The latest Viscount—the 831—is larger, much faster and even more luxurious than its predecessors. In a perfectly relaxed atmosphere, you can eat and drink, read and talk (nearly everyone on board will have a common interest in the Sudan) or simply sleep, lulled by the soothing hum of the four Rolls-Royce jet engines. An unusual feature of this flight will be a Free Information Service on all matters relating to Sudanese business, political, and social life. This will be very helpful to newcomers and to those returning after a long leave of absence. If you have business in the Sudan, ask your travel agent about the new Blue Nile Viscount.

CRC 4

meated Europe's air transport network and less and less like the economic merger that it was originally intended to be. Under these circumstances, the defection of the Dutch airline, KLM, from the talks is understandable. Traffic pools are a device invented by small or weak national airlines to protect themselves from stronger competitors. They usually work as follows : the airlines agree to pool traffic over routes linking their two countries in a ratio determined in advance. The weaker of the two is then guaranteed a fixed percentage of the pooled receipts even though its own aircraft may have been running empty. Though there is usually a ceiling on the amount of revenue handed over in this way and the ratios are regularly revised, bigger airlines such as British European Airways have come to regard this as a form of "protection money" that they pay in return for a free hand in developing traffic. The alternative—in Europe at least—is to have the number of flights severely restricted in order to divert traffic to smaller competitors.

In defence of pools, airlines claim that they provide passengers with a better round-the-clock service than unpooled flights that tend to cater exclusively for peak hour traffic, an argument unlikely to impress passengers with experience of flying in North America or on the North Atlantic where pools are unknown. The emergence of the Airunion pool is not likely to have any immediate impact on BEA: the corporation has acquired its present dominating position in European air traffic by the judicious negotiation of traffic pools with all the main European operators, which alternatively give BEA scope to expand traffic or protect it from the competition of long-range carriers with more attractive aircraft. These agreements will be honoured by Airunion members so long as they last, but all of them come up for re-negotiation at regular intervals ; it will be interesting to see what terms BEA is then offered. The most surprising feature of the pool agreement announced this week is that the biggest airline of them all, Air France, has a quota of only 34 per cent compared with 30 per cent for the relatively small Lufthansa and 26 per cent for Alitalia. But Air France is putting fewer of its routes into the common pool.

MOTORS

A Record Month

OUTPUT of the motor industry reached an all-time record level during April, with 100,464 cars and 28,894 commercial vehicles being produced during the four-week month. The weekly average of 25,116 cars compares with 20,538 during March and 20,314 a year earlier ; it was accomplished despite model changeovers and unofficial strikes during the early part of the month. Production of commercial vehicles also showed a sharp increase during the month, after having fallen during both February and March: weekly output of goods vehicles totalled 6,881, compared with 5,579 in March and 5,519 a year earlier. Vehicle exports also rose during April ; 55,358 cars were exported during the month, compared with 41,590 in March, and a similar rise was shown by overseas shipments of commercial vehicles. All of the major manufacturers reported substantial increases in output during the month of April: Ford, Rootes, Vauxhall and Standard announced record production. All are still working at full capacity, including overtime ; it is likely that output this month will approach, if not exceed, that of April.

Demand, for both cars and commercial vehicles, appears to be far from satisfied ; in fact, waiting lists for many models have lengthened considerably since reductions in purchase tax were announced in the budget. A part of the boom in April undoubtedly represents seasonal buying and pent-up demand following the budget, but it is likely that output will continue at a high level throughout the summer. It is difficult to see how production could significantly exceed last month's figures, however, since the industry's capacity is not scheduled to increase much during that time ; effective capacity will in fact fall slightly next month, when the Standard Eight and Ten is discontinued, until production of the new Triumph Herald gets fully under way.

The Spare Parts Business

THE business of manufacturing spare parts for cars and commercial vehicles commonly receives little attention compared to the business of producing the vehicles themselves, possibly because manufacturers think it undesirable to draw attention to the fact that replacement parts are ever needed (much in the same way that airlines have found it unwise to emphasise safety). But they constitute an important part of the industry, and one whose importance has been growing in recent years: spare parts account for between 15 and 20 per cent of motor manufacturers' current annual output, varying inversely to some degree with the demand for vehicles. The supply of replacement parts is of growing importance to, particularly, export sales ; it is an aspect of motor business frequently sadly neglected in the past by British manufacturers, to their cost.

The Rootes Group, which has some 6,000 dealers throughout the world, has now centralised its spare parts distribution in a single primary depot, which was opened in Birmingham this week. The new depot, through which all the spare parts for the group's cars and commercial vehicles will pass in future, replaces parts departments formerly in operation at each of the company's three plants at Luton, Coventry and Silverstone. Formerly a factory producing Singer cars, the depot was extensively renovated by Rootes ; it is linked with the company's main overseas distributors by a Telex system.

The greater part of the £10 million stock at this depot is of parts for cars no longer in production, which are made by outside suppliers after production has ceased ; in some cases parts are held for models produced in the 1930s. Roughly three-fifths of all orders for spares go to the home market, and about twice as many parts for cars are held as for commercial vehicles ; both of these proportions parallel the company's experience in manufacture and exports of vehicles. Spares are probably slightly more profitable than vehicles, for both manufacturer and distributor. As the number of cars on the road increases, and as complicated unit frame-and-body construction becomes even more common, so that a given accident damages a greater part of the car, it seems likely that this part of the industry's activities will become even more important.

INTERNATIONAL INVESTMENT

A British Fund for Europe

THROUGH the New European and General Investment Trust, M. Samuel and Company, the merchant bankers, are offering British investors a chance

to secure a modest stake in the risk capital of Western European industries and are trying, at the same time, to strengthen the links between the City and the Continental bankers. This is not a grandiose scheme ; it is a first step towards collective British participation in the capital markets of Western Europe taken with cautious deliberation. The authorised capital of this closed-end trust is £3 million and most of it has been placed this week with investment trusts and medium-sized general insurance companies—that is, with professional investors who know that the trust cannot be expected initially to pay a large dividend out of low yields but are prepared for a long pull. The initial call is 10s. per £1 unit and the remaining calls of 5s. can be made on three months' notice.

The trust intends to invest in the equities of Western Europe, largely but not exclusively in the countries of the common market ; but the sponsors are prepared, if necessary, to use short dated bonds as a temporary haven. Investment advice will be provided by the Continental bankers represented on the board and management committee. Their knowledge of European equities extends well beyond the published accounts of the companies concerned (which can sometimes be misleading) and their participation may open the way to unquoted securities and underwriting on the Continent.

The New European and General is another good example of the cross-fertilisation of international capital. Swiss and German bankers have recently been active in launching a number of open-ended mutual funds, investing their moneys throughout Western Europe. Of these one of the most successful is **Eurit,** which has attracted subscriptions of 80 million Swiss francs ; the most recent is **Intervesta,** sponsored by the Deutsche Bank, which quickly secured subscriptions to its initial offer worth 40 million D-marks. Investors in the United States, too, have been turning their eyes towards Western Europe. The most ambitious move there is **Eurofund,** which seemed set for an initial issue of $50 million, but its ambitions were scaled down by the Berlin crisis to an actual offer of 1,250,000 units at $20 each; the lists of this closed-end trust, which includes among its sponsors Glore, Forgan of New York, E. Gutzwiller of Basle, and R. de Lubersac of Paris and which intends to distribute much the greater part of its income, are still open. The **Transatlantic Fund,** sponsored in this country by Kleinwort Sons and Company, has placed well over $5 million of capital, at a minimum subscription of $100,000 per investor, successfully. This trust will invest in Britain and the Commonwealth as well as Western Europe and its aim is to keep distributions low and secure capital growth.

STERLING

On a See-Saw

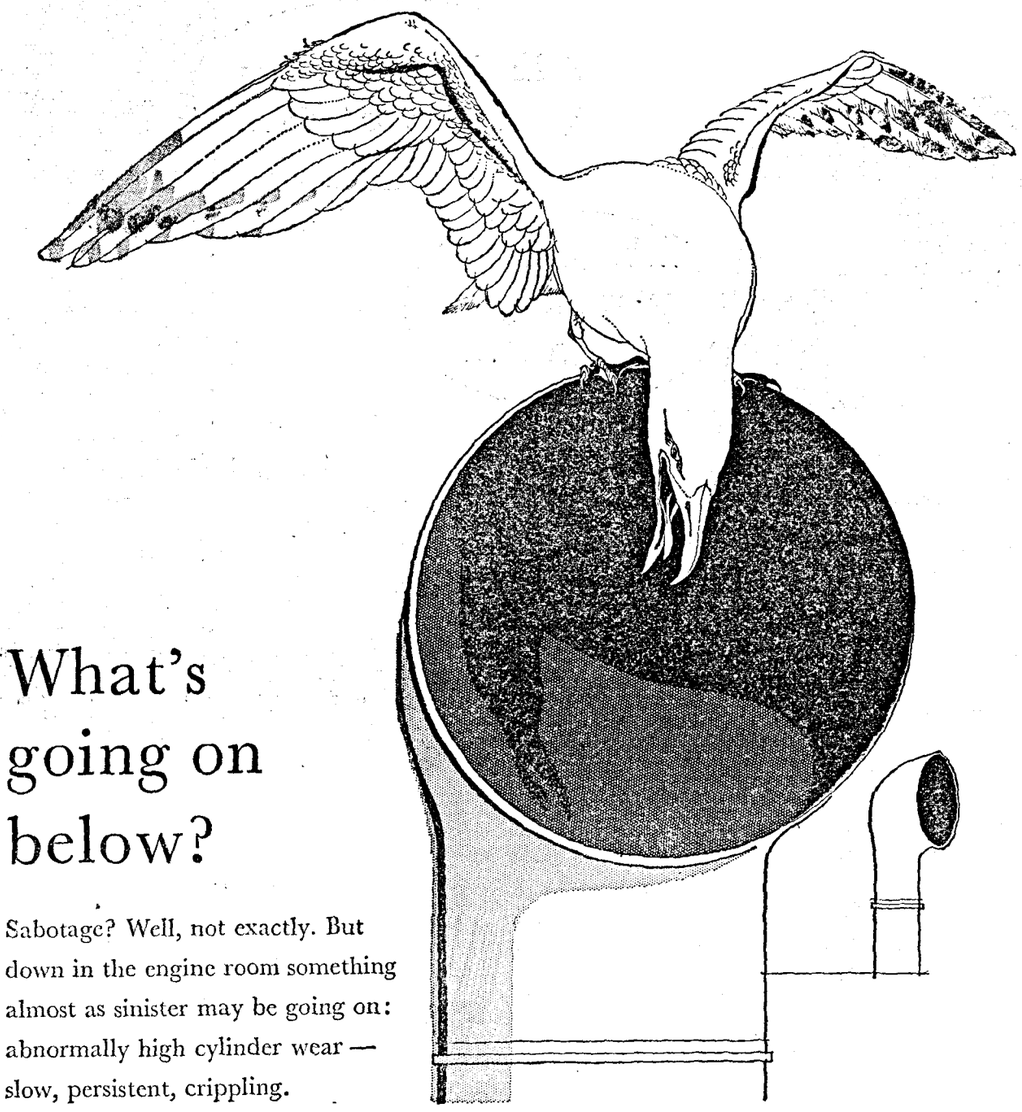
STERLING weakened in the foreign exchange market on Monday and Tuesday but then it took a decided turn for the better. Against the dollar the rate fell from $2.81 1/16 to $2.81 1/8 on Tuesday but has since recovered to around $2.81 3/8. In extremely thin markets some offering of sterling from Paris against purchases of dollars was said to have played a big part in bringing the rate down. The Exchange Equalisation Account appears to have remained outside the market during this period, for the authorities are evidently unwilling to give support to sterling while it remains substantially above its parity—as it was even at the lowest point reached this week. The subsequent recovery of sterling was largely due to some commercial bidding from New York. This demand for sterling is less subject to seasonal fluctuations now that so much of the sterling area's sales to North America consist of manufactured goods exported from the United Kingdom.

The Exchange Equalisation Account returned to the market later in the week with some purchases of Continental currencies. The German mark, Swedish krone, Dutch guilder and Belgian franc weakened against sterling on Wednesday and the authorities seem to have acquired some of these currencies. The Belgian franc, which had recovered well from the bout of weakness which followed the disorders in the Congo, has again come under slight pressure this week on reports of the coal crisis and the unsettling effect of royal discord. The dollar is still inclined to be soft in terms of a number of Continental currencies, even though a fair volume of short-term funds is making its way from Switzerland and Germany to the New York market.

BUILDING SOCIETIES

Reducing the Rates

A GOOD number of building societies have quickly applied the recommendation of the Building Societies Association that the rate on new mortgages should come down from 6 per cent to 5½ per cent "not later than July 1st." The association's further recommendation that the societies should bring down the net rate paid on shares from 3½ per cent to 3¼ per cent as soon as it was "desirable and practicable" is less imperative ; this gives the smaller societies an opportunity, if their reserve ratios are strong enough, to bring down their mortgage rates but to leave their share rates unchanged until the summer lending activity tails off.



The recommendation recognised the real difference of opinion and experience between the big and small societies. Three big national societies—Abbey National, Co-operative Permanent and Woolwich Equitable—have reduced both the mortgage and share rates to the recommended levels. Most medium-sized societies have been content to cut the mortgage rate but to leave the share rate at 3½ per cent net. The Hastings and Thanet, for instance, is now at 5½ per cent for new mortgages but the net rate of 3¼ per cent on shares will not come into effect until October 1st.

On existing mortgages some societies, including the Woolwich, will bring the rate down to a uniform 5½ per cent ; others, including the Abbey National and the Co-operative Permanent, will reduce their rates by one half of one per cent, with a minimum of 5½ per cent. The Co-operative Permanent, one of the few societies to lend on long mortgages, is to bring its rate down from 6¼ per cent to 5¾ per cent on mortgages of over twenty years. The application of these reductions for existing mortgages varies with the notice that each society has to give to its borrowers.

VICKERS-ARMSTRONGS

The 400th Viscount

THE 400th Viscount built by Vickers-Armstrongs was delivered to Hunting Clan on Friday, which leaves exactly seven more Viscounts still on order. Although the rate of sales has fallen sharply, and only three Viscounts

What's going on below?

Sabotage? Well, not exactly. But down in the engine room something almost as sinister may be going on: abnormally high cylinder wear — slow, persistent, crippling.

A few years ago this was a costly problem to shipowners running diesel vessels on marine fuel oil. Cylinder liners, normally good for 25,000 to 30,000 hours, were lasting barely a quarter of that time. To the rescue came Shell with a new cylinder lubricant — Shell Alexia Oil A — a great development in marine diesel engine lubrication. Now in a range, Shell Alexia Oils go to the heart of the trouble by neutralising the acid combustion products which cause excessive wear. So successful have they proved in service that more than 1,200 diesel ships (over and above the Shell Fleet) are now using Shell Alexia Oils, and reductions in liner wear of around 70% are common.

Shell Leadership in Lubrication stems from deeds, not words . . . from fundamental developments born of research which, like Shell Alexia Oils, are meeting and beating the problems of the modern world.

BRITISH TRANSPORT ADVERTISING

1,000 million passengers travel on British Railways every year, 4,000 road side sites confront millions of people, British Transport buses travel 841 million miles every year: Add the 910 million rides on the Underground and the people who see the 9,000 poster-carrying vans and what have you got? **The largest advertising audience in the country.** British Transport Advertising is a well-documented medium: ask for rentals and all the statistics you want from British Transport Advertising, Cranbourn Chambers, Leicester Square Station, London WC2 (Phone: Temple Bar 3490) or 6-7 Castle Terrace, Edinburgh 1 (Phone: Fountainbridge 5222).

Colour, continuity and a massive audience at economical rentals

security officer—and with the fuss and a valid sacrament *ex opere operato*. 11 Keighley

have been sold since the beginning of the year, the outlook is not quite as black as these figures suggest. Vickers are building nine Viscounts for stock and manufacturing components for the same number; orders for about 50 machines are in various stages of negotiation. This would bring the total sold to just under 460; whether Vickers can reach the 500 mark is an open question.

Viscounts have been flying now since 1948, and the value of the 400 delivered amounts to £156.25 million, £57 million of which represents sales to North America. During all this time, Vickers-Armstrongs has paid a royalty to the government on every aircraft sold, making the Viscount one of the few profitable investments ever undertaken by the Ministry of Supply. The government provided £1.8 million towards the development of the first Viscount protoypes (the company paid all the cost of developing subsequent versions which are now roughly twice the size of the original aircraft), and has since recovered this sum several times over. On several occasions Vickers-Armstrongs has tried to renegotiate the agreement, and now has an understanding that royalties will cease when Viscount sales exceed a certain figure. But there is almost no chance that the prescribed figure will ever be reached. It is largely the size of royalties paid to the government in return for financial aid in the early stages of development that decided Vickers to undertake the development both of the Vanguard and the even bigger jet V.C.10 as private ventures.

ENGINEERING EXPORTS

Buying Shares with Machinery

A NOVEL course in setting up a foreign manufacturing subsidiary has been followed by F. Perkins of Peterborough in establishing Motores Perkins S.A., the company which will make Perkins diesel engines in Brazil beginning next year. The new company has been formed by Perkins and Murray Simonsen S.A., a holding company widely represented in manufacturing, importing and banking in Brazil; half of the £2 million share capital of Motores Perkins will be owned by the British company, who will pay for it in part by sending a comprehensive engine manufacturing line worth between £500,000 and £750,000 from Peterborough to São Paulo. Perkins are supplying, among other things, a complete cylinder head plant and a crankshaft plant, a connecting rod plant, and auxiliary equipment; totalling about 1,000 tons, the equipment has mainly been shipped by canal barge for packaging at the Chiswick warehouses of Lep Transport, where it is awaiting shipment to Brazil next month. About 500 tons of new machinery will also go into the São Paulo plant, and only about 15 per cent of the basic engine components will ultimately be "bought out."

Motores Perkins will produce a version of Perkins' F.340 engine, a six-cylinder 5.56-litre engine developing 110 horsepower, which has had wide application in vehicles and agricultural machinery. Output is expected to reach 18-20,000 a year by 1962, and other models may be added if demand warrants and production facilities permit. While it is often argued that manufacturing companies in less-industrialised countries like Brazil should use older—and consequently cheaper and more labour-intensive—plant for the most economic operation, Perkins have not done this. Although well written-down on the company's books, the machinery being sent to Brazil—where skilled labour is now relatively scarce—is comparatively modern, and some of it makes use of a considerable degree of automation. Transferring a complete production line will save substantial time in getting into production in Brazil; if entirely new equipment were bought, as much as a year might be spent in obtaining special tools and in organising the plant.

Perkins now make seven models of lightweight diesel engines, which are in use all over the world. They expect to sell to General Motors, Ford and International Harvester, all of whom are Perkins' customers elsewhere, and are now manufacturing in Brazil. The company report that output and demand have risen steadily throughout this year, and production reached a record level of 410 a day last month. Capacity will be increased later this year by the addition of a new production line at Peterborough (to replace the machines being sent to Brazil) which will produce three engines, including a new model to be announced in the near future. In their own range—of perhaps the highest power-to-weight, and the lightest diesels now produced—Perkins have virtually no competitors.

COMMONWEALTH DEVELOPMENT

CDFC Prepares for Expansion

A SHORTAGE of permanent finance has limited the growth of the Commonwealth Development Finance Company. By the end of March, it had invested £11.4 million, financed by bank advances of £7.2 million and by £4.2 million of issued capital, with 8,250,000 of "A" ordinary shares of £1 each, 2s. paid, and 6,750,000 "B" ordinary shares of £1 each, 10s. paid. Early in March, CDFC, with the support of the Chancellor, made an appeal for new capital. Its authorised capital is to be doubled by the creation of 15 million new ordinary shares, of which 11 million shares will be in issue. Some 92 companies with interests in the Commonwealth (including 16 companies which already owned shares) applied for 6,010,000 "A" shares and the Bank of England and "certain subscribers in the Commonwealth" are to take up 4,990,000 "B" shares. A call of 2s. on the "A" shares and of 10s. on the "B" units will provide £3,096,000, which will be used to reduce CDFC's debt to the London clearing banks; Lord Godber, the chairman, says that CDFC with this additional capital can now "contemplate an increase in the volume of its investments."

The uncalled portion of the new capital will provide additional cover for borrowings. The directors are, moreover, considering the possibility of a funding operation to strengthen the capital structure. From its investments, CDFC earned in 1958-59 £283,824 before tax (against £120,806) and its net income of £89,864 (against £20,087) has again been ploughed back.

COPPER MARKETS

"Comex" Overtakes London

THE London Metal Exchange is no longer the biggest market in copper. Copper trading on the New York Commodity Exchange (Comex) has surpassed London and become a force to be reckoned with here. Last year, when London's turnover rose by a third to 635,000 long tons,

trading on Comex rose nearly eight times to 814,000 long tons, and in the first four months of 1959 it rose to 596,000 long tons, compared with 243,000 tons in London. This growth reflects increasing participation among dealers in scrap and refined copper, merchants and custom smelters, mainly for hedging and also for speculation. More arbitrage between New York and London is also being done. Comex has attracted little interest from fabricators, largely because the fabricating industry is dominated by the subsidiaries of the major producers of copper, who sell at fixed prices that have no direct relation to prices on Comex. But it has attracted a large volume of support from outside speculators. Though Comex is exerting more influence on the American dealers' and custom smelters' prices, and on London, it is not a pricing medium; the Metal Exchange is.

The growth of futures trading is in a young market handicapped because the market initially is narrow, and more traders will not use it until it broadens out. To break this vicious circle traders need something to "go for." The opportunity for Comex came last year. A recovery in copper prices was clearly due, and the big brokerage houses publicised the attractions of investing in the commodity itself instead of in copper stocks. A purchase of one contract on Comex of 50,000 lb (25 short tons) brings a profit of $500 for each rise of one cent in copper prices (and copper can be traded for delivery in up to twelve months' time, compared with only three months in London). On this occasion the brokers were right. The custom smelters' price rose from 23 cents a lb in the spring of 1958 to 34 cents a lb this year, and then dropped back to 32 cents. Heavy buying of copper in anticipation of a strike in the mining industries this summer gave fresh impetus to the market, though it has suffered several shakeouts; a burst of selling following reports that the American government might sell copper from the supplementary stockpile brought turnover to a new peak of 29,500 tons in one day last month. This peak may not be reached again this year, but trading should remain relatively high. With the progress of Comex before them, producers and consumers of Rhodesian copper might ask themselves again whether they are wise to transact so much of their business outside the market under direct long-term contracts which, while using London as a pricing medium, make its turnover more marginal than it should be.

GOLD DISCOUNT BANK

Watchdog for "Dego"

GERMANY'S postwar record in fulfilling prewar external debt obligations has in most respects been a model of correctness. The 1953 external debt settlement has been honoured in full. Bond holders and standstill creditors, who hopefully clung to their claims through the barren years, have seen the bonds honoured and the arrears of interest paid. This good record brings any exception into prominence and there is a certain blot on the escutcheon in connection with the claims of foreign shareholders of the Gold Discount Bank ("Dego") preference shares. These preference shares were acquired by some American and British investors who had provided part of the Reichsbank's capital in 1924 but were compelled in 1939 to exchange Reichsbank shares into "Dego" preference shares. The bulk of them are held by Germans and the claim, on behalf of the foreign holders, is comparatively small.

In the 1953 German debt settlement it was agreed that foreign holders of the "Dego" Preference shares should receive the same treatment as the German holders. What precisely they are to receive has yet to be determined, for the series of law settling the domestic prewar obligations of the Reich have yet to be passed and when enacted, will almost certainly be followed by a series of lawsuits. It is too early, therefore, to complain of default. The possibility of unfair treatment arises from the fact that one of the principal assets of the Gold Discount Bank consisted of German external bonds, which are not subject to the 1953 settlement since they are held by a domestic institution. The bank was used by the German authorities as the means by which external debt was repatriated during the 1930's at the depreciated prices to which the German bonds fell as the result of the default on interest and capital payments. But American and British protective committees have been formed and their representatives met in Frankfurt this week. The power of the American protective committee has been strengthened by the addition to the bill for the return to German nationals of their property in the United States of an amendment which would make such a return conditional on the German government making suitable provision to pay US nationals money due to them because of the defaulted obligations of the Gold Discount Bank.

SHORTER NOTES

The directors of Shorts, the wine and spirit merchants, have rejected the £385,250 bid of 30s. for each £1 deferred ordinary share and £9 10s. for each of the £10 preferred ordinary shares made by Leadenhall Investments and Finance. In a letter to shareholders Mr. A. V. Slater says that the directors believe that dividends in the foreseeable future can be more than maintained. Last year's dividend on the deferred ordinary shares was 10 per cent.

* * *

British Match is to make a 50 per cent scrip issue and on the enlarged ordinary capital the directors expect to pay a dividend of 8½ per cent for the year to March 31st. This is equivalent to an increase from 11 per cent to 12½ per cent on the existing capital.

CAMMELL LAIRD & CO. LIMITED

FACTORS CONTRIBUTING TO REDUCED LEVEL OF PROFITS

CAUTIONARY NOTE JUSTIFIED BY EVENTS

SHORT AND LONG-TERM PROSPECTS REVIEWED

MR J. C. MATHER ON GROUP'S ACTIVITIES AND COMPETITIVE ABILITY

The ninety-fifth annual general meeting of Cammell Laird & Co. Ltd., was held on May 27th at Birkenhead, Mr J. C. Mather, JP (the Chairman) presiding.

The following is the Chairman's statement which had been circulated with the report and accounts for the year ended December 31, 1958:

In view of the warning which I gave in my statement last year and the further recession in trade during 1958, particularly in the steel and ship-owning industries, I think Shareholders will have been prepared for some reduction of the record level of profits achieved by the Group in 1957. The Group Operating Surplus has declined by about £450,000 due to a reduction of profits, both in Cammell Laird & Co. (Shipbuilders & Engineers) Limited, particularly on the ship repairing side, and in The Patent Shaft & Axletree Co. Ltd., caused by a shortage of work in all departments.

There are, as yet, no signs of any improvement in the fortunes of shipowners and in consequence, orders are very scarce and the outlook for shipbuilding is not good. Our shipbuilding subsidiary is fortunate in having orders on hand which will keep most sections busy for some time, but long term prospects must depend upon the receipt of further orders. Nor are immediate prospects much brighter in the steel industry although there has been a slight improvement in order books in recent weeks.

Just as the full effects of the credit restrictions imposed in 1957 were not felt until much later than anticipated, so the relaxation of them can only have a long-term effect. It is to be hoped that the recent Budget proposals will provide the stimulus to industry which the Government expect and another long-term tonic for the economy may be provided by an improvement in commodity prices which, for the first time since 1956, have risen steadily over the last two months.

The improvements which we are carrying out in our subsidiary companies will undoubtedly put us in a better position to compete in these difficult times and will help us to reap the benefit when more prosperous times return. In the meantime, I am sure Shareholders will wish me to thank all those working for the Group who have given of their best and produced results which, in the circumstances, I believe will be regarded as satisfactory.

ACCOUNTS

The order of the accounts has been rearranged to conform with modern practice and further improvements have been made in their presentation which make it necessary for me to comment only on important changes in the figures compared with the previous year.

Consolidated Profit and Loss Account.—I have already referred to the difference in the Operating Surplus and income from Associated Companies and Trade Investments shows little change. The reduction in Investment Income is due to the realisation of [illegible] for capital expenditure.

Loan and Bank interest show a considerable increase but Taxation takes less than in 1957 and after taking into account Outside Shareholders' interests, net Group profit for the year amounts to £843,201, approximately £250,000 less than the previous year. Profits retained by Subsidiary Companies are also less than last year and the net amount available, including the balance brought forward from 1957, is £231,311. An interim dividend of 4 per cent less tax, absorbing £122,475, was paid on October 30, 1958, and your Board now recommends the payment of a final dividend of 3 per cent less tax for the year 1958. At the same time, it is proposed to pay a special interim dividend of 8 per cent less tax, amounting to £260,925, to be charged against the profits of the year 1959. This will have the effect of giving shareholders the same overall rate of dividend as for 1957, but will reduce the incidence of profits tax. Your Board feels that although prospects for the future are less favourable, the results for the year 1958 justify the maintenance of the rate of dividend.

Consolidated Balance Sheet.—The considerable increase in the amount of Fixed Assets during 1958 compared with the previous year is the main item of note and is reflected in increased loans on the opposite side of the Balance Sheet and the sale of some of our investments.

Parent Company's Balance Sheet.—Investments in Associated Companies have increased by £625,000, paid in respect of the further 1 million "B" Ordinary Shares of £1 each in the capital of English Steel Corparation Ltd. for which we have now subscribed, thus maintaining our proportion of the equity holding in that Company. A like amount is payable on these shares at the end of 1959. The only other item of note in the Parent Company's Balance Sheet is the reduction in the holding of quoted securities to which I have already referred.

Capital Commitments.—Contracts in respect of capital expenditure at December 31, 1958, amounting to £4,347,464 as shown in the Notes consisted of £3,672,464 for our shipbuilding subsidiary and £675,000 for our steel-making subsidiary in connection with their reconstruction schemes.

CAMMELL LAIRD & CO. (SHIPBUILDERS & ENGINEERS) LTD

Ship Construction.—The Company has been engaged on a varied programme of new tonnage for both the Merchant Navy and the Royal Navy, which has kept it well employed during the year. Seven vessels totalling 47,819 gross tons were launched and ten vessels totalling 73,183 gross tons were completed. This tonnage includes tankers, refrigerated cargo liners, a bulk paper carrier, tugboats and naval vessels.

At the present time the Company is engaged upon the construction of a variety of ships, including the prototype of the guided missile destroyer, HMS *Devonshire*, whose keel was laid earlier this year, and the large mail passenger and cargo liner *Windsor Castle*, for the Union-Castle Mail Steamship Co., Ltd. It was with great pride and pleasure that we received the news that Her Majesty Queen Elizabeth the Queen Mother is to visit the Works on Tuesday, June 23, 1959 to launch this liner.

The construction of the new Platers' Sheds and extensions to the Welding Bays have been completed and we hope that the new processing equipment will be installed and in full operation later in the year. With these modern facilities and the implementation of up-to-date production methods, combined with the goodwill of all those operating the plant, we look forward with confidence to effecting a considerable improvement in our competitive ability.

Engineering.—During the year four sets of steam turbine double-reduction geared machinery were built and tested in the main Engine Shop and, in addition, four diesel engines, comprising the balance of an order for eight engines, were built and tested for the Admiralty.

Work has proceeded throughout the year on the construction of two sets of steam turbine machinery for the *Windsor Castle* and these are now nearing completion.

The Gearing Department has also had a busy year and, apart from producing gears for some of the machinery sets referred to above, has completed a considerable amount of work for the Ship Repair Department. A new 200 in. gear hobbing machine, one of the largest and most accurate in the country, has been brought into production and will enable us to maintain our position in this branch of engineering.

The Boiler Shop, too, has been kept well employed and work is at present proceeding on the three main boilers for the *Windsor Castle*, which will be the largest water-tube boilers which we have ever built. They are now almost complete.

Work continued throughout the year on the gas turbine installation for the tanker *Auris*. Several series of trials have been run during the year to test the design and to obtain data for further advancement in this field. At the time of writing this report further series of trials are being carried out and we hope to undertake extensive sea trials in the near future.

As part of the modernisation of the Engineering Department a complete system of planning and production control has been intro-

duced and is now in operation in the main Engine Shop. In addition, the Inspection Department has been considerably improved and now covers all aspects of material supply and manufacturing processes to meet the latest requirements of our customers.

SHIP REPAIRING

During 1958 the activities of the Ship Repair Department, in common with those of other British ship repairing firms, were greatly curtailed due to the lack of orders, and intense competition has been experienced from Continental firms. Nevertheless, we succeeded in obtaining a fair share of business. Unlike the previous year the large docks were fairly well occupied during 1958 but the smaller docks remained empty for considerable periods and this is attributed to the falling-off in the coastal trade and the reluctance of owners to put in hand major overhauls.

On July 23, 1958, No. 5 Dock, together with additional land acquired by the Company, was handed over to the contractors who were awarded the contract for the building of the large new dock. The new dock will be 850 feet long and 140 feet wide at the entrance and, if necessary, it can be lengthened up to 1,000 feet. Since the contract was awarded, the contractors have progressed very satisfactorily and it is hoped that the dock will be completed by the end of 1960.

Last year I referred to the facilities we propose to provide for the cleaning and gas-freeing of tankers at Rock Ferry Pier, in conjunction with our neighbours Grayson, Rollo Clover Docks Ltd. Contract work commenced on June 9, 1958.

It is with pleasure that I place on record the awards by Her Majesty the Queen of honours to two of our Staff. Mr Frederick Price, Head Foreman Sheet Metal-worker, was awarded the MBE in the New Year's Honours and Mr Frank Shaw, an Assistant Foreman in our Outside Engineering Department, was awarded the BEM.

THE PATENT SHAFT & AXLETREE CO. LTD.

In my statement last year I mentioned that as the Development Scheme progressed the charge for loan interest would increase, and although some relief was obtained from the reductions in Bank Rate during the year, interest on loans amounted to £253,858 compared with £74,905 in 1957. Bank Interest on overdrafts also increased, from £4,234 to £13,478.

I stated last year that the demand for some of the Company's products had begun to fall off and that it was likely that the total output in 1958 would be less than in 1957. This has proved to be the case and, as Shareholders are no doubt aware, a marked trade recession developed during the year and now affects nearly the whole of the heavy steel trade. Demand for steel bars and sections declined throughout the early part of the year and in the second six months the decline extended also to steel plates, the principal product of the Patent Shaft. By September all departments were working short time and have continued to do so.

In these inauspicious circumstances certain sections of the Development Scheme were completed and brought into operation. One new oil fired melting furnace commenced production in mid-October and the new slabbing and blooming mill started at the beginning of November. It was of course necessary to train the operators in the use of the new plant and certain teething troubles were inevitably encountered. Owing to the trade recession it was possible to work the new mill at only a fraction of its potential capacity, and in addition considerable extra expense was incurred in using the old plate mill in conjunction with the new mill. On the other hand depreciation had to be provided on the full cost of the plant brought into production. All these factors combined with the interest charges mentioned above produced a loss for the year of £242,819.

The Development Scheme is now substantially complete and trial rollings in the new 4-high Plate Mill began on March 2, 1959. This modern plant is now almost ready for full scale operation but the possibility of such operation is limited by the volume of orders available for its products. No effort is being spared to obtain orders but the profitability of the plant depends on the return of prosperity to the heavy steel trade as a whole.

METROPOLITAN-CAMMELL CARRIAGE & WAGON CO. LTD.

For the Metropolitan-Cammell Carriage & Wagon Company Limited the outstanding event of the year was the receipt of a contract from the London Transport Executive for 532 Piccadilly Tube Cars similar to the prototype train supplied in 1957 with unpainted aluminium alloy exteriors. Most of the cars now running in this service were built by Metropolitan-Cammell. The value of this latest contract was about £5½ million and deliveries will commence during 1959 and continue into 1962.

The British Transport Commission placed additional orders with the Company for 93 Standard Main Line Coaches and 168 Diesel Railcars. An order was also received from the Pullman Car Company for 44 of their special types of coaches.

A severe decline in demand for new wagons for British Railways coincided with fewer inquiries from overseas. Competition became even more acute for the smaller amount of work, but the Company succeeded in obtaining orders for wagons from Pakistan, Nigeria and Portuguese West Africa.

The value of output again reached a new record level. Overseas shipments included coaches and coach shells for electrified suburban railways in South Africa, Brazil and India, and wagons for New Zealand, Rhodesia, the Sudan, India and British Guiana. While continuing deliveries of standard coaches and wagons for British Railways, the Company also completed during the year more than 200 diesel railcar units making a total of 565 supplied for the modernisation programme.

Output from the Company's 'bus building factory was maintained at a reasonable level, but because of import and financial restrictions there were fewer new inquiries from home and overseas customers. Against more severe competition orders were obtained from Jamaica and Ceylon and those from the home market included more than 200 of the new type of Atlantean Low-loading double-deck 'bus with the engine at the rear.

Results for the year were satisfactory and the order book remains generally at a high level, but the lack of wagon orders is causing some anxiety.

ENGLISH STEEL CORPORATION LIMITED

The operating companies of English Steel Corporation Ltd. could not escape the difficulties general to the Steel Industry, despite the heavy order book with which 1958 commenced. The prosperity of the Industry —and particularly of the Heavy Section—is closely tied to capital development and investment and any restrictions therein affect steel production directly. Orders on hand at the commencement of the year enabled full production to continue during the first quarter but in the later months production was restricted in many sections. Whilst the decline in order input appears to have levelled off, new orders are inadequate to occupy more than about two-thirds of full production capacity. Steel production for the Group was 505,660 tons, a fall of 76,518 tons compared with the previous year.

All companies had difficulty in obtaining export business. Severe competition was experienced from continental competitors short of work and able to offer their customers financial advantages not available to British suppliers.

The Heavy Forge was well occupied throughout the year. This section has not yet felt the full effect of the recession, its products being mainly parts for heavy capital equipment. The halt in the investment programme during the past year will result in a reduced demand during 1959. A notable achievement during the year was the completion of the largest forged boiler drum drum in Great Britain.

The reconditioned Heavy Plate Mill began during the year the supply of thick plate to the general engineering industry and the preparation of stainless steel slabs prior to rolling in the plant of Firth-Vickers Stainless Steels Ltd.

The Drop Forge was employed at a much reduced capacity throughout the year. A substantial proportion of its output was devoted to forgings for the aircraft industry and the suspension of orders for military aircraft has created a gap in the programme which it has not been possible to fill from other sources.

The Machine Shop with a floor area of approximately 108,000 square feet for machining railway castings and special forgings was completed towards the end of the year and will shortly be in use.

There has been a steady demand for specialised steel castings which has more than compensated for the reduction of orders for castings for the general engineering industry and an average weekly output greater than in any previous year was obtained. During the year a mill housing weighing 168 tons, the largest yet made in Great Britain, was successfully produced and delivered, while a cast steel bogie exhibited at the Universal and International Exhibition, Brussels, was awarded a Diploma of Honour by the Fair's International Juries in Class 20/3 (Steel and Iron Foundry Work).

The plant engaged in the production of rolled products suffered from a serious shortage of orders and from March onwards short time working of the Rolling Mills was necessary.

Railway wheels, tyres and axles were again produced in large quantities and Taylor Brothers' plant was fully occupied throughout the year. The completion of the wagon replacement programme by British Railways and smaller overseas requirements will much reduce activity at this plant during 1959.

Both the Forge and Foundry of The Darlington Forge Ltd. were well occupied.

The plant for production of wheels in Canada erected in Canada by Canadian Steel Wheel Ltd., in which the Company has a 50 per cent interest, commenced production early in 1959. Building work and plant erection were completed in a period of fifteen months. The South African subsidiary, Steel Wheel and Axle South Africa (Pty.) Ltd. had another successful year.

Firth-Vickers Stainless Steels Ltd. completed the installation of Steckel hot rolling equipment and had largely overcome technical difficulties by the end of the year. There has been some fall in demand for its products from the aircraft industry, but the lifting of restrictions on credit facilities for the purchase of durable household equipment is expected to increase the demand for stainless steel products.

Building schemes and plant designs for the melting plant and heavy forge at the new Tinsley site have proceeded during the year but no construction contracts have been placed. The buildings for the new Spring plant on the same site were nearly completed at the end of the year.

The report and accounts were adopted and the dividends, as recommended, were approved.

The retiring directors, Mr A. Reith Gray and Mr P. B. Hunter, were re-elected and the remuneration of the auditors, Messrs Cooper Brothers & Co., having been fixed the proceedings terminated.

THE FRIARS INVESTMENT TRUST LIMITED

LARGER DIVIDEND

The thirty-second annual general meeting of The Friars Investment Trust, Ltd., was held on 25th May at 33 Cornhill, London, EC, Mr J. N. Buchanan, DSO, MC (chairman of the company) presiding.

The following is his statement circulated with the report and accounts for the year ended 15th February, 1959:

As I indicated was likely in my statement last year, our revenue for the year under review has not shown an increase such as we have been accustomed to in recent years. There was a reduction in some dividends received, mainly in commodity shares where we expect some recovery this year, and we paid Profits Tax for the first time so that the Net Revenue is slightly reduced and the earnings on our Capital are 12.12 per cent, compared with 12.36 per cent in the previous year.

We feel justified, however, in recommending an increase of ½ per cent on the Dividend to 9 per cent, as this means a distribution of 80 per cent of the Company's overall revenue. We do not think this is too high particularly as the Final Dividend is taxed at 7s. 9d. whereas our revenue was all received taxed at 8s. 6d. The proposed Dividend would only have required 78 per cent of the earnings had it not been for the change in tax. Next year the charge for Profits Tax will be higher, but we should be able to maintain this rate of dividend without an unduly high distribution of earnings.

APPRECIATION OF INVESTMENTS

The value of our Investments has increased during the year from £4,159,000 to £5,449,000 so that the appreciation over the amount at which they stand in the Balance Sheet is 76 per cent instead of 37 per cent. While this is very satisfactory too much weight should not be attached to it as capital values fluctuate considerably and at present many of them, particularly in USA, seem very high.

The report and accounts were unanimously adopted and the dividend, as recommended, was approved.

DICTAPHONE COMPANY LIMITED

MR C. KING WOODBRIDGE'S ADDRESS

The Annual Meeting of Dictaphone Company Limited was held on May 20th in London.

Mr C. King Woodbridge, the chairman of the company, and chairman of Dictaphone Corporation, presided and in the course of his address prefaced his statement by referring to the Annual Meeting of the parent company, Dictaphone Corporation, which covered the same period under review, that being the year ended December 31, 1958.

He said that it gave him very great pleasure to preside at this meeting of shareholders and to congratulate those concerned with the management and conduct of the British company on the substantial progress that had been made since the last Annual Meeting.

The chairman continued: I am happy to state that not only has the British company maintained its position in the dictating machine world but, in step with the parent company and its Canadian offshoot, which is so closely linked with the British company, have all maintained their position as leaders in the countries in which they operate and throughout the world.

MAGNITUDE OF BUSINESS

Before I go into any details with the affairs of this company, you may like to be reminded of the magnitude of the Dictaphone business.

In the United States, as in this country it has been necessary for us to extend our manufacturing space, which in turn calls for the installation of new equipment and larger stocks of material for 1,500 components which go to make up the Dictaphone Time Master dictating machines.

While our major business is in Dictaphone Time-Master dictating machines and the Dictabelt record. we have found a large potential market of increasing interest in recording and reproducing machines of various types. These include the small portable Dictet for recording travel and inventory data, machines for monitoring radio broadcasts, air traffic control, telephone recording, police and fire calls, the time-announcer (best known as the "talking clock") and the machine for audibly instructed manufacturing operations.

We have also entered the educational field through the adaptation of Dictaphone dictating machine equipment. It can be truly said that Dictaphone is no longer a single purpose organisation directed toward providing office machines for communication. It has broadened its base and opened up new channels which will add to its volume and profits as indicated by the present trend of sales for recording and reproducing equipment.

A NEW MODEL TIME-MASTER

During the year under review, we have introduced in our British market and on the Continent a new model Dictaphone dictating machine, known as the Time-Master Number 6. This gives us a wholly automatic dictating machine of the very latest components which has met with a very enthusiastic reception by our users.

THE DICTABELT

It is, of course impossible to talk about the Dictaphone "Time-Master" without emphasising Dictaphone "Dictabelts" manufactured in our own factory, which you will appreciate is by no means a small undertaking when I tell you that during last year over fifty million "Dictabelts" were made and distributed.

DICTAPHONE TELECORD SYSTEM

Since I last addressed you we have introduced an instrument as simple and convenient as the ordinary telephone. That, basically, is the Dictaphone Telecord System. Skilfully and simply engineered, the Telecord System is a connection of a telephone to a centrally located "Time-Master" dictating machine. All you have to do is to pick up the handset and think out loud. Stations can be placed anywhere—any distance from the centrally located "Time-Master"; the recording is always crystal clear, of matchless Dictaphone quality.

WIDE AVAILABILITY

With this system a number of people in different parts of the building may dictate letters simply by picking up a telephone and talking. There is no need to have secretaries waiting about, no time wasted when there isn't one available.

In addition, with such a simple and efficient method of dictation, even people who seldom need to dictate can have all the resources of a full-time secretary. Such a method opens new vistas of time-saving and efficiency to a cost-conscious business organisation. Such a method is the Dictaphone Telecord System.

Most important, the Dictaphone Telecord System is backed by the world's oldest, largest and most experienced company of dictating machine manufacturers. Behind the Dictaphone Company is more than 60 years of concentrated specialisation, beginning with the invention of the first practical dictating machine.

FACTORY EXTENSION

To make this possible this company has purchased a new building in Acton at a cost of £75,000 for the expansion of its operations, where engineering and research will be a constant and growing activity. We have a most capable and imaginative group of engineers, and with new products ahead the money spent in this Division will continue to protect our future.

SERVICE

No dictating machine company, in fact, no manufacturer of machinery of any type, deserves the public's confidence unless the company has provided available service throughout the country. A reasonable amount of service and maintenance is required for any machine. Dictaphone has been a pioneer in its field, and its service organisation has won admiration not only in this industry, but also in many enterprises not related to the dictating machine field.

We regard this as good business, we appreciate the support of our customers and our employees, and in offering them my personal thanks and those of my colleagues on the board of the company, I do so with considerable pleasure.

The report and accounts were adopted and the retiring directors re-elected. The proceedings terminated with a hearty vote of thanks to the chairman, moved by Mr C. Harold Vernon and seconded by Mr F. Graham Maw.

CEREBOS LIMITED

SALES EXPANSION CONTINUES IN HOME AND OVERSEAS MARKETS

TRIBUTE TO TRADITIONAL HIGH QUALITY STANDARDS

MR W. ARNOLD INNES ON THE GROUP'S WIDESPREAD ACTIVITIES

The Fifty-Fifth Annual General Meeting of Cerebos Limited was held on Thursday May 28, 1959, at The Hyde Park Hotel, Knightsbridge, London, S.W.1.

Mr W. Arnold Innes, the Chairman, presided.

The following is his Review which has been circulated with the Report and Accounts for the year ended December 31 1958:

"It is with pleasure that I report on the results of the Cerebos Group of Companies for the year ended December 31, 1958. It has been a period of further progress within all branches of the business.

ACCOUNTS AND DIVIDEND

The Consolidated Balance Sheet and Trading Statement, with the comparative figures for the previous year, clearly sets out the position of the Company and its Subsidiaries as at December 31, 1958, but a few comments thereon may be of interest to Stockholders.

The Fixed Assets of the Group, after depreciation, together with the premium on the acquisition of shares in subsidiary undertakings and the investment in the French subsidiary at its written down value, now amount to £4,076,978 as compared with £3,784,909 as at December 31, 1957.

Group Capital Commitments outstanding at the date of the accounts approximate £300,000, some £33,000 less than was reported last year, but substantial new commitments for extensions to buildings and machinery have since been undertaken.

Productive capacity and the trend of Group Sales have again been upward and this position is reflected by the increase in Stock in Trade and Trade Debtors. The liquid position has been well maintained and shows an excess of Current Assets over Current Liabilities of £2,870,613, an increase on the corresponding figure for 1957 of £363,869.

The holding in Gilt-edged and other Securities, which last year was written down to the prevailing market value is now, on the same basis, £58,929 in excess of book value. For the purpose of the Balance Sheet, however, the increase in the market value has not been taken into account.

A note on the Balance Sheet shows clearly how the Issued Capital was increased by £1,038,175 to £3,114,525, and the effect of the Bonus Issue made in June last year on the Reserves existing at December 31, 1957. However, Capital and Revenue Reserves, with the sum set aside out of profits in cover of the deferred liability for taxation at £865,000, now aggregate £3,643,054 as compared with £4,025,291, before making the appropriations necessary to meet the cost of the Bonus Issue.

Outside interests in Consolidated Subsidiary Companies at £190,012 remains unchanged.

The Trading Profit of the Group for the year is, as shown by the Directors' Report, £2,086,471, an increase of £191,399 over the corresponding figure for 1957.

The reductions in Company taxation announced by the Chancellor in his recent Budget are very welcome and should provide a useful stimulant to industry generally. Nevertheless, it has been necessary to make provision for taxation on the profits for the year under review to the extent of no less than £1,021,215.

W. Arnold Innes
Chairman, Cerebos Ltd.

The net profit for the year, after providing for taxation and making due allowance for outside interests in the profits of Subsidiaries, therefore amounts to £1,057,939 and the balance available for distribution, after transferring £444,600 to General Reserve, writing off £25,000 from the investment in the French Subsidiary and including £278,556 brought forward from last year, is £866,895. As will be seen from the Directors' Report, a Final Dividend of 12½ per cent (less tax) is recommended which, with the Interim Dividend paid in November last, makes 19½ per cent (less tax) or £368,001 net of tax for the year on the Issued Capital as increased by the Bonus Issue.

