom, but the effect on profits was unmistakable, for some highly capitalised plants were underemployed. ICI's export sales actually rose by about 2 per cent, to £73.8 million, for increased sales to Europe and Australasia offset a decline in sales to India, Africa and South America. Total exports of some products, notably plastics, "Terylene" and sulphate of ammonia, were appreciably bigger. At home, sales by the paint, plastics and leathercloth divisions ran at a high level, because one of their principal customers, the motor industry, enjoyed a good year. Fertiliser sales were also higher. But the depression in textiles reduced the sales of chemicals used in processing and dyeing (with, for example, the rayon industry reducing its purchases of caustic soda) and domestic sales of "Terylene" were also lower. Building, iron and steel and coal industries bought less from ICI (the fall in output of deep-mined coal hit the Nobel explosives division), and the cutback in the production of military aircraft has reduced sales of titanium. Practically every division had to sell in more competitive markets and that was as true of those that were able to achieve an increase in sales as in those that did not. The heavy organic chemicals division in the Billingham-Wilton complex, for instance, manufactures about one third of Britain's petroleum chemicals and sales last year rose in volume by about 13 per cent; but ICI, noting the additions to capacity elsewhere in Europe, says plainly that competition will become increasingly severe.

ICI's answer to competition is to maintain the drive towards more capital-intensive operations. Last year £45.3 million was spent on capital account, against £50.6 million in 1957, and further expenditures of £49.8 million are sanctioned. The tendency as more capital is installed is to employ less labour. ICI's payroll was reduced last year from 115,846 to 112,108, mainly because some of ICI's activities were transferred to Yorkshire Imperial Metals; but there was some redundancy, mainly in the Nobel and metals divisions, resulting from changes in the pattern of business and from mechanisation. The company has tried to lessen the impact of redundancy by transferring labour elsewhere in the group or by offering generous payment on dismissal.

For the ordinary shareholder, whose dividend was effectively the same as in 1957, the impact of the group's policies is clear. As ICI becomes more heavily capitalised, its profits become more vulnerable, as last year's recession demonstrated. But profits quickly respond to any improvement in industrial production. ICI's sales were beginning to improve in the last quarter of 1958 and as economic activity expands ICI will certainly be a gainer. That is the justification for a yield of 4.7 per cent on the £1 ordinary shares standing at 34s.

Continued from page 377

in silk spinning and manufacture as well as adding to its established interests in the woollen and worsted industry. West Riding is offering five 6 per cent £1 cumulative preference shares for six Lister 5 per cent £1 cumulative preference shares, and three £1 ordinary shares for every ten £1 ordinary shares in Lister. With West Riding's ordinary shares standing at 56s. 9d. the offer is worth about 17s. for each of the Lister ordinary shares, against a market price of 13s. 4½d. The directors of Lister have accepted the offer in respect of their own holdings. Presumably, the other shareholders will follow suit, for the Lister shares have never been higher than 14s. 9d. since 1956, and fell to 7s. 10d. last year when Lister passed its ordinary dividend.

BRITISH MOTOR

THE decision by the directors of BMC, not only to pay an interim ordinary dividend of 7½ per cent (against 4 per cent) following the special interim of 5 per cent of last November, but also to make a 30 per cent scrip issue took investors by surprise, though Sir Leonard Lord had already said that "the going had been rather better than expected." Investors must now decide on what dividend basis the 5s. shares now stand. They will note that last year's effective final dividend of 13.5 per cent is equivalent to 10.4 per cent on the new capital. If this is rounded up to, say, 11 per cent the total ordinary dividend would then be 16.8 per cent, after scaling down the 7½ per cent interim dividend now paid on the existing capital. But the market is hoping for more than this, setting its sights at not less than a total dividend of 17½ per cent. On that assumption the 5s. shares would yield 5¼ per cent at 17s.

DISCOUNT HOUSE PROFITS

THE small and medium sized discount houses reporting this spring, like the larger houses with balance sheets to end-December, show striking improvements in earnings in their latest year, during which they have benefited from the sharp reduction in money and bill rates. The discount market has made very good running profits on its bond holdings, and the successive reductions in Bank rate gave them a capital gain on portfolios of both bills and bonds. This year, however, competition for the available Treasury bills has heightened while the cost of money has tended to increase.

Smith St. Aubyn discloses a net profit of £233,682 after transfers to reserves for the year to March 31st, compared with £188,160 in the previous year. The ordinary dividend has been raised to 15 per cent. In the previous year a total equivalent to 9⅜ per cent on the capital as increased by a one for three scrip issue was paid.

Allen, Harvey and Ross also made a scrip issue last year. It was able to raise its ordinary dividend to 12 per cent for 1957-58, and this year has maintained this rate of dividend on capital increased by a two for nine scrip issue. The directors had previously forecast a payment of 10 per cent on the larger capital. Disclosed net profits rose from £125,452 to £145,112 for the year to April 5th.

Jessel, Toynbee maintained its dividend at 10 per cent after a three for ten scrip issue. Disclosed profits for the year to March 31st jumped from £96,557 to £177,247, but in the previous year the company reported a decline in profits.

Cater, Brightwen has maintained its total ordinary dividend at 15 per cent although its disclosed net profits for the year to April 5th have jumped from £111,647 to £216,099. But the company is to make a one for five scrip issue and hopes to maintain this rate of dividend on the increased capital.

THOMAS TILLING

SINCE its formation as an industrial holding company Thomas Tilling has had a record of uninterrupted expansion. It did not stop expanding in 1958. It sold its majority holding in Mutual Finance to Mercantile Credit, but it made new acquisitions as well. The changing pattern of holdings within a group such as this makes a comparison of one year's results with another impossible. The 1958 accounts show a decline in total income from £3,631,780 to £3,399,995. Elsewhere in the group, Cornhill Insurance earned better profits, but some other companies did not fare so well; textiles were depressed and technical difficulties reduced the profits of James A. Jobling.

Net profits after tax fell from £1,324,585 to £1,200,412 and the ordinary dividend was left unchanged at 13¾ per cent. But the dividend will not be left unchanged for long: a one-for-ten scrip issue has been proposed and the directors intend to maintain the current rate of dividend on the enlarged capital. The ordinary shares are also to be split into 4s. units, improving marketability. The £1 ordinary shares now stand at 68s. xd to offer a prospective yield of 4.3 per cent.

SPILLERS

IN the year to January 31st the net profits of Spillers rose by over one-third, from £1,492,000 to just over £2 million, and the directors are effectively raising the ordinary dividend from 8¾ per cent to 10 per cent. The advance in net profits still leaves the ordinary dividend covered nearly 2½ times. No doubt Spillers continued to find flour milling highly comptitive in view of the industry's excess capacity, but the bakery division probably contributed to earnings even more than it did in 1957-58. In addition, profits from sales of animal feeding stuffs should have benefited as those of Unilever did last year. The £1 shares have risen by 2s. 3d. to 44s. 9d., at which they yield just under 4½ per cent—a not uncommon return on food shares these days.

London Stock Exchange

FIRST DEALINGS:	Apr. 15	Apr. 29	May 20
LAST DEALINGS:	Apr. 28	May 19	June 2
ACCOUNT DAY:	May 5	May 26	June 9

GILT edged stocks were dull when dealings began in the 5 per cent LCC loan stock 1980-83. The stock (£10 paid) opened at 8⅜ and closed at the same price on Wednesday after touching 8⅞. But later in the week prices were marked up throughout the list under the lead of the "tap" stock Conversion 5½ per cent 1974, which rose by ⅝ to 101 7/16.

Industrials were firm at first but activity slackened on Tuesday and buying remained selective. *The Economist* index gained 1.6 to 260.1 over the week to Wednesday. Among blue chips, Glaxo lost 2s. 3d. to 46s. xd and EMI the same amount to 54s. 6d., but Hudson's Bay gained 3s. 9d. to 222s. 6d., and Unilever NV 1s. 9d. to 123s. 9d. In motor and component shares, Standard gained 11¼d. to 10s. 3d. on the announcement of the "Herald" models and Jaguar regained 6s. 9d. to 56s. 3d. on Wednesday on bear covering, but even so the shares had made a net loss of 6s. 10½d. over the week. Automotive Products jumped by 4s. 7½d. to 65s. 7½d. on take-over rumours and dividend hopes. Among commercial vehicles, Leyland gained a further 2s. 6d. to 53s. 6d.

In aircraft shares, Fairey rose on US buying by 2s. 1½d. to 22s. 4½d. Electrical issues were particularly active; Plessey gained 8s. to 84s. 3d. on the scrip and impending "rights" issues. But following the AEI chairman's report that a loss had been incurred on the Berkley power contract, GEC lost 2s. to 34s. and English Electric 9d. to 64s. Cotton shares continued to advance in anticipation of the Government's announcement, but woollen textiles, having advanced quite strongly earlier in the week, weakened on Wednesday following the US decision on quotas. Aire Wool lost 6d. to 28s. 3d. on that day although it made a net gain of 2s. 3d. over the week, and Woolcombers 1s. 3d. to 59s. 6d. Commercial Union's bid for North British led to rises in other insurance shares; Eagle Star went up by 7s. to 96s., Atlas by 6s. to 85s. and Scottish Union by 4s. to 82s.

Oils were dull pending the outcome of the Arab oil conference, but Shell's surprise bid for Canadian Eagle announced late on Wednesday put Ultramar 2s. 6d. higher to 69s. 6d., a gain of 1s. 3d. on the week. Shell Trinidad also gained 2s. 6d. on Wednesday to close that evening 6s. higher on the week. Kaffirs were dull, with FS Geduld losing 6s. 10½d. to 175s. and Western Holdings 3s. 8½d. to 146s. 10½d. Coppers were subdued at first but hardened later following the rise in the metal price, Chartered gaining 1s. 3d. on Wednesday to 85s. 3d. But elsewhere Messina lost 3s. 1½d. to 116s. 10½d. and Rhodesia Katanga 1s. 3d. to 15s. 3d.

THE MONEY MARKET

NOT unexpectedly, the discount market syndicate reversed tactics at last week's Treasury bill tender. The market's concerted bid was lowered by 3d. to £99 3s. 9d., following the rise of 6d. at the previous tender after the budget, and its allotment fell from 65 per cent to 38 per cent. This was the lowest proportion obtained since February 20, when the market dropped its bid by 9d. The Treasury allotted only £230 million of the £250 million of bills offered, but total applications declined by £47 million to £387 million. The average rate of discount rose from £3 4s. 0.89d. per cent to £3 4s. 8.12d. per cent, compared with a rate of about £3 5s. obtained by the discount market on its basic allotment.

Credit became easier just before the week-end, the authorities having to sell bills to mop up a small surplus of funds on one occasion, but tighter conditions returned on Saturday and the authorities then made small special purchases. On Monday three or four houses borrowed a small amount at Bank rate.

The average rate of allotment for 91-day bills at the latest tender of United States Treasury bills rose from 3.075 per cent to 3.105 per cent, the highest since December 1957.

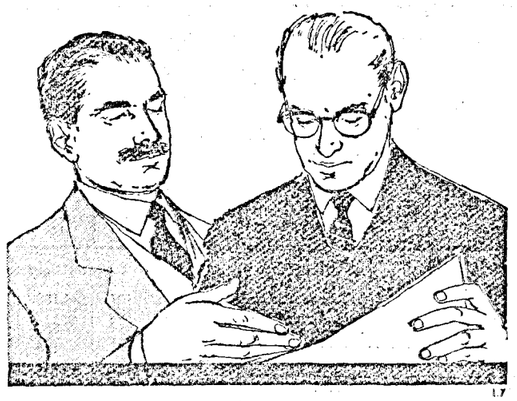
If she suddenly became the bread-winner...

Life's busy enough now for your wife—looking after you and the children, managing the home.

But think of that other, lonely life if you weren't there: the job-hunting, the strenuous work with strict hours, and then the housework to do in the evening. No time for fun and playing with the children. It's a barren existence for a mother, but that is what might face your wife.



What have you done about it? Adequate life assurance is the answer. Talk it over with the man from the Prudential. He will suggest a policy to fit your individual needs.

Ask the man from the

APPOINTMENTS

GKN

THE GUEST KEEN AND NETTLEFOLDS GROUP OF COMPANIES wish to make the following appointment in one of their constituent companies.

OPERATIONAL RESEARCH

A vacancy exists in the South Wales Operational Research Unit of the Guest Keen & Nettlefolds Group of Companies. This is a new unit which serves all Group Companies in the South Wales area.

Applications are invited from qualified mathematicians, mechanical or electrical engineers and statisticians. Some experience in Industry or Operational Research would be an advantage, coupled with enthusiasm and an ability to get on with people. Replies in writing quoting ref. OR/2 to: Recruitment Officer, G.K.N. Group Research Laboratory, Birmingham New Road, Lanesfield, Wolverhampton.

TECHNICAL SALES

Hilger & Watts Ltd., seek to engage a suitably experienced man who will undertake scientific liaison and sales work in Lancashire and Yorkshire, mainly in the field of Automatic Analytical and Data Reduction equipment, and invite applications in confidence to The Chief Personnel Manager, 98 St. Pancras Way, London, N.W.1.

DATA PROCESSING (IBM)

MULLARD RADIO VALVE CO., LTD.

MITCHAM, SURREY

has one or two vacancies for

ACCOUNTANTS OR GRADUATES

in the planning section of an Integrated Data Processing Unit for the factory. Punched Card knowledge preferable but not essential.

Candidates should have industrial accounting experience including standard costing, knowledge of, or interest in, clerical systems analysis and office machines and some mathematical ability. Age 23-30.

Starting salary not less than £750, or more according to age, qualifications and experience, according.

Applications giving full personal particulars should be sent, in confidence, to:

The Personnel Officer,
MULLARD RADIO VALVE CO., LTD.,
New Road,
Mitcham Junction, Surrey.
quoting ref. IBM/JFG.

STATISTICIAN is required by the International Latex Corporation as an assistant in their Quality Control Department. The successful applicant should have had a comprehensive training in statistical method and applied statistics preferably to degree standard. Working experience in this field would be a decided advantage. Applications to the Personnel Officer, International Latex Corporation, Industrial Estate, Port Glasgow.

QUALITY CONTROL MANAGER

A well-known American Company in Scotland has an important opening for a Quality Control Manager.

The man we are looking for will:

—be conversant with the most advanced quality control techniques;
—be a University graduate with a degree in statistics or equivalent academic background;
—have had some years' practical experience in a senior post in this field.

This opening has been created by expansion within the Company, and carries a four figure salary. Prospects are excellent for the successful applicant who possesses the essential qualifications and experience, plus energy, drive, initiative and personality.

Applicants should forward full particulars (education, chronological break-down of career to date, age and salary required) within 7 days of the appearance of this advertisement. All replies will be treated in the strictest confidence. Box No. 1156.

THE UNIVERSITY OF MANCHESTER

WARBURTON SCHOLARSHIP IN LOCAL GOVERNMENT

Applications are invited for the above Scholarship for research in local government, the law relating to local government, or comparative local government. The Scholarship is tenable for one year and is of the value of £700. It is open to graduates of this or any other approved University, and applications are acceptable from students who expect to graduate this summer.—Applications should be sent not later than July 1, 1959, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

DUNLOP RUBBER COMPANY LIMITED

ECONOMIST

The Company requires an economist for a new post in the Economic Intelligence Department at the London Head Office.

The successful candidate will be between 25-30, possess a good honours degree and have at least three years practical experience in economic analysis and interpretation.

The ability to think clearly and write concisely on a wide variety of problems involving the Company's activities will be essential. A good knowledge of sales forecasting techniques and statistical methods would be a useful additional qualification.

The commencing salary would be based on the calibre and experience of the candidate, and the post offers good future prospects.

Applications, which will be treated in the strictest confidence, to:
Finance Personnel Manager, Dunlop Rubber Co. Ltd., St. James's House, St. James's Street, London, S.W.1.

BUCKINGHAMSHIRE EDUCATION COMMITTEE

SLOUGH COLLEGE OF FURTHER EDUCATION
(Principal: R. Edgar, M.Sc., M.A.)

Applications are invited for the post of Senior Lecturer in Management Studies, the appointment to date from September 1, 1959. Candidates should possess high academic and/or professional qualifications. Experience in industry in a responsible position is essential. Management courses are well-established and short courses at post-graduate level have been developed. The successful candidate will be encouraged to undertake research and to assist in the further development of courses.

Salary will be paid in accordance with the Burnham Report, i.e., for a man £1,350 x £50 to £1,550 per annum. The five per cent Special Addition to Salary (1959) will also apply.

Forms of application and further particulars may be obtained by forwarding a stamped addressed envelope to the Principal at Slough College of Further Education, William Street, Slough, Bucks, to whom completed forms should be returned within fourteen days of the date of the appearance of this advertisement.

GRADUATE ASSISTANT

COURTAULDS LIMITED require a man or woman GRADUATE ASSISTANT in their London office. The work will be concerned with import tariffs and other questions affecting international trade in man-made fibres and related products. Candidates should be able to marshall facts and figures and to present complicated data concisely and clearly. Only candidates with a good Honours degree will be considered.

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 16 St. Martin's-le-Grand, London, E.C.1, quoting reference number E.92.

THE UNIVERSITY OF SHEFFIELD

Applications are invited for a post of ASSISTANT LECTURER in POLITICAL THEORY and INSTITUTIONS, to begin duties on 1st October, 1959. A candidate should be interested in Political Institutions. Salary scale £700 x £50—£850, with F.S.S.U., provision and family allowance. A grant towards removal expenses will be made. Further particulars may be obtained from the Registrar to whom applications (4 copies), including the names and addresses of three referees, should be sent by 16th May.

BRITISH COKING INDUSTRY ASSOCIATION is prepared to receive applications for the post Director of the Association in succession to the late Mr. Leslie O'Connor. The Association includes almost all producers of hard coke; it deals with commercial, technical and administrative matters on behalf of the Industry, including its relations to Government departments. Its headquarters are in London. Salary commensurate with qualifications; satisfactory pension arrangements. Applications in confidence to Sir Frederick Scopes, Chairman, B.C.I.A., 74 Grosvenor Street, W.1.

UNIVERSITY COLLEGE OF GHANA

Applications are invited for post of Chief Accountant from professionally qualified accountants with several years' practical accounting experience, preferably in a University or equivalent institution. Interest in, or knowledge of, systems of mechanised accounting an advantage. Salary scale: £1,925 x £75—£2,150 per annum, F.S.S.U. Outfit and family allowances. Passages for appointee and family on appointment, annual leave and normal termination. Part-furnished accommodation at a charge not exceeding 7.5 per cent of salary.

Detailed applications (6 copies) naming three referees, by May 30, 1959, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

ACCOUNTANT FOR SOUTH AFRICA

A qualified accountant aged 33-45 is required for the South African Subsidiary of a Group of Civil Engineering Contractors. This is a new appointment though the group itself is well established in the territory.

The position, which calls for experience of management accounting, preferably in the contracting industry, will carry a salary of about £2,000 p.a. After an exploratory interview selected candidates will be asked to meet members of the South African Company in London. A period of some months is envisaged in the U.K. prior to going overseas.

Please write, with relevant information, to Box 1160.

UNIVERSITY OF OXFORD

LECTURESHIP IN SOVIET ECONOMICS AND INSTITUTIONS

The University proposes to appoint with effect from October 1, 1959, a lecturer in Soviet Economics and Institutions. Stipend in the scale £900-£1,750 per annum plus F.S.S.U. and children's allowances of £50 per annum for each child. Eight copies of applications, with names of two referees, by May 11, 1959, to Secretary of Faculties, University Registry, Oxford, from whom further particulars may be obtained.

HEAD OFFICE near St. Paul's of important international mining house requires woman graduate in economics with good experience and statistical acumen as junior assistant and librarian to Economic Adviser. Salary £750-£1,000 according to qualifications and experience. Write Box C.119 c/o Streets, 110 Old Broad St., E.C.2.

CYANAMID OF GREAT BRITAIN LIMITED

require a

STATISTICIAN

to lead a department responsible for all Statistics and Market Survey, in an expanding worldwide organisation. Background for this replacement appointment should include Economics degree, plus minimum 4 years' business Statistics and related experience.

Commencing salary around £1,400 per annum.

Employee benefits include contributory Pension/Life Assurance Scheme.

Applications, which will be acknowledged, should be addressed, in complete confidence, to:—

PERSONNEL MANAGER,

CYANAMID OF GREAT BRITAIN LIMITED

BUSH HOUSE, ALDWYCH, LONDON, W.C.2.

(Anyone who replied to our February, 1959 advertisement should not apply again.)

GILT EDGED DEPARTMENT

Leading firm of Stock Brokers requires someone with experience of [illegible] switching, etc., to take over and develop their Gilt Edged business. Substantial participation in profits for the right person. All enquiries treated as confidential. Box 1159.

ACCOUNTANTS

THE MULLARD RADIO VALVE CO., LTD.

MITCHAM, SURREY

requires one or two Accountants to help develop the Punched Card Department to serve the data processing requirements of the factory.

Work will involve investigation of existing procedures and the design and installation of improved methods.

Men who can take a broad view of accounting and are bold and imaginative enough to propose unorthodox approaches are wanted. Training will be given in the use of Punched Card machines. Starting salary will be in the region of £900-£1,100 according to age and qualifications.

Applications giving full personal particulars should be sent, in confidence, to:

The Personnel Officer,
MULLARD RADIO VALVE CO., LTD.,
New Road,
Mitcham Junction, Surrey.
quoting ref. IBM/JFG.

GILT-EDGED. Statistician with experience in Gilt-Edged or young man, actuary or with economics degree, required by leading progressive firm of stockbrokers. Good salary, good prospects, pension scheme. Box T.2343/2 c/o Foster Turner & Everetts Ltd., 11 Old Jewry, E.C.2.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

Applications are invited from graduates for the post of ASSISTANT LECTURER IN SOCIAL SCIENCE in the Department of ECONOMICS AND SOCIAL SCIENCE. Experience in social work and social research will be regarded as additional qualifications. Applications (six copies) should be sent not later than May 16, 1959, to the Registrar, University College, Cathays Park, Cardiff, from whom further particulars may be obtained.

UNIVERSITY COLLEGE OF WALES ABERYSTWYTH

Applications are invited for the post of Assistant Lecturer in the Department of International Politics, to take up duties on October 1st next. Applications should be sent to the undersigned, from whom further particulars may be obtained, by May 8, 1959.

T. MAELGWYN DAVIES,
Registrar.

THE POLYTECHNIC

309 REGENT STREET, W.1.

SCHOOL OF COMMERCE

Applications are invited for two full-time appointments as Grade B teachers, duties to commence on 1st September next.

(a) to teach Statistics as main subject and Mathematics as subsidiary to students taking B.Sc. (Econ.) alternative statistics paper, the Association of Statisticians' final, and G.C.E. Advanced level Mathematics examinations; and

(b) to teach Spanish as main subject and German to students taking secretarial, G.C.E. Advanced level and B.Sc. (Econ.) courses. Ability to teach also some French would be an additional recommendation.

The salary scale for a graduate rises to £1,155 per annum, plus London allowance of £37 10s. or £50 8s. Additional allowances are payable for a good honours degree and training where appropriate. The commencing salary will depend upon qualifications and experience and may include up to twelve increments in respect of Industrial experience. The posts are subject to superannuation and some concession in this respect may be made for previous industrial employment.

Application forms, to be returned within two weeks of the publication of this advertisement, may be obtained by sending a stamped addressed foolscap envelope to the undersigned.

J. E. RICHARDSON,
Director of Education.

REED PAPER GROUP

is expanding its

MARKET RESEARCH UNIT

A number of new appointments are being created in the Unit, which is based in London and provides research services for the parent company and all subsidiary companies of the Group. Its activities cover a wide range of products and markets in the paper and board, packaging and other converted paper product fields.

Appointments will be made at various levels and applications are invited from men holding first or second class honours degree with:—

(a) several years' experience in industrial market research, or

(b) a good knowledge of statistical methods coupled with some industrial market research experience, or

(c) experience in technical sales, preferably in the paper and board or packaging industries.

These posts offer the possibility of real satisfaction and the opportunity for original and stimulating work. The prospects are excellent and attractive starting salaries and other benefits will be offered to the successful candidates.

Apply in writing, giving full details of qualifications and experience to:—

The Group Personnel Officer,
ALBERT E. REED & CO. LTD.,
Larkfield, Near Maidstone, Kent.
Quoting Ref. MR/25.

THE NORTH BRITISH RUBBER COMPANY LIMITED

have a vacancy for an Assistant to the Manager of their Market Analysis and Sales Operations Department. The position, with an expanding Company, offers scope to the man selected to develop as understudy to the existing Manager. Applicants should be aged 20/30 with a degree in Economics and a Statistics and should have had some experience in industry (preferably Automotive Industry) in Market research or Market Analysis Dept. Reply to North British Rubber Co., Ltd., 62/64 Horseferry Road, London, S.W.1., marking the envelope "MASO Assistant".

A COST ACCOUNTANT

is required by

KUWAIT OIL COMPANY LIMITED

for service in KUWAIT

Applications are invited from Associates of the Institute of Cost and Works Accountants who should be in the age range 23-28 and have not less than one year's experience in industry since qualifying.

Local salary according to qualifications and experience, but not less than £1,900 p.a. Kit allowance. Write for application form, sending brief details and quoting K.2469, to Box B/48, c/o 191 Gresham House, E.C.2.

THE MANCHESTER COLLEGE OF SCIENCE AND TECHNOLOGY

(FACULTY OF TECHNOLOGY IN THE UNIVERSITY OF MANCHESTER)

APPOINTMENT OF BURSAR

Applications are invited for the post of Bursar of the College. The Bursar is the executive officer responsible to the Principal for all financial matters including the preparation of estimates and participation in negotiations with the University Grants Committee, for the development and maintenance of the estate and the buildings of the College and for legal matters arising therefrom. Candidates must, therefore, have a wide experience in these fields, must possess suitable qualifications and managerial capacity of a high order.

The salary will be in the range £1,800 to £2,300. The appointment will be subject to the Federated Superannuation System for Universities and family allowances will be payable.

Application forms and further particulars may be obtained from the Registrar, The Manchester College of Science and Technology, Manchester 1, to whom applications must be forwarded by Monday, May 25, 1959.

CENTRAL ELECTRICITY GENERATING BOARD

Applications are invited from suitably qualified ENGINEERS for the post of SECRETARY to the Standardisation Committee, attached to the Purchasing and Contracts Department at Headquarters, London, S.E.1.

Applicants should be interested in standardisation as an aid to stock control and purchasing, and preferably have had experience of the production of standard and/or buying specifications. Some knowledge of purchasing and coding would be an advantage.

Salary scale £1,560-£1,760 p.a.

Applications stating age, qualifications, experience, present position and salary, should be forwarded to the Personnel Officer, 24-30 Holborn, London, E.C.1, by May 12th. Envelopes and applications to be marked "Confidential Ref. E/138".

THE UNIVERSITY OF NEW SOUTH WALES

VACANCY FOR PROFESSOR OF ECONOMICS

The University invites applications for appointment to a Chair of Economics in the School of Economics within the Faculty of Commerce at Kensington.

Salary will be £A3,763 per annum.

The School of Economics prepares undergraduates for the Degree of Bachelor of Commerce in the following specialisations:—

Accountancy	Economics
Statistics	Applied Psychology
Industrial Relations	Wool Commerce

The School also supervises candidates for higher degrees. The present staff of the School numbers twenty economists and statisticians and the Head of the School is Professor D. C. Rowan.

Applicants must be of high academic standing in their chosen field. The University will particularly welcome applications from those interested in the application of mathematical and statistical techniques to economic problems.

Subject to the consent of the Council of the University, Professors may engage in a limited amount of higher consultative work.

Subject to satisfactory medical examination, Professors will be eligible to join the Superannuation Fund which provides a pension of £A1,638 per annum.

Professors are eligible for six months' study leave on full salary after three years of service, or twelve months after six years of service.

With the approval of the University and its bankers, married men may be assisted by loans to purchase a home.

The University reserves the right to fill the Chair by invitation.

First-class ship fare to Sydney of appointee and his family will be paid.

Four copies of applications (including the names of three referees) should be lodged with the Agent General for New South Wales, 56 Strand, London, W.C.2, and a copy forwarded by Airmail in an envelope marked "University Appointment" to the Bursar, University of New South Wales, Post Office, Box 1, Kensington, New South Wales, Australia, to reach him not later than May 31, 1959.

CHARTERED ACCOUNTANT

Exceptional opening for man of outstanding personality, experience in industry and drive, with a large group in the light engineering field. The Group has a turnover of the order of £30,000,000 per annum and is organised on a "basis of decentralisation. The Group also has manufacturing units overseas as well as in the U.K. There is a good supporting accountancy staff in the individual units of the Group but it lacks the necessary fusion and leadership to ensure that the Group acts as a single body on policy matters.

A successful applicant who proved that he could, in practice, carry this responsible post would find himself well remunerated, with the usual perquisites of high managerial office.

Letters of application, which will be treated in confidence, should contain full details of background, education and experience and be sent to Box No. 1157.

COUNTY COUNCIL OF ESSEX

STATISTICIAN

Applications invited for above appointment on established staff of Health Department—salary not exceeding £1,175 (Salary scale at present under review).

Candidates must be University graduates who have taken statistics as a subject of degree course. Preference given to those with previous experience in medical and other vital statistics. Superannuation. Medical examination. Application forms from County Medical Officer of Health, County Hall, Chelmsford, to be returned by May 6, 1959. Canvassing disqualifies.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships and grants for research in Economics, Economic Statistics, Government, Social Administration, Social Anthropology or Sociology, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £400. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University, and applications are acceptable from students who expect to graduate this summer.—Applications should be sent, not later than July 1, 1959, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

BUSINESS AND PERSONAL

MANUFACTURERS WISHING to increase their overseas sales, should consult the organisation that specialises in every aspect of export sales promotion:

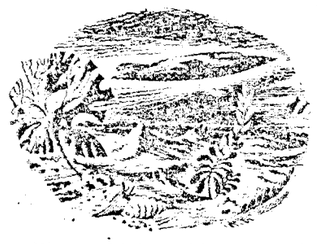
The Company of Adventurers . . .

RITCHIE CALDER, the science writer, describes how atomic freighters could travel under the icebound seas of the Arctic throughout the year

THE OFFICER'S MESS at Fort Churchill on Hudson Bay is a bus-ride from the cinema. But there is no bus. Instead one walks through centrally heated corridors, built-in streets, buried beneath the snow, which link the living quarters with the cinema, the school, the shops and other civic amenities. In the winter the average temperature outside is 20° below zero FAHR.

This is the Frozen North. Yet this Canadian base and port is no further north than Oslo, Stockholm or Leningrad. Beyond it lie The Barrens, the snow deserts of the wandering Eskimos, before it Hudson Bay, which extends as far south as most of England yet is frozen solid for seven months of the year.



ATOMIC AGE MINERALS

Today, on the Bay at Churchill, stand the great grain silos. The port handles over eleven million bushels of grain every year. Across the Bay is Ungava, a region of great mineral resources, including some of the biggest iron deposits in the world. To the north of Churchill is Keewatin, that region where geologists and prospectors are discovering the minerals of the Atomic Age.

Access to new agricultural and mineral wealth of the mid-west and north of Canada depends on Hudson Bay, yet it is ice-locked for the greater part of the year, with deep water channels navigable only from August till early October.

Hudson Bay owed its discovery to the quest for the North West Passage, and its development to King Charles II's "Company of Adventurers". The successful navigation of that Passage by mid-20th century adventurers, may well provide the means of liberating the Bay from its ice-bondage.

U.S. atomic submarines, the Nautilus and the Skate, have navigated under the Arctic ice and opened the passage from west to east and east to west. Similarly, submarine atomic freighters could travel under the ice of Hudson Bay, throughout the year. Atomic heat could keep Churchill and other harbours open, like seals' breathing holes in the ice, for all-the-year handling of freight and so revolutionise not only the port itself, but the economy of half a continent.

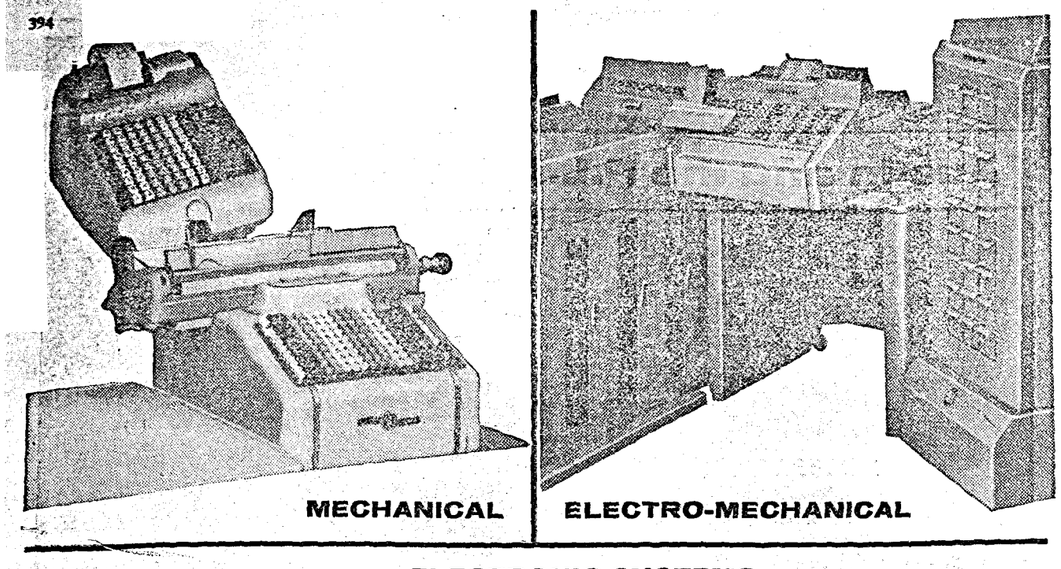
Austin and the P.L.A. Police

IN 1802 a hundred men, armed with musket and cutlass, guarded London's first commercial docks. Today the tidal reaches of the Thames, 69 miles from the Estuary to Teddington, are controlled by the Port of London Authority.

The five great dock areas—in Wapping and Shadwell, Rotherhithe and Bermondsey, the Isle of Dogs, North Woolwich and Tilbury—are protected by the P.L.A. Police. At the dock gates, on the quays, in the roads, round the warehouses, they are on guard.

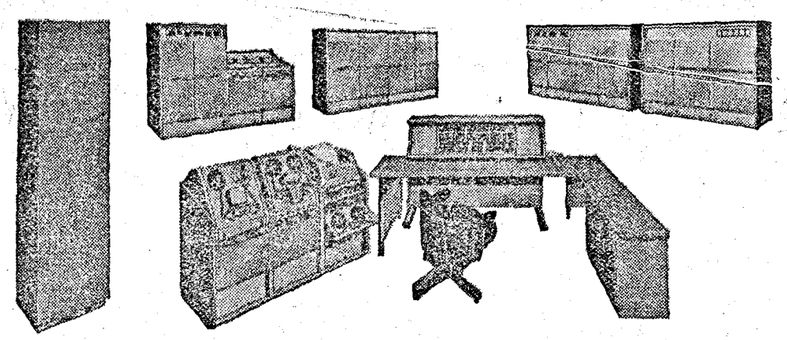
Riches of the world The P.L.A. are probably the largest warehouse-keepers anywhere. Their tall gaunt buildings, clustered about the docks, hold the world's wealth. Wine and wool, tea and tobacco, rubber, meat, drugs and timber, oil, ivory and ostrich feathers. Dockland is rich in temptation, its protection a man-sized job.

The 600 men who make up the P.L.A. Police are highly trained, highly skilled, ready, when trouble flares up, to assemble at a moment's notice. Night or day, the P.L.A. Police are constantly on the alert. The mobile part of the force is soon at a danger spot.



At a moment's notice A mobile force needs dependable transport. The Port of London Authority have chosen Austins. Their police vans are likely to be needed anywhere, at any time, to carry any and every kind of load. Speed, manoeuvrability and large capacity are essential. The P.L.A. Police find what they need in Omnivans.

And more besides Load space in the Austin Omnivan is exceptional—200 cubic feet for a good 15 cwt. Low floor and wide rear door make for easy loading. All-steel monoconstruction gives great strength—with lightness. Power from 1500 c.c. O.H.V. engine. Luxury comfort in cab. 12 months' warranty and the backing of B.M.C. Service—Britain's best service and parts organisation.



See the Omnivan at your Austin dealer's. Ask him, too, about the rest of the Austin commercial range: ½ ton to 7 tons plus prime movers for gross train weights up to 15 tons.

ELECTRONIC SYSTEMS

Whatever your business...whatever its size...Burroughs build equipment to meet your every data processing requirement!

The reason Burroughs can meet your every data processing requirement is this: Burroughs produce the widest range of business machines in the world.

In adding machines, Burroughs offer you a choice of full-keyboard and multiple-total models. It's the same with accounting machines—you have a choice with Burroughs. To name three: new low-cost, fully automatic Director accounting machine... Sensimatic, with unlimited programming flexibility... Sensitronic, for automatic electronic accounting. In electronic computing equipment, too, Burroughs can virtually custom-fit a machine to your job. For business computations it's the new Burroughs F2000 ...for more complex, medium-range computing, the new desk-size E101... and for large-scale computing, the new Burroughs 220.

No problem is too small... no application is too big for Burroughs data processing equipment. And the beauty of it is, a Burroughs machine will pay for itself in savings, over and over again.

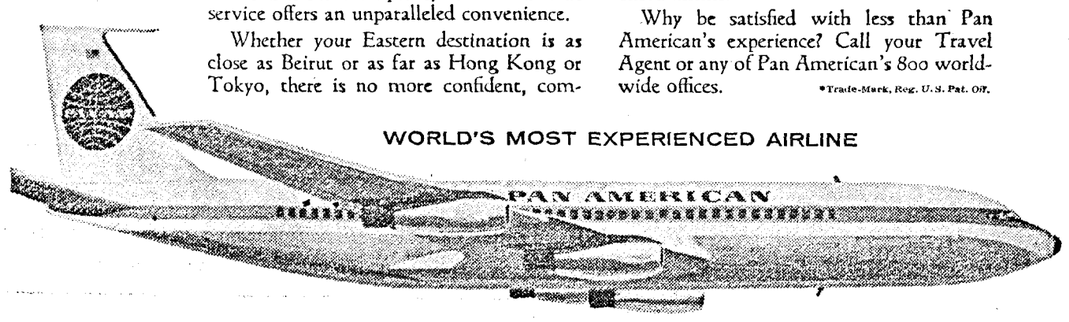
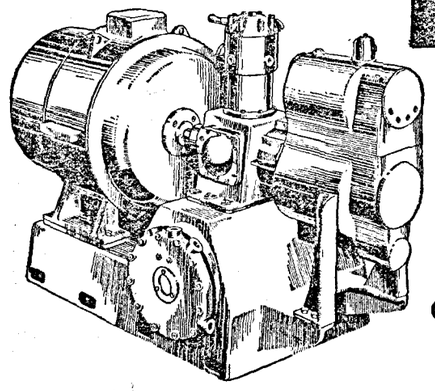
To the East: You owe it to yourself to fly Pan American

When the man who knows goes East ...he flys PAN AMERICAN



Every major city in the East has long been on the routes of the Flying Clippers*. To the experienced traveler Pan American is his assurance of on-time arrivals and departures when he's flying a tight schedule. And Pan American's frequency of world-wide service offers an unparalleled convenience.

Whether your Eastern destination is as close as Beirut or as far as Hong Kong or Tokyo, there is no more confident, comfortable way to fly than by Clipper. Pan American's on-the-ground service is as well regarded as their in-flight care . . . no better way to make your trip to the East carefree and easy than on the world's most experienced airline.



Why be satisfied with less than Pan American's experience? Call your Travel Agent or any of Pan American's 800 world-wide offices.

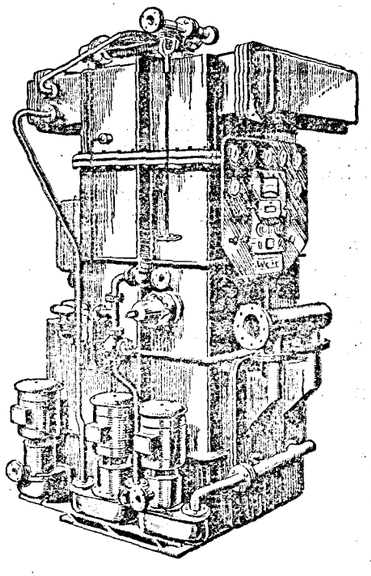
Weir's

pioneer still greater efficiency
in power plants
afloat and ashore...

Some striking NEW products



"R2" STARTING AIR COMPRESSOR

Expressly for starting marine Diesel engines, it has a rotary first and a reciprocating second stage, with built-in multi-purpose cooler. It saves 25 per cent. in space and 40 per cent. in weight, compared with a conventional set.

"WL" TURBO-PUMP UNIT

At last—a glandless boiler feed pump with no lubrication troubles! Smaller and of less than half the weight of any set of similar capacity, and lubricated by water alone.

"P3" VERTICAL MARINE EVAPORATOR

A range of 'packaged' plants to produce up to 75 tons per day of high-purity distillate for boiler feed and ship's services. Non-ferrous construction throughout.

Brunswick

a name established on customer confidence

The Brunswick trade-mark has earned customer confidence since 1845. It appears on products of unequaled performance for use in recreation and education. Today these products, constantly improved by research and development, are available on a world-wide basis through Brunswick International C. A.*

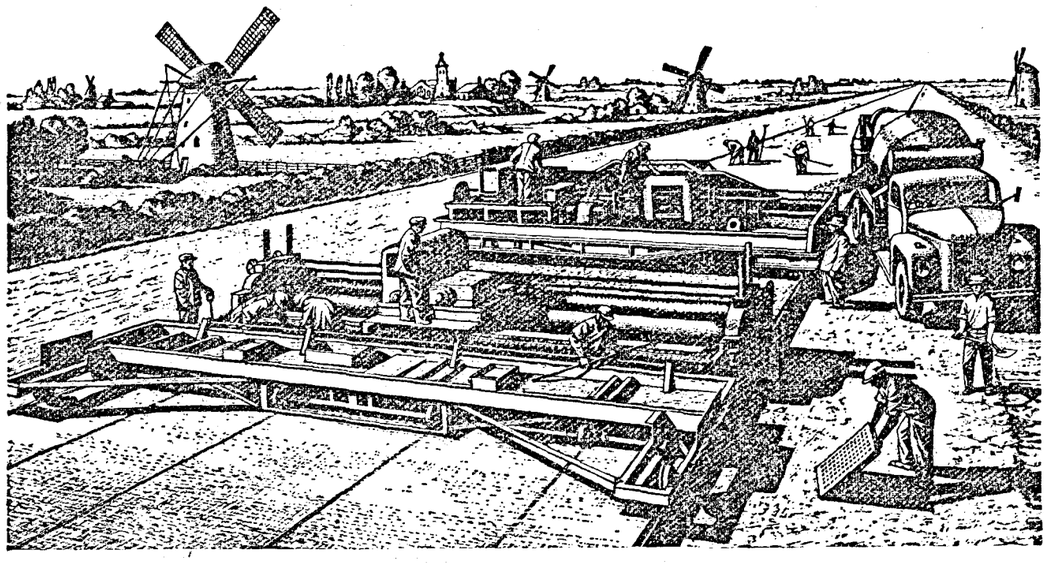
BOWLING: As an investor or proprietor, you are offered the equipment and assistance necessary for successful operation of bowling establishments around the world. As a bowler, you can choose your equipment from the world's most famous and complete line.

BILLIARDS: Both players and billiard room owners look to Brunswick for all the equipment they need, from one reliable source.

SCHOOL FURNITURE: Movable furniture and fold-away gymnasium equipment of advanced design increase the learning and recreational activities available to today's students.

GOLF AND ATHLETIC EQUIPMENT: Under the name MacGregor, "the choice of those who play the game" for more than 80 years, Brunswick offers you a quality line of athletic equipment for individual and group use.

Here are a few of the famous trade-marks of products of The Brunswick-Balke-Collender Company:



BOWLING • *Black Beauty* bowling balls • *Fireball* bowling balls • *Dura-King* bowling pins • *Red Crown* bowling pins • *Tel-E-Score* projectors • *Crown Imperial* bowling equipment • BILLIARDS • *Monarch* cloth and cushions • *Centennial* balls • *Challenger* cues • *Anniversary* tables • FURNITURE • Brunswick school and office furniture • Brunswick gymnasium equipment • MacGREGOR • *Tourney* golf balls • *Jack Burke* Irons • *X10L official* basketball • *Official 97* baseballs

Dutch firm trebles output of a vital material

Holland's roads depend on cement. Indeed, the Dutch produce and use more cement per head of population than many other countries in Europe. Of Holland's entire output 65% comes from the ENCI Cement Company at Maastricht, who now produce over 900,000 tons per year, more than three times their pre-war figure. Compressed air is vital to the cement industry. When ENCI began to expand, they made a very careful study of available compressed air equipment. They chose two Atlas Copco compressors—and saved £3,000 a year on fuel bills alone. To-day nine Atlas Copco AR and AA compressors are installed at the ENCI works, supplying air for drilling in the pit, stirring operations, agitating the mixture in slurry tanks, and for the pneumatic transport of cement and other materials.

Brakes that never fail

Compressed air is versatile. Atlas Copco provides the means for all its many applications. For over 40 years Atlas Copco have supplied brake compressors for railway engines of all types. The latest diesel locomotives built by the NOHAB Company for Norwegian and Danish State Railways have a maximum speed of 65 m.p.h. and weigh nearly 98 tons—and use Atlas Copco brake compressors.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Atlas Copco puts compressed air to work for the world

The Common Sense of 1959

"*No more peace parleying* with the enemy." The caption is from *John Bull* in 1917. In a sense, 1959 is the 1917 of the cold war, the moment when the question is asked whether a negotiated peace or truce, on part at least of the front, can be attempted. The French Foreign Minister called it on Tuesday "a turning point in postwar history": the moment (and M. Couve de Murville hedged this round heavily with qualifications) for pursuing, on the basis of a "balance of forces," a "normalisation of relationships." From the start of 1917 the verdict was No: the Germans could not be trusted; nor, if talk of a negotiated peace was admitted, could the allies themselves be trusted to preserve the will to fight. Now, in the cold war, it is the British will to soldier on that is suspected, by Americans and Europeans.

The suspicion is as disquieting as it is unfounded. Trust among allies is even more important than agreement; trust between Britain and America is a necessity. Usually a misunderstood country, like a misunderstood husband, has only itself to blame. Certainly Lord Montgomery did not help by recording his view for television, not long before going off to Moscow, that "the leadership is passing to the British." Certainly, too, the suspicion abroad *that British policy is* just British politics has been fed by the tendency (familiar enough to Americans) for politicians and political writers here to treat everything that happens in terms of the election-to-come. So the latest caricature of Mr Macmillan, accepted by some quite sensible foreign friends, goes something like this: he went to Moscow in search of a summit meeting because he had an early election to fight; he *is not going to* have an election yet because he is soon going to the summit; and, when he gets to the summit, he will want to throw western interests to the Russian wolves because of the "peace at any price" mood of British voters. It is a cruel caricature. If it were true it would be a calamity for Britain and the West alike. But it is not true.

The counts in the indictment can be met one by one. To begin with, there can be no question of western leadership, in face of the Russians, belonging to anybody but the Americans. The fact is that the only power with power enough to appease the Russians, whether weakly or wisely, is the United States itself. (The only possible exception, in some future contingency, is the Germans, who happen to be both subject and object of these dealings on the European front.) It is true, as Mr Dulles recognised, that the Americans have to work with their allies, and want to do so. This can mean, as Mr Dulles found, that the Americans may be persuaded not to do certain things. It does not mean that they can be forced by their friends to do what they do not want to do. When Mr Chamberlain went to Munich in 1938 he had power to act. When Mr Macmillan went to Moscow this year he had not. (Still less has Lord Montgomery, who has not even got any divisions.) The dice at the summit will be cast by the Americans—and the Russians.

The chief fallacy, however, is the charge that the Prime Minister, for electoral or any other reasons, wants anybody to be weak with the Russians at the West's expense. The purpose of the advice he has offered to his American and other allies is precisely what Sir William Hayter, in *The Times* on Wednesday, finally defined as the proper purpose of talking at the summit:

> Winning victories should, of course, not be the aim of these or indeed of any negotiations. Their objective must be to establish, sooner or later, the common advantages that both sides ought to be able to draw from a more rational and more peaceful organisation of Europe and ultimately the world.

There is room for much disagreement among the allies —and argument with the Russians—about (to use M. Couve de Murville's terms) the balance, and disposition, of forces in central Europe upon which a "normalisation of relationships" there might possibly be rested ; and about the relationships themselves. But there is nothing at all in this endeavour that need weaken the will or the means of the West to resist force with force, or impair the credibility of its ultimate sanction against aggression: the nuclear deterrent itself.

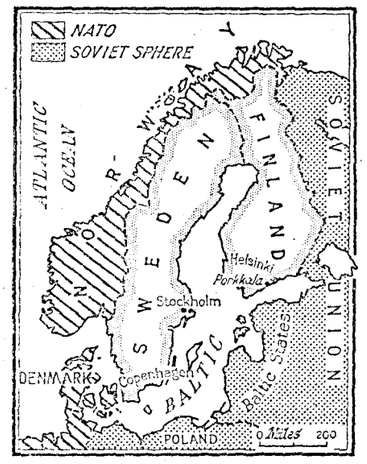
It is here perhaps that anxious friends abroad see the danger: willy nilly, Mr Macmillan must want to buy off the Russians in order to allay the British voters' fears of catastrophe. This is a complete misreading both of British politics and of the British mood. The Prime Minister is a politician, but he did not go to Moscow simply because of the coming election ; he went because he thought the time was ripe for a contact at the top. He did not put off the election pending a triumph of appeasement ; he put it off because he could not be sure of winning it by a sufficient margin. And at no point have these decisions of his been imposed upon him by any popular pressure for peace at any price, or by any popular wish to relax in the long haul against communist pressure.

There is indeed in Britain, as in every other sensible and articulate country, a common horror at the mere thought of nuclear war and a deep desire to prevent it. But there is no common belief now that this can be done, as the busy and devoted nuclear disarmers demand, by throwing up the sponge. The bulk of the British people still accept that, while the other side stays armed, the West must stay armed, too, to keep the peace. What they do ask is that all the time—and without any illusions about the obstacles presented by a strong and ruthless rival—peace-seeking shall go persistently on. This is not the appeasement of 1938 ; it is the common sense of 1959.

With a sensible brevity, Sir Winston Churchill once said "We arm to parley." The two are not alternatives ; both are needed. Both indeed have the same simple aim: security. In 1917 the decision was made to go on, without parleying, to Passchendaele and "unconditional surrender"; historians will argue about it for ever. The crunch of the cold war has still to come; but in 1959 it has to be recognised that unconditional surrender by either side is impossible. Whether a negotiated peace, however limited, is possible can be found out only by seeking. The search will not be helped if, without cause, the seekers mistrust one another.

Tsar of the Baltic

Mr Khrushchev is showing a benevolent interest in detaching the Scandinavian countries in a separate (and neutral) Nordic block



TSAR ALEXANDER II still stands in front of the Great Church in the Senate Square in Helsinki: the one Russian monument left in Finland. It has its uses. In the bitter years at the turn of the century when the Finns withstood Russification, the statue's foot was covered with flowers, a silent protest before the last liberal Tsar that Finland—and Russia—had known. Since then the Finns have fought three wars against the Russians to win, and hold on to, their independence. But it still matters very much to them who the Soviet Tsar is and how his mind works. Neither they nor their Nordic neighbours—whom Mr Khrushchev is going to visit in August—think of the present ruler of Russia as excessively liberal. But all the same, they have some hopes of him. And Mr Khrushchev plainly has his hopes of them.