I would particularly draw the attention of Stockholders to the reference in the Directors' Report to the Special Interim Dividend of 5½ per cent (less tax) to be paid in respect of the year ending December 31, 1959, which will be paid at the same time as the Final Dividend of 12½ per cent (less tax), in respect of the year ended December 31, 1958.

HOME SALES, ADVERTISING AND MARKETING

I am happy to report that Sales in the Home Market during 1958 exceeded the record volume achieved in 1957.

A significant feature of this successful result is that there has been an increase in the sales volume of each product manufactured by your Company and its subsidiaries. The demand for our principal proprietary lines—namely Cerebos, Saxa and Stag Salt, Bisto, Scott's Perage Oats and Scott's Baby Foods—continues to increase in the face of extremely competitive conditions existing today in their respective fields. This is a tribute to the high standard of quality which by tradition and in fact is synonymous with the name of the House of Cerebos.

The results of Stamina Foods Limited, which is a relatively new member of the Group, are especially gratifying. This subsidiary manufactures and markets Pet Foods under the brand names "Stamina" and "Paws." We are confident that continued progress will be made with these lines.

Our experience of introducing "Stamina" and "Paws" Pet Foods to wholesale and retail distributors has demonstrated once again the splendid co-operation extended to us by our friends in these trades and I would like to take this opportunity of expressing my sincere appreciation of their support.

Some two years ago Scott's "Hy-Line" Animal Products were introduced—these cover feed for cattle, pigs and poultry, etc. The results attained during this comparatively short period are most encouraging.

Our sales to industrial users in a variety of trades continue to increase.

I am pleased to report there has been no increase in the prices of our products during the past year and, in fact, we have been able to effect a reduction in the consumer price of one of our brands of cooking salt.

As the variety of products continues to increase the corresponding responsibilities of our Sales, Advertising and Marketing divisions increase proportionately. New outlets for the sale of our products have to be found and an increasing number of sales promotion campaigns planned and brought into action to meet the varying circumstances in the many different fields in which we are now interested. Results indicate how diligently and successfully these responsibilities are being discharged.

The cordial relationship which exists between your Company and the many customers it is privileged to serve is a matter of deep satisfaction.

DISTRIBUTION

Every effort continues to be made to maintain our high standard of delivery service to our customers and to effect improvements and economies whenever possible.

The new depot at Chapelhall mentioned in my previous report is now in operation and is providing an excellent service to a large area in Scotland. With the opening of Chapelhall we have been able to dispense with the depot we originally operated in Glasgow.

A close watch is being maintained on the modernisation programme of British Railways in the hope that it may prove to be an economic advantage to make greater use of rail facilities.

EXPORT AND OVERSEAS

We attach great importance to the extension of our overseas interests and Export trade. I am, therefore, pleased to be able to report an increase in Export sales during the

year. In my Review last year I drew attention to the licensing difficulties which beset Exporters in many markets, particularly in regard to such products as pre-packed foodstuffs. It is unlikely that the general position in this respect will improve and our policy of searching constantly for suitable markets in which to embark upon local production I feel is well justified. Since the initiation of overseas production involves considerable capital expenditure, preliminary investigations must necessarily be very thorough.

Last year I reported on the opening of our Australian factory in Melbourne. Production difficulties which invariably attend the operation of a new unit have been overcome and satisfactory progress is being made in sales. As our Australian Sales Force develops, it is hoped to extend gradually our range of products.

I also reported last year on my visit to Canada, where our sales have shown a steady increase. In this market, however, we are confined by import restrictions as to the range of products that we can offer. Therefore we are studying closely the possibility of extending our activities by local production in this very important market.

In Eire sales of the products of our Dublin factory record a satisfactory increase, a reward for the considerable efforts which have been made in that market.

The results of our French Associated Company are disappointing. Our position has been adversely affected in the last few years by the prevailing economic situation. Nevertheless, I hope that the position now existing will permit us to make progress in France, where Cerebos Salt is well known and appreciated by the consumer.

During the year under review I was able to pay a visit to the Federation of Rhodesia and Nyasaland and to Kenya, markets of importance to us. I visited many of our customers and was well satisfied with the volume of our sales to the European populations. However, I was very forcibly impressed by the growing impact which the native consumer must have in an expanding economy with its rising standard of living. Markets of such magnitude would justify a measure of local production and we are making every effort to introduce our products to the native consumer. I was not able on this occasion to visit the Union of South Africa and West Africa, where we have a substantial export trade and which has been well maintained in spite of the stringent import restrictions within the Union which have limited this particular market for many years. I am considering, however, a visit to the Union towards the end of this year for on-the-spot discussions with our agents and customers.

In other markets the pattern of trade has remained more or less unchanged and I am pleased to report that we have been able to take advantage of the relaxation in New Zealand of certain import restrictions.

In regard to the future, I feel confident that provided we continue to study the particular requirements of individual markets, we shall continue to maintain a satisfactory and expanding export trade.

PRODUCTION

Throughout the Group production has been maintained at a satisfactory level, thus ensuring that the demand for our goods has at all times been satisfied with speed and efficiency. The year under review has seen a number of schemes referred to in my remarks last year brought to completion. The reorganisation of the Middlewich factory is now complete; further building extensions are, however, in the planning stage, since Middlewich is being developed as the principal distribution centre for the populous areas in the west of the country.

The Greatham factory has operated very satisfactorily throughout the year and the only development of importance here is an extension to the Bisto manufacturing plant, enabling us to perform ourselves certain processes to raw materials hitherto carried out elsewhere.

The new cannery at St. Helens producing dog and cat food for our subsidiary, Stamina Foods Limited, was completed within a period of twelve months from the inception of the idea—in itself, I suggest, a tribute to our own Management, the Architect and the Builders. Apart from the usual teething troubles, the new cannery is running very efficiently and the demand for these particular products is so great that we have already decided to build a second cannery within the curtilage of the existing factory.

The production of Perage Oats by A. & R. Scott Limited at both Edinburgh and Cupar exceeded that for the previous year. The establishment of the Animal Feeds Division of this Company at Midcalder is now virtually complete and at the present moment, the plant and machinery are being subjected to test runs. The high quality of "Hy-Line" products is proving very acceptable to the stockbreeder and we look forward to continued progress with confidence. "Hy-Line" products were prominently displayed at the Royal Highland Show in Ayr during 1958 and we propose to have a Stand at the 1959 Show in Aberdeen.

Not the least of the problems of production is the necessity to assure regular and adequate supplies of raw and packing materials and to acquire these on the most economical terms consistent with the use only of materials of the highest quality.

The increase in the sales of all our products brings with it increased requirements of all component materials and calls for constant vigilance and skill in the art of buying and of continuous and widespread search for potential new sources of supply.

One of the "cornerstones" of the whole Cerebos organisation is the quality of its products, and I would assure you that the reputation we enjoy of providing nothing but the best in this respect is one which is guarded most jealously. We are continuously seeking to improve our system of quality control in all our factories and, apart from the valuable assistance which is given by the Central Research Department, each factory now has a fully equipped laboratory, the staff of which concentrates its attention entirely on the maintenance of first-class quality.

RESEARCH

The Group Research Department, which was designed and equipped during the current year, is situated in pleasant rural surroundings on a site within the premises of A. & R. Scott Limited, at Colinton, in the outskirts of Edinburgh. The laboratories are arranged on four floors of a building whose total area exceeds 10,000 square feet.

The department is within easy reach of the many academic institutions established in the city on whom we can draw both for information and for technical collaboration. A strong team of scientists and technicians has been recruited and they are playing their part in making the department an effective unit within the organisation.

The Group's activities are highly diversified and the various sections of the Research department are specialising on a number of topics. These include salt production; the wide range of cereal products, herbs and spices with which the Group is associated; problems connected with canning practice, particularly applied to meat products; and packaging problems dealing with all our products offered both to the housewife and industrial consumers.

The work of this Department is concerned with the fundamental knowledge of our wide range of products as well as the more immediate technical problems so as to maintain the quality of and, where possible, to improve our existing lines.

The efforts of the Research Department are also being directed to the investigation of the possibilities of the development of products to be added to the existing range at present marketed by the Group.

PERSONNEL

I wish to record the sincere appreciation of the Board for the devoted efforts of all executives and staff in every branch of the Group. Their work has been a major contribution to the success of the Group during the past year. Every encouragement and facility is given to employees of all grades to equip themselves for managerial positions within the Group. The continued expansion increases the necessity for ensuring an efficient programme of training for the future managers of the business.

To my colleagues of the Boards of Cerebos Limited and Subsidiary Companies I am indeed grateful for their continued support in the direction and management of the Group."

The Report and Accounts were adopted.

Mr W. Tricker and Mr J. R. Richardson, the Directors retiring by rotation, were re-elected.

ADDITIONAL REMARKS BY THE CHAIRMAN

"Stockholders will be interested to learn that the formal offer made to the Directors of Sifta Salt Limited earlier this month is now being despatched to the holders of Ordinary Shares in that Company.

Cerebos Limited has offered to acquire such Ordinary Shares in Sifta Salt Limited as are not already owned by Cerebos Limited on the basis of one Ordinary Share of 5s. in Cerebos Limited, credited as fully paid, in exchange for every two Ordinary Shares of 4s. each, fully paid, in Sifta Salt Limited.

The Directors of Sifta Salt Limited are recommending the offer to the holders of Ordinary Shares and, if accepted, it will enable Cerebos Limited to effect economies in the production and marketing of Table Salt. This will ensure that the retail price of an essential food is kept to the minimum—a purpose which is the moral responsibility on the owners and Directors of a business of this nature."

The proceedings terminated with a vote of thanks to the Chairman.

Chairman's Statement: ANGLO AMERICAN CORPORATION OF SOUTH AFRICA LIMITED

Incorporated in the Union of South Africa

Racial policies in Southern Africa

MR H. F. OPPENHEIMER REVIEWS ANGLO AMERICAN CORPORATION'S DEVELOPMENTS AGAINST POLITICAL BACKGROUND

Confidence in future of Union and Federation in spite of dangerous problems

The following are extracts from the statement by the chairman, MR H. F. OPPENHEIMER, *which has been circulated to members:*

THE Anglo American Corporation is rooted in Southern Africa. We would certainly be prepared to do business in other parts of the world, but other things being equal we prefer to do business here. And, in fact, all but a negligible proportion of our investments have been made in the Union and the Rhodesias. We are conscious, of course, that many people are worried about the ultimate effect of the racial policies followed in the Union, that the disturbances in Nyasaland have raised grave doubts about the future of the Federation, and that, for these reasons, the economic growth of both countries has slowed down. In the circumstances I think that shareholders would wish me to say something of the political environment in which we are working.

The Union and the Rhodesias have comparatively large European populations with no other homes. They are determined to stay in Southern Africa and to create conditions in which their children and grandchildren can stay there also, any political approach which does not accept that fact is unrealistic and useless. Nyasaland is different from the other territories. It is an African country with a very small European population. The question there is not so much of building up a multi-racial country but rather of finding a fair way for an African territory to be associated with multi-racial territories in one political system. Apparently there are African nationalist leaders who think any such association intolerable and seek to destroy it by methods of violence. The overwhelming economic advantages of Federation are summarily rejected in favour of what is called "freedom", regardless of the danger that the course they pursue would mean years of poverty and stagnation for the vast majority of the population.

Nevertheless, whatever the material benefits of the association to Nyasaland, it is plainly not going to be workable unless the policy of partnership is honestly and intelligently implemented not only by the Government but by individuals in the daily life of the two Rhodesias. It is not going to work either unless African opinion and aspirations in each of the federated territories are fairly represented in the central Government.

The question that must be answered is whether the Federal Government and Europeans in the Federation as a whole are sincere in the racial policy they profess. I am convinced they are. Criticism is easy, particularly for those without first-hand knowledge of the situation; but I think that any person with experience of conditions and prejudices in Southern Africa and an understanding of the dangers implicit in the racial situation, will give the Federal Government credit for a real desire to implement the racial partnership envisaged when the Federation was founded, and for proceeding with courage and determination and as much speed as in the circumstances has been practical.

It is particularly encouraging that Europeans in Rhodesia are not allowing the violence and folly that have been manifested in Nyasaland to destroy their faith in the possibility of inter-racial co-operation or weaken their determination to do their part in securing it. What has happened has, at least to my mind, made it clear that when the time comes to make changes in the present constitution, it will be essential to devise safeguards to ensure that neither the present European majority nor a possible future African majority would be able to enact unfair legislation on racial grounds. It is this understandable mutual fear which constitutes the chief bar to the confident and fruitful co-operation of the races that all reasonable people want to see.

The Problem in the Union

As compared with the Federation, the Union has the advantage of a much larger European population. The Union, unlike the Federation, is making no serious effort to strengthen its European population by immigration, but in spite of that even the most fervent African nationalist knows that the Union cannot be turned into an exclusively African country. Indeed, in the Union all thinking Africans and Europeans know very well that the question that must be answered is not whether South Africa should be a multi-racial state but rather how such a state should conduct its affairs.

In these circumstances, it ought to be easier in the Union than elsewhere to find the way to inter-racial co-operation. Nor should a justified concern at certain unfortunate aspects of race relations in the Union be allowed to blind us to the fact that considerable progress has been made. The economic expansion of the country has benefited all races, and the standard of living of Africans, which is still far too low, has risen rapidly—indeed, more rapidly than that of the Europeans. It seems to me that too little recognition is given to this improvement in the material well-being of all races which has taken place since the end of the war, and to the significant changes in thinking of a large cross-section of the public of the Union during the past year.

Most Europeans in South Africa now realise that in due course the Africans must obtain a share in the government of the country. The differences between parties do not turn on whether or not Africans should have greater civic rights but on whether reasonable African aspirations can or should be satisfied by the grant of autonomy in their tribal areas or whether, on the other hand, they must receive a share in the central government of a united country. The Government has emphasised its desire to develop the tribal areas to the full—economically, socially, and politically. This, in itself, is highly desirable. It is important that it should be clearly understood, both by its opponents and its followers, that the Government's policy of *apartheid* has a positive as well as a negative aspect.

On the economic side the idea that the tribal areas should be developed in separation from the rest of the country is, I am sure, both impractical and dangerous, but the fact remains that the economic development of the reserves has lagged far behind and needs to be energetically tackled.

On the political side it may perhaps seem strange, after what has happened in the North, that the South African Government should deliberately set about creating autonomous African territories whose relationship to the rest of the Union would seem in many ways analogous to the relationship of Nyasaland to the rest of the Federation. Nevertheless, I am convinced that the policy of building up machinery of local self-government in the tribal areas is wise.

Obviously, however, it is only a beginning. There has been some talk of eventual full independence for the African areas, but I do not believe that South Africans of any race or party would seriously contemplate the partition of the country. And it is surely plain that autonomous African territories will never accept membership with Europeans in one political system unless they can at least look forward to a fair share in the central government of the whole system. The development of local self-government for Africans in the tribal areas, and the granting to Africans of a part in the central government, are not opposed but complementary conceptions.

Then it must be remembered that the policy of local African autonomy leaves untouched the question of the political future of the millions of Africans who do not live and never will be able to live in the tribal areas.

Constitutional Changes Essential

It seems to me that, from whatever angle one approaches this complicated problem, one comes back to the conclusion, just as much in the Union as in the Federation, that constitutional changes are essential by which both Europeans and Africans would be guaranteed against the passing of unfair discriminatory legislation based on race. Once it has been admitted, as it has been by thinking people of all parties, that Africans must be allowed and encouraged to develop economically, culturally and politically to the full extent of their capabilities, no other conclusion is possible. It seems to me that there is much more unity on this matter among South Africans than appears on the surface, and it may be that a satisfactory way of co-operation between Europeans and Africans in those countries which are and must remain the permanent home of both races, will be found sooner than is often supposed.

It is no good glossing over the fact that both the Union and the Federation face difficult and dangerous problems. Nevertheless, we retain full confidence in their future. Both have great economic potentials and both require a high rate of investment to create the material conditions in which their human problems can be solved. Our Corporation is favourably placed to help provide the risk capital and the technical and administrative skills that are needed. The Union and the Federation have an inspiring task before them and the Anglo-American Corporation, in its sphere, can play an essential part in tackling it.

Gold Mining Industry

Looking back on 1958, it is possible to detect a significant and widespread revival of interest in investment in the gold mining industry. This is striking in view of the slowing down in other sectors of the economy. This interest appears to be continuing in spite of the political uncertainties I have mentioned. The loan of £4,262,000 by the Deutsche Bank to the Corporation, and the formation of the American-South African Investment Company to acquire shares in South African companies, are symptoms of this revival of interest.

The year 1958 was a record one for production and profits by the South African gold and uranium industry and it was a notable year for new business in this sphere. From this point of view Western Deep Levels takes pride of place. This company's mine will be of exceptional size and opening it up will require an investment of nearly £30 million, or more than twice what is normally required for the development of a large mine. A relatively high grade of ore is expected and operations are planned on a very large scale. For these reasons we are confident that this great enterprise will be a highly satisfactory and profitable one for the Corporation.

The picture of the Orange Free State goldfield is a most encouraging one, and we are beginning to earn increasing benefits from our large investment there. Although no new mines are at present being opened up by us in that field, there is a great deal of new development taking place on our established properties, aimed at increasing their capacity and realising their potential to the full.

Copper and Diamonds

The copper mining industry started the year under very difficult conditions. The price of copper fell to as low as £160 a ton in February, 1958, and all the major producers were faced with the necessity for reducing production to correct the condition of oversupply and to restore stability to the market. Fortunately, during the year the position improved substantially, and in October copper reached a price of £240 a ton.

The diamond industry, like the copper industry, started the year 1958 in unfavourable circumstances, but here again, a marked improvement occurred during the year.

At present the demand for diamonds, both gem stones and industrials, is satisfactory. Fundamentally, however, the market for gems is in a sounder position than that for industrials. There are, however, we believe, considerable opportunities for increasing the use of diamonds in industry in their present applications and also for finding new fields for their use. Much work is being done in this direction. We may confidentially expect that the year 1959 will be a sound one for diamonds.

All in all, 1958 was a most successful year for the Corporation. Mainly as a result of an improvement in income from investments, the profit for the year increased by just over £1 million. Because of the larger number of shares in issue, unchanged dividends for the year on the Ordinary shares of 8s. per share cost nearly £250,000 more than the Ordinary dividends paid for 1957. The appropriation to general reserve amounted to £1,500,000, which is £500,000 more than last year, and the general reserve now stands at £24,500,000. There has been an increase in the unappropriated balance of over £175,000. By the end of the year the book cost of quoted investments had increased by nearly £2,670,000 and the market value by these investments by about £17,740,000.

I welcome the greatly improved cash position, not only of the Corporation and its subsidiaries, but also of most of the other associated finance companies. In fact, I think I can say that never in its history has the Group been so well placed for financing any new business that may arise.

We are strong not only in financial resources but also in personnel. At our offices in Johannesburg, Salisbury and London and on the properties a technical, administrative and financial team has been built in which we have the greatest confidence and on whose skill and loyalty we can rely.

POWER SECURITIES CORPORATION

SATISFACTORY INCREASE IN PROFIT

The Thirty-sixth Annual General Meeting of Power Securities Corporation Limited will be held on June 11th in London.

The following are extracts from the circulated statement by Sir Andrew M. MacTaggart (Chairman and Managing Director) for the year ended December 31, 1958:

In the circular letter dated October 2, 1958, sent to the Ordinary Shareholders regarding the issue of 250,000 Ordinary Shares of £1 each, it was stated that the estimated group profit before taxation for the year ended December 31, 1958, would be appreciably lower than such profit for 1957. This estimate has proved to be conservative, and, after expenses but prior to taxation, such profit shows an increase over the previous year of £92,641. I trust you will regard this as satisfactory.

The increase in the profit over the estimate is accounted for partly by additional payments received by Russell Construction Limited, from the dredging contract carried out by that company for the St Lawrence Seaway Authority, and partly by certain contracts of other subsidiary companies producing better results than were anticipated.

PROFIT AND DIVIDENDS

The consolidated net profit at £525,452 compares with the previous year's figure of £373,948, an increase of £151,504. Adding to the consolidated net profit the taxation over-provided in past periods of £4,994, and the balance brought forward from 1957 of £487,587, there is available an amount of £1,018,033. Of this amount £225,000 has been transferred to General Reserve, and your Directors recommend the payment of a dividend on the Ordinary Shares at the rate of 11 per cent, the same as for 1957.

During 1958 we took an active part, in association with important Canadian, British and other interests, in the formation of the Peace River Power Development Company, Limited, a company incorporated in British Columbia for the purpose of making investigations into the power potentialities of the Peace River in that Province. We have subscribed for part of the share capital of the Company, and this Corporation has been appointed its London Managers, General Co-Ordinators and Advisers.

FUTURE PROSPECTS

Now a word about the future. Although I have only briefly referred to the Peace River Power project, this is really one of the most outstanding developments which has ever been projected in Canada, and we look forward confidently to its maturity as a joint Canadian-British venture which could have a far-reaching influence on Commonwealth development.

Field surveys are now complete for the Seven Forks Hydro-Electric development in Kenya, and the data so far obtained points to this project being one of the most economical so far projected in that part of the world; with an abundance of power to ensure Kenya's requirements for many years ahead. Designs are now being completed ready for the commencement of work whenever power demands justify the expenditure.

With the work we have in hand, and further developments maturing, we can look forward with reasonable confidence to the future.

PRESSED STEEL COMPANY

INCREASED PROFIT

SATISFACTORY LEVEL OF BUSINESS

MR ALEX. ABEL SMITH ON THE OUTLOOK

The thirty-second annual general meeting of the Pressed Steel Company Limited, was held on May 27th at Winchester House, Old Broad Street, London, E.C., Mr Alex. Abel Smith, TD, JP, chairman of the company, presiding.

The Secretary (Mr J. S. Kean, CA) read the notice convening the meeting and Mr T. Howorth, FCA, read the report of the auditors.

The following is the chairman's statement circulated with the report and accounts:

The Report and Accounts for the year ended December 31, 1958, are presented in a new form, which I hope you will find pleasing and informative.

PROFIT AND APPROPRIATIONS

The accounts show a balance of profit for the year, after charging Debenture interest, depreciation and all taxes, of £2,017,598; this compares with the previous year's figure of £1,527,121. Taxation was higher by £361,849 and the charge for depreciation and obsolescence of buildings, plant, machinery and equipment was also higher by £147,111, reflecting a further increase in the Company's fixed assets.

From the profit of £2,017,598 there must be deducted the discount on and the expenses of the issue of the 6 per cent Debenture stock 1978-83, together totalling £157,431, and also the amount of the regular dividends on the Preference shares and the interim dividend of 7½ per cent less income tax paid last November on the Ordinary stock, amounting in all to £211,123. This leaves £1,649,044 to be added to the balance of £1,847,822 carried forward on profit and loss account from 1957, and gives a figure of £3,496,866 to be dealt with.

Your Board now recommends the transfer to General Reserve of £1 million and the payment of a final dividend on the Ordinary stock of 17½ per cent less tax, which absorbs £423,518. This leaves £2,073,348 to be carried forward on profit and loss account.

BALANCE SHEET

You will note the net increase of £3,033,575 in the Company's long-term liabilities. This has resulted mainly from the issue of £3,500,000 6 per cent Debenture stock 1978-83. On the other hand, last June, £466,425 of the 5½ per cent Convertible Debenture stock 1977-82 was converted. The amount of Ordinary stock units of 5s. issued is now £3,951,185. The proceeds of the issue of the 6 per cent Debenture stock are reflected in an increase in fixed assets of £1,993,824, and in a strengthening of the liquid position.

Outstanding commitments for capital expenditure at the end of the year amounted to approximately £1,050,000, but as at today's date this figure is considerably higher as a result of further commitments entered into in connection with the Company's expansion plans, to which I make reference below.

You will note the creation of a new Revenue Reserve entitled Tax Equalisation in the amount of £250,000. Your Board think it wise to set up this reserve out of profits in view of the substantial initial allowances included in the tax computation by reason of the Company's large capital expenditure on fixed assets during the year. The benefit of these initial allowances will be offset to some degree in coming years by the smaller wear and tear allowances calculated on the lower written down values, with the result that tax payments will be relatively higher.

I would also call your attention to another item which has not previously appeared in the balance sheet, namely Interests in Subsidiaries, in the amount of £158,624, representing the acquisition of the business of one of our Prestcold distributors, Prestcold (Midlands) Ltd, and our investment in Pressed Steel S.A. Brussels.

MOTOR CAR BODY DIVISION

Business was maintained at a steady and satisfactory level throughout the year; costs, although higher, did not rise at a rate comparable with recent years. In the first half of the year we had to buy considerable quantities of American and continental sheet steel at substantial premiums, but it is gratifying to be able to report that more recently increased domestic production has enabled us to make an appreciable reduction in our overseas purchases. The outlook happily is for a further gradual increase in supplies from home sources.

RAILWAY CARRIAGE AND WAGON DIVISION

Our Linwood factory again showed satisfactory results. The original order for utility vans for British Railways was completed during the year, but we received a follow-on order for an additional number. Work on the passenger coaches required in connection with the Glasgow suburban electrification scheme has proceeded satisfactorily and the first train is about to be delivered.

Production of wagons of various types continued, but at a reduced tempo.

PRESTCOLD DIVISION

The reduction in purchase tax on domestic refrigerators from 60 per cent to 30 per cent in the 1958 Budget, and the subsequent easing of credit restrictions, had a very stimulating effect on sales. After a steep initial rise in business, sales settled down at a level well above anything we have previously experienced. A particularly satisfactory feature has been the improved demand throughout the winter months.

The commercial side of our business, which includes such items as large refrigerators, food display cabinets, ice-cream conservators, cold rooms and special refrigeration equipment, again showed satisfactory results.

Our export business made a useful contribution. During the year we set up a company in Belgium and opened an office in Brussels. At this juncture we regard it primarily as a listening post in the Common Market area: at the same time we believe that, whether or not a Free Trade Area eventuates, having a staff stationed on the Continent will put us in a better position to take immediate and full advantage of opportunities for business that we feel certain will arise.

THE OUTLOOK

After a somewhat slow beginning in January and February of this year—due in part to model changes and in part to the fire to which I refer below—output of motor car bodies is now running at a higher level than ever before.

It is gratifying also to be able to report that the Company recently received an important order for press tools and body shells from a continental motor car manufacturer and that we have other enquiries from abroad on hand.

The expansion in our production facilities for motor car bodies and for press tools for making bodies, to which I referred in my speech last year, is proceeding according to plan. We are gradually bringing into operation the new presses and the automated production equipment in the second and recently completed 300,000 sq. ft. building at our Swindon factory.

In the course of the year, in order to meet a steadily rising demand for press tools, your Board approved the erection and equipping of another building of approximately 153,000 sq. ft. at Swindon, as well as an expansion of the already existing tool making capacity at our Linwood factory in Scotland. The benefits from this expansion should begin to accrue towards the end of the current year.

I am sorry to tell you that last January one of our buildings at Cowley in which we do paint and trim work was severely damaged by fire. The assembly line concerned could not be brought fully back into production for several weeks, but, thanks to the splendid efforts of many of our office staff and work people and to the ready and generous help given to us by a number of our customers and suppliers, production on a much reduced scale was resumed within five days. We were of course covered by insurance, including cover for consequential loss, but inevitably severe dislocation was caused. A thorough investigation of the causes of the fire satisfied us that it was accidental, but steps have nevertheless been taken to strengthen further our already extensive fire precautions.

We are taking the opportunity of erecting a four-storey building on part of the destroyed area in order to improve the overall efficiency of that section of the Company's activity.

REDUCTION OF PURCHASE TAX

The recent Budget announcement of a reduction in purchase tax on motor cars from 60 per cent to 50 per cent will clearly benefit the home sales of our customers. It is my belief that the outlook, barring unforeseen happenings, is for an increasing volume of motor car business which I am confident will fully justify our large capital expenditure on increased production facilities.

Turning now to the Railway Equipment Division, the outlook is less clear. In the home market much depends on the tempo of the British Transport Commission's modernisation programme. As I have already mentioned, we have received a further order for utility vans and are working on the passenger rolling stock for the Glasgow electrification scheme; we also have on our books a substantial order for diesel railcar units, and we are tendering for other passenger coach equipment.

In the wagon field, we have secured a number of orders for limited quantities of different types, but the fact must be faced that the British Transport Commission's wagon building programme has, for the time being, reached virtual completion; this not only means less business in view, but stiffer competition for such business as is from time to time offering.

TOUR OF INDIA AND AUSTRALIA

Export markets for railway equipment are difficult. I recently completed a business tour which included visits to India and Australia, two countries to which in the past we have sold railway equipment. In both countries it was clear that a determined effort is being made to attain self-sufficiency. In the meantime, competition from Japan is an important factor to be reckoned with. I nevertheless believe that there is business to be obtained and in the challenging situation that confronts us our design and development departments are working hard on several projects which we are hopeful may, in due course, produce business for us both at home and overseas.

As regards the Prestcold Division, we are looking for record sales of domestic refrigerators this year. The commercial side of our business will, I am confident, also continue to prosper.

Work has commenced on the new 650,000 sq. ft. factory which, as announced in the press last summer, the Government is putting up for us near Swansea and where we intend to concentrate this Division. The equipment and layout will be the most up to date and will incorporate a high degree of automation. We are hoping to start limited production there in about a year's time and to have the plant fully productive by the spring of 1961. This new plant will enable us to produce more efficiently and in greater volume.

We are constantly reviewing the domestic appliance field. In due course, we plan to produce and market other lines of household equipment, some of which will be manufactured under licence from our associates, the Whirlpool Corporation of America, who are one of the leaders in the American domestic appliance field.

ENLARGEMENT OF EXPORT MARKETS

We are continuing our efforts to enlarge our export markets. In the course of my business trip, I had discussions with our agents, not only in India and Australia, but also in Thailand, Hongkong, Japan and New Zealand. It was gratifying to find how highly our refrigeration products are regarded. Competition in overseas markets tends to be fierce, but, with enthusiastic agents and high quality and properly priced products, we can, I feel sure, not only hold our own but enlarge our share of foreign markets which are constantly growing as standards of living improve.

It was with export markets for our railway and refrigeration equipment in mind that we produced the book, a copy of which was sent to all shareholders and debenture holders whose names were on the Company's register at the end of last November. We considered it important that both the Company and its products should be made better known throughout the world.

Looking at the Company's future, I can say that the prospects are encouraging, but at the same time I cannot over-emphasise the importance of cost stability. A revival of the destructive inflationary forces which have been kept under some degree of control during the past twelve months could so quickly destroy the prospects for a further improvement in business.

PENSION AND LIFE INSURANCE SCHEMES

In the autumn of last year we decided to provide more generous pension and life insurance benefits for our employees. The improved scheme provides that, in general, all works employees will receive a free pension at retirement age, based on length of service with the Company, and staff employees will make a considerably lower contribution to their superannuation fund than hitherto. These new arrangements also provide the opportunity for employees to increase their basic pensions at retirement age by additional contributions to the scheme. In addition we have substantially increased the free life insurance cover given to our employees during their period of service with the Company; this additional protection for the family is very much appreciated.

TRIBUTE TO THE COMPANY'S EMPLOYEES

As is my custom, I should like to close my speech by paying a special tribute to the excellent service rendered by all who work for the Company. The prosperity of a Company depends largely on good team work; we have that, and in addition an excellent spirit prevails among our employees, who now number over 19,000. I am sure it is the wish of the shareholders that I should express their thanks to the employees, each of whom has made his contribution to a successful year's results.

The report and accounts were unanimously adopted; the proposed dividend was approved and the retiring directors, Mr Alex. Abel Smith, TD, JP, and Mr A. L. Shuttleworth, were re-elected.

ARISTON GOLD MINES

NEW SHARE ISSUE

The twenty-ninth annual general meeting of Ariston Gold Mines (1929), Limited, was held on May 22nd in London.

Mr C. J. Burns, chairman, said: I would refer you to the Remarks in my Statement accompanying the Report and Accounts, outlining the proposals for the issue of further capital.

The Board has had no doubt for some time past of the necessity for the raising of further money, and the only question has been when would be the most appropriate time for such an operation.

Having regard to current market conditions and prospects and following a visit I paid last week to Ghana, when I had the privilege of discussions with Cabinet Ministers and Members of the Government there, it has been decided that the issue should be made forthwith. In consequence all Stockholders registered on June 3, 1959, will receive on or about July 10th next a Provisional Allotment Letter representing one share for every seven shares held by them on June 3, 1959, and which are being issued at 3s. 3d. per share payable in full on acceptance. Acceptances will be received up to August 7, 1959, which date has been fixed, having in mind the Stockholders who are resident abroad, and to ensure preservation of their rights so far as is possible.

When the Issue is completed the Company would receive an amount of £208,929 gross, and the Issued Capital of the Company would be increased by £160,714 to £1,285,714. On the increased capital the Board feel confident that, in the ordinary course, a Dividend of not less than 20 per cent gross will be paid, which on the basis of the net profit figures of 1958 would be covered 1½ times. Assuming a dividend of not less than 20 per cent the yield on the new capital at the issue price of 3s. 3d. per share would be approximately 15 per cent.

DEEP LEVEL DEVELOPMENT

As mentioned in my Statement, the main purpose of raising the new capital will represent the expenditure on the major shaft sinking and deep level development programme now being vigorously pursued. This programme will ensure the continuity of the ore reserves position (which is about five years ahead of the Mill), and which will not only preserve the stability of future output, but will provide that flexibility which is so essential for the most economic working of the Mine.

In that connection, during my perforce all-too-brief visit to Ghana last week I had comprehensive discussions with our General Manager, Mr F. Clelland, and he assured me that the development on the lowest levels of the Mine is proceeding well up to schedule, and is looking most satisfactory.

We all realise that the present fundamental mining and development operations must be primarily concerned with the main orebodies at depth, but it was most pleasing to hear from Mr Clelland his conviction that the disclosure of a new rich lens on the 13th Level in the North Orebody augurs well for the future of the new section of the Mine. So far, the length exposed is 344 feet at an average value of 6.6 dwts over 131 inches, and driving is continuing. Additionally, the rich zone being explored near the surface on the 3rd, 5th and 6th Levels between our main orebodies and the northern limits of the Ghana Main Reef Company's reefs gives encouragement as an indication of first, an available store of richer ore (limited in tonnage though it may be until it is fully developed), and, secondly, an indication that more extensive development in this area is warranted. In that connection, it could be visualised that if the area opened out into major orebodies then your Company would proceed with the full opening up and development of this area.

I need hardly say that whenever we have any further news as to these important developments this will be immediately conveyed to Stockholders apart from the usual information covering the actual conduct of operations reported in the customary monthly and quarterly progress Reports.

GHANA GOVERNMENT'S APPRECIATION

In the course of my discussions with the Ghana Ministers the opportunity was taken to review the position of the gold mining industry in that country. These discussions to my mind only serve to confirm the views which I have already expressed in my Chairman's Review of this Company and also remarks that I have passed in associated Companies.

The Ghana Government are appreciative of the work that has been done by Ariston Gold Mines and the contribution they have made towards the prosperity of their country, and they have no intention of making that task more difficult. A number of suggestions were made by me to Government this time and I hope shortly to be in a position to announce further progress in the policy of full co-operation which at present exists.

The report and accounts were adopted.

CADBURY BROTHERS LIMITED

GROUP TURNOVER EXCEEDS £84 MILLION

WELCOME INCREASE IN EXPORT TRADE

MR L. J. CADBURY ON VAGARIES OF RAW COCOA MARKET

The sixtieth annual general meeting of Cadbury Brothers Limited will be held on June 15th at Bournville, Birmingham.

The following is the statement by the chairman, Mr L. J. Cadbury, which has been circulated with the Report and Accounts:

During 1958 the vagaries of the raw cocoa market had an important effect on our trading results. Our cash turnover increased for Cadbury Brothers Limited to just under £51 million, and for our group to over £84 million. On the other hand, making allowance for 1957 being a 53-week year Cadbury tonnage was 3 per cent down. The divergence between the trends of cash turnover and tonnage was almost entirely due to the substantial price increases and weight reductions which we had to operate early in the year because of the high price of cocoa.

It may be remembered that with a very good cocoa crop in the 1956-57 season prices in the spring of 1957 were less than £200 a ton. This no doubt encouraged world consumption, which in 1957 reached an all-time record of nearly 900,000 tons. The 1957-58 crop was 14 per cent down, there were fears of a shortage, and prices rose to £400, double the figure touched the year before.

I am glad to say the 1958-59 crop has turned out better than expected, while the high prices caused a noticeable drop in consumption last year. Though we had to pay a high price for cocoa we bought earlier in the season just past, we ended it with prices under £300. The net result, however, was that we had to make in the spring the price adjustments already mentioned.

INCREASING COMPETITION

Demand for the industry's products was particularly buoyant in the first half of the year, but during the second half-year it generally seemed to have fallen off; a tendency that has so far continued into 1959. It is probably associated with the slight industrial recession, and also with the relaxation of hire-purchase restrictions which has diverted a certain volume of purchasing power from everyday consumer goods such as ours. We have obviously always been in competition with other lines of chocolate and confectionery and also with other foods, drinks and consumable products and services such as entertainment. The rapid extension of Hire Purchase now means we have to compete more strongly than before with washing machines, refrigerators, TV sets, etc., for public patronage.

But of greater importance for us than these developments because of our large share of the moulded chocolate market was the rise in price of raw cocoa and the consequent increase in the price of our lines.

There were no major introductions in 1958 on the home market. Its chief feature was increasing seasonality. Our sale of Christmas boxes amounted to 7,500 tons, which made a contribution of £4 million to our turnover. This increasing seasonality throws a heavy peak load on our storage and distribution system. In November our Cadbury-Fry joint distribution service employed at one time over 500 delivery vans to deal with our goods.

INTRODUCTION OF NEW LINE

Since the end of the year under review an important new line has been put on the market, "Lucky Numbers." It is an assortment with a number of confectionery as well as chocolate-covered units; some of the former have presented us with new technical problems that have not been easy to solve. "Lucky Numbers" is only on sale at the moment in certain areas, but as factory capacity expands will be extended to all parts of the country.

We have had our usual publicity campaigns on TV, press, magazines and posters. In view of the declining cinema audiences we are reviewing our cinema activities. A completely new feature in the summer was the employment of a helicopter to advertise our "Roses" assortment at seaside resorts. It had some mechanical troubles, but no doubt the novelty of the scheme made its mark.

One of our most important selling efforts has been at the "point of sale." We have converted the counters of 9,000 retail shops with open display equipment designed and supplied by ourselves. A parallel scheme was undertaken by Fry's in a further 4,000 shops, and the benefits were shared between us.

RESTRICTIVE PRACTICES ACT

We are very interested in the working of the Restrictive Practices Act and the important decisions of the Court which have been made in several cases.

There are two main Agreements affecting us on the Register. One is the Wholesalers' Price Schedule which recommends prices at which wholesalers will generally buy from various classes of manufacturers and at which they will sell to retailers. The Schedule has been referred to the Court and will probably be heard before the year is out.

The other is a long-standing Agreement between ourselves and three other firms, the main object of which is to agree upon the level of distributors' margins, which of course form a substantial part of the price the consumer pays. This Agreement has not yet been referred to the Court.

COCOA BEAN SUPPLY

In connection with our cocoa-bean supply, we have continued to take an active interest in both existing and potential growing areas. Our agents have recently visited East Africa to examine the possibilities of growing cocoa there, and India at the request of the Indian Government to look into the possibility of the growing of both cocoa and oil-palms. Our own plantation in the British Cameroons at Ikiliwindi is making steady progress, and although we have been there for only three years the first pods have already been harvested. The news from Malaya is disappointing; the newly planted cocoa is retarded in growth, due probably to a fungus. Our latest investigations have been in Borneo. A great deal of development work in communications etc. is required there before practical results can be expected, but soil, climate and rainfall appear to be ideal for cocoa growing.

Desiccated coconut is a small but important ingredient. It is required for half-covered Cadbury biscuits and Fry Cokernut Bars. There are two sources of supply, the Philippines and Ceylon. The former is ruled out through our lack of dollars. Supplies from the latter have become precarious with increasing civil disturbances and strikes. There is also a profitable demand for converting coconut into copra. With other members of our Alliance we are endeavouring to start a desiccated coconut industry elsewhere, possibly in Tanganyika.

EXPORT AND OVERSEAS

Despite many difficulties our export trade showed a welcome increase of over 5 per cent last year, but we fared very differently in different markets.

In our traditional general markets we had a decline in practically every direction. We had to face political troubles in countries like Iraq, the Sudan, and many more. The fall in prices of commodities such as copper, rubber, coffee, tin, though helpful to our national economy, affected sales in Rhodesia and other producing countries.

On the other hand, sales of chocolate-covered biscuits to Canada and the USA increased by nearly 500 tons. We also sold those countries substantial quantities of cocoa powder and cocoa cake. After a decline in our trade there in the last two years, the joint Cadbury-Fry dollar exports once more topped the £1 million mark.

All our overseas companies showed increases in cash sales last year, and, apart from a slight fall in Canada, increases in tonnage as well.

Australia is still our leading overseas subsidiary, followed by Canada and New Zealand. At a lower level South Africa and Ireland run neck and neck, with the latter for the first time slightly ahead in cash turnover.

Our newest overseas venture, India, has had its progress impeded by causes outside our control. The trading position of that country has called for caution, and to safeguard its balance of payments position import quotas have been imposed on many goods including cocoa beans. This has cut back our production of cocoa powder, especially as we have switched our available bean supplies to Bournvita, which has shown a healthy increase. Total sales for the first time topped £½ million.

The turnover of our overseas factories reached a new record at £16½ million.

DEVELOPMENT PROGRAMME

We have begun the construction of a new office block at Bournville, though, as has been the case for the last few years, our main factory extensions have taken place at Moreton in Cheshire.

Bournville remains the centre of our technical and mechanical research; but other factories in the group carry out pioneer work in various directions. A completely new factory for the continuous production of milk chocolate crumb (from which the finished

product is made) is nearing completion in Tasmania. At Fry's one of their oldest traditional lines, Fry's Chocolate Cream Cake, is now being made on a fundamentally different and again continuous process. Both developments, and particularly the latter, save labour and are some set-off against rising wages.

Considerable interest is being taken in stimulating the provision of new capital and equipment for industry. Official and semi-official bodies have carried out investigations into the rate at which this has proceeded in different trades. Some of course require and can employ profitably far more capital than others. In our Cadbury Company the plant per operative varies greatly from highly mechanised production such as the manufacture of cocoa powder to hand-packed chocolate assortments. Pooling all our employees, men, women, boys and girls, the equipment provided per capita, after depreciation, amounts to £1,260.

Chocolate made for us under licence in Germany showed a further increase to the equivalent of £1.4 million. This trade is not very profitable at the moment. We have only a small share of the market and have to conform to the rest of the industry's prices. These have not been adjusted sufficiently to last year's high cost of cocoa, and margins have suffered as a result.

EUROPEAN FREE TRADE AREA

During the year there were many discussions about the European Free Trade Area in which the United Kingdom would participate. We did our best to support the proposal through our membership of the Cocoa, Chocolate & Confectionery Alliance and to have our products included in the arrangement. Unfortunately by the end of the year it was clear that the idea was dead. On January 1st what is known as the Common Market of the six Mid-European countries came into being. Eventually there will be a common tariff by these countries against the United Kingdom. The only means of counter-attack open to us at present is the continuance of the production and sale of our goods in Germany. This, of course, restricts us to start with to one country out of the six. It is possible in time we may be able to export to the other five countries, but the tariffs against German exports to them are only to be reduced annually by a small percentage over fifteen years.

PENSION SCHEMES

Last year I spoke of the reports by the actuary on the Men's and Widows' as well as the Women's Pension Fund. They resulted in increases in pensions of 20 per cent on the Men's and 15 per cent on the Women's Fund.

During the course of 1958 contributions to National Insurance were increased. After exhaustive investigations into the effect the new national rates would have on future pensions, it was agreed to reduce our Men's and Widows' Pension contributions by 2s. 8d. per week. This to some extent will offset the burden of the new national deductions.

We are following closely the discussions on the Government's new graduated pension proposals.

Our own schemes of graduated pensions began with our Men's Fund fifty-three years ago. The total Funds for both men and women now total about £12 million, and are invested in a spread of securities which have included for a number of years a substantial holding in equity shares.

To enable the Actuary to value on a higher rate of interest than he would otherwise have done, we have for some time guaranteed the rate of interest for a period ahead of twenty years; at present the guaranteed rate of interest is 4½ per cent, and our actual earnings over 5½ per cent. It is for this reason that the Government's scheme (where, as the President of the Institute of Actuaries recently remarked, the rate is 0 per cent) is such a poor bargain as compared with schemes like ours.

Nevertheless, the complications of contracting out of the Government's scheme, involving as they do the position of different grades of employees with different rates of pay and graduated contributions, are very great, and we shall reserve our decision on this important question until the Bill becomes law and the resulting regulations are known.

THE YEAR'S RESULTS

May I turn finally to the financial results of our Group? I have already mentioned that our total sales showed a small increase at £84.2 million. The consolidated profit after charging UK taxation was down from £5 million to £4.2 million, which was not an unexpected result in view of the trading conditions already mentioned. With depreciation and retained profits we are, however, ploughing back into the business just under £6 million.

We have a forward programme of new buildings, plant and equipment that we revise quarterly. Some of the items, particularly where a site has to be cleared by the demolition of existing buildings and plant reshuffled, will not be completed for three or four years. Our present forward programme for this period at home and abroad amounts to something over £15 million. Last year's results, though not quite up to those of 1957, will thus make a substantial contribution towards financing it.

TOZER KEMSLEY & MILLBOURN (HOLDINGS)

The eleventh annual general meeting of Tozer Kemsley & Millbourn (Holdings) Limited will be held on June 17th, in London.

The following is an extract from the circulated statement of the chairman, Mr Joseph R. Millbourn:

The deterioration in trading conditions in the countries we serve, which I predicted this time last year, unhappily materialised and our turnover and profits fell away disappointingly in the second half of the year. In the circumstances, a Group trading profit of £662,336, a reduction of £137,098 as compared with the previous year, can be considered very satisfactory.

Our turnover with the Union of South Africa exceeded last year's although it tended to fall away in the second half of the year, while our trade in Australia, New Zealand and Central Africa declined. In other markets our turnover was, in the aggregate, maintained.

Your board are fully aware of the changing pattern of certain important sections of the company's business and realise that with the continuation of the growth of local industries in the Commonwealth market, every effort must be made to seek opportunities for increasing the scope of our activities and the further development of local and export financing of these newly established industries overseas.

The financial position of the company is stronger than it has ever been and we are in an excellent position to take advantage of any favourable opportunity of broadening our activities.

E. POLLARD & CO.

The forty-seventh annual general meeting of E. Pollard & Company Limited was held on May 22nd in London.

Mr H. Edward Pollard (Chairman and Managing Director) presided and, in the course of his speech, said:

The Group Profit for the year was £411,000, a decrease of £30,000. Although the turnover of the Group increased over the twelve months, the trading profit dropped. The last few weeks of the year were disappointing as the demand suddenly fell away and orders became extremely competitive, particularly in the Shopfitting section. The end of the year is seldom a busy period for Shopfitting, but this time it was more than usually quiet and lost us some of the profits earned earlier in the year.

Our Engineering business is much less sensitive to such short term fluctuations of the retail trade, and was hardly affected.

Plans have been approved and this year we hope to complete the erection of a factory of about 30,000 square feet on the Kingsland site at Basingstoke. This will be equipped and started on steel shutter production and a new labour force built up for further production expansion.

As regards the future, our Accounts show a substantial amount of Work in Progress and our Engineering order books are satisfactory. The Display business is on the increase, but Shopfitting is still suffering from its recent setback. There are, however, some signs of recovery which we must have if we are to show good results at the end of 1959.

The report was adopted and the Ordinary dividend distribution of 17½ per cent approved.

LIMMER & TRINIDAD LAKE ASPHALT

SIR JOHN HATHORN HALL'S REVIEW

The eighty-seventh general meeting of the Limmer & Trinidad Lake Asphalt Company Limited will be held on June 18th, in London.

The following is an extract from the circulated statement of the chairman, Sir John Hathorn Hall, GCMG, DSO:

The Group's gross trading profit has fallen by £91,000. The recession of trade and the resultant contraction of building and road work, the hampering continuance of the credit squeeze for the greater part of the year, the limiting effect on aerodrome construction of the Government's new defence policy—all these and a number of associated influences militated against the prospect of successful operation by asphalt companies. But your Group would, I believe, have overcome these adverse factors and produced results no less favourable than those of the previous year if we had not had to contend also with an even more redoubtable adversary in the weather. We did, nevertheless, contrive somehow over the year virtually to maintain our output, and indeed, in some sections it actually exceeded that of 1957.

Our order book is such as to justify a sober confidence in the months ahead. We are glad that the Group should have secured the contract for the surfacing of an important section of the London/Birmingham Motorway and also the contract for the surfacing and foundation work on the whole of the Lancaster By-pass. Attempting to project into the future, I should be disappointed if a rather better year were not ahead of us.

OTTOMAN BANK

VERY SATISFACTORY LIQUID POSITION

LORD LATYMER'S REVIEW OF WIDESPREAD INTERESTS

The ninety-second annual general meeting of the Ottoman Bank was held on May 27th at Winchester House, Old Broad Street, London, E.C.2.

The Right Honourable Lord Latymer, the chairman, presided and, in the course of his speech, said: You will no doubt have seen in the press details of the Anglo-Egyptian Agreement of February 28, 1959, in the terms of which the Egyptian Government is providing the sum of £27,500,000 to meet claims in respect of property taken over by the Egyptians and claims for losses in respect of sequestrated properties which are being returned to their owners, and a statutory body, referred to as the "Foreign Compensation Committee" has been appointed to assess the amount of loss with respect to each claim. Our claim for compensation has, of course, already been lodged with the Authorities.

KENYA, TANGANYIKA, SOUTHERN RHODESIA

I mentioned last year that we had opened branches in Kenya and were expecting to open branches in Tanganyika.

As I said then, the branches at Nairobi and Mombasa were opened in January, 1958, and I am glad to report that the conversion of Torr's Hotel in Nairobi into suitable banking premises has been highly successful.

In Mombasa we have since acquired a very good site in the centre of the town and hope to move there from our temporary premises in the summer of this year.

In Tanganyika our branch at Dar es Salaam was opened in June, 1958, and in November we opened a branch at Kigoma, which is the terminus on Lake Tanganyika of the railway from Dar es Salaam and transit port for goods passing from Dar es Salaam to Ruandsa Urundi and to the eastern region of the Belgian Congo.

Since the close of the year we have also opened a branch at Moshi, at the foot of Mount Kilimanjaro.

In the Federation of Rhodesia and Nyasaland we opened a branch in temporary premises in Salisbury in August, 1958, and have acquired an excellent site for which plans are being prepared to build permanent premises in Jamieson Avenue.

As so many businesses in the Federation operate both in Salisbury and Bulawayo and, in fact, so many have their Head Offices in Bulawayo, it is essential to establish our bank in both centres and we have therefore arranged for the opening of a branch in Bulawayo which we hope will be ready in the course of a few weeks.

In Salisbury we commenced our banking operations at a period when credit restrictions were in force, but these have now been removed and we hope that our business will expand accordingly.

Both in East Africa and in Rhodesia we cannot expect progress to be very rapid, but in each of those territories our reception and our progress have been most encouraging.

TURKEY

In Turkey important measures were taken in 1958 to reinforce the economic and financial situation involving stabilisation of the credit structure, a more liberal import policy, especially for goods of prime necessity, and a greater liberty in distribution of goods, more especially imported goods, in the country.

At the same time the Government introduced a system of exchange rates adjusted to the situation; the basic rates for the Turkish Pound remained unchanged, but certain premiums, between 210 piastres and 620 piastres per dollar, were fixed according to category of export; imports and all foreign exchange payments, were subject to a fixed premium of 620 piastres per dollar. These steps have already given satisfactory results; there is an increased supply of goods on the market and this is already helping to keep prices steady.

Foreign financial aid to Turkey under various headings, particularly from the United States of America, increased to $359 million in 1958-59; of this $44 million went in settlement of existing indebtedness.

Turkey's foreign trade figures for the year are as follows: Imports, Ltq.882,300,000 against Ltq.1,112 million in 1957. Exports, Ltq.739,300,000 against Ltq.966,600,000 in 1957. Thus the commercial trade deficit is about the same as in 1957: Ltq.143 million against Ltq.145,400,000.

SUDAN

In the Sudan the economic conditions in 1958 were not encouraging. The country relies for its prosperity very largely upon cotton, and for cotton it was a very bad year.

A steady drain on the country's resources had reduced the holding of foreign exchange reserves from £S.23 million in January to £S.8 million by June, and the imposition of very stringent exchange restrictions and import licensing measures were necessary. The situation has since rallied.

Although the country's problems and difficulties in 1958 could but affect the working of your branches in the Sudan, I am glad to tell you that they had an active and satisfactory year.

JORDAN

The sealing of the frontier between Syria and Lebanon in the spring of 1958 denied to Jordan access to the port of Beirut via Damascus. Great efforts, however, were made to make fuller use of Jordan's own port of Ataba on the Red Sea and with such success that the total value of imports into the country during 1958 rose by some JD.2,500,000 compared with the previous year. Exports and re-exports, however, fell by about JD.2 million, principally as a result of very poor local harvests, especially of cereals following persistent drought. The trade figures for the year amounted to JD.33,900,000 for imports and JD.3,600,000 for exports and re-exports.

Legislation has been introduced for the establishment of a Central Bank of Jordan.

The currency in circulation showed an average of about JD.16,600,000 in 1958 against an average of JD.15,800,000 in 1957.

IRAQ

The general development of Iraq progressed during 1958, but there were signs that the authorities were concentrating less upon large public works schemes, such as barrages, irrigation and road construction and more upon projects calculated to produce an immediate improvement in the standard of living of the population; the emphasis was upon agriculture, housing and industry.

CYPRUS

The unsettled state of Cyprus in 1958 which involved a boycott of British goods had, as might be expected, a damaging effect on the Island's economy. Imports, which had stood at £45 million in 1957, fell to some £37 million in 1958, and exports declined from £18 million in 1957 to some £16 million in 1958.

PERSIAN GULF (QATAR)

For Qatar 1958 was a record year for oil production; export from the Qatar Petroleum Company's terminal at Umm Said for worldwide distribution exceeded eight million tons. Prospecting for further oil resources continues. The loss of the Shell Company of Qatar's marine drilling platform, of which you may remember reading in the press, naturally restricted the Company's activities temporarily. The Company hopes, however, to resume operations when a new drilling platform is delivered this autumn.

MOROCCO

In Morocco the outstanding event from the monetary point of view was the decision not to follow the French franc at the readjustment in December, though remaining in the Franc Zone. The result is that the exchange rate is Moroccan Frs. 1,000 to French Frs. 1,175.

In spite of difficult market conditions, our Casablanca Branch has maintained the usual volume of business with its clients.

LONDON AND PARIS, ETC.

Our London and Paris offices, and our Marseilles branch, had a very satisfactory year. In July, 1958, a branch of the Bank was opened in Geneva.

BALANCE SHEET ITEMS

May I now invite your attention to the figures before you.

The balance sheet shows a total of £95,642,976 against £108,838,319 at the end of 1957. This decrease reflects the consequences of currency revisions which have taken place in the various countries where the Bank is established. In our present Balance Sheet the rate of conversion used for the Turkish Pound is 25.27 to the Pound Sterling as against 7.91 in recent years.

The liquid position is again very satisfactory with cash, money at call and bills receivable together totalling more than 53 per cent of the deposits. The proportions of investments and advances to deposits work out at 16½ per cent and 35½ per cent respectively.

The total amount of profit available, including the balance of £32,321 brought forward, is £380,333, compared with £382,321 last year.

£150,000 has again been appropriated to "Reserve for Contingencies" leaving a balance of £230,333; and the Committee proposes that the dividend be maintained at 8s. per share. This will absorb £200,000 and leave £30,333 to be carried forward to 1959.

The report was adopted.

GALLAHER LIMITED

(Incorporated in Northern Ireland)

LARGER TURNOVER AND PROFITS

COMPETITION INTENSIFIED AND COSTS HIGHER

SIR EDWARD DE STEIN ON THE OUTLOOK

The sixty-third annual ordinary general meeting of Gallaher Limited was held on May 27th at Winchester House, Old Broad Street, London, E.C. Sir Edward de Stein, chairman, presiding.

The secretary, Mr George Iliff, ACA, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year ended December 31, 1958:

In introducing my Statement for 1957 I told you that the year had been one of intense competition and rising costs. Competition in 1958 has been even more intense and costs continued to rise. The further expansion of our turnover in the past year together with the small increase which was made in our prices in September, 1957, have enabled us to show a further increase in our total profits. In fact our margin of profit expressed as a ratio to turnover was fractionally lower in 1958 than it was in 1957.

TRADING PROFITS

The trading profits of the Group for the year 1958, before tax, amounted to £7,754,578, an increase of £1,191,682 over 1957 profits. After provision has been made for Income Tax and Profits Tax the net profit for the year shows an increase of £1,023,113 to £3,910,292. The proportion of our total profits required for tax provision is considerably lower this year due firstly to the alteration in the rate of Profits Tax to a flat rate of 10 per cent, introduced in the Finance Act, 1958, with effect from April 1, 1958, and secondly, to the reduction of the Standard Rate of Income Tax to 7s. 9d. announced with the Budget proposals this year.

We are recommending to Stockholders a final dividend of 20 per cent on the Ordinary Stock—making with the interim distribution already paid of 5 per cent, a total of 25 per cent for the year, against 20 per cent in 1957. The final dividend will not be payable on the new Ordinary Shares offered to Stockholders in January last.

We have further strengthened our reserves during the year by appropriating £500,000 from the year's profits to General Reserve, increasing the reserve to £5,500,000 in the Consolidated Balance Sheet. We have also set aside £100,000 from the Gallaher Profit & Loss Account to employees' pensions provision, and in the Subsidiary Companies' Accounts we have set aside a further £50,000 for the same purpose, making a total for the Group of £150,000.

The remaining balance of the net profit for the year, namely £1,410,113, has been added to the Carry Forward in the Consolidated Balance Sheet, making the balance forward £3,834,966.

CURRENT ASSETS

At December 31, 1958, Stock-in-Trade in the Consolidated Balance Sheet at £49,133,759 shows an increase of slightly more than £9 million over the corresponding figure in 1957, mainly accounted for by the quantity of stocks of leaf tobacco held at the end of 1958: higher prices make a small contribution to this increase. Work in progress and finished goods stocks are higher at the end of the year than at the beginning, and this increase is approximately in line with the increase in the Group's turnover in 1958.

The considerable increase in Debtors in the Consolidated Balance Sheet is entirely due to the higher turnover in November and December, 1958, compared with 1957.

FINANCE

The continued growth of the Group's turnover from £204 million in 1957 to £244 million in 1958 resulted in the Group's borrowings reaching a high level in the autumn of 1958 despite the fact that in May, 1958, we raised approximately £9,320,000 net by the issue of £10 million 6 per cent Unsecured Loan Stock 1983/85. The expansion of our brands last year outstripped our forecasts for them and, as a result, the proceeds of the Loan Stock issue which we said would provide sufficient working capital for the Group's then present business has proved insufficient to cover our requirements in 1959. The end of the credit squeeze has made it possible for us to negotiate short-term borrowings at increased levels for 1959, but your Directors have considered it prudent to raise additional permanent capital by the issue of new Ordinary Shares, so that a higher proportion of the Group's assets should be covered by permanent finance. The net proceeds of the new share issue, namely £8,750,000, are being applied immediately to reduce the Group's short-term borrowings.

LEAF SUPPLIES

During 1958 we purchased more than one year's usage of tobacco because the increase in our turnover above estimates had run our stocks down below the levels planned, but our present stocks of leaf tobacco in terms of months' usage are more in line with those of the country as a whole than they have been for many years past.

I regret to say that 1958 prices rose again to new high levels, particularly in Southern Rhodesia, where the size of the crop was affected by adverse growing conditions which caused greater competition among the buyers for the suitable leaf offered for sale. Sales of the 1959 crop tobacco have commenced in Southern Rhodesia and preliminary reports show that there may well be a record crop in size with a general improvement in quality over last year. In America in 1958 we made a satisfactory purchase, with prices slightly up on 1957, though we were unable to buy our full programme owing to lack of suitable grades. We have recently completed our purchase of Canadian tobacco.

The extension of our leaf-handling factory in Southern Rhodesia made it possible to handle a record quantity of leaf during 1958, and further extensions remain to be completed.

SALES

In spite of the intense competition experienced in 1958 the Group's sales continued to expand throughout the year, and our experience this year shows that this trend continues though not at the same rate. In their respective categories our two main brands of cigarettes, Senior Service and Park Drive, continue to widen their popularity. I have no doubt that this is, in the main, due to the high quality of the leaf that we buy and the extreme care in manufacture and packing, together with the force of our selling and advertising policy. The sales of tipped cigarettes retailing at 3s. 4d. for 20 generally continue to grow in popularity and our brand Olivier made good progress in 1958. In order to strengthen our position in this market we are making plans for the introduction of another tipped cigarette. In the cheaper category of tipped cigarettes retailing at 2s. 6d. for 20 our brand Park Drive Tipped, introduced in 1958, has become well established in what is comparatively a small market at present.

On the tobacco side, whilst there was a decrease in the total national consumption the Group's business in 1958 expanded and our "roll your own" tobacco Old Holborn and pipe tobacco Condor Sliced both showed increased sales.

Our cigar business expanded and the sales of Manikins, our small cigar, showed a satisfactory increase.

We are, needless to say, continually reviewing the range of brands which we have to offer for sale to the public in all categories of both cigarettes and tobaccos, and you may rest assured that new brands will be introduced to meet changing market conditions if it should prove desirable to do so. I think I can say that at present we are strongly represented in most of these categories.

GENERAL MATTERS

I informed you last year that production had commenced early in 1958 in part of the premises being built for us by the Government of Northern Ireland at Lisnafillan, Northern Ireland. That factory is now in full production and we commenced manufacture early this year in a further factory there which was completed towards the end of 1958. During the past five years the number of the Company's employees in this area has increased from 450 to over 2,500.

The imminent completion of the installation of new machinery at Lisnafillan will ease our production problems, although some overtime and double-shift working will still be necessary.

In order to have stocks of tobacco adjacent to these factories we have built a new Bond Store on the factory site which will hold 13 million lb. of tobacco leaf. This storage was first used at the end of March, 1959.

Towards the end of 1958 J. A. Pattreiouex Limited purchased a further cotton mill in the Manchester area and plans are now being drawn up to adapt the building for our use in the same way as we have previously dealt

with two other cotton mills which have now been equipped as modern and efficient cigarette factories.

ENGINEERING SUBSIDIARY

The past year has not been an easy one for engineering companies generally, and I am pleased to be able to tell you that Mono Pumps Limited and its subsidiaries have had another satisfactory year's trading. We are grateful to the Management, Staff and Workers for their splendid contribution to the Group's results.

OUTLOOK

When your Directors issued a statement to Stockholders in January, 1959, advising the terms of the recent issue of 2,750,000 Ordinary Shares of £1 each at 65s. per £1 share they said that, provided no unforeseen circumstances arose, they would be able to recommend in respect of 1959 a total dividend of 25 per cent on the Ordinary Capital as increased by that issue. I can only add that since January our turnover has continued to increase in line with our forecast of sales on which that statement was based.

Factors which will affect our profit margins this year include the higher average price of our leaf tobacco stocks at the beginning of 1959 compared with a year earlier, the higher depreciation and other factory costs we will have to meet as a result of bringing additional factories and new machinery into use. Selling and advertising costs have increased due to intense competition and we also have to face a full year's cost of the wage increase granted to our workers in 1958 as compared with six months of the increase last year. To offset these items interest rates are lower now than they were a year ago and as I have said above our turnover should be higher than in 1958.

Competition is becoming even more intense but we have great confidence in our brands and look forward to a satisfactory year in 1959. I must, however, add that we do not expect to be able to increase either our turnover or our profits to the same extent that we have done in the past few years.

It is the intention of your directors to adjust the wide difference (5 per cent to 20 per cent) between the interim and final dividends on the Company's Ordinary Stock.

EMPLOYEES

The substantial expansion which has taken place in our business during the last few years has thrown a very heavy burden on Management at all levels. Additional factories have had to be staffed and supervised and new employees trained in what is a very complex production process. It has been very interesting and encouraging to see how the younger members of the organisation have responded to the increased responsibilities which they have had to shoulder, and how quickly and efficiently our new employees in our new factories have learned their jobs. We are grateful to all employees of the Group for the splendid support which they have given to the Management throughout the year, and for their enthusiasm at all times in the interests of the Company: we have again this year paid them a bonus equal to six weeks' salary or wages.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring directors, Sir Edward de Stein, Sir Walter A. Edmenson, CBE, DL, and Mr J. D. Hopkins, were re-elected and the auditors, Messrs Hill, Vellacott and Bailey, were re-appointed.

LONDON BRICK COMPANY LIMITED

YEAR OF EXPANDING DEMAND

PROVISION OF ADDITIONAL PRODUCTION FACILITIES

RECORD DAY'S MAKE OF BRICKS SUFFICIENT TO BUILD OVER 500 HOUSES

MR A. T. WORBOYS ON POLICY OF PRICE STABILIZATION

The fifty-ninth annual general meeting of London Brick Company Limited was held on May 26th in London.

Mr A. T. Worboys, CBE (the chairman), presided and, in the course of his speech, said:

The profit on trading and sundry income for the year amounted to £2,539,311 compared with £2,673,265 for 1957. After providing for Directors' remuneration and the sum of £400,000 for depreciation, the net profit before taxation amounts to £2,130,575 compared with £2,149,305 for the preceding year. Taxation amounts to £1,169,338 leaving a net profit of £960,737, an increase of £65,215 over the previous year.

After adding unappropriated profits at the beginning of the year and £19,838 taxation adjustment for previous years, there remains a balance available of £1,361,339. Following our usual conservative policy, out of this available balance £450,000 has been transferred to General Reserve and after deducting the net dividend for the year on the 8 per cent Cumulative Preference Stock and the net interim dividends of 17 per cent on the Ordinary Stock, there remains a balance of £384,639 to be carried forward. The Directors do not recommend any further dividend for the year 1958. I am sure you will agree that the Accounts show the results of another successful year and reveal a strong financial position.

Dealing now with our two Subsidiary Companies, Stewartby Housing Association Limited continues in full operation and the housing provided through this medium is much appreciated by our employees.

Transformers (Watford) Limited, our manufacturing Subsidiary, enjoyed a year marked by a substantial improvement in trading results and it is a pleasure to record that this should have been achieved in the very year when, on August 31st, the Company completed its twenty-first year. The output during the year reached a record level —some 30 per cent above 1957. This increased production enabled us to counteract, to some extent, the effect of the fall in selling price levels occasioned by the continued severe competition in both the home and the export markets.

Orders on hand at the turn of the year are commensurate with our increased manufacturing facilities and carry us forward into 1959 with confidence.

THE PARENT COMPANY

The works management has been mainly occupied during the year with large scale planning for increased output and towards the end of the year it was decided to carry out extensions at our Calvert Works. The nature of the extensions comprise a new kiln, which is already in course of construction, together with increased grinding machinery and ancillary plant and buildings. It is hoped that the work will be completed towards the end of this year.

The early months of the year were overshadowed by the Government's monetary policy. Both municipal and private house-building felt the pinch in the early months of the year and other Government and private work was either curtailed or postponed. In these circumstances, together with the seasonable weather conditions, it was not surprising that some stacking of bricks, and slight easement of production became necessary.

The position soon improved and by the late Spring we were once again on maximum production and the accumulated stocks proved a useful addition in coping with the growing demand and were rapidly taken up. For the remainder of the year production and deliveries were at a high level.

Up to the end of the year under review, our record daily make of bricks stood at 8,587,369. I am sure you will be glad to know that on April 7th this year that record was passed when a daily make of 9,075,188 was achieved. Accepting the general calculation that some 18,000 bricks are required in the construction of an ordinary type house, this one day's make is sufficient to build 504 houses—some achievement.

The comparative ease with which we came through what is generally accepted to have been a minor recession in building in the winter of 1957-58, was due to our wide area of distribution and the universal popularity of our bricks. Indeed, 1958 was a year of expanding demand for our products and, in view of the persistence of this demand for our bricks preventing us from supplying promptly the needs of the industry, it was decided that a further increase in output was required.

The demand for increased distribution of "Phorpres" bricks is particularly strong in the South West and the Midlands, where our District Sales Offices at Bristol and Birmingham have been forced to ration out available supplies, and, in view of the favourable geographical situation of Calvert Works, the nearest works to these areas, it was agreed, following upon discussions with our works management, that the additional output should be made there. These extensions which will be completed towards the end of this year, together with other general kiln improvements, will yield an additional 100 million bricks in a full year. Furthermore, we have decided to increase the output of our Bletchley establishment and the constructional work for this extension is now in hand. By July of this year, six months after the commencement of the work, the first additional production will be in delivery to the sites.

PRICE STABILISATION

There were no increases in the price of our bricks or hollow clay blocks in 1958. The last increase took place in April 1957 and so two years have elapsed since there has been any advance. We are ever mindful of the benefits of price stabilisation and we take considerable pride in being able to say that since 1954 right up to date, a period of five years, our bricks have only been increased to the extent of 5s. per thousand on commons with varying increases on facings yielding an average advance on all types of bricks of 8s. per thousand. The moderation of these price increases is very apparent when compared with the increases in other building materials as shown in the official figures published in the Board of Trade Journal in December and it is not surprising, therefore, that in a time of changing building techniques, traditional construction in Fletton brick is as popular as it has ever been.

We shall endeavour to pursue our policy on price stabilisation. This policy has been maintained in spite of increases in wages and other costs. Our ability to hold brick prices steady reflects the increased efficiency throughout every sphere of the Company's activities. I am sure you will appreciate that the longer this position obtains, the greater the achievement.

THREEFOLD RESEARCH PROGRAMME

Throughout the past year our Technical and Research Department has been actively engaged in three broad fields of work. The detailed study of the properties of our raw materials and of our finished products, the drive to establish the true scientific bases of all our production methods, and the development of new building materials suited to our manufacturing skills and sales requirements, are all essential industrial research objectives designed to keep us in the forefront of building materials producers.

In the field of new products there are, this year, a number that have advanced beyond the laboratory stage and are now being considered for pilot scale production and for the necessary long term exposure and other tests to which we must subject new materials before they are freely marketed. At the moment the future for some of these new materials appears to be promising.

Deliveries of our Field Drain Pipes during the year created a record. "Phorpres" Field Drain Pipes are manufactured to the requirements of the British Standard Specification and are supplied to the farming industry in all areas of England and Wales.

Another product of the Company that is not dependent on the demands of the building industry is the "Phorpres" Clay Electric Cable Cover. "Phorpres" Cable Covers are manufactured to the British Standard Specification and are used extensively for the protection of underground electrical cables.

I have no doubt you are expecting a few words on the current position. The year opened with bad weather but the results so far achieved are in excess of those for the corresponding period of last year. With a strong demand for our products, all our works are in full production and, in these conditions, I can say to our Stockholders today what I said to our employees at the end of last year—we face the future with confidence. I hope to present a good account of our activities when we meet again next year.

The report and accounts were adopted.

INNS & COMPANY

(Public Works Contractors, Asphalters, Sand and Gravel Pit and Quarry Owners)

AN EVENTFUL YEAR

The twenty-fourth annual general meeting of Inns and Company Limited was held on May 22nd in London, Mr Walter Wallace (Joint Managing Director) presiding.

The Chairman, in the course of his speech, said:

The year under review has been an eventful one for your Company. Firstly, because its own trading activities and profits showed a distinct improvement on those of the previous year, and secondly because the offer we made in October of last year to purchase the Ordinary Share Capital of W. and R. Wallace Industries Limited met with unqualified success, resulting in a 100 per cent acceptance by the Shareholders of that Company. This purchase became effective on November 5, 1958, so that only just over seven weeks' profits fell to be included in our Accounts as post-acquisition earnings. The proportion of the profits applicable to the pre-acquisition period were retained by our new subsidiary Company.

If any Shareholder wishes to see the Accounts of W. and R. Wallace Industries Limited, copies will be made available at the close of this meeting, but I am sure you will find that our own Accounts have been prepared so as to set out as clearly as possible the rather complicated position reflecting the profits for twelve months in the case of the parent Company and for only six months in the case of Wallace Industries and its own subsidiary Companies.

The trading profit of the parent Company rose from £508,815 in 1957 to £626,016 in 1958.

The trading profit of Wallace Industries for the six months to December 31, 1958, was £117,289, which compares not unfavourably with the rate of profits made during the previous full year, bearing in mind the particular period of the year to which they refer.

The net profits before tax amounted to £575,262 as against £399,071 shewn in our previous Accounts.

The report was adopted and the total distribution of 27½ per cent, less tax, was approved.

BARTON & SONS

A DECADE OF STEADY PROGRESS

The ordinary general meeting of Barton & Sons, Limited was held on May 27th in London, Mr H. Prichards (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement:

For the first time our profit on trading exceeded the million pounds, being in fact £1,052,456. This landmark in our history highlights the company's steady progress, a measure of which may be obtained by comparing figures with those of 10 years ago. In 1948 our pre-tax profits were £258,818, they are now £862,415; Ordinary stockholders' funds employed amounted to £647,745, they now amount to £3,041,777, an increase of £2,394,032, accounted for by £256,250 ordinary stock issued for cash, £1,117,916 ordinary stock issued as a bonus and an increase of £1,019,866 in reserves.

An ordinary stockholder who owned 400 5s. units in 1948 when the mean market value was 6s. 2d. per unit had an investment worth £123 6s. 8d. and if he then subscribed for the cash issue to which he was entitled in 1953 he would have subscribed a further £115 12s. 6d. The holding would now be £437 10s. at nominal value and at mid-April, 1959, market value (10s. 6d. per unit) would be £918 15s.

With the impetus to industry which should result from the accumulated benefits of the budget provisions and the easing of credit and hire-purchase restrictions, I am hopeful that the results for 1959 may again give cause for satisfaction.

The report was adopted and the final dividend of 6 per cent making 10 per cent for the year was approved. The Directors have also declared a special interim dividend of 2½ per cent, less tax, in respect of the year 1959.

MILK MARKETING BOARD

SUPPLIES AND PRICES

MR RICHARD TREHANE'S REVIEW

The Annual General Meeting of the Milk Marketing Board was held on May 28th in London.

Mr Richard Trehane, chairman, in the course of his speech, said:

Last year Sir Thomas Peacock spoke of the great output of milk which was sold from farms during 1957 and in the early part of last year, and of the record supplies which the Board had been able to market. This upsurge in total supplies seemed to have lost its force by mid-summer; subsequently, as you all know, milk supplies declined and during last winter, they were at an unusually low level. In some months they showed a decrease compared with a year ago of as much as 13 per cent which is an almost unprecedented drop in so short a period. The difference between output in the year which we have just passed and in the previous year was 113 million gallons or 6 per cent.

After nearly three years of rapidly rising supplies and a high level of manufacture in all categories, we were with unexpected suddenness required to deal with a lower total level of supply and a much smaller scale of manufacturing activity. This change in the direction of supply has meant a drastic alteration to manufacturing programmes and whilst at no time have we been in any danger of shortage in the liquid milk and fresh cream markets, we have made almost no butter in any creameries throughout the winter and the quantities of milk available for cheese-making had to be strictly rationed to the individual makers.

PROSPECTS OF LOWER SUPPLIES

On the whole we believe from all we have gathered and studied that in the next year or two at any rate milk supplies will run at a lower level than the recent peaks but the amount of surplus for manufacturing, of course, will be influenced considerably by the nature of the seasons. The lower the total level of supply, the greater the incidence of climatic factors on quantities to be manufactured. And a point not often appreciated is that a decline of one-twentieth in total output in a year will reduce the volume of dairy products by as much as one quarter.

I might mention in passing that in the last few years there has been a very clear tendency for milk producers to go out of the milk business in fairly large numbers. Our total of registered producers, for example, has been reduced by 20,000 since 1954. This trend, I have no doubt, is a reflection of the difficulties which many small producers have found in the industry and is also an indication that milk production with only a declining record of profitability is regarded by some producers as too arduous an undertaking when compared with the prospects in some other branches of farming. Our number of registered producers in 1945, swollen by wartime needs, was 158,000; today it is 127,000. This is a startling decline in the number of persons concerned with milk production and its significance should not be disregarded when national farming policies are formulated.

BUTTER AND CHEESE PRICES

When the Chairman spoke last year, he drew attention to the very low prices of butter and cheese then prevailing. You will remember that both these dairy products were sold for a time at prices which even our friends in the Commonwealth could not bear for long. The situation improved before the end of the year and I am glad to be able to report that prices have been much more satisfactory during the first part of this year. Prices of cheese have, in fact, been very high, almost higher than we would wish.

The butter situation is also very much improved and whilst butter prices are much less favourable to producers than those which I have described for cheese, they are at a higher level than last year.

What we all require is a steady market at reasonable prices which will give to us and our competitors the opportunity of expanding the size of the market. I hope that we shall be able to do even more in the years to come by co-operative action with the great dairying countries to co-ordinate supplies in relation to demand so as to achieve greater stability—this I am sure is the soundest foundation for making the best of this most important market in the interests of all concerned.

LIQUID MILK MARKET

Coming now to the liquid milk market, which is the main concern of milk producers in this country, I am very pleased to report that over the last year this market has shown welcome signs of expansion. Whilst we have done our utmost in recent years to stimulate an increase in sales, this is the first year in which we can show positive results. Over the twelve months ended March, total sales of liquid milk in England and Wales increased by 12 millions compared with the previous year and by 7 millions compared with 1953-54, which preceded the re-instatement of the Board following Government control.

We have spoken so much on this question of expansion of the liquid market in recent years that I do not propose to dwell on the subject at length today. I do want to say, however, that in my opinion there is room for a further steady growth of this market and that we should prepare jointly to do even more to stimulate expansion by advertising, publicity and all modern sales promotion methods.

Higher sales of liquid milk satisfy us as producers and they are good business for the dairyman. This is a most valuable market and in pursuing our sales campaign we are not forgetful of the interest of the consumers. We believe that the milk supply and the milk service gives satisfaction today. It is still a cheap product, cheap by comparison with other foods and other items in the household budget or when we compare its price today and prewar. It is well known in the industry that the great gain in efficiency in production, transport, processing and distribution which has taken place in the past 20 years has been very largely passed to the consumer in a better product and in good service at low prices. This is as it should be and it is a fine foundation for an expanding industry.

We are constantly devoting a great deal of our attention to the quality of the milk supply. I need hardly say that in the last ten or twenty years this has greatly improved. It is our desire to introduce such improvements as we can all the time and in this we have the full co-operation of the dairy trade.

There are two tasks—to create a standard for market milk and to grade at the consumer end so as to cater for varying tastes and requirements. We think both these are tasks for the industry, with the least possible degree of Government control—we have expressed this view to the Cook Committee. This leaves the initiative for improvement and for satisfying consumers' requirements as the responsibility of the industry. The dairy farmers and the whole trade wish to continue actively to raise standards and to pass the benefits of the better product to the public.

During the autumn the Board decided to improve the business of the Preston bottling creamery by the acquisition of the Palatine Dairies at Blackburn. We had found that our wholesale business in Preston was losing ground because of dairymen customers being taken up, and their business operated, by competing wholesalers. The Board decided that we should not allow the business to fail but that we should do as our competitors were doing—supplement our wholesale efforts by acquiring an existing dairy with an established semi-retail and retail trade. We have operated the Palatine Dairy since the beginning of this year and I believe that the service we provide is acceptable to our customers.

However, as you all know, this step which we have taken has been the subject of strong objection and adverse criticism by the leaders of the dairy trade. They claim that we—having the powers enabling us to retail milk granted in the terms of the Scheme—should refrain from any further intrusion into the retail markets.

BOARD'S POLICY

We have said consistently that it is not the intention of the Board to embark in any substantial way on retail trading. This continues to be the policy of the Board. The retail service given by the dairymen in this country is generally speaking very good and economical. Circumstances can and do arise, however, when the Board consider it to be in their interest to enter the retail market. This was the case in Blackburn. Other circumstances made it necessary for us many years ago to establish a retail dairy in Norwich and this dairy is still operating. After 25 years of experience as a producer marketing organisation we still have only two small retail dairies throughout the length and breadth of the country.

I understand fully the feelings of many producers, expressed by them to me and through the Press, indicating that we should go much further to establish the producer interest in a substantial way in retail business. There are many aspects to this problem; what governs Board policy mainly is our real desire to work closely with the dairy trade and the belief which we have that such close and constant co-operation will bring to producers in the long term the best results from the market.

The Report was adopted.

HARLAND AND WOLFF LIMITED

COMPANY'S ACHIEVEMENT IN A DIFFICULT YEAR

ADVERSE EFFECT OF PLATERS' STRIKE

SATISFACTORY PRESENT AND PROJECTED WORK PROGRAMME

SIR FREDERICK E. REBBECK'S NOTE OF WARNING

The seventy-fourth Annual General Meeting of Harland and Wolff Limited was held on May 20th at the Registered Offices of the Company, Queen's Island, Belfast. Sir Frederick E. Rebbeck, KBE, DSc, DL, JP, Chairman and Managing Director, presided.

The Secretary read the Notice convening the meeting and the Report of the Auditors.

The Chairman said: As the Statement of Accounts and the Directors' Report have been in your hands for some time, I presume I may take them as read. (Agreed.)

You will have noted that for the period under review there has been an improvement in the profit on trading compared with the previous year. This result, which can be considered satisfactory, has been achieved despite the adverse effects of the platers' strike in the early part of the year, and the additional charge of £100,000 which has been required for depreciation.

As a result of the welcome reduction in the standard rate of Income Tax and other tax concessions, the increased profits have not been accompanied by a corresponding increase in the charge for taxation. Nevertheless you will observe that taxation still absorbs over 50 per cent of our available profits.

In the past I have often stressed the importance of providing adequate reserves to enable the Company to keep abreast of developments and equip our shipyards and engineering works with the most modern plant and machinery. The replacement of assets is a continuing process and you will observe that during the year we have transferred £480,000 from the Reserve for Fixed Asset Replacement to Capital Reserves. It is equally important that we should be in a position to mitigate the effects of world depression and, for this reason, you will agree that it is desirable when possible also to build up the General Reserve.

The Directors therefore propose that of the surplus available for distribution, £130,000 should be allocated to Fixed Asset Replacement and £150,000 to General Reserve. It is also proposed to repeat the dividend of 10 per cent to the Ordinary Stockholders and to carry forward the balance of £11,931 in the accounts of the parent company.

THE YEAR'S WORKING

During the year a satisfactory level of activity was maintained in the Company's shipbuilding yards. Eleven merchant vessels, a frigate, two coastal minesweepers and a number of small craft were launched. Although the total output of 136,580 tons gross fell short of the corresponding figure for 1957, the reduction was due not to any overall contraction in the amount of work on which we were engaged, but primarily to the adverse effects of the protracted platers' strike at Belfast to which I have already referred. This strike, which lasted for eleven weeks, disorganised our building programmes, and the launches of three merchant vessels, scheduled to enter the water before the end of 1958, could not take place until the early months of 1959. Although it is not possible to assess accurately the financial consequences of this strike, its results will also certainly be reflected in next year's accounts.

Thirteen merchant vessels for British, Norwegian and American owners, the Frigate *Blackpool* for HM Navy and the Coastal Minesweeper *Port Elizabeth* for the South African Navy were delivered during the year. The ship of the year was without doubt RMS *Pendennis Castle* (28,582 tons gross) for The Union-Castle Mail Steamship Company Limited, which made her maiden voyage in January of this year. The new liner, which replaced the *Arundel Castle* on the weekly mail service from Southampton to South Africa, is the largest of eight ships at present engaged on this route. Other merchant vessels completed included oil tankers, cargo and refrigerated cargo liners.

BUILDING PROGRAMME

Ships at present under construction include three 20,000 ton passenger and cargo liners, *Amazon*, *Aragon* and *Arlanza*, for Royal Mail Lines, Limited. Her Royal Highness The Princess Margaret has honoured both owners and builders by graciously consenting to name and launch the first of the trio, *Amazon*, in July of this year.

Work is proceeding steadily on the 45,000 ton Passenger Liner *Canberra* for the Peninsular and Oriental Steam Navigation Company.

The remainder of a varied merchant shipbuilding programme includes important groups of cargo liners and large oil tankers for British and foreign owners.

Naval work continues to represent an important part of the Company's shipbuilding activity. Contracts in hand include the fitting out of the Light Fleet Carrier *Hercules* for the Indian Navy, and the construction of a guided missile destroyer and two frigates for HM Navy, the Frigate *Trishul* for the Indian Navy and the *Walvisbaai*, the last of three coastal minesweepers for the South African Navy.

Although our present and projected programme will provide a satisfactory volume of work for our facilities for the next two years, I must sound a note of warning. The persistence of depressed conditions in the freight and tanker markets has now led to the almost complete cessation of enquiries for new tonnage, a position which naturally gives cause for concern. This situation is likely to continue until an improvement in trading conditions stimulates a revival in the demand for shipping space.

DIVISIONAL ACTIVITIES

The Marine Engineering Division continued to make an important contribution to the Company's output. Our extensive and well-equipped establishments at Belfast and Glasgow were fully employed on the construction of a wide range of main propelling and auxiliary machinery for vessels building in the Company's shipyards and for hulls building by other shipbuilders.

The reduced demand for the products of our Industrial Engine Division reflected world conditions, and output during the year was below our potential. Contracts completed included the supply of diesel engines and compressor units for industrial and public service.

Activity in the Electrical Division was well maintained throughout the year. Apart from the installation of electrical systems on board merchant and naval vessels under construction, the Division was engaged on the manufacture of alternators and other electrical equipment.

Despite some contraction in the demand for structural steelwork, the output of the Steel Structural Division continued at a high level, and the Division continues to play an important part in industrial and public building and civil engineering projects.

During the year the Company's three Repair Branches at London, Liverpool and Southampton handled a substantial volume of ship and engine repair work, and a number of important repair contracts were carried out at Belfast and Govan. The adverse conditions to which I have already referred have also had a restrictive effect on the demand for ship repairs, and a reduced level of activity may be expected to continue so long as present conditions obtain in the freight market and substantial numbers of cargo liners and tankers are laid up.

There are two further matters to which I must refer. You will recall that in the autumn of last year your Directors decided to follow the example of other leading British companies concerned with important Government contracts by taking steps to prevent voting control of your Company falling into alien hands. At an Extraordinary General Meeting of the Company, held at Belfast on November 25, 1958, a Special Resolution was passed making certain alterations to the Articles of Association which will ensure that voting control will continue to be vested in British subjects.

CAMP BIRD LIMITED

You will, I am sure, expect me to comment on the spate of statements which recently appeared in the press in which the name of Camp Bird Limited has been mentioned.

The facts are that on March 19 I received from Mr John Dalgleish, Chairman and Managing Director of Camp Bird Limited, who is a complete stranger to me, a personal letter dated March 18, marked "Private and Confidential." The reply which I sent to Mr Dalgleish on March 25, 1959, was also marked "Private and Confidential." Since then, however, Mr Dalgleish in a statement to the press has made reference to the contents of this correspondence, which I therefore regard as having automatically ceased to be either private or confidential.

In his letter to me Mr Dalgleish stated that Camp Bird Limited had recently acquired some 100,000 shares in this Company. He also referred to plans for further acquisition of shares coupled with an astonishing proposal for representation on our Board. He said that he looked forward to hearing my views and perhaps to an early meeting. In

my reply I said that the proposal that Camp Bird should have representation on our Board was quite unacceptable and, in these circumstances, there would be no point in arranging a meeting. No reference was made in Mr Dalgleish's letter to me to a cold forging process which figured so prominently in his subsequent statements to the press. In any case the process would be of no interest to us. I have had no further communication from Mr Dalgleish.

DIRECTORATE

During the year Mr J. S. Baillie, our London Office Manager, who has been a member of the Board since 1948, was elected Deputy Chairman. Mr Baillie joined the Company in 1913, and I am naturally pleased to have as my deputy a colleague who has worked so closely and so successfully with me for many years.

Mr J. H. Crossey, who has been an executive officer of the Company for many years, was appointed to the Board in October, 1958.

In conclusion, I take the opportunity to thank everyone in the Company's service for their loyal co-operation during the year.

The Report and Accounts were adopted; the proposed dividend was approved; the retiring Directors namely, Mr J. H. Crossey, Mr J. S. Baillie, Mr H. R. Humphreys and Mr J. H. McCuaig were re-elected. Messrs. Price Waterhouse & Company were re-appointed Auditors and their remuneration was fixed.

The meeting terminated with a unanimous vote of thanks to the Chair.

DARWINS GROUP LIMITED

DIFFICULT TRADING CONDITIONS

The thirtieth annual meeting of Darwins Group Limited was held on May 21st in Sheffield, Mr F. Thompson-Schwab, the Chairman, presiding.

The following is an extract from his circulated review:

The results for the financial year 1958 were very disappointing when compared with the previous year. Last year I referred to the difficulty of forecasting the 1958 results owing to the general uncertain trading conditions operating at that time and pointed out the effects a decline in demand would have on our financial results.

Demand for many of our products did decline and at a more serious rate than I anticipated at the time, with the consequence that trading conditions, particularly during the second half of the year were extremely difficult. Actually the total value of the Group's deliveries declined from nearly £6 million in 1957 to £5,169,000 in 1958.

I am confident that, subject to no unexpected political upheaval, trading conditions will, in time, become more normal, with consequent increased demands for the products of the Group.

All your Works are well equipped to meet the increased demand when it comes.

Improvements in some shape or form are continually being made to obtain the maximum possible efficiency.

Turning to the Profit and Loss Account, after all charges the balance remaining is £234,764 from which must be deducted £121,400 for taxation provision. Including the balance of £156,670 brought forward from last year the amount available for disposal is £270,034.

In view of the fall in profits and the necessity for conserving the Company's liquid resources, your Board recommend a final dividend of 6 per cent actual (less tax) which compares with a rate of 8½ per cent paid last year. This will absorb £29,510 leaving a balance to carry forward of £206,530, an increase of £49,860.

Regarding prospects for the current year, so far business has not been at a satisfactory level, the overall demand being such that our plants are working below their full capacity. There are signs, however, that the recession has now reached bottom and that some gradual recovery may be expected.

The report was adopted.

KAPALA RUBBER ESTATES

The twenty-fourth annual general meeting of Kapala Rubber Estates of Malaya Limited was held on May 29th in London.

In his circulated review, the Chairman (Mr P. B. L. Coghlan) comments on the accounts for the year ended September 30, 1958. Reflecting less favourable market conditions and a somewhat lower crop these show Net Proceeds of Rubber Sales at £163,977 compared with £210,646 for the previous year. However, this decline had been partly offset by substantial working economies and the Directors recommend a dividend of 5 per cent, less tax, on the Ordinary Shares.

After the sale of 420 acres of outlying old rubber during the year, the Estate is now a compact unit well placed for efficient working under present-day conditions. It is therefore not intended to dispose of any further large areas although, Mr Coghlan adds, advantage may be taken of any favourable offers for land containing tin and iron ore deposits which are believed to exist over relatively small parts of the Estate. Profits from previous sales of such areas had assisted in accelerating the Company's replanting programme and in financing the Company's investment in the Central Factory. It was considered equitable that Shareholders should participate in these profits and the Directors now recommend that £12,940 should be applied in the payment of a capital bonus, not subject to Income Tax, of 7½ per cent on the Issued Ordinary Capital.

Especially encouraging was the trend in production, it being estimated that notwithstanding the cutting out of a further 227 acres for replanting during 1959, and land sales, crop for the current financial year would reach the 2,000,000 lb mark.

Mr Coghlan continues:

"It must be becoming increasingly evident to all concerned that, statistically, the natural rubber position is sound with consumption fully meeting production. There is ample evidence of improvement in world trading conditions and, with substantial buying from the Iron Curtain countries, it seems likely that every pound of natural rubber that can be produced will be needed for some time to come. Neither producers nor consumers desire wide movements in the price and it is hoped that the demand for natural rubber will be met in an orderly fashion and any undue fluctuations prevented. This should now be possible with synthetic production acting as a buffer to any such movements.

The higher prices which have now been ruling for some months will undoubtedly make a material difference to our profits for the current year. Provided that there are no unforeseen setbacks, it is hoped that considerably better figures will be presented at our next Annual Meeting."

THE PROJECTILE AND ENGINEERING COMPANY LIMITED

MR JOHN WADDELL'S STATEMENT

The Fifty-seventh Annual General Meeting of The Projectile and Engineering Company Limited was held on May 27th at the offices of the Company, Mr John Waddell, Chairman, presiding.

The following is his statement:

Your Directors are pleased to be able to put before you their Report and Accounts for the year ended December 31, 1958, which reflect improvements made after overcoming some of the problems which confronted your Company a year ago.

Trading conditions during the year have been difficult, and the results do credit to the management and staff for their efforts to increase the efficiency and profitability of your Company.

Before offering my review of the Company's business, I would like to pay tribute to Sir Lynden Macassey. Sir Lynden joined us in 1941, and I cannot let his retirement from the Board pass without expressing my personal thanks, and those of my colleagues, for the benefit he has given us over the past 18 years of his extremely wide and varied experience in the engineering industry, in the law, and in commerce and finance.

METAL PRESSINGS DIVISION

Overall production was well maintained, the value of turnover in the division being some ten per cent higher than the comparative figure for 1957, although from time to time work was subjected to interruptions and delays arising from spasmodic stoppages in sections of the motor industry.

This business is still extremely competitive but the order book remains at a healthy level and your Company in continuing to serve the motor industry anticipates maintaining the output of the metal pressings division.

MACHINERY DIVISION

Demand for the new range of Injection Moulding Machines for the plastics industry continued at a high level. Output was expanded accordingly, and this side of the business is now geared for the speedier turnover necessary to meet the increasing need to make deliveries at short notice.

Competition overseas, particularly in Europe, has become very keen, but this is being met by extra efforts on the part of the sales staff, increased sales promotion at exhibitions and in advertising, and the assistance of active and enthusiastic agents abroad. In other territories further afield, additional difficulties are caused by the shortage of sterling, and adverse trade balances, and the extended credits demanded in many cases provide a special problem.

Market requirements are the subject of careful study and the range of machines available is adjusted appropriately from time to time. "PECO" machines were satisfactorily shown at the Leipzig Fair earlier this year and there will be further displays at various other international shows during the year, including a full-scale exhibit at the British Plastics Exhibition being held at the Olympia, London, in June, and at the Dusseldorf International Fair in October.

This division also caters for the diecasting industry with the supply of Pressure Diecasting Machines. The progress that has been made can be regarded as satisfactory, and it appears that future steady expansion can be anticipated as new applications for pressure diecast products are developed.

MISCELLANEOUS RAILWAY CONTRACTS

During 1957 your Company successfully negotiated some large-scale contracts for the supply of equipment in connection with the British Railways development and modernisation programme. This programme was severely curtailed following Government restrictions on capital investment, and work on these contracts came to a standstill.

ACCOUNTS AND FINANCE

The consolidated Profit and Loss Account presented to you shows a profit for the year of £84,466, after taxation, compared with the net loss of £32,620 for the year 1957, expressing the benefits of the improved efficiency and increased production to which I have already referred.

As to the current assets and liabilities, the liquid position shows a considerable improvement compared with a year ago. There has been a reduction in stocks and work-in-progress from £940,088 to £811,186, and you will also note there has been a satisfactory reversal of the unfavourable position which obtained last year in regard to sundry debtors and creditors.

The Company's investment in capital equipment has continued on a modest scale, as plant available has been adequate for immediate needs. Since the end of the year the Board has considered it wise to sanction further increases in plant purchases to widen and improve production capacity.

The terms of the five per cent loan have been satisfied by a further repayment of £30,000 since the date of the Balance Sheet, leaving the balance of the loan at £210,000.

DIVIDEND

Your Directors, having given due consideration to the trading results for the year and being mindful of the necessity to conserve resources, recommend the payment of a first and final dividend of six per cent, less income tax, on the 10s. Ordinary Shares.

The report and accounts were adopted.

BAYERISCHE HYPOTHEKEN-U. WECHSEL-BANK

Bayerische Hypotheken-und Wechsel-Bank

MUNICH

Theatiner St. 9-15 Kardinal-Faulhaber St. 10

240 Branch Offices in Bavaria, the Palatinate and Baden-Württemberg

Offices of the Mortgage Department
at Augsburg, Berlin, Düsseldorf, Frankfurt/Main, Hamburg, Hanover, Landshut, Ludwigshafen/Rhine, Nürnberg, Würzburg.

At the General Meeting held on April 29, 1959, it was agreed to distribute **a dividend of 12 per cent and a bonus of 4 per cent on nominal DM 60,000,000 common stock** for the business year 1958.

Starting April 30, 1959, dividend and bonus will be paid less a deduction of 25 per cent capital tax, against surrender of warrant No. 6 at any branch office of our bank and the paying offices already published.

Following are some figures from the Balance Sheet as at December 31, 1958:

Capital (capital stock and reserves)	DM 120,020,000.—
Deposits with the Banking Department	about DM 1,926,572,000.—
(including Savings Deposits	about DM 679,339,000).—
Pension Fund	about DM 64,489,000.—
Debtors	about DM 856,179,000.—
Long-Term Loans of Mortgage Department	about DM 1,320,969,000.—
Outstanding Bonds and Borrowings of Mortgage Department	about DM 1,397,159,000.—
Net Profit	about DM 9,770,000.—

Munich, April 1959. THE BOARD OF MANAGERS.