The Scandinavian invitation to Mr Khrushchev has been unashamedly badgered out of his hosts. When Denmark seemed to hum and haw before the Scandinavian prime ministers' meeting in Oslo in January, Mr Mikoyan stopped off for a quiet chat in Copenhagen on his way home from America. The next day Mr Khrushchev showed off his best party manners at a surprise luncheon for the Finnish president in Leningrad. Russo-Finnish relations had lurched into an unnecessary crisis last autumn with, it now seems, considerable political embarrassment in Moscow as well as Helsinki. Mr Khrushchev brushed all that aside. Addressing the suspicious Swedes as much as the Finns (who are usually not as rattled by a crisis as the anxious listeners at the end of a telephone line in Stockholm), he insisted that a big neighbour could be a good neighbour, too:

> We want to be friends with the Finnish people, and we pay heed to their interests. . . . We should like to establish relations with Finland that could be a model of good relations between a socialist state and a state whose social system is not based on socialist lines.

This was not new, but it was hopeful. The biting winds from Siberia died away, and Scandinavia was warned that the diplomatic spring might come early this year. It was good news for most Finns, except for the communists and left-wing social democrats who had thought they could enter the cabinet if President Kekkonen lost his nerve and pushed them in, whether the Russians wanted them there or not. The crisis was probably not of Mr Khrushchev's making (some of its engineers were almost certainly in Helsinki), and his haste to cut it short seemed to betray a surprising sensitivity to Scandinavian criticism.

But it also seems true that Russian policy towards the Nordic countries is changing purposefully. Mr Khrushchev's August tour may make this plain. There are signs that the Soviet Union would be quite content to settle for a neutralist block in which the Swedes and Finns would temper the Anglo-Saxon enthusiasm of the Norwegians and Danes, and in which Iceland, already at odds with Nato and increasingly dependent on Soviet trade, would be a useful makeweight. This is still a misty and insubstantial notion, but it is at the back of some hard Nordic heads. Stalin preferred more old - fashioned ideas in 1948, even at the cost of letting Norway and Denmark go their own way into Nato. (And the Americans, too, refused to give arms to such a Scandinavian block when it was suggested then.) But times, and Tsars, have changed. Finland has been allowed to join the Nordic Council. It got the Porkkala base back in 1955. The Finns believe there is no political objection to their entering a Scandinavian free trade area ; the Russians merely draw the line at ties with Bonn.

Mr Khrushchev will have to make several summer cruises, and change the tone of his diplomatic missives, if he really wants to detach the Norwegians and Danes from Nato. But there are some weak links that he may try to prise apart this time. General Speidel's reception when he toured both Norway and Denmark after taking up his command in 1957 showed how unpopular the rearming of west Germany is. A noisy agitation has been running in Norway against accepting German officers at Nato's northern command at Kolsas, near Oslo. The Norwegian foreign minister, Hr Lange, a staunch supporter of Nato, has faced internal, as well as Russian, criticism for permitting supply dumps for the Germans on Norwegian territory and allowing German naval vessels to refuel at Norwegian ports. The minister of defence, Hr Handal, has pointed out that these facilities must be given to Nato allies without exception, and that if Norway does not allow foreign troops on its soil in peacetime it must not make it impossible for them to go to Norway's aid in a crisis. Good sense has prevailed, and the Storting voted this week to agree to German officers at Kolsas. But Mr Khrushchev, as his diplomatic notes show, believes he can make political capital of it all, even within the Norwegian government.

The Germans themselves set off the Nato row in Denmark in November. Herr Strauss's desire to change the Nato structure to incorporate the Danish straits in the central European, instead of the northern, command—under German influence—made the worst impression. The Danes do not want to be separated from the Norwegians. While they recognise the strategic importance of the straits in bottling up the Russian Baltic fleet and its submarines, they are not too certain whether, in two years' time, German plans for the Baltic will be more offensive than defensive. When the Russians talk of a "sea of peace" they get some ready, if uncritical, listeners.

THE energies of the Soviet block are plainly bent on isolating the west Germans. In October, before the Berlin crisis began, the Polish foreign minister, Mr Rapacki, was in Oslo talking encouragingly of revising his plan for banning atomic weapons in central Europe to include the limitation of conventional arms as well. Even if this was an independent Polish initiative, Mr Khrushchev can take it up where he chooses. At the least, he stands to reinforce Norwegian doubts about accepting intermediate-range missiles.

Mr Khrushchev's diplomats have had to be reminded by Hr Lange last month that the Baltic is not geographically a Norwegian concern. This is only one example of what seems a growing Russian obsession with revived German naval power. In Finland these Russian fears are taken much more at their face value. There are whispers of a *dossier* of Finnish politicians, said to be compiled by the Soviet embassy in Bonn, which the Russians are thought to have used during last winter's crisis. Needless to say, it has never been seen by outside eyes. But Mr Khrushchev is apparently unable to trust the right-wing Finnish social democrats because the party's older leaders accepted German aid during the second world war. At all events, even a tough Baltic command could not be the threat to Russia that Germany was in 1939. Soviet forces control the entire southern Baltic shore. Stalin's quest for Finnish bases is unnecessary now.

The idea of an independent Nordic block has its attractions for the Scandinavians. But, except for the Finns, these are probably not enough to outweigh its present disadvantages. Norway and Denmark are unlikely to consider it, unless as a corollary to general

disengagement in central Europe. Sweden must have reserves about new commitments which might imperil its traditional non-involvement. But Swedish foreign policy is naturally concerned with Finland, and membership of a neutral Scandinavian block would undoubtedly answer the Finns' prayers in holding the balance between East and West. Nordic unity is a sensitive structure that now works best on the individual level, such as dispensing with passports and allowing free movement of labour. Closer economic ties in a Scandinavian free trade area are being discussed, and a ministerial meeting will be held in Helsinki this month. A five-year transitional period, with a further five to seven years for Finland, may be economically acceptable. But it is the political decision to take this step that counts. Mr Khrushchev is likely to be mildly encouraging, at least until after August. This is the opportunity to tighten Nordic ties that Finland has been looking for. It is a more hopeful policy than waiting for liberal Tsars.

Caribbean Cross Currents

While Señor Fidel Castro has no interest in backing the Panamanian rebels, his peasant revolution in Cuba has given new heart and cohesion to movements for political change in the Caribbean area.

REVOLUTIONARY impetus, Señor Fidel Castro is discovering, is hard to keep within bounds. Like President Nasser, he is finding himself involved, not always willingly, in incipient revolts kindled from the flame of his own successful revolution. In Central America, the Cuban leader is in a fair way to achieving something of the symbolic status that has fallen on President Nasser, although the two men do not altogether stand for the same things. The Arab leader stands for the independence of the Middle East from outside interference; Señor Castro, at least for the time being, represents what passes for a liberal current within Latin American politics. Over and above the familiar pattern of personal feuds and national rivalries, new and explosive forces that demand a choice between dictatorship and political freedom have imposed themselves on the area. Although Central America has lagged behind South America (three of the four remaining Latin dictatorships are in the Caribbean area) Señor Castro's Cuban victory has made him the brightest hero of them all.

But this has now led him into an awkward situation. Señor Castro has no conceivable interest in backing one Panamanian feudal family against another, and Havana has not only dissociated itself from the Cuban volunteers who are taking part in the rebel expedition that landed on Panama's Atlantic coast last weekend, but is doing its best to call them home. The expedition came at a particularly embarrassing moment for Señor Castro, since it coincided with his visit to Washington, where the administration has decided to support the Panamanian government with an emergency gift of arms. At this early stage, it would also be awkward for the Cuban government to cross swords with the Organisation of American States, and on Tuesday the Cuban representative voted with the other American states to give Panama every necessary help to repel the "international pirates."

Panamanian politics have become news outside the Americas mainly because Dame Margot Fonteyn appears to be mixed up in them. The British press, having gone freely to town over the ballerina's brief incarceration in the prison's presidential suite (about which she herself was completely reticent), has followed subsequent developments blow by blow. But Panama, which has had on average a new president every other year since its creation in 1903, is used to seeing its politics played this way. The presidential term is four years; but the families out of power have often preferred to remove the president forcibly rather than wait their chance at elections.

MANY of Panama's neighbours still conduct their affairs on similar lines. Family feuds within the state are repeated at the international level, where each state is frequently guarding its frontiers against its neighbours. Five Central American republics—Guatemala, Honduras, El Salvador, Nicaragua and Costa Rica—have often since they won their independence of Spain more than a hundred years ago dreamt of political unity (Panama, which was a part of Colombia in the formative period and gained its independence much later, has never really been accepted as an integral part of the region). The strip of Central America with its range of mountains for backbone, subdivided into independent states sharing a common language and a background of cultural unity, does somewhat recall Italy before unification. The five republics are now trying to co-ordinate their economies; but politically their leaders have usually been at odds, and no Central American has yet proved himself a Cavour.

One of the oldest quarrels is a border dispute between Nicaragua and Honduras. Nicaragua has been ruled for a quarter of a century by the Somoza family, whose members by now also own about two-thirds of the land; when General Anastasio Somoza was assassinated in 1956, his son, President Luis Somoza, automatically slipped into his place. Honduras, on the other hand, had respectable elections a couple of years ago, won by the Liberal party under Dr Villeda Morales. But the army's loyalty is doubtful, and earlier this year there was an abortive uprising on the northern border. Both Nicaragua and Honduras shelter each other's exiles, and although they signed an agreement in February to prevent their territories being used to mount rebellions against each other, their mutual suspicion remains. Nicaragua used also to be at loggerheads with its southern neighbour, Costa Rica, whose former president, Señor José Figueres, was fiercely opposed to the old-fashioned feudalism of the Somoza family. Costa Rica's new conservative president, Señor Echandi, has now smoothed over this quarrel, but at the cost of seriously weakening his standing at home. Further north, the Guatemalan government under its extreme right-wing president, General Ydígoras Fuentes (who won the elections because both Left and Right in Guatemala were determined to keep out the candidate openly sponsored by the United States), is trying to divert attention from its domestic troubles by starting up a squabble over prawn fishing rights with Mexico and by reviving the old claim to British Honduras. Only El Salvador, politically tranquil and financially sound, seems at peace with its neighbours and itself. But the gap between rich and poor is nowhere wider.

WHILE old ways of political life persist, new gusts of political theory are blowing through the Caribbean area. Señor Castro and President Betancourt of Venezuela, who both owe some of their success to the popular voice, stand for the liberating ideas that threaten dictatorships. After Señor Castro was feted in Venezuela earlier this year, Central Americans began talking about a "Caracas group" as a sort of shorthand term for active anti-autocracy. What the group is supposed to do, nobody has much idea. But broadcasts are beamed north from Venezuela, presumably for the ears of President Somoza's opponents, and Cuba is broadcasting twice a week in French for Haiti. Cuba has become a centre for the area's political exiles (including Panamanians) and there has been a movement to revive the Caribbean Legion. The legion, which is also called the phantom army, came into being in 1947 when an expedition, including Señor Fidel Castro, set out from Cuba in an attempt to overthrow General Rafael Trujillo, ruler of the Dominican Republic since 1930. The expedition was broken up by the Cuban navy at the insistence of the United States, which then, no less than now, wanted at all costs to keep the peace; and the phantom army faded away.

Señor Castro's main target is still General Trujillo, who not only is an affront to his revolutionary principles by being Latin America's toughest and longest established military dictator, but is also General Batista's host. General Trujillo has always been unusually generous towards refugees from other parts of the world; his regime at home is efficient and politically stifling. He is also very well prepared to defend himself. Since a Cuban expedition might possibly strike at the "white" Dominican Republic through the negro republic of Haiti, whose western tip is only 50 miles from Cuba, General Trujillo has set about defending Haiti as well. The two parts of the island have signed a mutual defence pact; Dominican gunboats patrol Haiti's ports; and Dominican army officers have started up a Foreign Legion which is claimed, improbably, to be 25,000 strong.

Haiti, which lives off tourism and American aid, has been going through a very bad patch. Prolonged droughts have caused horrible suffering and President Duvalier's assumption of emergency powers has frightened away a good many of the tourists. The president, a new recruit among dictators, has now, in theory, ended the state of martial law, but his opposition show their trust in this by keeping well out of the way in hiding or in exile. The two unsuccessful candidates at Haiti's presidential elections in 1957 have apparently joined forces to organise a coup from Cuba. Señor Castro can hardly interpret this as a popular rising; the purpose from his point of view would be to establish a basis for guerrilla operations against the Dominican Republic.

The United States has decided to show its disapproval of all such tactics by giving Haiti an emergency grant of $6 million and by sending a military mission to help train its tiny army. In April, the State Department called together its twelve ambassadors to the Caribbean republics for consultations; their advice apparently was that, while there was intense revolutionary activity on the part of political exile groups in virtually every country, no rebel attack from outside was likely to be successful. But to be on the safe side, and perhaps to give warning to Señor Castro, the United States is giving a helping hand to Dr Duvalier. The State Department admits that he has his "shortcomings," but emphasises that he has given his country more stability than his immediate predecessors. Since, before Dr Duvalier, Haiti had five presidents in as many months, this is true enough.

It may seem unreasonable for Latin Americans to complain when the United States helps an established government to resist attack from outside, but complain they often do; and correctness on Washington's part does not always prove to be wisdom in an area of revolutionary upheaval. With its strong interest in a tranquil Central America, the United States is almost automatically inclined to support the *status quo*. Washington's difficulty is to determine at what point the support of a government in power is no longer the best way to keep the peace.

How to Get Chosen

An elementary guide to becoming a Member of Parliament.

"THE best or the worst are usually chosen." This dictum attributed to a senior politician on the skill of local party committees in picking the runners for the electoral race is too sweeping—some of those chosen present a distinctly second best appearance. But it illuminates what some would call the extreme capriciousness and others the sturdy independence of the local party organisations in carrying out their most important constitutional task.

If you have parliamentary ambitions and are not bent on making things hard for yourself by being a Liberal, a Welsh Nationalist, or an Independent, how should you set about getting to Westminster? First, pick your party. This may be no problem for some, who were either blue or red babies at birth. For others, who have left the choice of colour to their maturer years, this may present special difficulties—such as which party's more unappetising prescriptions are easier to swallow without making a face. And for those who have made a false start a period of purgatory must be served in which the convert cleanses himself by good hard voluntary party work. It is necessary in both parties to belong to a local branch (or, in the case of the Labour party, an affiliated organisation such as a co-op or a trade union) before qualifying as a candidate—a fact which recently surprised no less a luminary than Mr Christopher Shawcross, when he sent in for the Conservative nomination at Bournemouth East.

Once you feel yourself enough of an insider, you should try to get on a list. This is done in the Conservative party by seeking interviews in London with a panel made up of MPs and officials of the National Union, and with Mr Donald Kaberry, a shrewd Yorkshire MP with a sense of humour, who will check up on your personal and political background. Then, if you pass muster, your status will be confirmed by the party's standing advisory committee; and Mr Kaberry will send your name and dossier (with about ninety others in the case of a safe seat in a cosy neighbourhood) to any inquiring association in the type of constituency for which you have opted. In the Labour party there is also a list—or rather two lists, 'A' for union-sponsored aspirants and 'B' for the rest—but to get on it you have to be put up by your local Labour party or trade union branch. Transport House is always pleased to give you an interview, but this is not essential.

The next step is to pick your constituency. The ideal rule for a politician is only to fight seats in which the result is a foregone conclusion—ones in which you either cannot win or cannot lose. The reason is that although the candidate's personality makes practically no difference (except possibly in the case of a third party, which for reasons of space we are not now considering) many constituency parties think it does. Moreover, there is no way of acquiring party merit quite so effectively as putting up a really great fight for a hopeless seat. If you do, and if you conduct yourself so that you cannot possibly be saddled with any responsibility for the disheartening result, no one beyond hailing distance of Lord Beaverbrook will blame you if next time you seek your just reward in a seat that you cannot fail to win. But if at any time there is any doubt about the outcome you may be in trouble. If you win by a narrow margin you may be out next time with the national swing, no matter how good a member you are; if you lose narrowly you may either get blamed unfairly for the result, or, if you improved the vote and your campaign was beyond reproach, you may be under strong pressure and in honour bound to try again in the same place next time—where the tide may still be against your party.

VESTIGES of the old-fashioned delicacy which prescribed that a seat should at least appear to seek the candidate, rather than a candidate the seat, still survive, though to a diminishing extent in both parties. The narrowing down of the possibilities in each constituency is done by a committee of anything from less than ten to over thirty people. In the Conservative associations, this is a selection committee elected by the local executive; in a local Labour party, it is the local executive itself. The main difference is that with the Tories the names have come from the Central Office list, from personal suggestions made by members of the association (almost invariably including one or more local men), and from letters simply applying for the job (a trend that seems to be increasing). With the Socialists the names come also from these sources, but they have to reach the executive by way of nomination by ward or trade union branches. Wards differ greatly in the thoroughness with which they approach this task—some do it most casually, others hold selection interviews of their own. If you are a Tory, it is best to have a friend or admirer high up in the main association; if a Socialist, you need your contact in one, or preferably more than one, ward or union. The first overblown list is then scrutinised more closely for short-listing. Labour tends to have the longer short-list—usually four or five, and at least once recently seven—against the Tories' two or three. But the Tories more often reach it by two stages. Some Tory selection committees first reduce the field to five or six, and then eliminate further after interviews.

If you have been lucky enough to survive this, then comes your crucial appearance; before the full executive if you are a Tory, and if a Socialist before the general management committee. Both bodies are representative of the parties' local branches, women's and youth organisations, and so forth (and in the Labour case also affiliated organisations). Both will vary in size between, say, 50 and 200 members. Both will require you to deliver a ten to fifteen minute speech (which should be a thin sandwich of political meat contained within slices of autobiography) followed by fifteen minutes of questions.

WHAT are the selectors looking for? It is impossible to generalise. The one thing that can be said about your speech to them is that it should not be too intelligent—selectors will not want to work with someone who they feel is uncomfortably clever. The questions often deal surprisingly seldom with policy—and much more with such personal matters as whether, if adopted, you will live in the constituency and, if elected, will devote full time to politics. (The first of these questions is a more sensitive matter with Tories, and the second with members of the Labour party). If you are a Tory, it is quite likely that you will nowadays be asked where you stood on the Suez expedition at the time and where you stand on it now; if a Socialist, you must be prepared to find at least one unilateral nuclear disarmer in most management committees. Some selectors favour asking each aspirant a few set questions which are more designed to test his general political knowledge and mental agility than to saddle him with awkward commitments on sensitive issues.

Although the subjects are naturally not much discussed, religious and racial prejudices do sometimes show themselves. The chairman of the Labour party's national executive was excluded from consideration for one seat last year because he was not a Roman Catholic. Despite Disraeli, it is still difficult to get a Tory seat if you are a Jew (unless you are also titled: the two present Jewish Tory MPs are both baronets).

Some selectors are looking for a candidate who resembles his predecessor; others for one who contrasts with him. A young man may be selected for a good seat because the retiring member was a safe mediocrity who never came within sight of office and the local party would like to invest in the prospects of a more sparkling career. Another young man may be lucky because his predecessor was a cabinet minister and the constituents want, for a change, a member who is unlikely to obtain office soon and will devote more of his attention to them. Older candidates are sometimes genuinely favoured because of experience. But, in addition, some Tory associations have a weakness for the decent not-too-bright father figure who will never go far in politics; and some local Labour parties, especially the pocket boroughs of particular trade unions, notoriously prefer decent not-too-bright trade union officials whose lifetime of devotion has not brought them quite to the top.

Often the main struggle within a Conservative selecting body will be between the partisans of a local and of an outside candidate (which may be especially tense if the local party chairman is himself the native contender). In the Labour party it is often a question of whether there should be a sponsored or a non-sponsored candidate. Sponsoring can mean that up to 80 per cent of the election costs will be met by a trade union or co-operative society. Occasionally, in seats for which several unions and the co-operatives are competing, the selecting process resembles an auction sale.

Suppose you are lucky and have emerged the winner. If you are a Tory and were not on the Central Office list you will probably have been cleared by the standing advisory committee when you were short-listed. (Vetoing by it is possible but rare.) You will then be presented for adoption to a mass meeting of the local Conservative association, which will have only your name before it. The Labour party does not make this final concession to democratic appearances. Instead the management committee's choice has to go before the National Executive Committee which has had a representative present at each stage of the selection except at the ward level. This is no formality—two candidates were recently rejected and an appeal is pending from a local branch in North-East Derbyshire (where Mr Morgan Phillips had wanted to stand) accusing the miners of packing the meeting which selected one of their number.

Except for the formal adoption meeting when the election campaign officially opens, all you have to do now is to get elected. This is usually either the easiest or the most hopeless part of your task.

The Economist

APRIL 30, 1859

RESPONSIBILITY OF JOURNALISTS

"It is the evil of a time like this, when *political events of great importance are taking place at a considerable* distance from us, that the air should be full of all manner of reports, true and false—half correct and half incorrect. It is the characteristic evil of an age like this, when telegraphs spread rumours with extreme rapidity, that their accuracy can be less easily tested than formerly, and that they are frequently distorted and magnified in the very process of transmission. But it must be remembered, at the same time, that very grave responsibility rests on those journalists who, at a *critical moment, publish reports of alarming importance. If at such a time* they give way to the temptation—so natural in their profession—to publish the first news, without waiting to ascertain whether the facts stated be true or false; if they suffer the fear of competition, or natural zeal and emulation to hurry them into statements which are unverified, and of which there has been no time to consider the accuracy, it is certain that they are violating one of the most important duties of their *important profession*—that they are *running* a risk of causing great injury to persons of whom they never heard, and that even a single error of this kind may cause calamities which the labours of an industrious life would hardly be sufficient to repair. Those who publish such intelligence do so under no check of publicity. We can never know the care which they have taken, or the negligence they have committed. The greatest mistake may have been published after the maturest consideration, and the most important item of true information may have been blundered on by accident. But with *the great calamities of the last few* days before our eyes, we cannot but feel more than ever the great responsibility with which those who undertake to communicate intelligence to the public are charged, and the terrible consequences which might on similar occasions ensue from a slight deficiency on their part in vigilance or accuracy.

NOTES OF THE WEEK

DIPLOMATS AND DETONATIONS

The Off Season

LIKE a menu in a third-rate café, the agenda for the coming Geneva meeting of foreign ministers looks as if most of the more interesting items will be crossed off before the meal begins. Russia and its fellow members of the Warsaw Pact, supported by China, have just repeated their argument that German reunification should not be discussed at Geneva. In turn, their contention that what should be discussed is the removal of the allied garrisons from west Berlin has been unanimously rejected by the western governments. And that, despite the reassuring noises officially made in Paris on Thursday, seems to be the only thing the western governments are really unanimous about.

The French foreign minister, M. Couve de Murville, addressing the national assembly in Paris just before his American, British and west German colleagues arrived there for this week's four-power ministerial talks, declared it to be inconceivable that the allies should develop any official relations with the east German government, and viewed with great caution any idea of a zone of limited armaments or of giving the United Nations a role in regard to Berlin. The west German government has made it sufficiently clear that it shares these views. Mr Selwyn Lloyd, on the other hand, indicated in Monday's debate in the Commons that the Government wanted to talk about "contacts between the two parts of Germany," zones of arms inspection and limitation, and "methods by which the UN might contribute in any new arrangements" for Berlin. If Mr Christian Herter has reconciled these viewpoints, he will indeed have proved himself an able Secretary of State.

In the margin of this week's unpromising menu there are also the gay doodlings of Lord Montgomery, who has contrived to be talking football in the Kremlin while his prerecorded hits-for-six echo across the world from a New York television station. Who will not echo his remark about military men keeping out of politics?

Fencing by Half Light

AFTER Monday's debate in the House of Commons Mr Selwyn Lloyd could look his fellow foreign ministers of the Nato alliance in the face in Paris on Wednesday in the knowledge that, although he may never have a great parliamentary reputation, he no longer has a sorry one. Partly no doubt he was reflecting the glory of the Prime Minister, whose diplomatic virtuosity has so flattered the self-esteem of British politicians that members on both sides of the House—many of whom in their hearts believe that all Mr Macmillan's brave efforts will end in tears—fell over each other to pay him tribute. But the House was deeply impressed by his firm exposition of the British scheme, publicly patronised by Mr Khrushchev but not yet stamped with American approval, for an annual quota of spot checks of suspected breaches of a ban on nuclear testing.

It was a pity that Mr Bevan got himself into such a muddle over this idea. First he urged that the Russians should be "untempted" from accepting Mr Macmillan's control plan because it was insufficiently comprehensive; in the next breath he was calling on everyone to give up bangs for good, in the hope that this unusual gesture of trust would lead to controls later. The kindest explanation would be that Mr Bevan just got the Macmillan idea of a limited number of inspections mixed up with the Eisenhower plan for a limited prohibition of tests.

But on Tuesday morning Mr Bevan got banner treatment in the newspapers for his repetition of the Labour party's two-year-old pledge to give up testing British bombs regardless of "the technical or political situation that we shall find when we assume office." By simply raising his voice on a dull day he had imparted a sheen of novelty to the one talking point left to those Labour candidates who are having difficulty in drawing the sulking unilateral disarmers out of their political tents. There are, of course, no nuclear tests in prospect (and, according to Mr Donnelly's gloss on the glossy pamphlet, it is part of even the Labour party's policy to reconsider testing, if other nations fail to reach a test agreement). But Mr Bevan apparently thinks that this is the right time to announce that, whether the Geneva talks succeed or fail, there will be no more British bangs.

This judgment seems to be founded on the highly dubious assumption that American public opinion will then rise up and force President Eisenhower to make a similar announcement. Would this make Russian agreement on controls more likely? It would surely rather strengthen Mr Khrushchev's original contention, from which Mr Macmillan has slightly weaned him, that controls and inspections are unnecessary. One general reflection, indeed, from Monday's debate, is that both Mr Macmillan and Mr Gaitskell need to beware of the new jingoism on their benches, which takes for granted that Britain is so admired for its example that it has only to give a theatrical "lead to the world" for everyone else to follow along at the double.

Half a Year, Half a Loaf

HALF a loaf is worse than no bread; that seems to be the only coherent reasoning behind Mr Khrushchev's rejection of the latest western proposals for making a practicable start on the banning of nuclear tests. Since the Geneva talks began six months ago, Moscow's once vocal anxiety about the harmful effects of fall-out seems to have become less urgent. The Soviet government will not accept international inspection on the scale that a total ban would necessitate, and it will not agree to start by banning those types of test that could be policed with less difficulty. It has been a revealing six months—and even for those who are most sceptical about Soviet professions, the lesson would seem to be that the way to test their sincerity is to get the Russians to a conference table and cross-examine them in the eyes of the world.

Some brisk cross-examination has already followed Mr Khrushchev's adoption of Mr Macmillan's ideas about fixing annual quotas of permissible on-site investigations by the international inspectorate. Mr Tsarapkin, the chief Soviet delegate at Geneva, at first seemed rather put out by being asked questions about this, and argued that the Americans and British ought to accept the Soviet version of the idea in principle without finding out what it meant in practice; but he now appears more willing to study the questions that were put to him on Tuesday. The two western delegations should continue to press these questions. They should again press the Russians to look at the scientific evidence about the Nevada underground tests, which they have had since January but have refused to consider. And they should also press, undiscouraged by Mr Khrushchev's messages last Saturday, for further consideration of the first-stage proposal for a ban on tests above ground and below a height of fifty kilometres. In negotiating with the Russians, it is fatal to abandon a plan simply because it is turned down flat the first time round. They themselves never make such a mistake.

The Malevolent Rain

THE Prime Minister's long and technical statement on radioactive fall-out in the House of Commons on Tuesday merely confirmed two facts widely suspected: that Russian nuclear tests carried out last autumn were responsible for a sharp increase in levels of radioactivity all over Europe; and that the wet summer aggravated matters by washing down the radioactive debris from the tests at an unusually high rate. This malevolent rain brought down twice as much strontium 90—the one really dangerous constituent of fall-out—over Britain as in previous years; fortunately it also rained long and hard enough to wash a great deal of it down through the topsoil and beyond the reach of cattle and shallow-rooting plants. But for this chance, the Prime Minister might have found himself in the unhappy position of reporting quite a significant rise in the amount of radioactive strontium found in children's bones, instead of only a "slight increase."

Sensible comment is hampered by the lack of reliable data on either the behaviour of fall-out or (and this is the crux of it all) the likely medical effects of exposure to the minute quantities of radiation that it involves. It is now suspected that the radioactive debris falls down from the atmosphere in a much shorter time than the ten years previously postulated; and it certainly comes down much more rapidly when tests are carried out in the Arctic, where the Russians have their proving grounds, than in the Pacific, where the British and American tests are conducted. One consequence is that fall-out from Russian tests contains a good deal of what are known as "short-lived fission products" which cease to be radioactive in a matter of weeks and are therefore no danger to health. Much of the 400 per cent increase in radioactivity recorded in parts of western Europe last year was suspected to be of this short-lived type, while the only radioactivity measured in Britain is that of the long-lived strontium 90.

There is urgent need now for some measure of standardisation in the methods used to measure and record fall-out in order to estimate the extent of the hazard. The six Euratom countries are attempting to introduce a system of this kind and expect to start publishing regular monthly reports on the level of fall-out in their territories by the end of the year. Unless last summer's high deposit rate proves to have been a freak of the weather, the Prime Minister may have more alarming results to report when he is next asked to bring Tuesday's statement up to date.

WAGE CLAIMS

Background . . .

NOW that the engineers have decided to make a £200 million wage demand, it is important to get straight the facts about the cost of living, earnings and hours of work, all of which are sure to crop up during the autumn bargaining. The cost of living has, in fact, shown remarkable stability over the past year, rising by only 1¾ points. This is not enough to be useful as a handle for wage demands; cost of living arguments are therefore likely, on the unions' side at least, to sink from sight during this year's bargaining.

Earnings vary widely from industry to industry, as the table below shows, and can nearly always provide suitable instances of workers who are better paid "for a comparable job elsewhere." Men in the coal, printing and vehicle industries are the best paid; and workers in textiles, clothing and agriculture are the worst. This pattern of earnings,

AVERAGE WEEKLY EARNINGS IN LAST PAY WEEK IN OCTOBER, 1958.

Industry group	Men over 21	All workers	Industry group	Men over 21	All workers
	s.	s.		s.	s.
Coal mining*	308	294	Chemicals	264	228
Paper and printing ..	296	234	Building etc.	249	237
Vehicles	281	251	Food, drink, tobacco.	240	189
Metal manufacture..	280	262	Textiles.....	232	169
Engineering, etc. ...	269	234	Clothing	228	144
Dock labour	266	n.a.	Agriculture†	196	n.a.

* Cash earnings excluding value of allowances in kind. † Figure relates to the six month period April–September, 1958 and includes the value of allowances in kind.

which includes overtime, piecework, bonuses and other plus payments, differs markedly from the pattern of nationally negotiated wage rates. The earnings of engineers and vehicle builders, as Mr Carron, the Amalgamated Engineering Union's president, pointed out this week, have not been much affected by the recession. Those of railway and textile workers have.

It is on hours of work that the unions at first sight appear to have their best case. Not since 1947, when a major move to a 44-hour week was made by 5½ million workers, have standard working hours been significantly reduced. In recent years, almost every major union has made a claim for shorter hours as well as for higher wages; but when the test came the shorter hours were always dropped in favour of the wage demand. The same has been true of claims for longer paid holidays and other fringe benefits. There is no proof that workers want more time off, since the number of hours actually worked per week has remained roughly constant for ten years; moreover, employers have never looked kindly on claims for shorter hours, which they see as simply a disguised wage claim. But if tighter organisation were to enable a cut to be made in the seemingly lavish overtime worked in certain sectors of industry, and if the unions were prepared to bargain for a

more gradual scale of overtime payments than at present (such as time and a quarter for the first hour instead of time and a third all the way through), there might be a real future for the shorter week.

. . . and Forefront

THE one major union which had lately been exploring in some detail the possibility of getting a shorter working week was the Amalgamated Engineering Union. During the one-year wage freeze which followed the 1957 engineering strike the union pressed hard for a 40-hour week; later, when the employers refused this, the union asked more moderately for a phased reduction of hours over two or three years. These demands were made quite seriously, not just as a display of panache; but to suggest to the AEU's national committee, as Mr Carron did this week, that the 40 hour week should take precedence over an immediate wage claim was a brave move indeed. And it was resoundingly defeated.

There were probably two main reasons for this. The first was certainly that the strong communist and fellow-travelling minority on the 52-man committee is now intent on sowing industrial trouble and being as militant as it can; and, in so far as this involves urging massive increases in wages or an out-and-out policy against redundancy, this minority can count on the support of many non-communist officials for whom an annual wage claim and resistance to dismissals are now articles of faith. The second reason for Mr Carron's defeat was the extreme moderation which his hours claim would have involved. The engineers, whose habit in the past has been to sanction a new claim before the old one was decided, were being asked to forgo a direct wage increase this year altogether. This was too much for 32 of the committee's members and Mr Carron will now go to the conference of the Confederation of Shipbuilding and Engineering Unions in June loaded down with a demand for a 15 per cent wage increase all round as well as his claim for shorter hours.

This claim breaks the present industrial quiet with a vengeance, though it is likely to look a lot less dramatic once it has been toned down by the more sober counsels of the general unions in the confederation. More important, it shows the difficulties which face a union leader who tries to do some new thinking on wages. Even if he feels that, in being moderate, he is in line with rank-and-file feeling—and, if rumours of Mr Carron's sweeping victory for the presidency are true, he can fairly claim that—there remains the almost impossible task of winning over the active militants to such a policy. This difficulty is particularly acute in the AEU, which more than most unions is affected by unofficial action countenanced by local, and sometimes quite senior, officials. Mr Carron had some strong things to say about these people in his well-balanced address, but the fact remains that the communists in the union are showing resilience. They have now made sure that the engineers shall be the pace-setter in wage demands this autumn.

THE PARTIES

Neck and Neck

THE latest Gallup poll, confirming conclusions that have been drawn from by-elections, points to a dead heat between the Conservative and Labour parties. This has rather subdued those Tory voices which were heard muttering with displeasure at the luncheon of the 1922 Committee when Mr Macmillan offhandedly dismissed the notion of an early election. It is not much use arguing that you should cash your chips while you are ahead if you are not in fact ahead.

The prospect for party politics without an immediate battle is one of competitive boredom. Both Government and Opposition have lost their "edge." Only the Liberals seem likely to gain from the postponement, since in many of the constituencies in which they are now intervening their organisation needs to be built up from scratch. Their strengthening should on balance help the Labour party—probably to a substantially greater extent than some recent analyses have suggested.

Although the political scene somewhat resembles a Japanese wrestling match in which two enormously overweight contenders lock with each other in apparent immobility, there is not the same certainty that one or other of them will suddenly collapse. Both sides have shown themselves skilled in spoiling tactics. Mr Macmillan's peregrinations (although their main motive was not political) have headed off the Labour party's effort to make foreign policy a major political issue; the Opposition, by making so much diversionary fuss about pensions, has gone some way to depriving a tax-cutting budget of its political glamour. And now both sides are on the defensive. The Government is hoping that, with a few more months' grace, the idea that it is callous towards unemployment and towards Lancashire will have been softened by the falling unemployment figures which even Mr Gaitskell predicts, and by a smooth working out of the new plan for cotton. Mr Gaitskell is sufficiently worried by the Labour party's negative reputation for grim austerity, loss-making nationalisation, love of the country's enemies and support for trade unions which bully their members that he devoted a whole party political show on television to answering "men-in-the-street" who made these complaints.

From now on it will be every man to his image. The chances of the Government stumbling or making itself more boring might seem to be the greater. But, if there are serious labour troubles or foolish strikes about boundary disputes, the Labour party's mask could slip past recovery.

EUROPE

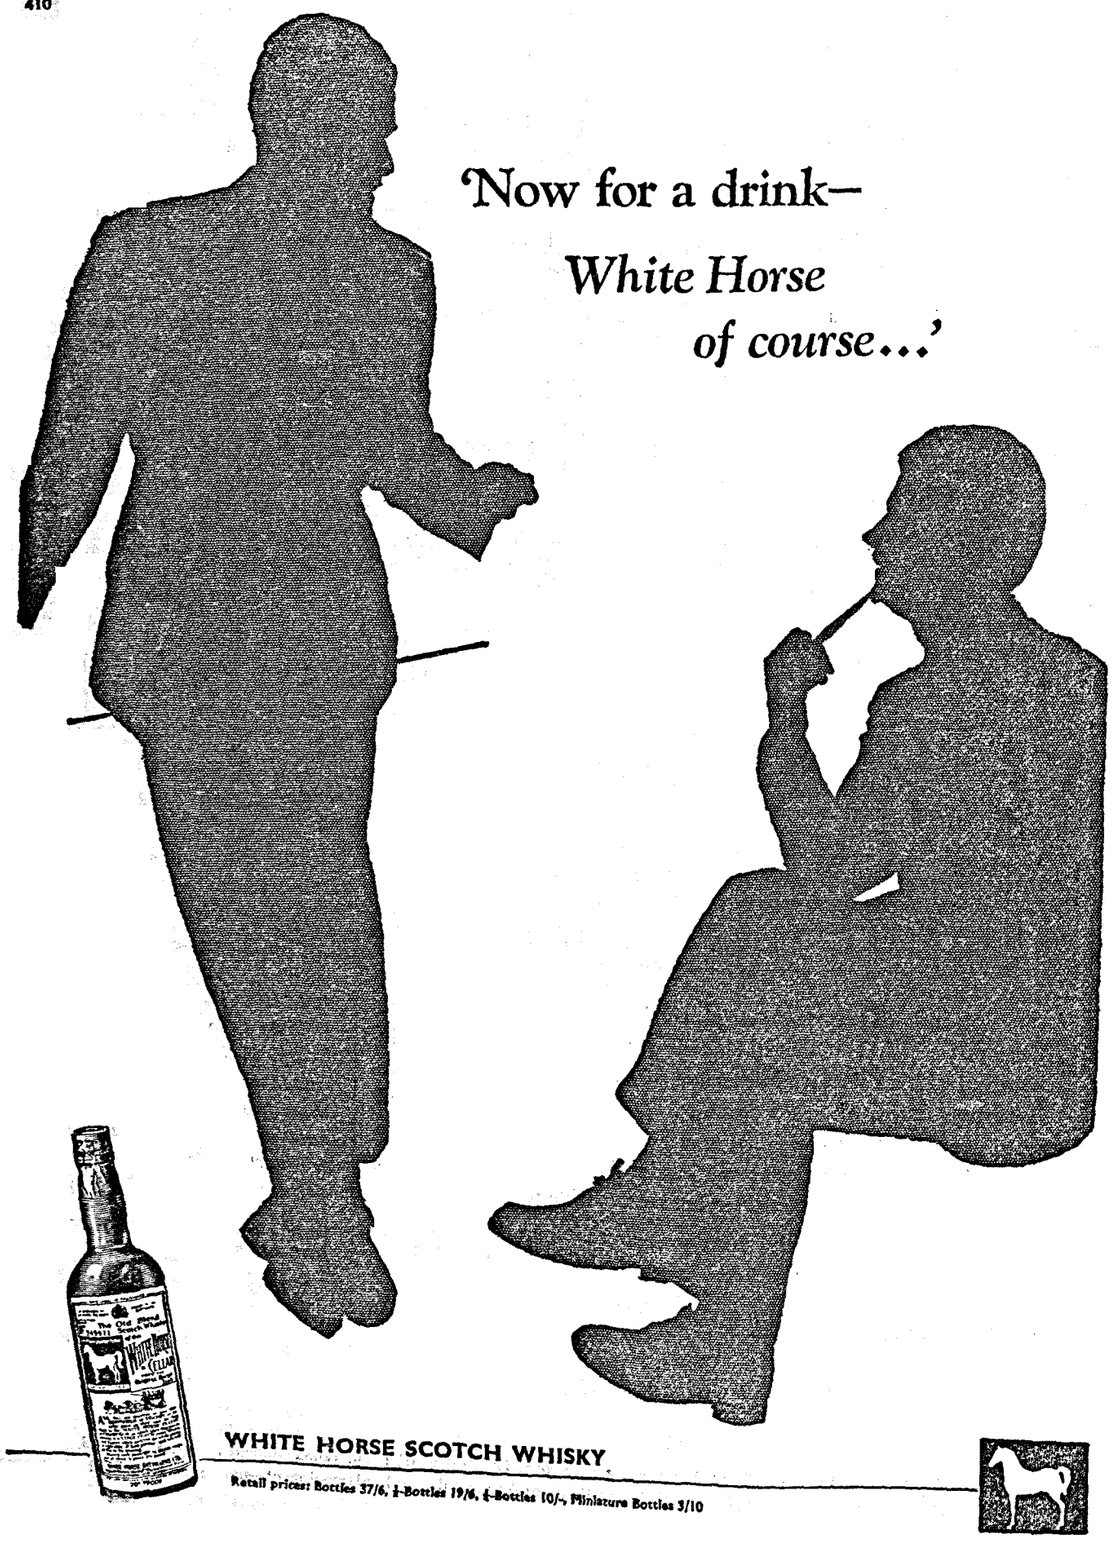
On the Burning Deck

MR MAUDLING'S speech to the Council of Europe on Monday showed that the British government still pins its European policy on the idea of a free trade area. Once more he raised the familiar objections to British membership of the common market: Britain must preserve free entry for commonwealth raw materials; it could not agree to a common European commercial policy towards the outside world. He added the debatable new point that the common market system could not be spread over the other OEEC countries without fundamentally changing the common market treaty.

Perhaps Mr Maudling found some encouragement for his view in the motion passed by the assembly, calling on the governments to sign a "declaration of intent" in favour of a European Economic Association and to resume negotiations on it. Such resolutions are agreeable, but they have been passed before without effect. The difficulty arises

The glass-enclosed promenade deck is an ideal setting for afternoon tea. Here, perfectly sheltered, yet within sight and sound of the sea, you will be served with delicious sandwiches and cakes. A game of table tennis is in progress further along the deck . . . table tennis while making full speed across the Atlantic! What a memorable experience the whole voyage is . . . what a welcome and invaluable breathing space if you are on business—and secretarial services are available if you need them. No matter whether you are travelling First, Cabin or Tourist Class, this is travel in a big way.

ATLANTIC HOLIDAYS



With the £100 Dollar Allowance, holidays in the United States and Canada are an exciting possibility. Ocean fares and all inland transportation in North America can be paid in sterling, leaving the dollar allowance intact.

when they have to be put into effect. The French representatives, in any case, did not support the motion. It would be a pity if such expressions of goodwill misled the government into imagining that there is still a possibility of going back and reviving the free trade area scheme, or if a mistaken assessment of the European situation caused it to be unprepared when an opportunity occurs for a more hopeful move.

THE WEST INDIES

Crisis Over?

THE relaxed mood of Sir Grantley Adams, Prime Minister of the West Indian Federation, during his visit to London last week hardly suggested a man oppressed by a constitutional crisis. On the contrary, he left no doubt of his opinion that talk of Jamaica's secession from the federation after a year of its life is simply a matter of electoral fisticuffs within Jamaica; there Sir Alexander Bustamante is hoping to wrest the island's government from his cousin, Mr Manley, at the forthcoming general election. Nevertheless, it was a painful federal matter—taxation—which caused Sir Alexander to start beating the anti-federal drum so successfully that Mr Manley found it necessary to join in with a blast on the anti-federal trumpet. Sir Grantley stated, quite rightly, that the West Indian government had the right to levy taxes retroactively to 1958, the date of its formation; and this gave Sir Alexander his chance to cry that Jamaica was not in any case getting value for its contribution (more than £800,000 a year) to federal funds. Sir Grantley evidently feels that if the Busta party should win in Jamaica, it would soon learn what good value for money Jamaica gets (including a university, a teaching hospital and soon an engineering college); and if Mr Manley's party wins, as is likely, he will quickly remember his own pledge to support the federation.

Nevertheless, the whole affair, even if it goes no further, reveals the inherent strains in the new West Indian political structure. The ten island "units" which compose it cling jealously to island rights; the federation, under Sir Grantley's firm guidance, stands for the implementation of a full customs union and the removal of inter-island barriers to immigration—and it is also short of money. To make matters harder, Sir Grantley's supporters in the federal legislature come mainly from the small islands that are beneficiaries of federation, while the opposition comes mainly from Trinidad and Jamaica. Sir Grantley has certainly brought his problems up in London; and, since it is most important that federation should succeed, the question should be asked what Britain can do to help. There are several possible ways of raising the authority of the federal government. One would be to enable it to raise money, perhaps by using the new procedure of Exchequer loans. Another would be a successful negotiation over British purchases of West Indian citrus fruit, which suffers (or so West Indians contend) from ruthless American dumping. Yet another would be to bring British Guiana into the federation—although the benefits it could confer would materialise only in the long run, since at present unemployment there is severe. Meanwhile, Trinidad and Jamaica are prospering—and it is the very fact that industries are developing and living standards rising that helps to turn them inwards on themselves. Sir Grantley must console himself that the first ten years of any federal state are the worst.

KENYA

Planning a Conference

ENCOURAGED by the lead given by Mr Michael Blundell's New Kenya Group, and pressed by the alliance of African and Asian members, whose delegation is now in London, Mr Lennox-Boyd has wisely decided that there is now a basis for fresh discussions on Kenya's future. He has agreed to call a round table conference, to make an outside constitutional expert available, and has broadly defined the next move in Kenya as towards responsible self-government. This is far short of the Africans' demand for an "undiluted self-governing parliamentary democracy," but they have accepted it as meeting to some extent their request for a definition of Kenya's ultimate status; they interpret the Colonial Secretary's remarks as implying ultimate African rule and they have ended their boycott of the Kenya legislature.

But they still stand by their full claims, which can hardly be conceded, since they would virtually give decisive power to African politicians in the interim period. Their immediate concern is to have the emergency regulations withdrawn so that they can develop a mass movement in Kenya. This tactical point might be conceded—but not without a parallel strengthening of the governor's power to deal with disorders and keep hardcore Mau Mau out of circulation. The African leaders continue to demand Jomo Kenyatta's release, but perhaps rather because it sounds a good rallying slogan, than because they want him back. Nothing would seem more calculated to frustrate their plans to gain power quickly than Kenyatta's return—if the official view that this would re-start the Kikuyu civil war is correct.

Mr Michael Blundell's arrival next week should make it possible to discuss possible dates for a conference (it certainly ought to be held in London where the sort of double-shuffle usual in Kenya inter-racial political negotiations would not be possible under the glare of publicity). But it is idle to conceal that, vague as the proposals of the New Kenya Group are, there is a vast gap between what they offer and what Mr Odinga's delegation is asking for even as a first step. Perhaps Mr. Blundell may be able to narrow the gap a little, and steal some tricks by appearing his usual earnestly reasonable self.

OBSCENITY BILL

One Up for Private Members

FIVE years' work by private members, prodded and assisted by freebooting from the intellectuals' lobby, was crowned with success on Friday last week. A deal between Mr Roy Jenkins, the resourceful pilot of the Obscene Publications bill, and the Home Secretary went through without a hitch. It was a simple swap, by which the requirement that all prosecutions for publishing obscenities must be cleared with the Director of Public Prosecutions was dropped in return for the law officers' agreement to a clause making expert witnesses for the defence admissible. The clause on expert witnesses was much the more important—especially after the Attorney-General revealed that every one of the asinine cases against reputable publishers since the war had been undertaken with the director's consent. To safeguard the judges' prerogatives, about which the law officers had previously

made so much fuss, the new clause provides that the experts "may" be admitted in connection with the new defence that publication contributes to the public good by advancing the causes of literature and the arts; but it is difficult to conceive of a judge refusing a reasonable application.

The bill now goes to the Lords, where it will be under the impressive care of Lord Birkett, who as a defending counsel was once refused such permission. It is now different in many respects from the bill Mr Jenkins first introduced. There has been give and take on both sides. For instance, the provision for an author to intervene in a trial when he is not one of the defendants, which was one of the original bill's principal features, was sensibly dropped during the committee stage; the author's status would have been anomalous and the precedent from divorce proceedings proved singularly unhappy. For the sake of progress, the bill's promoters accepted the Home Office's insistence on heavier penalties and greater police powers against straight pornography; some of these provisions could perhaps do with closer scrutiny in the Lords. But the Solicitor-General's attempt to broaden the definition of publication to cover giving and lending, playing and projecting, was sensibly rebuffed.

The Government deserves some credit for taking its defeats in a rather better spirit than had been feared. But the congratulations for demonstrating that time spent by private members can be worthwhile are due to Mr Jenkins, to his principal Tory ally Lord Lambton, and to his legal right arm, Mr Niall MacDermot, the victor of the North Lewisham by-election.

INDIA AND CHINA

Dragon's Breath

WHILE several thousand Tibetan refugees have now found sanctuary in India and Bhutan, India has also been receiving a flood of invective and accusation from Peking, where the National People's Congress ended an eleven-day session on Tuesday with a resolution accusing "certain Indian political figures" of interfering in Chinese affairs. From the congress, in the Peking press, and at public meetings organised in various parts of China, wild abuse has been hurled at "Indian expansionists." Peking radio continues to claim that the Dalai Lama is being held under duress at Mussoorie. One congress speaker is reported to have addressed a warning to India that the Chinese "will never allow foul hogs to poke their snouts into our beautiful garden."

In the Indian parliament on Monday, Mr Nehru dwelt on the need for self-restraint under this offensive torrent, and rebutted the Chinese charges one by one with dignity and firmness. He pointed out that the Dalai Lama's declarations at Tezpur and Mussoorie were the Dalai Lama's own work, and that there was no question of the Dalai Lama being kept under duress either by India or by his own entourage; Mr Nehru had talked with him for several hours alone except for one Indian interpreter. Mr Nehru described the Chinese talk about "Indian expansionists" as "unbecoming and entirely void of substance." Equally unjustified, he said, was the charge that Kalimpong had been a centre of the Tibetan rebellion, which he called "a major upheaval"; and, dealing with Peking's claim that the revolt was the work of only a small upper-class group, he pointed out that even Chinese accounts of it conceded that it was too large to be explained by anything but a "strong feeling of nationalism."

Mr Nehru went on to warn Peking that neither military nor political methods would serve to deal with the kind of instinctive reaction their actions had evoked, not only in Tibet, but in India and other Asian countries, and to urge a reconciliation based on the carrying out of China's own assurances about Tibetan autonomy. Unfortunately Peking, which has been announcing the final crushing of the Tibetan rebels almost every other day, shows little concern about the damage it is doing to its own relations with other Asian and African peoples. If the Indians continue to show their sympathy for Tibet and their contempt for Mao Tse-tung's falsehoods, they will get even hotter blasts of the dragon's breath down the backs of their necks.

CHINA

A Moscow Graduate

THE meeting of the National People's Congress on Monday was presented with, and duly approved, a significant reshuffle among China's top people. Liu Shao-chi, on the second rung of the communist hierarchy, succeeded Mao Tse-tung as the chairman of the republic. Two new vice-chairmen were elected: Tung Pi-wu, Mao's old friend and until recently the president of the supreme court (this post went to Hsieh Chueh-tsai, the former minister of interior), and Mrs Soong Ching-ling, Sun Yat-sen's widow and Chiang Kai-shek's sister-in-law. The aged Marshal Chu Teh, the founder of the Chinese communist army, became chairman of the congress after having resigned the vice-chairmanship of the republic; in addition, the standing committee of the congress acquired eleven new members.

The old guard of Chinese communism, and the triumvirate of Mao, Liu and Chou En-lai in particular, are still at the helm. Unlike their colleagues in Moscow, they found no difficulty in weathering the two comparatively mild purges in the past; the present personal changes have taken place within the family. But Liu's elevation to titular head of state may well mean that, having succeeded Mao as chairman, he will also eventually succeed him as party boss. Five years younger, he has a fair chance of surviving his friend at the very top; nor does Liu's new office place undue limitations on the extension of his power. As chairman of the republic, he will be able to preside over the State Conference and the Council of National Defence, two of the highest policy-making organs of the state.