COMPANY AFFAIRS

BRITISH TIMKEN

THE bid of 83s. 9d. in cash made by the American parent, Timken Roller Bearing, for the 2,337,500 £1 ordinary shares in British Timken held by the minority shareholders seemed reasonable. But it was not attractive enough for the Prudential Assurance, which owns 112,000 shares, and some other institutional investors, who held that for really long term holders, the offer was inadequate. Their opposition has been strong enough to prevent TRB securing the 90 per cent acceptance that would have enabled it to acquire the remaining shares compulsorily. Holders of over 1,600,000 shares (about 70 per cent of the minority portion) accepted the offer; TRB now controls just over 85 per cent of the ordinary capital of £5 million.

The offer has now been made unconditional, so that the £1 million of £1 preference shares will have to be redeemed as promised in the original offer at 22s. 6d., but the date for acceptance has been extended until June 9th. If by that time the remaining minority shareholders have not accepted, they are faced with the possibility of the liquidation of British Timken. The American parent always intended to absorb British Timken and holding more than 75 per cent of the equity, it can force a liquidation. In a liquidation, the American company would be the only obvious buyer, for if British Timken were sold to a third party it might be without its name and trade marks. What the minority shareholders would get out of liquidation is problematical, but it must be hoped that the need to liquidate will not arise.

ANGLO AMERICAN

IN the boom in Kaffir shares, the 10s. ordinary shares of Anglo American, biggest and most powerful of the South African finance houses, have risen relatively more steeply than the shares of the gold mines it administers. At 190s. 6d. the Anglo American units yield only 4¼ per cent on the maintained dividend of 80 per cent. They open an important route into copper, diamonds, coal and many other minerals in Southern Africa as well as gold. But at the moment the yield is clearly discounting the rising income of the OFS and Klerksdorp gold producers rather than reflecting hopes of a spectacular rise in income from the group's other interests. It is true that the dividends of the Rhodesian copper producers will be raised this year and that the diamond industry is likely to enjoy a better and more profitable year than in 1958, but the real justification for the present price of Anglo American lies in the information in the full report about the South African gold mining industry.

Last year, thanks to the better grades and higher output of the new mines, the working profit of the gold producers in the Anglo American group rose from £22.1 milion to £26.3 million, and, thanks to the higher dividends declared by the new gold mines and by such associated finance houses as WRIT and OFSIT, the investment income of Anglo American rose from £4,763,000 to £6,317,000. The revival of interest in Kaffir shares is reflected in the rise of the market value of Anglo American's quoted investments from £69 million to £90 million—representing a massive reserve behind the book value of £36 million. It was also reflected in the issue of convertible bearer bonds to the Deutsche Bank in connection with De Beers' purchase of an interest in Williamson Diamonds and in the sale of Kaffir shares by Anglo American and other finance houses to the American trust, American-South African Investment. The profit that the "shops" made on these sales was not taxed and this is reflected in a surplus on realisation of investments of £308,000 in the consolidated accounts. That surplus is struck as is the group's usual practice, after charging amounts written off investments against any share-dealing profits.

* Less amounts written off. † Includes the loan of 50,000,000 D.M. made to the Corporation who in turn made a convertible loan of £4,200,000 to De Beers Consolidated Mines. ‡ Market value :—1957, £68,971,000; 1958, £89,982,000.

The accounts thus bear every mark of the Kaffir boom that has so strengthened what was already an enormously strong finance house that its chairman, Mr Harry Oppenheimer, says "that never in its history has the group been so well-placed for financing any new business that may arise." In considering this statement and the political risks in Southern Africa (to which Mr Oppenheimer devotes much of his statement), investors must hope that their expectations of a more liberal distribution policy will soon be fulfilled.

BOWATER PAPER

BOWATER PAPER CORPORATION is to raise £5,000,000 by the issue of 6½ per cent debenture stock at par, of which £1,500,000 will be placed with one of the company's bankers and £3,500,000 with institutional investors. The issue is a funding operation to pay off the £5,500,000 bank overdraft incurred by the Bowater Steamship Navigation in financing the group's shipbuilding programme. The stock will not have a quotation and the proportion taken up by the bank is to be redeemed in 1968 at par and the remainder will be redeemed between 1969 and 1982, also at par.

Bowater's shipbuilding programme is now almost completed. Last year one new 8,500 ton paper-carrying vessel and four 5,400 tons vessels designed to carry raw materials such as woodpulp were brought into commission. Another 5,400 ton ship is still under construction, and in the last report the directors stated that they hoped this last vessel will be delivered and in service by the end of this year. The group's fleet will then comprise 12 ships, including the four vessels acquired in association with the subsidiary, Mersey Paper of Canada, in May 1956. The Bowater fleet carries about half the group's cargoes and at the moment, in spite of the world surplus of newsprint and the slump in freight markets, all the vessels are fully employed.

J. AND P. COATS

FOR the third successive year J. & P. Coats, the sewing cotton group, has reported a fall in its consolidated net profits. This time they have fallen again sharply, from £8,692,309 to £6,157,925. The directors have in the past pursued a conservative dividend policy and for 1958 they are leaving the total ordinary dividend unchanged at 8¾ per cent. But in addition they have declared a special interim dividend of 1¼ per cent for the current year. This presumably is a profits tax interim. The further fall in group profits is partly explained by the higher provision for exchange losses of £1,310,000 (against £568,000), though slightly less has been written off stocks at £1,196,000 (against £1,250,000 in 1957). A fall in profits from the group's overseas interests is suggested by the smaller foreign tax charge of £2.3 million (against £2.8 million), while the fall in British tax from £1.9 million to just over £1 million and the lower gross profits of the parent company at £4.5 million (against £4.9 million) probably reflect narrowing profit margins at home. The £1 ordinary stock units at 26s. 3d. yield 7.9 per cent on the assumption of a 10 per cent dividend, which is only barely covered by earnings.

PHILIP HILL

PHILIP HILL Investment Trust's report and accounts for the year ended March 31st reflect the buoyancy of the capital market in a period when *The Economist* ordinary share indicator rose from 139.4 to 256.1. Issuing houses and industrial bankers are among the first to benefit from active markets and the consolidated profits before tax of the trust's subsidiary Philip Hill, Higginson have jumped by 21 per cent from £553,803 to £673,645; its net profits have risen by £63,507 at £317,395. The consolidated balance sheet of Philip Hill, Higginson shows its total share capital and reserves at £1,976,000 but the trust's interest in this wholly owned subsidiary is entered in its books at only £500,000. Moreover, the market value of the quoted investments is £732,069 higher than the book value of just over £1 million.

The parent trust has had another record year and the total ordinary dividend has been raised from 17 to 20 per cent. The higher dividend is still covered twice by the net income of £723,899 (against £605,294). The aggregate market value of the trust's own quoted investments stood at £16,714,507 —more than double the book value of £7,172,270, after deducting an investment reserve of £2,970,396. Practically all the trust's holdings—95.6 per cent of their total market value—are in equities, with 23 per cent in dollar equities. The 5s. ordinary shares at their current price of 29s. 6d. yield 3.4 per cent.

GUEST, KEEN AND NETTLEFOLDS

A NOTE in these columns on May 16th drew some wrongly based conclusions about the profit experience of Guest, Keen and Nettlefolds and its subsidiaries last year. John Lysaght Limited is a holding company owning eight overseas subsidiaries, mainly in Australia; all its ordinary capital is owned by GKN but as its preference shares and debentures are quoted its results are published separately. John Lysaght's Scunthorpe Works, the iron and steel company, is wholly owned by GKN and its results are not announced separately. The increase of £1,196,225 to £4,716,986 in the profits of John Lysaght Limited (which was bigger than the increase reported by the GKN group as a whole) came from the operations of overseas subsidiaries and not, as was stated in the note, from the iron and steel operations of John Lysaght's Scunthorpe Works.

SIMON-CARVES AND JOHN THOMPSON

SIMON-CARVES has fared better than many of the other companies that have a stake in atomic power. Its ordinary dividend was raised from 20 per cent to 25 per cent in 1957 and although it was left unchanged at 25 per cent for 1958 shareholders received a tax free capital distribution of 7½ per cent last November. Earnings in recent years have been stable; last year net profits at £686,301 were £16,334 higher than in 1957 as to some extent earnings have been insulated from the growing keenness of competition by the volume of orders in hand. Following an advance of more than 10 per cent in 1957, sales last year scored another "impressive increase," and the chairman, Mr R. B. Potter, says, that although the order book is less than it was a year ago he does not expect any great change in turnover or profits in the coming year. Nonetheless, he sounds a distinct note of warning; the number of new orders obtained was disappointingly low, and he points to an excess of capacity in the boiler making industry. No doubt some investors had been counting on Simon-Carves' association with GEC in building atomic power stations to offset any decline in other business but Mr Potter points out that big sums are being spent on research and development (which are written off as they are incurred) in nuclear power projects without any real assurance of a proper continuity of work.

Similar fears were voiced last year by the chairman of **John Thompson,** the boiler making company linked with AEI in an atomic power consortium, and with Power-Gas and Humphreys in setting up nuclear chemical plant. Over the full year to December 31st, the group's trading profit fell by 29 per cent, from £2,411,055 to £1,742,336, and the cover on the unchanged ordinary dividend of 25 per cent was reduced to 1½ times. Although profits from year to year must vary with the completion of contracts, it seems that profit margins have narrowed sharply. John Thompson's 5s. ordinary shares now yield 5½ per cent at 22s. 3d. and the 5s. ordinary units of Simon-Carves yield 4¼ per cent at 29s. 3d. xd.

ROYAL MAIL

ALTHOUGH the trading profits of Royal Mail Lines fell by more than a third last year, from just over £3 million to £2,300,000, the ordinary dividend was reduced by only one per cent to 8 per cent. Mr Walter C. Warwick points out that the group pursued a conservative policy in earlier years when profits were booming. That is no longer the case and shareholders have to be prepared for a further fall in earnings this year. Royal Mail operates a fleet of 46 ships, trading chiefly with South America and the West Indies. The earnings of the group's refrigerated cargo ships suffered last year from the decline in shipments of meat from Argentina and Uruguay while the further fall in the profits of its passenger liners reflected the economic difficulties that Argentina and Brazil continue to experience and another fall in the value of their currencies. The profits of the group's wholly owned subsidiary, Pacific Steam Navigation, have been affected by the decline in commodity prices and the chairman says they will fall sharply this year. Royal Mail had £7 million in gilt-edged and cash at the end of last December.

London Stock Exchange

FIRST DEALINGS:	May 20	June 3	June 17
LAST DEALINGS:	June 2	June 16	June 30
ACCOUNT DAY:	June 9	June 23	July 7

GILT-EDGED prices weakened this week on the setback in sterling and fears of higher interest rates in the United States; but on Wednesday small investment buying and some "bear covering" led to a slight rally. In the long-dated stocks Gas 3 per cent 90-95 lost ⅞ at 65⅝. Among irredeemables War Loan 3½ per cent closed ⅞ lower at 65⅝. The announcement of the South African loan had no significant effect on home Corporation and Dominion loans, which were easier in sympathy with Government stocks. Among foreign bonds Greek issues were again in demand and the 7 per cent stock rose 7 to 43½ on continued debt settlement hopes.

Industrial equities prices moved rather irregularly and on Monday some profits were taken. But on Tuesday, the Watney Mann take-over bid from Sears Holdings dominated the market and led to widespread gains in brewery shares. On Wednesday, the employment figures helped most industrial stocks to close above their worst, but over the week to Wednesday's close *The Economist* indicator gained only 0.1 to a new peak of 272.4. Brewery shares were bought as a speculation about the value of their properties; Fremlins gained 5s. 3d. at 59s. and Friary Meux put on 3s. 9d. at 55s. 6d.

Enfield Rolling Mills gained 6s. to 56s. 6d. and Enfield Cables jumped 2s. 6d. to 23s. 6d. on rumours that a bid would be made for the two firms following the completion of the proposed merger. Fisons shot up 6s. 3d. on investment buying in a market short of stock. Motor shares were active with Rover gaining 2s. 7½d. at 25s. 9d. and Jaguar 1s. 9d. at 58s. 1½d. on merger rumours, which have since been denied. Ford jumped 1s. 7½d. to a new "high" at 67s. 1½d. and B.M.C. rose 6d. to 18s. In commercial vehicles, ACV put on 10½d. at 67s. 1½d. In aircraft shares Fairey gained 2s. 4½d. to 26s. 6d. on US buying. Stores were active with Harrods up 5s. 6d. at 93s. 9d. and House of Fraser 4s. better at 42s.

Leading oils were dull with Shell 1s. 1½d. lower at 135s. and Burmah 2s. down at 82s. 6d. Lobitos lost 1s. 1½d. on the passing of the dividend and, in sympathy, Anglo-Ecuador eased 3d. to 16s. 9d. Anglo-Egyptian dropped 3s. 9d. on reports of a setback in the desequestration of the company's properties. Kaffirs were well supported largely by buying from Johannesburg, West Wits gaining 7s. 3d. at 66s. and Offsits 2s. 3d. better at 102s. In the finance house group, Union Corporation gained 3s. to 62s. The *Financial Times* Gold Mines index touched a new peak on Monday at 94.2. In diamonds, De Beers reached a new peak at 150s. 7½d.—9s. 4½d. up on the week.

THE MONEY MARKET

DESPITE the low proportion of Treasury bills secured by the discount market at recent tenders, the syndicate reduced its concerted bid by 2d. to £99 3s. 3d. last week. But the tender was raised by £40 million to £230 million so that the market's allotment at this price jumped from 25 per cent to 45 per cent, the highest proportion for six weeks. The average rate of discount rose by 7d. to £3 6s. 9.73d. per cent, against the rate obtained by the market of about £3 7s. 2d. per cent, suggesting that outside tenderers had not anticipated the market's tactics. This week the tender has been raised to £260 million.

A large amount of help was given to the money market on Thursday of last week, but one or two houses were forced to borrow a small amount from the Bank of England. Light calling and the inflow of fresh funds have since made conditions comfortable. On Saturday some late balances offered to the market were unwanted. Due to uncertainty in the market, fresh overnight funds have commanded quite high rates at the start of each session, but rates have subsequently eased. After last week's Treasury bill tender, new bills have been sold at 3¼ per cent.

UK External Trade

Imports are valued cif: exports fob
Total trade unless otherwise stated.

The following list shows the most recent date on which each statistical page appeared.

BRITISH			
Prices and Wages	May 16th	External Trade	This week
Manpower and Output	May 23rd	Industrial Profits	April 18th
OVERSEAS			
Western Europe	Feb. 7th	United States	May 9th

From January, 1959, some small changes have been made in the coverage of the trade statistics (see *The Economist*, February 14, 1959, page 623). Back figures have been revised where possible: those still on the old basis are shown in italics.

Fixed Assets	3,437,208	3,878,064

Salient points from Joint Chairmen's Review
Annual General Meeting, May 26, 1959

An increase in Trading Profit of £104,107, has been achieved in a year when costs have become steadier, but competition much more fierce. The increased Dividend of 22½ per cent. is payable for the full year on the additional 1,045,730 "A" Ordinary Shares Issued against acquisitions in April, 1958, hence the increase of £71,398, in Dividends paid (less Tax).

The Palais de Danse, Dennistoun, was acquired as at March 1, 1958. In the City of London we opened in September, 1958, a new Licensed Restaurant, the Baron of Beef, and in February, 1959, the new Cotillion Restaurant, Cafes and Banqueting Suites at Bucklersbury House. Trading Results for the first quarter of 1959, compared with last year have been maintained.

It is hoped to complete this year and next, new Dance Halls and Party Suites in Birmingham, Blackburn, Bradford, Coventry, Derby, Newcastle-upon-Tyne and Stevenage. Negotiations are in hand for further new Branches. The recent Issue of an additional One Million Pounds Nominal, First Mortgage Debenture Stock, should be sufficient to cover present requirements.

Whilst it is prudent to respect your Competitors, we have no reason for fear, and know of no signs of any deterioration in our popularity with our Patrons regarding the things we sell and the prices at which we sell them: so we look forward to the future with confidence.

Prototype Reactor Development

The Advanced Gas Cooled Reactor now under construction at Windscale is an experimental prototype using uranium oxide fuel canned in beryllium, and operating at high temperatures and ratings, for developing and proving this system for use in the civil power programme. Engineers and Scientists are required to form a team to commission and operate the reactor and applications are invited for the following posts. Where necessary, a full course of training at Reactor Schools and in operating reactors will be given. A desire to work on the problems associated with a prototype reactor is an essential requirement.

(a) Reactor Manager (*Ref.* 3092/J20)

to plan the commissioning programme of the reactor and to be responsible for the safe and efficient operation of the plant and its experimental facilities.

A good honours degree in an appropriate scientific or engineering subject, or equivalent qualification is required, together with wide experience of plant operation or research and development work. Engineers should have corporate membership of a professional institution.

Salary within scale £1,855 to £2,155 according to qualifications and experience.

(b) Assistant Reactor Managers (*Ref.* 3094/J20)

to be responsible for either (a) the day to day operation of the reactor or (b) the experimental facilities, as well as for general assistance to the Reactor Manager.

A good honours degree in Science or Engineering, or equivalent qualification, is required, together with at least three years' experience of plant operation or research and development work. Engineers should have corporate membership of a professional institution.

Salary within scale £1,345 to £1,800 according to qualifications and experience.

(c) Power Plant Manager and Assistant Manager (*Ref.* 3093A/J20) (*Ref.* 3093B/J20)

to plan the commissioning programme of the steam raising equipment, turbo-alternators, and associated electrical circuits, and to be responsible for their safe and efficient operation.

A recognised engineering apprenticeship and corporate membership of a senior engineering institution, or equivalent, is required, together with power plant operating experience.

Salary Plant Manager within the scale £1,345 to £1,800. Assistant Plant Manager within scale £845 (at age 25) to £1,315 according to qualifications and experience.

(d) Shift Managers (*Ref.* 3095/J20)

to be responsible during shift hours to the Works Manager for the operation of the A.G.R. station including the reactor and its fuel charging and experimental facilities and the electrical generation equipment.

For engineers a recognised apprenticeship and corporate membership of an appropriate senior professional institution, or equivalent, is required. Scientists should have a good honours degree. At least three years' practical experience of plant operation is essential.

Salary within scale £1,345 to £1,800 according to qualifications and experience.

Contributory Superannuation. Staff Housing Scheme. Additional payments for regular shift work.

Send postcard for application form, quoting appropriate reference to :—

WORKS SECRETARY

U.K.A.E.A. (I.G.)

Windscale and Calder Works, Sellafield, Seascale, Cumberland. Closing Date: 22nd June, 1959.

APPOINTMENTS

A YOUNG STATISTICIAN or ECONOMIST is required by one of the largest furniture manufacturers. He will be responsible for organising the provision and interpretation of sales and production information to the Board. Some previous commercial or industrial experience is essential, and a recognised qualification in statistics or economics would be an advantage. Age about 23-30. Salary and conditions will be designed to attract a first-class man.—Applications with full details in writing to the Sales Director, GREAVES & THOMAS Ltd., Clapton, E.5.

UNIVERSITY OF SYDNEY

CHAIR OF ECONOMIC STATISTICS

Applications are invited for a newly established Chair of Economic Statistics.

Salary will be at the rate of £A3,750 per annum, plus cost of living adjustment. There is retirement provision under the Professorial Superannuation Scheme and in addition a pension of not less than £A400 per annum upon retirement after the age of 60 years.

Under the Staff Members' Housing Scheme, in cases approved by the University and its Bankers, married men may be assisted by loans to purchase a house.

The Senate reserves the right to fill the Chair by invitation.

A statement of conditions of appointment and information for candidates may be obtained on application to the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, WC1.

Applications close, in Australia and London, on August 3, 1959.

UNIVERSITY OF SYDNEY

CHAIR OF ACCOUNTING

Applications are invited for a newly established Chair of Accounting.

Salary will be at the rate of £A3,750 per annum plus cost of living adjustment. There is retirement provision under the Professorial Superannuation Scheme and in addition a pension of not less than £A400 per annum upon retirement after the age of 60 years.

Under the Staff Members' Housing Scheme, in cases approved by the University and its Bankers, married men may be assisted by loans to purchase a house.

The Senate reserves the right to fill the Chair by invitation.

A statement of conditions of appointment and information for candidates may be obtained on application to the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, WC1.

Applications close, in Australia and London, on August 3, 1959.

MARKET RESEARCH ASSISTANT

Applications are invited from qualified men and women (though women preferred) in age group 25 to 30, for the position of RESEARCH ASSISTANT in an expanding MARKET RESEARCH organisation in LONDON. The position is a supervisory one as Assistant to Executive. Essential qualifications are, a sound mathematical background, an understanding of statistical method, a vital interest in Market Research and some commercial or industrial experience preferably in Market Research or allied fields. Write, quoting reference 10/RA, giving details of age, qualifications, experience and salary required, to Box 1175.

JOHN SUMMERS AND SONS LTD.

require for their

MARKET RESEARCH AND DEVELOPMENT DEPARTMENT

a man interested in new technical developments and their commercial implications, in the field of sheet steel and its use in industry. The successful candidate will be attached to a small but enthusiastic department located in London. It will be advantageous if he has had similar experience and has spent some time with a Research Organisation. Sales experience would also be an advantage. Salary will depend upon qualifications and experience.—Please send brief details in confidence to: Market Research and Development Manager, Box E.8580, Basil Butler Co. Ltd., 78 Brook Street, London, W.1.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

Applications are invited for the post of temporary ASSISTANT LECTURER or LECTURER in ECONOMIC HISTORY from October 1, 1959, to September 30, 1960.

Salary scales: Assistant Lecturer, £700-£850; Lecturer £900-£1,350.

Applications (two copies), with the names of three referees, should be sent, not later than June 9, 1959, to the Registrar, The University, Birmingham, 15, from whom further particulars can be obtained.

MARKET RESEARCH. British Nylon Spinners Limited have a vacancy for a graduate economist for duties in the Company's Knightsbridge Offices. The successful candidate will join a team whose primary function is to forecast product demand, and which therefore undertakes detailed studies of the numerous constituent factors. Original thought is encouraged both as a matter of policy and by the nature of the work, which is varied and inherently interesting. The post carries an attractive starting salary and offers good prospects.

Candidates should be 35 or under, and must have a good honours degree in economics or commerce; relevant industrial experience would be an advantage. Applications should give concise but full personal history and should be addressed to the Personnel Manager at Pontypool, Mon.

FIBREGLASS LIMITED, MARKET RESEARCH DEPARTMENT, have the following vacancies, both of which are new appointments:

An assistant, male or female, to collate market information and prepare market reports and forecasts. Applicants should have a good degree with economics as a main subject and some industrial or commercial experience is preferable. Upper age limit—29.

An assistant, male or female, principally to help prepare budgets. Applicants should be graduates and should have an aptitude for figures. Upper age limit—25.

Apply in the first instance to the Secretary, Fibreglass Ltd., St. Helens, Lancs, for an application form.

UNIVERSITY OF BRISTOL

The University proposes as soon as possible to make an appointment in the Department of Economics to a Chair in Accounting or in a subject dealing with Accounting in a fundamental way. Candidates should have academic and professional qualifications. The occupant of the Chair will assume responsibility for research in his subject and for teaching in the present degree courses. He will also have the opportunity, in co-operation with his colleagues, of developing research and postgraduate study in fundamental subjects relevant to administration and management.

Suitably qualified candidates are invited to apply, submitting the names and addresses of referees, to the undersigned from whom further particulars of the appointment may be obtained.

H. C. BUTTERFIELD,
Registrar and Secretary.

UNIVERSITY OF LONDON

Readership in Economics at the London School of Economics and Political Science

The Senate invite applications for the Readership in Economics tenable at the London School of Economics and Political Science (salary £1,475-£1,775-£2,150 a year plus £80 London Allowance). Applications (10 copies) must be received not later than July 1, 1959, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars may be obtained.

THE ECONOMIST INTELLIGENCE UNIT LIMITED

wishes to make further appointments to its research staff. Applicants should have a good honours degree, preferably in economics and/or statistics, and should have had at least two years' experience in industry, commerce or finance; knowledge of foreign languages, especially German, an advantage.—Please write, giving particulars of education, experience, qualifications and present salary, to "Research," 22 Ryder Street, St. James's, London, S.W.1.

SPECIALIST OFFICER (STATISTICIAN)

FEDERATION OF NIGERIA

To build up and supervise a statistics branch in the Department of Agricultural Research. Candidates should possess a good Honours Degree in mathematics and have had two years' post graduate experience in statistics as applied to agricultural research.

Appointment on contract/pensionable terms, inclusive salary scale £966-£1,824. Gratuity of £25 to £37 10s. for each completed three months of satisfactory service. Furnished quarters when available, at a rent of 8½ per cent of basic salary subject to a maximum of £150 a year. Free passages for officer on first appointment, duty and leave, also for wife once each way in each tour of service. Assistance in respect of children's passages or allowance in lieu. Income tax at local rates. Generous home leave.

Apply, giving brief particulars to Director of Recruitment, Colonial Office, London, SW1, quoting BCD/63/14/048.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

Applications are invited for the post of Senior Research Officer in the Survey Research Unit within the Research Techniques Division. The Survey Research Unit is concerned with the examination and the development of research techniques used in social and market research. Projects include studies of: respondent memory in the interviewing situation; question design; the characteristics of members of the public volunteering to take part in research operations; interviewer performance; validity and reliability. The successful candidate will be required to conduct research within the Unit's programme, assuming responsibility for specific projects.

Applicants must have an honours degree in psychology, with some statistical training, and they must have had practical experience of a substantial kind in either social or market research.

Salary scale £950 x £50—£1,500 plus £60 London Allowance; with superannuation benefits and family allowances. The starting salary will depend upon qualifications and experience. The appointment is for three years.

Applications should be sent to Dr. W. A. Belson, The London School of Economics and Political Science, Houghton Street, Aldwych, London, W.C.2, not later than June 15, 1959.

BRITISH RAILWAYS

have a vacancy for a

CHIEF PROGRAMMER

for an Elliot 405 Computer Installation at Wolverton, Bucks.

Candidates, preferably under 35, must have had previous Elliot 405 Computer Programming experience; qualifications to degree standard are desirable.

Commencing salary, £1,000-£1,100, with prospects of advancement. Contributory pension fund, sick pay, and travelling facilities.

Applications to Regional Accountant, London Midland Region, British Railways, EUSTON STATION, LONDON, N.W.1.

CITY OF STOKE-ON-TRENT
EDUCATION COMMITTEE

COLLEGE OF COMMERCE

Principal: A. E. Hayes, M.A., B.Com., A.C.I.S.

Applications are invited from Graduates with teaching experience for the post of Assistant Grade B to teach General and Commercial Subjects.

Duties will commence on September 1, 1959, if possible, and will include teaching on two evenings per week if required.

Application forms are obtainable from the Chief Education Officer, P.O. Box No. 23, Town Hall, Hanley, Stoke-on-Trent, to whom they should be returned within 10 days of the appearance of this advertisement.

H. DIBDEN, Chief Education Officer

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the post of Junior Research Officer in the Social Science Department. The appointment will be for three years from a date to be arranged but not later than October 1, 1959. Subject to satisfactory qualifications and experience, the salary will be £700 x £50 to £800 per annum. The appointment is in connection with an enquiry into family life and kinship in the Swansea area and will have special reference to the position of old people.

Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, by whom applications (five copies) must be received by Monday, June 15, 1959.

UNIVERSITY OF EDINBURGH

HOUSING RESEARCH TEAM
SOCIOLOGIST

Applications are invited for the post of Sociologist in this team. The work involves a partly survey of existing housing conditions in typical urban and rural areas, and partly assistance with the design of new experimental housing projects. The post is for five years in the first instance. Salary £1,100 per annum. Superannuation can be arranged.

Applications should be lodged with the Secretary to the University, University of Edinburgh, Old College, South Bridge, Edinburgh, not later than June 13, 1959.

May, 1959.

UNIVERSITY OF BIRMINGHAM

CHAIR OF HIGHWAY & TRAFFIC ENGINEERING

Applications are invited for the newly established CHAIR OF HIGHWAY & TRAFFIC ENGINEERING within the Department of Civil Engineering.

Three copies of applications with the names of three referees must be sent not later than June 20, 1959, to the Registrar, The University, Birmingham, 15, from whom further particulars can be obtained.

CENTRAL ELECTRICITY GENERATING BOARD

Applications are invited for the appointment of ECONOMIST in the Commercial Department at Headquarters London, E.C.2.

The duties will include the provision of an economic intelligence service to all Departments; the formulation of long and short term estimates of the future maximum demand and the consumption of electrical energy; the assessment of production trends affecting the consumption of electricity; and appraisals of the probable effect of changes in policy of the Government and of other bodies.

Candidates for the post should have an Honours Degree in Economics, a sound knowledge of modern statistical techniques and practical experience in a large organisation.

Salary within the scale £2,160—£2,360 p.a.

Applications, stating age, qualifications, experience, present position and salary, to the Personnel Officer, 24-30 Holborn, London, E.C.1, by June 15. Please mark envelopes "Confidential Ref. E/193."

COST ACCOUNTANT

Well-known British Company in West Africa requires a Cost Accountant, not below Intermediate standard, aged under 40. A sound knowledge of Accounts, Costing, and Budgetary Control is required. The post offers good prospects.

Starting salary £120 per month plus marriage allowance. Non-contributory Pension Fund and passages paid. Tour of duty 15 months and 3 months paid leave. Free accommodation and medical attention provided.

Applications will be considered from ambitious men of high character who wish to work in harmony with Africans in a worthwhile enterprise. *Please reply in confidence to:—*

Robert Clive (Consultants) Limited
Appointments Consultants,
27 ALBEMARLE STREET, LONDON, W.1.

UNILEVER LIMITED

TRAINING ADVISER

Changes in factories, offices and distribution units; in the numbers and age range of those available for employment, and in educational and apprenticeship schemes, require accelerated development of the Unilever programme for training and re-training in the United Kingdom.

Applications are, therefore, invited for a new central position whose holder will be expected to advise in these developments. He will undertake liaison with schools and technical colleges, with employers' federations and trades unions, and with national training and examining bodies.

The position requires familiarity with the changing pattern of interests and skills of employees in both office and factory; also with current policies and plans in commercial and technical education. A degree in one of the social sciences and/or a scientific qualification may be an advantage.

Candidates are likely to be found in educational or training work, or in an industrial post not centred on training. They will require capacity to build up an acceptable advisory status and for this should have considerable experience in planning or operating training programmes.

The post will be based in London but will involve travelling to other industrial centres in this country. Age range 35-48. A commencing salary of £2,750 per annum is envisaged with room for substantial advancement. The post is pensionable.

Applications should be marked "Strictly Confidential" and addressed to the Head of Personnel Division, Unilever Limited, Unilever House, London, E.C.4.

NATIONAL COLLEGE OF FOOD TECHNOLOGY

CRANWOOD STREET, CITY ROAD, LONDON, E.C.1.

Principal: J. D. Mountfield, M.Sc.Tech., Ph.D., F.R.I.C.

The Governors invite applications for a post as LECTURER at the new College now being built at Weybridge, Surrey. The successful candidate will be expected to organise courses in LIBERAL STUDIES and to undertake some of the teaching. He will also be responsible for organising courses in management studies.

The College will have residential accommodation for 80 students and the lecturer selected may be offered the post of Hostel-Warden which would attract additional emoluments.

Salary scale: £1,312 10s. x £31 10s. to £1,470 p.a.

Application forms (obtainable from the College) should be sent to the Principal as soon as possible.

MIDDLESEX COUNTY COUNCIL

STATISTICAL CLERK (Clerical I) required initially for newly formed Social Research Unit at Brunel College of Technology, Woodlands Avenue, Acton, W.3. Should be either university graduates or have worked for at least one year as statistical assistants under professional direction. Appointment is for three years. Salary (male) £595—£670; (female) £561—£634, plus London Weighting according to age. Prescribed conditions.—Full particulars and two referees to Principal, above address. (Quote Z.622 E.)

GOVERNMENT OF WESTERN NIGERIA

VACANCY FOR CHIEF AGRICULTURAL RESEARCH OFFICER

Applications are invited from suitable candidates for the post of Chief Agricultural Research Officer.

Qualifications: Candidates must have a First or Second Class Honours degree in Natural Science or Agricultural Science, and should have considerable research experience in tropical agriculture. Essential that applicants should have shown aptitude for direction of research.

Duties: The successful candidate will be required to plan, organise and develop the work of the Research Division of the Ministry of Agriculture and Natural Resources, assist in the formulation of crop research policy and take up the Agricultural Extension Service of the Region on the application of research findings to crop production problems.

Terms of Appointments: On contract terms for a minimum of two tours of 12-18 months each. In the first instance on consolidated salary which is subject to negotiation but which in any case will not be less than £2,448 per annum. Gratuity at the rate of £37 10s. for each completed three months' service. Free First-class passages for officer and his family on first appointment and when proceeding on leave, free medical treatment for officer and his family; furnished quarters provided at a rent of 8½ per cent of basic salary subject to a maximum of £150 per annum.

Applications should be completed in duplicate on the prescribed form obtainable from the Official Secretary (Recruitment Branch), Office of the Commissioner for Western Nigeria, 178-202, Great Portland Street, London, W.1, from whom further particulars may also be obtained.

Closing date: 13th June, 1959.

THE QUEEN'S UNIVERSITY OF BELFAST

The Senate of The Queen's University of Belfast invites applications for a lectureship in political science from October 1, 1959. Salary £900 to £1,650 plus F.S.S.U. Initial placing on the scale will depend on experience and qualifications. A special interest in political institutions is desirable. Applications should be received by June 17, 1959.—Further particulars may be obtained from G. R. Conie, M.A., LL.B., J.P., Secretary.

UNIVERSITY OF AUCKLAND

NEW ZEALAND

SENIOR LECTURESHIP IN ECONOMICS

Applications are invited for the above-mentioned post. The salary scale is £1,315 per annum, rising by three annual increments to £1,615 per annum. An allowance is made towards travelling expenses.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close in New Zealand and London on June 20, 1959.

AUSTRALIAN NATIONAL UNIVERSITY

RESEARCH SCHOOL OF PACIFIC STUDIES

Applications are invited for a FELLOWSHIP and a RESEARCH FELLOWSHIP in the DEPARTMENT OF PACIFIC HISTORY (head of Department: Professor J. W. Davidson).

It is desired to appoint to the Fellowship a candidate with research experience in the field of South-East Asian, and preferably Indonesian or Malayan, history. Candidates with experience in either South-East Asian or Pacific Islands history would be considered for the Research Fellowship.

The salary and range of a Fellow are determined within the limits £A1,793-£A2,563, and appointment is made for an initial period of five years; thereafter it may be made permanent. A Fellow is entitled to one year's study leave on full pay, plus a contribution towards travel and other expenses, in every seven years.

The salary range for a Research Fellow is £A1,398-£A2,113, and appointment is made for three years, with possible extension to the maximum of five years.

Superannuation is on the F.S.S.U. pattern. Reasonable travel expenses are paid and assistance with housing is provided.

Further particulars are available from the Registrar, Australian National University, Box 4, G.P.O., Canberra, Australia, or from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on July 10, 1959.

THE ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION, PARIS

seeks Head of Productivity Measurement Advisory Service, Nationals of O.E.E.C. member countries only are eligible.

Total annual income-tax-free emoluments Fr. frs. 3,455,000 (head of household) and Fr. frs. 3,080,000 (bachelor).

Duties: to centralise and distribute technical information on the various aspects of productivity measurement, in particular, interfirm comparison, and to edit the quarterly Productivity Measurement Review.

Qualifications required; solid theoretical knowledge of Economics and Statistics; preferably some practical experience in the preparation and application of Statistics in the management of industry; very good knowledge of either English or French.

Applications in French or English to Personnel Division, O.E.E.C., 2 rue André Pascal, Paris XVI, before the 13th June, 1959.

CENTRAL OFFICE OF INFORMATION require ASSISTANT INFORMATION OFFICER (unestablished). Duties involve the study of United Kingdom social and political affairs, the selection of source material and the writing, under supervision, of factual articles and reference papers on these subjects. Desirable qualifications are a university degree, knowledge of relevant sources of information, and the ability to summarise and present basic material to serve information purposes (e.g. for use in articles, lectures or broadcasts). Salary according to experience and qualifications, rising to a maximum of £1,085 (men); £1,058 (women).—Write, giving age, full details of qualifications and experience, to Ministry of Labour and National Service, P.E.1250, Professional and Executive Register, Atlantic House, Farringdon Street, London, E.C.4. Only candidates selected for interview will be advised.

LABOUR RELATIONS. The Newspaper Society (employers' organisation for the Provincial daily and weekly newspapers) has vacancy for assistant in Labour Department. Commencing salary not less than £1,000 according to experience, etc. Age range 30-40. Excellent prospects.—Apply Box 1176.

BRITISH TRANSPORT COMMISSION requires to fill the following Operational Research posts in the Department of the Traffic Adviser at 20 Euston Square, N.W.1. Candidates should have a degree in science, economics or mathematics, with considerable mathematical background. Academic qualifications in operational research desirable, together with interest in and for research using O.R. methods. Transport experience an advantage:

Post 1 Senior Scientific Officer—
Salary range: £1,200 — £1,420

Post 2 Senior Scientific Officer—
Salary range: £1,200 — £1,315

Posts 3 and 4 Scientific Officers, Grade 2—
Salary range: £665 — £985

Superannuation scheme. Certain free travel facilities. Medical examination.—Write, quoting post number and stating age, qualifications and experience, to Director of Establishment, British Transport Commission, 222 Marylebone Road, London, N.W.1, within 14 days. S.A.E. for acknowledgment.

THE MULLARD RADIO VALVE COMPANY LIMITED

MITCHAM JUNCTION, SURREY

SENIOR PRIVATE SECRETARY

required for the Technical Director of the Mullard Group of Companies.

The work, which is of a confidential nature, is interesting and varied. The successful applicant must be capable of doing precis abstracts, deal with financial and planning information and be capable of working on her own initiative. This is a new appointment which is likely to be of interest to an Arts Graduate who has had several years' experience in industry or commerce. Some knowledge of technical terms would be an advantage and competent shorthand typing is essential. This is a senior appointment carrying superannuation rights. Annual holidays already booked will be honoured.

Applications are invited from young women over the age of 25 who are prepared to work from 9 a.m. to 5.30 p.m. Monday to Friday, but are willing to adjust their hours of work to meet the flexible needs of this new appointment.

Please apply in writing, giving fullest details, to

Miss M. B. Little,
Senior Women's Personnel Officer,
The Mullard Radio Valve Co. Ltd.,
New Road, Mitcham Junction, Surrey.

Mosquitoes Traced by Radioactive Nectar

RITCHIE CALDER, the science writer, explains how atomic power is helping to open up the frozen wastes of the Arctic . . .

PEOPLE do not usually associate mosquitoes with the Frozen North, but Arctic Old Hands will tell a tenderfoot: 'Mosquitoes! They are so big we skewer them on spigots and roast them!'

That is an exaggeration, but they are certainly 'man-eaters'. Fortunately they do not, like the anopheles of the tropics, transmit malaria; but when the icebound swamps unfreeze in the Arctic summer they swarm in such vast numbers, and bite with such blood-thirsty persistence, that the settlers' lives become unbearable. Indeed, it can be said that the mosquitoes are a bigger obstacle to settlement and development of Arctic regions than the cold or the six-month long night.

RADIOACTIVE ISOTOPES

Something will have to be done about these hostile and voracious insects. Already scientists are hard at work studying their habits. Ingenious methods are being devised to keep track of the swarms, not the least of which enlists the help of nuclear energy.

It is known that the mosquitoes drink the nectar of the Arctic poppies (again, people do not usually associate flowers with the Frozen North) and the experts are feeding the poppies with an artificial fertiliser containing radioactive isotopes, which are, of course, by-products of the release of atomic energy.

In the Arctic poppy then, this radioactive fertiliser finds its way into the nectar. The mosquitoes sipping the nectar, pick up the radioactive elements. And from there on, they are marked. They carry in their bodies a 'radio transmitter' and the scientists can follow them wherever they go and so find out vital information concerning their habits—information that will lead to their effective control.

The end result of using this by-product of nuclear energy to plot the mosquitoes' activities will help to make the Frozen North a more comfortable place in which to live and work. And this, in turn, is an important factor in preparing the way for the time when atomic power itself releases the immense industrial resources of the Far North.

***MITCHELL ENGINEERING** are designing and constructing Nuclear Power Plant to meet world needs in the New Atomic Age*

Do you run a home?

LOOK AROUND YOU . . .

LOOK AT ALL THE THINGS THAT

MAKE RUNNING A HOME A BIT

EASIER THAN IT USED TO BE

The tins of food in your cupboard, for instance; your modern cooker; your vacuum cleaner. Think of things like the refrigerator, the washing machine and the TV that are all part of the familiar pattern of modern living.

We at The Steel Company of Wales have a direct interest in you running your home. This is because all of these things are made from steel in one form or another. And we make steel, a very great deal of it.

CITY OF STEEL

Steel sheet and tinplate from this vast City of Steel go, of course, direct to the manufacturers; those companies which make the many kinds of everyday things you have in your home or see and use outside it. All the household appliances, the prams and bicycles, the motorcars and tractors—even the dustbins!

OUR LINK WITH YOU

But in the long run *you* buy or use, in some way, these finished products of our steel. So there is our link. That is why we see to it that our steel sheet and tinplate are of the right kind—and at a competitive price—to suit the manufacturer's needs and, ultimately, your needs. If you happen to run a home you will know what we mean.

MAGNETIC CHARACTERS ON CHECKS SIGNAL FORWARD STEP IN WORLD-WIDE BANKING AUTOMATION

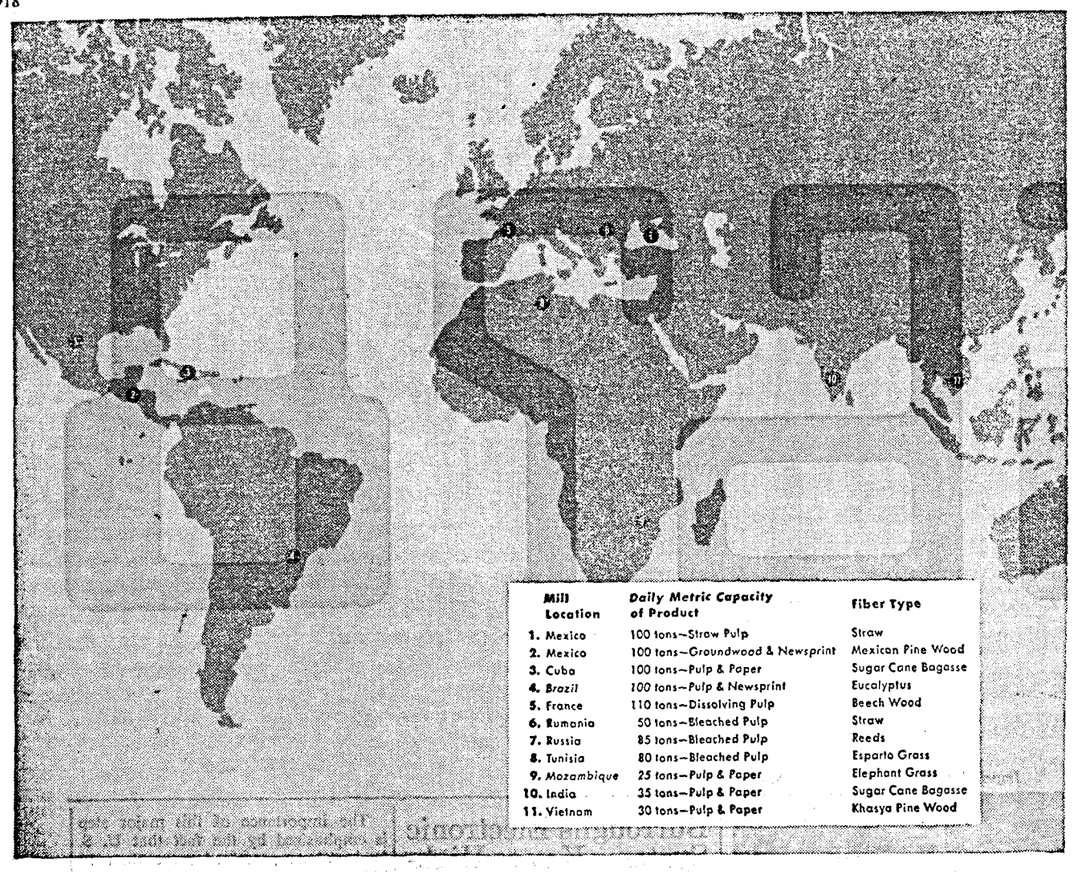
The black magnetic-ink characters imprinted on bottom of check identify bank number, depositor's account number and amount of the check. Burroughs Electronic Sorter reads and follows the coded instructions at the rate of 1,500 checks per minute.

Burroughs Electronic Systems Key to High-Speed Banking

DETROIT—Automation in world-wide banking recently moved a long step closer to realization when the American Bankers Association announced its unqualified approval of "common language characters." These characters will be printed in magnetic ink on checks and other bank documents to speed their flow through electronic data processing systems.

The design of the new magnetic characters was selected, after several years of study, because of its universal applicability to the check collecting systems of banks everywhere. They can be read by anyone—and particularly well by Burroughs electronic machines.

The importance of this major step is emphasized by the fact that U. S. banks alone processed more than 10 billion checks in 1958, and must prepare for handling an estimated 20 billion in 1970! Corresponding increases in check usage are expected in many other areas of the world.



To meet this developing situation, Burroughs has just announced its "MICR (Magnetic Ink Character Recognition) Program" which encompasses a complete range of integrated systems and a comprehensive line of automation equipment, so that various sized banks may automate immediately *or* progress one step at a time.

Burroughs research and manufacturing know-how have gone into similarly intensive development of automatic data processing equipment for hundreds of other businesses and industries, including the U. S. Government.

Building new pulp and paper mills on five continents

Right now, The Parsons & Whittemore/Lyddon Organization provides the equipment, installation services, technical advice and, in some cases, construction supervision for eleven mills—on five continents—using nine different locally-available fibrous materials. These eleven projects represent a capital investment exceeding $100 million. Contracts for projects not mentioned here are in preliminary stages.

In addition to its own staff of renowned pulp and paper making experts, Parsons & Whittemore/Lyddon has engineering and financial associates throughout the world.

The Organization is closely affiliated with *The Black-Clawson Company*, which has manufactured over 700 paper and board machines and more than 100 continuous pulping units. Over three-quarters of the paper stock produced in the world passes through some Black-Clawson stock preparation equipment.

Parsons & Whittemore/Lyddon is ready to advise and assist you on any phase of pulp and paper making—planning, building, financing, training of plant personnel and marketing of the mill's products. For full information on our services, write our nearest office.

The Press under Pressure

WE regret very much the present troubles in the printing trade. We apologise for the inconvenience to our readers. *The Economist* is not a party to the dispute that will slow down, slim, and may even stop, its publication this week or afterwards; this paper is simply one customer of a printing works caught up in the conflict. It is altogether right to say that any halt to the flow of printed news and views is in every way a sore misfortune. But *The Economist* can certainly not say of any industrial dispute, even in printing, that any settlement would be better, for the industry or for the national economy, than a stoppage. It will be more to the point, perhaps, to glance at some of the larger issues that lie behind the contemporary upheavals, financial and editorial as well as industrial, in the complex of printing and publication to which we in the trade of journalism belong.

Three sorts of changes are at work. All are interconnected. One is immediately economic; it is the high cost of printing and publishing, from paper and machines to labour itself. Another, and potentially the most important practically, is technological; the printing of newspapers and periodicals, though it is still basically in the same linotype stage of development that saw the birth of Northcliffe's *Daily Mail* two generations ago, is teetering on the brink of a tremendous transformation in the reproduction of words and pictures. The third, and at bottom the most important of all, is sociological. What Northcliffe and his successors set out to do was to cater, by flair and improvisation, for the first products of popular education; what editors and publishers of all sorts have to do now, half a century later, is find the wavelength of their literate (if not literary), affluent and socially shifting generation of readers, provided now in its popular culture and entertainment with all the apparatus (if not the proper understanding) of a scientific age.

Clearly the recent dramatic moves that have taken place in the financial ownership and control of British newspapers and, especially, magazines are the consequence of high-cost economics and of competition, with television as well, for sustaining revenue from advertisements. But they are also the consequence of technological, and still costly, changes in methods of production. Clearly, too, the labour difficulties in the printing industry, still organised as it is on both sides according to an older-fashioned pattern of firms, jobs and processes, are the product of the same economic and technological pressures. Indeed, it is only too easy for journalists to say, aloofly, that the trouble with the printing trade is that it is still trying to run an Elizabethan industry on a Victorian basis. But what all journalists have to recognise is that precisely the same indictment may apply to their own contribution to the common business of disseminating the printed word in the mid-twentieth century.

Editors are for the most part conservative folk—in Ryder Street no less than in other places. They have good reasons for being so. In journalism

as elsewhere the old Victorian virtues are better appreciated nowadays than they once were. Always within the limits set by the ever-present need to make ends meet, newspapers and magazines which have not become simply the vehicles of popular entertainment or merely the carriers of popular advertisements are rightly determined to preserve the sacredness of fair and full news and the freedom of comment. Here is the perpetual dilemma of the middle-sized "less popular popular" British newspapers : to be, at the same time, both good and prosperous. The trouble is that, as with all virtues, these tend to become negative. The question for all these editors to ask, if they wish to keep up their sights and their standards in the old tradition—and if they wish to keep alive—is whether the devil should be allowed a monopoly of the best new songs. The need now, in face of the technological and social revolutions, is to make good journalism as positive and effective, by every modern means, as Walter, Barnes and Delane did for *The Times* a century ago.

This can be, in fact, as large an age of opportunity for editors and for journalists, in the oldest and best sense, as it is for the entertainers, the tycoons and the advertisers (by whom all newspapers live) and the television men. The printed word, properly produced and displayed, still has its own unique place. This, at any rate, was the somewhat apprehensively qualified conclusion reached in the several discussions of some two hundred editors from some thirty countries meeting in Berlin last week for the eighth annual assembly of the International Press Institute. There, as at next week's annual conference of the Commonwealth Press Union in London, a central theme was the impact of television, not only directly on circulations and advertising revenues but also by implication, and more significantly, on journalistic technique. There, too, in Berlin as in London next week, the question was raised of the great part which a free and effective press, if it is allowed to function freely, could play in the newly emerging nations of the world. Certainly there will be no lack of readers anywhere in the world ; literacy grows almost as fast as populations. The task, and the challenge, is to catch and hold them.

There is nothing automatic about the survival of the press in the next half-century. It could be, as Mr Muggeridge cruelly said in Berlin last week, that, just as print has tended to drive out thought, so the screen could drive out print. Survival has to be earned. Publishing, both within itself and in rivalry with other means of communication (and of advertising), is bitterly competitive. But certainly it can be said that the press in all its variety will only survive, and flourish—as it can—if it will adapt itself to the technological changes in its means of production and to the sociological changes among its possible readers. This is true of all newspapers and magazines, from top to bottom. It is a relevant, and salutary, thought as we look on at an old-fashioned dispute in a still old-fashioned industry.

Thunderer over Geneva

"The Times," which has made many ministries, has this week made a bloomer about a minister

By reporting on Monday a prime ministerial conversation with Mr Selwyn Lloyd which evidently had not taken place, *The Times* has made it less likely that it will take place for a long time to come. It is easy to guess how Monday's surprising lead story in that newspaper—about Mr Selwyn Lloyd's "possible transfer [from the Foreign Office] several months ahead"—probably came about, even though to expatiate upon it is to risk the same criticism, that of making fascinating speculation look misleadingly like factual reporting, as is now raining down upon the Thunderer. To pick the government that Mr Macmillan will form after the next general election, if he should win it, is as favourite a pastime in Britain as to pick the next test match cricket team. Up to a short while ago, the majority opinion among armchair cabinet-makers was that there would probably be a change at the Foreign Office. Mr Lloyd's emergence as the most senior foreign minister at Geneva had caused the balance of opinion among armchair forecasters to alter. *The Times's* relatively new—and intendedly livelier—political correspondent accepted or chose the assignment of reporting whether he thought that a movement of Mr Lloyd was still likely.

Either through judgment or hope, he expressed the view that it was. He went further, and opined that "we may safely accept" that Mr Macmillan had already made some such intimation to Mr Lloyd. If the article in *The Times* had been put in the political correspondent's usual Monday morning place, on an inside page, it would have attracted less comment. But, in an edition obviously short of other interesting news, it was put as the main news story instead. Two unfortunate consequences have followed.

By far the most obviously and immediately unfortunate, as our special correspondent notes on a later page, has been its effect on the foreign ministers' conference at Geneva. *The Times* should have foreseen this. Where 1,200 journalists from every quarter of the globe are gathered together, thirsting in a dry land for their daily story, this kind of thing comes like a gift from heaven. The report in *The Times,* accompanied by

every conceivable kind of speculation, was well on its way to Tokyo and Tunisia, to Stockholm and Santiago, before Mr Macmillan's personal telegram of support for Mr Lloyd could overtake it. One must remember that outside this country *The Times* is generally regarded as the voice of the British gods. No amount of denial or derision or careful explanation is going to persuade the editors of the world's press that this kind of smoke can be generated without fire—or that the fire was started merely by a boy scout rubbing two sticks together.

Governments are more cautious entities than newspapers, and one need not assume that either in Moscow or in Washington, Paris or Bonn there will be any immediate jumping to conclusions about the Foreign Secretary's prospects. But there is bound to be a certain suspending of judgment. For perhaps a week or so, both the Soviet and the allied governments will be paying more attention to what is being said about Mr Lloyd than to what he is trying to say to them. That alone is likely to increase the existing discrepancy between the length of this conference of foreign ministers and the very modest scale of the possible results. It is even conceivable that this episode may be enough to tip the balance against any tangible results emerging from Geneva at all.

In case the original wood has by now been lost to sight behind the flowering trees of May, it is worth recalling that the British delegation is the only one that came to Geneva four weeks ago with a positive attitude towards the conference. The Russians had accepted the meeting of foreign ministers only with a sulky grace, as a tiresome formality to be got through before Mr Khrushchev could queen it from his "summit"; the Americans, the French and the Germans were scarcely enthusiastic about conferring at all. Mr Lloyd's position at Geneva has thus been a pivotal one, although the pains he has taken to keep in step with his western partners have been obvious enough to make nonsense of the jibes from various quarters about a "London-Moscow axis." Now, when his fellow ministers' gaze is fixed, momentarily at any rate, not on his mouth or on his gestures but on his future, his special task has been made much harder.

The second and perhaps less obvious misfortune is one that cannot be blamed on *The Times*. This fracas has revealed once again how widely and insidiously changes in ministerial office have come to be regarded as matters of face. This is a most undesirable trend. Other things being equal, one can say that individual ministers ought not usually to remain in charge of major departments of state for much more than three years at a time. Necessarily, this always shaky rule of thumb does not hold good when ministers are in the midst of trying to bring to fruition policies for which they have been largely responsible and in the details of which they are therefore temporarily the most instructed experts. Mr Selwyn Lloyd happens at the moment to be pre-eminently in this position. Possibly, he will still seem the best available Foreign Secretary next year, if a new Conservative government is formed then ; as seen from this distance, there might well be a much better case in early 1960 for saying that—to cite a sample list—the Colonial Secretary, the Minister of Defence, probably the Minister of Labour and possibly even the Chancellor should then be moving sideways to pastures new.

This is not because any of these gentlemen have been failures in their present office; indeed rather the reverse. Generally speaking, when an able minister takes over a department, he will need anything up to six months to get out of his administrative nappies. There follows a period of up to about three years (but not much longer) during which he is well placed to carry through his policies and personal ideas. Then, especially if his immediate policies have been achieved, it becomes very difficult for him to carry forward the momentum of yet further new ideas—not so much because he has been exhausted by what is usually called the gruelling burden of modern office, but because he is by then likely to be impeded in the enactment of those new ideas by the memories of the

The Economist

JUNE 4, 1859

LACK OF CONFIDENCE

This is not a time to change Administrations recklessly, but it assuredly is a time when every effort should be made to secure a Government for England which in the proper sense of the term really possesses our *confidence*,—or, in other words, which is in hearty sympathy with our predominant wishes, and commands as much moral capacity and intellectual strength as the state of parties admits. There never was a time when more important issues were really left to the Administration than at present. It is not only that the long vacation is near, when the Cabinet rules the country without a check ; for even while Parliament is sitting we know only too well that our Foreign Office is almost as independent in its immediate policy as it is during the long vacation. The question to be decided next week will, we venture to say, seem even more important to those members of the House of Commons who least wish to act in the spirit of mere partisanship, than to those who are only interested in the issues of a party-conflict. The administration of the Government during a great war, from taking any practical part in which all England desires to abstain, is a very responsible and delicate matter. It requires not only sober judgment, tried capacity in diplomatic affairs, and studiously cautious practical impartiality, but a complete sympathy with the nation as to the consummation to be desired and negotiated for, as the only conditions which England would recognise as likely to secure a durable peace. On the policy and energy of the English Cabinet very much will, undoubtedly, depend before the second year of the war begins ; on the tone impressed upon our diplomacy now, may very probably hang the kind of pacific solution which will eventually be arrived at. It is no party question ; it is the gravest national question which has been discussed for years, whether the Derby Administration are or are not worthy of the *confidence* of the House and the country. Confidence is clearly not that state of mind which is felt towards an agent who needs constant supervision and control ; on the contrary, it implies willingness to trust much to his principles, much to his abilities, much to his general good feeling and good sense.

fights (and of some of the things he has had to say) while enacting the old ones.

A great difficulty of our politics is that, when the time comes for really senior ministers to move on, there is now often nowhere for them to go except towards apparent demotion. This is one of the very few disadvantages of the British system of recruiting ministers from men who have made their way in (and who continue to maintain daily contact with) Parliament, as compared with the American system of recruiting cabinet ministers who can happily return to their real job of leading big business corporations. It is, incidentally, a difficulty that is much greater for Labour politicians (except lawyers) than it is for Tory ones, who usually can find business directorships if they depart for a while to lie fallow. It is a handicap that is being made much more grievous in modern times by the popular newspapers' habit of assuming that the reshuffle of any minister is a confession of his failure instead of sometimes a hallmark on his success.

The maladroit mistiming of these surmises about Mr Selwyn Lloyd, the slightly comic spectacle of who the commentators are who are now constrained to call that "Selwyn Lloyd must stay," the short-term misfortune of *The Times's* effect on the negotiations at Geneva, all these may be only a few weeks' wonder. But they will be a longer term misfortune if they make people forget that no minister "must stay" for more than a limited period of time. It would be too silly if this newspaper *gaffe* induced Mr Macmillan or any future prime minister to relapse yet further into the grave political vice of showing immutable loyalty to his friends, and to fall yet further from the essential prime ministerial virtue of being, at the right moment, a very good butcher.

Atlantic Isolation

The Atlantic Congress now meeting in London has to consider not only the cohesion of the western alliance but the danger of drawing apart from the rest of the world

REPRESENTATIVES from the fifteen countries now belonging to the North Atlantic Treaty Organisation have come to London to debate the state of their union. This Atlantic Congress, sponsored by the Nato Parliamentarians' conference and opened by the Queen on June 5th, is to look at the relations between the alliance and the rest of the world, and at the health of the ten-year-old alliance itself.

Ten years ago, twelve European and North American countries formed a grand alliance in order to call a halt to the growth of Russian political and military power in Europe—and perhaps one day to roll that power back. Today the map of Europe testifies to the success of the negative, but more important, part of their common purpose ; no new satellite has come into existence, and nobody now expects one to do so. But in 1949 the threat was urgent and the problem clear-cut ; now the apparent lessening of the urgency and the multiplication of problems have robbed the alliance of its early dynamism. In its prospect of the next ten years, the Atlantic Congress has to consider not only the balance of power in Europe but also the state of the cold war throughout the world. One major theme running through the discussions will be the best employment of complementary resources for constructive ends. But every drawing together risks a drawing away from others outside the circle ; the theme of cohesion needs to be balanced by an awareness of the attendant danger of isolation.

The alliance was brought together by outside pressures and it has developed no internal forces to keep it together, if and when the fear of the Soviet Union may relax. The one self-generated and working essay in cohesion within the western world is the common market of six European countries, but this takes in only six of the fifteen allies and indeed sets up fresh antagonisms—and anti-bodies—that create new divisions in Europe. In the political field, the wholly welcome Franco-German rapprochement has, in traditional European fashion, only been effected with some drain on the good will of both these countries with Britain ; there is suspicion and competition whenever any one government takes any initiative on its own in relations with Moscow.

Stresses and strains of this kind are evident enough to deserve attention, but not grave enough to imperil the basis of the alliance. The same generalisation holds for the state of feeling between the United States and Europe. On the European side there are lingering fears not now of American imperialism but of American isolationism, enhanced by the belief that the increase in the range of missiles is reducing America's need for overseas bases. Yet in the next ten years the danger of the United States coming tardily to the aid of Europe may become less real than a European inclination to contract out of what may seem to be America's war. This new form of European neutralism is the one thing that, if it were not checked, might cause the United States to lose faith in the alliance.

These are some of the disruptive factors within the alliance itself. But the Atlantic Congress is to examine not only Nato's own cohesion, and the state of play with the Soviet Union, but also its relations with the free and uncommitted world. In the last ten years, Nato's horizons have broadened. In Asia, the victory

of the Chinese communists has extended the scope of the cold war to an area where the West is distrusted because of its colonialist past. In Africa, four members of Nato have continuing colonial interests, distracting their energies and even diverting their troops—the Algerian war is one of the most serious drains on Nato's land forces. So far it has had to be accepted that, since there was no agreement on African policy as there was on European defence, these colonial preoccupations could be none of Nato's business. Although there is machinery within the alliance for meetings of the foreign, finance and defence ministers of the member countries, there is no forum for the discussion of colonial affairs.

YET the ill-will that attaches to a particular western ruler is easily extended to the West as a whole ; the distinction between one European and another is often no more apparent to an African today than it was to a Levantine a thousand years ago. The point is that, in face of the basic African determination to be rid of every foreigner, the West does not try to co-ordinate its tactics. The British, and perhaps now the Belgians, realise that sooner rather than later they will have to cease to rule ; the French appreciate very well the need for change in western and equatorial Africa, but their policies are obfuscated by their obsession over *Algérie française* ; whether the Portuguese think at all about their future in Africa is obscure. Because of their different attitudes and problems, all four colonial powers recognise the need neither to pool information nor to co-ordinate their next moves. And the United States keeps at arms length and with eyes shut.

Outside the colonial territories, the West has also to reckon with a pervasive anti-western feeling that is inclined to equate a white skin with an unfair share of the world's goods. The Russians are usually left out of this opprobrium ; since in the nineteenth century they failed to get their slice of Africa and were late to profit from the industrial revolution, they are not generally included in the regiment of overprivileged whites. This division between the well-to-do millions and the poor billions is becoming perhaps the most important factor in international politics. It not only embarrasses the conscientious ; it also begins to perturb the political realist. Ten years from now, a second decennial Atlantic Congress may be giving at least as much of its time to the isolation of the West from the rest of the world as to the techniques of cohesion within the alliance itself.

Living with Mr Lee

Britain has gambled on Singapore's statehood —and on Mr Lee. He has to be given a fair trial

THE emergence of the new State of Singapore is not unmixed with mercies. The People's Action Party, winning 43 of the 51 seats in the legislative assembly, has demonstrated that it is the one popular and coherent force at present in the island. Since the Colonial Office decided to accept political realities in Singapore, the eventual confrontation with Mr Lee Kuan Yew and his party has been inevitable. There is a benefit in not having it too long delayed. Mr Lee's decisive success, even although assisted, and electorally magnified, by the divisions among the other parties, now saddles him with responsibilities. He must be given the chance to live up to his own words: not the preposterous words about the "foreign-controlled press" and the bellicose anti-white declarations that are part and parcel of a PAP electoral campaign, but the more sensible appreciations of Singapore's place in the evolving world of South-East Asia that he has also made. Mr Lee is a clever man ; it remains to be seen if he is an able one.

His first duty, as he has described it, has been to secure the release of the pro-Communist PAP members, principally Mr Lim Chin Siong, who had been imprisoned since the 1956 riots. There are indications of a greater understanding on this issue between Mr Lee and the governor, Sir William Goode, than the party's electoral demands suggested. Mr Lee has had to make good his promise, but it is plainly not unhelpful to him to have it emphasised that he won a popular mandate for himself before achieving an accommodation with the governor over the release of his own extremists and potential rivals. This recognition of personal authority is of primary importance in the situation in which Mr Lee finds himself. The polite exchanges over the detainees earlier this week ended in exactly such a solution. Mr Lee can now stand forward as both victor and liberator. It may be his last easy success.

Two of Mr Lee's latest declarations on internal financial policy are mildly encouraging. He said on Monday that he intended to impose no restrictions on capital moving out of the island "in the immediate future." His handling of the business community is the first test of his realism. He is perfectly well aware that Singapore's present prosperity—the national income per head of population is several times greater than in most Asian countries—depends on the preservation of its existing trade. Even more, its soaring birth rate, which now brings 25,000 young workers on to the labour market each year, makes the attraction of fresh investment capital indispensable. During the election, the PAP vigorously denied its opponents' claims that 36

Singapore firms intended to move across the causeway to Malaya if the party formed the new government. But the mere possibility is serious enough. Mr Lee's own strictures against foreign capital in "the propaganda business"—meaning British-owned newspapers—have scarcely been reassuring.

Now Mr Lee has sensibly declared that he means to keep Singapore's fiscal policy generally in line with that of the sovereign Federation of Malaya. This follows his constant professions that he will do nothing that would further separate Singapore from Malaya. That union is his ultimate aim. He has even promised to stop the teaching of Chinese in the state schools, and to make Malay the overwhelmingly Chinese island's official language. These are necessary verbal overtures to the distrustful Federation; how far Mr Lee will be able to carry them into effective policy is highly doubtful. The claims of his extremists, and financial emergency, may eat away his words in a matter of months. For the moment, the Federation is keeping the wariest of eyes on Singapore. Yet ultimately the reconciliation must surely be attempted.

The big test for the Malays will be how Mr Lee deals with his communists. He has said that he is non-communist, not anti-communist; but he has also announced that his party means to take a democratic stand. For the moment the Singapore communists are unlikely to argue with him. The Malayan Communist Party has learned some hard lessons since it went in for armed uprising in 1948. It prefers now to infiltrate into legal political parties, trade unions and other organisations, particularly in Singapore where it has already made considerable progress within the PAP's left wing. This process will continue. Sooner or later, it must be expected, the internal security council—on which Britain and Singapore will each have three votes and Malaya one—will be seized with some case concerning communist subversion. The casting vote will then be with Malaya. This argues for the closest understanding in Singapore of the needs and susceptibilities felt by the Federation government; and in a wider sense it argues, even more strongly, for an understanding of South-East Asian affairs as they are seen in Delhi. Mr Lee's awareness of the world he lives in—which is nothing like as simple an affair as his post-election claim of a victory "of right over wrong, clean over dirty, and righteousness over evil" suggests he sees it—is on trial.

For Britain, Singapore's statehood is a gamble that had to be taken. Even if there are serious doubts of Mr Lee's ability to hold his extremists in check, these cannot affect the readiness of the Government to give him a fair trial. The more talk there is about another British Guiana within six months, the more likely such a breakdown becomes. The long-term future of the Singapore bases is anything but assured. Yet Mr Lee has said that under the present constitution the bases are in British hands and are bound to remain there at least until Singapore merges with Malaya. The fact that the bases give employment to 45,000 people is not unimportant. Mr Lee has thus been able to talk in terms of 10-20 years before the changeover he envisages is completed. Britain's gamble on statehood—and on Mr Lee—may not be justified by events, but the alternative would be even more disastrous. The Singapore bases would be untenable if Britain had to hold down an island population which is united in its will for self-government. Singapore and its communities now have the chance to work out their own salvation—or to fail conclusively.

NOTES OF THE WEEK

FRANCE

Almost a Crisis

It has almost been like old times. The Fourth Republican survivors in the French National Assembly reasserted themselves last week, demanding the right to vote on discussions arising from ministerial answers to questions. M. Debré's tart rejoinder relied on the terms of the new constitution. The massed Gaullist ranks agreed with him, although the search for a compromise continued this week. Then the Senate—where Fourth Republicans are better represented—tried its hand at a crisis, too. It also wants extended debating and voting rights, and the resignation of two of M. Debré's ministers, both of them senators, on May 27th suggested that some members of the government were thinking the same way. M. Berthoin's departure from the ministry of the interior aroused momentary fears that M. Soustelle might put in his old claim to the job, but M. Debré avoided all dispute by appointing yet another civil servant, M. Pierre Chatenet, to his cabinet.

On Tuesday, the Senate went still further, deciding to debate the question of ex-servicemen's pensions after M. Debré had sternly forbidden such a liberty. M. Debré claimed that the Senate's action was completely unconstitutional. The fact that the cut in these pensions has proved perhaps the most unpopular of the regime's financial measures of last December has played its part in the dispute. The affair looks like ending in the Constitutional Council, the special body set up to decide such matters. How many of these signs of a reviving parliamentary spirit have actually been observed by the public is a nice point.

M. Debré's Algerian policy is the next parliamentary preoccupation, with the Socialists now formally opposed to the government. The Algerian electoral college—in which Europeans and Moslems voted together for the first time last weekend—has returned a body of 32 senators distinguished, if anything for their economic rather than political

interests. Local extremists, like M. de Sérigny, and "outsiders," like M. André Morice and M. Jean Dides, both fared badly. The emergence of a minor difference of opinion between M. Soustelle and M. Chalandon on which candidates to support in Algiers itself does not seem to have disrupted the UNR party, as some reports had suggested. But if this week's mission by the Moroccan Crown Prince to arrange a meeting between General de Gaulle and Mohammed V at the end of July manages to upset right-wing susceptibilities, there could be trouble ahead.

A Murdered Lawyer

On Monday afternoon the Montparnasse cemetery in Paris was the setting for an unusual ceremony. For once Algerians and Frenchmen mingled freely in a crowd of some three thousand gathered to pay a last tribute to Maître Ould Aoudia, murdered two weeks ago, presumably by "counter-terrorists." M. Aoudia, a Kabyle and a Catholic, was a young lawyer who made no secret of his nationalist sympathies. He belonged to that small group of barristers who, despite repeated threats, go on defending Algerians, including FLN terrorists, before French courts. It now seems clear that the threats are not empty.

Demands that the killers should be promptly brought to justice were made this time even by papers whose views on Algeria are diametrically opposed to those of the murdered man, for the question at stake is not merely whether the French cause in this conflict is just or not. It will be impossible to claim that France gives a fair trial even to its foes if lawyers who venture to defend them are to fall victim to "avengers" who do not fear retribution. At protest meetings held in Paris this week it was openly suggested that these "avengers" have accomplices among the police and protectors in very high quarters. This theory is backed by precedents, of which the best known is the "bazooka affair." In 1957 an attempt was made on the life of General Salan (then commander in Algeria and considered "too soft" at the time by some of the "ultras") and an officer was killed in the process. Investigations dragged on for a curiously long time. When the trial was finally staged at the end of 1958, the principal accused had miraculously escaped from police supervision. He heard of his sentence from a safe hiding place abroad.

Only by doing all it can to bring the killers, whatever their connections, to a prompt trial will the government answer the suspicion that the really guilty hand is not simply the one whose finger was on the trigger. Otherwise, the tragic Aoudia story will join the list of cases which make some people think that the Algerian war has brought the law of the jungle not only to the battlefield but even to the country which was the birthplace of the Declaration of the Rights of Man.

NOTTING HILL

Other Areas' Fault?

Most conscientious MPs have come back from the Whitsun recess deeply worried by the renewal of evidence about racial antagonisms in Notting Hill and elsewhere, but not at all clear what they can do about it. This is a matter which requires careful thinking out. The root of London's trouble is that, outside a few limited areas which are becoming little Harlems, the immigrant West Indian finds it impossible to rent working-class accommodation.

Where other sorts of "embarrassing" tenants are concerned—people with lots of noisy children, for example—the prejudice against them is usually countered in a free market by their having to pay slightly more per room. Although West Indians are only too willing to afford more per room, by the process of doubling up, they have not been widely assimilated in most parts of London through an edging up of prices against them in this way; perhaps the continuance of rent restriction on unfurnished working class accommodation has had something to do with that. The only areas in which West Indians can rent rooms at all are those in which rent restriction has become a dead letter. In the Notting Hills, West Indians are being charged rent far above the level permitted by law for unfurnished accommodation or dictated by custom for furnished rooms. Originally this rack-renting in cheap property was done mainly by richer West Indians themselves, but now a new sort of white landlord has moved into this profitable business in Notting Hill and elsewhere; sometimes any tenant who intends to appeal to the rent tribunal has been deterred by threats of physical violence.

Obviously, all efforts at physical intimidation should be put down with the full force of the criminal law. Another suggestion is that Kensington borough council should itself bring all cases of excess rents before the tribunals; this is more doubtful. For concentration on the minor problem that in some areas coloured people are charged too high rents misses (as the rent laws themselves exacerbate) the major problem—which is that in most areas coloured people cannot find accommodation at all. There seem to be two ways of tackling this major problem; both of them are difficult, but neither is impossible. First, when a particular group of citizens finds it difficult to get private accommodation, a strong case arises for granting them special privileges in access to public housing; in other words, local councils in the London area could be asked to provide more places for coloured tenants on their council housing lists. Secondly, it could be made illegal for any private person who offers accommodation for letting to discriminate between applicants on grounds of colour alone. This law would not always be easily enforceable; but it would have some marginal effect in the right direction.

RACE RELATIONS

Shouting Across the Gap

What Hamlet would rightly have called a tragical-comical-historical scene was enacted this week on a train between Durban and Johannesburg. Chief Albert Luthuli, the Zulu president of the African National Congress, was on his way to make his last public appearance before withdrawing to his home in rural Natal, where he has just been sentenced to remain for five years. White newspapermen who tried to interview him on the train were forbidden by the police to enter his "non-European" coach; and he was likewise prevented from entering their "white" one. The interview, such as it was, took place with Chief Luthuli and the correspondents shouting across the gap between their coaches as the train rumbled across the Transvaal.

This episode neatly symbolised the whole disastrous effect

of segregation, in all its forms, on human beings' ability to communicate with one another. Idealism as well as interest may admittedly inspire some of those who, whether in the Union, elsewhere in Africa, or in the American South, support social or educational separation of the races—and even some of those who, in totalitarian states, erect curtains of silence to prevent impious thoughts from reaching their subjects' ears. But the net effect is always a state of affairs in which one human group has little idea what other groups are thinking. And, ironically, it is always the man who has thus insulated himself (be he a white boss or a red one) who is most ready to cry: "You don't understand these people—I do," even when visitors from outside have demonstrably made contact more successfully than him, the Man on the Spot. It is this kind of self-blinkering that fosters such delusions as the idea that, once the Luthulis and Bandas have been shut away, "moderate" leaders will replace them. When communication has been reduced to shouting across a wide gap, above an ominous rumble, it is only the strident voices of the extremists that will make themselves heard.

TRADE UNIONS

A Parliament for Industry?

THE one major union fortunate enough to be holding its annual conference by the sea this week is the giant National Union of General and Municipal Workers, 750,000 strong and one of the most responsible unions in the country. Its relative conservatism is ensured, on the one hand, by its widely scattered membership; unlike the other big general union—the TGWU with its dockers and busmen—it has no guards divisions which it could easily call out on strike. And it is buttressed, on the other, by its rigidly entrenched leadership; officials in the NUGMW, unlike those in most other unions, are appointed for life. This year's conference has been even more right wing than usual. First, it has been that remarkable rarity, a union conference which has not put forward a single wage claim; the leadership want to concentrate on the drive towards a 40 hour week instead. Secondly, all the talk about strikes at the conference has been of other people—such as the boilermakers—calling too many of them, and thus throwing NUGMW members out of work.

Thirdly, and most interestingly, Mr Jack Cooper devoted much of his presidential address to urging greater co-operation at the highest level between unions and employers to map out and implement a "policy of controlled expansion." These remarks followed hard on a recommendation put out by the TUC this week that co-operation through the Joint National Production Advisory Council on Industry should be much strengthened; under certain circumstances, they could be a significant straw in the wind. Ever since the war, the "standard" for wage rises in any one year has usually been set by some arbitrator or nationalised industry running away from some individual trade union's pressure at a moment of crisis. Mr Gaitskell, for one, has always had a yen that, under a Labour government, this "standard" could more logically be determined by some vague and amorphous grouping of big employers and unions, representing many different industries, sitting round a table and making recommendations, after listening to an address by a Labour Chancellor which would no doubt call for "reasonable restraint." One may doubt whether the recommendations of such a body would ever, in practice, be united and therefore significant. But significantly or not, wisely or unwisely, Mr Cooper's remarks about a "parliament for industry" and the TUC's call for a stronger NPAC can be read to mean that one section of trade union thought is at present inclined to view such an experiment with rather greater favour than heretofore.

Last Year's Strikes

WHILE this peaceable union conference has been in progress, the Ministry of Labour has published the final full official figures for last year's industrial disputes. The total number of days lost in 1958 was 3½ million, and it is no surprise to learn that they were thus well above the average of 2 million days per year lost between 1933 and 1956. What may surprise some people, however, is to learn that the 1958 figure was still well under half the 1957 total (which was swollen by that year's prolonged rolling strike in the engineering and shipbuilding industry). As is the usual pattern, over two-thirds of the time lost last year resulted from only six major strikes while, at the other end of the scale, 2,000 strikes accounted for 3.5 per cent of the losses; and slightly under half the strikes were over wages. Again as is usual, the most disturbed industries were mining (with 2,000 disputes, mainly unofficial), motor vehicles, shipbuilding and general transport. Last year, among the major groups, only white collar workers, printers, china and leatherworkers had a completely clean dispute sheet.

Nevertheless, the cost to the country of these 3½ million man days lost by strikes in 1958 can only have been a relatively few millions of pounds. It needs to be measured against the gain to the whole community from standing up to some of them. The cost of living in April was fractionally lower than in April a year before. The index of wage rates in April was some 3½ per cent higher than a year before, but was standing stable at the same level as in February and March of this year, a good augury for price stability to come.

COLONIAL DEVELOPMENT

CDC Fights Back

THE Colonial Development Corporation is often criticised for doing too much or too little. In his last report before he resigns from its chairmanship, Lord Reith hits out at his critics by exposing the frustrations of his job. The difficulty of obtaining an official seal to CDC projects has meant that though in 1958 more new schemes were considered than ever before, only five of them were finally approved. Applications for loans are held up for innumerable reasons; for instance that the project is outside the corporation's powers, or is not immediately justifiable by the financial return. As Lord Reith exclaims impatiently: "the emphasis often seems to be heavier on the negative of doing nothing than on the positive of encouraging development." He sums up an unhappy situation:

> Unfortunately 1958 was not a happy year. . . . as CDC came to real terms with itself in its task, relations with government departments became such that the corporation felt frustrated and discouraged.

There is still the wretched hiatus between colonial territories and independent, self-sufficient states. Despite the

ALL OVER THE WORLD B·O·A·C TAKES GOOD CARE OF YOU

BRITISH OVERSEAS AIRWAYS CORPORATION

THE LABOURS OF HERCULES

THE EIGHTH LABOUR

THE GIRDLE OF HIPPOLYTE

The old king of Argos knew what he wanted. You will recall that his fancy turned towards possession of Hippolyte's magnificent Girdle. Hippolyte, of course, was Queen of the Amazons, and quite a woman; but she herself gave Hercules little bother. It was only when the Goddess Juno stepped in disguised as another Amazon that the going became really rough. But that just made success the sweeter.

Do you know those problems which seem to be solved and then flare up again at the eleventh hour? They're common enough in a world of technology. And Hercules has learned the best way of dealing with them—solve them completely to start with. Pentalyn Resins, Cellulose Acetate, Hercolyn liquid Resin, are three of his many weapons. Respectively they can abate problems in printing inks, plastics and plasticising, usually very thoroughly indeed.

Might you be seeking a secondary plasticiser resistant to oxidation and yellowing whilst assisting pigment dispersion milling and gloss? That's probably Hercules' Hercolyn.

HERCULES POWDER COMPANY LIMITED

ONE GREAT CUMBERLAND PLACE · LONDON · W.1.

good intentions expressed at the Montreal conference last year, there is no government machinery for helping the emergent territories to develop their resources. The only West African scheme approved in 1958 was for a new hotel in Sierra Leone. The corporation is debarred from any new activity in Ghana now that it is independent, and with time running short in Nigeria no new project was set in motion. Perhaps more than any other colonial territory, Nigeria calls out for development; but, as Lord Reith predicts, many schemes there will probably still be in the air when the services of the corporation are shut out next year. The corporation's functions are strictly, and perhaps unnecessarily, limited but even within these limitations it is able to do pitiably little.

ALBANIA

Peninsula of Peace

MR KHRUSHCHEV has seen about as much of Albania as there is to see: after visiting Scutari in the north he travelled to Korcha, a town near the Greek frontier and the former seat of a French lycée where Enver Hoxha and other Albanian communist leaders had been introduced to Marxism, in days long gone by, by their teachers from Paris. On May 31st, most of the Russian visitors, apart from Mr Khrushchev and Marshal Malinovsky, left for Moscow; a day later, *Pravda* printed the text of a joint Soviet-Albanian communiqué. It proposed a Balkan zone free from atomic armaments; it also announced the readiness of both parties to "continue to develop their relations with Jugoslavia on the basis of mutual respect, equality and non-interference in domestic affairs." Apart from the Russian visitors, the Albanians entertained a Chinese military delegation led by Marshal Peng Teh-huai. General Balluku, the Minister of Defence, treated them to a speech punctuated by references to the "leading role" of the Soviet Union in the communist movement; replying, the marshal gave full support to Mr Khrushchev's proposal to transform the Balkans into a "peninsula of peace"; and he added that, in spite of geographical distances, "we are closely related by the struggle against revisionism."

The Jugoslavs have doubtless taken a keen interest in these pronouncements; they may, however, have difficulty in deciphering their message. Although Mr Khrushchev is likely to have advised his friends in Tirana to lay off, for the time being, making over-articulate references to the "filthy flag of revisionism" carried by their neighbours, he spoilt his record of moderation towards the Jugoslavs by dwelling too much on the help Russia could render the Albanians in case of an attack. As the Soviet premier sees it, Albania can be thus helped in spite of the fact that it has no common frontiers with the countries of his block: the Jugoslavs may choose to interpret this statement as a provocation, and protest. The Balkan peace zone proposal, however, presents a more important challenge to Belgrade. Temperamentally, Marshal Tito might be inclined to support it; but any such inclination would be tempered by other considerations, including those of Jugoslav relations with other communist countries. As far as Mr Khrushchev is concerned, this proposal and Belgrade's reactions to it will clearly serve as a test case of Marshal Tito's intentions about coming back or staying out of the fold; and future Albanian attacks on "revisionism" will certainly be regulated according to the Jugoslav reactions.

SUDAN

State of Confusion

THE Sudanese coup d'état last December was, by all accounts, a gentlemanly affair. There were no arrests and there have been no stage trials of the sort that has become fashionable after changes in other Middle Eastern governments. During the past few weeks, however, the game of politics in the Sudan has been getting rougher.

A fortnight ago, a report from Cairo described communist efforts to persuade other political groups in the Sudan to join them in forming a "popular front." The minister of local affairs, Brigadier Abd al-Rahman Shennan, was said to be regarded by the Sudanese communists as the most likely candidate for "strong man" if the popular front could form a government. He is not a communist, but he is anti-Egyptian. The Cairo report was officially denied in Khartoum, but apparently the government is taking no chances. Brigadier Shennan and several members of his family were put under house arrest on June 1st. The minister of communications, Brigadier Mohieddin Ahmad Abdullah, and about twenty other army officers have also been arrested.

It is still not clear whether the trouble in Khartoum arises mainly from local discontent with the way the present regime is running the country, or if there is really some sinister outside influence at large in Khartoum. The junior army officers, lieutenants and captains, may only be trying to find the quickest way to become captains and majors. The Egyptians may be trying to discredit their opponents in the Sudan government before they have to begin negotiations on the use of Nile waters. Perhaps these things are all happening at once, and the communists are hoping to move in while their enemies are in confusion. They may be disappointed. In another set of arrests, the government has gaoled 24 known communists and intends to keep them there. There is no indication that an early date will be fixed to try them for whatever crime they are accused of committing.

CRIMINAL LAW IN PRACTICE

The High Cost of Innocence

THE popular press has performed a real service by drawing somewhat lurid attention to a recent case in the courts. This was the so-called "kiss-in-the-car" case, where an engaged couple were accused of committing an "act of lewd, obscene and disgusting nature"; they elected to be tried by jury, were acquitted, but found themselves some £500 out of pocket—the costs of their defence. Had they been tried by a magistrate's court, their costs would have been much slighter; but so, it is said, would also have been their chances of acquittal, for the prevailing view is that, where it is your word against that of the police, a busy magistrate is more likely to believe the police.

This means that an innocent person may be badly out of pocket in establishing his innocence. Under the present law, an acquitted person may recover his costs if the judge, or chairman of sessions, so orders. But the courts rarely exercise their discretion in the accused's favour, and there are two arguments against their doing so as a matter of course. The first, which should carry very little weight,

is that a grant of costs is tantamount to saying that the police should not have brought the case. The second argument against a readier grant of costs is that the withholding of them might then be taken to mean that the judge believed that the accused was really guilty—whatever the jury said. This argument has more force. But it is not entirely convincing. At the very least one can ask for an official judicial view on the principles that should guide courts of assize and quarter sessions in granting costs. That should help to establish whether there is any uniformity in the exercise of the courts' discretion. Once it had been issued there might be room for searching political debate whether the principles should not be significantly extended.

The Varying Cost of Guilt

ANOTHER case that has been in the news has been that of the widowed mother, who was sentenced to two months' imprisonment for cheating the National Assistance Board. She is now out on bail, has been taken under the (presumably profitable) wing of a national newspaper, and has appealed; any discussion of the magistrate's action in this particular case is therefore ruled out for the time being. But there has been a great deal of general comment recently on the admitted lack of uniformity in sentencing between one court and another. Research is, in fact, being carried out into sentencing policy. The courts must have some discretion in imposing a sentence so that they can take account of mitigating or aggravating circumstances, and of the personality and previous history of the accused. There are, however, many cases, superficially the same, which one judge will punish by imprisonment and another by a probation order. Do these discrepancies depend on the judge's or magistrate's own personality—and perhaps on his liver?

In the meantime, while this research is being pursued and the widow's case goes to appeal, *Justice* (the British section of the International Commission of Jurists) has performed a useful service in pointing out* the extraordinary discrepancies in the maximum penalties laid down by the law. Many of these discrepancies still reflect the insecurity felt by the established order towards its institutions. Piracy can carry the death sentence; sacrilege can carry life imprisonment and so, under the common law, can bribery of public officials and cheating generally. Other anomalies reflect the greater respect shown by the criminal law towards property than towards the person; thus, many forms of larceny can carry sentences of seven years to life imprisonment, whereas many sexual offences have a maximum sentence of two years. *Justice* recommends the setting up of an official inquiry into the revaluation of the penalties imposed by the criminal law. Such an inquiry could, as *Justice* recognises, profitably extend from archaic penalties to archaisms—like Sunday observance—in the laws themselves.

YEMEN

New Deal

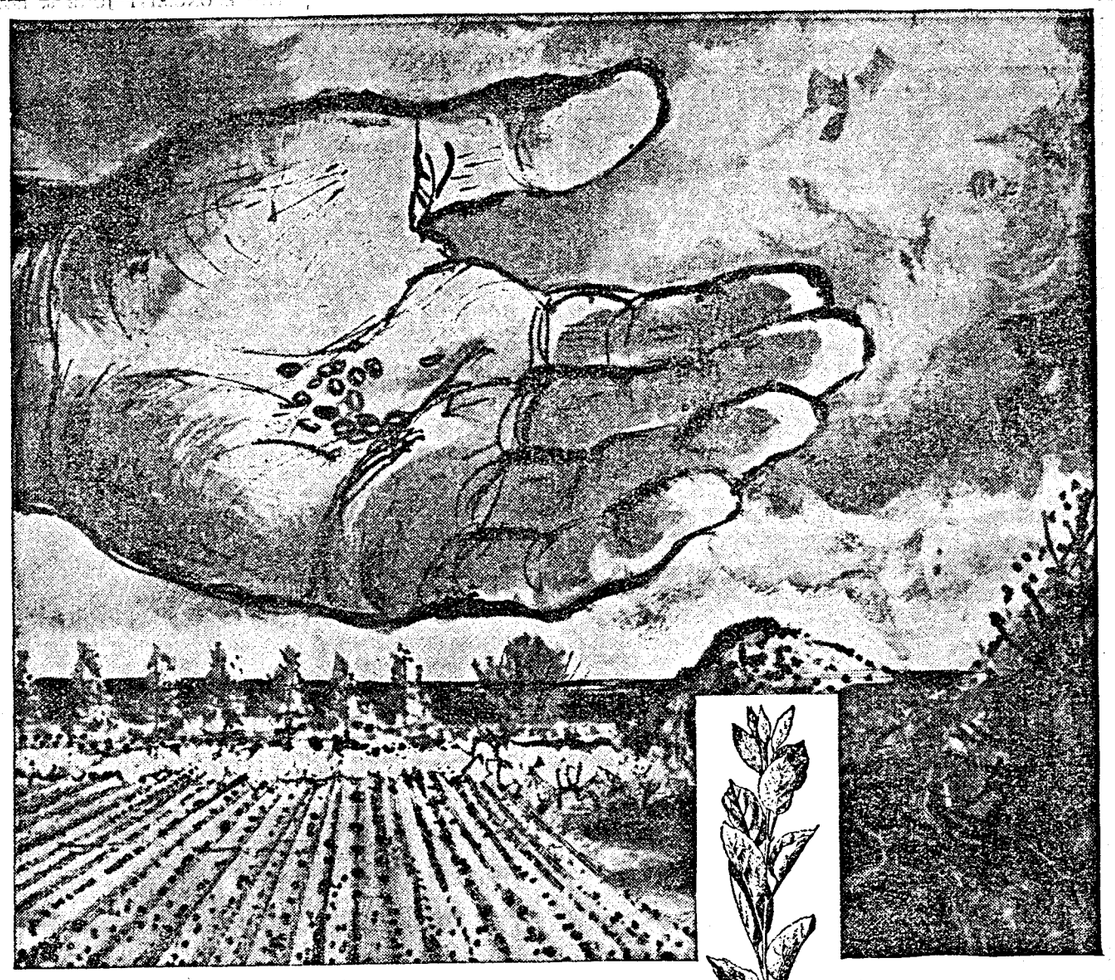
THE Arabic title of a Yemeni prince is *Sword of Islam*. There are not many left. Of perhaps a dozen brothers of the reigning Imam, only one or two remain. They have succumbed to disease, assassination and the headsman's axe. The family affairs of the Yemeni royal house have not run smoothly since old Imam Yahya was machine-gunned to death while on an afternoon outing near Sanaa in January 1948.

Yemen is far behind the rest of the world in every kind of development, but it is not lacking in natural resources. All over the country there are signs of a former agricultural prosperity. In the recent past, while dreaming of getting rich on oil that has yet to be found, the ruler neglected agriculture and taxed farmers so heavily that they preferred to chop down their trees rather than pay taxes on them in bad years. Thousands of Yemenis, unable to bear the burdens imposed on them by an oppressive government at home, have emigrated to neighbouring countries, where they have become useful citizens and industrious workers.

Among the few surviving Swords of Islam is Crown Prince Muhammad al-Badr, the only adult son of Imam Ahmad, who did not, as a young man, show promise of becoming a forceful leader. Now, however, that his father has been packed off to Rome for treatment of the half-dozen killing diseases that rack his tough old frame, the crown prince has given the government a good shaking up. He has made new appointments in all departments and promises a new deal for his people. He has urged the expatriates to come home and put their capital and their experience to work for the glory of Yemen.

Since the Imam left for Rome, and while the crown prince has been consolidating his position in the country, the border between the Aden Protectorate and Yemen has been quiet for the first time in many months. On May 18th, a Yemeni delegation arrived at Aden to discuss common problems with Aden officials. The talks never got started, because the Yemenis refused to negotiate with any of the Arab rulers of the newly formed Federation of Arab Amirates of the South. Now that the Yemenis have returned to Taiz, it remains to be seen whether the border remains quiet. If the crown prince is going to allow his people to catch up with the times, and if he wants to encourage the expatriate Yemenis to return, he will have no time for meddling in protectorate affairs.

SOVIET UNION



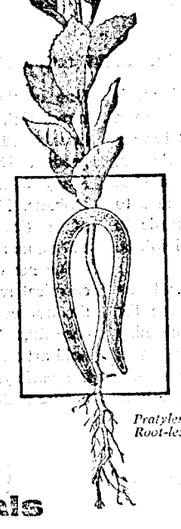
Wives at Work

WOMEN account for 43 per cent of Soviet non-agricultural employment, so that there must be about 25 million women working in towns alone. They actually outnumber men in teaching and the medical profession. But even in the Soviet system it is difficult to combine an outside job with looking after a family, and the government has now taken further steps to make this easier.

One is the amalgamation of nurseries—for infants up to three years—with kindergartens, which keep children up to the age of seven. Up to now, the two together have been attended by 3.4 million children, which is scarcely more than a third of urban children in that age group. It is hoped that the amalgamation and improved services will help to increase the proportion. The extension of boarding schools, foreshadowed last year by Mr Khrushchev, may also have been partly prompted by a desire to lighten family burdens. There are only 180,000 Soviet school boarders now; there should be 2.5 million by 1965.

Meals are another big problem for the working woman, and public catering facilities—and standards—are still

* Legal Penalties: The Need for Revaluation. *Stevens.* 3s. 6d.



So grows a tree

Seed and shoot, sharpness of bud, first paired leaf. So grows a tree: On which one day a child may swing or lovers carve their names, a tree which can outstature the man who sowed it, yet may be killed by something no greater than a speck of dust.

Individually, root-lesion nematodes (*Pratylenchus penetrans*), are almost invisible to the naked eye. But in their teeming swarms—many thousands may feed on the root system of a single seedling tree—they are capable of such destruction that an entire nursery may be made utterly useless, and the land have to be abandoned. Even crop rotation is of no avail, for the nematodes return to the attack the moment the original crop is replanted, even after an interval of several years. The only hope is complete fumigation of the soil, and in the Netherlands, where agricultural land is restricted and every acre must be used to advantage, it has been found that there is one outstanding method of such soil-cleaning: with D-D Soil Fumigant, developed by Shell.

Injected in the autumn, the dark brown D-D liquid rapidly vaporizes into a powerful penetrating gas. The following spring, the nursery can be re-sown, with the knowledge that the young trees will live and grow unmolested by nematodes, and that the soil will remain sweet and clean. In one nursery in Holland, for example, excellent crops were raised in D-D treated soil *three years after application.*

Pratylenchus spp.
Root-lesion nematode x 100

D-D

So grows a tree. And so also grows the ever-increasing list of important crops effectively and economically protected by one or more of the Shell pesticides for world-wide use. Between them, aldrin, dieldrin, endrin, Phosdrin, D-D and Nemagon control virtually every significant world pest, both below and above the soil. If you have a pest problem, consult your Shell Company. Whatever Shell does, Shell does well.

you can be sure of SHELL chemicals

The Philharmonia Orchestra of London

Sweet music for housewives

Yesterday's washboard is today's musical instrument. Cleaning goes with a swing. Soon perhaps we shall have a concerto for spin-dryer and orchestra, washing-machine and strings untied. For today the sound of these aids to easier housekeeping is sweet music to women in many countries—and will be in many more.

Engineer, designer, chemist... all play important roles in making home life easier. And where washing and cleaning is concerned, the work of chemists in developing synthetic detergents has brought about a domestic revolution. One of the world's leading manufacturers of the base materials for detergent liquids and powders is Shell: one of its products, Dobane P.T. (*dodecyl benzene*). Many a famous brand is based on Dobane. Many a wash is whiter because of it (including, maybe, musicians' shirts), many a day less tiring.

But not only in detergents does Shell chemical research and production help the housewife. Shell plastics bring her cheerful, colourful, easier-to-clean household articles in amazing and ever-growing variety. Shell resins and solvents inspire better and longer-lasting surface finishes and paints. The clothes she wears, the cosmetics she uses, the food she serves... all are better because of chemicals. If *you* have a process calling for industrial chemicals, call on Shell.

Dobane
detergent alkylate *Trade Mark*

Detergents, solvents, resins, plastics. Base chemicals and additives, aromatics, glycols, synthetic rubber... Shell chemical production serves every industry. Ask your Shell Company how Shell facilities, experience and world-wide service can serve you.

you can be sure of SHELL chemicals

Issued by the Shell International Chemical Company Limited and the Bataafse Internationale Chemie Mij. N.V. For further information consult your Shell Company (in the U.K., apply to Shell Chemical Company Limited).

inadequate, despite the campaign to improve them earlier this year. According to *Voprossy Ekonomiki,* there are 57,000 restaurants or tea-rooms and 72,000 snack-bars. Efforts are being made to provide half-prepared meals which can be taken home, while restaurants are advised to switch to self-service. Customers apparently complain not only about the quality but also about prices, which are too high for a working-class family budget. Much remains to be done to relieve the burdens of the housewife out at work. Now the Russians seem eager to learn from foreign experience, a Soviet delegation could profitably include, say, Lyons on its list of establishments worth visiting in England.