Like Mao Tse-tung, Liu was born in Hunan province, the "cradle of revolutionaries," the son of a fairly well-to-do peasant family. The characters of the two men are in complete contrast. Mao's creative, artistic temperament can often make men like him; Liu's calculating, bureaucratic mind and his subtle dogmatism have never been known to inspire more than respect. In their youth, they came to see Marxism not only as a method by which China could be made modern and strong, but also as an instrument of national revolt against foreign domination. Nevertheless, their paths soon diverged: while Mao was building China's own brand of peasant communism in the nineteen-twenties and early thirties, Liu spread a more orthodox gospel among the people of the towns. At 25 he become vice-chairman of the communist trade union congress; after the suppression of the urban communist movement, he left for party schooling in Moscow. Yet as soon as the success of Mao's communism became apparent, Liu wasted no time in giving it his loyalty. Liu Shao-chi has not, however, given unqualified support to two major policy-making mistakes of Mao. He was enthusiastic neither about the "hundred flowers" theory, nor about the imminence of the "leap into communism"; herein may well lie his strength.

ALGERIA

The Oracle Speaks

AS the first anniversary of the successful coup of May 13th approaches, the mood in Algiers is not all for rejoicing. It is probably to relax tension that M. Laffont, the pro-Gaullist deputy for Oran, published on Thursday in his paper, *L'Echo d'Oran,* an interview granted to him by General de Gaulle. In this interview the general expressed his astonishment that measures of clemency should cause concern in certain Algerian quarters. He reminded the *ultras* that last year's fraternisation between French and Moslems was not of their doing, but was achieved under the banner of his name. And he also warned them that they had no chance of preserving Algeria as it had been "in Daddy's day."

Dissociating himself from the Algiers extremists, the general has also tried hard to steal their thunder. Asked why he refuses to pronounce the magic word "integration," he replied that the word does not count. Measures such as electing a single college, or the wider employment of Moslems in the administration, point in that direction. As to the other context of the word, meaning that Algeria is French, the general added briefly: "Is it useful to say it? It is a fact."

General de Gaulle sounded satisfied with the state of military operations, though he admitted that no military victory can be lasting without a deep transformation of the country. His offer of the *paix des braves* still stands. The FLN (rebel) representatives, must, however, come to Paris. The general has refused to send an emissary to neutral territory to talk with the FLN, because that would have been a form of recognition. He has also warned "serious countries" that recognition of the FLN government would mean breaking off diplomatic relations with France. The countries included the Soviet Union and India, but an exception was made for Arab states. Significantly, General de Gaulle considers that the FLN will now lean more heavily on communist countries (other than Russia) with whom France has no diplomatic ties. His interview is likely to annoy some Algiers extremists and appease the bulk of the settlers. It does not, however, give great hopes of an early negotiated solution.

Unknown Refugees

IN the last two years there have been nearly as many refugees from Algeria as there were from Hungary after the 1956 revolution. Unlike the Hungarians, the Algerian refugees have received almost no publicity and very little help. They have fled east and west; there are now more than 100,000 in Tunisia, and some 80,000 in Morocco. As the French army tightened its control over the Tunisian frontier, the eastward flow died down; but the numbers in Morocco are increasing daily. About 85 per cent of the refugees are women and children; many of the men who might be expected to accompany them are fighting with the rebels. They are living in shacks that they built themselves and existing upon whatever the Red Cross, the Red Crescent and the United Nations High Commissioner for Refugees has managed to scrape together for them.

There is absolutely no prospect of employment. Tunisia itself has a hefty unemployment problem and can afford nothing towards the maintenance of refugees, although it will provide free transport for stores and food given by others. The United Nations does not want to put them into camps for fear that they will become as settled a problem as, say, the Palestinian refugees. The immediate problem is how to feed them. The United States is helping out of its surplus food stocks, particularly with wheat, but there is urgent need for money in order to supplement and balance this diet.

These are far from the only victims of the war in Algeria. Many others (estimated by M. Delouvrier, General de Gaulle's delegate-general in Algeria, as more than a million) have had to leave their homes but remain in the country and are being resettled permanently by the French army. At present a fair number of these displaced people find work in building their own new villages; but where will they find work when this comes to an end?

IRAQ

Communists in the Cabinet?

ON the eve of May Day, the Iraqi Communists have suggested firmly that the time has come for their party to move officially to the front of the stage. So far no avowed Communist is in the cabinet (although the minister of economics, Dr Kubba, is known to hold views very far to the left). Party political activity having been in almost total abeyance since the revolution, the Communists have concentrated—successfully—on work in professional bodies and front organisations and have not tried to operate as a party in political affairs. The only political organisation officially recognised is the National Front. This state of affairs could not be expected to last. On Monday the newspaper of the National Democrats, *Ath-Thawrah,* flew a kite by suggesting that the time had come for the cabinet to be remodelled to include ministers specifically representing the three parties in good odour—Communists, Kurdish Democrats and themselves. Two days later the central bureau of the Communist party sent in its official demand for "representation in the government, side by side with representatives of the other loyal democratic parties and forces."

The cabinet at present consists of General Qasim, a

INDEX

The Index to *The Economist* is published quarterly. The subscription rate is 10/- a year; single copies are priced at 2/6 each. The Index to Volume CXC (January to March 1959) is available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1

bunch of army officers, and a few civilians, some apparently non-party and some National Democrats. The way will be opened for new appointments when the development board (hitherto an autonomous administration) is replaced by five new ministries. This change, which has already been announced, overshadows Dr Kubba's recent statement about the re-allocation of oil revenues. The board has been receiving 70 per cent of the royalties, the government keeping only 30 per cent; in future they are going to be split fifty-fifty between investment and ordinary revenue. But when the board disappears, the spending of all the oil money will come under the direct control of government departments. The appointments to the new ministries will be significant straws in the political wind.

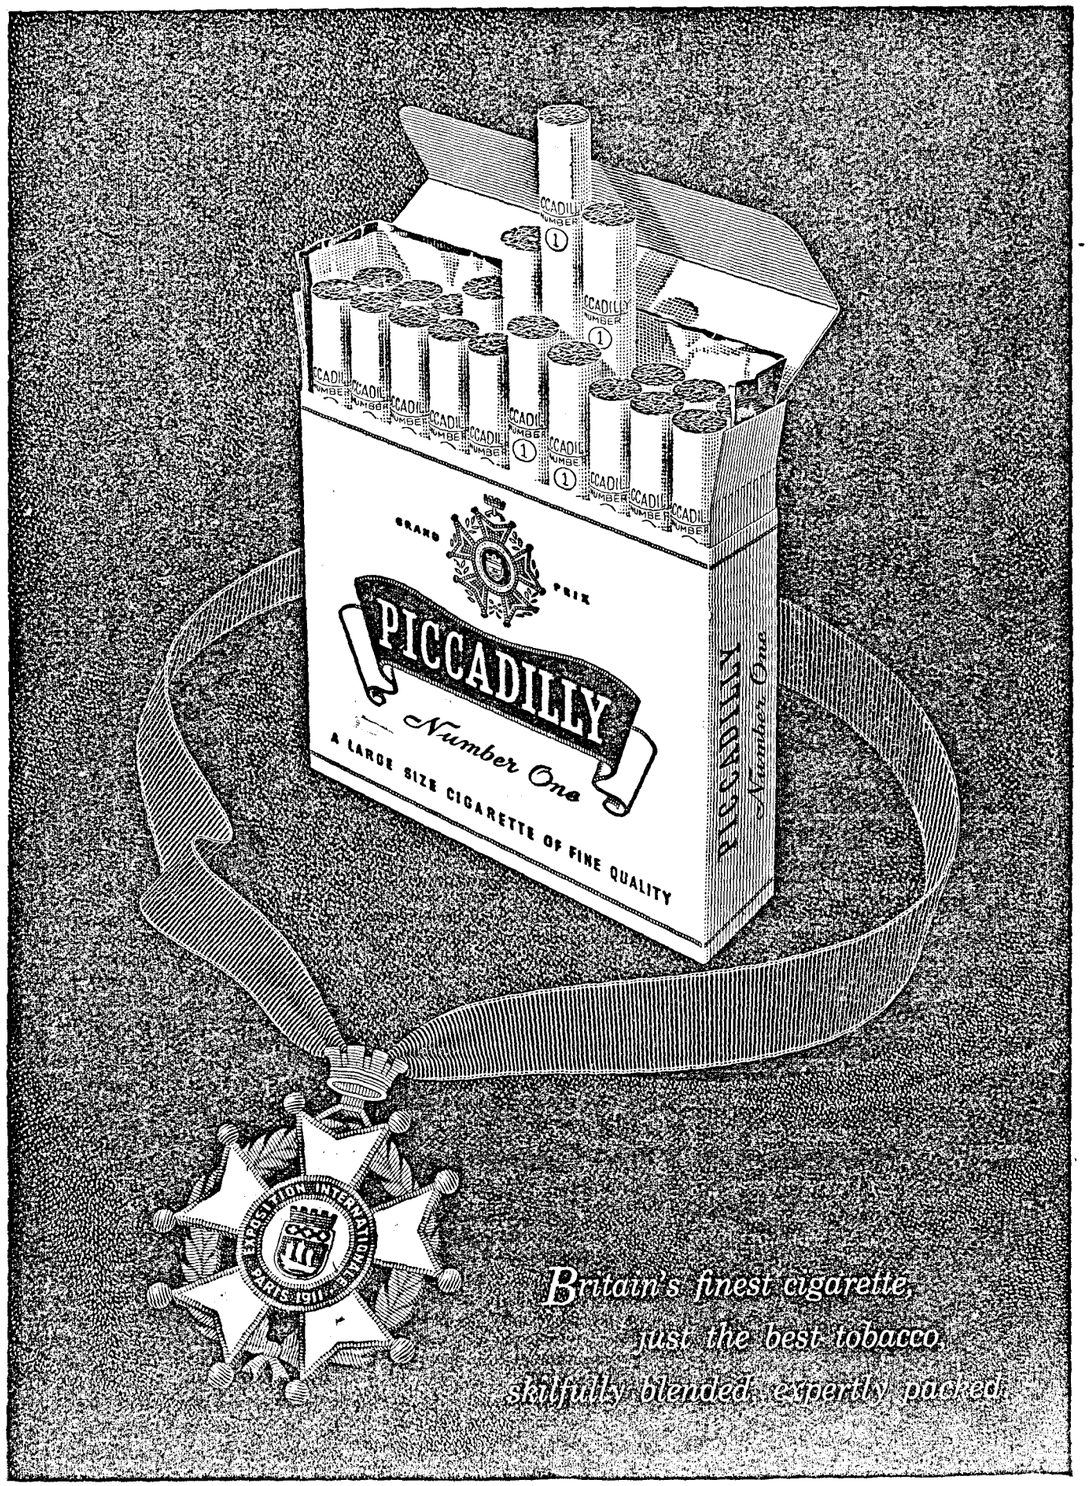
LONDON GOVERNMENT

Which Plan for London?

THE interchanges between Sir Isaac Hayward and his Labour colleagues on the London County Council and the members of the Royal Commission on Local Government in Greater London are a cynic's delight. Every ball was blocked by Sir Isaac with the stolid obduracy of a born conservative. Could the LCC's boundaries and functions be defended? No, not in theory—but they worked and any tampering would produce "chaos." Was the LCC not too small for some functions which concerned all London and unnecessarily big for others? The only reply was that other local authorities also objected to changes and any co-ordination needed could be done by the Government. The LCC —admittedly in common with its neighbouring county councils—reckons that if it lies low nothing will be done.

This reasoning is as feeble as it should prove futile, since it is clear that something drastic should be done about local government in London, and the only sensible question is which of two possible approaches to adopt. One approach (which was outlined in *The Economist* of December 13th) would accept the original conception which fathered the LCC and the metropolitan boroughs but bring it up to date. A single body for the whole of Greater London would be established to run certain key services with a series of enlarged boroughs to run the remainder. The other approach calls for a group of large well-balanced authorities able to provide almost all services, except a few metropolitan-wide ones, at a high level of efficiency.

Right or wrong this latter view is worth examining. The undeniable efficiency of a big, powerful body like the LCC is a point in its favour; but the LCC most emphatically is not a "balanced" unit; it is a claustrophobic political fortress based on the crumbling core of nineteenth-century London. If large authorities are needed, the only way to let air into this fortress is to combine the older, mostly poorer areas of inner London with the newer, richer suburbs beyond. Central London itself (an area roughly bounded by the main-line terminals) has traffic and other problems which call for—and on this plan would get—special treatment. It would then be possible to combine the surrounding residential and industrial areas in the County of London with the corresponding segments of North and West Middlesex and of metropolitan Surrey, Kent and Essex to produce five or six large authorities of about a million and a half population each. The new councils would govern areas following the natural lines of communication and daily travel, as well as the lines of traditional loyalties (the Oval would be back in Surrey and Lords in North Middlesex). All of them should have a healthier political balance than the LCC. Such a scheme would be opposed not only by the Labour bourbons at County Hall, but also by Tory diehards in the suburbs, but this is the kind of opposition which any worthwhile plan must outface.



MANAGEMENT EDUCATION

Cambridge and Industry

THE announcement that Cambridge University has approved a proposal that the Faculty Board of Engineering shall introduce a one-year course and an examination in "the principles of industrial management" will please all those who have been demanding that the universities should emulate America in taking management education seriously (but have hardly dared to hope that the ancient universities would set the pace). The experiment should be generally welcomed; cautiously, though perhaps wisely, the university has stipulated for a trial period of five years, after which results will be evaluated. The Engineering Faculty have apparently satisfied themselves "that there is a sufficient body of knowledge and that teaching can be of a sufficiently high standard to justify the introduction of teaching in management at a standard comparable to a Tripos." This is just what the arts and science faculties of most universities have so long doubted, despite the assurances of management experts, and the success of the Harvard Business School.

The new course is to be restricted to those who take mathematics or science at the university; evidently this is felt to be the proper foundation for a course on industrial management. There will be criticism from those who think an economics basis would be just as solid, since plenty of arts students (as well as accountants) go into management. The course has been deliberately designed, however, for young people who base themselves on science (especially those who take Part I in two years), since it stresses quantitative analysis and control. It adds the study of economics, industrial pyschology, economic history and law, to what is evidently hoped will be a mainly "mind-training" course in the mathematical approach to "complex problems in the analysis of industrial activities." Such a course should broaden the mind of the young scientist intending to go into industry; and it is significant that Cambridge is fitting this course into the undergraduate stage, rather than (as academics have hitherto thought best) making it a post-graduate course, possibly for those already in industry.

So far even postgraduate courses in this subject have found only a few sponsors among universities, though they are, in various forms, provided in most Colleges of Technology. The Cambridge experiment may thus form the pattern for others. But the arts faculties will have to watch it carefully. If it is successful, will it prove that all training for management is best based on science? If so, arts subjects may lose still more good students to technology. Or will the arts faculties decide, in due course, that administration, in the widest sense, ought to be perfectly compatible with an arts degree (since classics was for long the basis of the higher civil service, banking and even commerce) and therefore feel compelled to introduce some specific study of its "principles" in first degree syllabuses? They will not be able to baulk this question if the "Management Tripos" acquires cachet in the practical world.

NO. 3 HOW TO OPEN A FLOWER SHOW

As everybody knows, there never was such an expert in flower-show-opening, such a perfectionist in this difficult art, as Lady Margaret Horley-Lampe. "A great pleasure to come amongst you once more" is of course the right way to begin: but it is not exactly what she says—it is the absolute rightness of her general Flower Show qualities. To begin with, as the daughter of a Duke but married to a Mr., her position is ideal, and her choice inevitable. It is true that in 1953 her sequence of sixteen consecutive appearances was incredibly broken in favour of Miss Daphne Dote, the film actress, from Ruislip: but fortunately this breach was healed by the resignation of that unsuitable Show Secretary, Charlie Wiggins. Lady Margaret knows exactly when to arrive, by which entrance, and across what reserved paddock, in her completely un-self-driven car. Flower Show colours, we observe from her, are strongly pale and emphatically matching. The accent is on the good grey of her suede gloves. Her coat, pale in a very slightly contrasted direction, is English summer weight—i.e. suitable for all purposes.

"All of us who have the interests of the Flower Show at heart" is a good thing to say before a slight criticism: but Lady Margaret was so outstandingly suitable that nobody minded, or indeed noticed, if in her speech she wandered to the extent of mentioning her plan for a washing-up machine in the canteen of the kennel club. But the Complete Opener should know by instinct that it is Goatley, cashier of the little bank in the High Street, who is this year's Secretary; she will remember that Miss Edelscote must be complimented, as she has been for the last twenty years, for producing the best Lauschia phipps-vaughanii, though it is faintly annoying that as always she slightly mispronounces Miss Edelscote's name. She is delighted, once more, that the younger people are taking an interest in flowers; and though she somehow infers that flower shows in general are not subject to the petty differences of local politics, she makes it fairly clear which politics these are.

LETTERS

Decaying Industries

SIR—On page 308 of your issue of April 25th you imply that official industrial policy is to "encourage decaying industries to take an unconscionable time a-dying." I should like to examine this more closely by sketching a thumbnail case-study of the policy in one area of high unemployment. In South West Wales a major industrial transformation is taking place as revolutionary new labour-saving steel plants and plate mills come into production. The old-type steelworks and hand plate mills of the area have therefore become "decaying industries." The Government in 1953 appointed the Lloyd Committee to advise on the problems likely to arise from this threat.

The main result of the Lloyd Committee was a programme of roads to improve communications between South West Wales and the Midlands. In February, 1958, a team of four experts was again sent to the area. It reported that the industrial transformation was so complete that there was little chance of any of the old-style plate mills surviving and that most of the old-style steelworks would also be likely to be put out of business by the new plants. Though unemployment would result (as the new plants employ far fewer men), the 1958 Committee did not recommend, any more than did the Lloyd Committee of 1953, that the Government should try to keep the older plants going. On June 12, 1958, the Government accordingly accepted the establishment of new industries as quickly as possible in West South Wales as their policy.

The policy of attracting new industries seems to be succeeding. A new engineering workshop being built by the Government for the Pressed Steel Company near Swansea will eventually provide 4,000 jobs. Other projects have started at Gorseinon, Pontardulais, Llanelly and elsewhere. Altogether, it has been estimated in Parliament that new industrial projects approved will provide some 10,000 new jobs.

My conclusions from this case-study are: (i) While your statement that the Government always protects dying industries and towns may be sustainable, the suggestion that it does so by encouraging dying industries to take an unconscionable time a-dying is not. (ii) A decidedly realistic policy of building new roads and bringing in alternative industries has been followed in this area. (iii) The success of this policy casts doubt on your statement that the policy of trying to move work across country to the workers is not succeeding—at least as a generalisation.—Yours faithfully,

GEOFFREY D. M. BLOCK

London, N.W.1

Resale Price Maintenance

SIR—Your article on the Restrictive Practices Court in your issue of April 25th states that "supermarkets have been the chief agents" in the decline of resale price maintenance in food retailing. This argument is surely untenable. To suggest in this way that a mere 200 supermarkets out of some 150,000 grocery outlets can have been "the chief agents" is to place supermarkets in a totally misleading perspective, however important they may be eventually.

Admittedly, self-service shops as a whole have often led the way in price cutting, but these only account for about 4 per cent of grocery shops today, even though they are taking a relatively bigger proportion of total grocery turnover.

The true picture, surely, is that the lead in price cutting has been given by certain of the multiples, most of whose branches are even today run on conventional counter service lines.—Yours faithfully,

K. C. SHARD

Amersham

Renewal of Passports

SIR—I am not impressed by your apologia on behalf of the Foreign Office in respect of the outrageous 100 per cent increase in the charge for the renewal of passports. There is no more valid reason why the salaries and expenses of overseas officials responsible for the issue occasionally of United Kingdom passports in other countries should be borne solely by the holders of British passports than that the salaries and expenses of ambassadors should be the financial responsibility solely of those holding passports.

I would also emphasise that far from the Foreign Office being a reluctant victim of a need to issue passports, on more than one occasion in the life of the present Government has it declined the suggestion of foreign governments that passport formalities should be waived. Hansard records that the British Government's view is that passports are very useful and that it has no intention of abandoning their use.

Finally I would suggest that if the renewal of passports represents any appreciable expense, the logical action is to abolish such a renewals practice. There is nothing sacrosanct about five years representing the initial life of a passport, and by a figurative stroke of the pen the period could be extended to ten years—relieving the Foreign Office of all the work associated with a renewal after five years and relieving the passport holder of a quite unnecessary and meaningless irritation and expense.—Yours faithfully,

Birmingham H. R. MURRAY SHAW

ALLEN & UNWIN

BOOKS

Friend of Britain

Nuri es-Said
By Lord Birdwood.
Cassell. 306 pages. 30s.

THE Iraqi revolution happened on July 14th, and the Bastille chosen for storming was the British Embassy. Of the many messages that can be read into the humorous and resourceful face of Nuri Pasha that looks out from the dustcover of this book, the most important is that he lived believing in Iraq's alliance with Britain, and died for his convictions. It is suitable, therefore, that the first full length biography of him should appear in London. The pity is that, though a most affectionate book, it is not a penetrating one.

It gives a fairly full narrative of the main events through which Nuri lived, and from this emerges, piecemeal, a picture of his many virtues—that he was a wonderful companion (best illustrated by a splendid campaigning photograph dated 1917); a skilled negotiator; a good judge of the importance of continuity in government and administration, and ready to be ruthless in the interests of holding his country steady in a crisis. But much greater service would have been done to his memory if, instead of devoting so much space to the battles that are in Lawrence and the cabinet shuffles that are in Longrigg, Lord Birdwood had amassed in whole chapters the evidence on Nuri's personal contributions towards the attainment of Arab goals, including that in Palestine. These were substantial, particularly in the fields of Arab unity and of the economic development of Iraq. At present, such subjects are taboo there; all the more reason why they should be elaborated elsewhere.

The chief drawback of a superficial book is its judgment of every scene from the angle of a Pall Mall club, and not of the Arab world which Nuri had to handle in order to get along. Often, what Lord Birdwood finds so right with him is just what Arab nationalists found so wrong. Take, for instance, the Baghdad Pact, which started with Turkey:

> A long road lay behind, stretching back to the days when a young Iraqi officer had in bitterness renounced his Ottoman loyalties, and it was a satisfying and happy fulfilment at the end of the journey which the chief architect of the new and firm friendship could now enjoy.

A basic fact, essential to an understanding of Nuri's life, work and death, is that the Arab world was nationalist within an Arab orbit, and radical, and craving for self confidence and so for expunging every vestige of former imperialisms, long before not only the Iraqi but also the Egyptian revolution. Nasser captured it because he catered for and advanced these ambitions. He stood for unity, and social betterment, and against Israel, and against British and Turkish connections. Nuri stood for the first three but not the fourth, and the Arabs wanted the whole loaf. When he signed up with Turkey without first squaring Egypt, he lost ground on the first count, and when his friends the British fought alongside Israel in 1956, his case as an anti-Zionist champion was likewise wrecked.

Lord Birdwood, who admires Nuri and abominates Nasser, is not prepared to give space to these facts. He therefore attributes far too much of their respective fortunes to Egyptian skill in radio propaganda, and Iraqi neglect of it. Admittedly the one was good and the other poor, but to argue that "history in the Middle East would have followed a different course had Nuri exploited the spoken word" is to ignore the important fact that propaganda, to be successful, depends not only on technique but also on having something acceptable to say.

Rightly, Lord Birdwood lays considerable emphasis on the consistency with which Nuri fought communism. Wrongly, President Nasser is equated with this, and the Syrian leaders' rush into his arms to evade it is described as a push of their country "down the slippery slope." There was plenty of evidence the other way when Lord Birdwood was writing his last chapters; there is still more today. So much so that Nuri, if he could send his friends a message from his Valhalla, would no doubt exercise his proverbial talent for moving with the times, and advise clubbing up with President Nasser in order to baulk Khrushchev. If he and his London friends had thought so a year ago, he might be alive today.

Not to be Repeated

Economic Elements in the Pax Britannica: *Studies in British Foreign Trade in the Nineteenth Century.*
By Albert H. Imlah.
Harvard University Press. London: *Oxford University Press.* 224 pages. 48s.

OVER the past two decades economists and economic historians have drawn much closer together, as both have addressed themselves to the conditions of economic growth. The nineteenth century has had to be provided with a quantified framework, in order that we may see how the chief elements of the economy altered and were historically related to one another. Britain has provided the best opportunity for such inquiries; Mr Imlah is one of the most successful scholars in the field.

For twenty years he has been investigating the statistical background of British foreign trade. His immense labours have produced no unreadable compilation, but, by a model of statistical skill, they issue in a thing of elegance. The anatomy of British trade has been given a structure in a beautiful, and probably definitive, way. The general historian has, until recently, tended to use economic references as descriptive garnishings to his tale—partly because the parts were unmeasured and unassimilated to one another. With Mr Imlah's earlier work now amplified in this form, this will no longer do.

Mr Imlah reasserts the nineteenth century view of the role of the statesman. It is also the eighteenth century view: that man, by taking thought about his condition, can control it. Thus we see Huskisson, Peel, Gladstone, and the other great exponents of free trading intercourse choosing for their country the right path, and thus contributing the most important element of its growth. This emphasis is a useful corrective to a generation that sees expanding output as the product of science and invention, elements having a life of their own, capable of dragging all else with them, irresistibly urging society into ever new forms.

But perhaps there might have been more explicit emphasis upon the historical uniqueness of the *Pax Britannica.* The more closely we look at it, the more peculiar it becomes. Britain, in the three generations or so after the mid-eighteenth century, was able quietly to generate within itself the conditions making it possible for the country to dazzle the world with its industry. This could happen because of the inadequacy of international communications, and the great lags in the response of other countries. So great was Britain's lead, and so divided were the other great states by national rivalries, that it could play upon the Concert of Europe and maintain an equipoise. Yet, great though British power might be, it was not of such an order that Britain could aim at dominance in its own right. Other powers were neither greatly affronted nor frightened as they accepted the verdicts produced by Britain's adroitness, and might even be grateful. It was within this situation that British statesmanship enjoyed that rarest of opportunities—it could be fully effective in the promotion both of peace and the national interest.

Yet Britain's position was self-liquidating. As the condition of its enormous prosperity from the fifties to the seventies it had to help to build up the economies of its rivals. Moreover, as science played an increasing part, the advantages in production which Britain had enjoyed became universal. A second age of peace and prosperity, based upon a general attempt to overtake a leading, but not dominating, country, which is also the keeper of the peace, with the leader helping to provide the means of its own supercession, is out of the question.

The publishers tell us that "the current importance of the British experience in the nineteenth century lies in the similarity of the position of the United States now and the Britain of that period." This sort of claim can be dangerous. The soundness of a liberal trading policy must be demonstrated in contemporary terms rather than by implied historical analogy. But American statesmen will find Mr Imlah's book a revealing treatment of an aspect of the situation out of which the present has emerged, and a model of economic inquiry.

Human Dynamo

Fear God and Dread Nought. *The correspondence of Admiral of the Fleet Lord Fisher of Kilverstone, Vol. III.*
Edited by Arthur J. Marder.
Cape. 661 pages. 50s.

WITH the appearance of this bulky volume Professor Marder completes the task to which he set his hand some ten years ago. The earlier parts, which cover Fisher's return to the Admiralty in October, 1914, at the age of 74, his seven months as First Sea Lord, his quarrel with Mr Churchill and his typically dramatic resignation in May, 1915, are as interesting as anything in the first two volumes; but the second half of the book, where we see a restless and discomfited human dynamo whirring uselessly in a position stripped of all power and responsibility on the Board of Research, and Inventions, comes as an anti-climax. Fisher was never dull in his letters, but he was often extremely repetitive; and Professor Marder could have spared his readers a good deal of tedium by cutting some of the many variations on the same themes. But one would not have missed the correspondence with the Dean of Wells (beginning "Dear Mr Dean. I'm Lord Fisher") about "unravelling ancient renderings of the Holy Word" in the various versions of the Bible and Prayer Book.

By 1914 the period of Fisher's greatest reforms was long past, and although his return to the Admiralty applied a much-needed stimulus to a conservative department—very much as Mr Churchill was to do in 1939—his prescriptions were in general merely extensions of what he had achieved a decade earlier: more speed and bigger guns. But he never lost his faith in the submarine, and he had the vision to understand the immense possibilities opened up by naval aviation. Had he remained First Sea Lord until 1918, it is surely inconceivable that the Admiralty would have surrendered control over the air arm—only to have to wage a twenty-year fight to regain it. As a strategist Fisher had flashes of genius, such as rushing out the *Invincible* and *Inflexible* to the Falkland Islands just in time to catch von Spee's squadron; and he certainly appreciated the benefits to be derived from exploiting sea power to carry out combined operations. In fact his vision of "amphibious hippopotami crawling up the beaches" was to be very precisely fulfilled in 1943-45; and it is now generally accepted that, as he so often emphasised, we could and should have made far more imaginative use of our superiority at sea in the earlier war. Hankey, in a thoughtful retrospective letter written in February, 1918, certainly expressed such a view.

There is not very much new here about the distasteful intrigues and clashes of 1915. The most interesting revelation is that either George Lambert, the Civil Lord, acted without authority in promising Fisher a Cabinet seat if he would accept Churchill's return, or Fisher himself exaggerated the proposal made to him; but it seems inconceivable that Asquith, after reading the outrageous letter in which Fisher stated his "conditions" for remaining, would ever have accepted him in his Cabinet. Had the Admiral not sent that letter (and he very soon realised what a colossal blunder he had committed) it seems likely that he would have succeeded in getting rid of Churchill while retaining his own position. But from the country's point of view the consignment of them both to the wilderness must surely have been the worst possible solution.

Undoubtedly Fisher and Churchill had much in common—enjoyment of power and responsibility, restless energy, great popular appeal, and the vision of true genius; and in their hearts each held the other in deep respect. Perhaps their characters, qualities and faults were too alike for them ever to work together smoothly; but over Fisher's attitude to the Gallipoli campaign—in Churchill's words, "trying to spite this operation by sidewinds . . . when you have accepted it in principle" (and Fisher *had,* albeit unwillingly, accepted the purely naval attempt to force the Dardanelles)—it is hard not to feel that Churchill had the greater share of the right on his side, and showed surprising forbearance towards his difficult colleague.

Fisher's farsighted prognostications often proved extraordinarily accurate, and Lord Esher did not exaggerate when, in July, 1918, he told him that "the prophets were not in it with you." Long before 1914 the Admiral had foretold that the Germans would wage unrestricted war on merchant shipping; yet, like so many other naval men, he failed to see that the only strategy that could counter such a measure was that of convoy and escort. Much of what his vision revealed to him—for instance "the war of young men and small vessels," "the swarm of aircraft in the heavens carrying inconceivable cargoes of men and bombs" and the employment of the Army as "a projectile fired by the Navy" at the point least expected by the enemy—was not completely fulfilled until a quarter of a century later; and, as he himself said, to be only 25 per cent ahead of one's time resulted in being regarded as a lunatic.

What is the final judgment of history on this highly original and flamboyant man? Professor Marder calls him "a great naval administrator, as well as a great Englishman, and a fascinating person"—which is certainly no overstatement. He will surely never be forgotten, and his true monument is the great fleet which, in spite of some uncertain fumblings and occasional major error, controlled the seas from 1914-1918 and destroyed Germany's first bid for world power. Professor Marder's excellently edited and annotated volumes will form a lasting contribution to the history of the period.

Under Which King?

The Profession of Government
By Brian Chapman.
Allen and Unwin. 352 pages. 28s.

The Spirit of British Administration
By C. H. Sisson.
Faber. 162 pages. 21s.

TWO excellent books have emerged simultaneously from the University of Manchester. They are oil and vinegar: wholly different in almost every respect, but the better for being taken together. Mr Chapman is a lecturer at the university who, after ten years' research, has produced an extraordinarily thorough analysis of the workings of the civil service in the main countries of western Europe, excluding this country, to which he deals only glancing blows. Mr Sisson is a career civil servant who used a research fellowship to look more cursorily at his opposite numbers in some of the same countries and to relate what he saw there to his experience at home, which is his main subject. Neither, unfortunately, draws on the United States. Mr Chapman is methodical and academic; Mr Sisson is witty, unfair and discursive. Both books are well written and worth reading. Mr Sisson, as a professional, knows exactly what administration is about, and his natural history of the higher civil service cannot be bettered. Mr Chapman is a skilled observer of exotic plants, but not so reliable as a naturalist in this country. His comments on the relations between politics and administration are not much like real life; he attributes to the civil service more importance than it has; and, by looking too much at the formalities, he appears to underestimate the strength of parliamentary control.

The two authors are most interesting where they overlap, on the fundamental question whether the executive is best controlled, as in Britain, by political methods backed by the ordinary courts, or, as in most parts of the continent, by the army of administrative law. Mr Chapman is all for law and despises political control; Mr Sisson feels the other way round. Each author is most reliable when dealing with the merits of his favourite, and least when putting up Aunt Sallies, as both do, though Mr Chapman is more discreet. One sometimes wonders whether the two men are in the same world—witness the following passages. Mr Chapman hits hard in a footnote on the Austrian Administrative Procedure Act:

> . . . the former Anglo-Saxon tendency to snigger at these precautions has dis-

appeared. Their utility would probably only be questioned by the narrow, self-righteous lower-grade official.

Mr Sisson, after a good many sniggers at this same law, concludes as follows:

> It would not be a gain to exchange an administration sensitive to the rough tests of common sense and public opinion for one obsessed with anxiety about procedural points and the sort of figure it would cut before the judges of an administrative court.

The answer, of course, is that the two men are not in the same world. One is in England, and proud of it; the other's spiritual home is (in this context) on the continent. Civil services and administrations cannot be treated in vacuo. They are moulded to fit national histories, prejudices, problems and constitutions; and, above all, to fit the needs and powers of ministers in each country. The fact that the Conseil d'Etat fits the needs of France is no reason, by itself, for introducing it into Britain. One thing is certain: one must choose between strong legal control and strong political control—the one inhibits the other. Which one prefers is mostly a question of taste and upbringing.

A Great Translation

The Romance of the Rubaiyat

By A. J. Arberry.
Allen and Unwin. 244 pages. 25s.

THIS is the centenary of the first edition of the Rubaiyat, which fell flat from the printer's hands. It was published anonymously, failed to gain a single review, and was remaindered for one penny. A wise passer-by bought it, was entranced, bought more copies and distributed it to his friends, with such instant effect that Quaritch marked the price up to twopence; and from that moment it went steadily on to its position as a classic of the language. It passed through an era of over-excitement and limp bindings, but survived it; and by now its place in our literature seems secure.

Professor Arberry has published a facsimile of the first edition, with a learned and very readable account of how it came into existence. Everything is there: the originals, in Persian (latin characters) and in literal translation; full notes on provenance; collation with the second and third editions (but not of those stanzas which were added after the first); correspondence and narrative. Less learned readers need not be alarmed by the Persian text: everything is explained in English. As one might expect, Fitzgerald emerges a good deal more clearly than Omar. He never claimed to have made a literal translation; he adapted and arranged separate tetrastichs so as to make a more or less continuous whole. Professor Arberry explains how freely he used his original. Where it was obscure or inadequate, he stitched two stanzas together, or added pieces of his own. His style is more strikingly oriental than that of the original. In his own words, there is "something lost, I doubt, of Omar's simplicity, which is so much a virtue in him"; but on balance more is gained.

Fitzgerald's knowledge of Persian was not perfect, nor was his text; but he was never careless. He worked hard and continuously at Omar, corresponding at enormous length about his difficulties with a friend in Calcutta, who had taught him Persian and given him his texts. Some things escaped him to the end; but even his mistakes were fruitful. The splendid last words of "Man's forgiveness give—and take!" are a happy mistranslation; and so is "The memory of this impertinence." When in doubt, in translation or selection, Fitzgerald leaned towards the more sceptical alternative.

One of the oddities which Professor Arberry reveals is Fitzgerald's first translation, which was into monk-latin verse. This version, which has considerable charm, was fragmentary, but strongly influenced the later English translation.

Professor Arberry's book is a charming tribute to a charming work.

Organised Fiction

The Novels of George Eliot.

By Barbara Hardy.
Athlone Press. 242 pages. 25s.

WHEN Alexander Main compiled the "Wise, Witty and Tender Sayings of George Eliot" he was promoting, without much intending it, that view of her work later codified by Henry James in his judgment of "Middlemarch" as "a treasure-house of detail, but an indifferent whole." The novels are thought of as loosely conceived, rambling and proliferating affairs, undistinguished in point of formal organisation, but embracing so much that is dispersedly perceptive or sagacious or amusing as to render their lack of the higher structural qualities of fiction somewhat less disabling than it would otherwise be.

Mrs Hardy is concerned to indict this as an inadequate view of George Eliot's art. "Complicated artifice" lies everywhere beneath the surface of the novels, and what diverts our attention from it is the "quiet normality" of the novelist's world. There is nothing naïve or unconsidered in her manner of telling a story. On the contrary her work "is usually as complex and as subtle as the composition of Henry James or Proust or Joyce." When we fail to notice this we do so for the same reason that induces a similar unawareness of answering features in the art of a painter like Rembrandt. So realistic and compelling a representation of human feeling and experience is spread before us that we never think to isolate the underlying structural principles. It is in non-representational painting that compositional features obtrude themselves; it is in fiction like Joyce's or Virginia Woolf's, where there is "a disruption of the realistic surface of language, character and chronology," that pattern inclines to become prominent. Close reading, however, reveals that a formal organisation of characters is an essential part of George Eliot's art, and that from novel to novel she tends to repeat with variations the same essential devices of similarity, contrast and balance. Image and metaphor, too, are regularly so employed as to have formal and structural significance. But it is all done unobtrusively. "Her images echo much more quietly than the underlined repetitions and cross-references of the imagery in *The Golden Bowl*."

Mrs Hardy is an intent listener in the muted world she has chosen to explore. There are some occasions upon which we are tempted to feel that the only sound objectively present is the rather dry rustle of her own progress. Nevertheless we finish her book with a new realisation that George Eliot took as seriously as she took most things the development of prose fiction in some of its more strictly æsthetic aspects.

Change in Latin America

Political Change in Latin America: *The Emergence of the Middle Sectors*

By John J. Johnson.
Stanford University Press. London: *Oxford University Press.* 272 pages. 40s.

The Bolivian National Revolution

By Robert J. Alexander.
Rutgers University Press. 302 pages. $7.50.

PROFESSOR JOHNSON traces the economic and political development of five Latin American republics (Uruguay, Chile, Argentina, Mexico and Brazil) and indicates the part played there by the urban middle-classes, whose influence has naturally increased with the growth of the towns and of industry. The author is a pioneer in this subject. His task is complicated by the fact that until now the middle-classes in most of these countries have lacked the capacity to act independently as a political unit and therefore have sought support wherever they could find it. Thus in Argentina the middle-class *caudillos* Irigoyen and Perón relied on working-class backing, and their efforts to satisfy the workers make it difficult to detect a specifically middle-class orientation in their policies.

While the economic and educational status of the urban workers has been raised, their pretensions have grown—to the embarrassment of middle-class employers and politicians. When political co-operation between the two classes began,

> a considerable share of machine industry was in foreign hands. Foreigners also had important holdings in commerce and particularly in transportation and foreign trade. Consequently, the foreigner and the foreign-domiciled company were made to bear directly a large proportion of the original financial burdens of increased wages and other benefits that were awarded to the working elements.

During the last two decades, however,

> the trend has been for commerce and industry to become domestically controlled. Domestic capitalists, as a result, have been called upon to carry an augmented share of the costs of wage gains and other benefits to labour. As the pressure upon them grows, they increasingly insist that the public good requires that the concern should be on expanded production rather than on equalitarian distribution.

Although uncertain whether the Latin American middle-classes can occupy a dominant position without working-class support, Professor Johnson considers that they may now be strong enough to act at least as "stabilisers and harmonisers" in countries where political compromise hitherto has been virtually unknown.

Professor Johnson does not deal with Bolivia, and "The Bolivian National Revolution" by another American writer shows that the social and economic revolution that began in that country in 1952 cannot be fitted into any general picture of Latin American middle-class development. Two of the leading instigators of the revolution (Víctor Paz Estenssoro and Hernán Siles) were middle-class intellectuals; but their principal aim was "to integrate the largely Indian peasant masses into the life of the nation, through giving them land and education and making them full-fledged citizens." Mr Alexander traces with sympathy the course of Dr Paz Estenssoro's presidency—providing long quotations from speeches and interviews—and he justifies the harsh manner in which the opponents of the regime were treated. "The opposition," he reminds the reader, "has never abandoned its belief that the [revolutionary] government can and should be overthrown by force." Dr Paz, the outstanding revolutionary figure of modern South America, is now Bolivia's Ambassador in London.

OTHER BOOKS

THE JACOBITE MOVEMENT. By Charles Petrie. Third edition. *Eyre and Spottiswoode.* 499 pages. 35s.

Sir Charles Petrie is the most persistent and pertinacious of our latter-day Jacobite historians. Time has wrought upon his thesis but not his loyalty. His third edition, "completely rewritten," still finds him convinced of the practicability of a rightful and natural restoration of James III and VIII to the very hour Lord George Murray turned back from Derby in December, 1745. This edition contains new material from Spanish and Irish sources. It also recognises in its bibliography, if not markedly in its text, the work of recent writers like Sir James Fergusson, who have contributed to our knowledge of why the cause succumbed. Such Whiggery is not, of course, for Sir Charles.

INTERBANK DEPOSITS: *The purpose and effects of domestic balances, 1934-54.* By Katherine Finney. *Columbia University Press.* London: *Oxford University Press.* 129 pages. 32s

This is a description of the key element in the working of correspondent banking in the United States.

RICARDIAN ECONOMICS. By Mark Blaug. *Yale University Press.* London: *Oxford University Press.* 270 pages. 40s.

This is a work for specialists in the history of theory. It is also a regrettable instance of duplicated effort; for it overlaps considerably with Mr Oswald St Clair's excellent "Key to Ricardo," published little more than a twelvemonth ago. It devotes much more attention, however, to Ricardo's disciples and critics and in general to the fortunes of the Ricardian structure after its architect's lifetime. It is partly, in fact, an attempt to throw light on an ever-vexed question: why do certain doctrines, visibly (to hindsight) as full of holes as many of their contemporary rivals, sweep those rivals away and establish themselves as dogmatic certitudes? But Dr Blaug is too cautious a scholar to venture a definite answer.

INTERNATIONAL FINANCIAL TRANSACTIONS AND BUSINESS CYCLES. By Oskar Morgenstern. *Princeton University Press.* London: *Oxford University Press.* 591 pages. 96s.

Professor Morgenstern has a good subject—the interaction in practice of financial markets in leading countries in the days of the gold standard. He assembles a mass of information about short term money rates, exchange rates and movements on stock markets; and he shows that in many cases, in face of traditional theory of the unifying impact of the gold standard, there were marked divergences in different centres. The book has the bulk that has come to be expected of studies by the National Bureau of Economic Research; this, plus a style that makes little attempt to escape from econometric jargon, weakens its value as a critical analysis of gold standard theory. But it incorporates a great deal of useful work.

BIOLOGICAL PRODUCTIVITY OF BRITAIN. Edited by W. B. Yapp and D. J. Watson. *Institute of Biology.* 132 pages. 25s.

This book, the seventh in a series of symposia of the Institute of Biology, comprises thirteen papers on various aspects of biological productivity. They are by, and for, natural scientists; but economists will find useful data and suggestive ideas, especially in the papers relating to land use and to livestock and crop improvements.

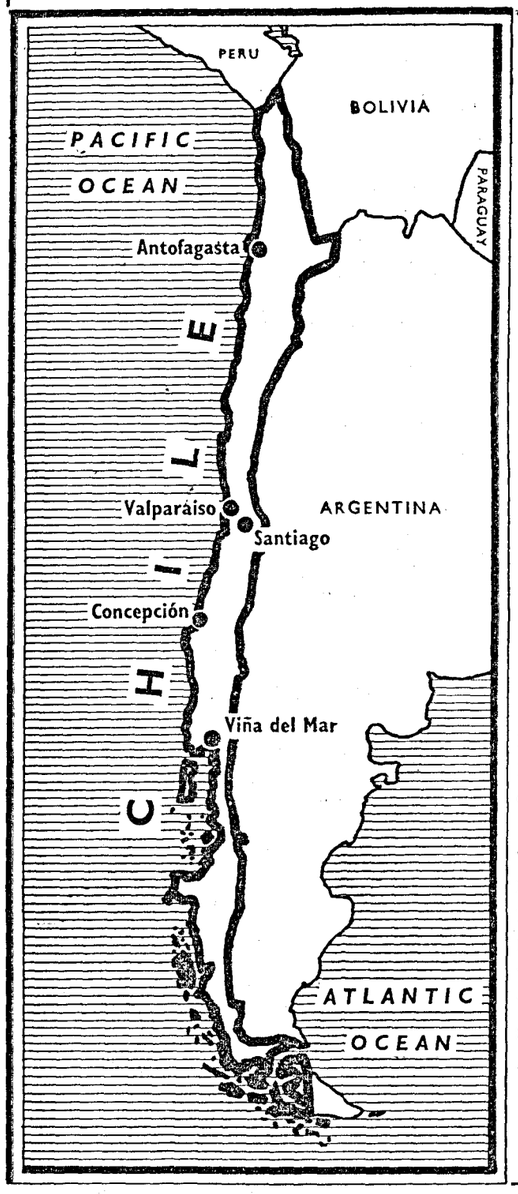
THE LONDON METAL EXCHANGE. By *The Economist* Intelligence Unit. 224 pages. 21s.

This is a history of the Exchange, and an account of its organisation, operations and the services it provides. The book was commissioned by the board of directors of the Exchange, and has a foreword by Sir Oliver Franks. It is obtainable only from the Exchange.

WHO'S WHO IN TRADE AGREEMENTS 1958. *Gordon Rayment.* 124 pages. 40s.

For professional searchers after company information, among whose newest jobs may be a dig in the Register of Restrictive Practices, this little book may well become indispensable. It consists of an alphabetical name index of all companies who are parties to agreements on the register; followed by a list in numerical order of all the agreements appearing there, with details of the parties and the nature of the business concerned. These two new kinds of index supplement the public register itself, where the agreements are classified only by commodities.

THE EFFICIENT USE OF FUEL, *Second Edition.* Compiled by the Ministry of Power. *HM Stationery Office.* 892 pages. 35s.



WORK STUDY IN THE OFFICE. By Harry P. Cemach. *Office Magazine.* 166 pages. 25s.

REGISTER OF DEFUNCT AND OTHER COMPANIES 1958. *Thomas Skinner.* 532 pages. 30s.

SAVORY'S INSURANCE SHARE ANNUAL, July, 1958. *Thomas Skinner.* 146 pages. 10s. 6d.

THE PRINCE. By Niccolò Machiavelli. *Dent Everyman's Library.* 231 pages. 7s.

AMERICAN SURVEY

AMERICAN SURVEY *is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.*

Kennedy's Second Labour

WASHINGTON, DC

FOR the second year running, Senator Kennedy has persuaded the Senate to pass a labour reform Bill to deal with scandals in trade unions ; the best that can be said for it is that both those who wanted more and those who wanted less seem grumpily willing to accept the Bill. But the going has been harder this year, and in the middle of last week Senator Kennedy's youthful brow wore the herculean frown of a man who sees two amendments springing up for every one he cuts down. The apparent unanimity of the final vote—90 to 1, with only Senator Goldwater, that true-blue incorruptible from Arizona, still in opposition—hides the fact that three major attempts were made to stiffen the Bill, two of them led by Democratic colleagues of Mr Kennedy's and one of them temporarily successful. The compromises which eventually brought Senator Kennedy and his critics together were arranged for the most part by liberal Republicans. Thus the fluid American party system, so different from the rigidity of the House of Commons, was able in the end to produce a measure acceptable to the " consensus of reasonable men " which Senator Johnson, the Democratic leader, holds so dear. It remains to be seen whether the compromises concocted in haste in the Senate cloakroom will be repented at leisure by the lawyers who have to interpret them.

The House of Representatives, which killed Senator Kennedy's Bill last year, is unlikely to get round to the subject this year until June at the earliest. But the debate in the Senate has already exposed one paradox. The trade union movement, which was supposed to have strengthened its political influence in last November's election, is now faced with a measure more restrictive than last year's.

The conservatives, on the whole, dealt gently with the core of the Bill. This consists of the " reporting and disclosure " provisions—which order trade unions to make financial reports to the Secretary of Labour each year, and their officers to lay bare any business dealings with the companies their members work for—and of a section requiring unions to hold regular secret elections. But even here a potentially explosive amendment was put in by Senator McClellan, the Democrat from Arkansas who has presided with visibly fraying patience over the committee investigating corruption in the relations between labour and management. His amendment specifies that union officers have a fiduciary responsibility for the funds they handle ; some lawyers think it might lead to a stream of complaints before the courts about the way officials spend the dues paid by their members. Later, when the debate turned to the top and tail of the Bill, the conservatives made some fairly substantial changes.

Senator McClellan, who towards the end of the nine-day debate virtually took over command of the conservative attack from the Republican leaders, added an introductory " bill of rights," spelling out a list of unexceptionable freedoms to which members of trade unions are entitled. In the form in which this was first passed by an alliance of Republicans and southern Democrats, aided by Vice President Nixon's casting vote, the Secretary of Labour could have sought injunctions in the federal courts to enforce these rights. But this weapon of injunction is exactly the one which the southern Democrats managed to keep out of the Civil Rights Act of 1957, except when it was to be used in the limited field of voting rights. Some liberal Republicans also developed qualms lest the Bill make discipline impossible even in honest unions. In the end the conservative coalition collapsed. The injunctive power was left out, and the members' rights were made subject to " reasonable rules " by the unions. Nevertheless, the section still prescribes the rights which the unions' constitutions must guarantee ; and the courts are likely to see some pretty tests of what constitutes a " reasonable rule."

NOR are the union leaders going to be entirely pleased with the changes which the Senate has made in the cordially hated Taft-Hartley Labour Relations Act. The final section of Mr Kennedy's Bill embodied a number of amendments sought by the American Federation of Labour and Congress of Industrial Organisation. These were the price demanded by the AFL-CIO for its support of the anti-corruption measures which, though aimed at dishonest union leaders, will mean a lot of unwanted form-filling for honest ones as well. The Senate chose to leave the Taft-Hartley changes in, in spite of a plea from Senator Ervin of North Carolina, one of the most intelligent and moderate of the southern conservatives, that the problem of cleansing the unions should be separated from the entirely different question of labour-management relations. Having done this, the Senate was unable to exclude some amendments about which the AFL-CIO is likely to be less enthusiastic.

One of them bans " hot cargo " clauses in transportation contracts, under which a lorry-owner agrees not to handle freight coming from another employer with whom the union has a dispute. This particular amendment is aimed at Mr Hoffa's lorry-drivers union, which is now so stained with scandal that it is fair game for any Senator. It may, however, affect some of the building unions indirectly ; the lorry-drivers help their organising campaigns by this technique. A second amendment to the Taft-Hartley Act limits the use of picketing when a union is trying to organise the workers in a factory. The limitation is a good deal less restrictive than the one which the conservatives originally sought, but since the unions have been asking for their picketing rights to be extended it is a distinct rebuff.

The AFL-CIO may decide to swallow its regrets, lest worse befall in the House of Representatives. The House Committee which deals with the subject is notably sympathetic to labour ; it includes members ready to chip

away the barnacles on the Kennedy Bill as well as others who think, like Mr John L. Lewis's mineworkers, that there should be no Bill at all. But a process of revision, once started, might easily get out of hand. The House as a whole is less liberal on the subject than the Senate ; it contains a higher proportion of members who proceed from the fact that some unions are corrupt to the conclusion that all unions are too powerful. An attempt might be made to stiffen the picketing rules still further, and to include the ban on secondary boycotts—in which a union gets a neutral employer to boycott the goods of the company it is striking against—which Senator McClellan narrowly failed to obtain in the Senate. One influential southern Representative has already introduced a set of proposals as punishing as anything offered in the upper chamber. Sympathisers with the unions may therefore decide that it is the better part of valour to escort the existing measure, additions, glue and all, as quietly as possible through the House.

The great unanswered question is whether the Bill, if it eventually becomes law, will end the corruption which inspired it. The chairman of the monitors whom a federal judge has set to supervise Mr Hoffa's lorry-drivers thinks that it would help. Clearly the " reporting and disclosure " provisions will make it harder to continue those manipulations of funds which, even if they have not enriched Mr Hoffa himself, have benefited his friends and put the lorry-drivers' dues to some highly unusual uses. What remains of Senator McClellan's bill of rights may make it easier for rebels to go to court with their complaints. But Mr Hoffa's union is so rich that it can afford the best of lawyers and accountants. Senator Mundt, a right-wing Republican from South Dakota, expressed a fairly widespread view when he said that the necessity of submitting reports would constrain Mr Hoffa only if it gave him an attack of writer's cramp.

As the Bill stands, the chief burden of attacking corrupt union leaders in the courts is left to individual trade unionists. The power of the Secretary of Labour to start an action is confined to occasions when the rules about reporting and elections have been violated ; and in both cases Mr Hoffa may well go through the motions of compliance. It is one of the most ominous facts about unions like his that most of the members seem willing to stifle doubts about their leader's ethics if he brings home the bacon from the wage bargaining table. Either fear or favours—and more often the latter—will discourage members from going to court. The main hope of the Bill is that it will make access to the law easier for the brave few who want to enforce their ideas of clean unionism.

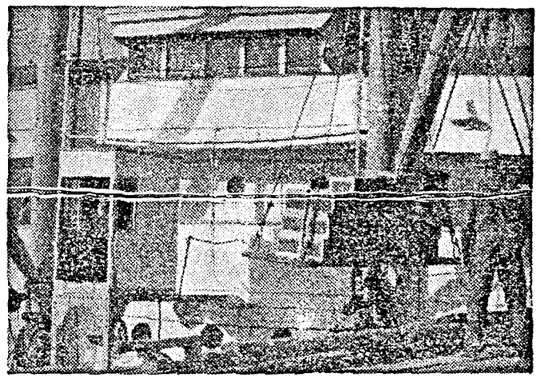
Inquisitive Senators

MRS CLARE BOOTHE LUCE'S intemperate remarks about Senator Morse were particularly unfortunate because she had already admitted, when under examination by Mr Morse and other members of the Senate Foreign Relations Committee, that some of her past criticisms of such Democratic heroes as President Roosevelt and Mr Acheson had indeed been intemperate. But these attacks she excused as having been made long ago in the heat of political campaigns —she is a Republican. They were thus, she maintained, no guide to how she would behave as Ambassador to Brazil, the post for which she had been nominated ; to judge whether she was suitable for that Senators had only to look at her recent praiseworthy work as Ambassador to Italy.

Unfortunately her denunciation of Senator Morse came not in a moment of irritation after his bullying examination of her—something which in any case a diplomat ought to be able to face unmoved—but after she had returned home and as the Senate was in the process of confirming her appointment by 79 votes to 11. While many members of both parties felt that Mr Morse had gone too far, Mrs Luce's public attack on him was taken as an insult to the Senate as a whole and made several Senators regret having cast their votes for her. It is, however, too late for these to be changed now and there is little likelihood that Mrs Luce will take the advice of her husband, the editor-in-chief of *Time* magazine, and resign, since both the President of the United States and the government of Brazil are still on her side.

Senator Morse's inquisition of Mrs Luce was supported by Senator Fulbright, who announced when he became chairman of the Foreign Relations Committee recently that he would go over all the President's nominations for diplomatic posts with a fine tooth comb to make sure that the candidates were suitably qualified. The next sufferer will be Mr Ogden Reid, formerly editor and publisher of the *New York Herald Tribune*, who has been nominated as Ambassador to Israel, mainly, some people think, in order to endear him to the Jewish voters of New York should he later enter politics.

But the Foreign Relations Committee is not the only one in this Democratic Congress which is holding up nominations made by the Republican President. Mr Eisenhower pointed out this week that at the moment there are 76 nominations pending before the Senate (not to mention the thousand postmasters awaiting confirmation), and of these 47 are major appointments. Since in the end such nominations are practically never rejected, it seems that the Senate is delaying only for delay's sake. The outstanding hold-ups have been in the confirmation of a Supreme Court Judge, Justice Potter Stewart, nominated last October and only approved by the Senate Judiciary Committee last week, and of Mr Lewis Strauss, also nominated last October as Secretary of Commerce and still being questioned by the Senate Commerce Committee. All of this makes more striking the confidence which the Senate showed in Mr Herter by confirming him as Secretary of State in a few hours.



Plentiful Profits

NEW YORK

ANY lingering uneasiness about the current pace of the economic recovery has been drowned by a flood of reports from corporations showing that their profits during the first quarter of the year were abundant. While the final count has yet to be made, it appears certain that total corporate profits were the highest for any first quarter on record and, if the present belief that pre-tax profits were running at an adjusted annual rate of about $48 billion is substantiated, an all-time record for any quarter will have been struck. While profits began to recover in the latter half of last year, this quarter's earnings have the dramatic advantage of being compared with the first quarter of 1958 when the recession was taking its heaviest toll. It is estimated that total profits after tax were nearly 50 per cent higher than a year ago.

IMPORTANT BANKING ADVANTAGES

The long experience of The Hanover Bank offers important advantages to firms that engage in trade with the United States and other countries throughout the world.

EXPANDING

THE COMPRESSED AIR BUSINESS

Mr. K. ALLAN BELFRAGE is Managing Director of Atlas Copco A.B., Stockholm—a company that has already expanded to become the world's largest organisation dealing exclusively with compressed air equipment.

With factories, distribution and service centres in 90 countries, Mr. BELFRAGE naturally enlists the powerful aid of international advertising. And he uses TIME, The Weekly Newsmagazine—not only to get business for his organisation's world-wide branches, but also to unify them into a corporate whole.

AROUND THE WORLD

The major victims of the 1957-58 recession have staged the strongest comeback. Profits have shot up in the steel industry, which operated at 84 per cent of capacity in the first quarter against 50 per cent a year ago. With automobile output up 20 per cent the Ford Motor Company announced after-tax earnings of $2.46 a share compared with 55 cents last year. Chemical and textile firms have shown a similar resilience. More modest gains and a few losses have been reported by those corporations which rode the recession well, notably some of the large chains of food stores; by those which have had labour troubles; and by those in industries, such as aluminium and drugs, where competition has forced prices down. Business in capital goods is still lagging, but increased earnings are expected in this field later in the year.

Profit margins have climbed faster and farther than output or sales. Business is now reaping the benefits of cost cutting during the recession and of extensive modernisation, factors which are likely to bring even more plentiful returns in the current quarter. Under the pressure of prosperity costs will inevitably rise but in spite of the possibility of a steel strike pre-tax profits for the year are widely expected to reach $50 billion, more than ever before. This is having widespread repercussions. The trade unions know a useful bargaining weapon when they see one and they are unlikely to be impressed by the fact that even at this level profits would not represent an unusually high percentage of national income. The Administration, which creams off 52 per cent of corporation profits in taxes, feels that its hope of balancing the Budget is no longer merely notional. And Wall Street regards this confirmation of corporate plenty as some justification for the current exuberance of the stock market. Even though most corporations maintained their dividend rates optimistically during the recession at the expense of undistributed profits, increased dividends are already beginning to appear in the current year.

Public Interest in the Air

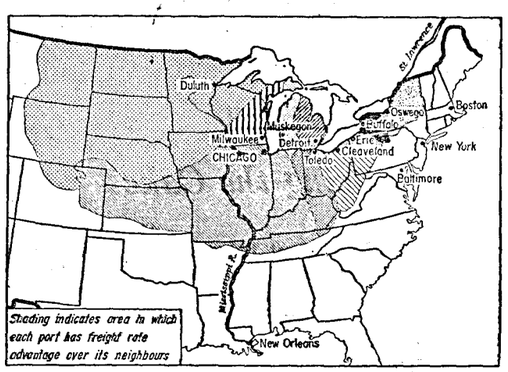
WHAT best serves the public interest may be the criterion by which the Civil Aeronautics Board will decide whether or not to allow the British Overseas Airways Corporation to fly between San Francisco and Hongkong by way of Tokyo. But the American public is not at all interested in the discussions which have aroused so much feeling in Britain; they have hardly been reported in the American press. It seems fairly certain that in the end BOAC will get its permit, in spite of last month's unfavourable report from the CAB's examiner. For the board has already ruled that BOAC has the right to fly to Tokyo under the 1946 Bermuda agreement; and another CAB official pointed out this week that the public interest in the honouring of international agreements is powerful enough to over-ride practically any other consideration. Even if this contention is not accepted by the CAB itself, it almost undoubtedly will be by the President, with whom the final decision rests, as it obviously is by the State Department, which advises him in these matters.

The objection to giving BOAC a permit to fly between Tokyo and the United States as part of its round-the-world service was lodged by Northwest Airlines, a comparatively small but aggressive company, which now flies from Seattle to Tokyo—and would like to go on to Hongkong. The company insists that competition from "powerful, globe-girdling" BOAC would affect its profits so seriously that it might have to claim a renewed subsidy from the government. This is where the public interest comes into Northwest's side of the argument. The CAB examiner claimed that the trans-Pacific route had been developed, with the help of subsidies from the American taxpayer, by Northwest and Pan American Airlines and that the two would lose about $13 million worth of business a year if BOAC were allowed to fly the lucrative Tokyo route. He proposed that BOAC should cross the Pacific Ocean by way of Wake Island and Honolulu instead. According to BOAC, and in the opinion of the CAB's own Bureau of Air Operations, the diversion of traffic from American airlines would be much less than the examiner thinks.

That the dispute has come into the open at all suggests that BOAC has not handled its case well, for these rivalries are normally settled by bargaining behind the scenes; it is noticeable that Pan American is carefully keeping out of the present argument, even though it too serves Tokyo. Last February the President ordered the CAB to investigate the whole question of trans-Pacific air services, in order to encourage more competition. The authority of both Pan American and Northwest to fly to the Orient expires next year, and various applications are pending, both from them and from other airlines, for additional services. BOAC's troubles seem only a preliminary skirmish in the coming air war over the Pacific.

ST LAWRENCE SEAWAY—II

Slicing the Cake



CLEVELAND, OHIO

THE ports of the Great Lakes are now beginning to realise that something less than pure gold will flow into them through the St Lawrence Seaway which opened to deep-draught ships last Saturday after nearly five years in the building. Estimates of future traffic drawn up in the heady years when the project was young suggested that half a dozen American ports would get more foreign commerce than now seems likely to come through the seaway to the thirty-odd major lake harbours in Canada and the United States combined. Yet Buffalo, a place of 600,000 people, continues to assert that the seaway can make it the largest city in the country. The afterglow of an earlier optimism lingers and competition to divide the somewhat diminished cake is still hearty.

Every major American city on the lakes except Detroit—whose voters have rejected proposals for a bond issue for the purpose twice in the last two years—is now engaged in a publicly-financed programme to improve its port. Work in progress or planned in the six most important of them—Chicago, Duluth, Milwaukee, Cleveland, Buffalo and Toledo—will cost over $110 million, nearly as much as the United States spent on the seaway itself; Chicago accounts for almost half of this. It is no doubt partly because the public port authorities are committed to schemes of expansion, many of which were drawn up under the influence of the early estimates, that they are almost uniformly more optimistic about the traffic which the seaway will bring than are most of the local businessmen. But the scepticism of

chambers of commerce is also, in its way, artificially exaggerated. Their attitude has been coloured by the dismal head-shaking of the powerful railway interests who always opposed the seaway; it is only now, when it is an accomplished fact, that enthusiasm is beginning to quicken.

Chicago is almost certainly justified in thinking that it will get the lion's share of the new business. Each of the ports, as the accompanying map shows, has its own tributary area in which the rates charged on freight carried by rail and road transport give it an advantage over its neighbour. Chicago's is by far the richest. The vast but thinly-populated hinterland of Duluth produces chiefly iron ore and grain, while the general cargo—the more valuable goods like machinery, cars and processed foods—which goes from the Chicago area to foreign markets alone accounts for almost a sixth of all United States exports. The railways running into Chicago from the west, unlike those running eastwards to the Atlantic ports, have nothing to lose from the seaway and are therefore more likely to adjust their rates to co-operate with it; moreover, since more of them run into Chicago than into Milwaukee or Duluth, Chicago may poach on its neighbours' hinterlands. Above all, Chicago has the unique advantage of lying at the intersection of two systems of waterways: the Great Lakes and the network of canals which lead down the Mississippi into the Gulf of Mexico.

Source: A study published by the Chicago Association of Commerce and Industry, January, 1959.

On present plans some $49 million will be spent on developing the port facilities at Lake Calumet, in south Chicago, which lies at the nub of this intersection. The city is likely to keep at least its customary share of two-fifths of the total foreign trade carried on from the American side of the lakes. A careful survey made last year by the local Association of Commerce suggested that by 1965 Chicago will export 629,000 tons of general cargo by water each year—almost as much as the total overseas tonnage that moved through the old shallow channel of the St Lawrence—and three million tons of bulk commodities.

Most of the other ports will gain, although less substantially, in general cargo, shipments which save the most on transport costs by moving through the St Lawrence. Milwaukee, where an imaginative port authority has been preparing for the seaway longer than anyone else, has one advantage in its competition with nearby Chicago; its port lies more accessibly on the lake front than does Lake Calumet. Cleveland and Toledo, which between them will spend $21 million, back on to the rich hinterland of Ohio. The comparative pessimism of Detroit is accounted for partly by the limited size of its tributary area and partly by the fact that cars, its principal cargo, are expected to save less in transport costs than most other goods which travel by the seaway. But there is still so much uncertainty that one expert at the University of Chicago said recently that there may well be an over-supply of port facilities in the next few years, while the directors of most ports prophesy that the potential traffic will be too heavy for them to deal with.

Any foreigner visiting the area is bound to be struck by the caution of most business communities in the Great Lakes. This is understandable in places like Duluth and Buffalo, at opposite ends of the lakes, to which the seaway brings worries as well as hopes. Duluth, most of whose traffic consists of iron ore from the dwindling reserves in Minnesota, faces the competition of ore coming up the St Lawrence from Labrador; Buffalo fears that up to a quarter of its old export trade in grain may now sail straight past its docks in the bigger ships that can use the seaway instead of being trans-shipped into the little "canallers" as it used to have to be. But it is odd that it is so difficult to detect signs of industrial expansion to take advantage of the seaway's cost savings. The one major area of growth is round Massena, near Oswego, where two aluminium plants and a car factory will draw on the power provided by the new hydro-electric scheme connected with the seaway. The steel industry is expected to expand along the shores of the lakes—around Chicago, Cleveland and perhaps Buffalo—to get the maximum benefit from the Labrador ore, and there are rumours that other processing industries, using imported raw materials—sugar and chemicals—may move in. But this is all in the future; industrialists still prefer to wait and see.

This conservatism, which seems highly un-American to an outsider, may help to decide how far the seaway lives up to its advocates' hopes. It is common to be told in the Middle West that importers and exporters are used to shipping through the Atlantic ports and are reluctant to disturb an old and friendly relationship. The phrase sounds like an epitaph on a British businessman. The pessimists, who are almost certainly too pessimistic, are now saying that the seaway will affect only a narrow ribbon of land round the edges of the Great Lakes. But if it turns out that shippers are dismayed by the limitations of a channel which is closed by ice for four months a year; if the railways cut more of their freight rates to the east coast, while keeping up the north-south rates to the lake ports; and if there is congestion in the canals; then the pattern of trade may change less radically and the seaway's influence may penetrate less deeply into the hinterland of the Middle West than the enthusiasts forecast.

(A previous article on the St. Lawrence Seaway appeared on page 329 of the issue of April 25th.)

Prototypes—Pro and Con

FROM A CORRESPONDENT IN NEW YORK

MANY of the differences between the Atomic Energy Commission and Congress's Joint Committee on Atomic Energy revolve around what may be called "the industrial learning process." The commission and Congress agree broadly on the goals they seek: American leadership in nuclear technology and peaceful atomic power which is as cheap as electricity from conventional sources. The aim is to make nuclear energy competitive within ten years in areas of the United States where fuel costs are high and competitive in some foreign countries in half that time.

The argument is over how the United States can best maintain its technical leadership and bring nuclear costs down. The commission's present programme concentrates on what are called "prototype" plants; to encourage private firms to build some of those regarded as essential, it is proposed, for the first time, to subsidise most of the difference in capital costs between an atomic plant and a conventional one. The Democrats who control the Joint Committee are pushing hard for the construction of large-scale plants as well. The question is: how much can you learn from a prototype? The AEC's answer is: everything you really need to know. Members of Congress, with the support of a few key men in the industry, are unconvinced.

Part of the trouble arises from a confusion of terms. In every glossary but the American nuclear one, prototype means first of a series. In Washington's atomic vocabulary, however, it means a pilot plant, a unit built to gather information which can be used in plants of commercial size. Already nuclear plants with a capacity as great as 80 electrical megawatts are sometimes referred to as prototypes and an expanded definition of the word may be a part of a compromise over policy.

The Government's Proposals

The AEC has asked Congress to appropriate $30 million for the fiscal year which begins in July to enable it to start building four prototype reactors: an experimental organic-cooled power reactor and an experimental low temperature process heat reactor, both to be constructed by the commission; a boiling water prototype to be built by private enterprise or by a public electrical authority with government help; and a small generating plant of unspecified type to explore ways of reducing costs, for which the AEC would provide the nuclear reactor and a public electrical authority the conventional part of the plant. According to Mr McCone, the chairman of the AEC, the capacity of most of these plants will range from 30 to 80 megawatts.

The decision to restrict future government projects to prototypes is supported by the AEC's advisory committee on reactor policy. In its report, which was written largely by Dr Henry de Wolfe Smyth, a physicist and a former member of the AEC, the committee said that the need for "demonstrating the feasibility of large-scale nuclear power plants has passed and such plants should be built only when their costs are low enough to be acceptable to utilities [electrical companies]." Specifically the committee argued that all the information obtainable from large plants can be had more quickly and more cheaply from prototypes of less than half their size.

Not all the leaders of the industry agree. Dr Walter Zinn, the former director of the Argonne National Laboratory, who has an awe-inspiring reputation as a designer of reactors, distinguishes between the technical and the economic information to be derived from prototypes and feels that the economic conclusions are likely to be less reliable when applied to larger plants. He told the Joint Committee that he did not see how it was possible to solve the problem of costs without actually building and operating large-scale installations and that this should be done when estimates put their capital costs at no more than 20 to 30 per cent higher than those of conventional generating plants. Last autumn the Joint Committee announced an ambitious programme calling for design studies of 21 reactors of different types—nine of them large—and now the Democrats are talking of the need for several more.

Toeing the Budget Line

The commission's programme reflects the influence of the Bureau of the Budget as well as the technical arguments. Prototypes are one way of stretching a limited amount of money over a number of projects. Some of the commission's advisers also hope that by confining itself to prototypes the agency will escape the worst of the perennial battle between the supporters of public and private development of sources of energy. The AEC has also decided to cut down the number of different types of reactor which it will finance and the amount of money it will spend in preliminary work on "advanced" concepts. It has cancelled plans to build a heavy water moderated, sodium-cooled plant near Anchorage, Alaska; eliminated work on a molten uranium-bismuth fuel reactor; and placed the aqueous homogeneous reactor far down on the list.

Mr McCone is putting the commission's money mainly on water reactors, with decided emphasis on the boiling type, on gas-cooled reactors and on organic-cooled ones. So far he has not shown much interest in building a reactor fueled by natural uranium and, in spite of his denials, he does not seem impressed by the pressurised water reactor as it stands—something which has him in hot water with companies committed to that type. This is a warning of the problems the AEC will run into as it becomes more selective in picking out the most promising reactors.

Heat over Gas-Cooling

The outcome of the contest for funds between two gas-cooled reactors, one supported by the commission, the other by the Joint Committee, will show which of these two can make its will prevail. Since ACF Industries and Kaiser Engineers designed the 40 megawatt plant ordered by Congress, the Philadelphia Electric Company, with 51 associated companies, has offered to build, with government aid for research and development, a prototype high temperature gas-cooled reactor designed by the General Dynamics Corporation. This reactor, based on the ideas of a scientist formerly associated with the British Atomic Energy Authority, is apparently almost identical with the high temperature one scheduled by the AEA for construction in the nineteen-seventies. The AEC now proposes that the $51 million ACF-Kaiser graphite-moderated project be reduced to an experimental one, with only enough electrical generating equipment to test the technology, and that $14 million be invested in the private alternative.

Senator Anderson, the powerful Democratic chairman of the Joint Committee, objects strongly to this reduction in size and compares the rival scheme to an earlier private project which, he claims, was started to prevent the AEC from building its own large prototype homogeneous reactor—and then abandoned. For this reason Senator Anderson thinks that the building of prototypes should be a function of the government, with industry concentrating on plants of commercial size based on them.

Members of the committee consider themselves old hands at nuclear policy and regard Mr McCone as a neophyte. Their staff and that of the commission are now trying to agree on a compromise programme which both sides can support. To make this possible, the AEC and the Bureau of the Budget will have to give some ground and accept reasonably large reactors in addition to the prototypes.

Copper Stays Stockpiled

THE Administration, which is bracing itself to resist a demand from the mining states that the quotas reluctantly introduced for oil, lead and zinc should be extended to other "deserving" cases, has just had a sharp demonstration of the political power of the western mining interests. Its timid attempt to dispose of some of its excessive holdings of copper had to be abandoned after the Senate rushed through a resolution declaring that this would endanger the security and economic well-being of the United States. The Office of Civil and Defence Mobilisation had been planning to release only 5,000 tons a month, at least at first, but this reminder that there are 128,000 tons of copper in the supplementary stockpile shook world copper prices, to the distress of the State Department as well as of the domestic mining companies, and the OCDM climbed down with a reassuring statement that there is no intention of selling any copper from the stockpile "in the foreseeable future."

This copper was bought, in the main, under contracts designed to stimulate production during the Korean war. Unlike materials in the strategic stockpile, those in the supplementary one can be sold at any time and without the permission of Congress; this explains why Senators from the mining states would like to transfer this hoard of copper to the strategic reserve, where it would be securely locked up unless there were a national emergency. An alternative which they are considering is a Bill forbidding its sale without congressional assent. If government copper cannot be sold at present, the chances of relieving the strain on the Budget by realising much of the $1 billion tied up in the supplementary stockpile seem dim. Demand for copper is strong in the United States at the moment, partly because of the recovery, but also because users of copper are safeguarding themselves against the risk of a big strike at the end of June by buying ahead.

The entering wedge of the western attack on the Administration's somewhat battered trade policy is a Bill for quotas on fluorspar sponsored by Senator Allott of Colorado; this is being sturdily resisted, partly because it would hurt producers in Mexico, Italy and West Germany and partly because, if it were to pass, it would open the congressional door to a flood of other claims for protection. The lead and zinc producers, for example, want the quotas on the raw metals to be extended to include their products. Senator Allott contrived to have his Bill referred to the Interior Committees of both houses, where western voices predominate, but there are good hopes that the Senate Finance Committee and the House Ways and Means Committee, which are far less sympathetic to it, will insist that it falls under their jurisdiction.

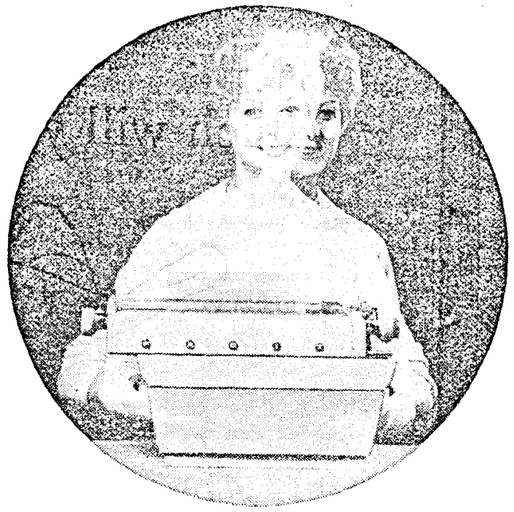
Sic Transit Chalk

A COMMITTEE chosen by Mr Wagner, the Mayor of New York, to consider the startling offer of Mr Roy Chalk to buy the city's municipally-owned transport system—the largest in the country—has rejected it with some indignation. Mr Chalk, a British-born financier who is a self-made millionaire many times over, bid $615 million, most of it to be paid on the instalment plan, for facilities which the committee said had cost the city $2.1 billion to build and buy, and which would cost $6 billion to replace today. Worse still, Mr Chalk insisted on either the right to raise fares, now set at 15 cents a ride, or on a municipal guarantee of a profit of at least 6½ per cent, after taxes, on gross revenues.

Under municipal ownership, the underground system has lost money ever since the war, as costs rose and the number of passengers fell. Fares have gone up twice, but never in time to staunch the flow of red ink, for politicians are convinced that to raise the fare is political suicide and some more disinterested observers feel that raising the fare only speeds up the flight of people and business from the city. Instead the tax-payer has subsidised the strap-hanger. The city pays the interest on the system's debts and provides all capital outlays. The Transit Authority, which was created in 1953, has only to meet the operating costs, but last year it lost $11 million; this year the loss will probably be higher. Unless the city is prepared to subsidise the direct, as well as the indirect, costs, the fare may soon have to go up to 20 cents in any case—and the city will be no nearer to solving the problem of how to squeeze out of its own capital budget the money to keep the buses and trains in repair, quite aside from modernising or extending the system.

Mr Chalk, a property speculator in New York, is no amateur where transport is concerned; three years ago he bought control of the transport system in Washington, DC, from the notorious Mr Louis Wolfson and extracted from Congress a highly favourable franchise which exempts him from most taxes. By the reinvestment of profits and by the exercise of imagination and a flair for useful publicity he has made the system both popular and profitable—one of the few in the country which is either. He has introduced pretty stewardesses on trams, air conditioning in some buses, and runs a lucrative sight-seeing service. So far there has been practically no increase in fares but they may have to go up soon. No one can say whether Mr Chalk could have duplicated his success in New York City, where the problem is bigger and more complex than in Washington. As a realist he can hardly have expected to be allowed to try. But at least he has harvested a splendid crop of headlines.

You might be opening a new factory in Europe; or seeking new markets in Latin America; perhaps you may land a big contract out East. To trade internationally one must, as it were, don many different hats and think from many points of view.



None knows this better than Shell, with its *unrivalled world coverage, and none is better* placed to assist you. Oil is essential to the modern world and the demand for it grows ever more widespread. Wherever you go, you will need oil products—automotive, industrial, marine, chemical, agricultural—and wherever you go Shell will be there. The Shell Group markets its products in 130 different countries including the U.S.A. and Canada, and we have responsible representatives in many areas as yet comparatively undeveloped.

Our experience in marketing our own products in diverse fields enables us to co-operate in many other ways. We can provide technical service and information on local conditions from our men on the spot. We can sometimes assist in establishing contacts. By knowing the ropes, one can often save people tripping over them. When you deal with Shell, you have associates everywhere. You can be sure of Shell all over the world—and in many different ways.

YOU CAN BE SURE OF SHELL

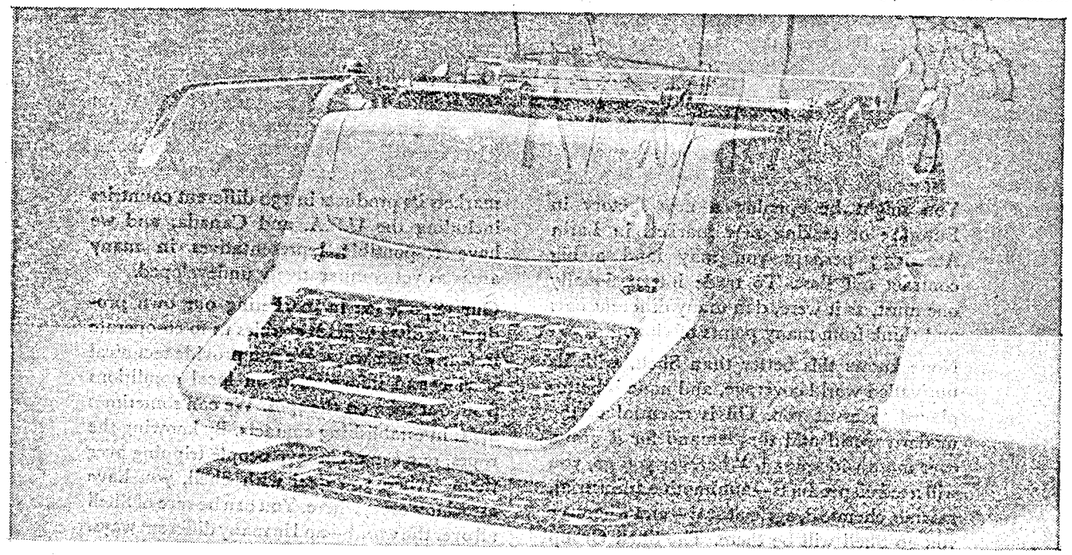
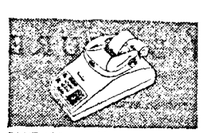
turn your typist into twins



give her a FACIT T1

Aren't there times when you wish your secretary had a twin sister in the office? Another girl of her efficiency and accuracy to lend a hand when typing jobs of various kinds start piling up? ● Most likely your secretary has no twin, but the FACIT T 1 typewriter *does* have a "twin tabulator" to help you out. The T 1's unique "mechanical memory" actually "remembers" the standard forms of your letters and invoices, while the regular tabulator takes care of the jobs in-between.



Calculators, adding machines, electronic computors, typewriters, duplicators.

Factories in Sweden and West Germany. Literature from nearest local agent or Åtvidabergs, Stockholm, Sweden.

THE WORLD OVERSEAS

Japan's Conservative Grassroots

FROM OUR CORRESPONDENT IN TOKYO

In the cities, towns and villages of Japan over the past three weeks, the days and still more the nights have been rendered hideous by "sound-trucks" rumbling through the streets, and even, in some places, by helicopters whirring overhead. The grassroots have been thoroughly examined to see which way they are growing, for four elections have been going on at the same time: for prefectural governors, for city mayors, for prefectural assemblymen, and for city assemblymen. Nor is the end yet in sight: on April 30th the apparently indefatigable voters will be called on to elect more mayors and more city assemblies, while on June 2nd they will be voting to fill 123 seats in the House of Councillors. The later elections, however, are not expected to produce much of a change in the pattern that the earlier elections have revealed, and which is plain to even the most undiscerning political eye, including that of the discomfited socialists. While there is no wild and overwhelming enthusiasm for the conservatives, the grassroots by and large remain sturdily true-blue: socialism is for the birds.

Japan's extremely restrictive electoral laws do not permit door-to-door campaigning, and heavy penalties, at least in theory, lie in wait for the candidate who ventures even to print his name too large on too many posters. Hence the aforementioned "sound-trucks": hence the helicopters. In Osaka, the police attempted to arrest an electioneering helicopter, pointing out that speeches, even tape-recorded ones, could be delivered only from stationary vehicles. The police, however, went away scratching their heads when the liberal-democrat candidate triumphantly pointed out that his helicopter hovered and so ought to pass as a stationary vehicle within the meaning of the regulation. Elsewhere, it was impossible to venture into the streets without encountering a "sound-truck," in the back of which an elderly spectacled man repeatedly removed his hat and bowed, as the vehicle sped him on his way. These manifestations of public spiritedness on the part of the candidates seemed to be running into a good deal of sales resistance on the part of the public, for no one appeared to be paying the slightest attention to the bowing men and when the trucks' sound apparatus boomed forth, people tended to flee rather than to congregate. But this apparently was misleading, for on election day almost 80 per cent of the electorate voted.

What they did when they got there is clearly visible in the results. The conservatives got over 53 per cent of the votes, compared with under 44 per cent in 1955, and the socialists got 23.6 per cent, compared with their previous 18.8 per cent. The independents' vote slumped from over 32 to under 20 per cent. Plainly, national politics and political parties in Japan have now deeply penetrated to the local level, and future local elections may be expected to be fought along strictly big-party lines. Of the 46 prefectural governors, 32 may now be counted as supporters of the present Japanese government. By contrast, there are only five governors who are either socialists or socialist sympathisers. The socialists lost Hokkaido, which they have controlled for the past twelve years. They managed to instal a governor in Fukuoka; but, though there is undoubtedly a big socialist vote among the coalminers of that area, Fukuoka was not so much won by the socialists as lost by the deposed governor, Mr Karoku Tsuchiya, a conservative politician of the old school whose interesting financial manipulations led last year to a demand for his recall which was postponed rather than averted.

Sadly surveying the results, the socialists have been moved to charge the liberal democrats with winning by means of unprecedented bribery and corruption. The liberal-democrats had during the election campaign freely charged the socialists with being the dog that was wagged by its communist tail. These charges and counter-charges are stereotyped to the point of being dismissable as hardly distinguishable from automatic conditioned political reflexes. Whatever influence the communist tail had on the socialist dog, it did very feeble wagging on its own behalf. The communists had no Moscow-hued governors before the elections, and have none now, and they are not likely to derive much satisfaction from the fact that their percentage of the poll has soared in four years from 0.9 to 1.1 per cent. The charge of corruption against the liberal-democrats is probably quite true, depending on the definition of corruption and with the rider that the socialists were just as "corrupt" but unfortunately for them did not have as much money to spend on vote-buying. Despite the stern electoral laws, it is the common custom in Japan, and one which the voters do not seem to find entirely disagreeable, for candidates to provide potential voters with £1-a-head feasts at a nominal charge of half-a-crown. Undoubtedly a good deal of this went on; but it certainly does not account for the extent of the conservative victory or the degree of the socialists' discomfiture. For the socialists had been straining every nerve to knock the liberal-democrats for six.

The alternative is to accept the fact that the Japanese electorate is basically and stubbornly conservative and that even an indifferent conservative government or conservative local administrations are preferred to socialists with bright and shining faces. The election results indicate that this is indeed the case, and that the socialists are failing even to make those slow but steady gains that would provide them with at least a reasonable hope of being able to come to power in a foreseeable future. Both parties gained voting strength at the expense of the independents and minor parties; but the conservatives' gains much exceeded the socialists' gains. Most thinking Japanese—and this includes even some thoughtful liberal-democrats—would feel happier if the socialists now tempered their gustier proposals, especially their hero-worship of communist China, to suit the mood of an innately cautious and pragmatic-minded elec-

torate. Some real Opposition gains, in fact, are badly needed merely in order to make Japan's two-party system really work. But, of such a change in socialist thinking, there is as yet no sign.

Arabs Talk Oil

FROM OUR SPECIAL CORRESPONDENT

Cairo

WHEN the Arab League oil congress ended here on April 23rd, the participating Arab government delegates and oil company observers were almost as uncertain what it was all about as they had been when it started a week earlier. Both the host (United Arab Republic) government and the petroleum department of the Arab League insisted that the congress was purely technical. Politics were not supposed to intrude into the discussions of exploration, production, petrochemicals, refining, or the economics of the oil industry. The most popular sessions, however, were those of the group set up to discuss petroleum economics ; and inevitably it was here that politics raised its ugly head from time to time.

At the first session of this group, the legal adviser to the Saudi directorate-general of petroleum and mineral affairs read a paper on a sovereign nation's ability to make, and obligation to abide by, petroleum concession contracts. The paper largely reflected the Saudi attitude to the award, made at Geneva last summer, in which the government's right to force Aramco to use tankers owned by Mr Onassis was denied. The government accepted the decision of the tribunal ; it had long before realised that its bargain with Mr Onassis was not a good one. Without actually mentioning the Onassis decision, the legal adviser set out to prove that it was not acceptable as a precedent for the limitation of sovereignty. It looked as if the fireworks were beginning ; but nothing came of it, the speaker himself refusing to engage in what he then chose to call political argument. The boldest political speech was made by the representative of the Algerian government-in-exile, who flatly warned the companies interested in Sahara oil that his government would not recognise concessions granted to them by the French government.

In his final address to the congress, Muhammad Salman, director of the Arab League petroleum department, made two unfortunate references—one to the imperialists and the other to Cairo's position as the centre of all Arab aspirations and knowledge. It was not polite to mention imperialism to the well-behaved oilmen, and there were among his Arab listeners many who do not agree that Cairo is the centre of the Arab universe. Two star performers at the congress were Abdullah Tariki, head of the Saudi delegation, and Emile Bustani, who did the talking for the Lebanon. Mr Bustani once more presented his plan for an Arab development bank financed by 5 per cent of everybody's profits on oil operations. With the introduction of the Arab pipeline plan by Mr Tariki there arose a brief rivalry between the supporters of the two schemes. At the end of the congress, however, the government delegates heartily endorsed the pipeline plan and consigned Mr Bustani's bank to the limbo of the " competent authorities in the Arab League."

At the early age of forty Abdullah Tariki is already an elder statesman among Arab oilmen. Only a few years have passed since he set out on his mission to make Arab governments agree on a common policy towards the oil companies. His way has not always been smooth. First, he was ignored by the companies and regarded as an upstart by the governments. The companies are now fully, sometimes painfully, aware of his activities but the governments, for all their resolutions and declarations of solidarity, do not find it any easier to agree on oil policy than on any other policy. Perhaps the greatest obstacle to Mr Tariki's plans is no longer the companies but the Arab governments. But at least he is no longer alone. Such able men as Anis el Kassem, of Libya, and Ahmad Omar, of Kuwait, proved at the congress that there is an increasing number of Arabs aware of the problems of the oil industry.

Many people came to Cairo ready for a battle which, to everybody's relief, never took place. The Arabs stated their case for integration, price control, increased local refining, and petrochemical industries. There were some company men who thought it unwise to take issue with the Arabs. Forgetting that discussion was what they had been invited to Cairo to engage in, they failed to realise that a conspiracy of silence would have given further weight to the Arabs' complaint that the companies stick together against them. Those brave few who said what they thought lost no Arab friends by doing so, and gained for the industry a measure of the respect so often lacking when Arabs and oil men meet together.

The formal proceedings of the congress never assumed any definite shape. Papers were read and discussed briefly, and the final resolutions were a mishmash of what various people had proposed. But the congress was a huge success all the same. Its success lay in providing a meeting ground for people who in one way or another share the same interests. At the exhibition at Gezira the producing companies made the most of their chance to show what they are doing. In the lobbies of the hotels and at countless receptions, luncheons and dinners, Arabs and industry representatives learned a great deal not only about each other but about other Arabs and other oilmen. So long as they all realised with what manner of men they had to deal in the future, it did not matter that they were still uncertain what the meeting immediately amounted to.

A Chancellor's Entourage

FROM OUR BONN CORRESPONDENT

IT is the mode just now among government spokesmen in Bonn to emphasise the continuity of west German policy, notwithstanding impending changes in the leadership. For this there are sound reasons of state. Yet everybody knows that after a formative decade dominated largely by a single personality, west German political life is about to experience the stimulus of new direction. The way is being opened for younger men, who will be bringing with them counsellors of their own choosing.

Dr Adenauer, who left for a holiday in Italy on April 7th immediately after announcing his decision to stand for the presidency, is due back in Bonn early next week. He is being widely advised to make clear as soon as possible whom he proposes to nominate as his successor ; and since the idea is being advanced in some quarters that it would become him to resign the chancellorship straight away in the event of his election to the presidency on July 1st, it may well be that the world will know fairly soon who the next federal chancellor is going to be.

For all the auguries in his favour, it is still not certain that it will be Dr Erhard. The group of Christian Democrats and business men who would prefer Herr Etzel are influential and may yet have their way. There are some who would like to see Herr Etzel displace Herr von Brentano as foreign minister. But, for reasons that the Germans sometimes like to call "optical," a change of foreign minister seems unlikely while the imminent series of international conferences is in progress.

Dr Adenauer's translation is expected to affect also the small group of civil servants upon whom he has relied so much for counsel and company during the past ten years. The Chancellor has often been accused of confining consultation to a too narrow circle. And, not for want of telling, he has been careless—he would probably say loyal and unlucky—in his selection of close colleagues. Many Germans deplored—again for "optical" if for no other reasons—Dr Adenauer's choice of Dr Hans Globke as state secretary in the chancellery. Dr Globke has been all along the Chancellor's principal administrator, memory-jogger, and mentor in governmental procedures. He is an experienced and efficient civil servant who does what he is told. He did as he was told when, as an official in the Reich ministry of justice, he contributed an unquestioning expository preface to the anti-semitic laws passed by the Reichstag in a macabre session held at Nuremberg in 1936.

WITH remarkable tenacity, Dr Adenauer has resisted all demands for Dr Globke's withdrawal from this influential post. It is being put about by some that Dr Adenauer would like to take his apparently indispensable state secretary with him to the president's office. Others, more fancifully, are conjecturing that Dr Erhard, a minister disposed to neglect paper work, would need Herr Globke in the chancellery even more than the methodical Dr Adenauer has done. They are surely underestimating Dr Erhard's resources. And, as bad luck—or carelessness—has had it, the prestige of the Adenauer-Globke chancellery is about to suffer further assault in the forthcoming trial, on charges of corruption, of Herr Hans Kilb, who served as Dr Adenauer's personal assistant for some three years. With the same confidence with which he has brushed aside objections to Dr Globke, Dr Adenauer seemed at one time to have assumed that he could arbitrarily rescue Herr Kilb from the attentions of the law.

Dr Adenauer's reluctance to be bothered by awkward lapses from the impeccable conduct expected of civil servants had spectacular consequences last week in Herr Blankenhorn's conviction by a Bonn court of having slandered another senior civil servant. Along with Professor Hallstein (who was unenthusiastically acquitted at the same time on the ground of lack of evidence) Herr Blankenhorn has been one of Dr Adenauer's closest advisers on foreign policy since the establishment of the German Federal Republic. Although the Chancellor knew that this embarrassing case was pending, he promoted Herr Blankenhorn last year to the embassy in Paris ; to which he is now not returning, at least for the time being. Doubtless Dr Adenauer had originally supposed that the injured Herr Strack would be as ready to settle out of court as he himself and Herr Blankenhorn had been in 1955 not to pursue to the bitter legal end their objections to allegations published in *Der Spiegel* that in the postwar years they had supplied the French intelligence service with information in return for money and food.

Dr Adenauer began his long run at the chancellery in days when there was a scarcity of uncompromised civil servants willing to accept major responsibility. Today there is a larger reserve to draw from. In consequence of the embarrassing disclosures of the Strack case, many Germans are expressing the hope that the next Chancellor will pay more attention than Dr Adenauer has done to maintaining the integrity and reputation of the government service.

Singapore's Loud Voices

NOMINATION day has dashed the hopes of moderate men in Singapore that Mr Lim Yew Hock would lead a united moderate team into the election campaign against Mr Lee Kuan Yew and the People's Action Party. Simply on form, the other parties thoroughly deserve to lose the election on May 13th. Their plan was, very sensibly, to unite in a single Singapore Alliance the whole anti-PAP coalition—the Liberal Socialists, the United Malays' National Organisation, and the Malayan Chinese Association—and put up a single list of candidates to fight the 51 seats in the new house. This implied that some people would stand down in favour of others. But the result has been that the disappointed politicians have put up as independents and new parties have sprung up like mushrooms, while the Liberal Socialists have split in two. Finally, Mr Marshall, the former premier, is fielding a side of his own called the Workers' Party. The result is that there is a straight fight between PAP and anti-PAP candidates in only seven constituencies, while in 29 the anti-PAP vote is split between three or more candidates, of whom there are more than 200 in the field.

The Singapore electorate is credited with being weary of all the factions. Every party has some discreditable episode to live down. Just before nomination day the Minister of Local Government, Abdul Hamid, was expelled from his party and from Mr Lim's alliance on an obscure quarrel connected with the charges against Mr Chew Swee Kee, another minister, whose financial affairs are under investigation ; on the other side, the PAP mayor of Singapore and all his party supporters on the council, a body racked with quarrels and scandals and also under investigation, have resigned in order to contest the parliamentary elections—for all that they had sworn to stand by the municipal underdogs to the last. This ratting was not unconnected with the PAP's own decision to abolish the council if they get power. At the hustings, Mr Marshall is in a straight fight with Mr Lim, whom he will seek to " expose " ; while Mr Lee Kuan Yew finds himself standing alone against Dr Subramanyam, who had just defected from the PAP, and purposes to " expose " him too.

But Singaporeans cannot react by staying away from the polls because voting has been carefully made compulsory ; and as the prospect of a fine is likely to bring the underdogs as well as the business men to the ballot box in force, the betting is now very strongly on a PAP victory. It will be surprising if the same hectoring voices which have been heard denouncing British imperialism in the city council chamber are not heard, with amplification, in the parliament of the free state. The question is how much weight they may carry in the ministry.

Limelight on the Luxembourg

FROM OUR PARIS CORRESPONDENT

IN the charming Luxembourg gardens, on the left bank of the Seine, stands an Italian-style palace. Commissioned by Queen Marie de Medici in the early 17th century, the Luxembourg palace has witnessed many changes. It belonged to various princes ; during the Revolution it was a prison and then it became the seat of the Consulate. Later it housed first the senate of the Third Republic and then the Council of the Republic, the truncated upper chamber of the Fourth. On Tuesday, it inaugurated a new chapter in its varied story as the seat of the senate of the Fifth Republic.

The regime may have changed. But the political complexion of the upper chamber is scarcely altered. As if to underline this continuity, M. Monnerville, who last May played a prominent part in the transfer of power to General de Gaulle, was on Tuesday re-elected speaker. Out of a total of 255 senators for metropolitan France, 170 have sat in the Luxembourg before. Among the newcomers, there are many deputies of the Fourth Republic who were defeated in the November elections, among them such well-known figures as MM. Edgar Faure, François Mitterrand, Gaston Defferre and Jacques Duclos.

This apparent return to the established pattern was no surprise, nor could it be. Senators are elected indirectly by local councillors and their representatives. The local elections in March (see *The Economist* of March 21st, page 1075) showed that last autumn's peculiar mood, which produced a national assembly dominated by the neo-Gaullist UNR, disappeared after the introduction of last winter's fiscal measures. Back to normal, however, does not mean that the senate will be to the left of the national assembly. The method of its election is a guarantee that the upper chamber will always tend to be conservative.

IT has been calculated that France's small villages (with less than 1,500 inhabitants) account for less than a third of the country's population but supply more than half of the "grand electors" taking part in the senatorial poll. Towns of over 10,000 inhabitants account for more than two-fifths of the population and yet provide only a fifth of the senatorial electorate. This bias in favour of the predominantly conservative rural areas explains the general political complexion of the upper chamber.

The Communists, with 14 seats, a loss of two, have managed to provide for a few of their more prominent members who were defeated in the parliamentary elections last November, but the voting system, in which proportional representation is the exception, gives them only a slight chance of success. The slight losses of the Socialists (48 instead of 53 seats) confirm their setback in the local elections. The Radicals of all colours, who now have 51 instead of 47 seats, showed that they still have strong local positions, while the MRP, with 29 seats, a gain of eight, shows that years of patient work are now bringing some results. The UNR with 27 instead of 29 seats is the real victim of the poll. The unorthodox Right dominates the national assembly ; the traditional conservatives, the Independents and their allies, with 85 seats, form the biggest party in the senate.

Universal suffrage may produce a right-wing chamber, as it did last November ; it may also produce the opposite result. Senatorial elections will always have a conservative bias. This is why the constitutional draftsmen of the Fourth Republic curbed the powers of the upper chamber. Their successors have restored to the senate some of its prestige. Its Speaker is the second person in the state after the President (and replaces him provisionally in case of death). Unlike the assembly, the senate cannot be dissolved: a third of the senators are renewed after three years ; another third after six years ; and after nine years the whole membership is re-elected.

Professor Duverger, in a penetrating article, has demonstrated how the senate can be used as a brake which the government can apply at will. A bill passed by the national assembly must be approved by the senate before it becomes law. A bill that is rejected by the senate and disliked by the government can simply be buried without any further reference to the assembly. On the other hand, if the government wants to get a bill through, it can call a mixed commission of the two chambers. Should the mixed commission fail to agree, the bill can become law by a simple vote in the lower chamber. Naturally, the two chambers could put the executive in a difficulty if they agreed on a reform it resents, but the conservative complexion of the senate makes it unlikely that such agreement would be reached except on a conservative measure.

The supposition that the draftsmen of the constitution intended to strengthen the existing conservative safeguards is borne out by the fact that the only exception to the procedure of mixed commissions is made for constitutional reform. Any revision of the constitution must be approved by both chambers separately. With an eye to the future, the draftsmen seem to have taken precautions against the possibility of a left-wing lower chamber. The King has strengthened the Lords in order to insure the realm against the zeal of the reforming Commons. But the strengthening is only relative. The senate, for instance, cannot bring the government down. It has really only gained prestige by comparison with a lower chamber whose powers have been drastically curtailed. Parliamentary prerogatives as a whole have been cut. In the Gaullist system the executive—and in particular the President—has the whip hand.

Almost opposite the Luxembourg palace stands a theatre once called *l'Odéon*. Until very recently it was the second house of that famous state-owned theatrical company, the *Comédie Française*. But the government decided that one state theatre was enough and on April 8th *l'Odéon* was denationalised. Two houses, however, are still considered necessary for political performances. The Luxembourg, with its old-timers and orators of renown, may attract a wider public than the Palais Bourbon. But neither house is likely to provide the stage for real political drama.

The Arab South—I

FROM A SPECIAL CORRESPONDENT

A SHOP in the old town of Aden (known as the Crater) sells illuminated Koran verses and coloured prints of popular personages, among whom the place of honour is held by Queen Elizabeth II and President Gamal Abdel Nasser. The portraits of the two heads of states are displayed side by side, Colonel Nasser being represented

with the Imam of the Yemen on his right and Crown Prince Badr on his left. The juxtaposition is typical of the political atmosphere of the Arab South.

The term "Arab South" has recently been adopted by Arabs in order to include in one designation Aden colony, the Aden protectorate (itself divided administratively into western and eastern portions), and the Kingdom of the Yemen. Some Arabs would include the Sultanate of Muscat and Oman as well. To British ears the term implies a subversive intention, since according to British political theory the various parts are distinct entities. Only within the limits of the western, and potentially of the eastern protectorate is political unification regarded as desirable. Here the rulers of six of the 30 or so princedoms and sheikdoms (many of which are minute) have been induced to ask for a federation. *In theory the objective is the benefit* to be gained from pooling resources and administration, though it could be urged that the addition of nothing to nothing remains nothing. The inducement most potent with the rulers is probably the increased British aid that may be expected to follow compliance with British wishes ; the more enlightened realise that federation will not help them to maintain themselves against the rising tide of nationalism, with its republican tendencies, unless the federation is seen by the people to be not merely a club for the rulers but also the source of substantial benefits for their subjects.

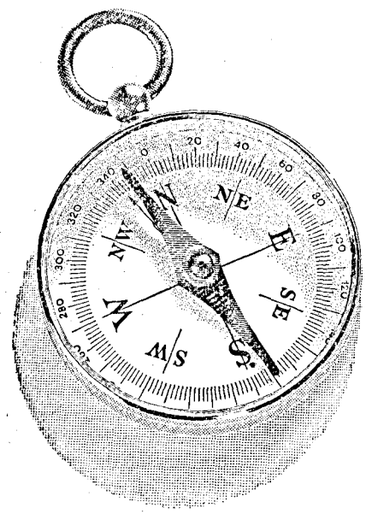
In British eyes, federation is an essential step in meeting the contemporary insistence that standards must be raised in poverty-stricken and backward colonial areas. There is, however, more to the project than philanthropy. British grants, and economic and social planning executed with British assistance, mean an extension of British influence and, it is hoped, the strengthening of a political foothold which is being increasingly menaced by the rising tide of Arab nationalism. In his recent book on Aden, the late Governor, Sir Tom Hickinbotham, makes it clear that he anticipates the ultimate emergence of a federated state within the Commonwealth ; this is to serve as a buffer between the Arab world and the politico-military centre which has been set up in the colony of Aden with the purpose of safeguarding British interests in Arabian oil. The hope is that concentration on Arab unity in a limited area will divert attention from wider projects of Arab unification favoured by the United Arab Republic.

IN fact, many modern-minded and progressive Arabs in Aden and the protectorates, outside the administration as well as within it, do welcome federation and do believe that a period of British aid and advice is essential if the region is to be successfully developed. It is, however, also clear that these Arabs interpret official statements to mean that in due course the federation will be able to form a homogeneous political entity with Aden itself ; and that this entity will be free, if it likes, to unite with a reformed and renovated Yemen and to establish whatever relationship it pleases with the Arab world as a whole. If this interpretation is proved incorrect, the subsequent disillusion will make it difficult to preserve the necessary degree of Arab co-operation.