PRIVATE ENTERPRISE ABROAD

Training the Underdeveloped

Most discussion of "economic development" is apt to turn either on such aggregates as the investment ratio or on the balance of different new industries. Less has been written or said about the role, as "starters," examples, and training-grounds for development, of the foreign firms already operating in [illegible] countries. A recently published pamphlet by Political and Economic Planning* analyses the problems of what is rather horridly labelled "-isation"—Africanisation, Indianisation, etc.—of management in such firms, and relates it to the rise of nationalist feeling and to the development problem as a whole. It usefully pinpoints the classic difficulties—absence of an educated middle class on which to draw, or a tradition within that class of seeking careers only in the liberal professions and in government; differences of standards, or of an understanding of what standards are implied in efficient management; deeper cultural differences, especially "where effacement is more esteemed than 'push'—where loyalties are to individuals not institutions, and where integrity does not include business integrity." It describes the degree of success which some firms have achieved in overcoming these difficulties and the failures of others. Ownership and control of expatriate firms, it concludes, is quite likely to pass eventually, in any case, to the nationals of the country concerned; and this transfer, no disaster if gradually and smoothly accomplished, certainly cannot be fended off by jealously reserving managerial responsibilities for expatriates.

This, however, is only part of the wider question of the relation of expatriate firms to economic development. The pamphlet does touch, finally, on the more general problem of foreign aid—aid which it criticises as being too often applied to projects framed with western experience and conditions in mind, and unsuitable either to the needs or to the human resources of the recipient countries. But it does not tackle an intermediate problem to which both national governments and expatriate firms should be giving attention: how—otherwise than by fostering the growth of managerial skill—can these implants of high development best serve the purpose of economic growth? To shrug off the not uncommon accusation that they are bloodsuckers, pumping off their hosts' wealth in the form of profits, is easy, but not enough. To treat them, on the same principle, as sponges to be squeezed by ferociously differential taxation is, to say the least, short-sighted. To win, even to exact, their effective co-operation in development is an exercise calling for a lot more study—both in boardrooms and Cabinet rooms.

* "Management and Underdeveloped Territories." (Planning: Vol. XXV, No. 434.) PEP 15 pages, 2s. 6d

NORTHERN NIGERIA

Pagans in Politics

In the federal elections next autumn Northern Nigeria will have 174 seats out of 320 in the federal house of representatives. If the region voted solidly enough for the Northern Peoples party (NPC) it might even form the first federal government unaided; and the NPC would have to sustain a political disaster to fail to be the decisive element in the coalition which in fact is expected to be necessary after the elections. The NPC expects to win 150 to 160 seats. It concedes a few seats in the northern emirates to the Northern Elements Progressive party (NEPU), which is anti-emir, pro-Nkrumah, and allied to Dr Azikiwe's party, the National Council of Nigeria and the Cameroons; it concedes a dozen or less to the United Middle Belt Congress (UMBC), the party of the pagans (and Christians) of the non-Moslem "middle belt," which used to provide the Hausa and Fulani ruling families with their slaves. The UMBC is allied to Chief Awolowo's Action Group which has promised them a state carved out of the North.

The NPC will [illegible] unless and until the holy North seethes with revolution; but the middle belt is [illegible] ground for Chief Awolowo, and it is there that the parties (including NEPU) are at grips, since it will decide the NPC's bid for supreme power. The NPC believes that when it comes to the point, the pagans will follow their rulers on the NPC ticket; meanwhile it is telling them that though not Moslems, they are men and brothers. So is the NEPU. Chief Awolowo says he will free them from their fears of enslavement to Moslem rulers, laws and courts. Nobody knows whether the UMBC will win ten seats or 25 out of the 55 in the Middle Belt; Awolowo expects to get 45-50 there. Nobody really knows how the pagans think. Or whether they will vote (they have certainly registered heavily). But at any rate in one area they have tested the sincerity of the rival parties' assurances of brotherly love—by inviting the speakers to partake of that old pagan delicacy, roasted dog.

There has now been quite a boom in pagan election agents and party workers, not least under pressure of NPC demand. Party workers invariably demand bicycles; and with six months to go before polling-day, it begins to look as if the bicycle will become as common as in Holland on the roads from Ilorin in the west to Adamawa in the east of the region.

Rostow on Growth

The first part of Professor Rostow's "Non-Communist Manifesto" was to have appeared in this issue. Unfortunately, however, it has been necessary to postpone it because of difficulties in the printing industry which have imposed a sharp reduction in the number of pages in this issue. Professor Rostow's recent lectures, which offer a revealing and practical analysis of the sweep of modern history, will be published as soon as normal conditions return.

LETTERS

Replacing the Queens

SIR—Mr Dimsdale's arguments in *The Economist* of May 23rd concerning Cunard's desire to replace the *Queens* with subsidy-help, cannot be allowed to pass unopposed.

The primary point gathered from Mr Dimsdale's letter is that Atlantic liners are not worth their cost in prestige to the operating nation. By no means conceding that point, let us however merely assume it. Is there nothing else left? Shall we forsake also any prestige contributed by the shipbuilding industry—an industry in which Japan is now the world's leader? Apparently we should.

Either the United States, France, and Italy have more pride in their prestige than has Britain (if a subsidy is denied), or these countries see still a potential value for such vessels in case of national emergencies. Again assuming—but not conceding—that the vessels have no such latter value, then it is a sad day when the Old Lady who has been holding a trident for so long cannot muster up enough strength to answer challenges to her prestige.

A red-herring in the suggestion that a subsidy for ordinary hotels would be more profitable is introduced by Mr Dimsdale. (May I suggest he maintains this as a campaign—the hotel industry has been trying to get tax-reliefs commensurate with other industries for years. But they even have to pay purchase tax on tools of their trade.) The obvious answer to this is the very reason for Cunard wanting a subsidy. The comparison of the capital structure of a trans-Atlantic liner service to that of a hotel is ludicrous. Further, hotels compete on a national (internal) company basis; shipping competes internationally.

Would Cunard shareholders carry the risk of replacement unaided? I think they would. If Cunard were to make a new issue for capital, unrestricted by frontiers as at present, they would be over subscribed. Especially at this time, when enthusiasm for new issues and interest in European affairs emanates from the investor in Wall Street and other American exchanges. But then there'd be another "aluminium" outcry: "We can use your money, but we don't want any advice on operation from you."

Mr Dimsdale must know, surely, that many steamship lines operate cruises primarily for the pleasure of relaxation. Comfort and courtesy are the keynotes of these cruises. That they are financially beneficial to the companies is a corollary of their operating such cruises at all. Cunard (and obviously the French, Italian and US lines) consider thousands more would like to cruise. Life being too short, some of these combine a cruise with their necessity or desire to cross the Atlantic. Now, you cannot, with outdated equipment, give competitive comfort and courtesy that should attract people to make extended visits to England.

Fallacies pour from Mr Dimsdale's pen. I suggest to him that there is an analogy between Cunard's approach to HM Government, considering the ratio of the wealth involved, and Ilford's link with ICI, in which 32 per cent of Ilford Ltd. issued ordinary shares [illegible] taken up by ICI.—Yours faithfully,

PHILLIP J. OFFORD

Sherry Netherland Hotel
New York

SIR—Perhaps Mr Dimsdale would be interested in my MP's written reply to my protest regarding the proposed Government subsidisation of two new Cunard ships.

Mr Orr-Ewing's (Parliamentary Under Secretary to the Admiralty) letter to me, dated April 10, 1959, included the following comment:

"In view of the fact that all other shipping nations subsidise their big liners, I can see no alternative but for the Government to give some financial help. They did this for the *Queen Elizabeth* and the *Queen Mary* and incidentally were repaid the money they had loaned by 1946. The alternative would be to drop out of the race and this would not only have serious repercussions on our balance of payments, but on the employment position and the whole wealth of the shipbuilding industry."—Yours faithfully,

Edgware HERBERT GRIFFIN

Israel

SIR—Your article "Political Octopus" in the supplement on Israel is most unfair to Herut. You display inaccuracy and prejudice in your remark "and beyond its savage criticism of Mapai offers little for the future."

Herut considers itself to be Israel's liberal party; indeed one of its recent booklets was titled "Towards a Liberal Government." In every field Herut has put forward practical sensible policies. It has submitted a wide range of reforms to deal with the effects of Parkinson's Law gone mad. It forced through the Israel parliament such elementary reforms as the provision of national labour exchanges in place of those under the domination of the trade unions. One of its aims is the establishment of a national health service to take over the welter of overlapping and wasteful schemes which are largely affiliated to political groups. Most certainly your journal would applaud its opinions on monopolies of the right and left, equally certainly you would not quarrel with Herut's proposals for foreign investors and for ending the Israel pound's multiple exchange rates.—Yours faithfully,

Dublin M. HARRIS

Church Unity

SIR—I read with interest your article "No Bishops in the Kirk" in your issue of May 23rd. But surely it is an oversimplification to suggest that it is only a matter of terminology that is at stake. Even more, to suggest that some Presbyterian dignitaries should amicably agree to a ceremonial laying on of hands by Anglican bishops to facilitate fuller communion can hardly commend itself to either of the conferring Churches. For either this would be ceremonial and without meaning, implies that there is something defective in Presbyterian order that needs an "injection" of episcopacy to put right. Underlying this latter is the assumption that episcopacy is essential to the very being of the Church, a doctrine which the Church of Scotland does not accept because it can find no ground for it in the Bible.—Yours faithfully,

WILLIAM C. BIGWOOD

St. George's Parish Church,
Edinburgh

Finishing Schools

SIR—I appreciate the reference in the article "The Finished Product" in your issue of May 30th to "the efficient course at Hartwell House," but would point out that your readers may well have gained a mistaken impression from the bracketing of the course with those of non-vocational finishing schools. The House of Citizenship—and the name, though admittedly slightly pompous, expresses ideals—provides a secretarial training recognised by the Ministry of Education. Its graduates hold important posts all over the world because with technical skill they combine command of written and spoken English, some knowledge of the institutions and problems of their own and other countries, and the responsibility, confidence and good manners to deal with a variety of situations. The secretarial teachers are qualified experts and the tutors graduates of Oxford, Cambridge and London. The students, who enter from age of 18 upwards and occasionally include university graduates, remain at Hartwell from three to five terms, paying £120 a term inclusive.

You will agree that this picture is very different from "the cockshy for social critics" which emerges from your article and for which you find some extenuation. The House of Citizenship does not claim to produce a finished product: it does hope to turn out young women who are beginning to learn wisdom and who lose none of their feminine charm by being thoughtful, reliable and efficient.—Yours faithfully,

D. NEVILLE-ROLFE

The House of Citizenship,
Aylesbury

BOOKS

American Isolationism

The World War and American Isolation, 1914-1917

By Ernest R. May.

Harvard University Press. London: *Oxford University Press.* 482 pages. 60s.

The Isolationist Impulse

By Selig Adler.

Abelard-Schuman. 538 pages. 42s.

To subsequent observers, particularly on this side of the Atlantic, there has always been an element of the enigmatic about the United States's entry into the first world war. Continuing neutrality, early intervention—either of these courses would have been logical, and in retrospect, might have been made to seem inevitable. But the declaration of April 2, 1917 (less than six months, we now know, after Wilson had seriously considered the possibility of the United States being at war with the Allies) comes, in retrospect at least, with such an air of the fortuitous that it requires a peculiar effort of the historical imagination to understand what pressure produced it at that precise point in time and why to Wilson and the majority of Americans it seemed a natural, indeed, an inescapable, decision.

Mr May's book is directed at the elucidation of this problem, by a full use of all the sources, American and European, which bear upon the question of American involvement. Amid all the literature that has so far appeared on this theme it stands out as the most comprehensive and balanced study that has so far appeared. It is well written, fully documented and thoughtfully argued. Perhaps its most distinctive contribution consists of its careful analysis of German policy, particularly the internal struggle between Bethmann-Hollweg and the war lords over the U-boat weapon. For this it has drawn on the great wealth of German first war documents now available.

The main enigma, nevertheless, remains not in Potsdam but in Washington, and there are times when Mr May's interest in the German drama pulls his main American narrative out of shape. Particularly is this so after the *Sussex* episode. Up till then he gives the reader, to a degree which no other historian has so far done, the sense of sharing in the decisions made by Wilson and his cabinet and understanding completely the balance of national and personal factors that affected them. After this, for all the book's many merits, this intimacy, this sense of the story carrying conviction on its own face, begins to evaporate. And when we need illumination most, in the months of 1917 when the die was finally cast, we get it least. To say this may seem hard on Mr May, whose narrative and analysis are always on a high scholarly level; it is in fact to pay him the compliment of judging him by the very high expectations which the first third or so of his book arouses and which the magnitude of his theme invites.

Mr Adler in "The Isolationist Impulse" writes at a somewhat different level. His concern is with a wider span, beginning where Mr May leaves off and continuing down to the present day. He is also interested primarily, not in the diplomatic record, but in the public moods which lay behind the decisions of Presidents, State Departments and Congresses in these unhappy, frustrated and convulsive forty years of American foreign policy. His book is not particularly profound; it would hardly set claim to the illusory title of "definitive"; it is by no means always well written: Mr Adler likes his metaphors lush—heartbeats turn into warps and woofs, and hydra-heads spring from the ruins of monoliths. For all that it has an engaging quality. It is felt, as well as analysed. It draws on a few new and interesting sources, like the Beveridge and Borah papers. It has an attractive and, by way of corrective, wholesome provincialism; it is no bad thing to be shown, for once, the epic struggle of 1941 through the eyes of the Buffalo branch of the compactly named Niagara Frontier Committee to Defend America by Aiding the British Commonwealth and their Allies. Finally, it has the merit of erring, if at all, on the safe side, concluding on its last page that "present signs point to a decision rather than a knock-out victory for the internationalists."

Appeasement and War

Les Crises du XXe Siecle, II: *De 1929 à 1945*

By Pierre Renouvin.

Hachette. 426 pages. 28s.

With his new volume Professor Renouvin brings to an end a very useful undertaking. As in the case of those previous volumes in the series written by himself, he manages to provide both a narrative of the principal events in the field of international relations of the period, and an analysis of the problems of interpretation that are raised by them. In the present volume the task has been made more difficult by two facts: first, it includes the war years, when, as he rightly points out, the course of diplomacy can only be explained by constant reference back to the military situation, and, second, because we are dealing with a period when official documentation is both scanty and uneven.

Luckily Professor Renouvin is not ashamed to suspend judgment when the state of the material justifies it, and those who think that we already know all there is to be known about the "appeasement period" may be startled to find how often Professor Renouvin indicates genuine gaps in our knowledge. For instance, the evolution of Italian policy between the Dollfuss murder and the Anschluss is still not wholly explained; the same is true of the precise expectations and intentions of the Russians in the summer of 1939. We do not know whether the French decision to fight in September, 1939, was based on the possibility of discord among the German leaders, and so on. Occasionally Professor Renouvin tends to what might be called a "revisionist" position, for instance in casting doubt upon the firmness of the Czech will to resist at the time of Munich.

It is a pity that a book that is in so many respects a model should have any shortcomings, but there are some minor ones. The bibliographies are slightly uncritical and are marred by the usual French penchant for misprints. In the text there are a few errors. In 1933 Macdonald was not head of a Labour Government, nor was he any longer a member of the same party as Mr Attlee; "John Hopkins" for Harry Hopkins is a curious error. More important is the mistake made in putting the Hawley-Smoot tariff into the New Deal period. It is not clear what Professor Renouvin means by giving 1935 an important place in the development of delegated legislation in this country, and it would certainly have astonished, for instance, the late Mr Mackenzie King to know that the Dominions are described in the 1930s in relation to Britain as those countries "qui sont placés sous son obédiance politique." The present reviewer would rather doubt, also, the strength of President Roosevelt's international convictions during the first term of his presidency, but this, of course, is still a matter of opinion rather than of fact.

In the light of what has happened since 1945—and one wishes that Professor Renouvin would occupy his impartial pen on this period—one thing is striking, and that is the very minor role assigned to international institutions in the period. The final collapse of the League of Nations is not even considered worth a mention; nor does Professor Renouvin consider the moves towards finding a substitute that fall within his chronological framework. While this may be justifiable on the ground that the important thing was the activity of the great powers, this can hardly be said about the extent and nature of the German occupation in Europe at the height of the Nazi period; nor can subsequent events be properly understood if the full tale of massacre, deportation and exploitation is not allowed to appear.

Essence of Monetary Theory

Lectures on Economic Principles: *Volume III*

By Dennis Robertson.
Staples. 164 pages, 16s.

READERS of the first two volumes of Sir Dennis Robertson's "Lectures" must have been looking forward with especial interest to this third and final instalment: not merely because Volumes I and II were instructive and delightful and the prospect of more of the same is delightful too; but also because Volume III, specifically, is concerned with money and credit, and it is in the field of money and credit that Sir Dennis is at once most outstandingly eminent and most outstandingly controversial. Such readers will not be disappointed. Here, wonderfully compressed but wonderfully lucid and presented with the usual sparkle, is the definitive Robertson position.

It is, in a sense, a minority position; overrun and submerged by the Keynesian revolution on the one hand, uncongenially heretical to the hard-money arrière-garde on the other. Yet it constitutes, as Sir Dennis is often at pains to point out, a development in a straight line from the Cambridge tradition stemming back to Alfred Marshall; it links up harmoniously with the formidable contribution of the Swedish school; and it is firmly grounded in the common sense which Keynes's love of paradox has unfortunately made so uncongenial to some of his followers. Sir Dennis expounds and defends it with just a shade less impersonal detachment than he brought to his earlier lectures; one notes, and enjoys, the occasional, always urbane polemical thrust in both the theoretical and policy sections—the latter renewing a keen regret that he should have allowed himself to become discouraged with his role, on the Cohen Committee, as a Wise Man.

For that discouragement he had indeed excuse enough. But this exposition of his doctrine fortifies the belief that he could well take as his consoling motto that of the City of Paris, also a much-overrun position: *Fluctuat nec mergitur.*

Poetic Revolution

The Achievement of T. S. Eliot: *An Essay on the Nature of Poetry, Third Edition*

By F. O. Matthiessen.
Oxford University Press. 271 pages. 25s.

NOW that Mr Eliot's plays and poems appear on the examination syllabuses not only at the university but also in the school, it is perhaps cheering to reflect that teachers have plenty of critical material to help them in their task of interpretation and elucidation. On both sides of the Atlantic, for the past thirty-five years and more, Mr Eliot's work has been submitted to a vast amount of scrutiny.

One of the best established and most useful studies is this book of the late Professor Matthiessen's, which first appeared in 1935, at a time when the unfamiliarity of Eliot's poetic methods made much of his poetry obscure even to adult and reasonably educated readers. The first edition consisted of six closely inter-related chapters, which dealt in an extremely perceptive and illuminating way not only with the poetry of Eliot up to that date but also with the general topics of a poet's relation to his cultural environment and the means by which a poem's meaning is conveyed and apprehended. In 1947 Matthiessen made a few revisions to the original study and added two chapters, one on the plays written before the war and another on *Four Quartets.* In 1950 he took his own life, and America lost a very distinguished literary critic. This new edition has been brought up to date by Professor C. L. Barber, whose final chapter covers Eliot's work of recent years, and defends *The Cocktail Party* and *The Confidential Clerk* against those who regard them as the sorry fruits of a poet's concession to Shaftesbury Avenue conventions of theatrical entertainment.

The original six chapters are still the best. As an interpreter of *Four Quartets* Matthiessen is somewhat deficient; there are times when he either misses or mistakes quite obvious allusions, lacking the familiarity with the Christian liturgical and mystical tradition that enables Miss Helen Gardner to be so illuminating a guide. But she, in her book "The Art of T. S. Eliot," acknowledges her own debt to Matthiessen. And, indeed, a whole generation of readers is indebted to the searching intelligence of this critic, who cared so profoundly for the integrity of a work of art and so clearly understood the significance of the poetic revolution of which Eliot was one of the leaders. It is valuable to have this completed version of his book.

Personal Views

Hellenism: *The History of a Civilisation*

By Arnold J. Toynbee.
Oxford University Press. 262 pages. 7s. 6d.

Greek Civilisation: *From the Antigone to Socrates, Vol. II*

By André Bonnard.
Allen and Unwin. 248 pages. 30s.

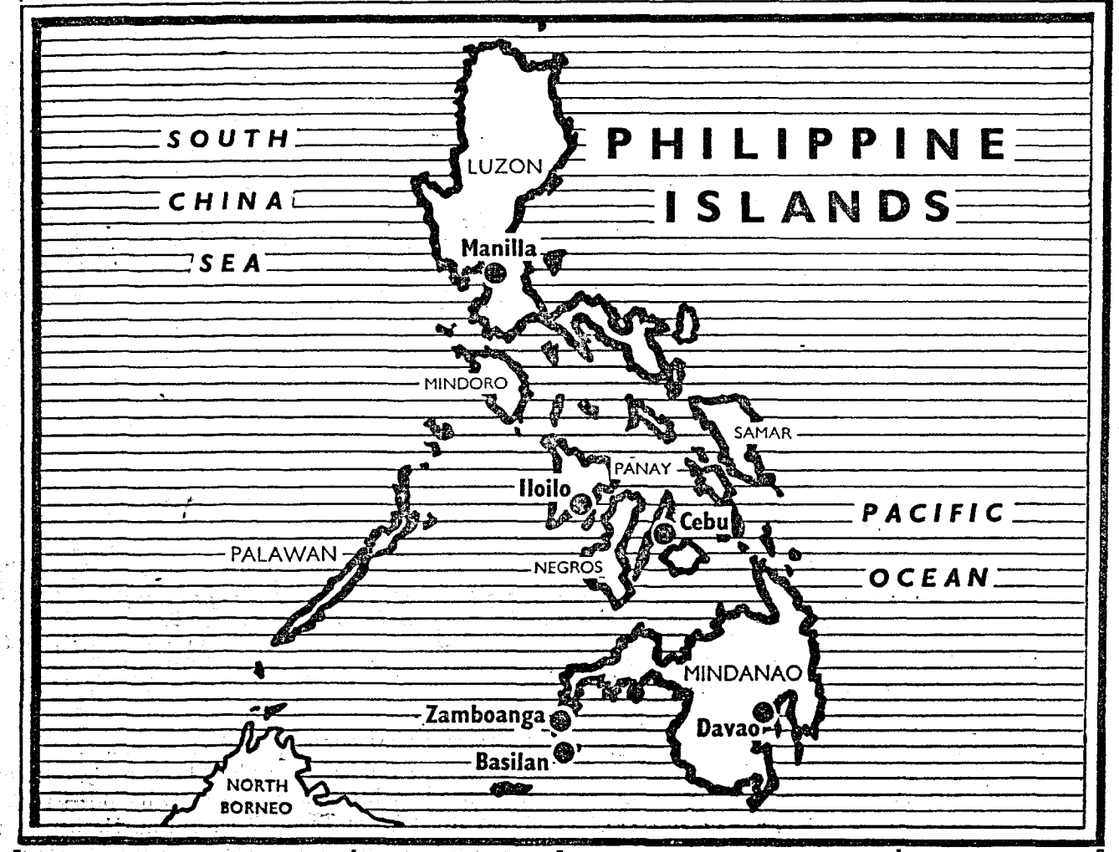
GREEK civilisation is so deeply rooted into the modern world that it is hard to write of it impersonally; nor do the authors of these two books try to do so. After reading them one feels that one knows both authors better, but that Greece is still something of a mystery; what is left out is, perhaps, a certain human simplicity.

For Dr Toynbee of course, Greek civilisation is a pattern of political organisation. Hellenism, as he defines it, covers a pretty wide field: Rome is included, as a Greek-style city-state; and the story lasts till the adoption of Christianity by the Empire. The theme is the failure of humanism: things went wrong, says Dr Toynbee, when the city-state ceased to be a convenience and became an object of worship. The Greeks are first blamed for failing to unite, and then for finding it dull when they were forcibly united by Rome. In the end the religion of the city-state falls before universal religion, and Hellenism collapses.

The book takes the form of a political and military history of the Greek world. It is brilliantly told and very readable. It is full of fascinating parallels, conjectures and might-have-beens. But it suffers from having too strong a moral and a pattern too forcibly imposed. The well-ordered surge of selected events crowds out the main issue: why were the Greeks, on balance, so successful, and why do they remain such a splendid inspiration? One is left with a suspicion that the chaos of their political history was caused more by muddle and plain human imperfection than by a false worship of the city-state. They are not the only people who have made a mess of their affairs; but that mess brought finer people down and was better recorded than others.

Professor Bonnard of Lausanne, essentially a writer in the French tradition, is a world away from Dr Toynbee. This is a second volume, and not so good as the first. The author writes ecstatically and sometimes controversially about a few of the great figures—mostly writers—of the great Greek epoch. He is best on prose-writers: there are good chapters, though not very deep ones, on Hippocrates and Socrates. On poets he writes in a high-flying style that grates on the English ear and adds little to one's understanding; and unfortunately he is served by some of the most prosaic translations in the English tongue (Aristophanes is an exception), which make nonsense of his comments if one cannot read the original. The book is well translated and produced, and is illustrated by charming photographs.

The Human Atom



Of Stars and Men

By Harlow Shapley.
Elek. 145 pages. 15s.

DR SHAPLEY, Director of the Harvard College observatory from 1921 to 1952, here provides us with an eccentric corrective to our traditional geocentricity. He describes the "expanding universe" in terms of the recently rapid and accelerating rate of penetration into its depths by man's instruments, including his logic and mathematics. He believes that in so vast—and vaster-becoming—a universe the mere mathematical chances of stars on which life of many kinds exists have multiplied to more than probabilities. A believer in the chemical origins of life, mainly by photo-synthesis, he counsels courageous optimism about further discoveries as an antidote to a humility ending in utter pessimism; and he gives reasons for believing in bigger and better human adaptations to all imaginable environments or events. The book is a useful introduction to current disputes between cosmographers, but it is slight, unindexed, unillustrated, and unduly dear.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

As Steel Goes

WASHINGTON, DC

IT is easy to make a case for the view that the present bargaining over wages in the steel industry is the most important labour negotiation in the United States since the war. This is true even more for psychological than for practical reasons. While steel has nothing like the "weight" in the economy—or in the cost-of-living index—that common opinion attributes to it, the opinion itself gives it much weight. Serious observers believe that such pressing—and seemingly unrelated—matters as the Treasury's inability to sell its bonds and the outflow of gold from the United States will be significantly influenced by the result of the steel discussions.

The reason is that the United States is at a sort of crossroads in the post-war inflationary process. Professor Slichter is winning more and more converts to his gloomy doctrine that further creeping inflation is inevitable, but there are surprisingly impressive arguments for believing that an extended period of price stability is now entirely possible. They range from the state of liquidity to that of the cattle supply, from recent increases in productivity to the existence of idle resources. But many objective Americans are convinced that the Utopia of prosperity without inflation can be realised only by defeating the cost-push coming from wage increases which exceed significantly the average gain in productivity for the economy as a whole. Indeed, Professor Slichter and his followers themselves rest most of their case on what is likely to happen to wages, and to trade union wages in particular.

Another liberal wage settlement in steel followed by yet another increase in steel prices would not in itself affect the price averages much, but it would affect people's expectations seriously. The pessimists' gloomy forecasts would be confirmed. By the same token a wage increase of 10 cents an hour or less, which the companies could absorb without a price increase, would raise at least the hope that the problem of keeping wages in step with productivity is not entirely insoluble. This would be true whether the union capitulated without a strike or after a long one. Such a settlement, following the modest gains won last autumn by Mr Reuther's automobile workers, would make investors and other people begin to wonder whether prices are in fact bound to go up indefinitely after all.

A great deal of thought is being given to the parallel between the steel situation and the London bus strike last summer. Some of the most powerful figures in the Administration are known to share the view that the British Government's resolution over that strike contributed more than any other single factor to the subsequent strength of sterling. Even the President, it is understood, has been impressed by this argument. But, assuming the argument is valid, there is no exactly comparable part for the government to play in the United States. The present conviction is that by far the most important contribution which the government can make toward achieving its objective—a settlement without a price increase—is to keep entirely clear of the bargaining, even if there should be a strike. The highly inflationary three-year contract negotiated after a five-week strike in 1956 came about largely because Mr Humphrey, the former president of a steel company who was Secretary of the Treasury at the time, intervened unofficially with the companies to get the strike settled (among the arguments which he presumably used was the presidential election coming later in that year). His successor, Mr Anderson, has no intention of following a similar course this year.

The real test of the government's determination not to intervene would come after about the sixth week of a strike, when the economy would begin to feel the pinch. Aside from the general interest in a settlement, the Administration cannot even be sure that each additional week of a strike would weaken the union more than the companies, though that is probable. The government has no desire for a long strike, on the London bus model, as a final trial of strength,

"Very Good, Sir—You Have Just Time To Change For The Wage Negotiating Conference"

though a few individuals may wish for this in their inner hearts. The union can still hope that, if the strike goes on long enough, the President will intervene. The whole history of major labour disputes since the war has demonstrated that when the government moves in the unions win.

What, then, is the prospect? The guesses among shrewd and informed men, inside and outside the government, cover an astonishingly broad range. There is, of course, widespread agreement that a strike is probable on June 30th, when the present contracts expire, but after that forecasts vary. Some observers scoff at the possibility of any settlement for less than 20 cents an hour, followed by another fairly large price increase. Some think that the companies may not have to concede much more than 10 cents, but there is disagreement on whether such a settlement would be followed by a price increase. Few doubt that a modest wage gain can be absorbed without seriously impairing profits, but the companies themselves have taken the line that any wage increase at all must be covered by higher prices.

Perhaps the key to the situation lies in the state of mind of Mr Blough, the head of the United States Steel Corporation, and the other captains of the industry. Do they really believe what they have been saying about the threat of competition from imports? (In the first quarter of this year steel imports exceeded exports for the first time in history.) Are they convinced that steel is at last reaching the point of pricing itself out of some domestic markets where substitutes for steel are available? Are they as worried as they profess to be about the threats in Congress of some sort of price control for "concentrated" industries? In short, have they a strong self-interest this time in avoiding another price increase? No one on the outside can be sure. But there is good reason to believe that they are serious in what they are saying. If they are, they will fight harder to avoid a large increase in wages than at any time since the war.

To bolster the managements, there is not only the present attitude of the government but also some fairly convincing evidence that members of the trade union have little stomach for a strike. Some of them were laid off for much of last year. Others, while still feeling that the companies' profits are "too high," are aware that a big wage increase will inevitably mean another increase in steel prices, and they share the belief of the general public that, as steel goes, so goes the cost of living. And of course there is the undisputed fact that the steel workers are princes among their fellows, with wages far above the average in manufacturing.

Thus, there is a genuine prospect that the cynics may be proved wrong and that steel prices may, for once, remain stable for more than a year at a time. It may take a long and, from the trade union's point of view, an unsuccessful strike to achieve such an outcome. But in at least some minds this would be a cheap price to pay for a change in the entire climate of thinking about the economic future.

Monkeys—by Jupiter!

OFFICIALLY the primary reason why a Jupiter intermediate range ballistic missile was fired last week from Cape Canaveral 300 miles up into space and 1,700 miles out into the South Atlantic was to test whether its nose cone was capable of protecting a nuclear warhead against destruction by heat friction when it re-entered the earth's atmosphere. But instead of a nuclear warhead the nose cone contained two monkeys and some biological specimens which were retrieved in good condition after a 15-minute flight, at a speed which reached 10,000 miles an hour, and about 90 minutes floating in the sea—the first time living creatures had survived such a journey. The monkey which has since died was the victim not of her trip into space but of what was done to her after she got back.

The National Aeronautics and Space Agency paid the Army $150,000 for carrying these passengers and thus providing evidence that man may be able to stand up to the strain of space travel. Tests on the biological material—yeast, mould and sperm from sea urchins, included in order to discover the results of radiation—are not yet complete. But the two monkeys were only slightly affected, as far as heart beats and respiration were concerned, during the flight and were able to demonstrate their energy and good spirits at a Washington press conference only two days later. The experiment has shown that mammals, a class which includes men, when protected by space suits and foam mattresses, can bear the shock of acceleration at launching and of deceleration when re-entering the atmosphere and the experience of weightlessness in between.

Of course it is not yet proved that human beings would come through as well as did the monkeys. But, apart from the fact that both monkeys were female, they resembled in many ways the seven Mercury Astronauts from among whom will be chosen the first American to make a space flight some time in the next couple of years. Able, the large rhesus monkey—American-born so as not to offend those Indians to whom these monkeys are sacred—was picked out from eight rivals because she responded best to training. This consisted of teaching her to press a telegraphic key to demonstrate her "behavioural response" to space travel; it was not her fault that it failed to work. Baker, the much smaller squirrel monkey, provided data on bodily functions during space travel. The monkeys did not need one facility which has already been provided for the astronauts—a lawyer to protect their legal interests and advise them on selling their stories to magazines and film companies. But the monkeys made it clear at their press conference that they had no aversion to publicity, even though television lights bring temperatures far higher than in their rocket and conditions far more cramped—where the reporters were concerned, at least.

Reshaping Foreign Aid

AT this time last year both the Senate and the House had passed Bills authorising another year of foreign aid and the appropriations committees, which determine what can actually be spent, were sharpening their objections. This year's delay has one virtue. With the return of good times, little is now heard of the angry threats of Democratic liberals to finance bigger domestic spending by slashing the President's foreign aid programme to ribbons. The House Foreign Affairs Committee last week voted to cut only $266 million from the President's request for $3.9 billion—rather less than it cut in 1958. But the committee ordered a slight but significant change in emphasis; it took $366 million away from military assistance and "defence support" and gave the President $800 million, instead of $700 million,

FRANC-LY SPEAKING

It's France this Year by Skyways

Now, with the new exchange rate, a holiday in France is a good proposition ... and going Skyways leaves more pounds to change into francs.

BOURBON

A GREAT AMERICAN HERITAGE

celebrates its 170th anniversary

THE GOVERNMENT of the United States of America came into being just 170 years ago this month.

In that same year, a gentleman by the name of the Reverend Elijah Craig distilled for the first time in Bourbon County, Kentucky, U.S.A., a delightful and delectable drink—Bourbon Whiskey.

This month Bourbon celebrates its 170th anniversary.

Thus . . . Bourbon is an American tradition that is as old as the country itself. Bourbon is the classic drink of the United States just as Scotch is the honoured heritage of Scotland. They are both fine whiskies. But Bourbon is completely different from Scotch.

Bourbon is distilled in the limestone regions of the United States from America's native grains. It is aged in specially prepared new charred white oak barrels under strict U.S. Government supervision. It gently rests in these barrels year after year until it has reached its rich amber glow of full maturity.

Most important—Bourbon is an individual whiskey whose unusual smoothness and special characteristics are best preserved when bottled straight.

Bourbon is mellow and distinctive in taste, and has a full body and unique flavour that has made it the preferred drink of generations of Americans. It has found acceptance elsewhere in the world . . . wherever fine liquors are served and appreciated.

Now Bourbon is available in Britain in limited quantities. It is an American tradition that we invite you to share—because we believe that discriminating Britons will appreciate Bourbon just as discriminating Americans appreciate Scotch.

We hope that in the very near future you will sip, savour and enjoy Bourbon Whiskey. Bourbon is bottled under many respected brand names.

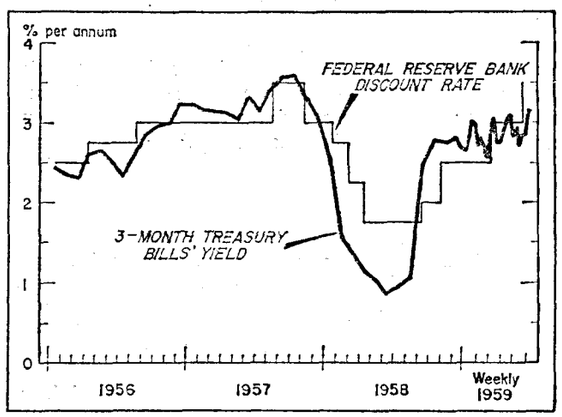
for the Development Loan Fund, which stimulates economic growth in under-developed countries by making loans on terms too lenient for other lending institutions. The Bill shows other signs of the presence on the committee of Mr Bowles, a former Ambassador to India, in stressing the humanitarian aspects of foreign aid and lessening the emphasis on fighting communism. The Bill would also limit military assistance to countries actually threatened by communist aggression or which need arms to fulfil their obligations under collective defence agreements.

Such a Bill reflects, though it falls short of, the demands for sweeping change advanced by Democrats on the Senate Foreign Relations Committee, probably not in the hope of obtaining them this year, but to prepare the public for big efforts when a new Administration takes charge. Senator Fulbright, the chairman of the committee, is sponsoring a Bill to give the DLF $1.5 billion a year for five years from the Treasury, without forcing it to run the gauntlet of the hostile appropriations committees, and has challenged the President to acknowledge and support a brain-child once his own. But Mr Eisenhower, his thoughts absorbed by the Budget, has refused to agree, although the eyes of the State Department plainly sparkled at the prospect of being able to plan ahead without the fear that Congress, at the last moment, will refuse the money.



Such loans are not the target of Senator Mansfield, the liberal if somewhat unpredictable Democratic whip, who believes that the public's uneasiness and boredom with foreign aid will bring all the programmes crashing down, good and bad alike, unless they are reformed. Neither does he want to end military assistance. His sights are trained on the $1.1 billion or so asked for grants, apparently without end, for countries such as Turkey, Vietnam, Formosa, Pakistan and Korea. Such aid, once christened "defence support" and "special assistance" to make congressional friends, and until recently justified because these five countries alone keep nearly two million men under arms, was defended by the Administration last month as basic to their economic survival and growth—a sign, perhaps, of accommodation to the changing temper of Congress.

Discount Rate Discounted

LAST week the rise in the discount rate, the interest charged by the Federal Reserve banks on loans to commercial banks, was for once no surprise. And for once it did not come after the yield on three-month Treasury bills, the government's means of short-term borrowing, had gone above the discount rate. This yield has been well below 3 per cent for some time and only went higher this week, after the discount rate had risen to 3½ per cent, back to the level of the last boom period in the summer of 1957 and as high as at any time for nearly thirty years. The comparatively low interest being paid on short-term loans reflects the desire of the business community to keep its money liquid and this in turn reflects its concern about where it is going to find funds to finance the coming boom. Already in the middle of last month the heavy demand for loans forced up to 4½ per cent the prime rate, the basis of all interest charges by banks to business borrowers.

Normally an increase in the discount rate precedes one in the prime rate. It is suggested that on this occasion the Federal Reserve authorities held back in order that their congressional critics should not be able to blame them for the higher interest charges which, according to these critics, are likely to nip the boom in the bud. While the central bankers are undoubtedly trying to discourage the boom from flowering too fast, such criticism carries much less weight than it did a few weeks ago. For now the recovery is so well established in all its branches that it would be almost impossible to kill it off.

However, the increase in interest rates may soon give the critics of the Administration's monetary policy an opportunity of making themselves heard more effectively. For under present conditions it is impossible for the Treasury to make any progress with its ambition of lengthening the maturity of the national debt unless it is allowed to offer more than the 4¼ per cent which is the present legal limit on any government issue running for more than five years.

To request such a change would mean a bitter struggle with Congress and the Treasury is now reported to be considering whether its chances of getting what it wants are good enough to make the battle worth while.

Another request which cannot be avoided but which is certain to be granted, although probably with some modification, is the perennial one for an increase in the limit on the national debt itself. To get through the inevitable period of deficit financing next autumn, when tax receipts run far behind government outlays, the Treasury would like the ceiling to be raised temporarily to $295 billion, $7 billion above the present temporary limit which reverts to the permanent one of $283 billion on June 30th. At that time the amount of debt outstanding will be at least $285 billion.

The Battle of Chavez Ravine

FROM A CORRESPONDENT IN LOS ANGELES

THE Battle of Chavez Ravine, which devastated the Los Angeles area for about ten days in the middle of May, began when a posse of sheriff's deputies forcibly removed members of the large family of Mr and Mrs Manuel Arechiga from their condemned property in the ravine and immediately demolished their two houses with bulldozers. The site, which had already been cleared of all its other residents, is to be made into a recreational area, to include a new stadium for the Dodgers' baseball team, which has recently moved west from Brooklyn. The law was undoubtedly with the Mayor and City Council, who were responsible for the eviction, but the way in which it was

done alienated many people and violent criticism came from all over the country.

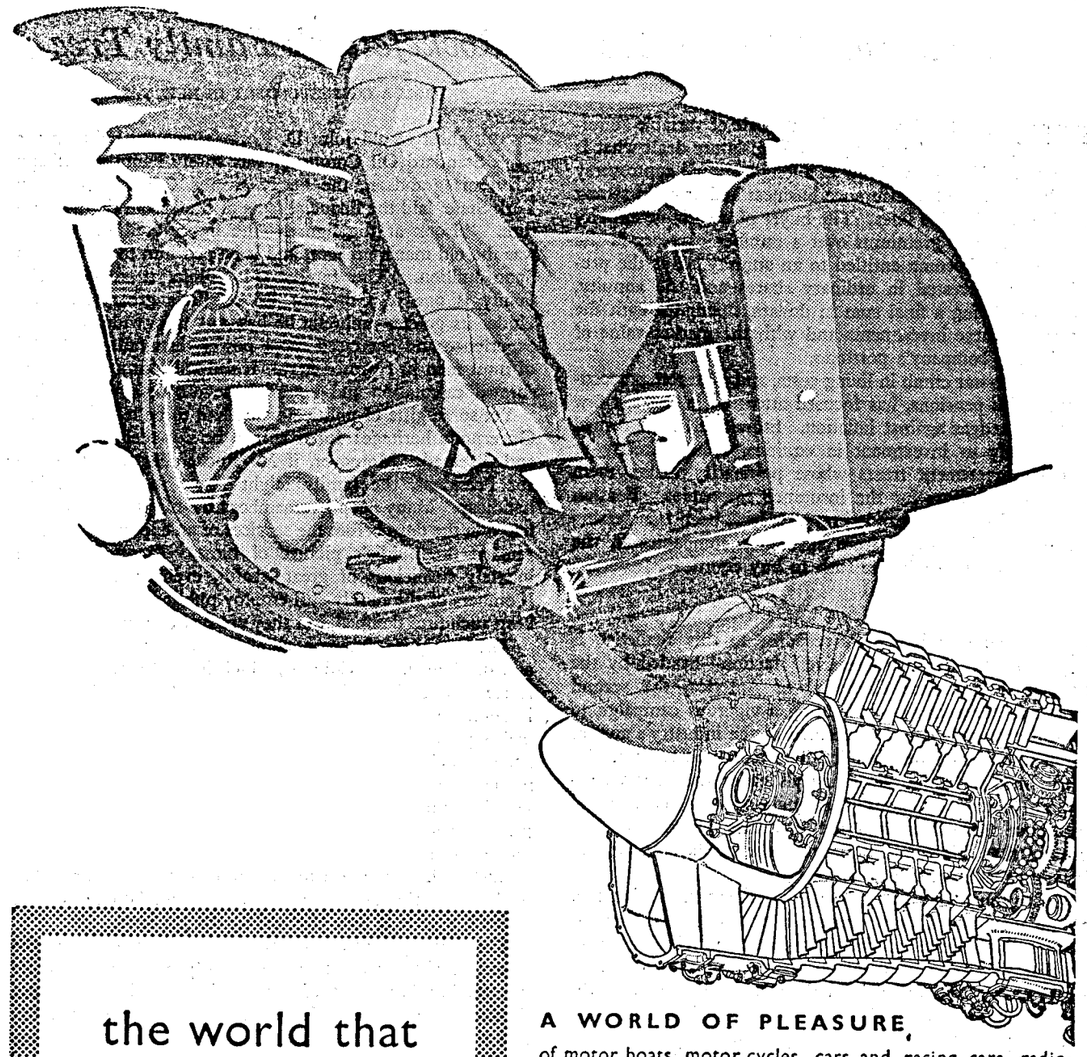
A few days later, however, the Mayor, Mr Norris Poulson, launched his own counter-attack, revealing that the Arechiga family had eleven other properties with an estimated value of about $75,000, in the Los Angeles area, and that they had been living in the houses in the ravine rent-free since 1953, because they had refused to accept the $10,050 in compensation which a court had approved.

Mr Poulson gave credit for this helpful piece of intelligence to the *Los Angeles Mirror-News*, an evening newspaper which he nominated for a Pulitzer prize. In the same breath, he scathingly denounced local television broadcasters, whom he blamed for the emotional atmosphere surrounding the Arechiga eviction. Thus encouraged, the local press immediately unleashed against television one of the most concentrated and violent assaults since the two have been in competition as media of news. The *Mirror-News* alleged that the Arechiga family's resistance to eviction had been "stage-managed" by opponents of the new ballpark for the Dodgers and that television "sensation-mongers" had hoodwinked the local public and "dragged the city's good name in the mud" across the country. The *Los Angeles Times*, the morning sister of the *Mirror-News*, blasted off the following fusillade:

> It is clear now that the dramatics of the eviction were precisely what that word means. . . . The television pictures—wonderful action pictures—were the answer to a demagogue's prayer. With such pictures, facts would only spoil the effect. . . . There may never have been a better example of the emptiness of on-the-spot television news coverage.

The Hearst-owned *Examiner*, though without any Pulitzer nomination, commended certain members of the City Council "who refused to permit the television 'cheerleaders' to provoke them into joining in this dismaying spectacle."

Under this attempt to label them as the yellow press of today most television newscasters dug in and employed purely defensive tactics. One who did not was Mr Clete Roberts of station KTLA, Los Angeles. This local station is owned by the Paramount Pictures Corporation and so is not hampered by the network affiliations which makes its rivals highly sensitive to both official and public reaction. Mr Roberts maintained a continuous counter-fire upon the critics of television. Backed by the station's director of news, who said that his policy was to go after circulation, like newspapers, and to do so by "getting a good story and putting the best headline on it," Mr Roberts used as his main weapon the action pictures taken on the spot in Chavez Ravine at the time of the eviction. For a few nights, his viewers did not get much other news as the films, or portions of them, were re-run. Mr Roberts even took them down to the Council Chamber and put them on show for the Mayor, who said he had not seen the original broadcast.



To one "war correspondent" who followed this battle as well as the bigger one, the pictures told the whole story. Stage-managed or not—the evidence of the turmoil-ridden episode seems against any but the most sketchy attempt at "direction"—they were graphic and moving: the sheriff's deputies breaking in the door of the Arechiga house; four of them carrying the struggling Mrs Aurora Vargas (a daughter) out bodily; the 66-year-old Mrs Avrana Arechiga hurling stones; sobbing grandchildren pushing ineffectually at strapping female deputies; dogs barking; bystanders barracking. Maybe some of the television reporting was slanted. Maybe there was some attempt at stage management. Maybe the newscasters should have commented on the underlying issue involved. But one thing is certain. Beside television's on-the-spot coverage of the eviction, the still pictures and the printed stories in the newspapers the same evening and the next morning were at an enormous disadvantage. In any case, the newspapers were scooped, so it is perhaps not surprising that they took it hard.

Anti-Trust's Skeletons

NEITHER political party has a monopoly of vigorous enforcement of the anti-trust laws and up to now the Eisenhower "businessman's government" has been remarkably successful in escaping criticism on this score. It has won some notable victories in the courts. Last week, however, the anti-trust subcommittee of the House dug up two skeletons which the Department of Justice would like to forget. Both involved consent decrees, which are settlements negotiated between the government and the defendants in a case; when they are registered with a court, they have the same standing as a verdict after a trial. Such settlements have been widely used in recent years because they relieve the strain on the department's limited legal manpower and can be the means of bringing about desired changes in business practices without holding long, expensive and acrimonious court trials.

The four Democrats on the subcommittee who produced the long and scathing report (with two Democrats not voting and the three Republicans dissenting angrily) hold, however, that in at least two cases the consent decree achieved little, was ill-enforced, and simply offered an easy way for the companies to escape prosecution. One, involving the American Telephone and Telegraph Company, was brought originally in 1949, when the Democrats occupied the White House; it sought to divorce the giant telephone company from its captive supplier, the Western Electric Company, on the ground that they were maintaining a monopoly in the manufacture and sale of telephone equipment. The case languished until 1956 when, according to a vice-president of the company, the then Republican Attorney General, Mr Brownell, passed the hint that, if Western Electric would promise to make its past and present patents freely available, the case could be amicably settled without breaking up AT & T's empire. In the other case, a consent decree in 1941 tried unsuccessfully to limit the dividends to be paid by pipeline companies to their parent oil companies on the ground that these were concealed rebates which put other users at a disadvantage. The subcommittee wants Congress to forbid such dividends and asks the Department of Justice to reopen the telephone case.