More actively nationalist Arabs advance two objections. The first is that the project would increase British interference. Even if this should be temporary and the final result different, they resent any increased British activity in the Arab world at the present time because Britain appears to them today as a principal opponent of the UAR and therefore of the policy of political unification of the Arab countries for which the UAR stands. The other is expressed principally by the potentially powerful trade union movement in Aden. They object that federation is being treated as an affair of the princes rather than of the peoples. Against this it can be replied that in the primitive conditions at present prevailing in the protectorate, rulers of the traditional type are indispensable, and that no system of elected assemblies would, for the moment, be capable of working at all.

Expressed in these general terms, the political scene in the Arab South appears fairly simple ; it is, however, complicated by two further factors. These are the character and policy of the present regime in the Yemen, and the special social and economic conditions of Aden colony.

(To be concluded)



Russia's Shorter Seven-Year Plan

WITHIN a few months of embarking on their first seven-year plan, the Russians seem to show a hankering after their traditional planning period of five years. In all branches of production, pledges are being made to fulfil the plan well ahead of schedule. Mr Brezhnev, a member of the party presidium, announced on April 22nd at the ceremony celebrating Lenin's birthday that seven years would be more than enough to reach the agricultural objectives set for 1965. Farmers throughout the Soviet Union are now binding themselves publicly to achieve their plan for the output of meat, though not of grain, two or even three years before the appointed date. The planners of the Russian Soviet Republic have decided to raise this year's targets for iron and steel.

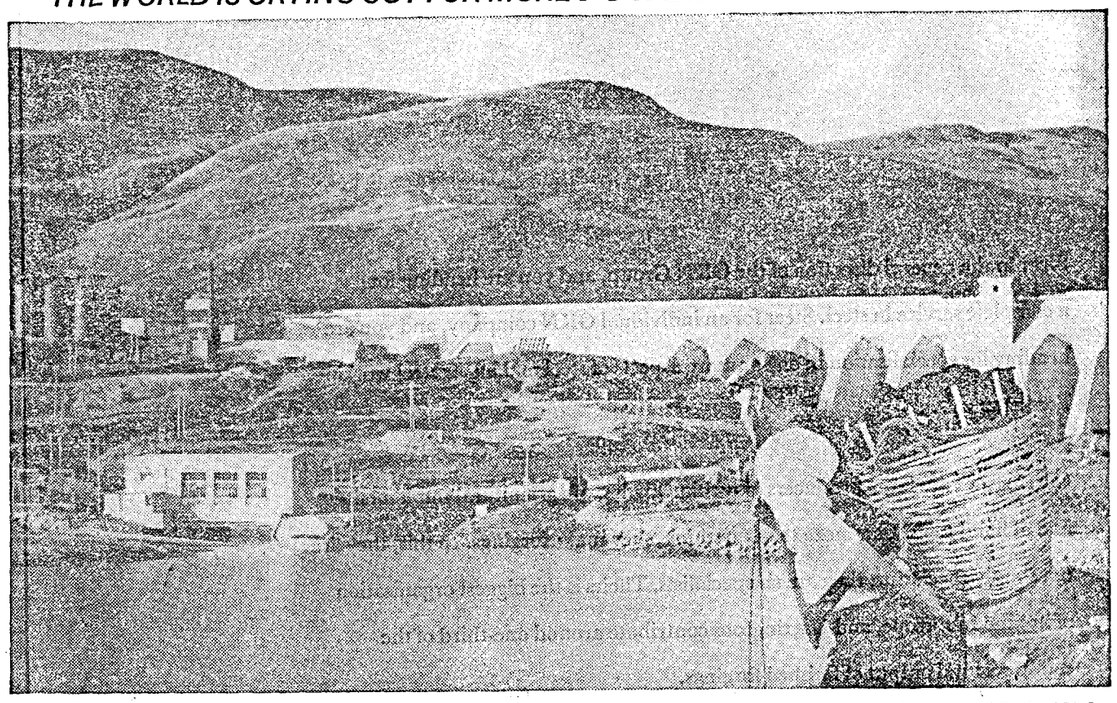
Signs of a speeding-up of production are confirmed by the progress report for the first quarter of this year. Gross industrial production, it is claimed, rose by 11 per cent *compared with the corresponding period of 1958* ; the expected increase had been only 8.6 per cent. When the outlines of the first seven-year plan (1959-65) were published last year, it was remarked that the contemplated rate of growth was slower than in preceding periods. The Soviet government has apparently decided that there is no need for such a slackening of the pace, particularly in the iron and steel industry. A faster exploitation of new iron ore deposits in Kazakhstan and in the Kursk region is intended to prevent bottle necks in metal supply.

Mr Kuzmin was removed in March from the chairmanship of the *Gosplan*, probably because his plan was not considered ambitious enough. His successor, Mr Kossygin, is acting upon instructions not to underestimate the country's resources. The present plan will not bring Soviet output abreast of American, but the Kremlin has evidently determined to accelerate the progress towards that goal. It would not be astonishing if the Russians were soon to publish a revised version of their first seven-year plan ; this would show whether the upward revision is general or whether it concentrates on basic industry and on agriculture.

GOING OUR WAY?

Steer in the general direction of the GKN Group, and you are heading for a complete service in steel. Steer for an individual GKN company, and you are heading for specialisation in one or more aspects of steel making or steel working. For instance . . .

Garringtons are large producers of turbine blades, of agricultural implements and of hand tools. But, more than anything, they make forgings. In this, they are not simply specialists, they are *the* specialists. Theirs is the biggest organisation of its kind in Europe, and Garringtons contribute around one-third of the country's total output of finished forgings.

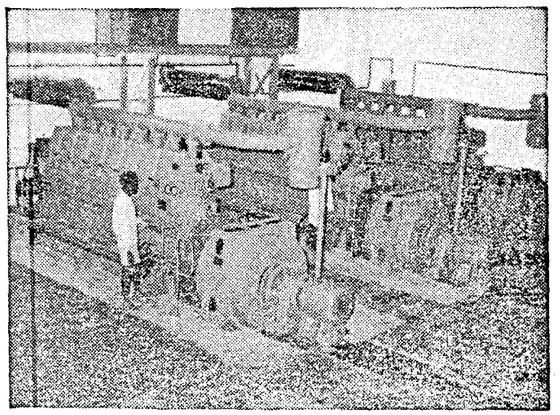


And so, when people need forgings they are very likely to come to Garringtons. Similarly, when they need any other particular steel product or service they will be equally well served to come to one of the many other specialists within the general framework of the GKN Group.

THE GKN GROUP OF COMPANIES

FOR ANYTHING AND EVERYTHING IN STEEL

GUEST, KEEN & NETTLEFOLDS, LTD., (HEAD OFFICE) LONDON WORKS, SMETHWICK 40, STAFFS.



THE WORLD IS CRYING OUT FOR MORE **POWER**

The Sron Mor pumped-storage power station of the North of Scotland Hydro-Electric Board contains an English Electric 6000 kW water turbine and induction generator/motor. English Electric has supplied generating plant to twenty-three hydro-electric stations in Scotland.

THERE'S A NEW SOUND IN THE GLENS

They'll hear it 12,000 miles away

At the White Nile Scheme Board's Cotton Ginning Factory at Gebel Awlia, Sudan, three English Electric 328 kW diesel-alternator sets are installed. This factory was also equipped with English Electric motors, switchgear and fusegear.

There's a new sound in the glens today—the quiet, purposeful hum of English Electric turbines and their alternators.

This undramatic sound represents more power in the Scottish Electricity Grid—the promise of more prosperity in Scotland . . . and of more money to spend abroad on imports. The sound from these English Electric turbo-alternators echoes around the globe.

Abroad, too, English Electric is concerned with projects for generating power—from water, coal, oil, the atom; with more efficient transformers and switchgear to distribute this power—as well as with the production of locomotives, marine engines, and aircraft.

This equipment earns Britain millions of pounds of overseas currency. And the power it creates means growing prosperity abroad, more money to spend, much of it on British goods.

Again, every project means more experience and even better techniques—from which Britain and the world will benefit.

English Electric's business is more power—for greater prosperity everywhere.

Power is the business of

ENGLISH ELECTRIC

bringing you better living

THE ENGLISH ELECTRIC COMPANY LTD., MARCONI HOUSE, LONDON, W.C.2

THE BUSINESS WORLD

A Funeral or a Cure?

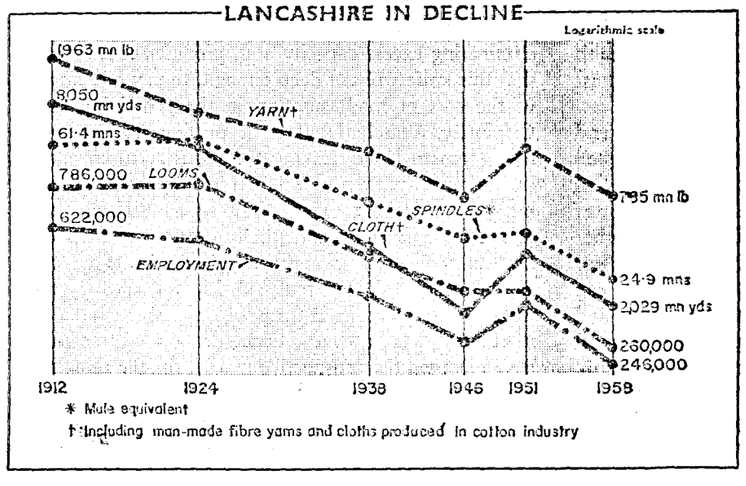
The Government have no doubt that the circumstances of the cotton industry which I have described justify the exceptional course of direct financial assistance from public funds.—Sir David Eccles, President of the Board of Trade, in Parliament on April 23rd.

A CALL on public funds to the tune of £30 million needs very full justification. Lancashire's claim rests on two broad grounds. It contends that in both the home and export markets it is the victim of forces largely beyond its control. Since the second world war its overseas markets have continued to shrink, as they did after the first war, owing to the growth of local industries behind tariff walls in countries that once were Lancashire's exclusive markets. These countries have not only become self-sufficient in textiles, but have also become substantial exporters, again at Lancashire's expense. And in recent years the industries in India and Hongkong have been competing with Lancashire in the British market, which allows Commonwealth goods in duty free. No other major manufacturing industry stands unprotected against low-wage competition from Asian countries. And as the Government has refused Lancashire formal protection, on grounds of broad national and Commonwealth policy, the industry argues that the Government must bear some part of the consequences.

These consequences—the loss of both export and home trade—have forced the industry to work well below capacity. Though mills have been closing at an increasing rate—118 closed in 1958 alone—a surplus of obsolete machinery still drags Lancashire down, together with a lack of up-to-date machinery. An industry weakened by surplus capacity, Lancashire argues, can muster neither the will nor the resources to scrap and re-equip at the necessary scale and speed. A surgical operation is needed to restore the industry to health, and the Government must help to pay the bill. Without that operation the industry sees no hope of arresting the decline in exports, and even its present export trade of £88 million (cotton and rayon goods) is not one that the Government can lightly dismiss.

The Government has accepted that case. The opportunity for action was taken after the industry, with all the Government's help short of directly threatening sanctions, persuaded Hongkong to limit shipments of cloth and most made-up goods for retention in the British market. The ceiling then set is still an uncomfortably high one for Lancashire; it excludes yarns (imports of which have risen recently, whether temporarily or not no one can tell) and has a guaranteed life of only three years. But it at least provides a breathing space in which to reorganise. A similar agreement with India was reached long ago in principle, and should be ratified soon. Finally, the Government's willingness to help may well have been influenced by the judgment of the Restrictive Practice Court, which declared void the minimum price scheme of the yarn spinners' association—an agreement which had helped to maintain excess capacity in being.

AFTER discussions with the industry the Government has now offered to pay two-thirds of the cost of eliminating excess capacity and, provided it is satisfied that this knife will cut deep enough, to pay one-quarter of the cost of modernisation in the remaining mills. Originally Whitehall talked of putting its money on re-equipment alone, leaving the industry to cope with excess capacity; then it switched its emphasis to financing concentration; now, after squawks from parts of the industry it has eventually decided to help with both. In theory one approach should be as effective as the other. A generous subsidy for re-equipment would have encouraged firms to scrap some mills and re-equip others; a drastic concentration scheme might have enlarged the prospective market for the remaining mills enough to encourage them to re-equip. But some influential members of the industry evidently felt that the Government should demonstrate its confidence in



Lancashire's future by helping it to re-equip. The industry, and the City of London, it may be assumed, will draw their own conclusions. With a sizeable stake in re-equipment the Government will surely be less likely to jeopardise the industry's future by allowing imports of yarn to reach "disruptive" levels, and will work the harder to ensure that the agreement with Hongkong is renewed.

The starting point for both schemes, for redundancy in particular, was an analysis by the Cotton Board's staff of the probable size of Lancashire's future market. While this study has not been published, it no doubt assumed a continuing modest growth in home consumption, per head and in total, and that this increase would be broadly offset, for some years at least, by a further, though moderate, decline in exports, with the hope of some expansion after the reorganisation schemes have been carried through.

A broad guide to the capacity that needs to be cut out in spinning and weaving is the extent of under-employment over the last two years. Making certain assumptions about re-equipment and shift-working, this suggests that about 40 per cent of the spinning capacity will have to go (mainly the 10 million mule spindles) and roughly 25 per cent of the looms (or about 65,000 —30 per cent—of the non-automatics). In finishing, capacity has to be expressed in a productive unit, which may be a line of machines within a works or a whole works. The finishers always need some surplus of capacity to cope with changes in the pattern of demand, but it is reckoned that about thirty per cent of the machines are surplus in all four sections (bleaching, dyeing, finishing and yarn dyeing). On the re-equipment side, perhaps 3½ million new ring spindles, working two shifts, ought to be put in within the five years, and the number of automatic looms—47,000—ought to be increased by perhaps one-half. The new looms would start immediately on two shifts if not three, and more of the existing ring mills should go on to two shifts.

There is no master plan, and no compulsion to close down. No one can yet be sure that enough mills can be induced to close down, what the inducement will have to be or how much it will cost altogether. In theory the cheapest and most equitable basis would be one that related the payment for closing down a particular mill to its record of return on its assets. In fact this method would not work. Firstly, there are obsolete mills in which the machinery has been written off long ago, and in which the return on assets is therefore relatively higher than in some modern mills. Secondly, the response of individual mills will not necessarily be based on economics. An offer that might be accepted by a family controlled business might well be turned down by one run by directors with a small stake in the equity, whose aim is to keep their jobs and keep their shareholders at bay.

The most practicable way is to try to guess the amount—per spindle and per loom—needed to induce the last marginal mill to close down; offer this to all comers for say three months, and hope for the best. Many figures are being canvassed, according to the authors' optimism; about 15s. per spindle and £50 per loom seem as good as any cockshy to start with.

GIVEN a favourable response, said Sir David Eccles, the call on public funds under both the redundancy and re-equipment schemes might well be of the order of £30 million. While it would be foolish to accept this figure as more than a guess, it is worth asking how much might be spent under the two schemes, and among the various sections? The impression that redundancy will absorb most of that sum is wide of the mark. In the finishing sections it is generally held that reorganisation is almost wholly a question of eliminating capacity; the re-equipment necessary is well within the industry's resources. By and large this is probably true of spinning, too, but less so in weaving; the weavers are the least prosperous section, having been squeezed between the spinners' price scheme and the recommended price schemes of the finishers (which have yet to come before the Restrictive Practices Court). Assuming, for purposes of illustration, that the finishers get roughly one-fifth, or £6 million (the bulk for redundancy), the other four-fifths, or £24 million, might be broadly shared between the spinners and weavers. If the maximum target of 10 million spindles are cut out for a price of about 15s. a spindle, the cost to the Government would be 10s. per spindle, or £5 million all told, leaving some £7 million of public funds for re-equipment. As the Government is contributing one quarter of the cost of re-equipment, this would provide for a

total expenditure of at least £28 million for re-equipment in spinning over the next five years, which compares with nearly £33 million spent in the five years up to 1957. The ratio of re-equipment to redundancy payments in weaving should be higher still, because this section has contracted faster than the spinning section.

The amount of compensation for redundancy will be directly influenced by the Inland Revenue's treatment of these payments. Sir David has said that the law will not be changed, but will be interpreted as liberally as possible. The industry is now waiting to know exactly what this means. From the Government's view the point is academic; if it has to give more with one hand because payments bear tax at the full rate it will get the excess back in the other hand from taxation. For the industry the levy to finance their third of the redundancy payments is in any case a business expense. It has already been made clear that investment allowances and initial allowances will apply only to the total cost of re-equipment, minus the Government subsidy of 25 per cent.

Cynics are saying that although the Government insists that the industry must compensate displaced workers, the money will effectively come out of the payments for closing down mills. They are wrong. It can be taken for granted that the Government will want it to be demonstrated beyond all doubt that the industry truly bears the cost. The probability is that the money will have to be raised mainly by an additional levy on the remaining firms, with the mills closing down perhaps making an initial payment before winding up.

It may be wondered whether the Government and the industry fully realise how ambitious is the task they have set themselves. After cutting the industry down to what is believed to be its right size, the Government is trusting the industry to ensure that re-equipment will take place in the right places and in the right way, and that the full fruits of re-equipment are realised. This is not just a matter of technique: it also means making the right goods and marketing them effectively. For its past failures on this front Lancashire has no one to blame but itself. If management in cotton carried bigger guns one might feel more confident about the outcome. The Government can only be allowed one go at this latest operation; it should be quite clear that it is giving a lot and must expect a lot.

Supersonics and Space Research

MR AUBREY JONES, the Minister of Supply, bears the heavy responsibility for deciding whether he should advise the government to undertake two costly and controversial long-term projects, a space research programme and the development of a supersonic transport aircraft. The experts have had their say. Mr Jones should now know what is technically possible and, within very broad limits, the order of cost likely to be involved. That experts want to undertake challenging new ventures is to be expected; on the Minister of Supply rests the more difficult task of judging whether to recommend that they should be given their heads.

Jet airliner development has now reached a point where speeds cannot rise many more miles per hour without running into the difficult flying conditions around the "trans-sonic" zone—the sound barrier. The choice for aircraft designers is, therefore, either to stay at the present speeds of around 600 mph plus, and concentrate on improving other aspects of performance, or to jump right across this trans-sonic zone to a minimum supersonic speed of 800 to 900 mph. But some experts argue that a mere 800 mph will not be fast enough to make the aircraft economic, and indeed that supersonic aircraft will not pay their way at speeds below 2,000 mph.

For two years, a committee consisting of Britain's leading aircraft designers and experts from the Royal Aircraft Establishment at Farnborough has been studying whether it would be technically possible to develop and build a supersonic airliner in this country and, if so, what its optimum size, shape and speed should be. They were not asked whether they thought such an aircraft ought to be built, nor how it might compare with the kind of improved but still subsonic machine that could be put into service about as soon, i.e. in the middle to late 1960s. After 50,000 hours of wind tunnel experiments, and the construction and testing of a large number of scale models, the committee reported that two alternative types of supersonic aircraft could be developed, neither of them large by current standards. One would be just supersonic, flying at 800 to 900 mph, carrying 100 passengers and suitable for distances of up to 1,500 miles such, for example, as the London-

Moscow route. The second would be faster, cruising at about 1,500 mph or twice the speed of sound and carrying 150 passengers across the North Atlantic. Estimates of the cost of developing the airframe and engines vary between £150 and £200 million. The market for such airliners is bound to be small; it is questionable whether there would be a market for two types, one American and one British, apart from any competition from Russia.

The committee did not recommend an attempt to reach the widely publicised speed of 2,000 miles an hour plus, three times the speed of sound. This would create some structural problems not present in the relatively slower aircraft, would raise serious difficulties about engine power and noise at take-off, would require vast increases in the length and strength of civil runways over and above the improvements already having to be made for jets—and could not by any stretch of imagination be fitted into existing or immediately foreseeable methods of air traffic control.

IT is one thing to say that such aircraft could be built; quite another to say that they should be built. The airlines have given no indication that they want to fly at supersonic speeds. Very few of them know what it is like to operate 600 mph jets, and their experience is limited to a bare six months. The great majority, though heavily committed in buying jet airliners, now have nothing faster in service than 300-350 mph piston engined airliners.

The airlines' lack of enthusiasm is understandable, but they cannot ignore the possible commercial value of very high speed travel. It might be that the speed of a supersonic aircraft would offset both the high price of building it and its high operating costs. The committee suggest that a 1,500 mph airliner making two round trips per day between London and New York and one round trip daily in winter would cost little more to operate per passenger than today's aircraft—taking its capital cost as the construction price not the cost of the ten years or so of development. (That is based on an assessment of possible traffic, not of what the aircraft is physically capable of doing. It would mean an average capacity of up to 450 a day, which is roughly identical with that of a new Cunarder costing, say, £25-30 million to build, but nothing extra to develop.) The airlines themselves seem to think, however, that a mere doubling of present jet speeds and a halving of journey time would hardly be worth the trouble. But some think there might be a sharp increase in business traffic if the crossing could be cut to something under two hours. This would require an airliner flying at 2,000 miles an hour, with all the technical difficulties that involves. Being well aware of these, most airlines, including the two British corporations, are staying mum.

Mr Jones can therefore expect no lead from the airlines in reaching his decision. He is getting even less from the aircraft industry, which has split into three camps on this issue, each giving him contrary advice. Some of the country's most experienced and commercially successful designers think it is folly for Britain to attempt supersonic design at all, and consider that our resources would be better used in trying to improve the economics of existing aircraft. Those who are convinced that the industry should build a supersonic aircraft if only in order, to quote Mr Masefield of Bristol's, "to stay in the big league," are still divided over what speed should be chosen; hence the two separate proposals from the committee to the Minister. The smaller, slower aircraft would be less costly and quicker to build, but a couple of years is not of all that consequence and an 800-mph British-built machine might be in danger of being put out of date by more ambitious American developments. The indications are that the Americans are thinking in terms of 1,500 mph and that talk of a 2,000 mph airliner is intended mainly to test the reaction of airlines. The manufacturers on both sides of the Atlantic are well aware that the fact that airlines are not now asking for supersonic speeds may not deter them from doing so in three or four years' time.

Mr Jones has to weigh the obvious advantages to the aircraft industry of a Government-sponsored supersonic project, and the possibility that some airlines will at some time come up with a demand for supersonic transports, against the development cost of such a project (which nobody seriously suggests would be recovered out of sales) and also the fact that the industry has been unable to agree on a formula for its design. A decision against building would knock most of the morale out of the aircraft industry, even though it would still have a large subsonic airliner market in which to operate. The temptation to undertake such a project in order to avoid disappointing a bunch of brilliant designers anxious to try their hand is a hard one for any Minister of Supply to resist. But the Ministry has to judge whether the designers are likely to be able to deliver the goods on time and to specification and whether, these having been delivered, anyone will buy them.

THE case for a British programme of research into space is simple by comparison, and a decision will probably be taken during the next few days. It turns on the importance of satellites as research tools, mobile laboratories in which instruments can be mounted outside the distorting effects of the earth's relatively dense atmosphere. From the region of space just beyond the atmosphere it would be possible to discover much more about a great deal of what goes on inside the atmosphere itself and on the earth—including matters of immediate practical interest such as the weather and radio communications. Space is large and satellites are small. The handful that the Americans and Russians have launched so far have not done much more than prove the soundness of preliminary scientific calculation about their probable behaviour.

Satellites themselves cost comparatively little and are potentially capable of earning big scientific dividends in return. The expense lies in providing a rocket powerful enough to place the satellite in its orbit, and the cost would be prohibitive if the sole purpose were space research. But a British rocket capable of launching satellites already exists in the shape of the 2,500-mile range Bluestreak ballistic missile. To convert Bluestreak into a satellite launcher would require the addition of one or two rocket clusters mounted in place of the warhead. The cost of preparing perhaps ten to a dozen Bluestreaks in this way, to allow for the launching of perhaps half-a-dozen satellites with a margin in hand for those that go astray, has been roughly estimated at £10 to £15 million spread over several years. The first would not be ready until the early 1960s. But it will take that long for scientists to analyse the information collected during the International Geophysical Year.

This is a question of Government support for fundamental research, not for industrial development. There are signs that the Royal Society has been able to convince the Government that more could be learned from a small British satellite programme—confined strictly to the region around the earth and not attempting to fly off to the moon and planets—than could be by accepting American offers to put foreign instruments into their satellites. If so, the scales may have been tipped by knowledge that intermittent firings of Bluestreak will have to be made in any case. If the cost estimates are in any way accurate, they compare quite favourably with, for example, some of the more costly experiments in nuclear physics. But only the Ministry of Supply knows enough about rocketry to judge this, and as the driving force behind rocket development it is difficult for the Ministry to be impartial. It is at such a time, when important decisions on scientific matters have to be taken that would commit the country to a decade or more of costly experiment, that the guiding hand of a strong and impartial Lord President of the Council is most missed.

BUSINESS NOTES

THE ECONOMY

Pre-Budget Level

THERE is too much time-lag in recording economic indicators for the latest figures published this week yet to show any of the stimulus that the budget has given industry; the industrial production figures indicate nothing later than March, and the mid-April unemployment figures were also taken less than a week after the tax reliefs were announced. The index of production in March does little more than confirm the Chancellor's case for a further stimulus; it appears to have remained at about the same level, 107-108 seasonally adjusted (1954=100) that had first been reached in November last year.

The unemployment figures for mid-April—released fairly early, with the chance that this may be done regularly—seem to be rather more favourable on examination than they appear at first glance. Between March and April the numbers unemployed fell by 20,000 to 531,000, of whom 486,000 were wholly unemployed. This second figure was 15,000 below the mid-March total, a fall that is no more than would normally be expected at the time of year. But the timing of Easter, and its relation to the April unemployment count, does seem to have held the number wholly unemployed in the middle of the month rather exceptionally high. When the end of the Easter holiday and the unemployment count come within a week of each other, a fair proportion of the children leaving school will not have registered with the juvenile employment service; if the two dates are three weeks or more apart, practically all will have registered but a substantial proportion will have found jobs. This year Easter Monday was on April 1st and the count on the 13th; so an unusually high proportion of the youths and girls who came on to the labour market at Easter appear to have been on labour exchange books: some 13,000 at the time the count was taken.

The effect of this further complication in the already shaky exercise of seasonal adjustment is roughly that the change from March to April was probably better than seasonal; but that one should correspondingly reckon on more than the usual seasonal decrease between April and May.

OIL

Living with Iraq

ONLY two new points appear to have been agreed firmly between the Iraq government and the oil companies operating in Iraq—IPC, Basrah, and Mosul—at their discussions last week. The companies agreed that any incidental surpluses of refined products from the government's refineries of Daura, Qaiyarah and Muftiah, "operating at their existing designed capacity" could from now on be exported. They also agreed that the notice required for the government to choose to take in kind 12½ per cent of crude oil production as part of its 50 per cent share in profits should be reduced to "the practical minimum"; the government's option could be exercised quarterly instead of six-monthly. The Government has possessed the right to take part payment of its profits in oil since 1952: the possibility of Russian aid in establishing chemical plant in Iraq may account for its newly-increased interest.

Beyond these specific points, the commentaries of the two parties upon their discussions are recognisably, for the most part, about the same subjects, but with massive differences

in emphasis. Dr Kubba, Iraq's minister of economics, said this week, for example, that it had been agreed to double production of oil in Iraq within not more than three years: IPC said that the companies were already engaged on projects that would double their production and transport capacity by 1962 (reaching 70 million tons) " but the actual increase in production will depend on market conditions at the time." Dr Kubba added that the companies had conceded the necessity of establishing more oil refining capacity in Iraq, on a profit-sharing basis, though negotiations were going on about details. The companies commented frigidly: " Since they have no intention of participating in the establishment of oil refineries in Iraq [they] are at a loss to interpret the comments attributed to the minister."

It is fairly clear that negotiations are continuing about giving up certain of the companies' concessions in areas where exploitation of possible oil deposits has not begun. Of Dr Kubba's claims that foreign staffs in Iraq would rapidly be replaced with Iraqis, and that the companies had agreed to appoint an executive director to the IPC board in London, the companies have pointed out only that one of the two Iraq government directorships already existing on the board is for the moment unfilled, and that the question of making one of these positions on the board an " executive," probably resident, directorship, was under discussion. Nobody would pretend that the position of the companies in a country where local communist influence is so strong and Russian influence is increasing can be comfortable. But the government's desire to get more, and no doubt to achieve more obvious improvements in its share than the countries who talked away at Nasser's oil conference in Cairo, appears for the moment to be tempered with some inkling of the condition of the world oil market.

IN THE MARKETS

The Kaleidoscope

INDUSTRIAL equity prices are now slightly above the peak they touched in the hectic dealings that took place on the day after the budget. It has, in fact, taken the market nearly three weeks to recover from the sharp reaction that immediately followed that boomlet. *The Economist* indicator and the *Financial Times* index are both less than one per cent above their post-budget peaks, at 263.3 and 227.5 respectively. The market has remained active and there have been reports of buying by unit trusts but there has been an edgy character to dealings, with private investors and speculators looking for a quick turn and eager to follow up rumours.

The steady stream of bigger dividends and the promise of more to come has given investors confidence, but even so no really firm pattern has emerged. Indeed, the market has been kaleidoscopic—one moment Jaguar, the next Standard Motor, then cotton shares and then Beecham and Elliott-Automation (which are to be traded in the over-the-counter market in New York). Next week it will certainly be Granada, whose request for an official quotation is discussed on page 477. But the sudden quirks of fancy that now characterise the market are perhaps best exemplified by recent dealings in the shares of Martins Bank. Before the week-end these shares were bid up to 25s. 6d. Then the directors issued a statement saying that they had no present intention of issuing new capital and surprisingly thought it necessary to add that they had no knowledge of a merger or similar transaction concerning the bank. The price of the shares is now back to 21s. 9d. When the directors of a bank become concerned at the market activity in the bank's shares it is a sign that speculation is rife and that dabblers may be in peril.

THE FUEL MARKET

Oil Goes on Up

SALES of fuel oil last year were more than half as large again as in 1957 and 62 per cent higher than in 1956, which affords a rather better comparison ; and in January and February this year they were running about 45 per cent higher again than at the beginning of 1958. In an economy where the total level of industrial production has hardly changed, they have doubled since 1955.

The biggest single element in the increase of 3,700,000 tons in fuel oil deliveries between 1957 and 1958 was the growth in use of oil under power station boilers—from some 640,000 tons to 2,635,000 tons. The power stations are at present taking oil at the rate of well over four million tons a year. The gas industry, also, more than doubled its purchases of fuel oil, and its total purchases of oil reached 665,000 tons. Much of the gas oil it consumes is used for carburetted water gas and other peak load supplies ; but a growing amount of its oil consumption and of the gas it obtains from refineries are directly at the expense of coal that might otherwise be carbonised, just as the fuel oil that power stations use reduces their purchases of steam coals. Right across industry, the switch shows: last year, with total fuel purchases in the main industrial groups down by 5 per cent, their purchases of oil rose 17 per cent, to close on a quarter of the total. In iron and steel, for example, where production fell sharply, coal purchases were cut 20 per cent, while the amount of fuel oil used rose by another 10 per cent.

Nor is this competition by any means confined to the factory. Oil deliveries for central heating, too, rose nearly 50 per cent ; moreover, sales of burning oil, which rose from just under 800,000 tons in 1957 to well over 1,100,000 tons last year, mainly reflect the rapid increase in the use of paraffin heaters in homes where central heating will take years to percolate. These heaters vie with coke central heating in providing a cheap therm of heat; gas, electricity, and the open fire cannot normally touch them on price.

Coal Stays on the Ground

IN the first four months of this year the National Coal Board has managed to reduce its production by about a quarter of the 9 million tons by which it planned to bring the 1959 total down below 1958. Allowing for the time that it takes marginal mines to close, and opencast contracts to run out without being replaced by new ones, this reduction in output may be about on schedule. Output is now down to some 250,000 tons a week below the rate in April, 1958, so that it might be possible even to bring it down a little more than was planned.

Unfortunately for the board, its sales have fallen away even more—by over 5 million tons so far, against the cut of 2¼ million tons in output. This is not so much a question of passing its " ceiling " of stocks. At the end of last year it had 19 million tons in stock ; over this year, it said it was prepared for a rise of 3 million tons more. But that was from end-December to end-December ; the board did not

set any ceiling above which stocks should not be allowed to rise at any season in the year, and one would normally expect them to be higher in the summer and autumn than by the end of the year. But the main worry for the board in the falling consumption that has already sent stocks up to 22 million tons is that in a period when industrial and economic activity is said to have been slightly higher than the 1958 levels, coal consumption has again been down by 7½ per cent. Warmer weather will have had something to do with this ; in the first 15 weeks of the year the average temperature has been 2½ degrees higher than a year ago. So may general economy in using fuel. But oil will have had most to do with it. And even if there should be a chance of reducing output this year by a little more than the 9 million tons already planned, the board could be facing a considerably larger fall in its sales at home and abroad, unless reflation pulls up total fuel consumption soon and then rapidly.

CREDIT EXPANSION

How Much More?

THERE is still no sign of change in the trend of bank credit. In the four weeks to mid-April advances of the clearing banks rose by £61 million (£49 million after deducting known extraneous items). Liquid assets rose by £39 million, and the increase in advances again had to be financed by selling investments (£44 million in April). Since the lifting of the credit squeeze in mid-July, advances have now risen by more than £500 million, a rise of over one-quarter. In the same period, the hire purchase debt has probably risen by £170-£190 million, or about one-third.

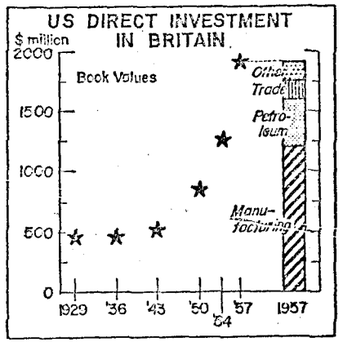
The banks' gilt-edged investments have been run down

Dollar Investment Both Ways

THE Chancellor confirmed this week that new official figures are to be prepared, from direct inquiries, of movements of private capital into and out of Britain. Meanwhile, some illumination of Mr Amory's striking statement that recent dollar investment in Britain has probably been fully matched by Britain's investment in North America is possible from United States and Canadian sources. The United Kingdom figures, in the regular white papers on the balance of payments, give only a broad regional breakdown of the whole dollar area (which includes many Latin American countries). These show an inflow of private capital of £16 million in 1956, £64 million in 1957 and £84 million in 1958—but the figures embrace unidentified short term capital as well as the tantalising balancing item. Interest, profits and dividends show a net credit for Britain with the dollar area of around £10 million—before taking account of the £40 million paid by Britain on the North American government loans. But the balance of investment earnings reflects the past rather than what is happening now.



US DIRECT INVESTMENT

Full information about direct American investments abroad is given by the US Department of Commerce, in its Survey of Current Business. Its latest figure for Britain, at book values, is $1,899 million (£678 million) at end-1957. The total has more than doubled in the fifties; as a focal point of the sterling area, the imperial preference system and OEEC trade and currency arrangements, Britain has attracted new American capital faster than most countries, and in total US direct investment it is outranked only by Canada and Venezuela. In 1957 the accretion was no less than $287 million. This is unlikely to have been maintained in 1958, but the much publicised acquisitions of recent months have quickened the pace. Britain's direct investments in the United States are not of this order ; but they are important. In 1957 British holdings rose by $100 million, out of a total increase in foreign investment in the United States of $240 million. All these figures include reinvestment of current earnings. In 1957, American companies in Britain earned $326 million, of which two-fifths was undistributed. These funds ploughed back represented 45 per cent of the growth in the total.

No comparable detail is available of American figures of portfolio investment. The nearest figures do reflect the increase of American buying of Continental shares in 1958, but not of British shares. There has certainly been a quickening in 1959. At the same time, purchases by UK investors of United States securities have fallen off. Since mid-1958 Britain has been a fairly persistent net seller on Wall Street.

United States investors, therefore, are adding to their assets in Britain considerably more than British investors are increasing their stake in the United States. But the balance is *the other way in Britain's capital* transactions with Canada—noted to a fine degree of detail by Canada's all embracing financial statistics. Of total foreign investment in Canada of Can $17 billion, Britain owns $2.9 billion, of which the greater part is still in portfolio securities. Between 1952 and 1957 Britain provided an average of $200 million a year in all—and there was virtually no offsetting Canadian investment in Britain. Since 1957 Britain's purchases of Canadian securities have fallen off, but its direct investment has risen.

by £320 million, since September. The authorities have eased the strain on the market, but on balance their operations have not provided the banks with the necessary liquidity to allow them to go ahead without worry. In March, liquidity ratios at two of the clearing banks, Lloyds and Williams Deacon's, dipped below 30 per cent. They have now edged above it, thanks to sales of investments—which at Williams Deacon's have cut the portfolio from £38 million to £31 million. The banks' average liquidity ratio is still only 31.2 per cent. Provided they make due use of the gilt-edged market to finance their needs for below-line spending, the authorities are in a position to exercise the traditional restraint on credit expansion if they care to do so.

OVERSEAS TRADE

Deficit with Sterling Area

THIS year Britain has been selling more goods to the industrial countries than it did a year ago, and buying rather less from them. But the balance of trade with the primary producing countries has deteriorated sharply. Imports from these countries have risen, particularly of foods at somewhat higher prices, while exports to them have continued to fall owing to the earlier decline in commodity prices. First quarter exports (including re-exports) to all countries amounted to £275 million a month, £9 million less than in the first quarter of last year, while total imports rose by £5 million to £314 million a month. The increase in the apparent trade deficit of £4 million to £29 million a month was wholly with the primary producing countries, the balance of trade with the sterling area changing from a surplus of £10 million a month a year ago to a deficit of £13 million a month in the first quarter of 1959. Imports from the sterling area rose by £5 million to £124 million a month, while exports fell by £18 million to £111 million a month. Total exports to Australia, Britain's largest sterling area market, fell by 14 per cent to £17.6 million a month while shipments to New Zealand were almost halved at £7.4 million. The only improvement was to the relatively

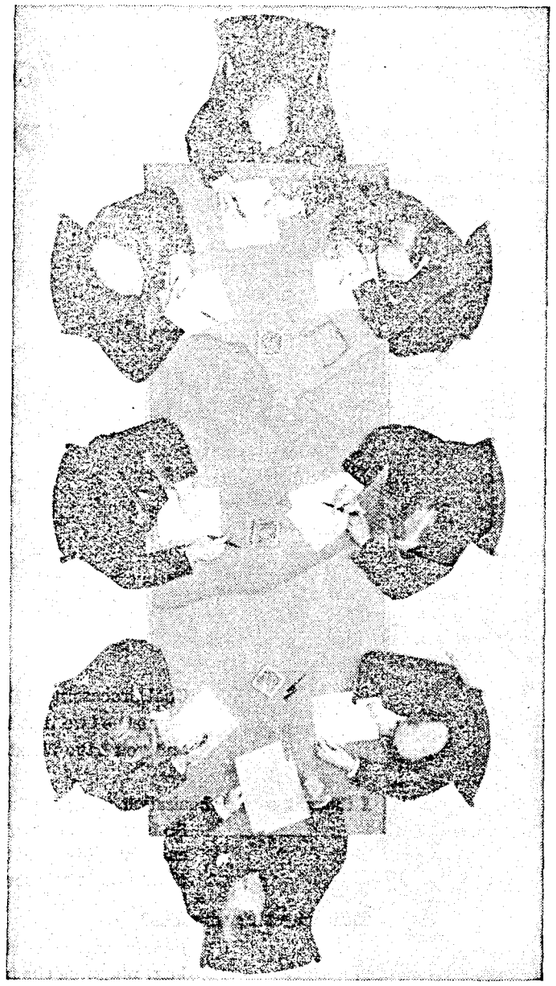
small markets of Ghana, Pakistan and Ceylon, and to some colonial territories. The recovery in commodity prices, which is not yet reflected in British import prices, is now raising the purchasing power of some of Britain's largest customers, particularly the wool-growing dominions of Australia and New Zealand. It will be some time before this improvement is reflected in British exports, though it may help to stave off any serious further fall.

Shipments to the United States were not affected by the general decline in British exports to industrial countries last year, and this year they have accelerated again, amounting to £28 million a month in the first quarter, over one-fifth higher than a year ago, while shipments to Canada rose by three per cent to £13.8 million a month. Exports to Western Europe were only one per cent higher at £76½ million a month. Exports to Germany, now one of Britain's largest markets, rose sharply by 14 per cent to £12½ million a month, and exports to Italy, Holland and Denmark were also up. But exports to Belgium fell sharply by 17 per cent to just over £5 million, while exports to Norway fell by one-fifth to £4.6 million.

EXPORT CREDITS

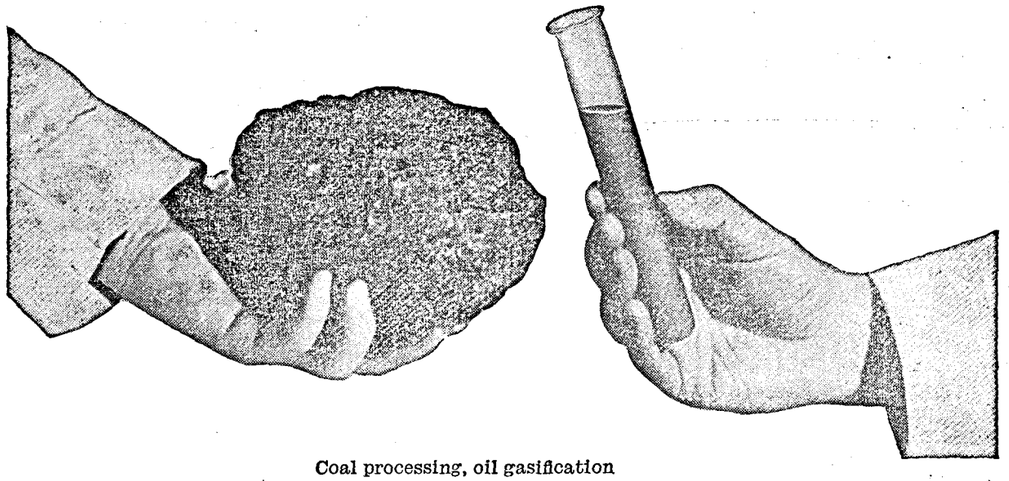


Retreat but No Rout

WHILE total British exports fell in 1958, shipments covered by the Export Credits Guarantee Department rose by 10 per cent in the year to end-March ; they comprised 16 per cent of all British exports (and in the March quarter 18 per cent) compared with 14 per cent in 1957-58. But Mr L. F. Menzies, the secretary to the department, would himself accept that greater public use of the ECGD cover brings risks as well as premiums. The department again achieved a trading surplus, and its cumulative reserves rose to £15.2 million on ordinary business and £2.9 million on the Section 2 "national interest" business. But premiums of £5.8 million were not themselves sufficient to cover payments on claims of £7 million. These were swollen by one huge (and unspecified) loss of very nearly £5 million. This loss moreover was from insolvency and default, and it must be largely written off. The big Brazilian losses of 1952, by contrast, arose from transfer difficulties, and the recoveries have recently kept the department out of the red. They are now tailing off. At the same time, the department bears an increasing forward risk on its medium term business, which in the past year accounted for three-fifths of premium income.

A year of world recession bore obvious dangers for ECGD, and for the basis of world export trade as a whole. One can look back with relief. Credit terms have progressively lengthened ; that is regarded as inevitable. But co-operation within the Berne Union has kept the process, as Mr Menzies puts it, to a rearguard action ; the retreat has never degenerated into a rout. The one case in which ECGD itself went beyond five years from shipment was "deceptively simple"—the matching of seven year credits offered by the Export Import Bank, which is not a full member of the Berne Union, for heavy jet aircraft, which are not yet manufactured by competitors in Europe. Other cases could be much more difficult. Often the right remedy, for borrower and lender alike, is not long term credits but an international loan ; and in practice, the increasing contributions made in this form in 1958, whether from governments in the Indian operation, from the World Bank or from private investors, may claim much of the credit for preventing a ruinous export credit race.

Mr Menzies has announced certain improvements in the department's facilities. Policyholders who cover their business for three years rather than one are offered rebates in premium up to 5 per cent ; and the department's organisation is being streamlined to permit branch managers to fix terms of credit granted to many buyers without reference to headquarters.



Better work in comfort

Picture yourself in a modern boardroom—all boredom gone. Think how much more clearly you could concentrate in a chair so comfortable you're unaware of sitting in it. Think how much more easily your imagination would flow in imaginative surroundings.
Think about it no longer. Get in touch with Heal's Contracts and let them furnish you with their latest ideas on making working conditions more comfortable. Or alternatively, come and see the special exhibition of office furniture now on show on Heal's third floor.

Coal processing, oil gasification
—put the two into focus
and you have Woodall-Duckham.

I thought coal carbonisation was your forte—had been for years?

So it is. Two out of every five tons of coal carbonised in Great Britain today are processed in plants built and serviced by Woodall-Duckham.

Then why oil gasification?

Because a progressive firm doesn't rest on its laurels; it's too busy planning the future. Gas from oil is becoming as important as gas from coal. So that is why Woodall-Duckham now build oil gasification plants—Shell process or Hall process.

Do you mean that coal processing is going out?

Certainly not. Coal processing provides the essential coke for steel making. Then there's town gas production; the bulk of the country's supply is still made from coal—either in the traditional way or in one of the newer plants for complete gasification.

So you make the most of your opportunities?

We make the most of oil and coal, if that's what you mean.

THE SMALL INVESTOR

"Everyman a Capitalist"

No democracy could be completely "property owning" unless the small saver has some opportunity to own industrial ordinary shares. So far, the Government has made approving noises rather than commit itself to any action; the budget offered no relief of stamp duty for small investors or large. A Conservative committee headed by Sir Toby Low, MP, has published a scheme* for encouraging small investment in securities, not as an official party pronouncement but with the intention of stimulating discussion. It may thereby serve a purpose, but it is hard to believe that in its present form it could become a plank in an election platform.

The scheme attempts to blend the principles of unit trust investment with the privileges accorded to national savings certificates. It envisages the creation of Industrial Investment Certificates, representing a unit in a mixed bag of fixed interest and equity securities. These certificates would have a maximum life of seven years and initially no investor could hold more than £500 of them. They would be sold by a variety of institutions, including banks and insurance companies, under regulations stricter than those that now govern unit trusts. Dividends and interest received on the portfolio and paid out to certificate holders would be tax free and no stamp duty would be paid on the purchase of underlying securities. Sixty per cent of the annual income of the fund would be distributed each year and the remaining forty per cent distributed only on maturity; premature encashment would also be discouraged by the clawing back of tax.

The costs of running such a scheme are bound to be high and it is difficult to believe that institutions dealing in competing and less privileged savings media will be persuaded to co-operate in prejudice to their own business. These are practical objections, but there is an even more important one in principle. Why seek for tax exemption on the lines of national savings certificates? Competing savings media, such as the unit trusts, will certainly demand similar concessions. To extend a dubious privilege which is most potently enjoyed by the surtax payer will hardly help the little man. The object of a property-owning democracy is not to make certificates attractive to those who pay high rates of income tax and surtax. Nor should it be to prejudice the free decision of the holder if he should want to sell within seven years; what is the virtue of seven years anyway? The certificates might be powerful competitors to other forms of savings, but they would hardly attract the £10 or so of the man who does not have to pay much tax. If the aim is to tap these new sources of savings for equity investment the first job is to ensure that the small investor receives without delay the tax relief on his dividends to which he is entitled, without handing out something big to the man who pays 17s. 9d. in his last pound. That is a job to be worked out through PAYE, not through another tax-free contrivance.

AIR TRANSPORT

One European Airline?

THE fact that the Dutch airline, KLM, has walked out of talks being held by the five national airlines of the Common Market countries does not necessarily mean that the idea of a single "European" airline is now dead. The chances of the four remaining operators, Air France, Sabena, Lufthansa and Alitalia, agreeing among themselves to pool resources now look slim. But the incentive to co-operate remains as strong as it did before the withdrawal of KLM.

The size and cost of a modern jet airliner has grown to a point where these become difficult to fit into the operations of any medium-sized airline. Some of the smaller European carriers now find themselves trying to compete on the North Atlantic with token fleets of two or three jets against bigger operators that have staked huge sums on fleets running to 20 or more in a major effort to increase their share of traffic on this, the most lucrative route of all. The sensible course would be for the smaller operators to pool their jet fleets and run a common North Atlantic service from a common maintenance base. But they have ordered too many different types, some with American, some with British engines, for a common maintenance pool and as the recent talks have shown, it is not easy to get agreement on the proportions in which potential traffic should be divided among the participants in the pool. This disagreement, coupled with a realisation that KLM has probably more to gain by going it alone, is the reason why the Dutch left the talks.

But jet aircraft will soon also be introduced inside Europe and on shorter routes to the Middle East, providing another opportunity for pooling fleets, though the incentive to do so is less strong than it is on the North Atlantic. Two airlines outside the Common Market area, Swissair and the Scandinavian SAS have already worked out an agreement of this kind, pooling their fleets of jet Caravelles, Convair 880s and trans-Atlantic DC8s, with arrangements to specialise in the maintenance of particular types.

The bigger, more efficient airlines have nothing to fear from this kind of rationalisation among their smaller competitors. If, however, the smaller operators consider pooling their traffic rights as well as their aircraft, the effect might be more serious. There has already been a move in Europe to consider treating the whole region as a single traffic area, just as the United States is treated as a single area for bargaining purposes. This could force the Americans to give European airlines as many landing points in America as American airlines have in Europe—where they now negotiate separately with each government and get by far the best of the bargain.

WAGES

Bigger Firms, Better Pay?

FOR the first time the Ministry of Labour has looked at the results from its half-yearly survey of hours and earnings in manufacturing to see how these vary with the size of the firm. From an examination of men's pay last October, it seems that in about three-quarters of manufacturing industries the highest average hourly earnings are paid by the largest firms employing 500 wage-earners or more and the lowest earnings by the smallest firms employing fewer than 25 workpeople. Since, more often than not, the smaller firms work a slightly shorter week, the difference is likely to be accentuated between the actual take-home pay packet from the larger and the smaller firm.

However, this does not mean that a man necessarily does better in a big firm. The pay figures are averages for all male manual workers and it may well be that the larger

* Everyman a Capitalist. Conservative Political Centre. 1s.

firms tend to employ a higher proportion of skilled workers. They may even employ a different kind of labour altogether: although a hundred or so manufacturing industries are

AVERAGE HOURLY EARNINGS
(Pence)

Industry	Number of wage-earners per establishment: Under 25	25–99	100–499	500 & over	All establishments
Motor vehicles & cycles	59·5	63·2	70·1	89·0	86·0
Chemicals	57·3	60·4	65·6	72·1	68·2
Iron and steel melting, rolling, etc.	61·8	67·3	69·9	76·9	75·6
Machine tools	72·6	72·8	70·7	75·5	72·7
Printing & publishing	67·0	72·7	80·3	105·0	92·8
Woollen and worsted	58·6	55·8	56·4	55·8	56·2

identified in this survey, a single category can cover a wide range of work. Among the industries where higher pay is not associated with larger firms are some, such as marine engineering, wireless valves and cotton spinning, in which no clear trend is discernible. But there are others in which the smallest firms pay most, notably locomotive manufacture, woollen and worsted, jewellery, and some of the dress industries. With the exception of the first, these latter industries tend to be those employing predominantly women.

This is a useful new analysis of earnings. But it still deals in aggregates, even if more refined ones. What is still lacking is a measure of the range of individual pay packets—a count of how many people earn much more and much less than these impressive but tantalising averages.

NEW CARS

The Triumph Herald

It is not often that two manufacturers produce answers to the question of what the public wants so close to one another as the Triumph Herald saloon unveiled last week by Standard (though not yet generally available), and the Austin A40 offered since last autumn by BMC. In passenger accommodation the two cars are practically identical though the A40 makes special provision for luggage, and both are powered by 4 cylinder engines of 948 cc. According to the authoritative road tests carried out by *The Motor*, the performance figures, and the figures of fuel consumption, are so close to each other that there would probably be no more difference between an A40 chosen at random and a Herald, than between two A40s chosen at random. In appearance, both are handsome cars with Italian lines, though the A40 is perhaps the more pleasing of the two.

The Herald has four notable features, two entirely new in the design of popular British cars:

A turning circle of 25 ft., which is three-quarters of the A40's—a considerable advantage for parking, though slightly offset by 9 in. greater length of the Herald.

Independent rear suspension, which many Continental but no British standard cars possess. This may be accounted rather a talking point for motorists than one which would make much difference to most of the users of the Herald. In some export markets, and to highly enterprising drivers anywhere, however, it will be a valuable feature. It carries the disadvantage that it may lead to more body noise.

The third feature is the elimination of all chassis lubrication—a welcome reduction in the chores which the owner must execute in person or by proxy.

The fourth is the use of a separate frame to achieve structural strength, instead of diffusing the loads all over the body, and clever design that at many points lead to body pressings being joined to one another by bolting instead of welding. This will considerably reduce the prospective costs of repairs to damaged body-work and certain motor insurance companies have already quoted specially low premiums for the Herald.

The price of these important features which distinguish the Herald from the A40 is a 10 per cent penalty in weight, plus a penalty in cost; the difference in the home retail price between the two cars is also precisely 10 per cent. If competition became really fierce, BMC, building the engine of the A40 on a manufacturing installation designed for an output of upwards of 1,000 such engines a day, and enjoying other advantages of scale in production and in distribution, could probably afford to sell the A40 at a price 15-20 per cent lower than the Herald. This car will cost more than £700 including tax; if it is eventually to replace the company's Eight and Ten, at about £610 and £625, it may indicate that Standard is deliberately moving out of the cheapest range of competition.

INSURANCE

More North American Losses

Underwriting losses in North America are still cutting deeply into the profits made by British insurance companies at home and in other countries overseas. The root of the trouble is motor insurance in the United States. Increases in rates have been obtained in some states and are under discussion in others. But they came too late to affect last year's figures and the accounts of the composite insurance companies, most of which have a big American business, show little improvement on the very poor 1957 results. The Alliance, with a relatively small stake in America, has as usual made money from fire, accident and marine underwriting. Its net profits excluding interest rose from £290,000 to £443,000 last year, and its dividend has been raised from 18¾ per cent to 21¼ per cent. But the Liverpool and London and Globe (the main partner of the Royal, which is the biggest British group in the non-life field and which has by far the largest stake of all the British offices in North America) has had another lean year.

The withdrawal by Yorkshire Insurance from the American market, which was announced last December, is reflected in the fall in its non-life premium income from £18 million to £13¾ million. The severing of the unprofitable American connection, which in 1957 accounted for a quarter of the total premium income, has been effected without capital loss but pension contributions and other expenses of the sale cost £424,000 and this reduced the amount realised to £1,900,000. As the proposed new issue will bring in another £1,170,000, the Yorkshire will thus soon have about £3 million available for employment "in the company's existing business and in extending it." Last year's reduction in its net non-life underwriting loss was offset by the fall in the interest income which resulted from the sale of the

BUSINESS IN EUROPE

A very important stage has been reached in the formation of the European Common Market. Through our European services, we can keep you abreast of events and show how they are likely to affect your interests.

THE ECONOMIST INTELLIGENCE UNIT LTD.
LONDON: 22 Ryder Street, S.W.1. (WHitehall 1511)
NEW YORK: Lincoln Building, 60 East 42nd Street. (Murray Hill 2-6195)

Over 3,000 miles between you and your most promising market could certainly offer plenty of scope for misunderstanding, frustration, and 'unavoidable' delays. That is what you might expect, unless you knew something of the way TCA services link Europe and Canada. Any day, any week, a relaxing over-night flight can place you in the heart of Business Canada. No need to lose any sleep over the competition. TCA has daily services to all Canada—so you can bring the personal touch to developing new territory in next to no time. Goods can get there quickly too, with daily TCA Air Freight to any part of Canada direct. So it's goodbye to distribution problems too.

FLY TCA—DE LUXE CLASS
Relax aboard a giant TCA Super G Constellation. Take it easy on fully reclining seats. Enjoy good food and drink and wonderful service. And it's more than possible that you'll meet some of Canada's many business men who always travel TCA.

THE LABOURS OF HERCULES

THE SEVENTH LABOUR

THE MARES OF DIOMEDES

A pretty problem for Hercules of old that seventh Labour! Even the ancient world had its need for transport, and not least, as you will recall, King Diomedes who kept a stable of especially fine mares. Only one little thing, of course: those mares had the gentle habit of man-eating on the side, and Hercules had to cope with this. But he yoked them to his chariot in short shrift.

Maybe we figure that we have harnessed our transport problems to-day. And so perhaps we have. But fresh problems crop up as a direct result. Making road-marking paints that stay put for example, and special adhesives for coachwork on multi-horsepower chariots. Prominent in his extensive chemical armoury, the modern Hercules has the weapons for these tasks.

For road-marking, he'll tell you of special synthetic compositions involving Pentalyn 802A or Ethyl Cellulose; for adhesives, of a group of versatile Dresinol Resins Emulsions, or perhaps certain speciality resins themselves.

ONE GREAT CUMBERLAND PLACE · LONDON · W.1.

American subsidiaries. Its dividend has, however, been increased from 97½ per cent to 105 per cent.

The Pearl, with a non-life premium income of £10¼ million last year, is not heavily committed in the North American market. But though its underwriting results were materially better than in 1957 they were still in the red, largely as a result of losses on American business. With total assets of £275 million the Pearl is one of the big life offices and is exceeded in size only by the Prudential and the Legal and General. Last year it put its new money largely into house purchase mortgages and loans to local authorities (£7 million), near gilt-edged stocks (£5 million), debentures (£4 million) and equities (£5 million); but its stake in British Government securities fell by £10 million and now accounts for 25.3 per cent of total assets, compared with 30.6 per cent at the end of 1957. Its tax-free dividend has been left unchanged at 70 per cent.

RETAIL TRADE

Dissent on Stamp Trading

ALTHOUGH stamp trading is both long-established and widespread in the United States, where it began some seventy years ago, it has not yet caught on to any appreciable degree in Britain: the 14 companies now operating stamp trading schemes here probably account for no more than two or three per cent of all retail sales at most. But this method of price-cutting is increasing here; and the prospect of its becoming a major factor in British retailing has already caused considerable alarm to at least one retail trade association. This association, the National Chamber of Trade, recently issued an "information booklet" condemning stamp trading in forthright polemical terms, and advising its members and the public to have nothing to do with them.

Trading stamp companies operate by selling a book of stamps to the retailer, who then gives the stamps to his customers, usually one stamp for each sixpence worth of goods purchased. The retailer pays £1 for a book of stamps sufficient for about £50 of goods; in other words, the scheme costs him about two per cent of his turnover, although costs vary between companies from about one and one half to three per cent. Customers with the patience and energy to save one or more books of stamps can then receive gifts of merchandise from the stamp company. Assuming that retailers do not raise their prices, the customer thus receives an effective price cut and the retailer hopes to gain enough trade to offset the two per cent turnover from his non-stamp-giving rivals, who would then be the only apparent losers in the game. The stamp companies, operating a sort of advertising business plus a quasi-retailing trade grafted into normal retailing, probably do best of all.

The National Chamber of Trade's report strongly deplores stamp trading (and all other forms of cut-price trading), arguing that traders will lose money, that customers will pay more for their goods, and that only the promoters stand to gain. There is some truth in these statements, but probably not much. Traders will lose no more money through this form of price-cutting than another; the moment it becomes too expensive they will no doubt drop it, and return to conventional price-cutting, if not to uncompetitiveness. Should all retailers adopt stamp trading schemes, prices would probably rise slightly to cover their cost; but competition should keep this to a minimum, and most price cuts—in supermarkets, for example—are now paid for by quietly "loading" other prices. The stamp traders will profit from their activities, certainly; provided they give value for money, why not? The one thing which is most certainly true about stamp trading is that the actual savings to the consumer are not as great as they are made out to be: but this is true in many, if not most, aspects of retailing.

TANKERS

Submarines in Cold Water

OPTIMISTS about submarine tankers gained no encouragement from a lecture given last week by Mr J. A. Teasdale of the Furness Shipbuilding Company. Comparing a nuclear powered surface tanker with a nuclear powered submarine tanker, both of 47,000 tons, he conceded that a submarine, on the most optimistic assumptions, might need about 20 per cent less power to achieve the standard speed for surface tankers of 15.75 knots, and about 30 per cent less power to do 20 knots, the improvement in efficiency rising with speed. It is most unlikely that the submarine could convert these advantages into lower costs.

If a 47,000 ton example was built with the type of hull that gives the greatest efficiency—circular in section—and a diameter/length ratio of five, its diameter would be 108 feet, and the draft, when surfaced, no less than 90 feet. About 45 feet is the limiting draft that can eventually be expected of ocean terminals or the Suez Canal, so such a craft of that type would involve the construction of special terminals: apart from being confined to the Cape route to the Middle East it would probably have some difficulty in navigating the narrow seas around Britain. If an elliptical hull were adopted to reduce the draft to 45 feet, efficiency becomes less than that of a surface tanker, because the skin area is so greatly increased—from 125,000 square feet to 204,000 square feet. But, as the elliptical submarine would be 160 feet wide, it might in any case introduce some problems of its own in canals or terminals.

All these comparisons are assuming similar machinery; but the actual choice is between a conventionally powered surface tanker and a nuclear-powered submarine. The operating costs of the Nautilus are ten times those of a conventional submarine; the latest guesses suggest that the operating costs of a nuclear power plant might be reduced to 10 to 40 per cent more than those of a conventional unit. A 20 to 30 per cent reduction in drag, balanced by higher capital costs and such great operating difficulties, is unlikely to offset this rise in propulsive costs. Much more knowledge about the operating costs of nuclear power plants is needed before their economic potential for marine propulsion can be established.

ITALIAN AIRCRAFT

Fiat's Success

WHILE the aircraft industries of Britain and France are declining for lack of military orders, a plum military contract has been won by a company making its first serious venture into aircraft design since the war. The Italian Fiat company has walked away with the competition for a light ground-attack fighter for Nato. The designs were

submitted in 1954, and in 1957 the prototype aircraft were tested by Nato pilots. The outcome is that Fiat is certain of orders, backed by American funds, for 150 aircraft that are nominally to be divided between Italy, France and Germany, and is receiving American orders for another 50, possibly to be increased to 100, which the United States will give to the Greek and Turkish air forces. The first squadrons of these new Fiat G. 91 aircraft with Bristol's Orpheus engine have already been formed in Italy.

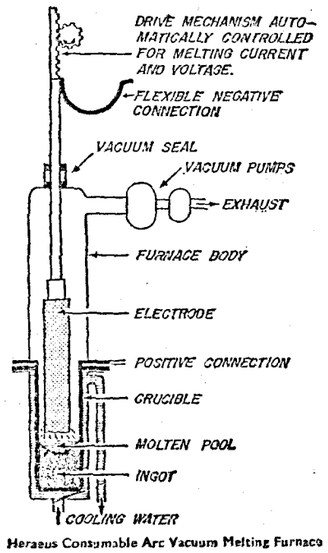
British and French aircraft designers may well ponder the moral that Fiat almost certainly won the contest by not attempting to be too clever. Nato did not ask for a classical interceptor fighter, which is what the other competitors provided, thinly disguised for the ground-attack role. Ground-attack calls first for an aircraft strong enough to resist the rapid inroads of metal fatigue ; secondly for ability to carry quite heavy loads, including tactical atomic weapons ; and thirdly, in the case of the Nato competition, ability to take off and land on 600 yards of grass. The Fiat's competitors had dazzling performance but could not make the humble grade.

By comparison the Fiat aircraft is slow ; it flies a little below the speed of sound but it can do so at heights of only 500 feet above the ground, which is a formidable performance for a heavily armed machine. The result is that Fiat, which largely subsidised its aircraft division out of other engineering activities, has captured orders that are sizable by today's standards and which would have kept the wolf from the door of many an aircraft manufacturer now fighting for existence. This is especially true in France, where the Fiat order is poorly regarded: the fact that Western Germany is arranging to build the G.91 and its British engine under licence is particularly galling. In this country the Folland Gnat might have had a much brighter future if the company had been prepared to re-engineer it from a fighter into a ground-attack aircraft or light bomber.

TELEPHONES

Answering Robots

Two new telephone answering machines—which will take a message when the subscriber is not there—have recently been introduced to the British market. These are the Ansaphone, made by Southern Electronics, and the Telephone Answering Machine, built by Gate Electronics. They are much smaller and cheaper than the type of answering machine previously available ; the Ansaphone is comparable in size with the tape recorder which it superficially resembles. It costs 27s. 6d. a week on a five-year rental contract, or 22s. 6d. on a seven-year contract. The TAM is a larger machine, with three hours' recording capacity, compared with half an hour on the Ansaphone. It costs 35s. a week on a five-year contract ; with both machines the cost of servicing is included in the contract, and because of Post Office regulations outright sale is impossible. All machines which are connected to telephones have to meet the approval of Post Office engineers ; and, though this may add to the development cost of the equipment, it does ensure the soundness of the machines put on the market.



These machines compete with the existing telephone answering services that operate in London—there are also small companies in the provinces, and the two large London companies will soon extend to Birmingham. The charges of these two companies are rather less than those for the machines ; they vary widely with the service provided, but the highest charge of Answering Ltd. is 21s. 6d. a week for a 24-hour service answering the client's number. Telephone Answerers charge 19s. 6d. a week for a similar service, but only the first 120 messages a month are free.

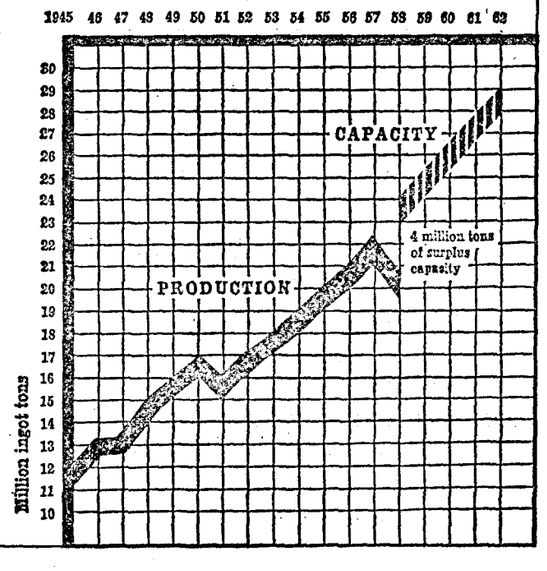
The makers of the machines claim that they are more than a means of answering the telephone ; they provide a simple method of recording messages, and it is suggested that this

Melting the Newer Metals

New technologies, such as nuclear and gas turbine engineering, demand new materials ; and some of the new materials need special forms of processing. Neither titanium nor zirconium, for example, can be melted in the presence of air, because both are made brittle by the gases they absorb from it when hot. Production of ingots, therefore, must be carried out by vacuum melting techniques, and they have also been applied to older-established metals. Certain steel alloys, for example, especially those containing titanium and aluminium, gain in strength from the absence of gaseous impurities that vacuum melting makes possible, and for some it is now considered essential. Most of the metals and alloys produced in this way can resist high temperatures and are used in gas turbines or aircraft, where cost is a secondary consideration.

Vacuum melting was first used in Britain to produce magnetic materials ; in the last five years its use has extended to the new metals and alloys. The Telegraph Construction and Maintenance Co., ICI, William Jessop and G. L. Willans are the only companies with commercial scale plants. Though demand for titanium, at any rate, has not developed on the scale that was hoped, the melting crucibles have obtained some employment on other metals. The type of consumable arc melting furnace illustrated, which is used by ICI and Jessops to produce either titanium, zirconium or steel alloy ingots, is of German design ; it operates by melting the consumable electrode, formed of a compacted metal powder, by producing an arc between it and a small charge of refined metal at the bottom of the crucible. As the electrode melts, an ingot gradually forms at the bottom of the pot of molten metal: the electrode is raised so that there is a constant distance between its tip and the growing ingot.

Heraeus Consumable Arc Vacuum Melting Furnace



£1,000,000,000

A thousand million pounds in fifteen years. That's what the companies in the Steel Industry are spending on new plant.

Result for Britain—cheap steel, plentiful steel, from one of the most efficient steel industries in the world.

Should Steel expand faster? This graph gives the answer

It shows Steel production and planned capacity—1945-1962

Issued by The British Iron & Steel Federation

may be their chief utility to a business—especially where many orders are received, or many salesmen's reports. So far as the Post Office is concerned, less revenue will be lost from unanswered calls, but calls may tend to be shorter because messages need not be written down.

INDUSTRIAL RESEARCH

Farming Out Research

NEARLY ten years ago, at the request of the Institution of Chemical Engineers, the Advisory Council of the Department of Scientific and Industrial Research set up a committee to review the needs and existing facilities for research in chemicals in Britain. The committee reported in 1951 that while the existing facilities for research were not inconsiderable, they seemed inadequate for the extensive demands of this constantly-changing industry; it went on to recommend that a central organisation be set up to do basic research for the industry, and to collect and interpret information already available within the industry and ensure its distribution to those who might profitably use it. This report met with prompt dissent from the industry's two biggest trade associations, the Association of British Chemical Manufacturers and the British Chemical Plant Manufacturers' Association. Both argued that there was no evidence, as far as larger firms were concerned, that a lack of adequate data was holding back engineering design; and that the need for smaller firms was to apply existing information rather than to conduct new research.

Accordingly, the two Associations set up an advisory service, composed of members of each group, to advise member firms where to go with their chemical engineering problems, to report to both associations on gaps in chemical engineering knowledge and to suggest how such gaps could best be filled. So far about 200 inquiries have been handled by the advisory service in its first capacity. The second, locating the best directions for future research, involved canvassing members of both groups, with the result that distillation was selected as the field in which there appeared to be the greatest need for future research. Although a great deal is known about distillation, it is such an important and expensive fundamental operation in many chemical processes that even minor economies arising from better design are important.

Subsequently an expert panel from the industry drew up a list of six research projects in distillation, and research contracts of up to three years financed by the two Associations were negotiated with six universities for the work. The first report on this research has now been published; another panel is now at work in the field of liquid/solid separation, and other panels will follow if, as and when they are needed. Certainly the cost of the work in distillation—a total of £10,000 for the six projects recommended for a period of three years—seems tiny: if this is the measure of the work that the industry needs done co-operatively, it would certainly not justify any co-operative research association.

SHORTER NOTES

In the article, "Another TV Merger," in our issue of April 4th it was incorrectly stated that the trade marks "HMV" and "Marconiphone" had been bought by Thorn Electrical Industries. These trade marks in fact remain the property respectively of The Gramophone Co. Ltd. and The Marconiphone Co. Ltd., wholly owned subsidiaries of Electric & Musical Industries Ltd. Thorn manufactures domestic television and radio broadcast receivers under these marks for British Radio Corporation Ltd., which company is duly authorised under the Trade Marks Act "to make permitted use of the marks thereon."

* * *

The National Association of British and Irish Millers, and the regional flour-milling associations have decided not to defend their cases before the Restrictive Practices Court. These restrictive agreements, due to have been heard by the Court at the end of this month, provide for recommended prices for flour sold by members of the Associations. The Rubber and Thermoplastic Cable Manufacturers' Association has also terminated its restrictive agreement, which concerned price-fixing and control of terms and conditions of supply.

On the eve of the dividend announcement of United Glass, its £1 ordinary units gained 2s. 3d. to 51s. 3d. The preliminary statement revealed that the dividend was to be raised from 11¼ to 12½ per cent, following an advance in gross profits from £950,962 to £1,251,455 and in net profits from £386,350 to £544,327. The directors have also proposed a 20 per cent scrip issue.

* * *

Secondhand jewellery, which was to have become liable for purchase tax on May 1st, is to remain free. Announcing this in a written parliamentary reply, the Chancellor of the Exchequer said that he had noted the trade's offer to co-operate in stamping out evasion, the reduction in the rate of tax to 25 per cent, the launching of one important prosecution with others impending, and the registration of traders dealing in secondhand jewellery, who will be required to keep comprehensive records. He would have to reconsider his decision if a substantial improvement was not reported.

COMPANY MEETINGS

THE BRITISH PETROLEUM COMPANY LIMITED

RECORD GROUP SALES REACH 62 MILLION TONS

FACTS OF THE FIFTY-FIFTY PROFIT SHARING PRINCIPLE: PRODUCING COUNTRIES WELL SERVED

CAPITAL EXPENDITURE ON A VERY LARGE SCALE

SIR NEVILLE GASS'S STATEMENT

The Fiftieth Annual General Meeting of The British Petroleum Company Limited will be held on May 21st at Britannic House, Finsbury Circus, London, E.C.

The following is the statement by Sir Neville Gass, KBE, MC, the chairman, which has been circulated to stockholders with the report and accounts for the year ended December 31, 1958:

Since our last meeting Mr Robert Gillespie has retired from the Board. He joined the Company in 1922 and served in BP Tanker Company Limited in various capacities before becoming a Managing Director of The British Petroleum Company Limited in 1956. His long experience of shipping matters will, however, continue to be available to us, as he remains on the Boards of the BP Tanker Company and the BP Clyde Tanker Company. Mr Gillespie has been succeeded on the Board of the parent company by Mr A. E. C. Drake, who joined the Company in 1935.

This year is the fiftieth Anniversary of your Company, which was incorporated (as Anglo-Persian Oil Company, Limited) on April 14, 1909. Its immediate task was to develop the first discovery of oil in the Middle East at Masjid-i-Sulaiman in Iran on May 26, 1908, and the company thereafter pioneered what is now the vast oil industry in the Middle East, where it was until 1933 the only exporter and refiner of petroleum. Now, at the opening of its second half-century, in addition to its major participation in the Middle East oil industry the Company also has very substantial interests throughout the free world.

In March of last year I visited the Middle East; and in the autumn went to Australia and New Zealand, spending a short time in Canada en route and visiting Aden on my way back. I had the opportunity of meeting the directors and staffs of our companies and of seeing the progress we are making in those areas.

For the year 1958 the Group sales amounted to 62 million tons, the highest yet recorded and nine million tons more than for 1956 or 1957. It should be borne in mind that in 1957 expansion was arrested by the effects of Suez, and accordingly the large increase in 1958 should be regarded as related to a two-year period rather than indicative of a single year's expansion.

Despite the increase in tonnage in 1958 the Group net sales figure of £598 million shows an increase of only £2 million on that for 1957 by reason of the lower prices ruling in 1958. The difficult trading conditions already being encountered at the beginning of the year, as reported in last year's statement, continued without relief throughout 1958. The Group Income before Taxation is up by £11 million, this higher increase being mainly due to the relief from certain exceptional expenses incurred in 1957 as mentioned last year.

FIFTY-FIFTY PROFIT SHARING

Our supplies in 1958 were drawn almost wholly from our own sources, including, as mentioned later in this statement, over 60 million tons of crude oil from producing Countries in the Middle East. Supplies from these countries are obtained under agreements which provide for profit sharing on the fifty-fifty principle. In total the sums included in the 1958 Accounts for payment to these countries under fifty-fifty amount to £119 million. The comparison between this figure and the net income for the Group—£63 million, as shown on the Group Income Statement—is instructive. The figures show that the fifty-fifty principle, and the manner in which it is applied, serve the producing Countries well.

For the assessment of the producing Country's 50 per cent profit share the crude oil is valued at the Posted Price, which is the published price available generally to buyers on a day to day basis. Large buyers prepared to contract with a supplier over a period naturally look for some discount; the result is that the average realisation is below Posted Price on which the producing Country's 50 per cent share of the profits is assessed. Moreover the fact that the assessment is made by reference to the crude oil price has sometimes been criticised as excluding the producing Countries from any further profits made in activities outside the country, i.e., in refining and distribution in the consuming markets. The criticism lacks foundation in principle—there is no economic precept that the provision of a natural resource of raw material (be it crude oil or, for example, iron ore) should create a right to share in the earnings of the capital and effort devoted to transforming it into consumption commodities and distributing those commodities to the user in other countries. That despite this lack of essential foundation such a view has been advanced, is presumably attributable to a mistaken belief that large extra profits are made in refining and distribution operations, so that concerns such as ours, which are involved in the whole range of operations from crude oil production through to distribution of products, derive an income much higher than that of the producing Countries from the crude oil which is the basis of the operations. The fact that the Group Income of £63 million for 1958 mentioned above includes our income from crude oil production, refining, transportation, and marketing, demonstrates how mistaken the belief is.

Attention has been drawn to these matters because it is felt important that stockholders should be aware of the true facts of the situation and so be better able to appreciate how unsupported by the facts are suggestions, which gain publicity from time to time, that the fifty-fifty principle fails to give fair and generous treatment to the countries whence the oil is obtained. One other important feature of these arrangements should be mentioned. This is that the oil companies find the capital, on the provision of which everything depends. As demand increases, the facilities have to be provided to produce, refine, transport and deliver to consumers larger quantities year after year. And this requires capital expenditure on a very large scale. As an illustration of the magnitude of the sums involved in production operations alone, it can be mentioned that there are in progress in the Middle East operations in which we are interested, schemes for the development of production and associated handling facilities costing over £150 million. The recurring need for heavy capital expenditure means that a high proportion of the companies' earnings must be ploughed back into the business. In our case this proportion has averaged 73 per cent over the past 10 years. The producing countries do not have to spend any part of their income from the oil to provide the facilities needed to make possible the expansion in offtake, which will increase the revenue-earning tonnage for them. They have their income fully available to spend as they consider best serves their national interest. This feature is a great benefit to the countries and in this respect our type of fifty-fifty agreement differs from the partnership type of agreement which has recently appeared, under which the producing country would be required to find its proportion of the capital necessary for the development of the undertaking if and when production has been found. The development of newly found production usually takes a long period and necessitates heavy expense.

The total capital expenditure of our Group in all areas of operation in 1958, including the expenditure by non-consolidated subsidiaries and our proportion of the expenditure by associated companies in which we have a part interest, amounted to £137 million. This was provided as to £33 million from depreciation, retained earnings, and locally obtained finance by non-consolidated subsidiaries and associates, and the balance of £104 million from the Group central resources, the replenishment of which is a matter needing constant consideration.

During the year we received approximately £33 million as the remaining instalments of the £41 million Convertible Debenture stock issued in December, 1957. Early in the present year an issue was made in Switzerland of a Loan stock for 60 million Swiss francs (£5 million). In Canada we have guaranteed the issue of a Debenture stock for the sum of $17 million (£6 million) towards the cost of the construction of the Montreal refinery. In December, 1958, an agreement was concluded to secure the availability of £12 million through the Clyde Charter Com-

pany Limited on arrangements similar to those previously made for £40 million with the Tanker Charter Company Limited, as reported last year. In the aggregate these arrangements will over the period 1957-59 have brought in over £100 million.

ARRANGEMENTS WITH SINCLAIR OIL

It was announced in October last that we had agreed in principle with the Sinclair Oil Corporation of America to develop a programme covering certain activities of mutual interest. These were a long-term supply agreement covering Sinclair's US domestic requirements for Middle East crudes of our production and the establishment of two jointly owned companies, one to engage primarily in the marketing of Middle East and Venezuelan crudes in the Western Hemisphere and the other to provide for exploration and production ventures primarily in Latin America. The two jointly owned companies were established, as Sinclair and BP Sales Inc. and Sinclair and BP Explorations Inc., in March of this year.

These arrangements with Sinclair, which are in no way exclusive, are founded on the fact that their position is complementary to ours in certain basic respects. Sinclair operates largely in the Western Hemisphere with extensive refining, pipeline and marketing facilities but needs to supplement its crude oil supplies. BP operates largely in the Eastern Hemisphere with extensive refining, tanker transportation and marketing facilities, and the Middle East crude oil reserves to which we have access are sufficient to support an additional long-term outlet. We are convinced that the soundest possible foundation is thus provided for the development of joint activities of mutual interest and long-term benefit. It will enable the joint resources to be more effectively used towards supplying the ever increasing demand in the Western World for oil as an essential source of supply in meeting the rapidly growing energy consumption required to support economic development and social progress.

MARKET CONDITIONS AND PROSPECTS

The year 1959 began in difficult market conditions and early in the year there was a world-wide recession in crude oil prices. There had in the later months of 1958 been a progressive weakening of crude oil prices in the United States, extending also to the heavier Venezuelan crudes, reflecting the pressure of lower product prices on already narrowed refiner's margins. To continuing pressure of this nature was added that from plentiful supplies, to which important new discoveries in Venezuela contributed, and the outcome was further reductions in crude oil prices in both the USA and Venezuela early in 1959. The effects of these basic conditions extended to the Middle East crude market and led in mid-February to a general reduction in Persian Gulf and Eastern Mediterranean crude oil prices.

In relation to the prospects for 1959 there are factors militating against an early improvement in trading conditions. Demand though increasing has not caught up with supply; more oil is coming on the market from newly developed areas such as the Sahara and from Russian sources; and limitation of imports into the USA may cause other markets to be sought for oil discovered in Venezuela by concerns which embarked, at large expense, on production activities there with the objective, for the time being frustrated, of supplementing their domestic supplies for the US market. Consequently although we expect our 1959 sales to exceed slightly the tonnage attained in 1958, present conditions do not provide grounds for anticipating that 1959 will show an increase in trading margins. The basic longer term consideration is, however, that a continuing expansion of oil consumption is confidently forecast and will lead in time to a better balanced position. Subject, of course, to forecasts not being upset by economic recession or by other conditions adverse to the free flow of international trade, there is, therefore, no need for diminished confidence in the future growth of the oil industry, nor in our ability to participate in that growth.

ACCOUNTS AND FINANCE

The Accounts of the Company consist, as in recent years, of three sections:

(1) The Balance-Sheet of The British Petroleum Company Limited and the Consolidated Balance Sheet and Profit and Loss Account of The British Petroleum Company Limited and Subsidiary Companies, excluding those referred to in note 11 on page 11 of the Report.

(2) The Accounts of The Tanker Insurance Company, Limited which, owing to the nature of the business, cannot properly be incorporated in the Consolidated Accounts.

(3) A Group Income Statement showing the income of The British Petroleum Company Limited and all Subsidiary Companies (excluding The Tanker Insurance Company, Limited, and Triad Oil Company Limited).

CONSOLIDATED PROFIT AND LOSS ACCOUNT

Trading profit in the Consolidated Profit and Loss Account after providing for depreciation and amounts written off is £123,822,128 for 1958 compared with £113,947,431 for 1957. Depreciation and amounts written off total £33,139,526 compared with £30,268,330 for the year 1957. The increase in depreciation arises from the additional capital expenditure particularly relating to Kent and Grangemouth refineries, the oil terminal at Finnart, and the production facilities in Kuwait.

The total taxation charge is £70,452,428 which compares with a figure for 1957 of £67,611,925. Due, however, to the benefit of Investment Allowances and a recovery against this year's expenditure out of taxed income of other years the United Kingdom taxation position shows a credit of £10,392,435 whilst the overseas taxation liability is £80,844,863. Of the overseas taxation £78,786,468 arises in Iran, Iraq, Kuwait and Qatar, in which territories payments in the nature of royalties of £39,996,747 have also been made and are taken into account prior to arriving at the trading profit mentioned above. The total for the Middle East countries from the Group in 1958 is, therefore, £118,783,215 which compares with £93,721,974 in 1957.

The consolidated net profit amounts to £61,922,563 compared with £52,018,461 for 1957 and of the Consolidated net profit £56,264,094 is dealt with in the accounts of The British Petroleum Company Limited.

In the accounts of The British Petroleum Company Limited your Directors have placed £1 million to Debenture Stock Reserve and allocated £36,500,000 to General Reserve, leaving, with the £4,793,618 brought forward from last year, £23,288,871 available for distribution.

The Preference Dividends, net, amount to £615,960 and the Interim Dividend free of income tax, equivalent to 6d. on the increased capital, was £5,060,033. Your Directors have recommended a Final Dividend on the Ordinary stock of 1s. 3d. per £1 Unit of Stock, free of income tax, making a total for the year of 1s. 9d. per £1 Unit of Stock, free of income tax.

This leaves £4,962,794 of unappropriated income to be carried forward in the accounts of The British Petroleum Company Limited which, together with the unappropriated income of Subsidiary Companies makes a total carry forward of £19,256,549 compared with £13,342,667 in the previous year.

CONSOLIDATED BALANCE SHEET

The capitalisation of Reserves of £101,200,570 and the issue of fully paid stock as approved at the Extraordinary General Meeting last October is reflected in these accounts.

The Capital Reserve which was reduced as part of the capitalisation from £47,853,131 at the end of 1957 to £9,073,121, has been increased by additions during the year of £9,350,415. These additions are made up of £2,500,000 being the second of 10 equal annual instalments received from the Government of Iran under the terms of the 1954 agreement and £7,350,415, being sums payable by the companies with whom we are associated in the operations in Iran.

The Revenue Reserves, which were reduced by £60 million to £91,549,532 as part of the capitalisation, have been increased this year by a total of £57,323,268. This increase consists of £36,500,000 allocated to General Reserve in The British Petroleum Company Limited, £5,823,268 retained income in the Consolidated Companies, and a transfer to General Reserve in BP Tanker Company Limited of £15 million. This latter item arises from a review of the value at which the tanker fleet stands in the accounts and in order to bring the book value of the fleet into line with the written down value for the purposes of United Kingdom taxation £15 million depreciation previously charged in the Profit and Loss Account of BP Tanker Company Limited has been written back. The effect of this adjustment on the Consolidated Balance Sheet figures is a transfer of £15 million from Depreciation on Tankers to Reserves in Subsidiary Companies.

The total capital expenditure of the Group including non-consolidated subsidiaries and our proportion of the expenditure by allied companies was made up as follows:

	1958 £	1957 £
Exploration and production	39,000,000	23,250,000
Refineries	40,000,000	38,500,000
Tankers (before deducting sales under tanker finance arrangements)	23,750,000	21,250,000
Distribution and marketing facilities	34,750,000	30,500,000
	£137,500,000	£113,500,000

The amounts retained in the business to meet new capital expenditure and to provide working capital were:

	1958 £	1957 £
Consolidated Companies:—		
Capital and revenue reserves	52,000,000	42,750,000
Depreciation and amounts written off	33,000,000	30,250,000
	85,000,000	73,000,000
Non-consolidated Companies:—		
Depreciation and profits retained	16,500,000	16,000,000
	£101,500,000	£37,000,000
In addition the receipts from the 6 per cent Convertible Debenture Issue (£33 million) and the Tanker finance arrangements (£17 million) were	£50,000,000	£21,000,000

The Investments in Subsidiary Companies not consolidated show an increase to a total of £97,720,845. These companies are engaged mainly in the distribution of petroleum products overseas.

Investments in Allied Companies, which now stand at £47,967,643, include our interest in certain marketing companies which are not subsidiaries, such as Shell-Mex and B.P. Limited and Consolidated Petroleum Company Limited, also our refining interest in Belgium and Italy, advances to the Refining Company in Iran and holdings in Lowland Tanker Company Limited, Warwick Tanker Company Limited and British Hydrocarbon Chemicals Limited.

The Expenditure on Exploration and Production Interests includes our advances to the Exploration and Producing Company in Iran together with our investment in exploration and producing companies elsewhere, in particular those in Canada, Iraq, Nigeria and Qatar. BP (Kuwait) Limited, which is a wholly owned subsidiary, holds our one-half interest in Kuwait and as this company is consolidated its assets are therefore included under the appropriate headings in the Consolidated Balance Sheet.

GROUP INCOME STATEMENT

The Group income statement for the year shows the summarised trading figures of The British Petroleum Company Limited and all subsidiary companies (excluding The Tanker Insurance Company, Limited and Triad Oil Company Limited). The net income is £62,952,000 (compared with £54,634,000 for 1957) of which £61,923,000 is dealt with in the Consolidated Profit and Loss Account and £1,029,000 relates to the non-consolidated subsidiary companies.

PRODUCTION AND EXPLORATION

In 1958 our main sources of crude oil were again Iran, Iraq, Kuwait and Qatar, from which we obtained 60,700,000 tons, 12 million tons more than in 1957, when the dislocations had resulted in a reduction of 1 million tons compared with 1956.

The following table shows the BP Group's percentage shareholding in companies producing crude oil in various parts of the world and the total production by each company in 1958 compared with 1957.

Company	BP Group Shareholding Per cent	Total crude oil production 1958 Tons	1957 Tons
IRAN			
Iranse Aardolie Exploratie en Productie Maatschappij N.V. (through Iranian Oil Participants Ltd.)	40	39,780,000	34,765,000
IRAQ			
Iraq Petroleum Company Ltd.	23¾	22,633,000	11,657,000
Basrah Petroleum Company Ltd.	23¾	11,019,000	9,140,000
Mosul Petroleum Company Ltd.	23¾	1,260,000	564,000
KUWAIT			
Kuwait Oil Company Ltd.	50	69,117,000	56,376,000

MIDDLE EAST—In Iran production increased to 39,780,000 tons, some 5 million more than 1957. Construction of the new loading terminal at Kharg Island and of the pipeline connecting it with the Gach Saran field is progressing steadily. Exploration drilling in the Ahwaz and Kuh-i-Binak areas continues.

In Kuwait production rose from 56,376,000 to 69,117,000 tons. Development of the Burgan fields continued and preparations were made to bring the Raudhatain field into regular production in mid-1959. Exploratory drilling at Minagish in south-western Kuwait is in progress. Construction of the new jetty north of Ahmadi has now been completed.

In Iraq, production from the Kirkuk and Mosul areas amounted to 23,913,000 tons, and from the Basrah fields to 11,019,000 tons compared with 12,221,000 and 9,140,000 respectively in 1957. Arrangements for expanding export facilities from the Basrah fields by the construction of an island loading terminal capable of handling large tankers are well advanced, and exploration drilling in several areas is being continued.

The Khanaqin Oil Company's exploration and producing rights in the Naft Khaneh area, covered by an agreement with the Iraq Government made in 1951, were terminated by mutual consent in November, further exploration having failed to establish additional reserves on a scale large enough to warrant the undertaking of the export commitment defined in the Agreement.

Production in Qatar increased from 6,505,000 to 8,092,000 tons.

Abu Dhabi Marine Areas Limited, in which we have a two-thirds interest, successfully completed its first off-shore well. The results were encouraging and following the successful completion of a second appraisal well a third is now being drilled.

UNITED KINGDOM—In the United Kingdom our exploration programme continues and further small discoveries of oil in Lincolnshire and Nottinghamshire were made. Work on behalf of the Gas Council was resumed and three wells were drilled, one of which in Derbyshire is a small potential gas producer.

In Scotland shale oil production at 63,000 tons was 8,000 tons lower than in 1957. It was explained in my last statement that as the Government had in April, 1958, decided that it was unable to accede to a request for an increase in the duty preference on motor fuels produced from shale oil, it had become necessary again to curtail operations by discontinuing working the poorer seams. This curtailment was carried out gradually in the latter half of 1958. Despite the economies thus effected, the condition of the shale industry continues to be a matter of concern since revenue is again proving inadequate fully to cover the costs.

EUROPE—Exploration in France continued in conjunction with French interests with deep test drilling in the Valence and Avignon areas and in the department of Landes.

In Sicily limited quantities of the heavy asphaltic oil previously discovered at Vittoria were produced for experimental purposes.

In Austria geophysical work began in April in Lower Austria as part of a joint venture with Austrian interests.

In Malta the first deep test well near Valletta was begun in September and is still drilling.

WEST AFRICA—In Nigeria progress has been sufficiently encouraging to justify the substantial development and exploration programme now in hand. Exploratory wells at Bomu, Krakama and Ekulama gave promising results and oil shows were found in other localities. Exploration drilling in hitherto unproven areas and appraisal drilling in the Afam and Oloibiri fields continues. Development costs in the conditions experienced in Nigeria are relatively high, and it may therefore be some time before these operations can be regarded as having reached a reasonably profitable stage.

In Senegal and Gambia, where we hold prospecting rights in association with French interests, a deep test well was drilled at Balandine and other exploration work continues.

NORTH AFRICA—In the Sahara our associated company, the Société des Pétroles de Valence, obtained permits over four areas totalling 16,000 square kilometres, and geological and seismic parties are at work.

In Libya three test wells were completed. Although no production was obtained, these wells have added to our geological knowledge of the area. Geological and geophysical work continued throughout the year.

The property of The Anglo-Egyptian Oilfields Limited which was sequestrated in 1956 remained throughout 1958 in the hands of the Egyptian authorities.

EAST AFRICA—The deep test well at Mandawa in Southern Tanganyika reached its final depth of 13,325 feet at the end of January, 1959. Shallow drilling was carried out in Kenya and geological work resumed in British Somaliland.

AUSTRALASIA—By the beginning of 1958 our long and costly exploration project in Papua had reached a stage when it was considered prudent to make provision for diluting our interest unless material encouragement was obtained in any of the wells included in the programme for drilling during that year. In the event, a substantial show of oil was found in Puri No. 1 well in November. Although this particular well went to water when still under test, we have decided to continue to participate in further exploration in this difficult region. The next phase is for further appraisal of the Puri structure and testing of other prospects in the same general area.

In Australia geological and geophysical work in which we are participating through Frome-Broken Hill continues in the Otway area of Victoria, and also in South Australia, Queensland and the Northern Territory. Exploration drilling in the Gippsland area of Victoria was discontinued.

In New Zealand geophysical survey work proceeded in the North Island and an exploration well was begun in January, 1959.

CANADA—In Canada, Triad Oil Company Limited, in which we now hold a 51.5 per cent interest, produced 104,000 tons. Had it not been for the necessity of restricting production in Western Canada, owing to a lack of market outlets which we hope will be temporary, production would have been appreciably higher. Thirty-six wells were drilled during 1958, of which 19 were completed as oil wells and four more as potential gas wells. The Company, through wholly owned subsidiaries as well as in association with Triad Oil, has acquired new areas in British Columbia and the North West Territories. Five wells were drilling at the end of 1958, and in the Beatton River area of British Columbia a productive oil sand has been located. Two further wells completed in January, 1959, found oil in the same sand.

CARIBBEAN—In Trinidad there was a further increase in production in the Soldado Marine field of Trinidad Northern Areas Limited. The Trinidad Petroleum Development Company also increased its production as a result of further development.

REFINING

In 1958 our total refinery throughput was just under 38 million tons, some 6 million more than in 1957. It has to be remembered, however, that the BP Group's refinery throughputs in 1957 were adversely affected by the dislocations of that year. The following table shows that BP Group's percentage shareholding in Companies with refineries and the total throughput in each refinery in 1958 compared with 1957.

Company	Refinery location	BP Group Shareholding Per cent	Total throughput 1958 Tons	1957 Tons
UNITED KINGDOM				
BP Refinery (Grangemouth) Ltd.	Grangemouth	100	2,053,000	1,881,000
BP Refinery (Kent) Ltd.	Isle of Grain	100	5,815,000	3,275,000
BP Refinery (Llandarcy) Ltd.	Llandarcy	100	2,782,000	2,311,000
Scottish Oils Ltd.	Pumpherston	100	143,000	151,000
ADEN				
BP Refinery (Aden) Ltd.	Aden	100	3,758,000	4,240,000
AUSTRALIA				
BP Refinery (Kwinana) Ltd.	Kwinana	100	2,691,000	2,287,000
BELGIUM				
Société Industrielle Belge des Pétroles S.A.	Antwerp	50	3,588,000	2,574,000
FRANCE				
Société Française des Pétroles BP.	Dunkirk	70	2,117,000	1,677,000
	Lavera	70	2,997,000	1,900,000
GERMANY				
BP Benzin und Petroleum A.G.	Hamburg	100	1,627,000	1,266,000
Oelwerke Julius Schindler G.m.b.H.	Hamburg	97	306,000	165,000
IRAN				
Iraanse Aardolie Raffinage Maatschappij N.V. (through Iranian Oil Participants Ltd.)	Abadan	40	14,986,000	15,202,000
ISRAEL				
Consolidated Refineries Ltd.	Haifa	50	1,190,000	1,052,000
ITALY				
Industria Raffinazione Oli Minerali, S.p.A.	Venice	49	1,385,000	1,370,000
KUWAIT				
Kuwait Oil Company Ltd.	Kuwait	50	5,939,000	1,352,000
LEBANON				
Iraq Petroleum Company Ltd.	Tripoli	23¾	305,000	495,000

Construction work on the Kent Refinery expansion project was completed at the end of the year and the new aviation gasoline plant was commissioned in August and was on full output in the fourth quarter of the year. In October we began delivering supplies of feedstock to the South Eastern Gas Board's new plant for the manufacture of town gas adjacent to the refinery.

At Grangemouth the new distillation unit, raising the refinery capacity to 3,200,000 tons per annum, together with its ancillary plant, has been commissioned and additional coastal jetty facilities have been completed in the Grangemouth Dock. The new tanker jetty at Finnart, suitable for the largest tankers, was commissioned.

Work proceeds at the Angle Bay terminal at Milford Haven which is expected to be able to deliver crude oil to Llandarcy Refinery about mid-1960.

The new refinery in the Republic of Ireland at Whitegate, in which we have an interest, has been completed and received its first cargo of crude oil.

On the continent of Europe new plant has been brought into operation. The hydrofiner and catalytic reformer at Antwerp have been commissioned and the catalytic reformer at Dunkirk has come into operation since the end of the year. Construction work has started on the new refinery at Dinslaken in the Ruhr which is planned to be operating in the summer of 1960.

At Kuwait the two new distillation units have operated efficiently. The offtake has been principally for the bunkering of ships. At Aden Refinery throughput was 3,758,000 tons and at Abadan our share of the crude throughput amounted to 5,025,000 tons.

At Kwinana in Western Australia the throughput rose to 2,691,000 tons. The second catalytic reformer was commissioned in February, 1959, and is now in operation.

In Canada work has started on the new Montreal refinery. A section of the refinery tank farm has been completed for use as a storage depôt for products pending the completion of the refinery, and we shall shortly begin shipping crude oil for processing under interim arrangements made with another refinery nearby.

In Turkey, it is anticipated that the preliminary work will shortly begin for the construction of the new refinery in which we are interested with other oil companies.

Additional joint refinery projects which are under consideration include Strasbourg and Algiers.

Following the sale in April of our associated marketing company in Israel, our associated refining company, Consolidated Refineries Limited which owned the Haifa Refinery, was sold at the end of the year.

PETROLEUM CHEMICALS

The expansion in the Group's manufacture of petroleum chemicals continued both as to scale of production and variety of materials manufactured.

In the United Kingdom BP participates in three companies whose plants are adjacent to our Grangemouth Refinery — British Hydrocarbon Chemicals Limited, Forth Chemicals Limited, and Grange Chemicals Limited. As a result of steadily expanding manufacture of chemicals from petroleum, competition is becoming severe, but all these companies have had a successful year. In the last quarter of 1958 demand showed a definite upturn and all plants were operated at very satisfactory rates. In the case of certain products, prices have been reduced. Sales of chemicals during that period were at the rate of 195,000 tons per annum.

Work started last autumn on the third cracker for British Hydrocarbon Chemicals Limited at Grangemouth. This unit, when completed in mid-1960, will have an ethylene production capacity of 70,000 tons per annum, the largest such unit outside the USA. The polyethylene plant for the manufacture of a new high density polyethylene, sold under the B.H.C. trade name "Rigidex," is now being commissioned. Plants to make phenol and acetone are due to come into operation later this year.

Operations of this magnitude cannot hope to remain competitive in such a highly complex sphere of activity unless they have the backing of a modern research organisation. B.H.C. is fortunate in being supported by the powerful research and technical service groups of the parent companies. It also has its own research laboratory, recently enlarged at Grangemouth.

In France, Naphtachimie S.A. in which the Société Française des Pétroles BP has a substantial holding, increased its production of ethylene and ethylene oxide considerably and a new plant for the manufacture of polyethylene by the Ziegler process was commissioned. The Naphtachimie plant is adjacent to our French associate's refinery at Lavera, near Marseilles.

In Germany, Erdölchemie G.m.b.H., in which B.P. Benzin und Petroleum A.G. has a half interest, has recently commissioned its Lurgi cracker and Linde gas separation plants at Dormagen both of which are operating very satisfactorily. Plants for the utilisation of the olefins produced have also been commissioned and as the construction of these plants and the offsite facilities required was only begun in March, 1957, the progress achieved is gratifying. Further plants in the second stage of development are already under construction and are expected to be commissioned towards the end of 1959. These plants include a second and larger cracking plant for ethylene production, together with a number of others to utilise the products therefrom.

SEA TRANSPORT

BP Group tankers, comprising the fleets of BP Tanker Company Limited, BP Clyde Tanker Company Limited, Tanker Charter Company Limited, and Société Maritime des Pétroles BP, totalled 157 ships at the end of 1958, the same as at the end of 1957 but of larger deadweight tonnage, 2,600,000 tons against 2,411,000 tons. The number is made up thus:

	d.w. tons
BP Tanker Company Limited. 123 ships	1,802,000
BP Clyde Tanker Company Limited. 10 ships	138,000
Tanker Charter Company Limited. 14 ships	435,000
Société Maritime des Pétroles BP. 10 ships	225,000

Since the end of 1958 BP Tanker Company Limited has sold for scrap a number of its older and smaller vessels which were becoming uneconomic to operate, totalling rather more than 100,000 d.w. tons, and has taken delivery of one vessel of 35,000 d.w. tons. Two vessels each of 42,000 d.w. tons have been brought into service for Tanker Charter Company Limited and one of 15,500 d.w. tons for the newly formed Clyde Charter Company Limited.

Nordic Tankships I/S, the partnership between our Danish subsidiary and East Asiatic Company Limited of Copenhagen, has two 35,000-ton tankers now in our service.

Two 35,000-ton tankers for delivery in 1960 to us will now be owned by Warwick Tanker Company Limited and time chartered to us. This company has been formed jointly with Houlder Brothers and Company Limited, who will act as managers for the ships.

The ten 16,000-ton ships of The Lowland Tanker Company Limited, in which we have a 50 per cent interest, continue to give us excellent service and will be joined in 1960-61 by five others, each of some 19,000 tons.

The balance of our shipbuilding programme under construction or on order comprises 44 tankers ranging from 15,000 to 65,000 deadweight tons whose delivery dates are being spread over a longer period than was at first envisaged. In addition Société Maritime des Pétroles BP has three ships on order.

The Group also has nearly three million deadweight tons of tanker shipping on charter, about the same tonnage as a year ago.

During the year HRH The Duchess of Gloucester honoured us by christening our first 42,000-ton tanker "British Duchess" and this ship is now in service.

Since the last report, tanker freights have remained depressed with world tanker tonnage continuing surplus to requirements. We, like other companies, still have tonnage withdrawn from service and from time to time have routed some of the larger ships to or from the Persian Gulf via the Cape.

DISTRIBUTION AND SALES

As mentioned earlier our Group sales of crude oil and refined products for the year 1958 totalled 62 million tons. The total for the second half-year was a little above that for the first half-year.

During 1958 Western Hemisphere product prices at main export centres showed a general downward trend except for middle distillates which, due to severe winter conditions, were subject to an upsurge in demand and consequently a rise in price later in the year. At main export centres in the East product prices, apart from fuel oil, showed little change throughout the year. In both West and East the greatest reductions were in heavy fuel oil. Selling prices in the consumer markets were affected also by the lower levels of freight.

Vigorous competition was met in all our marketing areas and in some countries this was accentuated by supplies from Russian sources. In general our marketing associates were successful in holding their position but in some areas under competitive pressure prices fell to unsatisfactory levels.

In the United Kingdom consumption was 24 per cent above the 1957 figure, which had been curtailed by rationing, and 20 per cent above the 1956 figure. Total inland trade exceeded 10 million tons of fuel oil for the first time and the demand for greater warmth and comfort in the home has contributed to large increases in the sales of heating oils and paraffin. Our associated marketing company, Shell-Mex and B.P. Limited, has been the leader in providing improved services to consumers in this field.