One of the general disadvantages of a consent decree, however, is that it closes a case for good, except in very unusual circumstances, thus tying the hands of succeeding Attorneys General. Another is that the terms of the settlement are usually kept secret until it is too late for outsiders to demand changes in them. Finally, a consent decree cannot be used as evidence in a private suit for damages; this weakens a sanction which may be more effective than government prosecution. For these reasons the subcommittee thinks that less use should be made of consent decrees and even its Republican members agree that the terms of such settlements should be made public and time allowed for other interested parties to file their objections.

Variable Annuities Arrive

NEW YORK

In passing three Bills to legalise the sale of variable annuities last week, the New Jersey Legislature dealt what is likely to be the decisive blow in a long-standing controversy that has split the life insurance business and aroused strong passions on the side lines. The buyer of a variable annuity has to pay fixed premiums over a number of years in the usual way to become entitled to an annuity. But the premiums are invested in ordinary shares and the annuity, instead of being a final sum in dollars, fluctuates with the return on these investments and with the market value of the issuing company's portfolio.

The post-war climb in living costs, and a greater preoccupation with pensions, has focused attention in the last few years on hedges against inflation. Individuals have turned increasingly to investment in equities, either directly or through investment trusts whose popularity makes them strong competitors for the insurance companies. Pension funds, which have expanded rapidly, have been transferring much of their custom from insurance companies to the banks in order to join the rush to buy equities.

The insurance industry's response to this challenge is divided. The "progressive" faction—headed by the Prudential Insurance Company of America, the second largest in the country—is fighting a vigorous campaign to have the variable annuity accepted as the industry's answer to an inflation-minded public. The more conservative element, lined up behind the industry's leader, the giant Metropolitan Insurance Company, strongly opposes the entry of insurance companies into the securities business on the ground that this would undermine the public's concept of insurance as involving no risks.

This group fears the tighter government regulation that would inevitably follow. And it is not convinced that the dollar will continue indefinitely to lose its purchasing power or that the value of common shares will always rise to offset such a loss; this is the basic assumption on which the variable annuity it based. Such opposition is warmly supported by the financial community, which dislikes the idea of insurance companies owning a large stake in the common shares of individual enterprises, and by the investment trusts which regard the variable annuity as an unwarranted invasion of their preserves.

A recent Supreme Court decision defined variable annuities as securities and not insurance contracts and subjected their sale to the regulations of the Securities and Exchange Commission, so meeting at least the main public objections of many critics of the device. Once the Governor of New Jersey has signed the variable annuity Bills, as he is expected to do, the Prudential—which has been the main protagonist in this legislative battle in its home state—can go ahead with its plans to sell them. If they prove popular, the opposition within the industry will crumble, and the investment trusts will have to resign themselves to narrower horizons. In the meantime pressure will be put on other key states such as New York, Massachusetts and Connecticut—whose Legislatures have already considered the merits of the variable annuity from time to time—to follow the lead of New Jersey.

Rockefeller's Family Tree

FROM A CORRESPONDENT IN NEW YORK

The ghost of old John D. Rockefeller who built up the Standard Oil Company, was surely haunting Albany when his grandson, the newly elected Governor of New York State, laid the financial facts of life before the Legislature. "Look at the figures—the figures tell the story," was the old man's precept, and it helped him to make some $900 million. The family still thinks it sound. His family is one of Governor Rockefeller's great resources. Under its golden umbrella he has had a far wider range of experience and exercised more power than falls to the lot of most men just turned fifty. It can still put skill, energy, shrewd calculation and honest benevolence at his service.

Yet some gifts of political value had to be left out of the Governor's heritage: for example, how it feels to be poor and defeated. Moreover, if Mr Rockefeller tries to stand for President, the family might prove to be a political handicap. Many people remember how his grandfather was hated in the days before the services of an expert press agent remade the public's picture of him. Many voters are innately suspicious of great wealth, even in good hands. Members of the family still employ public relations men to keep such fires damped, but they are by no means quenched.

The family is, of course, chiefly famous for the museums and the University (Chicago) which it has founded, for the research it supports, for the magnitude of the wealth which it commands, and for the enterprises which this wealth makes possible. But the Rockefellers have other characteristics which set them apart from the ordinary run of millionaires. The family's fortunes were built in the nineteenth century on the development and distribution for private profit of a great natural resource, petroleum. They are flourishing in the third generation, although the reaction against such unlimited exploitation of natural resources has made it something of a social sin, and accumulation of wealth on such a scale is now checked by the tax laws.

The third generation numbers six, all men except the eldest, a sister who contributes to projects of common interest but keeps out of the public eye. Energetic and shrewd, the five brothers have a sense of public responsibility and a flair for making money, for using it and for enjoying it. The picture that the public sees coincides to a surprising extent with that well-known stereotype, the ideal American. Nor is this entirely contrived; even the best of press agents must have material to work with.

At times the stress on the Rockefellers' benevolence makes them seem interested only in giving money away. This is, however, an illusion. In business circles they are known for their shrewdness and so are their representatives. The Rockefellers are land developers and business executives on an international scale, with Rockefeller Centre as their best-known trademark and an intelligent benevolence as their shield against over-heavy taxation and public envy. They still have large holdings in the complex of oil undertakings which resulted when a famous anti-trust suit broke apart their grandfather's Standard Oil Company; they have a known interest in the Chase Manhattan Bank and in certain chemical and aircraft companies. Their investment portfolio accents the good risk.

The Rockefellers are usually said to inherit their various abilities from their famous grandfather, who was born a poor boy in 1839, the son of a pious Baptist mother and an unregenerate hawker of patent medicines and died an incredibly rich old mummy in 1937. The present patriarch is Mr John D. Rockefeller Jr, now eighty-five years old, an imposingly quiet little man who inherited the full impact of his grandmother's piety and his father's wealth, and who used both of them with distinction. It was he who restored the eighteenth century town of Williamsburg, Virginia, who gave New York an interdenominational church on Riverside Drive, who rescued from decay several acres along the East River and presented them to the United Nations for its home. But with all this public benevolence, he did not let the family's private fortunes slip. He is believed to be worth $500 million, and each of the six children $100 million.

Of the five brothers, all were born within a single decade, all were educated in eastern colleges, all are married and with children, only two of them have passed fifty. But they are by no means peas in a pod. Mr Nelson Rockefeller, the Governor, is an energetic combination of private business man and occasional public servant, with an active interest in Latin America and in modern art. His elder brother, Mr John Rockefeller III, is shy and quiet with an inquiring mind, a belief in study groups and group reports and a deep interest in the trade and problems of the Far East; he is now chairman of the Lincoln Centre for the Performing Arts, which is being built in New York. Mr Laurance Rockefeller describes himself as the "gadget type," drives fast cars and boats, invests money in research on aircraft and missiles and preaches the conservation of natural resources; he also promotes tourist paradises in Puerto Rico, the Virgin Islands and Wyoming.

The youngest brother, Mr David Rockefeller, did post-graduate work at the London School of Economics and has become the family's only banker; he is vice-chairman of the board of the Chase Manhattan Bank. He is also chairman of the Rockefeller Institute for Medical Research, has promoted a slum clearance project near Columbia University, and is in charge of a reclamation plan for the lower end of Manhattan Island. Mr Winthrop Rockefeller supplied the "black sheep" element. Leaving Yale without taking his degree, he worked as a labourer in the Humble oilfields, went to war and was wounded at Okinawa, and married too spectacularly for long comfort. Having corrected that with a second try, he has happily settled in Arkansas and, after hiring a Negro as his farm manager in that race-conscious area, is setting out to reclaim land, improve cattle breeding, and attract new industries to his adopted state.

The Rockefeller brothers support jointly a group of staff offices and a library on two floors of the tallest building in Rockefeller Centre. A research organisation called Rockefeller Brothers Incorporated supplies them with information and suggestions on investment opportunities, and the Rockefeller Brothers Fund, to which they all contribute, finances projects of common interest such as the new series of reports on national problems. Otherwise for all their strong family loyalty, they act as individuals both in making money and in spending it. But so far the family is better known than any of its members and its most familiar symbol is the petrol pump. This is something Governor Rockefeller must overcome if he is to be a national figure in his own right.

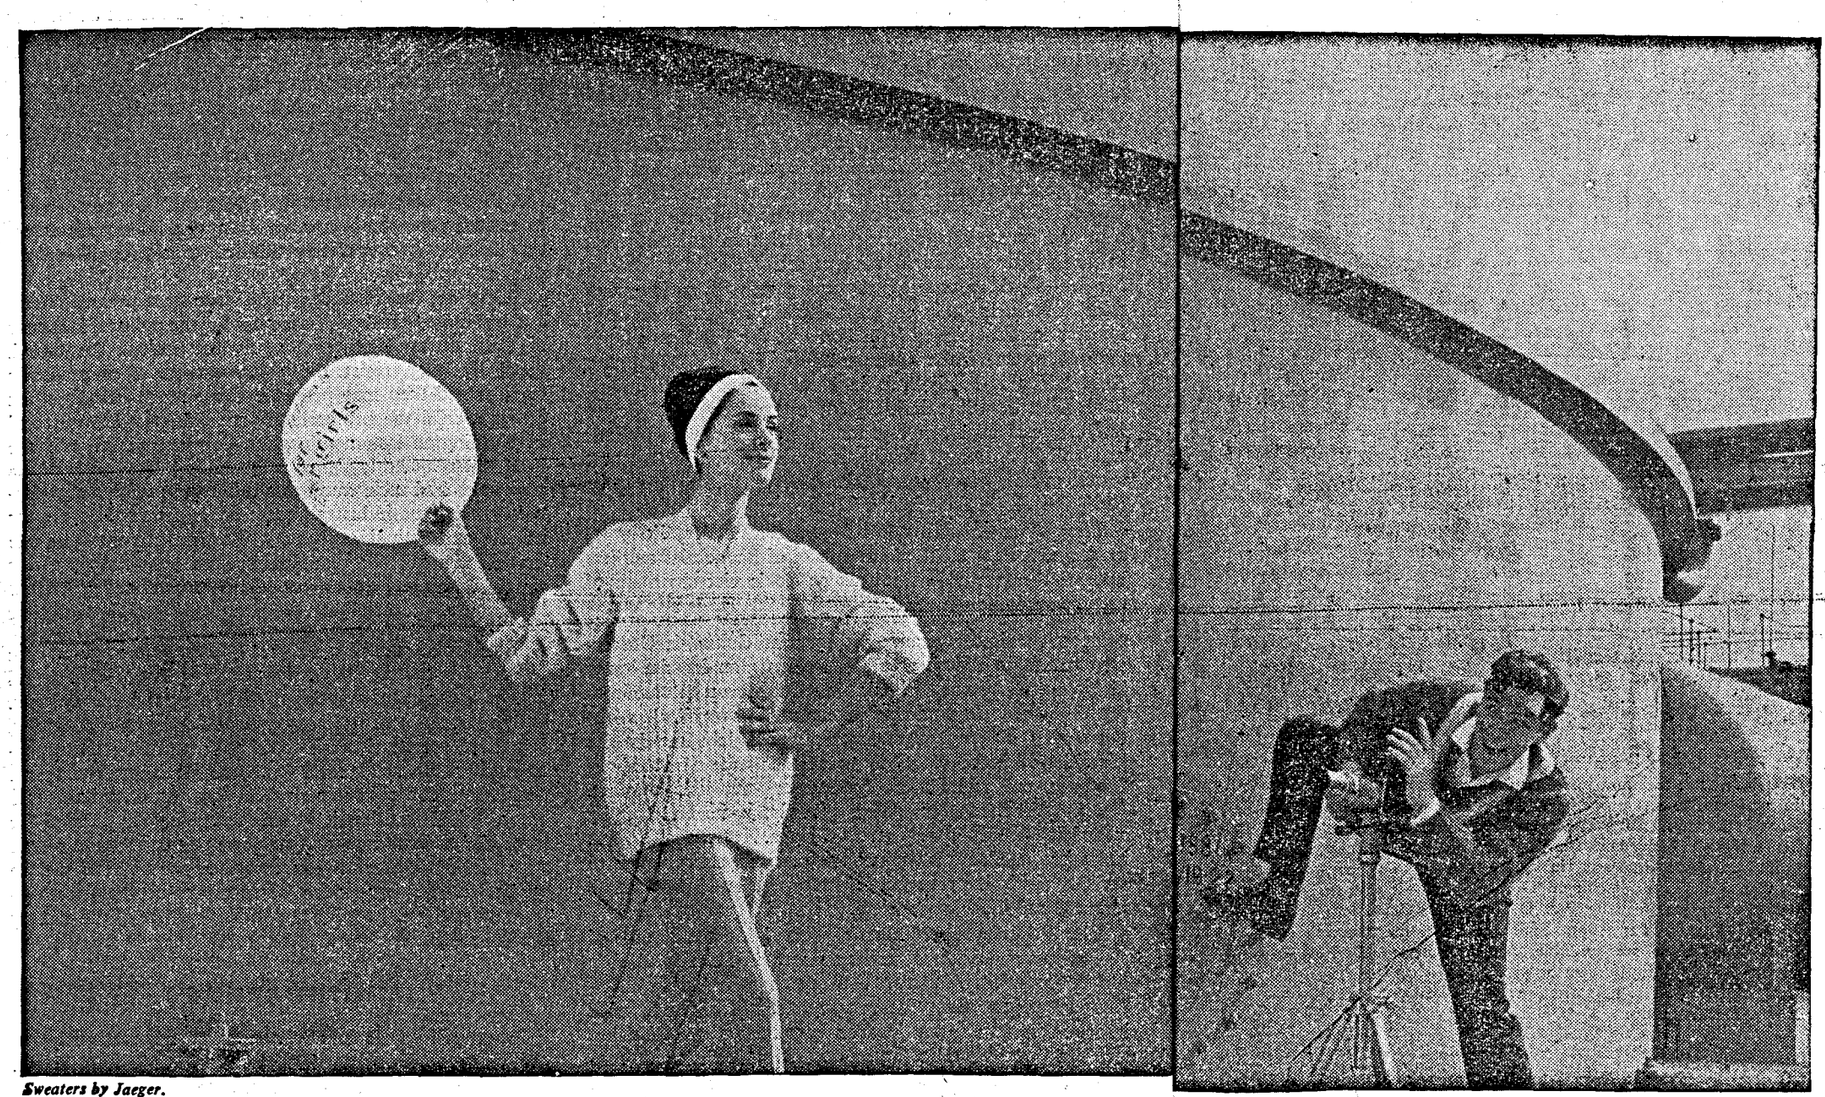
Irrational on Rails

Three years of brooding over the falling number of passengers the railways carry and their continuing heavy deficit on passenger account has not produced any startling or particularly hopeful ideas at the Interstate Commerce Commission. All of its recommendations have a wearily familiar ring. The federal government should give up its 10 per cent excise tax on fares, and it should take care not to gobble up the tax relief which states and cities are at last beginning to concede to hard-pressed suburban lines. This should go much further, to equalise the tax burdens of the railways and of competing forms of transport which enjoy free government facilities such as roads. The rails themselves must become more vigorous sellers of their wares—something which enterprising managements are already doing for their long-haul passenger business; on one Florida run, for example, free orange juice and sun lotion are popularising train travel. Antiquated working rules, which the railways complain cost them $500 million a year, should be revised; and the companies must plan for a "less extensive network more closely tailored to the needs of the public."

These last two remedies might have been pressed harder and put more bluntly if it were not for the political influence of the railway brotherhoods, as the unions are called. Naturally they resist the abandonment of unprofitable services and they may persuade Congress to curb it. Just how powerful the brotherhoods still are was demonstrated in Washington last month when Congress passed and the President reluctantly signed a Bill raising taxes on both the companies and their employees to improve the benefits provided under the industry's own social security scheme, for its idle and retired workers. The managements estimate that the changes will cost them at least $120 million a year to begin with and more later. In New York such increases in costs will exceed all the tax relief which Governor Rockefeller obtained for the state's railways this year.

The burden on the railways is so heavy because they are left unfairly to bear the whole social impact of technological change and of the competition from other forms of transport. Only about 825,000 railway workers are employed today, but there are nearly half that many receiving unemployment benefits, and over 700,000 receiving retirement pensions. The chief reason why the President wanted to veto the Bill was that it would strengthen the demand for more liberal state unemployment benefits. But the reason why he did not dare to veto it was because he knew that he might well be over-ridden by members of Congress who have a healthy respect for the political power of the railway brotherhoods.

SHORTER NOTE



Last month Mr Harold Stassen, that hardy perennial, won the Republican nomination for Mayor of Philadelphia. Even his own party's organisation, which helped to defeat him when he stood for Governor of Pennsylvania last year, did not think it worthwhile to oppose him. The Democratic Mayor, Mr Dilworth, is seeking a second term and is likely to get it unless Mr Stassen can somehow reinvigorate the Republicans in the city; in recent years they have had as many setbacks as Mr Stassen himself but with more justification.

THE ECONOMIST JUNE 6, 1959

Monsanto

Through creative chemistry, Monsanto tuesterday's dreams into present-day realities

Crude oil helpsweaters stay spotless

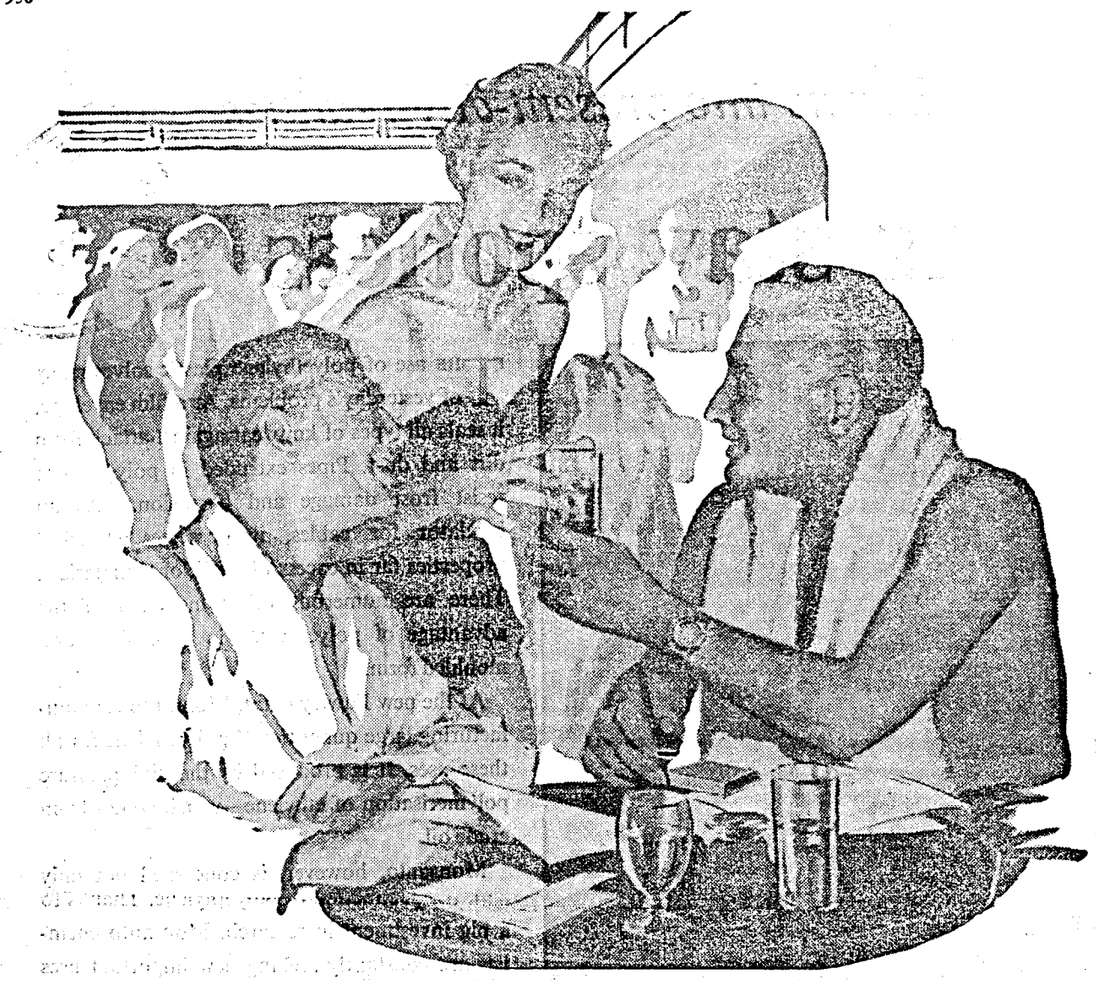
Sweaters by Jaeger.

THE use of polyethylene plastic solves many of yesterday's problems. As a film envelope, it seals all types of knitwear against attack from dirt and dust. Pipes extruded in polyethylene resist frost damage and corrosion. As an insulator for cables, it possesses electrical properties far in excess of traditional materials. There are numerous other instances of the advantage of polyethylene in film, sheet and moulded form.

At the new Fawley plant, Monsanto is manufacturing large quantities of polyethylene for all these uses. It is produced by the high-pressure polymerisation of ethylene—which comes from crude oil.

Monsanto, however, is concerned not only with the production of polyethylene. Thanks to a big investment in research, Monsanto chemists are constantly seeking new important uses for this remarkable material. They are discovering new applications in fields as far apart as textiles, building and agriculture. The scope is enormous.

Here's yet another way in which Monsanto brings a better future closer.



If you, as a manufacturer, are interested in chemicals or plastics, it will pay you to get in touch with Monsanto.

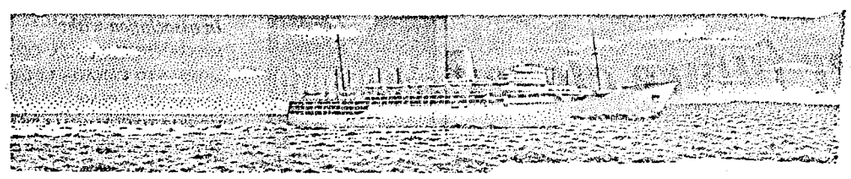
Monsanto

Such a good climate - for business



These men would have been perfectly happy to settle for the sun, the sea and the sky. It wasn't until they had begun to pool information and ideas that they really discovered just how favourable this climate is. For this is the P & O First Class Service to Australia. Here, in one of the mighty ships of the P & O fleet the British businessman gets an *intimate* line on the prospects in Australia and the East.

You can see why. Out of some six hundred and fifty fellow passengers travelling first-class *nearly half will be people with similar or connecting interests in the same territory as yourself.* A high percentage of *those* will be people from the very area you are visiting. *They'll* give you the lie of the land you're visiting as none else can. Conditions are ideal.

On P & O both the sun and the service wear a smile. You have time to know people, to pursue ideas without interruption, to rest properly. You do more constructive work in four weeks at sea than you do in four months at home. Yet you arrive back fresher than when you left!

If you have interests in Aden, India, Pakistan, Ceylon, Malaya, the Pacific or 'Down Under'—it *pays* to travel *all or part way* by P & O First Class Service to Australia (or the Far East). Special seasonal terms and Executive Tickets are available. Ask someone to check *now* with your Travel Agent or with P & O direct. 14/16 Cockspur St., S.W.1. Tel: WHI 4444 or 122 Leadenhall St., E.C.3. Tel: AVE 8000.

P&O First Class to Australia is an investment

THE WORLD OVERSEAS

India Focuses on Food

FROM OUR CORRESPONDENT IN INDIA

THIS year the monsoon was good ; and India produced 70 million tons of foodgrains. By 1966, according to a new Ford Foundation expert report, 110 million tons will be needed, and the proportionate increase in demand for such foods as milk and fat and eggs and fruit is expected to be larger still.

First, there is the acceleration in the growth of population. Until recently Indian planners assumed that the population was still growing at the 1.3 per cent, or 5 million a year at which it had grown between the censuses of 1941 and 1951. Now sample surveys have shown that the true rate is almost 2 per cent, or some 8 million per year. Although the birth rate has declined slightly, the death rate has gone down much more sharply, notably because of the spread of antibiotics and the nation-wide campaign of DDT spraying against malaria. Secondly, there is the stepping up of objectives. In the first five year plan the national income rose by 18 per cent. For the second plan the target is 25 per cent, and 20 per cent will probably be attained. The talk about the third plan is already of 30 per cent, and in India, as in all poor countries, the demand for food rises sharply as incomes rise ; given the money, Indians will probably buy twice as much of all the protective foods, three times as much milk, and perhaps 70 per cent more even of cereals. Thirdly, the main limiting factor on Indian economic growth is the lack of foreign exchange, and in 1958 food and agricultural raw materials cost the country £180 million.

Admittedly, present yields in Indian agriculture are so low, only about a third of Japan's, that it is technically possible to achieve greatly increased results quite quickly. The Ford Foundation team speaks of a doubling of production as an attainable target. But to achieve this fifty million peasant families must change the way they farm ; this can only happen if the government and the co-operative movement take upon themselves an enormous burden of organisation and persuasion.

To begin with, research must be done to find out what the peasant ought to do ; and this research must be specific, not general. The peasant must be told how much urea or potash his particular acre needs for the crop he has decided to grow. He must have recommended to him just the type of improved seed which suits his soil and weather and will resist his local diseases and pests ; in some areas he still has to be taught to sow in line and not broadcast. He must know how to level his field evenly, without leaving bits where the water collects or from which the water flows off. He must be persuaded to calculate more exactly his needs for irrigation water, and the engineering of his water channels. He must be shown in his own village the Olpad thresher and the rotary weeder, and the new pesticides and weed-killers. Since cattle slaughter is impossible, he must be persuaded to sterilise his scrub cows, and to castrate his bulls before they are a year old.

If he is shown the way, he responds. Demand for fertiliser has gone up from 275,000 tons in 1950 to at least a million tons now ; there has been a continuous shift from short to longer-staple cotton since the war ; the demand for diesel pumps for wells has consistently outrun the steadily increasing supply ; even artificial insemination has caught on in many development areas.

But this very eagerness to respond places a double responsibility upon the government and the co-operative movement. First, what is demonstrated to the peasant must really be suitable to his conditions ; an improved seed which fails the first time the rain is below average may frighten him off experiment for years. Secondly, when the peasant is convinced he must be able to act on his conviction. This is where both government and co-operatives most often fail. The improved seed is not available when it is wanted, or it is mixed with unimproved seed. Foreign exchange is never made available for sufficient imports of fertiliser to meet the whole demand. Tube-well water is sometimes charged for at so much higher a rate than nearby canal water that the peasant goes on strike against it. Major irrigation schemes, as on the Tungabhadra, bring water to farmers who have not been shown how to use it, and who may not have the resources with which to prepare their fields for wet cultivation.

Then there are the inadequacies of the credit system. Nine-tenths of all rural credit still comes from relations, the moneylender and the landlord. These sources are drying up ; to make a living, a moneylender must charge most clients a higher rate of interest than the law of most states allows, and landlords are steadily being got rid of by land reform. To fill the gap the co-operative movement is being rapidly expanded. In 1957-58 fresh loans by primary societies were £75 million, nearly six times more than ten years ago. But to register new co-operative societies still involves far too many burdensome formalities. Many societies are limited to one caste, sometimes to just two or three families. Many work so slowly that it may be almost harvest time before a man gets the loan he asked for to buy seed.

These defects explain the new emphasis on selling the idea and the possibility of a more productive agriculture to the peasant. He is to be encouraged to take risks by guaranteeing him a minimum price. The fluctuations in price between harvests, which so often leave him selling at the bottom and the consumer buying at the top, are to be reduced by a large expansion of warehouse space ; nearly 5,000 new warehouses are to be built. His supplies of fertiliser and improved seed and implements are to be made easier by a vast expansion of service co-operatives which, it is hoped, will also bring their members together

for such common programmes as contour-bunding—for the best results the bunds have to be able to follow the contours, and not individual field boundaries. Above all, more money is to be found for credit, both through government subscriptions to the share capital of co-operatives and through much larger loans from the Reserve Bank to co-operative banks—these are already nearly £60 million. Without cheap credit, at 7 or 8 per cent, most peasants can neither dig wells, nor buy fertilisers, nor hold their crop off the market till the harvest glut is over.

All these separate measures do not yet add up to a policy. On the political level the talk is still of service co-operatives today, without much idea of where the secretaries are to come from, and co-operative joint farming tomorrow, without any idea of how the peasant is to be persuaded into something so unacceptable. But so much is now said about agriculture and its needs that it has replaced heavy industry in the centre of the public's attention. In the next plan agriculture will be at the core of the hard core.

Both Sides of the Congo

FROM OUR SPECIAL CORRESPONDENT

SHORTLY after M. Kasavubu, the nationalist leader in the Belgian Congo, returned to Leopoldville from his rustication in Belgium, he took counsel with the Abbé Youlou, prime minister of the Republic of Congo, in Brazzaville. Both are men of the most advanced of the Congo races, the Bakongo (or Balali), but their positions are now very different. M. Kasavubu found M. Youlou busy making sure that his party (which is called the *Union Démocratique pour le Développement des Intérêts Africains,* but which is essentially tribal) should be returned in overwhelming strength at the forthcoming general election. In this M. Youlou is helped by having been on the right—and winning—side in the recent Brazzaville riots, for his opponent, M. Opengault, was saddled with the responsibility for them and languishes in jail, leaving his party (which is called the *Mouvement Socialiste Africain,* but which is basically anti-Bakongo) leaderless and despondent. M. Kasavubu, on the other hand, was sent on a study-tour of Belgian institutions because of his suspected part in the Leopoldville riots. When he returned this month he found that the political lead had been seized in the Belgian Congo by other parties, all claiming to be pan-Congolese, and to be strongly opposed to tribal politics in general, and to Bakongo domination in particular.

It has long been suspected that M. Kasavubu's ultimate ambition was the recreation of the ancient Bakongo kingdom, now divided between French, Belgian and Portuguese territory; undoubtedly the tribe has something of the pride and separatism of the Baganda in Uganda. M. Youlou's emergence as the dominant personality (if such a phrase can be used of a Father Brown-like figure in a white cassock) on the French side of the river provides one necessary element for a Bakongo renaissance; but the Portuguese are as usual standing no nonsense; and M. Kasavubu is now up against the bitter opposition of the Belgian Africans of the Congo's vast hinterland, who are apparently in no mood to see their narrow access to the sea blocked by a Youlou-Kasavubu barrage. In these circumstances, M. Kasavubu points out that Abako, now prohibited, never was a political party; as a cultural association it could have, and has, no precise political programme; but that he personally favours the conversion of the Belgian Congo into a federation. This leaves the door conveniently open; but other Belgian Africans insist that it disposes of M. Kasavubu's chances of becoming the Belgian Congo's man of destiny.

Who is to be that man if not M. Kasavubu? This is a question which it is natural to ask in Leopoldville, where shops, missions and schools still stand windowless and gutted, where the *Force Publique* is still grimly combing out "undesirables" from the fine modern African housing estates, and where the whites in the European city (though anyone can live there since February) sadly declare that the glory of the Belgian Congo has departed, the smiling, respectful African is no more, and the future is utterly spoilt. But there is no obvious answer; indeed it would be highly unwise to write off M. Kasavubu yet.

To Africans the question takes a very practical form: that of starting new political parties. There is a positive boom in new parties; they are formed in bars, in houses, almost on street-corners, wherever two or three are gathered together to ask "who are our leaders going to be after the elections?" The answer is to form a party and thus put in one's own bid. But it looks as if the *Mouvement National Congolais,* which has its own newspaper, *Présence Congolaise,* is now fairly well entrenched, and is likely to absorb many smaller parties before the elections take place in December, or earlier. Whether its present leader, M. Padrice Lumumba, will survive the political rapids is another question.

It is an oddity of the Belgian Congo situation that the parties declare that they operate only on sufferance, as no law has yet been passed to permit them to organise branches, collect subscriptions or hold conferences. There is no law, it is true, to stop them doing this (except in the special case of Abako); but they cannot believe that a proper law is not necessary, and they anticipate that when the minister for the colonies visits Leopoldville this month he will have one made, besides granting M. Kasavubu freedom to reform a party of his own, if he wants; indeed Abako is merely underground. Meanwhile the parties, such as they are, have a good many questions to ask the minister (now reconciled to the governor-general from whom he was so long estranged). The governor-general is now to be given what amounts in British terminology to an executive council; the Congolese demand that this shall include some Africans. They also insist that, in the administration, African "understudies" should be appointed to some high positions, to learn while working; and they demand this as an earnest that independence will really be conceded on January 1, 1961.

The Belgians will have to make some concessions; but they are most unlikely to tie themselves to any dates when they do not as yet know who their Congolese ministers might be. By combing the junior African public services they have found 500 Africans to promote to middle positions in the administration. But there are 10,000 Belgians at all levels in the administration of the Congo; and relatively few of the 500 Africans have even a secondary education.

The educational chickens have indeed come home to roost in the Congo; the Belgians, planning on a lordly time-scale, have given primary education to nearly 70 per cent of their Africans, but there are hardly 6,000 full secondary school pupils, and the new Lovanium university, which is being equipped not only with a teaching hospital but also an atomic pile, produced its first five graduates last year. On the French side of the Congo, there are African professional men in modest numbers (considering the poverty of the four republics which make up the former French Equatorial Africa); on the Belgian, it is hard to find a Congolese with a foreign university degree. The Congolese may thus be fitted to vote; it is hardly surprising that the Belgians doubt if they are fitted to rule—and have in fact made no promise beyond the granting of a share in government after the elections. Whether this will satisfy the Congolese or give rise to dangerous new frustrations is arguable.

The French have a hard enough time discreetly guiding their four small autonomous republics, but at least men like M. Youlou in Congo and M. Tombalbaye in Tchad are perfectly content to include in their ministries Frenchmen (if not always of a type acceptable to officials) to shoulder such arduous portfolios as finance. In the riots in French Congo between Bakongo and Mbushi, Europeans were unharmed and white troops welcomed in the restoration of order. "White-black relations are perfect; perfect!" M. Youlou told your correspondent. The French are shrewdly backing stable governments, however they come to power.

As they look across the river, which between Leopoldville and Brazzaville quickens towards the boiling rapids after thousands of miles of navigable smoothness, they do not envy the Belgians their skyline of imposing office blocks and harbour cranes. The Belgians, with their second £450 million ten-year plan all ready, and bemused with the herculean scale of the blueprint for the great Inga barrage, can still hardly believe that what counts now is the manœuvring, newspaper-mongering and bar-politics of a bunch of schoolboy politicians. But, nightmarishly, it is.

Bonn's New Top People

FROM OUR CORRESPONDENT IN BONN

DR ADENAUER has an incorrigible knack of making his actions appear unduly sinister. This is partly because he does not much care what other people think; nor, except for an occasional flash of spleen, does he even try to look as though he did. But chiefly it is because he is so sure of his own judgment that the questioning processes of democratic government often seem to the 83-year-old Chancellor an irksome waste of time, and best scamped if they cannot be avoided altogether. "Father knows best" has always been an infuriating maxim.

A Catholic politician more sensitive and worldly-wise than Dr Adenauer, persistently accused by his opponents of being a tool of "Rome and reaction," could be expected to take the trouble of keeping his clerical associations in the background. Speechless with *Schadenfreude*—or perhaps too coy to say precisely what it has in mind—this week's *Vorwärts,* the special pride of Social Democratic publishing, tops its front page with a large photograph of Herr von Brentano (returning chastened from Geneva) entering Dr Adenauer's gate in company with a priest carrying an armful of official-looking despatch cases. The priest is no more than the Chancellor's son Paul—the same who provided father's more desperate enemies with another round of ammunition by travelling to Washington in the Chancellor's aircraft last week and there consorting with another young man in holy Roman orders—Mr Dulles's son. Such unsporting potshots seem utterly incomprehensible to Dr Adenauer. As likely as not, he will be similarly astonished by the pother that is bound to be raised when he carries out his promise to attend the rally of 300,000 Silesian refugees which is being staged in Cologne at the end of June under the slogan "Freedom for Silesia!" He will, of course, be counselling restraint. And have not his spokesmen at Geneva been solemnly refuting protests that the Federal Republic is rearming in order to recover Germany's lost territory?

It is with a kindred ingenuousness that the Chancellor seems to have been surprised by the suspicions roused by his decision to stand for what he has plainly hinted is going to be a more politically active presidency; and by the resentment provoked by his intimated intention of nominating as his own successor Herr Etzel, whom the bulk of the Christian Democratic party consider too little known, and perhaps altogether too gentle and scholarly, to impress the electorate. Dr Adenauer has since put it about that his recent researches into the federal basic law have been conducted purely with the object of ensuring all the more loyal an interpretation. The basic law, he has conceded, empowers the Bundestag in the last resort to reject the president's nomination for the chancellorship and choose its own man.

Confronted with unexpectedly stiff resistance to his pure and selfless schemes, Dr Adenauer has now discreetly said for public consumption that he has not finally made up his mind about his successor. This tactical withdrawal should give him and his party time to settle their differences behind the scenes, which they are now trying to do. The choice between Herr Etzel and the vote-catching vice-chancellor, Herr Erhard, will be no doubt made behind a screen of amiability within the next four weeks. The new president is to be elected, in Berlin, on July 1st. Confidently assuming that he will be Dr Adenauer, the parliamentary party of the Christian Democratic Union have tentatively arranged to meet on July 7th in order to settle the question of the new Chancellor before the deputies scatter for their summer holiday. The posts will be actually changed in mid-September. According to the latest forecasts the new chancellor will be Herr Erhard (who is showing himself in the United States again this week), the vice-chancellor Herr Krone (now leader of the Christian Democrats in the Bundestag), and the economics minister Herr Etzel.

The attention which the Christian Democrats are paying to the factor of the beer hall has prompted the frustrated Social Democrats to take another look at their own grey leadership. The party chairman, Herr Ollenhauer, provokes but scanty public interest. His deputy, Herr Wehner, could make much more of a mark were he given a free hand; but he has the formidable electioneering handicap of having once been a member of the Communist party. Professor Carlo Schmid will probably be the party's candidate for the chancellorship in the 1961 federal elections. He is widely known, liked, and trusted; he is one of the few socialist leaders who have what the Germans call *Format.* It was not until the Social Democrats resolved to let him run for the presidency that the Christian Democrats appreciated that they too must put up a man of stature. In fact there is something to be said for the socialists' claim that it was really they who thus dislodged the "immovable" Chancellor.

Mr Lloyd Ploughs On

FROM OUR SPECIAL CORRESPONDENT IN GENEVA

Wednesday

As June came in the Swiss dairy farmers, cherishing their Alpine meadows according to their custom, had already taken a good heavy crop of hay and were busy drenching the blessed slopes in rich smelly liquid manure in preparation for their second. Not so the foreign ministers of the great powers, working a drier field; their first crop has still to come and it promises to be meagre.

Half-way through its fourth week, their conference does begin to show enough of a pattern to make it premature to dismiss the whole affair as a waste of breath. First came the argument about the status of the two German delegations, and the not very whole-hearted Russian effort to get the Poles and Czechs in. Next, the general debate in which the prepared plans of either side were expounded and exposed to counter-attack. When this was completed, all that was left was deadlock. Then, upon the death of Mr Dulles, the adjournment to Washington and the move to private meetings. By tonight there had been six of these meetings, including the two in mid-air over the Atlantic.

With the change of method went a change of subject, from the general to the specific, from the German question to Berlin. The two plenary meetings since the return from Washington have fitted in with this change. These plenary proceedings are still being expounded fully to the assembled journalists; the private meetings are being kept firmly private.

It would be pleasant and logical to infer that the change of subject and method meant an improvement of the prospect of success; but alas, no evidence of that is to be found. The manners have been better and the tone easier, but that is all. Mr Herter has yet to drop any hint of terms lower than those he expounded last week in the open phase. Mr Gromyko, though he occasionally lets fall a hint of a possible topic on which he might perhaps give ground one day, has never yet indicated what the concession might be. The French are well dug in on their familiar terrain. For Mr Lloyd this must have been a particularly difficult week. He was, and still is, engaged in the task of translating into conference tactics the search for an accommodation which has been British policy since Mr Macmillan's Moscow expedition, without allowing his tactics to impair western solidarity. He has done this job skilfully and with a degree of success. Relations between the western delegations are better than anyone would gather from the hostile treatment that British policy still gets in the western European press. Obviously the curious story about Mr Lloyd's future in *The Times* has added to his difficulties and offers, to those who wish, a new way of writing off his efforts as useless. Perhaps the damage can be repaired. Mr Lloyd, who can do little good either by explaining *The Times* away or by ignoring it, is hardly in a position to repair it himself.

Nevertheless, it is still Mr Lloyd who has defined the specific negotiating problem that now remains: that of agreeing to "improve" the Berlin situation in detail while negotiating it in essentials. Naturally he was at once accused of intending that the improvements should all be in the communists' favour, and naturally this is what the Russians themselves are anxious to assume. The real position is much less simple. The truth is that while improvements in the Russians' sense, of putting a curb on propaganda and undercover activities, are certainly possible, not much of this is capable of being formally agreed; thus, a written agreement to drop secret service activities would read very oddly, and its value would be dubious. The Americans have made it clear that they are not going to give up the RIAS radio station, and that any concessions on other matters would have to be reciprocated. Thus the idea of "improvements" in Berlin comes up sharp against the Soviet thesis that East Berlin is the capital of a sovereign east German state and can present no problem.

Finally, even in an interim or partial agreement on Berlin, the Americans in particular are disposed to insist on a more specific affirmation of the rights of civil access to Berlin than was provided by the reticent formula of 1949. If the Russians do not meet them on these points, then the American position is still that there will not be a summit conference.

All conferences reach a stage when people begin to wonder what the communiqué will say at the end. The ministers' task is small but hard: to extract from their debates enough in the way of general or specific statements that they can all sign to save everybody's face and permit a summit conference to be held. It is possible by now to think of general statements that could be uttered about the German question, but in concrete terms the ministers cannot do much more than send their heads of governments the western and Soviet plans as rival documents. On Berlin, just conceivably they can do a little better—that is, they could agree some propositions and submit only a few that are not agreed. Something more than this will be needed if there is to be a summit conference at all. Possibly Mr Gromyko might provide it, not by concessions on Germany or on Berlin, but by some move on one of the related subjects that hang in the air of the conference—disarmament, European security, or even nuclear tests. If he does not, it is hard to see the way out.

Holland Steers to Starboard

FROM OUR CORRESPONDENT

Full employment and an increase in productivity were the central points in the statement with which Professor de Quay introduced, in the Dutch parliament last week, the first postwar cabinet to exclude the Socialists. The statement fully reflected their exclusion. The de Quay government's first concern is to decrease budgetary deficits in order to leave more room in the capital market for private investment. Tax relief is highly desirable, according to the new premier, but possible only in so far as the increase in national income exceeds the rate of increase of the budget. He announced, however, specific plans for tax alleviation for private enterprises designed to stimulate industrial expansion and exports.

This implies a completely new approach to Holland's economic and social problems. The anti-inflationary measures of 1957 left a feeling of general disappointment. Dr Drees' paternalistic government had tried to distribute the burden of these measures equally between wage-earners, private business and the state. In practice, the private sector restricted its activity much more than was provided for, while the state increased its spending much more than had been agreed. Herein lay the origin of the crisis of December 1958, which provoked the March elections.

The Socialists, however, still saw no reason to try a new approach. They continued to pin their faith to an improvement of the paternalistic Drees system, which had proved more effective in distributing welfare evenly than in expanding it. Their tendency to go just a little too far in this direction was the fundamental reason why the old coalition could not again be restored.

Two immediate measures were announced by the new cabinet. House rents, which had been kept artificially low since the war, will be raised, and state subsidies to farmers for milk will be abolished. This will lead to an increase in the cost of living. But compensation will be sought not, as hitherto, by a general wage increase, but by increases negotiated by employers' and employees' associations without direct state intervention. The rate of wage increase will, therefore, differ between the various branches of industry. The government will only intervene when price increases which affect the Dutch competitive position on the world market are involved.

The paragraph in Professor de Quay's statement on the six-nation European common market and relations with the other OEEC countries reflected a new trend in public opinion. There is widespread disappointment and mistrust in Holland about the consequences of the community policy. This is due to several disturbing experiences. First, there is the coal crisis, which, under the pressure of a Franco-German bilateral policy, will lead to a policy of import restrictions that are to the disadvantage of the ports of Amsterdam and Rotterdam, and will cause an unwelcome increase in coal prices. Secondly, there is general concern about the Franco-German bilateral grain agreement, which is regarded as indicating how the articles of the six-nation Rome treaty on minimum prices for agricultural products and on long-term contracts will be carried out. Finally, there is the reluctance of France, and of Germany under French pressure, to negotiate further on the question of the free trade area, which the Dutch have always held to be a necessary complement to the six-nation common market. The new premier has emphatically repeated this Dutch conviction.

Nyasa Fairy Tales and Witch Hunts

FROM A CORRESPONDENT IN CENTRAL AFRICA

Two new events have highlighted the inconsistency of the Nyasaland government's policy. First, Mr Garfield Todd was refused permission to hold a public meeting in Blantyre. Officially the refusal came from the police; but it is an ill-kept secret that the decision was in fact made by the executive council, probably at the instigation of the Federal party elements. This decision is remarkable, since the Nyasaland government has been feverishly searching for the past two months for some party which it could claim is more truly representative of African opinion than Congress. Mr Todd's Central African party seemed the only possible candidate for such a role, and so it was expected that he would be received kindly and given every possible opportunity of gaining African supporters. It is, incidentally, unlikely that he will gain many, since his party covers the whole federation, and most Nyasaland Africans will not touch anything that is remotely federal.

The second event which throws considerable discredit on the Nyasaland government, was the publication of the second of two propaganda pamphlets by the government information office, entitled "Talking Points for Government Officers, Estate Owners and Managers," excerpts from which have also been printed in the official information bulletin circulated free amongst Africans. Both these pamphlets are written in the manner of fairy tales for five-year-olds (presumably because the government realises that the majority of educated Africans are already in gaol), and are designed to put the blame for every misfortune on the shoulders of the African National Congress. They are also a direct exhortation to start a witch hunt. To quote:

> Do you know of any member of Congress living near you who has not yet been arrested? Do you know of any group of Congress members near you who are plotting trouble? If you do you must tell the Boma (government), so that these wicked people can be arrested and removed from your area. . . . You can either report personally to a government officer, or, if you prefer to remain anonymous, send an unsigned letter to your district commissioner or police officer, giving the name and address of any Congress member still at large. (There is no need to put a stamp on your letter.)

It seems clear that the government is determined to discourage Africans from joining even a liberal party as responsible as Mr Todd's. As for Congress, which, it must be remembered, was the only African political party in Nyasaland and had an openly declared policy of self-government outside the federation, it is to be completely crushed:

> Whether they are charged with criminal offences or not, the Congress leaders are going to stay in prison for a long time until they constitute no threat to the peaceful lives of the inhabitants of the country.

It is difficult to see how this sort of policy is going to assist the Nyasaland government in its task of bringing about responsible self-government. This short-sighted policy is presumably forced on it, however, by the fact that it is pledged to federation, which is almost universally opposed by politically conscious Nyasaland Africans. Being thus compelled to suppress virtually all African political opinion, it seems likely to forfeit African sympathy, and increase the clamour for secession; in this way it will ruin the chances of economic development on which the whole case for the federation rests.

THE BUSINESS WORLD

Air Ticket to Moscow

BY A SPECIAL CORRESPONDENT RECENTLY IN THE USSR

At this time of year, the sun rises over Moscow soon after 3 a.m. with a milk-white light that makes the limes seem greener than they do in other countries and soaks into the bricks and stones of the city until the walls become luminous, rose-red, yellow, apricot, green and white below the Kremlin's pure gold domes. Spring comes late to Moscow in a flurry of new young leaves and lilac, the signal for a rush to get new building under way before the autumn frosts bring work to a standstill. The children pick dandelions all day long with ferocious concentration, customers stand four and five deep at the counters selling guns and fishing rods, and the first cuts were made a fortnight ago on a new underpass where Gorky Street joins Mokhovaya Street just below Red Square.

Moscow's polygot hotel population is still predominantly a business, not a tourist one, made up of Russians from the provinces ; East Germans and Czechs ; a substantial Middle East contingent coming mainly from Egypt and Iraq ; tired-eyed Americans ; Chinese army athletes six feet tall ; and a handful of British visitors looking as surprised to find themselves inside the Iron Curtain as Alice to reach the other side of the looking glass. Expense-account entertaining appears to play much the same part in Moscow as it does in the West, and the visitor looking for tangible evidence of Russian trade with the West might find it in the Turin-built Michelin tyres of many Russian buses or the shipment to Caracas of such unexpected freight as Russian-built electronic data processing equipment. With considerable secrecy, permission has recently been given to the American Rand Corporation — a "nationalised" research back-room set up by the US Air Force—to set up Moscow offices for the possible purchase of Russian inventions for the United States. Only those Westerners who actually live and work in Moscow or those who, like Sir David Eccles, come to the capital with the object of extracting firm written commitments from their hosts, know of the days and even months of preliminary stonewalling which pass in Russia under the name of negotiations before these deals are completed with a speed and suddenness calculated to throw the other side off balance.