On the continent of Europe consumption rose by some 16 per cent over 1957, and our trade showed a corresponding increase. France and Germany continue to be the largest petroleum consuming countries on the continent and BP sales in these countries have kept pace with the expansion. The two marketing networks which were acquired in Italy early in 1958 have been extended and are already starting to trade under the BP colours. In Belgium we have purchased a company with a network of selling points. In Austria and Turkey our companies have acquired assets which were previously operated under lease.

In Australia our marketing company had a successful year's trading and the increase in sales of premium grade motor spirit was particularly encouraging. In New Zealand also we made substantial progress.

In the Levant, Red Sea area, South and East Africa and Ceylon our trade has increased. In South Africa a full range of BP Energol motor oils has been introduced.

In North Africa the companies which market our products have increased their sales. In West Africa we have made steady progress, and BP du Congo, the newest of our African companies, completed its first full year of operation.

In Egypt, the property of our distributing company also remained throughout 1958 in the hands of the Egyptian authorities.

In Canada encouraging progress has been made. The first BP service station was opened in May, 1957, and by the end of 1958 the network comprised some 400 retail outlets. Sales and the provision of our own distribution facilities are being expanded by an enthusiastic staff most of whom have been recruited in Canada.

Despite severe competition and the continued recession in world shipping movements, mainly affecting the tramp and cargo section, sales of the BP International Oil Bunkering Service reached a higher level than ever before.

Our International Aviation Service, renamed AIR BP, has continued to increase its sales of aviation fuels and we have made available to the airline operators of the world knowledge gained by our research and development both in fuels and fuelling techniques.

All sections of the lubricants market expanded. Sales of BP Energol Visco-Static motor oil showed an increase of some 40 per cent over 1957. A new petrol/oil mixture for two-stroke engines sold under the name of BP Zoom was successfully put on the market. Our bitumen sales showed an improvement.

With the great developments in road traffic throughout our marketing areas and the heavy investment in new roads, attention has been focused on the development of our roadside chain of service and filling stations. This has been directed both towards increasing coverage and also to the improvement of appearance and service to which new colours and new designs have contributed.

The BP Touring Service, providing touring literature for motorists taking their cars abroad, was introduced in 1958. In view of its success it is being expanded in the current year.

We have had another very successful year in the field of motor sport. In Grand Prix Formula I racing the team of British Vanwall cars led by Stirling Moss won the Manufacturers' World Championship on BP fuels and lubricants. Donald Campbell also used our products for his successful attempt on the World Water Speed Record.

RESEARCH

Our research and development activities continue to broaden in scope and to receive the emphasis that this important side of our operations merits. New processes and improved qualities of products are constantly under review and the large number of British and foreign patent applications filed during the past year is a measure of the progress made in this respect.

Examples of the work include fundamental investigations of the flowing properties of aviation turbine kerosine at low temperatures; research on combustion with particular regard to problems arising from corrosion in furnaces; and the development and engineering of a new process for the treatment of gasoline obtained as a by-product from petroleum chemical manufacture.

Research is being encouraged at all the Company's technical centres and significant contributions to scientific progress have been made. In Australia methods were worked out for applying statistical analysis to the operation of Kwinana Refinery. This initial research, coupled with the use of a computer, has led to the development of linear programming techniques for control of the UK refineries. In Germany work has been done on the development of new and better products, particularly in the fields of road asphalt materials and special lubricants. In the United Kingdom important developments have been made on instrumentation and product analysis methods.

Research directed towards increasing the efficiency of our exploration methods resulted in advances in instrumentation for detecting oil/water interfaces in reservoirs and for dipmetering in boreholes; and in prospecting devices such as radio geophones and other electronic equipment for use on geophysical surveys. Studies in reservoir engineering have led to improved techniques for the acid treatment of limestone reservoirs.

PERSONNEL

I am again glad to be able to report a satisfactory record of industrial relations in the United Kingdom and in the many other countries in which we are working. We are continuing our considerable efforts towards developing the skills and abilities of national employees in our overseas areas with a view to enabling them to find full and satisfying work and opportunity in our industry. In the United Kingdom our various training schemes are now approaching full strength and ensure for the Company's operations a steady flow of young men who have completed a sound theoretical and practical training.

To keep pace with our expansion it has been necessary to augment our Head Office accommodation by acquiring a long lease of a new building known as BP House, about 200 yards from Britannic House. It will be fully occupied by June.

In this 50th year of the Company's history it gives me very great pleasure to record a warm tribute to all our past and present employees, by whose work, enthusiasm, and loyalty the Company has grown and developed from a mere handful of pioneers in 1909 to a world-wide organisation which now employs in the United Kingdom, afloat and overseas, directly and in our many subsidiary and associated companies, over 100,000 people. It is these men and women and their predecessors who have played the major part in building up a great enterprise and making the BP Group what it is today.

UNILEVER LIMITED

A MULTI-NATIONAL ORGANISATION WITH A MULTI-NATIONAL OUTLOOK

PARTNERSHIP IN PROGRESSIVE DEVELOPMENT OF COMMUNITY WELL-BEING

THE SEARCH AND COMPETITION FOR TALENT

LORD HEYWORTH ON NEED FOR GREATER FREEDOM OF MOVEMENT

The Annual General Meeting of the Members of Unilever Limited was held on Friday, April 24th, at The Hall of the Chartered Insurance Institute, 20 Aldermanbury, London, EC2. Lord Heyworth presided. Addressing the Meeting the Chairman said:

AN INTERNATIONAL BUSINESS

When you look at the world today, you may agree that there is something to be said for a pretty close study of any organisation—especially a large one—that can get people of different countries to work successfully together. Now our business is large. People of fifty countries work within it. We think their work is successful, and we don't think we are unduly boastful if we say that our view is supported by the Report and Accounts.

So I propose today to say something about the *international* aspect of Unilever. It happens that this year, on September 2nd just coming, Unilever will be thirty years old. Thirty years is a long enough time for us to look back and take a view of the way we have developed as an international business, and perhaps to make a guess at how we may develop in times yet to come.

The firms which came together in the Autumn of 1929 had already been at work in many different countries for fifty or sixty years before. There was hardly any part of the world which had not heard of Levers, Van den Berghs, Jurgens or one of the companies associated with them. Nevertheless, there was no doubt where the new organisation's main centres of gravity lay. They were in the United Kingdom and the Netherlands.

This was true whether you looked at the way the capital of the merging firms had been raised and was held, or at the nationality of the people who worked in them, especially towards the top. Lever Brothers was predominantly British in both aspects. The Margarine Union was rather more cosmopolitan, but its heart was in Holland. Both still had about them some of the character of family businesses, so that it was hardly to be expected that many managers or much of the capital would have been found from outside England and Holland. There were exceptions, of course, and the process of finding managers outside the founders' families had gone a long way, but I am speaking in the broadest terms. I need hardly add that, in the businesses in Asia and Africa, there was no thought, thirty years ago, of having anyone but Europeans to manage them.

Unilever today is still very much an Anglo-Dutch partnership. The management is centred in London and Rotterdam. A great deal of the capital is held in Great Britain and the Netherlands. But the mixture is diluted, compared with thirty years ago. More nationalities have a share in the ownership of the capital. As time passes, Unilever will become more and more multi-national, both as to management and as to ownership of capital. What I want to do today is to bring before you some of the implications of this very considerable alteration in the way our business is run and financed.

During the lifetime of Unilever, one great change in the world picture has been the rise of countries outside Europe, North America and the other main centres of Western culture. The greatest weight of our business—about 70 per cent of the turnover—is in Europe and North America, but we have great interests in many of these other territories as well. I think I may say that no other business in the world ranges over a wider variety of countries, at such different stages of development, and with such enormously different standards of life. This raises for us difficult problems of management and training. At the same time it constitutes, we think, a very compelling justification for our existence. With our range, our experience, and our concern with ordinary, everyday household goods, we are peculiarly well-fitted to help in bringing low standards of living in some countries closer to the higher standards in others. We are in business in countries of both kinds, and one of our main pre-occupations is to see that our experience and knowledge are freely interchanged between one country and another. We find that we can often adapt experience gained in countries with a high standard of living to help in improving conditions where standards of living are low.

WIDER HOLDING OF UNILEVER CAPITAL

Let me now pass from the general to the particular and glance, first, at the way the capital of the business is held and how we may expect to see it held as time goes on.

We must distinguish between the capital of our parent enterprises—Unilever Limited and Unilever NV—and the capital of our operating companies scattered about the world. In each case, the emerging pattern is one of a wider circle of people having money in the business. Where this happens with one of our operating companies, it may take some form of partnership with one or more local partners in the country concerned. In the case of the parent holding companies, on the other hand, the spread of capital is achieved through the great financial markets of the world.

You know that for some time American investors have been showing an interest in the shares of first-class European companies. Unilever shares have come in for attention along with others. For some years, too, NV shares have been quoted in Paris, and this year we have arranged for a quotation in West Germany, which seems to have been a welcome move there. You will see, therefore, that it is becoming simpler for investors in various countries to have a stake in the prosperity of Unilever as a whole. They generally prefer NV shares to the shares of Limited, partly because NV shares are "bearer" shares and partly because Dutch tax bears less heavily than British on the foreign investor. As a result, about 35 per cent of NV's Ordinary capital is held outside the Netherlands, but the capital of Limited is much less widely distributed.

The capital of the parent companies can only be really widely held in countries with a capital market of their own, where investors can easily buy our shares. In some other countries, we have made it possible for people to put money into their local Unilever enterprises. This is quite a marked change in our practice, because in the past it has been our almost invariable policy to have the shares of all our enterprises wholly owned by one or other parent company. In some countries, in the old days, it could hardly be otherwise. Either there was no local capital or, more often, there was plenty—but those who held it were after high and quick returns of the sort you might get in speculation or in plain money-lending, but hardly in our kind of enterprise, which sometimes needs years of development before it shows any returns at all, and even then not high ones by the speculator's standards. Nowadays, however, it is becoming easier to attract capital on terms that we find reasonable, and we are doing it in various parts of the world.

We are doing it either because we want to start a business or because we want to expand one. Our motive is always either creation or expansion, and, whichever it is, we add to the wealth of country where we invest. If the people of the country, on their own account or through their Government, will join their resources with ours, then we are very glad to have their co-operation, and we hope they may come to regard us as we believe we should be regarded—that is to say, as partners in the job of improving the country's well-being, and not in any sense as hostile interlopers.

In general, the form of local partnership which we find the most satisfactory—and it is the one which does most to create new wealth for the local community—is one in which the local partner invests new money, rather than merely taking over from us shares in the existing capital. The precise form of the arrangements we make vary according to local needs and conditions: we are not rigid about them. In Turkey, for instance, we have come to terms with a Turkish Bank, the Is-Bank. In Pakistan, Kenya and Burma we are in partnership with the Government, and so we are in some of the countries where The United Africa Company is engaged.

In all these partnerships with outside interests, we carry responsibility for running the business. This is a responsibility which we are anxious to discharge, as far as possible, through locally-recruited managers. We are in business to make and sell goods for ordinary households, and we don't think we can do that properly without a good deal of local knowledge. Local knowledge is most readily found in local men. So, apart altogether from any question of pressure from local opinion, our companies overseas have for a long time been bringing local men into their management.

CENTRAL CONTROL AND LOCAL PARTNERSHIP

This matter of finding and training local managers is one that I shall come back to.

Before that, I want to point out what we think are the main advantages which Unilever, as an international concern, can offer to national operating companies. I have already indicated that, first of all, we offer to make an investment, with all that that implies in the way of risk-bearing. Under the same agreements, where it is appropriate, we grant rights to use trade marks and patent processes, both of which are advantages by no means small.

Besides all this and, in our view, at least equally important, we undertake to give our local companies help from Unilever's central fund of knowledge and experience. This is the counterpart of the knowledge which locally recruited men bring in. It comes, first, from contact between managers throughout the business. Secondly, it includes the resources of the Central Advisory Departments in London and Rotterdam. These Departments run through the alphabet from Accounts, Audit and Buying to Research, Taxation and Technical. Each is charged with the duty of keeping up with, and adding to, the latest and best knowledge in its own particular sphere, and I don't think I am unduly complacent when I say that none of our companies, on its own, could get at anything like the range and quality of experience and advice which it can have as part of Unilever. Large headquarters have their dangers, and we may have been aware of them even before Professor Parkinson, but you cannot get away from the fact that business today depends on specialised skill and knowledge of many different kinds. You must either buy these specialised services from outside if you can—and very often you can't, especially in some of the countries where we operate—or provide your own. We find it generally pays to provide our own, and we do so.

It has long been our principle that operating companies know their own business, and should be left to get on with it in their own way. At the same time, we value the unity of the business and we do our best to foster a sense of loyalty to Unilever as a whole, as well as to one or another of its component parts. The reason why we insist on the principle of unity is that the central resources of the concern would lose their value if they were neglected or disregarded by companies of too separatist a turn of mind. We do not like to force advice or services on anyone against his better judgment—but we mean to make sure that it is judgment he is working from and not simply too narrow a view

In the linking of centre with perimeter, the Boards of the parent companies have a vital part to play. If they were to become too dictatorial, they might cramp the style of the enterprising. If they were to lean too far in the direction of becoming an advisory body of expert consultants, the business might fly apart by centrifugal force. Where outside partners have to be considered, there is a clear limit to the authority of the Board to give direct orders—they could not, even if they wanted to, give orders to the Government of Pakistan or the Is-Bank in Turkey. And there is in Unilever, in any case, a disposition to advise rather than command. But at the centre we must, and we do, keep and exercise the right of executive action, especially in the disposition of the resources of the business in money and in men. We keep our hand on major expenditure and on the placing of top management. If we didn't, Unilever would cease to be an operational company. It would become an investment trust, and most of the justification for its international activities would disappear.

We think that central control, within reason, helps our companies to grow more than it restricts their freedom. Take, for instance, the control of capital. In general, we expect our companies to pay their own way without too much help from the centre. But where a company has clear prospects of success, without the capital to make a start, we are prepared to call upon the resources of Unilever as a whole, irrespective of their origin. We did it on a very large scale for The United Africa Company during the difficult years of the thirties. We have done it since the War in other places, such as Italy, Turkey, Burma and Brazil. And when a company needs to borrow money in its own country, we can back it with the central credit of Unilever, which is a great advantage in arranging the terms of a loan.

THE SEARCH FOR TALENT

Now let me turn from the question of money to the question of men. Money, after all, is no more than an instrument—raw material, if you prefer—which will do no good at all unless you can find the right people to put it to use. That is our central problem in developing the international pattern of our business. It means, more and more, a world-wide search for talent.

When we are looking for potential managers in Europe or North America, or anywhere else with an industrial tradition, we know we are likely to find some considerable number of promising candidates. People with two hundred years of industrial development behind them have developed an outlook to match, and it encourages many of them to look for jobs of the kind we have to offer, both for themselves and for their children. People with this sort of ambition now do much of the work which, in times gone by, was only done by owner-managers. They come from all classes of society and, with the development of modern systems of education, their origins are likely to be even more diverse in the future than they are today. They have inherited a good deal of the owner-manager's outlook, but they have modified it with an attitude of mind which, formerly, was mostly found among what were called "professional people." They expect to be able to fit themselves and their children for the jobs they want by spending great effort and, often, money, in upbringing and education, and in the Western world systems of education are available which provide suitable preparation for careers in industry and commerce.

In many countries where we do business things are not like this at all. Instead, we are dealing with forms of society, each with its own meaning and value, in which economic and industrial development are new things, and the kind of society which we are used to in Europe has not come into being. There is no pattern of upbringing, no system of education, to develop the outlook and specialised skills which we must look for. In countries like this we cannot do a very great deal to improve matters, because the development of patterns of society and ways of thought is part of a nation's historical development which no single firm could massively influence.

Our way of meeting this problem has been to take promising men from among those who work for us and try to give them the kind of education and training which, elsewhere, they might have had earlier in life and outside the business. The United Africa Company has great experience of doing this kind of work in African countries, but useful as it is, this kind of training is not an entirely satisfactory substitute for a national system of education. The difficulty is that it gives men who must acquire, for their work, an outlook and a system of values which is at variance with the traditions of their community, and even of their own households, which is not a very desirable state of affairs. We are pleased, therefore, to be able to hand over some of our educational responsibilities as the new communities get their own systems under way.

Industrial development, we feel strongly, must be related to the general development of ways of thought and methods of upbringing and education in the community, otherwise very great strains will be set up—after all, our own society is by no means free of those strains yet, and it is nearly two hundred years since modern industrial development began. Now this is clearly a matter for the nations among whom we work, rather than one for ourselves, and it cannot be dealt with quickly. But they want—and quite rightly want—a standard of living which they cannot have without business organisation of the type familiar in Europe and America, and they want it quickly. That sort of organisation cannot be run without managers. We can help to give them the standards of living they desire, but to do it we shall be forced, in many parts of the world, to bring managers in from abroad for a good many years to come.

This does not mean that we want to stop the people of those countries from getting on terms of equality with the foreigner. On the contrary, so far as we can we give them every chance to do so. But we do not think that any good end is served by promoting a man simply because he was born there, unless he can do the job—or can be trained to do it—at least as well as someone who was not. And we think that any country which passes laws to force us to promote its nationals against our own better judgment is not, in the end, serving its own interests. We are confident that we know our own business, and that the economy of a country which insists on preference for its own people, regardless of their ability, will suffer as a result of its insistence on having mediocre industrial management.

THE TRAINING OF TALENT

Wherever we can find the right men to become managers, in a general sense, we are ready to train them for the particular work we want them to do. All over the world, and especially in the less forward parts of it, there is a great need for trained men. We go some way to fill that need, and we think that is one of the advantages which a country gains from having a Unilever company on its soil. We do not pretend that we are disinterested. We train men because we think it is in our interests to do so. But training, once given, can never be withdrawn, nor could we, even if we wished, keep its benefits to ourselves. Trained ability is part of a country's general capital stock. As such, it adds to the national well-being.

To get training of this sort, students come in great numbers to Europe. In the last academic year, 10,000 out of 96,000 places available in universities in Great Britain were filled by people from other countries. In the Netherlands, although they no longer have the high intake of students from Indonesia, over four per cent of the places in the universities are filled by students from other countries. And in our own business we find that we fill about one-third of the places on our management courses with managers from countries outside Europe. On top of that, every year some 200 managers and specialists from overseas are to be found spending up to six months with one or other of our European firms. When they go home again, they will probably be working under men who, themselves, have also been trained in Europe, whether or not they were born there.

But training in Europe is for the relatively

advanced and sophisticated few. Let me speak, for a moment, of those of our people who are trained by our companies in some of the less developed countries. These are the people, as I said earlier on, among whom we expect to find potential local managers; *and no company trains so many of them as* The United Africa Company, because no other company has so great a need.

The United Africa Company is a merchant, bringing into Africa the goods which Africans increasingly want—and can afford to buy. That means, among much else, all the machinery and gadgets of the West—motor cars, refrigerators, electric sewing machines—which must be put on the market in good order and repaired when they go wrong. The United Africa Company is also, more and more engaged in manufacturing, which means that there is machinery to erect and maintain. For both these reasons, therefore, The United Africa Company needs skilled and semi-skilled labour. And that kind of labour is even scarcer in Africa than elsewhere. If you want it, you must make it grow.

On the purely technical side, The United Africa Company has established eight training schools—five in Nigeria; one each in Ghana, Sierra Leone and Kenya. They have about 400 students, and they cover all kinds of courses from five-year apprenticeships in mechanical and electrical engineering to shorter courses in single trades and refresher courses for those whose knowledge needs refurbishing. On the office side, The United Africa Company runs vocational courses for accounts clerks, shorthand typists, comptometer operators, and so on. Throughout their organisation, travelling instructors run courses within the framework of Training within Industry.

On this foundation, The United Africa Company has begun to erect a system for training managers *in Africa.* In March this year the first group of African and European managers entered upon a residential course run with the help of the University College of Ibadan in Nigeria. This does not in the least prevent African managers from coming, as they have come in the past, to courses in Europe or to work with those holding similar appointments in this country which will give them experience which they could not get in Africa. But, in general The United Africa Company takes the view that basic training should be done in a man's own country and, as far as possible, on the job. *It is at a later stage* of his career that he and the Company will benefit most by additional training in the United Kingdom or the Continent. In any one year, The United Africa Company generally brings about 30 such people to the UK for training and probably more will come as time goes on.

THE PROSPECT FOR TALENT

Anyone who works for an international business has the right to be judged by his competence, not by his nationality. If he is good, he should have the same chance to get on as anyone else of equivalent ability, no matter where he was born. If this principle can be made to apply—and I do not say it is easy—then it means that in an organisation such as Unilever the representatives of any nation, large or small, highly industrialised or not—men of any colour or class—are on an equal footing so far as their prospects are concerned. What they can do, or what they can be *trained to do, are the things that* matter.

Thirty years ago, you could hardly have claimed that Unilever chose its management along these lines. There was already a fairly wide range of nationalities within its ranks but, generally speaking, Englishmen and Dutchmen had the brightest prospects. A young man of any other nationality—able, and proportionately ambitious—might well have been deterred from joining Unilever. He could have seen, all too plainly, that the best jobs in his country were usually held by English or Dutch managers. The situation, therefore, was inclined to be self-perpetuating. If local talent did not come in, then English and Dutch managers would be replaced, as their turn came, by yet more Englishmen and Dutchmen.

I think we may fairly claim that things are not like that nowadays. What we want to be able to do is to deploy our managers across the world to the best advantage of the business, without regard to nationality. For one thing, as I have already pointed out, there will for a long time be a shortage of trained ability in some of the countries where we operate, which means that foreign managers must come in if the business is to be carried on properly. For another thing, and in the long run it is probably more important, we think that managers in an international business ought to have international experience. This means that promising men ought, as a matter of principle, to serve from time to time outside their own countries for long enough to get the feel of a job and of a market. To the enterprising man, foreign service is often in itself attractive, but, if there is an element of personal inconvenience, he accepts it for the sake of his career.

This kind of opportunity ought to be open to everyone who can profit by it, not to the citizens of one or two 'most favoured nations' only. The Unilever 'expatriate' ought not to be thought of mainly as a European working in Asia or Africa, or as an Englishman or Dutchman in some European country outside Great Britain or the Netherlands. He ought also to be thought of as an Indian in the United Kingdom, a Frenchman in Denmark, or a Norwegian in Holland. At the present time, leaving English and Dutch managers out of account, we have 225 managers of 21 nationalities working in countries outside their own. These figures represent, we hope, a process of internationalising opportunity which is still at a fairly early stage. As it goes on, it should make the highest positions in the service of Unilever, in any country, realistic objects of ambition for any able manager, no matter what his nationality.

THE COMPETITION FOR TALENT

A great many people besides ourselves want the kind of people who show promise of becoming capable, in time, of running our business. Able men are not very common, and there is great competition for their services. I should like to draw your attention, before I close, to some aspects of this competition and to suggest how, in our view, it can best work to the general advantage.

In some countries, especially those newly independent and little industrialised, the Government itself is a strong bidder for men of the kind whom we, also, could usefully employ. There is a lot of work in these countries which must be undertaken, and which only Government can undertake. We recognise that, and we would not for a moment suggest that a Government should not have first call on the ability of its citizens for work of that kind. Of course it should. But the pressure which is brought to bear on able men to join the Government service can be very strong, and we ask ourselves, sometimes, whether it is not stronger than it need be, to the disadvantage of other work that urgently needs to be done, including our own.

For we think that our work is important to the community, not only to ourselves. It can help quite powerfully in raising general standards of life. It can help to bring into being patterns of life which are less rigid and which offer opportunities of advancement based on what you can do, not on who your father was. It can, in short, have a liberalising influence which can complement the influence of Government.

If we ask other employers not to be selfish in their search for good men—not to make a corner in talent—then we ought to practice what we preach. This is, in fact, what we try to do. Within our own organisation, we insist on our Companies allowing men to be transferred from one to another. Looking further afield, we do not see why movement of this sort should be confined within our own limits. We should like to see greater freedom of movement between firms, and greater interchange between 'business' in general and other fields of activity, such as the Universities and the Government service. When you have a good man you do not willingly let him go, but if he is to have the full opportunity of using his capabilities he must be free to go if the opportunity arises. If you hold him back you are unfair to the man himself and to the community as a whole, which needs the service of his scarce talents.

Our experience is that the exchange of managers gives us one of the greatest assets of our business: cross-fertilisation of ideas. Perhaps it does something more, too. What we are doing, or trying to do, is to build up, in the countries where we operate, management teams of able men, not men of any particular nationality or race. We are developing, we hope, a multi-national organisation with a multi-national outlook. In a world where narrow nationalism is not the least nor the most distant of dangers, we think that is something worth doing.

The Chairman concluded by moving the adoption of the Report and Accounts for the year 1958. Mr G. J. Cole, Vice-Chairman, seconded the motion and it was carried unanimously.

The proposed final dividend of 2s. 1.2d. per £1 of Stock on the Ordinary Stock ranking for dividend for the year 1958 and a dividend of 6 per cent on the Deferred Stock payable on May 12, 1959, were approved.

The retiring Directors were re-appointed.

The remuneration of the Auditors, Messrs Cooper Brothers & Co. and Messrs Price, Waterhouse and Co., who had been re-appointed under the provisions of the Companies Act 1948, was fixed.

The proceedings terminated with a vote of thanks to the Chairman, Directors and all employees.

UNILEVER N.V.

The Annual General Meeting of the Members of Unilever N.V. was held on Friday, April 24th, at Museumpark, Rotterdam. Mr F. J. Tempel presided and made a speech in similar terms to that delivered by Lord Heyworth at the Annual General Meeting of Unilever Limited, reported above.

The Report and Accounts for the year 1958 were adopted. The proposed final dividend of 9¼ per cent on the Ordinary capital ranking for dividend for the year 1958 (being the equivalent of the final dividend for the same year to be paid by Unilever Limited on its Ordinary Stock, calculated in accordance with the provisions of the Equalisation Agreement) was approved; the retiring Directors, with the exception of Mr R. E. Huffam who has reached retirement age, were re-appointed and the Auditors, Messrs Price Waterhouse and Co. and Messrs Cooper Brothers and Co., were re-appointed.

RUGBY PORTLAND CEMENT

RECORD PROFITS

SIR HALFORD REDDISH'S REVIEW

The Annual General Meeting of The Rugby Portland Cement Co. Ltd. will be held on May 29, 1959. The following are extracts from the speech of the Chairman, Sir Halford Reddish:

A year which opened with Bank Rate at 7 per cent and saw it reduced to 4 per cent; which began under the influence of an intensified credit squeeze and ended with a freedom to banks to lend and others to borrow which had not been known for nearly 20 years; which began with the £ under pressure and ended with a formal recognition of the external convertibility of sterling and world confidence in our currency fully restored; and a year in which the United Kingdom earned a record surplus on its overseas trade—all this merits the description of 1958 as an exciting and unusual year.

The changing economic climate naturally found reflection in the progress of our own Industry. Home-market deliveries by the whole Industry for 1958, while not of course reaching the record figures of 1956, were nevertheless within less than one per cent of the 1957 total.

Our Group net profit for 1958 is a record for the thirteenth successive year. We are therefore recommending to you that the dividend on the Ordinary shares should be raised to 1s. 3d. a share, and that on the "A" shares to 1s. 6d. a share.

DIVIDEND POLICY

A dividend of 1s. 3d. a share on the Ordinary shares is in reality one of 6.06 per cent on the book value of the equity capital employed in the business. If the present-day value of the assets were substituted, the real rate would be about 3.6 per cent. The total amount now carried forward to the credit of the 1s. "A" shares is £189,224 (gross), or about 3s. 9d. a share.

It has always been our practice in this Company to pursue a conservative dividend policy. I have no doubt that it was the right policy particularly during a period of comparatively rapid expansion such as has taken place since the second world war. But it has meant that the holders of the Ordinary shares have in effect been adding to their investment in the Company: the undistributed profit which belongs to them has become additional capital, and the assets which it represents have been used in the business. This additional capital is just as much entitled to its reward as that more formally designated as issued share capital. Logically (and equitably), therefore, one of two things should in theory happen. Either the undistributed profit should be formally "capitalised" by means of a scrip issue, or the *rate* of dividend on the nominal amount of issued capital should be proportionately increased. In neither case would there in fact be an increase in the real dividend, though it would be so regarded in many quarters. It would merely be the same rate of reward on the increased capital resources provided by the holders of the Ordinary shares.

Let me illustrate the point in this way. The net book value of the equity capital of the Group increased between December 31, 1956, and December 31, 1957, by about 7½ per cent. In other words, the real capital employed in 1958 was 7½ per cent greater than in 1957. Merely to maintain the same return to the shareholder the rate of dividend should be proportionately increased—which would have the same effect as maintaining the same rate of dividend on an issued capital increased by a scrip issue equal to the undistributed profit of 1957.

Since the close of the year we have made a further issue of one million Ordinary shares which were offered at 21s. 6d. a share as "rights" to the existing holders of our Ordinary shares. The new money will be used to finance the expansion of the Company's business at home and abroad—principally abroad—and for additional working capital.

RISING DEMAND

Group deliveries of cement and group profits for the first three months of the current year are in excess of those for the corresponding period of 1958. Indications are that the demand for cement in the home market in 1959 will be above that for 1958, and the same is true of our overseas manufacturing subsidiaries. The export trade, which was difficult throughout 1958, is not likely to contribute to any greater extent to the group profits this year.

But no consideration of our future can ignore the impact of the coming General Election, fought as it will be by parties with such widely differing economic policies.

Confidence in the £ has been fully restored by the bold policies of the present Government. But confidence is a delicate flower needing infinite and unremitting care: one touch of frost and it can wither overnight. The return of a Government in this country committed to a programme of more nationalisation would I am sure cause an immediate loss of confidence abroad, and a run on the £; and that would mean in a short time the loss of overseas markets and consequent unemployment in the United Kingdom.

EXPANSION WITHOUT INFLATION

Given political stability and a continuance of the policies of the present Government I believe that a period of increasing prosperity can be ours in this country. It is clear that there is considerable scope for expansion in the economy; and now that we have virtually achieved stability in prices, if wages are allowed to increase only in line with increasing productivity then the bogy of inflation can be held in check. A wage increase in one industry, or even in one company, is no reason for a similar increase in another.

The taxation reliefs proposed in the 1959 Budget should assist the realisation that stability of the price level is of far greater benefit to the wage-earner than a wage increase in terms of a depreciating currency: that what matters is not the pound notes in the pay packet but what they can purchase in exchange.

The Budget proposals should stimulate both production and savings; and have clearly been framed, very rightly, with a view both to the maintenance of the external value of the £ and to expansion of the economy at home without further inflation.

We in Rugby Cement look confidently to the future.

A copy of the full speech can be obtained on application to the Secretary, Crown House, Rugby.

INTERNATIONAL NICKEL COMPANY OF CANADA

HIGHER NICKEL DEMAND FORECAST

The annual meeting of The International Nickel Company of Canada Limited, was held on April 29th in Toronto.

Dr John F. Thompson, the Chairman, presided and, in the course of his speech, said:

Sharply reduced nickel demand in 1958 forced the Company to operate substantially below capacity during the year. Production was curtailed three times and, for a period of three months, our mines and plants in Ontario were shut down by a labour strike. These conditions, together with lower prices and reduced deliveries of copper and platinum metals, resulted in the lowest earnings for any year since 1949.

Our sales in 1958 totalled $322 million, down $120,800,000 from the previous year. Net earnings were $39,600,000 equal to $2.71 per common share, compared with $86,100,000, or $5.90 per share, in 1957. Four quarterly dividends, each of 65 cents per share, totalling $2.60 per share, were paid in 1958, compared with $3.75 per share in each of the three preceding years.

Our deliveries of nickel in all forms in 1958 amounted to 205,800,000 pounds, contrasted with 290,100,000 pounds in 1957. Refined copper deliveries were 210,600,000 pounds, against 280,800,000 pounds in the previous year.

MANITOBA PROJECT

Construction work continued on schedule at the Company's new mining project at Thompson, Manitoba, which is scheduled to start operations next year and to come into full-scale nickel production at an annual rate of 75 million pounds in 1961.

I cannot emphasise too strongly the long-range importance of the Manitoba project to the Company and to the nickel industry in general. Consumers of nickel must be assured of plentiful supplies in the years ahead if the full market potential of the metal is to be realised. Nickel production capacity must be capable of meeting surges in demand that will arise during the anticipated upward trend in nickel consumption. The prompt completion of our Manitoba project, which will increase the Company's total annual nickel production capacity to 385 million pounds beginning in 1961, will contribute greatly to the attainment of this goal. But we set no ceiling on the demand that can be created for nickel and we must do whatever is necessary to assure that future supplies will always be more than adequate. As a consequence, we are actively continuing our exploration in Canada and throughout the world for still further sources of nickel.

While figures for first quarter operations of 1959 are incomplete, net earnings for this period are expected to show an improvement over the corresponding quarter a year ago when they totalled $12,200,000, equal to 83 cents per common share. Contributing factors to the expected improved earnings for the first quarter were a sharp surge in demand for nickel in the United States, higher prices for copper and increased sales of platinum metals.

It is anticipated that the world demand for nickel will continue through 1959 at a rate higher than in 1958. This, together with improved prices for copper and platinum metals, should result in a satisfactory year.

The report and accounts were adopted.

THE RHODESIA BROKEN HILL DEVELOPMENT COMPANY LIMITED

(Incorporated in Northern Rhodesia)

INCREASED ORE RESERVES

The following are extracts from the review by Mr H. F. Oppenheimer, the chairman, which has been circulated with the annual report and accounts.

During 1958 lead and zinc prices fell to their lowest levels since 1946. Lead fluctuated between £68 and £78 per ton and showed no improvement in December, 1958, over the previous January; zinc prices varied from £61 to £78 per ton but finished the year fairly strongly at around £74 in December as against £62 in January, 1958.

LEAD AND ZINC MARKET

While the low level of prices was directly attributable to over-production in relation to the overall demand, consumption in Europe was maintained at a fairly good level and the market recession arose directly from developments in the United States of America.

There have been no significant changes in the market prices of lead and zinc since the end of the year, but it is interesting to note that the zinc price shows a firmer tone than the lead price and that the long-standing differential in favour of lead was reversed in November, since when zinc has frequently commanded £5 per ton more than lead.

It is difficult to make any prediction about the prices of lead and zinc during 1959. Some governmental decision may be taken to cut production and there has been an improvement in the industrial tempo of the United States, but it does seem that world production of both metals will be fully able to meet expected consumption this year.

While our Company is naturally no less affected by the fall in prices than any other producer, we are fortunate that the bulk of our output is sold in Southern Africa and although our metal stocks at the year end were slightly higher than we would have liked, I do not anticipate that we will have any difficulty in disposing of these and current production in 1959.

The lower prices inevitably resulted in a sharp reduction of profits during 1958 which, after providing for taxation, were £591,000 as compared with £909,000 in 1957. Capital expenditure at the mine was restricted to the minimum required for immediate essential items and amounted to £272,000 compared with the sum of £400,000 which we had estimated would have to be spent. The bulk of the expenditure related to the completion of the Mita Hills Dam scheme and associated electrical power plant; this outlay amounting to £240,000 was financed largely by drawing the remaining £200,000 of the Broken Hill Municipality loan. While no appropriation was necessary to cover capital expenditure during 1958, it was estimated that £300,000 must be spent in 1959 and it was considered advisable to make some provision towards this by appropriating £100,000 this year.

We have been able to recommend a net final dividend of 6d. per stock unit which, together with the interim dividend of 3d., makes a total of 9d. net per unit for the year. In view of the depressed state of the lead and zinc market, I think this can be considered a satisfactory return.

During the year it was possible to effect a reduction of £122,000 in the value of stores held. This is an important contribution to our cash resources but, while I am hopeful that further reductions will be effected, it is unlikely that these will be material in the future.

IMPERIAL SMELTING PROCESS

Last year I referred to the investigations being undertaken in search of better methods than those at present employed in dealing with the complex ores we have at Broken Hill and during the year these investigations and studies became concentrated on the use of the Imperial Smelting Process which is already in commercial operation by the Imperial Smelting Corporation at Avonmouth. Comprehensive trials on various mixtures of ores and intermediate products from our mine were carried out in the experimental units at Avonmouth with complete technical success. The Consulting Engineers are following up these tests with a thorough economic assessment as this type of furnace seems to offer the most satisfactory answer to the problem of improving the recovery of lead and zinc from currently mined ores and of the treatment of the growing stocks of high-grade oxydized products which are not amenable to present processes. The Imperial Smelting Process, which produces simultaneously but separately zinc metal of Prime Western grade and lead bullion, is designed to give high recoveries of both metals at reasonable costs. It is also thought that, apart from being able to assimilate accumulated oxide ores, it would be possible to reclaim metal from slag dumps and the scale of operations at the mine and the output of metals could be increased.

INCREASED ORE RESERVES

The capital expenditure required for the installation of an Imperial Smelting furnace and ancillary plant is under examination and I cannot give a figure at present. It is, however, likely to be very substantial and therefore, apart from a thorough assessment of the installation itself, the Consulting Engineers decided during the year to carry out an intensive programme of underground drilling in the mine so that further information could be obtained on the ore available. As a result an additional 386,400 tons of ore have been transferred from the indicated reserves to proved reserves and 583,300 tons of ore have been added to the indicated reserves. Although it was decided, as no work had been done at No. 2 Kopje for some years, to delete any tonnage previously allotted to this area, the total ore reserves at the end of the year were 5,145,300 tons averaging 28.6 per cent zinc and 15.32 per cent lead, compared with 4,387,100 tons at the end of last year, an increase of some 758,000 tons. Further work being undertaken at the mine is likely to reveal additional tonnages and the No. 2 Kopje deposit is being re-examined and will be drilled before any tonnage from this source is again included in the ore reserves.

This very satisfactory increase in the ore reserves gives an estimated life at the present rate of milling and extraction of about 25 years. As the Imperial Smelting Process will give a higher rate of recovery but will not shorten the working life of the mine, the Consulting Engineers' preliminary view that the installation of this type of process at the mine is probably an economic project is reinforced. We now have to await the full appraisal from them, which, if favourable, will have to be followed up by consideration of the best means of providing the substantial amount which will be required.

Even if the new process is introduced it is proposed to continue to produce electrolytic zinc from zinc concentrates in the existing plant, to which a second roaster is to be added by 1960 to enable a greater amount of zinc concentrates to be treated.

ALLIANCE ASSURANCE COMPANY LIMITED

Extract from the Review of the Report and Accounts for the year 1958 by the Chairman, Mr T. D. Barclay

LIFE DEPARTMENT

The net new sums assured completed during the year amounted to £15,367,184 compared with £12,189,750 in the previous year.

New sums assured by themselves do not provide an absolute measure of the Company's progress but an increase of 26 per cent over the previous year is satisfactory by any standard.

As you know, we carry out quinquennial valuations of our life funds and 1958 was valuation year for the Alliance Life and Annuity funds. I am pleased to say that we were able to declare a reversionary bonus at the rate of 46s. per cent per annum calculated on sums assured and existing bonuses. This rate, which is the highest in the Company's history and 10s. more than the previous one, has been well received by our policyholders and agents.

FIRE DEPARTMENT

In this Department the net premiums rose from £7,665,804 to £7,921,047 and the claims fell from £3,155,571 to £3,006,323, the result of the year being a surplus of £859,358 compared with £606,456 in 1957.

It is most pleasing to see a recovery in the results of this very important Department after two rather lean years.

MARINE DEPARTMENT

The net premium income was £2,297,368 which shows a reduction of £142,406 compared with last year's premium.

The underwriting Account for 1956 has now been closed with a balance of £165,726. Settlements arising from previous years' Accounts, however, amounted to £170,055 and a transfer from Profit and Loss of £4,329 is necessary.

ACCIDENT DEPARTMENT

The net premiums in the Accident Department amounted to £9,312,854 as compared with £8,564,005 in 1957. The claims rose from £4,151,186 to £4,603,349 and the surplus, after providing for unexpired risks, rose from £546,043 to £654,998.

Last year I reported a somewhat improved situation in our Motor business but this has not been maintained in this field and I am afraid our operations in this field and I am afraid our profitable although in some have again been unimprovement in results has overseas areas an[illegible]n shown.

TRUSTEE DEPARTMENT

The total fees received during 19[illegible] amounted to £32,455 showing an increase of £2,435 over the previous year.

INVESTMENT DEPARTMENT

The transformation of the financial scene during 1958 was reflected in the reduction in the Bank Rate from 7 per cent to 4 per cent and a general recovery in the market values of nearly all types of investment. The Company's portfolio of investments fully reflected this recovery which, of course, was very much more marked in the case of Equities than in the case of British Government Securities.

As a natural corollary to the general rise in prices the yields obtainable in 1958 receded steadily from the high levels touched in the latter part of 19[illegible] but in spite of this the average rate on the new investments exceeded 6 per cent and as a result the overall gross yield on the Life and Annuity funds was further increased to £5 7s. 8d. per cent.

PROFIT AND LOSS ACCOUNT

The profit of the Group, after making provision for taxation and other outgoings, amounted to £1,453,693 as against £1,284,944 in 1957.

This time last year I was guarded and, as it has turned out, conservative in my estimate for our future profits. I have learnt that it is unwise to attempt to give any indication in advance of the likely course of underwriting results and on this occasion I will content myself by assuring you that the increase in the dividend from 3s. 9d. to 4s. 3d. per share which your Board has declared is regarded as well justified and prudent.

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1958

After providing for taxation and for outside shareholders' interest in profits of subsidiary companies, the consolidated net profit for the year was £1,903,957 (compared with £1,578,431 in 1957). To this has to be added £845,888 brought forward from 1957, making a total of £2,749,845. From the amount available for appropriation by subsidiary companies, £150,000 has been placed to General Reserve Accounts, £60,000 to Exploration Reserve Accounts and £766,302 carried forward as unappropriated profits, leaving £1,773,543 available for appropriation by the Corporation. The Directors have written off Note Issue expenses amounting to £32,802, have placed £350,000 to the credit of Exploration Reserve Account and have declared a final dividend of 2s. 0d. United Kingdom currency per share less United Kingdom Income Tax, making, with the interim dividend of 1s. 0d. per share less United Kingdom Income Tax paid on 28th November last, a total dividend for the year of 3s. 0d. per share less United Kingdom Income Tax (the same as last year). These dividends absorbed £802,125. From the balance of £588,616 remaining the Directors have declared a bonus dividend of 6d. United Kingdom currency per share less United Kingdom Income Tax, absorbing £133,687. After adding in the unappropriated profits of subsidiary companies and parent company dividends receivable within the Group, there is a consolidated balance to be carried forward of £1,291,593. An increase in the final dividend in respect of the year would have entailed an additional United Kingdom profits tax liability. Accordingly the Directors have declared a bonus dividend not related to any specific period.

Holdings of shares, debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market value of 31st December last, or, where no market price exists, above the Directors' valuation. The Directors, as on other occasions, have thought it expedient to write down the book cost of certain holdings below both cost and market price to allow for the wasting nature of a substantial part of the portfolio. To this end they have charged the Profit and Loss Account with £150,000, of which £50,000 has been charged in the Accounts of a subsidiary company.

During the year arrangements were made to provide additional finance for the Corporation's business (including the further exploitation of the Kinross goldfield) by placing privately in the Union of South Africa £2 million of 6½ per cent. Registered Unsecured Notes at par repayable in instalments 1974-83. The money is being made available in eight equal quarterly amounts, the first of which was received on 31st March, 1958. Thus at 31st December the Corporation had issued £1 million of these Notes.

The Directors record with profound regret the death on 8th August, 1958, of The Right Honourable The Viscount Bracken, Sir Charles J. Hambro, K.B.E., M.C., was elected Chairman in succession to Viscount Bracken and Mr. T. P. Stratten was elected Deputy Chairman, retaining the appointment of Managing Director and remaining resident in the Union of South Africa.

The Report includes the usual tables of gold statistics and the Corporation's Annual Trade Cycles Chart, revised to date.

GOLD MINING INTERESTS

The following table summarises the results for the past year of Companies operating in the Transvaal and Orange Free State in which the Corporation is largely concerned:

	East Geduld Mines, Ltd.	Geduld Proprietary Mines, Ltd.	The Grootvlei Proprietary Mines, Ltd.	Marievale Consolidated Mines, Ltd.	St Helena Gold Mines, Ltd.	Van Dyk Consolidated Mines, Ltd.
Tons milled	1,547,000	929,000	2,360,000	891,000	1,468,000	913,000
Yield per ton, dwt.	6.16	3.31	4.25	5.22	5.53	3.68
Working Costs per ton	34s. 7d.	38s. 4d.	31s. 5d.	41s. 5d.	41s. 10d.	39s. 7d.
Working Profit per ton	42s. 7d.	8s. 3d.	21s. 11d.	24s. 1d.	31s. 6d.	6s 7d.
Total Working Profit	£3,296,000	£383,000	£2,588,000	£1,073,000	£2,310,000	£360,000
Net Profit	£1,668,000	£843,000	£1,323,000	£622,000	£2,276,000	£357,000
Dividends: Total	£1,650,000	£822,000	£1,325,000	£563,000	£1,063,000	*
Per Stock Unit or Share	3s. 8d.	11s. 3d.	2s. 4d.	2s. 6d.	2s. 1d.	*

* Return of capital in 1958, £546,000, or 1s. 3d. per share.

The net profit figures include revenue from other sources. Thus East Geduld Mines' dividend income in 1958 on its stockholding in The Grootvlei Proprietary Mines was £62,720 and Geduld Proprietary Mines' dividend income in 1958 on its stockholdings in East Geduld Mines and The Grootvlei Proprietary Mines was £648,358.

ST. HELENA GOLD MINES.—At No. 2 shaft excellent progress has been made with development and preparation of stopes. In order to provide ventilation for the mining of an up-thrown block of reef on the eastern side of the property adjacent to the boundary with President Brand Gold Mining Company, which will be mined from No. 2 shaft, a ventilation shaft (known as No. 7 shaft) is being sunk to an initial depth of 4,100 ft. At the year-end it had reached a depth of 40 ft. In March of this year a dividend of 1s. 3d. per share was declared.

WINKELHAAK MINES.—The small vertical shaft (No. 3B) situated 350 ft. north of No. 3 shaft was completed at a depth of 1,471 ft. and brought into operation, greatly assisting the servicing of the No. 3 shaft area. Trial crushing started in March, 1958 and was continued until the end of November, when full scale milling commenced. In December the Company earned a maiden monthly profit of £15,502.

Interests in Gold Mining Companies not under the administration of the Corporation:—

STILFONTEIN GOLD MINING COMPANY.—There was a further increase in the combined profits from the production of gold and uranium during the year and two dividends totalling 3s. 9d. per share were declared.

WESTERN HOLDINGS.—There were increases in the average yield and in the tonnage of ore milled during the year ended 30th September, 1958 and, in consequence, the working profit increased substantially to £4,708,288. Two dividends, totalling 7s. 0d. per share, were declared and a further dividend of 3s. 6d. per share was declared in March of this year.

OTHER MINING INTERESTS

SAN FRANCISCO MINES OF MEXICO.—The reduced tonnages of metals sold and the lower prices obtained for them resulted in a fall in gross revenue from the sale of the Company's products from £10,068,000 to £6,416,000. After charging taxation amounting to £1,456,000, all but £38,000 being Mexican export, production and mercantile taxes assessed on gross value of metals sold, the Company made a net loss for the year of £208,000.

CHROME MINES OF SOUTH AFRICA.—The trading results for the year ended 30th June, 1958 showed a slight improvement over those for the previous year and the Company declared a dividend of 1s. 0d. per share in September last. The improved results were achieved in spite of a softening in the market for chrome ores as the Company had orders on hand at satisfactory prices. The market remains weak, however, and it is likely that the results for the current year will show some decline in profits.

The Corporation is also interested, inter alia, in the following Companies:—

SELECTION TRUST.—This Company paid a final dividend of 5s. 3d. per Ordinary Stock Unit for the year ended March, 1958 and has since declared an interim dividend of 1s. 9d. per Unit for the year ended March, 1959.

TSUMEB CORPORATION.—Due to a decline in non-ferrous metal prices on world markets, the net profit for the year ended 30th June, 1958 was £4,226,029 as compared with £7,012,875 for the previous year, and dividends totalling 17s. 6d. per share were declared. During the first nine months of the current financial year the Company has declared dividends totalling 17s. 6d. per share.

OTHER INTERESTS

BAY HALL TRUST.—The net profit for 1958 was £138,961, compared with £136,244 in the previous year. The Company paid a dividend of 17 per cent., less tax, the same as for last year, plus a bonus dividend of 1 per cent., less tax. At market prices on 31st December, 1958 (for where no market price existed, at valuations by the Directors on that day) the investments had an aggregate value of £3,848,628, as compared with their book value of £2,017,151.

SOUTH AFRICAN PULP & PAPER INDUSTRIES.—The net profit for the year ended 31st December, 1958 was £492,070, compared with £486,835 for the previous year. A dividend of 2s. 0d. per share has been declared. At the Tugela mill the new M.G. paper machine was commissioned during the year. The Company is embarking on a project for the production of newsprint at the Enstra mill at an estimated cost of £2,700,000 of which £1,500,000 will be covered by a fixed interest-bearing loan, £275,625 by a small issue of shares and the balance will be drawn from the Company's own resources.

EXPLORATION

KINROSS AREA.—Drilling was continued during the year. It is intended shortly to make application to the Mining Leases Board of the Government of the Union of South Africa for two new mining leases. A further possible lease area is still under investigation and more drilling in this area will be undertaken.

Copies of the full Report and Accounts can be obtained on application at the London Office, Princes House, 95, Gresham Street, London, E.C.2.

Dividends Nos. 36 and 37 of 1s. 1d. and 1s. 5d. per share respectively		562,500
Leaving a balance unappropriated of		£225,723

Tonnage milled increased from 854,000 tons to 891,000 tons, but the average yield decreased from 5.25 dwt. to 5.22 dwt. Of the 11,130 ft. sampled on the Kimberley Reef, 34% was payable, averaging 233 inch/dwt. Of the 11,775 ft. sampled on the Main Reef, 30% was payable, averaging 230 inch/dwt. The ore reserve was re-estimated at the year-end and showed an increase of 100,000 tons at 5,300,000 tons, assaying 5.3 dwt. over an estimated stoping width of 46 inches. The extensions to the reduction plant have been completed and were being tested at the end of the year.

ST. HELENA GOLD MINES, LIMITED

(Incorporated in the Union of South Africa)

Extracted from the Annual Report for the year ended 31st December, 1958

	£	Per ton milled s. d.
Working Revenue	5,384,261	73 4
Working Costs	3,073,609	41 10
Working Profit	2,310,652	31 6
Add : Income from Investments and Sundry Revenue	44,446	£2,355,098
Less : Directors' Fees and Sundry Expenditure	69,287	
Interest on Housing Loan	11,275	
Transfer to Loan Redemption Reserve	20,000	
Net Expenditure during year on Fixed Assets	1,256,309	
		1,356,871
		998,227
Balance unappropriated at 31st December, 1957		835,599
		1,833,826
Dividends Nos. 5 and 6 of 1s. 0d. and 1s. 1d. per share respectively		1,002,604
Leaving a balance unappropriated of		£831,222

Tonnage milled increased from 1,392,000 tons to 1,468,000 tons and the average yield from 5.83 dwt. to 5.85 dwt. Of the 23,230 ft. sampled on the Basal Reef, 49% was payable, averaging 519 inch/dwt. The ore reserve was re-estimated at the year-end and showed an increase of 150,000 tons to 3,400,000 tons assaying 6.5 dwt. over an estimated stoping width of 55 inches.

Development at No. 2 Shaft resulted in an appreciable increase in the footage developed to 73,460 feet. The percentage payability declined slightly but the average value increased by 97 inch/dwt. No. 7 Shaft, sited approximately 5,200 feet east-south-east from No. 2 Shaft, had been sunk to a depth of 40 feet at the year-end.

In the case of each of the above Companies, discounts have been applied to development values to conform with adjustments necessary in estimating ore reserves.

UNION CORPORATION, LIMITED—*continued*

THE GROOTVLEI PROPRIETARY MINES, LIMITED

(Incorporated in the Union of South Africa)

Extracted from the Annual Report for the year ended 31st December, 1958

	£	Per ton milled s. d.
Working Revenue	6,295,365	53 4

Dividends Nos. 39 and 40 of 1s. 1d. and 1s. 3d. per unit of stock respectively		1,334,529
Leaving a balance unappropriated of		£677,463

Tonnage milled increased from 2,357,000 tons to 2,360,000 tons but the average yield decreased from 4.27 dwt. to 4.25 dwt. Of the 13,840 ft. sampled on the Main Reef, 39% was payable, averaging 195 inch/dwt. Of the 2,260 ft. sampled on the Kimberley Reef, 34% was payable, averaging 309 inch/dwt. The ore reserve was re-estimated at the year-end and showed a decrease of 500,000 tons at 13,500,000 tons, assaying 4.5 dwt. over an estimated stoping width of 48 inches.

WINKELHAAK MINES, LIMITED

(Incorporated in the Union of South Africa)

Extracted from the Annual Report for the year ended 31st December, 1958

(Financial Results for the period 1st to 31st December, 1958)

	£	Per ton milled s. d.
Working Revenue	194,352	56 4
Working Costs	178,850	51 10
Working Profit	15,502	4 6
Add : Income from Investments and Sundry Revenue	622	£16,124
Less : Sundry Expenditure	228	
Directors' Fees	192	
Interest on Loans	6,618	
		7,038
Profit for Year Carried Forward to 1959		£9,086

Trial milling started in March, 1958, and continued until the end of November, when full scale milling commenced. During December, the tonnage milled amounted to 69,000 tons at an average yield of 4.49 dwt. per ton. The ore reserve calculated as at 31st December, 1958, amounted to 1,200,000 tons with an average value of 5.7 dwt. over an estimated stoping width of 58 inches.

No. 3B Shaft was sunk 1,381 feet to its final depth of 1,471 feet and concrete lined.

The Company has been granted a prospecting contract by Capital Mining Areas, Limited, for two years commencing 1st August, 1958, in respect of a portion of the farm Winkelhaak measuring 353 morgen and adjoining the south-western boundary of the mining lease area. The contract entitles the Company to purchase the rights to minerals (excluding diamonds and coal) of this property or any portion thereof not less than 100 morgen in extent for £25 per morgen. The Company has entered into a deed of sale with Capland Estates, Limited, whereby it will purchase the surface of the property for £60 per morgen if it exercises its right to purchase the mineral rights in whole or in part.

VAN DYK CONSOLIDATED MINES, LIMITED

(Incorporated in the Union of South Africa)

Extracted from the Annual Report for the year ended 31st December, 1958

	£	Per ton milled s. d.
Working Revenue	2,108,854	46 2
Working Costs	1,808,624	39 7
Working Profit	300,230	6 7
Add : Income from Investments and Sundry Revenue	70,867	£371,097
Less : Directors' Fees and Sundry Expenditure	14,544	
Expenditure during year on Fixed Assets	4,254	
		18,798
		352,299
Balance unappropriated at 31st December, 1957		247,817
Balance available for appropriation		600,116
Amount of Second Reduction of Capital of 1s. 3d. per share		345,750
Leaving a balance unappropriated of		£254,366

Tonnage milled decreased from 919,000 tons to 913,000 tons, but the average yield increased from 3.54 dwt. to 3.68 dwt. Of the 7,730 ft. sampled on the Main Reef, 27% was payable, averaging 309 inch/dwt. Of the 5,815 ft. sampled on the Kimberley Reef, 3% was payable, averaging 289 inch/dwt. The ore reserve was re-estimated at the year-end and showed a decrease of 150,000 tons to 300,000 tons assaying 4.0 dwt. over an estimated stoping width of 48 inches.

Special resolutions will be proposed at the Annual General Meeting which, if passed and approved by the Court, will reduce the capital of the Company from 7s. 9d. per share to 3d. per share and will authorise the Directors, provided the Company has funds surplus to its requirements, to return capital to Members by instalments from time to time up to a total of 7s. 6d. per share. It is the intention of the Directors to return to Members an instalment of 1s. 3d. per share in August, 1959

In the case of each of the above Companies, discounts have been applied to development values to conform with adjustments necessary in estimating ore reserves

THE EMPLOYERS' ASSURANCE

PROSPECTS IN NORTH AMERICA

The Seventy-Eighth Annual General Meeting of The Employers' Liability Assurance Corporation Limited will be held on May 27th in London.

The following is an extract from the statement by the Chairman, Lord Knollys, which has been circulated with the report and accounts for the year ended December 31, 1958:

The total premiums written by the companies that comprise our group were £41,956,236, 9.2 per cent more than in 1957. Our trading result for the year was a profit, after taxation, of £381,682, and your Directors recommend the payment of a final dividend of 3s. per share, making a total of 5s. 6d. per share for the year.

You may remember that last year I said that I could offer no great hopes of any rapid improvement in conditions in the insurance market of North America. I am glad to be able to tell you that in Canada the loss we suffered in 1957 was replaced by a good profit for 1958. In the United States, however, my fears were realised and we could not make enough improvement to finish without an underwriting loss, though it was not so severe as that in the previous year.

We write a great deal of our business in these two countries, and, as I have told you in previous years, your Board is confident that they still present a vast area of great potentialities. Here British insurance can continue to find ample scope in which to make steady but satisfactory progress in building up business of good enough quality to show, in the long run, a reasonable degree of profit.

The improvement which I have mentioned in our Canada Branch has been due as much to careful control as to better rates. Similarly in the United States, though, as I have said, there have been rate increases there too, the partial recovery shown in 1958, which I believe will continue, reflects to a great extent the strenuous supervision which has been given to all aspects of our operations.

FIRE

Fire business in the United States has been improving gradually since the last months of 1957 and our Canadian Fire Account showed much improvement over 1957, though we did not quite break even on it. Our most successful territories were Australia and the United Kingdom, in both of which we made a good profit on a larger income.

ACCIDENT

The results of our Motor business in the United States were again disappointing, but it was a fair year there for Workmen's Compensation business. Miscellaneous classes were much better in 1958.

In the United Kingdom we had a bad Motor year, and so we did also in most of our smaller overseas branches. In Canada,

on the other hand, we made a profit on Motor business and on all Accident business taken as a whole. Our Australia branch had as good a year on the Accident side as it did on the Fire side, and as a result made the largest profit that it has ever made.

LIFE AND MARINE

The Clerical, Medical and General Life Assurance Society had another most successful year, and The Merchants Marine Insurance Company showed a higher premium income and a decrease in claims ratios. A transfer of £25,000 has been made from the Marine Fund to Profit and Loss Account.

INVESTMENTS

The book value of the Corporation's total investments was £46,455,600 and the total appreciation over their book value was greater than it has ever been before.

GEORGE MALLINSON & SONS, LIMITED

DIVIDEND 20 PER CENT

The twenty-second annual general meeting of this company was held on April 30th in London, Mr Dyson Mallinson, chairman, presiding.

The following is an extract from his circulated statement for the 52 weeks to February 21, 1959:

The Accounts show a net profit (after making full provision for taxation) of £102,464, a decrease of £21,209 on the previous year. This is mainly due to the fact that during the period of these accounts, the value of wool has fallen by 25 per cent which involves us in writing down our raw material stocks to a considerable extent.

The plant and equipment has been maintained in good order, and we consider the depreciation written off is adequate. Liquid assets exceed current liabilities by £959,429 (a decrease of £2,583), and the Directors recommend a final dividend of 15 per cent making a total of 20 per cent for the year. Further new machinery has been installed during the year, and the extra depreciation on it has been allowed for in the accounts.

I am reluctant to make any forecast for the future this year. The Textile Trade has not yet fully recovered from its depression, and we must again be cautious in our outlook. Our mills are equipped with the most up-to-date machinery, and our fabrics and designs continue to be well received by the leading clothing manufacturers and cloth merchants. I feel, therefore, that we shall obtain our full share of any business available in our industry.

The report and accounts were adopted.

ROYAL DUTCH PETROLEUM COMPANY

N.V. KONINKLIJKE NEDERLANDSCHE PETROLEUM MAATSCHAPPIJ

(Founded in 1890)

BALANCE SHEET, DECEMBER 31, 1958

THE CHARTERHOUSE GROUP

ORDINARY SHARE ISSUE PLANNED

SIR NUTCOMBE HUME'S STATEMENT

The twenty-fourth annual general meeting of The Charterhouse Group Limited was held on April 29th at 30 St Swithin's Lane, London, EC4, Sir Nutcombe Hume, KBE, MC (the Chairman), presiding.

The following is the review by the chairman which had been circulated with the report and accounts for the year ended November 11, 1958:

The Report and Accounts now presented reflect a significant step in the progress of your Company which was formed just 25 years ago with an issued Capital of £200,000 as a wholly-owned Subsidiary of The Charterhouse Investment Trust Limited. In the intervening years and particularly since the end of the last war, several new activities have been added and it has now become an association of enterprises engaged in complementary functions thus forming, what may properly be described as a "Group." Until now, the constituent companies of the group, whether they be financial or industrial, have been linked to the main company somewhat indiscriminately, either as direct subsidiaries, or as sub-subsidiaries, whilst the parent itself, until recently called Charterhouse Industrial Development Company Limited, was also an operating company. In recent months we have planned a major structural re-organisation, which is now well on the way to completion and your Board think that it is bound to be beneficial, in that it makes for simplification of control and clarity of presentation of results.

MAIN EFFECTS OF RE-ORGANISATION

The main effects of this re-organisation may be summarised as follows:—

1. The Group Company will become exclusively a Holding Company directly controlling a number of subsidiaries, each engaged in a specific and definable activity. The industrial and commercial companies in which we hold a controlling interest will become direct subsidiaries of Charterhouse Industrial Holdings Limited and those in which a minority interest is held will become investments of the new Charterhouse Industrial Development Company Limited. Details of the new structure are set out in the Directors' Report.
2. The Board of the Group Company can confine itself to major policy questions, leaving executive management to the Boards of the several operating subsidiaries, each of which is represented on the Group Board.
3. Fully consolidated accounts of the Group can now be prepared and Shareholders thus informed of its true earning power, assets and general progress.
4. The Group Company will be the channel through which future capital will be raised.

PROPOSED SHARE ISSUE

Plans are now well advanced for a public issue of Ordinary Shares, the proceeds of which will be used to repay present bank indebtedness and thus make possible with the continued help and co-operation of our banks, which we have always enjoyed, further development as opportunities offer. This will be the seventh time since 1934, that a cash issue has been made, but so far the Ordinary shares have been privately subscribed and only the 1,500,000 6 per cent Second Preference Shares have been quoted on The Stock Exchange and available to the general body of investors. It is your Directors' earnest wish to see the Ordinary Capital of The Charterhouse Group Limited recognised as an investment of the highest class and this of course, can only be achieved if the Group remains under the best possible management and the progress of the past is maintained in the future. I am convinced that this can and will be done because I have the greatest confidence in the men who form our management team from the Directors (most of whom work full time in the Group's service) downwards.

GROUP'S STRUCTURE

There are some features to which I want particularly to draw your attention.

First, the Group includes companies providing all financial services except that of hire purchase finance and in that field Japhets hold a substantial minority interest in one of the smaller companies. Second, the subsidiary industrial and commercial companies to be grouped in Charterhouse Industrial Holdings Limited cover a wide range of activities and are, we believe, under able management and capable of considerable growth. It should be noted that from this source comes the largest slice of the Group's consolidated profits. Third, the new Charterhouse Industrial Development Company Limited holds minority equity interest in 65 industrial and commercial companies, the majority of which are healthy and growing. Some of these will in due course (as has been the case in the past) provide business as public flotations for The Charterhouse Finance Corporation Limited. Fourth, the Finance Corporation is well-known as an Issuing House well able to attract new issue business on its own account. Fifth, Charterhouse Canada Limited, in which the Pearl Assurance Company Limited and the Compagnie Financière de Suez acquired participations aggregating 45 per cent during 1958, is a useful outpost on the North American continent, and is also capable of considerable growth. Sixth, the presence in the Group of S. Japhet & Company Limited, Merchant Bankers, and Glanville, Enthoven & Company Limited, Insurance Brokers, provide it with a steady source of profit and serve to enhance the services which it can offer.

If, as I hope and expect, the shares of The Charterhouse Group Limited can be established as a sound and popular investment, the Company will be able, as the years go on, to attract to itself additional capital as and when needed and should become an increasingly effective channel of finance for the development of small and medium-sized industrial undertakings which, in due course may themselves grow into the big companies and "blue chip" investments of tomorrow.

The report and accounts were adopted.

The retiring directors, Mr John St Clair Knechtli, Mr Eric Hamilton Owen and Mr Raphael Andrew Harari, OBE, were re-elected and the remuneration of the auditors, Messrs Price Waterhouse and Company, was fixed.

At a subsequent extraordinary general meeting resolutions were passed increasing the capital to £15 million by the creation of an additional 5 million Ordinary Shares and altering the Directors' borrowing powers.

THE ASSOCIATION OF CERTIFIED AND CORPORATE ACCOUNTANTS

MR W. JACKSON'S ADDRESS

The fifty-fourth Annual General Meeting of the Association of Certified and Corporate Accountants was held on April 28, 1959, in London. Mr W. Jackson, FACCA, was in the Chair, and in the course of his address said:

The number of new students admitted in 1958, is slightly up on the year before and we seem to have reached a fairly steady average intake of about 1,300 new students per annum. My predecessor referred last year to the general problem of recruitment to the professions and it would, I think, be true to say that never before have school-leavers been wooed as they have been wooed over the past five or six years. Educational and other attractions have been held out to them by industry and this has naturally had a direct effect on recruitment to the professions. But there are now signs that industry may be beginning to reach some measure of capacity in this respect. In the conditions which now obtain, we are entitled to hope for some improvement in the intake to the professions and we should make our plans accordingly.

The Council reported some two and a half years ago that it had appointed a special committee to consider fully the content and administration of the examinations and to make recommendations thereon. At that time we were conscious that in some respects the scope of the examination syllabus was probably capable of improvement, having regard to recent developments in accounting and related techniques and we thought it desirable that the whole structure of the examinations should be objectively and critically reviewed.

I am glad to say that since then much progress has been made and it is hoped that the committee's recommendations will come before Council in the near future.

THE BUDGET

We must all welcome the reduction in the rates of income tax, coupled with the re-introduction of investment allowances, and the more generous treatment of directors under the Profits Tax legislation.

In referring to the re-introduction of investment allowances, the Chancellor went out of his way to warn industry that these allowances were thought to be appropriate to current circumstances but that they should not necessarily be expected to continue. This remark, coupled with our knowledge of past history, creates a situation which we cannot fail to view with considerable concern. Indeed, I would go so far as to say that, as a point of policy, it is quite wrong to make such allowances the subject of frequent variation. The effect upon industry of the concessions now granted must be considerably lessened without some measure of assurance as to the future. Surely the time has come when the basis of calculating annual allowances in respect of capital expenditure should be the subject of the most careful review, because the present methods are liable to produce results which are not as equitable as could be wished. In particular, I regret that the Association's recommendation that allowances should be granted in respect of commercial buildings has not been followed up.

The Association, in common with a number of other organisations who made a similar suggestion, must also feel some disappointment that the opportunity was not taken to abolish assessments under Schedule A.

ATLAS ASSURANCE COMPANY LIMITED

REORGANISATION IN AMERICA

INCREASED LIFE BONUS

The annual General Meeting will be held on May 29th in London.

The following are extracts from the Statement by the Chairman, Mr Rudolph E. F. de Trafford, OBE:

The most important event that I have to report as regards the year 1958 was the agreement entered into with the Royal Exchange Assurance and the Sun Insurance Office Limited, some details of which were announced in the press last October. The effect of this agreement was that from 1st January, 1959, the United States affairs of the three offices and their subsidiary companies were placed under common management.

We hope for real benefits from this arrangement for the future handling of our business in the United States, which figures prominently in our world-wide operations and which was responsible for the adverse results of our Fire Accounts of 1957 and 1958. There have already been worthwhile reductions in operating costs and further savings are to be expected as the new organisation gets fully into its stride. *It must be recognised, however,* that the basic problems of operating profitably in the United States still remain.

FIRE DEPARTMENT

Net Premium Income 1958 ...	£7,197,310
Net Premium Income 1957 ...	£6,414,414
Increase	£782,896

Our loss on the Account was £275,612 (3.8 per cent) following on a loss of £129,880 (2.0 per cent) in 1957.

The profit from our home business was satisfactory and there was a considerable improvement in Canada, though we made a small loss there. Over the remainder of our overseas operations, apart from the United States, we fared well.

In the United States, claims were still unduly high and this, combined with a heavier incidence of commission and expenses and the substantial increase in the provision for unexpired risks, made it an unfortunate year for us. I think I may add that, while our primary purpose must always be to make profits on the underwriting of our insurance business, we receive a considerable income on an investment fund that was largely built up in the United States, and profits on investments realised there during the year under review exceeded £200,000.

ACCIDENT DEPARTMENT

Net Premium Income 1958	£4,321,449
Net Premium Income 1957	£3,815,015
Increase	£506,434

Despite rate increases in various parts of the world the situation in regard to motor insurance remains generally difficult. We again suffered a loss on this business overseas, and in place of the modest profit that we made on our home motor Account for 1957 we showed a small deficit in 1958.

Although the underwriting profit from our activities, £131,222 (3.0 per cent) was lower than that of 1957, namely £207,382 (5.4 per cent) I feel it was not unsatisfactory in all the circumstances.

MARINE DEPARTMENT

Net Premium Income 1958	£790,530
Net Premium Income 1957	£828,739
Decrease	£38,209

The expansion in our premium income from hull business was halted in 1958 as a result of the depression in world shipping and there was further contraction in the volume of our income from cargo business.

While the claims paid showed a small reduction by comparison with 1957 and first year settlements on the Account as a whole were rather lower, subsequent to the close of the year we have been called upon to pay substantial amounts in respect of major casualties.

We have transferred £100,000 to Profit and Loss Account and the Marine Fund at the end of the year was £1,346,983.

LIFE DEPARTMENT

Net Premium Income 1958 ...	£4,130,940
Net Premium Income 1957 ...	£3,962,583
Increase	£168,357

Net new sums assured amounted to £10,303,875 and new deferred annuities were issued for £956,781 per annum. Immediate annuity purchase prices were £352,739.

During 1958 security values rose considerably and at the end of the year the value of the investments was substantially *in excess of the book value before taking into* account the Investment Reserve of £1 million.

The gross rate of interest earned on the Fund increased by 5s. 11d. per cent to £5 17s. 4d. per cent.

The actuarial valuation at December 31st last revealed a surplus of £1,509,142, including £984,991 brought forward from 1957. A reversionary bonus of 50s. per cent per annum, calculated on sums assured and existing bonuses, has been declared in respect of the three years 1956 to 1958. This reversionary bonus, together with interim bonuses paid in 1958 and bonuses on reassurances, absorbed £981,675. The shareholders' proportion of the surplus distributed during the triennium was £112,114. £175,000 was applied to strengthen the valuation reserves and £100,000 has been added to the Investment Reserve. The balance of the surplus, £140,353, has been carried forward.

APPROPRIATION ACCOUNT

After providing for the dividend for the year at the rate of 3s. 6d. per share, 1s. 6d. per share of which was paid in November last, the carry forward amounts to £1,216,405.

PEARL

ASSURANCE COMPANY LIMITED

Chairman: **GEOFFREY KITCHEN, T.D., M.A.**

Points from the Annual Report and Balance Sheet for the year ending 31st December, 1958

TOTAL ASSETS £270,509,818 **GROSS INCOME £59,071,603**

INVESTMENTS

The Assets show an increase of £12,761,421. The valuation of the investments, taking Stock Exchange securities at middle market prices, showed a substantial margin compared with the values shown in the Balance Sheet after taking into account the Investments Reserve Funds.

LIFE BRANCHES

In the two Life Branches the total sums assured on new policies issued amounted to £81,806,225 compared with £74,644,530 for 1957 and the total sums assured and bonuses in force (including the Capital Redemption Fund), amounted to over £668 millions (an increase for the year of over £47 millions). The total new annuities of all kinds amounted to £1,030,590 per annum.

FIRE AND ACCIDENT

In this Branch the premium income was £10,365,951.

REVERSIONARY BONUSES

ORDINARY BRANCH.—A reversionary bonus of **£2 4s. 0d.** per **£100** sum assured or annuity on United Kingdom policies entitled to participate in full profits.

INDUSTRIAL BRANCH.—A sum of £2,581,328 has been allocated to provide bonuses in the Industrial Branch making a total allocation up to date of **£33,884,821.**

CHIEF OFFICES: HIGH HOLBORN, LONDON, W.C.1.

ENGINEERING COMPONENTS LIMITED

GROUP SALES FURTHER INCREASED

The twenty-fourth annual general meeting of Engineering Components Limited was held on April 28th in London, Mr C. C. Griffith, MC (the chairman), presiding.

The following is an extract from his circulated statement:

Group sales further increased by 5 per cent over the previous year but rising costs, most of which were outside our control, and a further rise in respect of wages and salaries, have contributed to the slightly lower profits recorded.

The gasket Manufacturing Subsidiaries continue to occupy the leading position as suppliers to the Motor Industry, and have done everything possible to support their customers by giving an unrivalled service.

Out of the stated profit of £396,321, from which £7,500 has already been deducted as a contribution to the Group Educational and Welfare Fund, taxation takes £222,047 and the Subsidiary Companies retain £16,616 leaving your Company a net profit of £157,658.

The Consolidated Balance Sheet discloses Current Assets totalling £2,185,572 against Current Liabilities of £534,763.

Export sales *reached a record level* and every possible step will be taken to develop this side of the business. During the year we made favourable arrangements for the sale of our gaskets and oil seals in Canada and the United States of America which should ultimately be profitable.

We have acquired the Motor Gasket Manufacturing Section of Hall & Hall Limited, which will enable us to secure the benefits of greater volume.

Whilst conditions remain uncertain, the future looks brighter than it has done for some time.

The report was adopted and the total dividend of 15 per cent approved.

TRADE INDEMNITY COMPANY LIMITED

[illegible] POTENTIAL MORE REALISTIC AND NORMAL

MR H. T. SILVERSIDES REVIEWS CREDIT INSURANCE

The forty-first ordinary general meeting of Trade Indemnity Company Limited was held on April 23rd in London, Mr H. T. Silversides (the chairman) presiding.

The following is an extract from his circulated statement:

The gross premiums earned in 1958 amounted to £1,758,339, a decrease of approximately 2¾ per cent on 1957. On the other hand, the retained premium income of £585,590, after taking into account reinsurances and brokerages, was very slightly up compared with 1957.

During 1958 the turnover of transactions underwritten was again roughly on the thousand million mark and there was virtually no change in the average rate of premium.

Unfortunately, at £2,327,498 the claims paid, less salvages, in 1958 were very much higher than in the previous year. In 1957 the corresponding figure was £449,704 and in 1956 it was £756,889. The increase relates to all three Underwriting Accounts but is heaviest in connection with 1957 Account, that is the Account relating to policies issued in 1957. It will be appreciated that these policies were at maximum exposure during the greater part of 1958 and therefore bore the brunt of the unusually heavy losses incurred during that year.

The retained share of the claims paid, less salvages, in 1958 was £427,540 as against £116,011 in 1957.

The provision for outstanding claims in respect of the closed 1956 Underwriting Account at £53,954 is £10,784 higher than in the previous year, and you will see that Profit Commission on this Account at £30,174 is £10,508 lower, thus reflecting the less profitable outcome. The balance transferred to Profit and Loss on account of 1956 underwriting is £191,312, but against that an amount of £150,000 has been transferred from Profit and Loss to support the 1957 Underwriting Account, thereby enabling a balance of £154,095 to be carried forward in respect of estimated claims and unexpired liability in that account.

The amount carried forward on 1958 Account is £68,100 but substantial additional premiums should accrue on this Account in 1959, and at this juncture it is impossible to make any prediction about the outcome.

Turning now to the Profit and Loss Account, we have £191,312 transferred from 1956 Underwriting Account, to which is added interest on investments and other income (gross) £48,235 giving a total of £239,547, of which £116,712 is absorbed by provision for taxation.

GENERAL REMARKS

During 1958 we have experienced a severe increase in losses. Furthermore, the increase has been of a general nature. It began with losses in Credit Insurance for Shipping and Confirming Houses operating in Commonwealth countries, and in South Africa in particular, it continued in the United Kingdom textile trade and has also affected the timber trade.

Where, for many years we have had to contend with arguments that our premiums are too high in relation to our losses, it could now be said that the reverse is true. Nevertheless, we are trying to steer an even course through a sharp economic squall and, although we have cut down our overseas commitments rather severely, we are hopeful that we can maintain facilities in other directions without undue increases in rates and restrictions in limits.

During the year under review, we have continued to maintain our contacts with the Export Credits Guarantee Department and with credit insurance companies and official export credits organisations in other countries through our membership of the Berne Union and the International Credit Insurance Association.

The years when inflation took so much of the risk out of granting trade credits have come to an end and we must face up to the fact that the risk potential from now on is going to be much more realistic and normal than it has been at any time since the war. Meanwhile we must continue to perform the function for which we exist, that is to say, the levelling out of losses through insolvencies and protracted default over the widest possible range of credit insurance business.

The report was adopted.

NORWICH UNION INSURANCE SOCIETIES

ANNUAL MEETINGS

LIFE SOCIETY

Speaking at the one hundred and fifty-first Annual Meeting of the Norwich Union Life Insurance Society held in Norwich on April 28th the President (Sir Robert Bignold) said it was fitting that in 1958, the Society's 150th Anniversary year, the results again constituted a record. Sums insured under new life insurances exceeded £100 million, an increase of 34 per cent, whilst new deferred annuity business showed a capital value of £50 million.

Total funds increased by £17 million to £168 million. Premium income now exceeded £26 million and net interest income £7 million. Payments to policyholders accounted for outgo of £11¼ million. The net rate of interest earned had risen by 3s. 3d. per cent to £4 12s. per cent.

On the investment side, ordinary shareholdings had been increased by £4 million, whilst a further £5 million was invested in real estate.

FIRE SOCIETY

At the one hundred and sixty-first Annual Meeting of the Norwich Union Fire Insurance Society Limited the Chairman (Sir Robert Bignold) said, although 1958 was a year with tension apparent in far too many quarters of the world, the Society's business had continued to grow.

Fire premiums totalled £7,988,845, an increase of £166,633, whilst claims decreased by £167,801 to £3,510,017. The profit before taxation in the Fire account was £512,960, compared with £148,929 in 1957.

Accident premiums, home and overseas, advanced by £801,014 to £11,466,844, but the account showed an underwriting loss of £204,018 *compared with the loss of £37,147* in 1957.

Marine premiums totalling £1,358,955 showed a fall of £56,411, but the transfer to Profit and Loss from the Marine Account was £40,000 against £30,000.

Total assets amounted to £26,691,042, an increase of £1,339,650.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE CO. LTD.

MR T. H. NAYLOR'S REVIEW OF 1958

A Statement by the Chairman, Mr T. H. Naylor, circulated with the Annual Report and Accounts of The Liverpool and London and Globe Insurance Company Limited reports that 1958 was another year in which the results were dominated by unfavourable conditions in the United States insurance market. The underwriting surplus of £278,876 was the lowest earned for 26 years. Nevertheless, the picture although calling for a cautious assessment of the immediate future was by no means devoid of encouragement. Interest earnings had continued their upward trend and the consolidated profit for the year had increased by £136,139 to £1,354,553.

After allowing for the increased final dividend recommended of 32s., making a total of 62s. per share for the year, the balance carried forward on Profit and Loss Account increased from £4.1 million to £4.5 million.

The biggest problem in the United States was in the Motor insurance market but some premium rate increases had been obtained, others were under discussion and there should be some alleviation this year in the unsatisfactory experience of the last year or two.

Overseas business elsewhere had shown continued development and there had been a gratifying improvement in the overall experience despite some rather severe losses in a few territories.

At home, the business of the Company had continued to expand and had shown a satisfactory result.

In contrast to the experience in the USA, underwriting margins in the Fire Department at home were satisfactory. After allowing for an increase in overseas taxation the final surplus on Fire underwriting at £433,724 was about £150,000 lower than in the previous year.

In the Accident Department the underwriting loss suffered in the United States exceeded the improved underwriting surplus elsewhere and the net result of the year's trading was a loss of £225,681.

At home, official road accident figures continued to show an increasing trend, and with the heavier labour costs of the motor-repairing industry the average cost of claims continued to rise. Everything possible had been done to mitigate the effect of these factors, by following the Company's traditional policy of conservative underwriting, re-rating of accident-prone and substandard risks at renewal, and by unremitting attention to repair charges to ensure that, so far as was economically feasible, no more than a fair and reasonable price was paid for the repairs which had been carried out.

As a consequence of the depression in the shipping industry the volume of business in the Marine Department had fallen slightly. The transfer to Profit and Loss Account in respect of 1956 business amounted to £70,833.

Life business had again increased and, following an actuarial valuation of liabilities as at the end of 1958, the bonus payable on with-profits contracts had been raised to 55s. per cent per annum.

The market value of the investments at the year end had exceeded the balance sheet value by a substantially increased margin.

THE LONDON & LANCASHIRE INSURANCE COMPANY LIMITED

THE HONOURABLE R. M. PRESTON'S STATEMENT

The Annual General Meeting of The London & Lancashire Insurance Company Limited will be held on May 21st at 7, Chancery Lane, London, W.C.2.

The Chairman, The Honourable R. M. Preston, DSO, has issued a statement to Stockholders from which the following has been taken:

The overall result of the operations, although still far from satisfactory, was considerably better in 1958 than in the previous year.

The net world figures for the combined Fire, Accident and Marine Departments were:

	1958	1957
	£	£
Premium Income	34,495,074	33,281,218
Underwriting Profit ..	106,329	—
Underwriting Loss....	—	547,399
Ratio.....	0·31% (Profit)	1·64% (Loss)

Including investment income, and after providing for taxation and contributions to Pension Funds, the aggregate result was a profit for the year of £719,569, against £145,292 in the previous year.

Fire Department:—The picture was much brighter than a year ago.

	1958	1957
	£	£
Premium Income	13,163,608	12,926,296
Underwriting Profit ..	150,319	—
Underwriting Loss ...	—	455,629
Ratio.....	1·14% (Profit)	3·52% (Loss)

Outside the United States and Canada the overall result was satisfactory.

Accident Department:

	1958	1957
	£	£
Premium Income	16,564,057	15,673,637
Underwriting Loss ...	343,990	441,770
Ratio.....	2·08%	2·82%

The Accident account was again dominated by unsatisfactory Motor business in most of the main territories where they operated, despite the tightening up of underwriting procedures which they had instituted and despite the steps which Companies generally had taken (where they were free to do so).

Marine Department:

	1958	1957
	£	£
Premium Income—current year.....	4,767,409	4,681,285
Transfer to Profit and Loss Account	300,000	350,000
Balance of Underwriting Funds—all years	5,232,759	5,129,384
Ratio.....	109·76%	109·57%

The recession in world trade and commodity prices had reduced insured values of hulls and cargoes, caused the laying up of many vessels, and must reduce the volume of premium income. There was still no sign of abatement in the rising cost of repairs.

The only bright spot in the picture was the likelihood that the decline in orders for new tonnage and the reduction in overtime working, would eventually lead to more competitive bids for ship repairs.

Against this background it was satisfactory that the premium income had been so well maintained.

Interest and Dividend:—The interest

THE ... at the first time exceeded £1 million. ... rate of dividend had remained at 7s. per £1 Stock for some years past, notwithstanding the appreciable advance in interest earnings. The Directors considered a modest increase in the dividend was now justified and it was accordingly proposed that the final dividend for 1958 should be at the rate of 4s., making a total of 7s. 6d. for the year. This proposal should not be taken as an indication that the rate of the next interim dividend would necessarily exceed 3s. 6d.

The Chairman concluded his statement by paying tribute to the skill and unremitting hard work of the General Manager, staff and agents throughout the world.

THE MERCHANTS MARINE INSURANCE CO.

The Annual General Meeting of The Merchants Marine Insurance Co. Ltd. will be held on May 27th in London.

The following are extracts from the circulated statement of the chairman, Lord Knollys:

Again, this year, I am able to report a further growth in all sections of our business. Our Marine premium in 1958 amounted to £550,759, an increase of £48,689 over 1957.

The premiums on our Fire, Accident and General business amounted to £498,658, an increase of £32,317 over 1957. However, these Accounts show an overall loss of £53,493.

So far as our Marine business is concerned, the year's results have been satisfactory, and, as I said at the beginning of my statement, the greatest increase in our marine premium has come from our oversea agencies and branches. This side of our business, which has always been a profitable one, has maintained a steady and continued expansion since the war. It would be appropriate for me, at this point, to express your thanks to our agents, branch managers, and their staffs, often working under difficult conditions, all of whom have contributed so materially to the excellent results derived from this side of our activities.

We have transferred £25,000 from our Marine Account to the Profit and Loss Account, and after bringing in interest on our investments, the net surplus is £13,211, which increases our carry forward to £181,015, after paying a dividend of ten per cent. The Marine Fund shown in our Balance Sheet amounts to £609,854 or 110.7 per cent of the premium income and is, in our view, adequate to meet all calls upon it.

COMPANY AFFAIRS

THE GRANADA GROUP

DEALINGS under rule 162 (2) in the 5s. "A" non-voting ordinary shares of the Granada Group were banned last August. But dealings in the shares took place unofficially as investors were eager to take a stake in the commercial television interests of this cinema group which is tightly controlled by the Bernstein family. Recently, in unofficial dealings, the price has been carried up to 83s. Now there is to be a full official quotation on the "A" shares. The brokers, Rowe Swann and Company, have placed 150,000 of these shares at 70s. each, of which 100,000 will be available through the market. There seems to be no chance that more shares will be released, and to promote an orderly market the Stock Exchange Council asked the jobbers to leave their lists open for a full day. This will enable the jobbers, who will sell the shares at 70s. 6d. each, to estimate the potential demand and to ration the allotment to individual buyers. The demand for the shares will be high, for the placing price is on the low side.

In seeking the official quotation, the directors have said that profits before tax in the year to end-September will be not less than £1,750,000 and the ordinary dividend not less than 80 per cent. Thus the shares are being offered on an earnings cover of about 2¼ times and on a yield of 5⅝ per cent. If the company terminates its programming arrangements in 1960 future earnings will be much higher. In addition, the company has dropped its plan for issuing "A" shares at par to executive directors and executive staff. This will please investors, but the plan has been dropped not so much because of the criticism it invoked but because of tax difficulties.

GEORGE NEWNES

WHEN the *News of the World* made a bid for the ordinary share capital of George Newnes, that company's £1 ordinary units stood at 107s., only 3s. below the bid price. The directors of George Newnes were therefore strongly placed if they wished to fight off the bid. That certainly is how Throgmorton Street judged the situation and after the bid was announced the shares climbed to 115s. This week the directors of George Newnes have recommended shareholders not to accept the bid. In doing so they made the classical riposte to a take-over bid: they have raised the ordinary dividend. But this was not a sudden change of heart in the boardroom prompted simply by fears of a take-over, for Newnes' dividend record in recent years has been progressive. A final dividend of 20 per cent is to be paid on the capital as it will stand after the 40 per cent scrip issue announced a month ago is made. An interim of 5 per cent has already been declared on the existing capital. On the present capital the effective increase in the total dividend is from 20 to 33 per cent, or from 14.3 to 23.6 per cent on the capital as increased by the scrip issue. It is to be made for the financial year ended on March 31st, in which gross profits were slightly down and net profits slightly up on their 1957-58 levels.

The dividend itself is an effective reply to the take-over bid and the directors have come to their decision in the belief that the bid price of nearly £9,700,000 does not adequately reflect the current value of assets nor the goodwill that has been built up, and that the company, possessing strong liquid resources, is capable of further development. The ball is now back in the court of the *News of the World*. But its ability to make a better offer than its original one is hampered by its own paucity of cash and by the fact that the Newnes ordinary shares are quoted at 117s. 6d.

DEBENHAMS

THE Capital Issues Committee did not eye with much favour applications by department stores and multiple stores to raise new capital. Now that the CIC is in cold storage, these stores, like the banks, have been quick to take advantage of the new freedom. Among the multiples, United Drapery Stores has announced its intention of making a £3,000,000 rights issue of ordinary shares and among the department stores both Harrods and Bentalls seem likely to come to the market for new money. The biggest department store group of all, Debenhams, could not afford to wait: over the next three or four years it will need £8½ million in new money, of which only £3½ million is expected to come from depreciation and retained earnings. It has therefore decided to raise about £5 million by a 5½ per cent second debenture stock, 1979-83, at 97½.

Debenhams has already modernised many of its stores. But its building and development programme is not yet complete since some major schemes had to be postponed when credit was tight and CIC restrictions were in force. With the directors bent on expansion and the acquisition of new subsidiaries, the new stock is being offered on good prospects of improving cover. For ordinary shareholders it means another increase in the gearing on their already highly geared holdings. The issue is pitched close to prevailing market rates; the stock offers a flat yield of £5 12s. 10d. and a redemption yield to the latest date of £5 13s. 10s.—which is only 1s. above the redemption yield now offered on the market price of the Esso debenture that has the same coupon and the same life.

LOMBARD BANKING

THE rights issue recently foreshadowed by the directors of Lombard Banking is to take the form of a composite issue of three £1 new 5 per cent cumulative second preference shares and three new 5s. ordinary shares for every ten 5s. ordinary shares now held. The terms of the issue have not yet been fixed, but the intention is to raise about £3 million. Now that profits tax is charged at a flat rate an issue of preference shares is more acceptable to ordinary shareholders than in the past when the full burden of distributed profits tax fell on their earnings. The issue of preference shares will raise the gearing on Lombard's ordinary stock, but clearly the real attraction will lie in the price on which the ordinary shares are issued. Lombard Banking is intent on expansion, both in this country and Australasia. After the issue it will have £2,612,000 of preference capital and £2,185,000 in 5s. ordinary shares.

DISCOUNT HOUSES

THE large profits shown by discount houses in the financial year ending this spring were described by Mr. G. M. B. Portman, the chairman of Allen Harvey and Ross, in his statement with the annual report as exceptional—"so exceptional that . . . the time is scarcely suitable to suggest any substantial increase in distribution." Bank rate was first lowered from 7 per cent towards the end of March, 1958, and then fell rapidly until it grounded at 4 per cent last November. The market can no longer feel sure in which direction the next change will be. Experience of fluctuating money rates since 1955 has rightly encouraged the discount houses to seize this exceptional opportunity to increase their reserves. The latest chairmen's statements emphasize the increase in these reserves rather than the increase in ordinary dividends paid this year. Nevertheless, distributions have been advanced quite generously.

Short-dated bonds have offered the discount houses attractive yields and bond portfolios have been increased considerably. A stronger reserve seems an obvious precursor to this policy. Allen Harvey and Ross has rebuilt its bond portfolio from £7,844,000 million to £11,815,000—still below the portfolio of £14,729,000 held two years ago. Smith St Aubyn has reduced its bond holdings from £20,811,000 to £11,856,000 a year ago, but at March 31st the book value of its investments had risen to £26,979,000.

SHIPPING PROFITS

ALTHOUGH shipping profits have fallen very sharply and promise to decline still more this year, investors in the shipping industry cannot be wholly dissatisfied with the dividends that have so far been declared. It is true that some of these payments have been reduced but these reductions have not been exceptionally severe. For example, the consolidated trading profits

Continued on page 479

Shell, BP and Burmah

PERHAPS the average stockholder makes little of the dreamy figures of the Royal Dutch/Shell and British Petroleum reports. He will notice that BP increased its production of crude and its sales of crude and products to 62 million tons last year—gains of 20 per cent or so, which hardly sound like a depressed year for oil. But here it is a case of taking two years together in terms of volume because the natural expansion to be expected in 1957 was frustrated by the aftermath of Suez.

The arresting thing about BP's figures last year is that despite this great increase in the volume of oil handled, the group's net sales were only £2 million higher than in 1957. And to rub in the arguments presented to the Cairo Oil Congress there is the calculation in the BP report that the Middle East host countries last year received £119 million, whereas the BP group net income was £63 million. This is what 50-50 was meaning last year, when realised prices (on which profits are calculated) were lower than posted prices (on which royalties are paid); and the post-production stages of shipping, refining and marketing were not earning nearly their proper keep. BP was fortunate that last year it had the best part of 25 million tons of cheap crude at its disposal, above its own refinery requirements.

BP's output was well up. Royal Dutch/Shell's was slightly down over the whole year—but with the important proviso that daily production in the last quarter of the year reached a new record. Indeed, it was in the last quarter of 1958 that Royal Dutch/Shell saw the first light of recovery from the depressing conditions earlier in the year; and now it seems that the expansion of volume, with business generally on the up-grade, is making good the effect (which certainly would otherwise be serious) of the continuing softness of crude oil prices.

In financial terms, BP did distinctly well, with an increase in net income after taxes from £54.6 million to £63.0 million. A year ago, there had been murmurings at Shell that the year might see a drop in net income of 25 per cent, and that is close enough to the final outturn—down from £212.7 million to £150.7 million. But already there are signs of improvement in oil earnings—shown for instance in Standard of New Jersey's advance to $167 million in the first quarter, against $146 for the first quarter last year—and Shell's first quarter figures due on May 28th will tell a different story from the 1958 results.

Sometime, it is supposed, oil companies will just give up spending so much on capital account and then it really will be the shareholder's turn. In last year's context—falling crude prices, conditions of general oversupply of crude and most products, tankers galore and more building and refineries and marketing installations on which (it is said) the return does not bear examination—by all these considerations there was never a time when a cut in new investment would have been more justified. Nothing of the sort has happened. Royal Dutch/Shell have spent virtually the same amount, just short of £390 million, on capital account in the last three years and they seem to be thinking in the range of £400 million for this year. There is certainly no hint in this slightly cautious report that capital investment should be modified:

> The Shell Group's programme of essential capital expenditure, being geared to the levels and the nature of business expected after several years, is capable of adjustment in the face of short-term influences only to a limited extent, and must accordingly be insulated from such influences so far as possible.

Incidently the Shell group reports that £1,000 of fixed assets are needed for every extra barrel a day found and marketed.

BP's figure for capital expenditure was £137 million; and there are contracts outstanding which involve £147 million of new capital expenditures. The generation of such cash flows counts on an ever-expanding basis of business and last year was not ideal for self-generated capital. BP provided in write-offs and appropriated profits rather more than £75 million—with the slightly plaintive note that the replenishment of the group's central resources out of which new investment is largely financed "is a matter needing constant attention." Royal Dutch and Shell provided £126 million of new money from issues made early last year—the first major capital raising for five years; and that covered less than a third of the operating group's capital needs in a single year. The voracity for capital continues unabated by any consideration of temporary marketing problems.

There is a common note of caution when the two groups assess the trading outlook. "Demand though increasing has not caught up with supply," says Sir Neville Gass; and he adds that BP's sales may slightly exceed last year's volume but, on present indications, without any increase in trading margins. Lord Godber talks of a considerable potential of oversupply continuing this year and causing keen competition and lower prices. Both chairmen mention Soviet oil exports—doubled in the last three years—and the frustration of increased sales of oil to the United States by the mandatory controls imposed in March. This latter is a point of particular relevance to Shell, which has important outlets of Venezuelan crude and products to the United States.

But neither report has any doubt on the score of long-run expansion. Last year even in the United States demand for oil rose by 2½ per cent, and in Europe, where the change to fuel oil is far from finished and demand for gasoline and kerosene is vigorous, there was a 15 per cent increase. The degree of world recovery that will lift world oil consumption by more than last year's 5 per cent and take some of the present pressure off prices would not, in all probability, have to be large. The industry has plenty of facilities for producing more oil; but it has always liked to have a two or three year start on demand, and its recent disappointments are the result of a kink in the consumption curve that seems even now to be straightening out.

For investors there is a difference of one per cent between Shell (4.6 per cent at 133s.) and BP (5.7 per cent at 50s.). Burmah, as seems appropriate, sits between them with a yield of 5.5 per cent at 81s. 9d. Burmah's one-for-one scrip issue is up to the best expectations after BP's similar issue last October; Burmah holds £53,429,850 of BP stock which is to be written up from the present book value of 10s. to 20s. per £1 unit and will thus still leave a 60 per cent undervaluation against the present price of 50s. Burmah's dividend of 2s. 9d. (against 2s. 7d.) tax free did no more than compensate for the change in the standard rate, despite the distinct improvement in trading profits. But there will be bigger investment income in the 1959 accounts because of Burmah's bigger holding in Shell and the increased dividend recently declared by BP.

Continued from page 477

of **Royal Mail Lines** fell by over a third from just over £3 million to £2,300,059 last year but the ordinary dividend has been cut by only one per cent—from 9 to 8 per cent. That payment is still effectively higher than the dividends paid in the years preceding 1957. How long the shipping companies will try to hold the line on dividends remains to be seen and investors have to continue to take careful note of the warnings about profits such as that made by Sir Alan Tod, the chairman of **Liner Holdings**, when he told shareholders that trading profits in 1958 (which fell from £6,560,000 to £4,960,000) did not fully reflect the fall in freight rates. But the directors of Liner Holdings have left the ordinary dividend unchanged at 13 per cent for the third year running. Their ability to do so is a reflection both of the strong cover that disclosed net profits provide and of the strength of the group's liquid resources. These resources at £17,692,000 amply cover outstanding capital commitments of £7,900,000. The £1 ordinary shares of Liner Holdings yield 5.9 per cent at 43s. 9d. while the £1 units of Royal Mail yield over 7 per cent at 22s. 9d.

The slump in freight rates hit **France Fenwick** with especial severity and it is one of the very few shipping companies that has brought the dividend down with a bump. Its ordinary dividend has been cut from 15 to 10 per cent and its tax-free capital distribution from 3 to 2 per cent. This follows on a fall of more than 40 per cent in the group's trading profits, from £1,158,172 to £677,895. Its £1 ordinary shares fell by 1s. 3d. to 30s. 6d. on the news. At 28s. 9d. xd yield is nearly 7 per cent.

UNITED MOLASSES

THE ordinary dividend of United Molasses for 1958 was never in any real danger even though profit margins on molasses were narrowing and shipping profits were falling, for the directors had already made it clear that they were prepared to hold the dividend at 1s. 5d. per share free of tax even if that meant drawing upon the substantial reserves amassed by the group when profits were booming.

Last year, United Molasses' trading profits fell by £1,461,051 to £5,112,271; that is sharper than the decline reported in 1957 when profits were reduced by the writing-down of stocks of molasses. The big fall in tax from £2,948,994 to £1,690,635, the writing back of £281,022 from tax provisions no longer required and a small reduction in depreciation have left the ordinary dividend still well covered. In fact, the directors have raised the net rate of dividend to 1s. 6d. per share. The gross rate of dividend has therefore been increased from 24.64 per cent to 24.93 per cent and this slightly more than compensates shareholders for the loss in income that faced them when the standard rate of income tax was reduced. The net dividend thus absorbs £1,319,288 out of available profits of £2,403,876, so that over £1 million has been ploughed back into the business. In addition, the directors have again recommended a tax-free distribution of 3¾ per cent from the surplus arising on the realisation of investments. The 10s. ordinary units at 34s. yield 7.2 per cent.

UNION CORPORATION & THE BRITISH SOUTH AFRICA COMPANY

UNION CORPORATION has only a limited stake in base metals and the British South Africa Company, anxious to build up its portfolio against the day when its royalty rights in Rhodesia expire in 1986, has so far acquired only a small stake in South African gold mines. The directors of both companies have put forward a plan for shareholders' approval which will have the effect of widening the spread of mining interests in the portfolios of both companies by the simple device of exchanging shares. Union Corporation proposes to issue to "Chartered" 700,000 of its 2s. 6d. shares in exchange for 455,000 of "Chartered's" 15s. units. At the ruling prices before the proposal of 56s. for Union Corporation's shares and 84s. 9d. for "Chartered's" shares, each company would acquire a holding in the other worth about £1,950,000.

This exchange should commend itself to shareholders in both companies. After the exchange, Union Corporation will own about 2½ per cent of the equity of "Chartered" and "Chartered" about 7 per cent of Union Corporation's equity, so that voting control in the two companies remains unaffected. The share exchange is limited in scope, but it could perhaps be a precursor of much greater integration between these two finance houses.

UNIT TRUSTS

THE "Allied" group has made a block offer of one million units in **Electrical and Industrial Development Trust.** Early in 1957 and again in 1958 they made offers of 200,000 units. In the latest issue the managers have set the price at 19s. 3d. net per unit, or 1½d. below the maximum price permitted by the Board of Trade regulations. This trust, which operates as an appropriation fund, has thus cut down its loading charge, passing on to investors some of the reduction in issue expenses which it hopes to achieve through a large block issue. The yield on this portfolio is relatively high at £5 12s. 6d. per cent—though it compares with a yield of £7 15s. 6d. obtainable on the units of the trust at the time of the previous block offer in January, 1958.

The Bank-Insurance group have introduced a new thrift scheme to encourage investment in **Investment-Trust-Units** and "**Consolbits.**" After an initial purchase of 10 units, a subscriber can make regular monthly payments of as little as £1 per month towards the purchase of more units by a standing order with a bank or the Post Office Savings Bank.

London Stock Exchange

FIRST DEALINGS:	Apr. 15	Apr. 29	May 20
LAST DEALINGS:	Apr. 28	May 19	June 2
ACCOUNT DAY:	May 5	May 26	June 9

AFTER some activity in gilt-edged stocks on Monday, especially among the longer dated issues, interest slackened when institutional buying dried up and War Loan closed at 66⅞ on Wednesday, having touched 66⅞ on Monday. Among corporation loans the new LCC 5 per cent stock 1980-83 (£10 paid) improved by ⅛ to 91⅞.

Leading industrial equities remained firm and on Monday 19,221 dealings were marked, against 17,692 on the previous Monday. Following the start of the Whitsun account on Wednesday prices went ahead quite strongly in a market none too well supplied with stock. *The Economist* Indicator rose by 3.2 to a fresh peak of 263.3. British Oxygen jumped by 4s. 9d. to 59s. 9d. and Rolls-Royce by 3s. 6d. to 98s. Elliott-Automation rose by 3s. 7½d. to 27s. and Beechams by 1s. 4½d. to 33s. 6d. after 34s. following the introduction of American deposit receipt facilities in these stocks in New York. Selected motor and aircraft shares were once again active, Rover gaining 1s. 3d. to 25s. 6d. and Standard 11½d. to 11s. 2½d. Jaguar ordinary rose by a further 5s. 7½d. to 61s. 10½d. Fairey in aircraft shares gained 2s. 1½d. to 24s. 6d. largely on buying from the US. Building and road making issues were in demand following the full report of Rugby Portland Cement. Associated Portland Cement rose by 5s. 9d. to 65s. 6d. and British Portland Cement by 6s. 3d. to 49s. 3d. Limmer and Trinidad gained 2s. 9d. to 38s. 6d. and Amalgamated Roadstone 3s. to 39s. Textiles scored further modest gains on the Government's plan for the industry but Horrockses fell by 2s. to 31s. 6d. Courtaulds fell by 7d. to 31s. 10½d., reflecting the fall in man-made fibre output.

HP shares were outstanding in the general advance and British Wagon jumped by 13s. 9d. to 144s. Insurance shares were also strong as bigger dividends were announced, but Eagle Star dropped by 7s. 6d. to 186s. 3d. on disappointment with its dividend. Banks were dull, and Barclays closed 3s. lower on the week to Wednesday evening at 65s. 9d. and Martins 1s. 6d. lower at 21s. 9d.

After last week's bid by Shell for Canadian Eagle the Bearer shares in that company gained a further 1s. to 82s. 3d. and the Registered the same amount to 81s. Elsewhere oils were dull but on the first day of the new account Ultramar rose by 3s. 3d. to 72s. 9d. Kaffirs were patchy, Middle Wits gaining 1s. 10½d. to 21s. 9d. on Johannesburg buying, and FS Geduld 3s. 1½d. to 178s. 1½d. Selection Trust gained 1s. 10½d. to 105s. 7½d. in line with the rise in the price of copper and "Chartered" rose by 2s. 3d. to 87s. 6d. Rubbers were irregular but teas scored many gains on yield considerations and the rising trend of prices at the auctions.