To tourists, and to visiting firemen of every kind and species ("delegation" is a powerful word in Moscow that opens many doors closed to resident foreigners, besides getting quick service in restaurants) the city presents a very different face ; urbane, confident and coloured with a certain amount of good-natured patronage. Shop assistants explain tolerantly that tourists cannot afford to buy the luxury goods, the glass, enamels, lacquers, the expensive dolls, or the embroidered shirts that Russians give each other for presents. This is hardly surprising because while a rouble bought at the standard rate of exchange costs 1s. 8d., and one bought at the special rate for tourists costs 8½d., its actual purchasing power is probably about 6d. or even less.

Rents are cheap, based on a percentage of the wage of the most highly-paid member of the family and ignoring the earnings of the rest. Having fallen into the trap of mistaking three American visitors for typically drab middle-aged Russian housewives, your correspondent is wary of making any comparisons between Russian and Western standards of dress. The uniforms of officers, or airline captains and, for that matter, the frilled petticoats of some Intourist guides indicate that the Russians can and do tailor textiles of extremely high quality when they choose. The fact that they do not apparently put these on sale in the big Moscow department stores seems part of a policy that regards these stores, like the big chains in this country, as catering for what would be called here a lower middle-class market with decidedly provincial standards of taste. The lampshade and furnishing departments are particularly revealing.

Since British European Airways recently became the sixth Western operator to open a direct air service

to Moscow (the Finnish and Scandinavian airlines began flying there in 1956 and the Belgian, Dutch and French last year) British travel agents have been able to negotiate much better terms with their Russian counterpart, Intourist, than they have before. Even though the standard Intourist charge of about £11 a day, which includes first-class hotel, car, driver and guide, is good value compared with the tariff of comparable hotels in the West, it remains well beyond the pocket of the average British holidaymaker. Within the last few days, travel agents have been able to make arrangements with Intourist that bring the charge down to something nearer £3 a day (plus £118 for the tourist return fare) and, what they consider even more important, leave the choice of hotel, method of travel and itinerary to be decided from the British end and merely rubber-stamped in Russia.

This is a major advance, but whether it will give any significant stimulus to tourist traffic is an open question. Moscow and the surrounding countryside have moments of breath-taking beauty; the restoration of those parts of the Kremlin and other historic buildings open to visitors has been done with skill and an unexpectedly subtle sense of colour. Modern Russian building at its worst is no uglier than the average municipal housing scheme in London, Paris and New York and at its best has a number of commendable features, including experimental methods of construction collected together on one housing estate given over to this purpose. But the city as a whole has few of the amenities that the average British holidaymaker normally expects when abroad, other than ice-cream of almost forgotten prewar quality, and for this reason travel agents tend to regard the Soviet Union as a strictly off-beat vacation.

This has a bearing on the volume of traffic that British European Airways can expect to carry between this country and the Soviet Union. Other airlines flying to Moscow have found that their traffic is largely diplomatic, with a sprinkling of businessmen, a few rare tourists and an occasional unexpected consignment of freight such as the two tons of penicillin recently flown in by the Scandinavian carrier, SAS. BEA's experience during the first week or so of the new service appears to be conforming to this pattern. It has been offered westbound Russian freight, such as gold and electronic equipment, in tonnages big enough to make the service break even immediately, but with no promise that this will continue. Where other, long-range airlines are prepared to operate at a loss to Moscow in the hope that they will eventually be allowed to use it as a staging point to the Far East, BEA has to try and break even on Russian-bound traffic alone, which will only be possible if it is allowed to operate into more than one Russian city. Negotiations are now in hand to allow a stop at Leningrad, but it will be difficult to make any service to Russia profitable until the corporation can put Comets on the route next year.

This is not because the Comet is a conspicuously economic aircraft to operate, but because the big Viscounts used by BEA have to carry fuel for 1,400 miles of non-stop flying. It is 900 miles from Copenhagen, the last re-fuelling point, to Moscow and 500 miles from Moscow to Minsk or Riga, the two alternative airports offered by the Russians for those occasions when Moscow's sudden and notorious thunderstorms close the airport. This weight of fuel reduces their payload from 58 to about 30-36 passengers. As the Russian airline, Aeroflot, gently points out, it is the shortcomings of BEA's aircraft that make it necessary to operate both Russian and English services with a stop at Copenhagen. Aeroflot's own jet Tu 104s could do the journey between London and Moscow non-stop as easily as they do the journey between Moscow and Paris.

AEROFLOT is well aware of the key position of Moscow as a transit point between East and West and advertises "fly via Moscow and save time." Using Aeroflot jets, the journey from London to Delhi takes 12 hours, compared to 13½ by BOAC, and the journey to Pekin 15. Although the Tu 104 shows unmistakable traces of having been evolved from a bomber—its cockpit with a transparent nose has a military air that no amount of carpeting can disguise—the three new aircraft with which it is being replaced all look as if they had been designed from the outset for commercial use. Surprisingly, when the West is converting its fleets to pure jets, these three new aircraft are all turbo-props; one is already in service, the second just coming into service, and the third promised for delivery this autumn. They range from medium stage lengths like those between Moscow and Kiev to 9,000-mile range machines capable of spanning the Soviet Union from end to end, and vary in size from 100 to 200 passengers. The interior fittings could have been planned by one of the better and less fidgety American designers except that cabin, cockpit and galley all provide far more space than any Western airline could afford to. There appear to have been some teething troubles with the engines, and the last two aircraft, the Il 18 and Tu 114, are at least six months late in coming into service.

In many respects, Aeroflot operates much like any Western airline; the 60 hours a month that its pilots are allowed to fly on jets and the 120 hours on other types of aircraft do not differ noticeably from BEA's own regulations, and 80 per cent of the huge Russian fleet is expected to be serviceable at any one time. But there is a significant difference in the approach to operating economy, which is shown not only in the amount of "wasted" space inside the aircraft cabins but in the rapid rate at which engines are overhauled. BEA's Dart engines on the Viscount are overhauled every 2,500 hours, but the Russian engines are overhauled every 800 hours on the piston-engined Il 14, 500 hours on the turbo-prop Il 18 (a new engine, so this is less surprising) but only 400 hours on the jet Tu 104 which has been in international service for at least three years. This suggests that Aeroflot has to make do with military engines that are designed for a short life at high performance; the other, unlikely, alternative is that the Russians have discovered how to make a cheap, expendable engine. The cost of engine overhaul is a big item in airline expenses and though it may not worry Aeroflot's accountants, this high rate of maintenance could be a serious deterrent to export sales of Russian civil aircraft.

It is easy to exaggerate the immense progress made by Aeroflot. Air transport is developing inside Russia on much the same lines as in the United States and for much the same reasons. Aeroflot probably carries about 10 million passengers a year—exact figures are difficult to get—which is perhaps one quarter of the traffic carried by the major internal airlines of the United States. The switch to the air is encouraged by the fare policy; it costs one fifth less to travel from Moscow to Leningrad by jet than by the crack Red Arrow express train. But only 150 aircraft come in and out of Moscow every day (making in airline jargon, 300 movements) compared with 250 aircraft at London airport on a busy summer's day. At any one time between 20 and 25 aircraft may be passing through the Moscow airport control zone, numbers small enough to be handled by one man and his assistant.

It seems unlikely on these figures that Moscow airport and its surroundings are busy enough to justify installing navigation equipment as elaborate as the Decca system that is designed specifically for areas so crowded that aircraft are flying almost wing-tip to wing-tip. The fairly elementary landing aids ordered from Pye by the Russians two weeks ago seem much more in keeping with the actual traffic requirements. The Moscow traffic control is at present housed in two separate buildings, one for the area up to 100 kilometres from the airport and the other for long-range control extending from 500 to 800 kilometres. This extraordinarily inconvenient arrangement will end when the new control building is finished. Meanwhile, the actual technical equipment of the airport, its radar, its blind-weather landing and general communications are of the type found in any Western airport of the same size; the unusual feature is the high standard of English spoken by the controllers, which is in sharp contrast to the sub-basic English of some other continental controllers. It is now easier to visit Moscow than at any time since the start of the cold war; all that remains is to think up some good reason for wanting to go there. The ball is in Mr K's court.

BUSINESS NOTES

TAKE-OVER BIDS

Primer for Politicians

BY the logic of the market place, property that is not fully or properly utilised will always be attractive to any buyer that can make it more profitable. The take-over bid simply applies that logic, sweepingly but justifiably. There may be gain to the victor and pain to the loser. But that too is logical, for the buyer will not bid unless there is the expectation of profit and the "loser" is not (in share bids at any rate) the owner of the property, but the man who was being paid by the shareholders to administer their interests. Shareholders can always refuse a bid and often do; they are the sole judges and it is their own self-interest that brings them to a decision.

To speak, as Mr Sydney Irving did in Parliament on Tuesday, of "economic gang warfare that has no regard to the interests of the nation" is fustian political stuff. The market in property or shares works in exactly the same way as the market for cabbages; through the competition between personal interests it produces the best accommodation that is possible between them. In that sense it can be said to serve the widest aims of the economy. To regulate the market to serve predetermined ends is a different matter—one of political choice. To equate nationalisation with take-over bids, as some speakers and writers have recently done, is to mix up the politics hopelessly with the economics. The notion that "the people" have some right to share in the "profits" of take-over bids has some ugly overtones, for it is the activities of governmental authorities in the last generation in such matters as nationalisation, compulsory purchase of land, and sequestration of foreign securities that have sometimes been reminiscent of the stick-up man. Mr Clore offers his price; shareholders can accept it, or they can see him off. That is more than holders of electricity supply companies' stocks were able to do in 1946.

BREWING MERGER

Ind Coope and Taylor, Walker

"ANYTHING Clore can do, we shall do better" will undoubtedly be the theme of the reply of the Watney Mann directors to his bid. In this expectation, Watney Mann ordinary shares, though down on short-term profit taking from a high point of 77s. to 73s., still stand well above Mr Clore's bid of 60s. The Watney Mann directors will no doubt point to the economies that have resulted from brewing mergers in the past, and they will certainly approve the latest example—Ind Coope's bid for the ordinary capital of the London brewers, Taylor, Walker—as a natural phenomenon, not to be confused for a moment with a bid from outside the industry. This is an agreed merger which the directors of Taylor, Walker, who control 163,000 of the

2,593,000 ordinary shares, urge other shareholders to accept. The offer is a fair one of 15 Ind Coope ordinary shares for every four Taylor, Walker ordinary units. With the Ind Coope at 16s., that puts a value of 60s. on Taylor, Walker shares, which since Mr Clore's foray have risen from 36s. to 51s. 6d. It happens that Ind Coope offer the same immediate gain in terms of market value that Mr Clore's bid offered to Watney Mann shareholders.

Talks about the possibility of a merger between these two breweries began as long ago as 1953. They were renewed early in May and the terms finally settled on Monday. It is not, said Lieutenant-Colonel William Kingsmill, the chairman of Taylor, Walker, "a speculative real estate deal or a financial raiding party," but rather "a natural fusion of complementary forces to obtain greater efficiency in production, distribution, and service to the public." If it goes through, it will bring Ind Coope into the London and Home Counties areas, adding 1,360 public houses and off licences to the 4,000 public houses and 51 hotels it already owns. It will make Ind Coope the biggest national brewer, with public houses in every area of the country and probably second only in production to Guinness. It will give Ind Coope control of five breweries in the London area and in a few localities too many competing outlets. "Rationalisation" will close down some of these breweries and public houses; some may be sold and others be modernised. All this is a familiar recipe to the brewing industry and one that Mr Clore has not been able to improve on for Watney Mann. Both his bid and this merger have the same economic justification. The question that the Watney Mann shareholders have to decide is who will do it more efficiently: the brewers with their experience of the trade and their measured ways or Mr Clore, whose flair extends beyond finance to hiring the right kind of help.

GEORGE NEWNES

Victory for Odhams

VICTORY for Odhams Press in the struggle to acquire George Newnes is now a formality. The Odhams offer of two ordinary shares (currently quoted at 25s. 9d.) plus 45s. in cash for each Newnes ordinary share remains open until June 19th but the other bidder, the News of the World, has already retired from the competition, with the announcement through Hambros Bank that as the conditions attached to its cash bid of 90s. had not been fulfilled, its offer had lapsed. It added that it had offered a "fair price"; but that price compared with a value of 96s. 6d. represented by the Odhams bid and a market price of 94s. 3d.

In their formal offer, the directors of Odhams said that there should be no difficulty in maintaining the ordinary dividend at 17½ per cent on the capital as increased by both the Newnes and the Hulton Press offers. They described the Odhams and Newnes businesses as "to a large extent complementary" and both they and the directors of Newnes (who have advised shareholders to accept the Odhams bid) expect that "considerable economies" will result from the merger, "without prejudice to the employees of both companies." The two groups compete with each other for readers and advertisements, and though the merger will produce a very strong block against commercial television and also against the development of the Amalgamated Press by the Daily Mirror group, it is likely that "economies" will mean the disappearance of at least some titles.

THE ECONOMY

Out of the Saucer

THE rise of 1-2 per cent in industrial production suggested by the preliminary estimate of 108-109 (1954 = 100) for April in the official index takes output back to the level of early 1958, before the shallow recession began; and the mood of growing confidence in industry suggests that the rise will have been going on since. The upward turn in April no doubt reflected record output of motor cars and other durable consumer goods; but it also included a welcome rise in steel output, which had been one of the heavy industries depressing the general output index for most of the last year. Since customers have begun to cease drawing down stocks of steel, one would expect them to have increased their demands upon intermediate engineering suppliers too. Output may thus already have "saucered out" of a minor recession of which the bottom was about 4 per cent lower than in September, 1957, or April, 1959—and before the reflationary impetus of the budget could have been exerting anything approaching its full effect.

Unequal fortunes continue to attend the different major groups of industry and the individual industries within them, contributing to the differential development that over the years accrues into structural change in the economy. Last year the only groups increasing steadily through the year, regardless of recession, were food, drink and tobacco; the utilities, primarily electricity; and paper and printing—all contributing to the higher living standards of most of the people even in a year when a few more people, steadily, were out of work. Electricity, newsprint, and packaging board are manufactures on the fringe of consumers' "service purchasing"; by contrast, output of some basic consumer goods such as clothing and textiles continued to decline last year. Output of most plant and machinery was still fairly high but past the peak of its three-year surge; however, the building of offices and houses, late last year, seemed to be bringing some recovery in the construction industries and their suppliers. Even in the production of durable consumer goods and their associated products a similar process of sorting out is going on; record production of cars is not paralleled in the commercial vehicles industry, while output of cycles seems to be depressed by adverse social trends here as well as by the growth of local manufacture in markets abroad. Output in the chemical industries has been growing again; the oil refineries, in particular, were producing 30 per cent more products than a year ago, in ebullient contrast to the coal industry's efforts to bring its output down towards the tonnage of coal that it can sell.

IN THE MARKETS

Writing on the Wall

IT would obviously be premature to say, at this early stage of Britain's recovery from recession, that the rise in ordinary shares has gone far enough. If present uncertainties, political and economic, were satisfactorily surmounted, many leading equities would look cheap at today's prices. That is looking to the future. For the present, signs accumulate that the equity market may have over-reached itself. The speculative fever evident in the following of every rumour and buying of second grade stocks has this week embraced those old friends, Baltic bonds and Channel Tunnel.

An earlier warning came last week from America, as the Federal Reserve raised re-discount rates from 3 to 3½ per cent; they have not been higher for a generation. Now officials of the US Treasury are rumoured to be urging Congress to raise the maximum permitted interest rate on government bonds above the present 4¼ per cent. No one should be bemused by the present state of the dollar in the foreign exchange markets and underestimate the significance of such moves for London. The further rise in the London Treasury bill rate last Friday, to over 3⅞ per cent, was a logical adjustment—though it also owed something to the weakness of gilt-edged.

Wall Street has paused this week, at its dizzy height; and in London, despite a new record in number of bargains, blue chips as a whole have risen only slightly (though on Monday substantial Continental and American buying produced a sharp rise in Unilever and on Wednesday speculation in brewery shares flared up again on news of a proposed merger between Ind Coope and Taylor Walker). In mid-week gilt-edged were making a rather better showing—as the gap between the yields on *The Economist* indicator of ordinary shares and on Old Consols narrowed to vanishing point. The danger signs are clear.

STERLING

Smaller Gold Surplus

AFTER making Britain's gold payment equivalent to £58 million ($162 million) for the increased quota in the International Monetary Fund, the central reserves of gold, dollars and other convertible currencies fell by £47 million in May. There was also a special payment of £1 million to settle old debts in the European Payments Union, so that the true surplus for the month was £12 million. This follows an April surplus of £44 million, and taken together, the results are good. From now on the dollar surplus must be expected to run down, as seasonal influences become adverse. In the months ahead, Britain will also have to meet part of the £40 million in gold needed to pay up the increases in other sterling countries' IMF quotas.

The flush season in earnings for the rest of the sterling area is reflected in figures of the sterling balances at end-March. These show that in the first quarter of the year the overseas sterling countries raised their London balances by £58 million, to £2,675 million—£96 million above their low point last September. Total sterling balances, however, fell in the March quarter, by £98 million to £3,869 million. This movement is wholly accounted for by special influences. The fall of £85 million in the holdings of "non-territorial organisations" reflects Britain's repurchase of £71 million sterling from the IMF; and the big fall from £372 million to £309 million in balances of OEEC countries is largely a technical result of the ending of the European Payments Union and of the transfer by the German Bundesbank of £22½ million from its account at the Bank of England to the British Government. There seem to have been no significant withdrawals of foreign funds in London—though the big build-up in 1958 when London money rates were notably higher than New York has clearly ceased.

NATIONAL SAVINGS

Rates Coming Down?

THE Chancellor of the Exchequer told a National Savings rally last Saturday that he contemplated no "immediate" changes in the terms of small savings securities. But the stress seemed obvious. Mr Amory reminded the savings workers of his responsibility to keep the interest burden on small savings in line; a difference of one half per cent on one of these securities represents several million pounds a year in debt interest from the budget. To a significant degree, rates on national savings are now out of line. Hence their extraordinary success last year, when Bank rate came down from 7 to 4 per cent, and rates on Treasury bills and on deposit accounts followed.

"National" Savings	Yield, per cent	Limit of Holding	Last change in rate
Savings certificates	£4 4s. tax free p.a. if held for 7 years; equivalent to £6 17s. gross with tax at standard rate, and £11 4s. with tax at 12s. 6d.	1,000 units (£750)	1956
Defence bonds	£5 p.a., subject to tax, plus £3 tax free after 7 years.	£2,000	1958
Post Office Savings Bank and Trustee Savings Bank, ordinary dept.	£2 10s., free of income tax (not surtax) for first £15 of interest.	£3,000 (£500 in any one year)	(Rate fixed by statute)
Premium bonds	Prize fund of 4 per cent.	£500	—
Market Rates			
Leading building society (shares).	£3 5s. tax paid; equivalent to £5 6s. gross with tax at 7s. 9d.	Usually £5,000 in any one society.	May, 1959
Deposit account at clearing bank.	£2, subject to tax.	None.	Nov., 1958
Deposit at leading finance house.	£4 10s. subject to tax.	No standard limit.	Nov., 1958

Rates on shares and deposits in building societies are now being reduced; the building societies have been waiting on national savings, but their turn has come first.

The first effect of the Chancellor's ruminations will presumably be to induce all investors who do not hold their full limit of savings certificates and defence bonds—the prize fund for premium bonds and interest paid by the savings banks are unlikely to change—to get in under the wire. But once a reduction is made, the new issue may not be easy to sell, as happened in 1947, the last time that a less attractive issue of savings certificates was made. Surtax payers can be expected to come in and buy up to the limit of the new issue; but in terms of gross interest this is expensive borrowing indeed. With its constant difficulties in the gilt-edged market, the Treasury ought to be especially reluctant to risk losing the support of the small investor; recent experience suggests that the rate does count.

LINERS

The Queen Victoria?

QUITE confounding earlier indications of the kind of liner that it might choose to replace the present transatlantic *Queens*, the Cunard Steam-ship Company

announced last week that it had in mind one of 80,000 gross tons to replace the *Queen Mary*, which is 81,237 gross tons. It sent broad specifications of the proposed replacement, with an estimate of cost, to the Minister of Transport last weekend: Mr Watkinson had asked also for a study of the expected growth of traffic across the Atlantic, by air (including possible supersonic liners) and by sea, over the next 25 years. He has already had an independent survey on Cunard's financial position. Colonel D. H. Bates, chairman of Cunard, said that the new ship would take another 12 to 18 months on the drawing board and four years to build—presumably at John Brown's. The rough estimate of cost is still of the order of £25-£30 million.

Gross tonnage is a measure of the space enclosed in a ship, not of weight: the liner to replace the *Queen Mary*, by employing light alloys, will be able to achieve the 30 knots required with somewhat lighter engines, and will have a draught of only 30 feet against the *Mary's* 39 feet, enabling it to dock at Southampton at any state of the tide. The new liner, however, would still be much larger than the *United States* or the new French liner. Cunard's decision will presumably arouse even more criticism than before from some shipping men who are publicly arguing that several smaller liners, with mainly one-class accommodation and far less elaborate catering than the somewhat overpowering hospitality of the present *Queens*, would serve Britain better on the surface of the Atlantic. With a similar number of passengers, the liner proposed by Cunard might offer even greater luxury and service (and perhaps an even higher crew-passenger ratio ?) than the present vessels.

This is an argument primarily for practical shipping men and naval architects, perhaps with evidence about future trends in traffic from the general travel business and from shipping's rivals the airlines. The extent of the public interest in it will depend upon the stake of public money put into building the liner. Cunard seems to have gained almost without argument the point that there shall be a building subsidy, or similar assistance. But if the assistance is to be as expensive as seems likely, Parliament should certainly insist upon some independent economic assessment of the best size and kind of ship or ships to subsidise before it rubberstamps the Government's decision to proffer the money. This will not be Cunard's business alone.

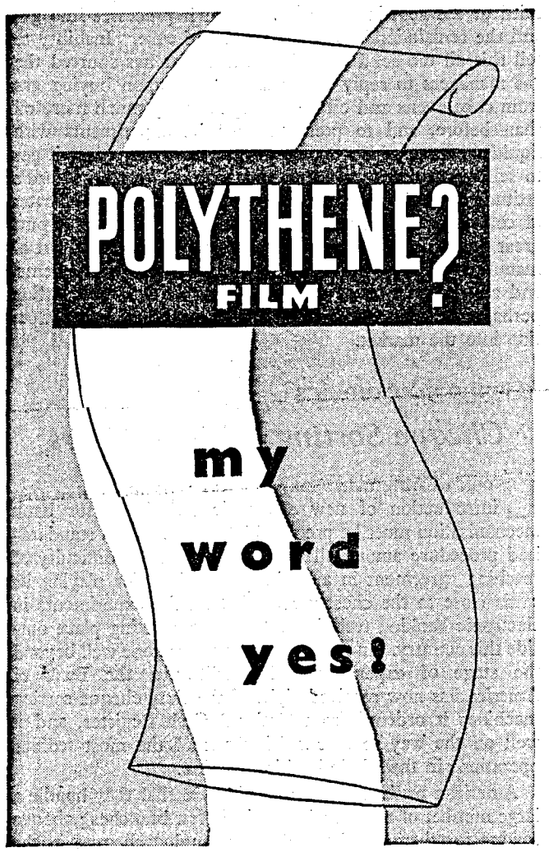
ATOMIC ENERGY

Home Truths

THE Parliamentary and Scientific Committee of the House of Commons heard some unpalatable home truths about atomic power on Wednesday from Mr Robert McKinney, who was chairman of the Congressional panel on atomic energy three years ago and has recently retired from the post of US representative to the International Atomic Energy Agency in Vienna. Mr McKinney was ostensibly speaking about the Euratom nuclear power programme, but it cannot have escaped his listeners that much of what he was saying applied equally well to Britain. Few experts have yet discussed the coal crisis in Western Europe along with the Euratom nuclear power programme, but when they do they are led, like Mr McKinney, quite inevitably to conclude that the probabilities of supply and price of conventional fuels like coal, oil and natural gas have changed so radically since the Suez crisis of 1956—when the Euratom programme was drafted—that high cost nuclear power is not needed in the energy supplies of Western Europe in the near future. He congratulated the public utilities of the Euratom countries for the hard-headed way that they had faced up to this fact and (unlike their British counterparts), have refused to be stampeded into ordering nuclear power stations.

About the high costs of nuclear power, Mr McKinney has no doubts at all. "In 1959," he said, "we in the United States have found that the real costs of building nuclear power plants are much higher than we assumed in the 'impressionistic' period of atomic energy" which he dates at around 1955. Individual nuclear power stations that were expected to cost $50 million to build in the United States now seem likely to cost $110 million and are still not finished. He suggested that the 15,000 megawatt nuclear programme for Euratom, planned to be completed in ten years from 1957, was now completely unrealistic and is likely to be replaced by a much more experimental programme involving perhaps five or six nuclear power stations in all. There is a crying need, especially in Britain, for more of this kind of informed criticism of investment programmes that commit countries to massive capital expenditure for a decade or more ahead.

HIRE PURCHASE



Puzzle about the Figures

HIRE purchase debt at the end of April approached £700 million, compared with £500 million at the end of the credit squeeze last summer; and the figures of Hire Purchase Information for May suggest that the expansion was then continuing in full spate. Total contracts for cars last month were very near their all-time record in April. Indeed, the surprising thing about the Board of Trade's preliminary estimate of the HP debt in April is that it is not larger. At £28 million, the rise is only a shade above the rise in March; since business in cars is known to have increased sharply, this implies a slackening in durable household goods. Yet direct observation and the Board of Trade's report on retail trade in April show that sales of durable goods rose sharply in budget month. Total hire purchase debt does not move exactly in line with new HP sales, as it reflects also repayments on past contracts. There may also be some timing lags in reports from shops and finance houses. But these influences do not obviously explain the present puzzle. Possibly the detailed official figures due later this month will help.

BUILDING SOCIETIES

Lesser Breeds within the Law

JUST over four million people have money in shares and deposits of building societies. Some of them, attracted by high rates of interest, have invested in societies that are more interested in financing property development and speculation than in lending on mortgage on owner-occupied property. To these investors Sir Cecil Crabbe, the chief registrar of friendly societies, issues in his latest report as clear a warning as any public servant could. A building society can lend on the security of shops, hotels, cinemas, farms and other commercial property. That is entirely legal. But although funds so lent, as Sir Cecil says, may

seem to be adequately secured, "there is a speculative element in much of this property and often there is no reliable covenant given by an individual or evidence of the borower's ability to repay the mortgage." This leads Sir Cecil to conclude:

> If the investing public wish to be sure that their money is being lent on the security of owner-occupied property they are advised to inquire as to the mortgage policy of the society and in any event to be content to receive the normal rate of interest and not be attracted by extravagant offers.

Building societies can expand by mergers as well as by active lending policies. To those societies that openly proclaim their willingness to accept a transfer of engagements Sir Cecil gives another pertinent reminder of his powers. He has the power to waive certain stipulations on voting on negotiations for mergers. In future he will keep a watchful eye on has regard to the possibility that the reserves of a society which is party to a merger may be excessively weakened and that reserves may be extravagantly dissipated by compensation to directors and other officers and by bonuses to shareholders.

THE FUEL MARKET

An Embarrassment of Coke

STOCKS of unsold coke in Britain today are not as vast in sheer tonnage as those that the National Coal Board holds of coal: on May 16th there were 2½ million tons of gas coke and 4.4 million tons of metallurgical coke at gasworks and coke ovens. Commercially, however, the stocks of ordinary coke weighed even more heavily on the market: unsold coal stocks represent just over six weeks' consumption, over and above consumers' own holdings, but the coke unsold represents no less than five months' supplies to domestic and industrial consumers.

This collapse in demand for ordinary smokeless solid fuels —which has not mollified those consumers who complain at the closing of anthracite mines that were losing about £4 a ton even at premium prices—has hit the Coal Board hard financially; has somewhat stiffened its relations with the steel industry; and has been one of the factors influencing the gas industry to lean farther over to oil. Last year, for the first time since nationalisation, the board made a loss on its coke ovens and by-products works, losing 3s. 1d., before charging interest, on each ton of coke that it carbonised. In its report last week the board referred delicately to an agreement, made in 1954 with the steel industry, that if it maintained and somewhat developed its coking capacity, metallurgical coke consumers in times of over-supply would reduce their own coke production as much as their purchases from the Coal Board and other merchant coke producers. In the first quarter of 1958, however, merchant supplies of blast furnace coke were down by 20 per cent on a year before, while those from steel industry ovens were practically unchanged; and in April last year the steel industry gave notice to terminate the agreement formally as well as in practice. "A basis of agreement," the board commented, "was reached early in 1959": this does not appear to provide for the board and the other oven operators any very considerable guarantees.

The gas industry, in its ordinary plant, turns about a third of the heat in every ton of coal it processes into gas and the remainder into about 10 cwt of coke. Inability to sell this all too solid second fuel last year has spurred the gas managers to reply as far as possible upon buying gas from coke ovens and oil refineries, to gasify much more oil than before, and to press forward its experiments with liquid methane with enthusiasm; anything that gives it gas to sell without coke to stock will help. The Coal Board's attitude towards proposed reductions in forward estimates of coal required for gas is necessarily ambivalent. It puts great store, rightly or wrongly, by its own development of manufactured smokeless solid fuels for the ordinary home, and an over-supply of the cheapest smokeless fuel lasting perhaps for years, will not necessarily assist their introduction into the market.

BANKING ELECTRONICS

Cheque Sorting Without Tears

LONDON clearing banks may be right in thinking that the introduction of new electronic techniques for bank mechanisation must be preceded by agreement on standardised procedure among all the banks. But the difficulty of reaching agreement in a business notorious for playing its cards close to the chest means that all the experiments in electronic banking techniques to date are taking place outside this country. In some cases they have gone well beyond the stage of experiment. In California, the Bank of America has now received eight of the sixty cheque sorting machines it ordered from National Cash Register, and is well on the way to mechanising one of the most tedious operations in the whole banking routine.

American banks differ from British in that they handle a large number of accounts in relatively few branches; cheque sorting for them consists only of arranging cheques in the correct account order, but a single branch may have up to 100,000 accounts. The "personalised" cheque, with the account identified by a code number printed on the cheque at the time it is issued, is already widely used in America; it is only just being introduced in this country. The Bank of America prints this number in ink that can be magnetised and so "read" by electronic eyes. The most difficult part of cheque sorting consists of the mechanical side of the apparatus, which actually moves the cheques from place to place. The new sorter uses a combination of suction, to pick up and move the paper, and friction rollers to prevent two sheets sticking together. It can sort the cheques in this way into twelve pockets (ten digits, one for rejects, one for big accounts) at the rate of 750 a minute. Since the machine only "reads" one digit during each run through, the cheques go through it several times, but the time saved on hand sorting is nevertheless considerable.

Cheque sorting in Britain consists of dividing cheques among 2,000 to 3,000 branch banks. Mechanically the problems are the same as in America, but the fact that sorting is done at head office and not at the local branches means that the numbers of machines needed by the British banks are far fewer than any American bank would require. This may well limit the amount of money that manufacturers will be prepared to spend in tailoring a sorting machine to suit British requirements which include, among other things, sorting into nearly twice the number of pockets provided in the United States.

WOOL MARKET

Prices Slip Back

WOOL prices rose so sharply in the first part of April that a pause was to be expected. In fact prices have dropped quite sharply. The average price of merino 64's wool last week was 91d. a lb, 7½ per cent below the peak, and crossbreds were also as much as 7½ per cent cheaper. This week some grades have weakened further. In Bradford 64's B tops can be bought for about 103d. a lb, or 9d. below the peak. To some extent the decline reflects the poorer quality of the wool remaining from this season's clip.

Little business has been done in Bradford since prices started to fall, though the order books of most firms are still comfortably full. Buyers are naturally hesitant; before this year's recovery began they had been operating on a falling market for over eighteen months, and that painful experience is still fresh. But few people expect prices to fall much lower. There is no sign of a check to the gradual improvement of world consumption, and buyers will need to cover their requirements before next season's wool becomes available.

In the first quarter, according to the Commonwealth Economic Committee, the rate of consumption of new wool in ten major countries was slightly higher than in the fourth quarter, and six per cent higher than in the first quarter of 1958. But the improvement is still patchy. While the United States, Britain and Japan used much more wool in the first quarter than a year ago, consumption in some other countries, especially France, was down.

OIL

Shell-BP Sign with Nigeria

THE contract signed this week between the Government of Nigeria and Shell-BP Petroleum Development of Nigeria for oil exploration and production comes as the climax of three years' negotiations, during which time the company has spent nearly £50 million on prospecting operations in several areas within the country. Under the terms of the agreement Shell-BP will pay royalties amounting to 12½ per cent on all oil produced (instead of a flat rate of 4s. a ton as it has been doing) and taxes will bring the government's share up to the once universal 50 per cent of the company's net profits. The agreement is subject to renegotiation during its 30-year life if the company concludes agreements with other African governments on more liberal terms during that time; it is stated to cover areas in all three regions of the country. Shell-BP's activities are concentrated at present in the Eastern region, although some prospecting is now going on in both the North and West. Three small fields have been discovered in the East; one of these has more or less turned to water and production from the other two is now running at a level of about 9,000

How Does Your Firm Compare?

UNTIL a few years ago the compilation of "interfirm comparisons," providing a company with a few key figures to show how its operating performance and financial results compare with those of others in the same trade, occurred in Britain only occasionally, as a by-product of price control or agreements. As a management technique in itself, interfirm comparison has been relatively little used in this country, although in some other countries, especially Germany, Switzerland and the USA, it has been extensively employed for many years. However, interest has been growing, and a Centre for Interfirm Comparison has just been set up by the British Productivity Council. This centre, with its headquarters at the BIM, will make comparisons by arrangement with individual firms and also act on behalf of trade associations. It will be able to provide an international IFC service through contracts with other national IFC bodies and the European Productivity Agency of OEEC. All the comparisons are strictly anonymous, and detailed instructions are given to ensure comparability.

The object of these comparisons is not to compare "firms" as such, but to show what effect certain differences in their features and practices have on their performance, as reflected, for instance, in profits and costs, sales, output and productivity. Such comparisons with other firms can be a valuable aid to management, since internal figuring is always liable to ignore what other ways of managing might achieve. What appears to be a satisfactory rate of progress, for instance, may represent a decline in one's share of a total market that is growing faster than appears, or a lower rate of profitability than one's competitors achieve.

The actual ratios compared will depend upon who is going to use them and for what purpose. Comparisons may be made for general management, to show, for instance, differences in financial achievement and the possible reasons for them. They can also be made for more specialised purposes, for example, to show the effects of differences in product design and methods of manufacture on the number of manhours used. A booklet on the subject published by BIM* instances:

1. Operating profit as percentage of assets employed.
2. Profit after tax as percentage of sales.
3. Turnover of capital employed (comparing the volume of sales obtained from capital).

Any comparative deficiencies shown in these can possibly be explained by some of the following ratios:

4. Cost of production as percentage of sales.
5. Cost of marketing and distribution as percentage of sales.
6. Cost of administration as percentage of sales.
7. Fixed assets as percentage of total assets.
8. Stock turnover.
9. Turnover of debtors.

The BIM booklet lists the industries, trades and products that have been covered by interfirm comparisons in various countries. These include such varied industrial and commercial activities as blast furnaces, coal mining, monumental masons, cutlery, cotton spinning, railways, bakeries, plant nurseries, a wide range of retail distribution, banking, restaurants, hairdressing and even undertaking.

* "Interfirm Comparison for Management," by Herbert Ingham and L. Taylor Harrington. British Institute of Management, 1958. Price 17s. 6d.

barrels a day, though the company hope that total output may reach half a million tons this year.

Shell-BP of Nigeria, like all the parent companies' African subsidiaries, is jointly owner by Shell and British Petroleum. This agreement is the second signed recently by a major oil company in Nigeria; it was announced last month that a subsidiary of Mobil Oil had signed an exploration agreement covering 2½ million acres in Western Nigeria, retroactive to April 1958, when Mobil first began prospecting operations there.

TIN MARKET

Export Quotas Again Relaxed

THE international tin agreement is behaving in model fashion: tin prices in London have held steady in the last three months at a little over £780 a ton. When the year began the buffer stock held too much tin and no cash, and producers were obliged to restrict exports severely to allow the stock to be run down. When the price is above £780 a ton the manager of the buffer stock is allowed to sell, and since the price climbed above that level he has sold substantial quantities.

Evidently the tin council now believes that enough tin has been sold from the stock to permit a further increase in exports, and it is raising export quotas for the third quarter by 2,000 to 25,000 tons, equal to 66 per cent of the rate of export before control was imposed. Under the provisions designed to enable the most economic producers to increase their share of the market, the basic tonnages of Bolivia and Indonesia have been cut, and those of Malaya and other countries increased. Agreement in principle has been reached for the sale of 2,500 tons of tin from the British strategic stock through the agency of the buffer stock. As sales will presumably be made more or less at the manager's discretion they should have less impact on the market than if the British government had followed its normal practice of inviting bids.

TIMBER

Expanding Chipboard

THE recent installation of a new chipboard plant at the Weybridge works of the Airscrew Company and Jicwood, a wholly owned subsidiary of British Match, has increased the British production capacity for this material by 7,000 tons a year, or about 20 per cent. Chipboard, which is made by impregnating wood chips with synthetic resin, forming the mixture into a "blanket" and then heating it under pressure to cure the resin and leave the finished board, has grown fast since its inception during the war in Germany. British production was begun by Airscrew in 1945, when they made some 450 tons; it reached 25,000 tons in 1956 and 35,000 in 1958, of which Airscrew made about 22,000 tons; the principal other producers are British Plimber and Bartrev, which has sold some plants to Russia.

World production of chipboard has grown at an even faster rate; from 20,000 tons in 1950, it is estimated that it will reach at least 1,800,000 in 1960, of which 1,500,000 would be made in Europe, 60,000 tons in Britain and 300,000 tons in the USA with perhaps 100,000 tons more from Russia. Germany has been the centre of the most rapid advances in output, and of the development of plant; the new machinery at Weybridge is German-built. Electronically controlled and largely automatic in operation, the plant cost £250,000. Labour and materials—in this case mainly waste chips from woodworking plants, though in others chips made from forestry thinnings or logs are used—are less important elements of cost than capital charges, so the plant is operated 24 hours a day.

Furniture and building are the two main uses for chipboard. It is not suitable for use outdoors, but can replace planking or plywood anywhere else. For use in furniture, it is normally veneered or covered with a laminated plastic, and used where extensive flat surfaces are needed; in building it is used for flooring and panelling. Compared with plywood, its most direct competitor, its cost is about half for the same thickness, and it is easier to work: though it is weaker than plywood, and so is normally used in greater thicknesses, its strength is the same in all directions and it does not warp. Consumption of chipboard in Britain in 1958, was about 2-2½ million cubic feet, perhaps 15 per cent of the volume of plywood used. But imports are rising this year and home production will rise also, so it seems likely that chipboard will increase its share of the market.

PHOTOGRAPHY

How Much for a Snapshot?

HOW much does an amateur photographer in Britain have to pay for his hobby—and how do his costs compare with those in other countries? These questions are surveyed in an article by Mr Michael Wilsdon, in the first issue of *Perspective*, an attractive quarterly review of progress in photography and ancillary industries published by Focal Press. Noting that British amateur photographers are prone to feel that they are at a disadvantage compared to their counterparts in (particularly) the United States and West Germany, Mr Wilsdon has set out to compare the costs, in real terms, of cameras, lenses, film and processing in Britain and other countries. This has made it necessary to derive a special exchange rate with which to compare price levels and costs of living in other countries; while admitting the difficulty of such an exercise, the author has relied largely on well-known studies by OEEC and the United Nations for his "real" exchange rates.

The comparison is in two parts: initial costs, including cameras, lenses and other basic equipment, and running costs, including film and processing. Four countries besides Britain are compared: the United States, West Germany, Italy and Belgium. Taking costs in Britain as 100 in each case, the results in the case of initial costs are the United States and West Germany 70, Belgium 80, and Italy 105; for running costs, the United States 90, West Germany 125, Italy 180, and Belgium 145. Thus while paying more for cameras and other equipment than photographers in any of the four countries except Italy, British camera owners enjoy lower costs, once they have bought their equipment, than in any country except the United States.

That initial costs should be high in Britain is to be expected: in addition to purchase tax, imported cameras are subject to an import duty of 50 per cent. Furthermore, the existence of severe import restrictions still nourishes a black market in high-class cameras in Britain, with premiums running as high as 25 per cent. This market's chief source of supply is Continental tourists, who are able to sell their cameras for nearly twice as much as they paid for them in their own countries; these cameras are then resold as second-hand by British retailers. The recent removal of import restrictions on separate lenses brought their prices down to list prices virtually overnight; but there appears to be little hope of relief for cameras.

STEEL

Cold Forging comes to Britain

"COLD forging" of steel, by a process that can form quite complex solid or hollow shapes under pressure without prior heating of the metal, was first used in Britain for the production of shells—following German war-time practice—at the Royal Ordnance Factories. The ROFs are now taking development contracts from civil companies, in order to apply their experience more widely: the motor industry in particular would like to use the method for certain components. One component supplier, Forging and Presswork, Ltd., has already begun to use cold forgings under licence from a German company.

The technique practically eliminates the need for machining with many components, because it can produce parts to small dimensional tolerances, and with an excellent finish. This greatly reduces the material cost by virtually eliminating wastage; as cold working of steel also improves its strength, so that cheaper grades may be used and heat-treatment eliminated, the overall saving may be considerable. German estimates suggest that the material and labour of cold forging may often be 30 per cent and sometimes as much as 75 per cent lower than hot forging and then machining.

The more machining one normally needs, the more cold forging may save. Its tooling costs are high, so the process is only economic where large batches are needed—perhaps a minimum of 5,000, though the figure will be higher for small parts than for large. So far the parts most commonly made have been relatively simple, such as shock-absorber cylinders; but gear wheels, chain sprockets and other more complex products can be cold forged, and one of the development contracts held by the ROFs comes from a motor manufacturer interested in these possibilities.

SHORTER NOTES

No restrictions are imposed by the Treasury on transfer of the proceeds of sales of direct investments in the United Kingdom by non-residents. The restrictions on transfers through the official market referred to in an article entitled "Capital Questions" in our issue of May 16th apply only to capital invested in portfolio securities.

Shaikh Abdallah H. Tariki, Saudi Arabia's Director General of Petroleum and Mineral Affairs, has been elected to the board of directors of Aramco, as has Shaikh Hafiz Wahba, the country's Ambassador-at-large to the Arab world, in accordance with an agreement to give the Government representation on the oil company board.

Imperial Chemical Industries' latest reductions in the prices of wrought titanium bring these down to less than half the level charged in 1955, when the company began to produce this light metal. "Titanium" it observed in announcing the cuts, "can only achieve its full commercial potential when its price becomes more directly competitive with that of conventional materials."

* * *

A Business Note "Commercials Cover the World" on May 23rd described Intam Ltd as conducting audience measurement research for commercial television, through confusion with TAM, Television Audience Measurement Ltd. Intam Ltd is the international division of London Press Exchange.

* * *

Sears Holdings, which already holds 65 per cent of the ordinary shares of Scottish Motor Traction, is to make an offer of 15s. 3d. for the remaining 5s. units.

* * *

Orders placed by the oil industries with its British suppliers of equipment and general supplies, in the first quarter of 1959, amounted to £29,166,155, which was 10 per cent lower than in the first quarter of 1958.

* * *

The World Bank has made a loan of $72 million to Iran to finance construction or reconstruction of 1,530 miles of roads. The loan is the largest ever made by the Bank for a road project. Four United States commercial banks are taking up $12 million of the loan. The interest charge, including the 1 per cent commision of the World Bank, is 6 per cent—a shade higher than usual.

* * *

Under the Anglo-Soviet trade agreement Britain is to open a quota to a total value of £2½ million for imports of Russian machinery. The machinery falls into nine categories, with a separate quota for each, and the details have yet to be worked out. The agreement takes effect on July 1st.

* * *

Opposition from some institutional investors holding non-voting shares in Butterworth and Company, the publishers, has prevented that company from carrying through its proposed two-for-five scrip issue in voting and non-voting ordinary shares, like for like. The issue would have raised the issued voting equity to £175,000 and the non-voting to £350,000.

* * *

Following an increase in total sales from £73.6 million to £76.9 million the trading profits of the Metal Box group rose by 10 per cent from £7.1 million to £7.8 million in the year ended on March 31st. The ordinary dividend has been raised from 11 per cent to 13 per cent and a 50 per cent scrip issue is proposed.

CUPIDS

COMMUNITY UNIT TRUST

Authorised as a Unit Trust by the Board of Trade and established by a Trust Deed made on May 20th, 1959 between the Managers and the Trustees. Copies of the Trust Deed may be inspected (or purchased for 5/-) at the offices of the Trust during normal business hours.

FAIR SHARES FOR ALL
—in the profits of industrial enterprise

The Managers offer for sale an initial issue of

20,000,000

UNITS AT **2s 6d** NET PER UNIT

to give an approximate gross yield of 4%

Managers: COMMUNITY UNITS (PARTICIPATING IN INDUSTRIAL DEVELOPMENT) LTD.

Directors:
Sir Kenneth Grubb, C.M.G., LL.D., (Chairman)
Rt. Hon. Lord Archibald (Vice-Chairman)
Frank C. Bennett, F.C.A., F.C.I.S. (Managing Director)
W. S. Shepherd, M.P. H. Poulter

Trustees: MARTINS BANK LIMITED

Auditors to the Trust: PEAT, MARWICK, MITCHELL & CO.

Solicitors to the Managers: ALLEN & OVERY

Solicitors to the Trustees: LINKLATERS & PAINES

DISTRIBUTION *of net income will be made half-yearly on the 15th May and 15th November. The Managers are entitled to deduct a half-yearly charge of ½% of the value of the Trust Fund. An initial charge not exceeding 5% and a small adjustment not exceeding one penny per unit or 1% (whichever is the less) are included in the sale price of the Units. No other management charges are a liability of Unit Holders.*

THESE ARE SOME OF THE ADVANTAGES OF COMMUNITY UNITS:
You will acquire...

★ **A SHARE** in the actual ownership of industry—by means of the lowest priced Units so far offered to the public;

★ **THE BENEFIT** of constant supervision of your investments by experienced financial experts;

★ **AN ASSURED INCOME** because each certificate represents a stake in the cream of home and overseas industrial enterprises;

★ **EASE OF REALISATION** whenever required. The Managers will at any time repurchase your Units at a price not less than that calculated in accordance with the terms of the Trust Deed.

PROOF of the soundness of the Unit Trust movement is to be found in a comparison between the records of Unit Trust shares and the "Financial Times" Index of industrial ordinary shares.

COMMUNITY UNIT TRUST FUNDS will be invested in more than 100 shrewdly chosen industrial shares and other securities, thus ensuring the participation by Unit Holders in the development and prosperity of expanding industries at home, in the Commonwealth, U.S.A. and Europe. In the first instance the portfolio will include ordinary shares selected from the following investments:—

Alliance Assurance	British Relay Wireless & Television	English Electric	Leyland Motors	Rolls Royce
Asquith Machine Tool	Brown (John)	Ford Motor	Lloyds Bank	Rugby Portland Cement
Associated Electrical Industries	Burmah Oil	Gallahers	Lombard Banking Company	Schweppes
Bass Ratcliff & Gretton	Cementation	Great Universal Stores	London Assurance	Shell Transport & Trading
Beaverbrook Newspapers	Charringtons	Guest Keen & Nettlefolds	London Brick	Standard Bank of South Africa
Beecham Group	J. & P. Coats	Guinness (Arthur)	Lucas (Joseph) Industries	Standard Motors
Boots Pure Drug	Consolidated Gold Fields of South Africa	Harrods	Marks & Spencer	Stewart & Lloyds
Bowater Paper	Consolidated Zinc Corporation	Hawker Siddeley	Martins Bank	Taylor Woodrow
British American Tobacco	Courtaulds	Hong Kong & Shanghai Bank	Metropolitan Estate & Property	Telephone Rentals
British Commonwealth Shipping	Daily Mirror	Hoover	Midland Bank	Union Corporation
British Home Stores	De Beers Consolidated Mines	Horlicks	Monsanto Chemicals	United Dominions Trust
British Insulated Callenders Cables	Debenhams	House of Fraser	Patons & Baldwins	United Molasses
British Match	Decca Record	Hovis McDougal	Prudential Assurance	United Steel
British Motor Corporation	Delta Metal	Imperial Chemical Industries	Qualcast	United Sua Betong Rubber
British Oxygen	Distillers	Imperial Tobacco Company	Ranks	Wakefield
British Petroleum	Dunlop	International Paints	A. E. Reed	Watney Mann
British Plaster Board	Electric & Musical Industries	Johannesburg Consolidated Investments	Rhodesian Anglo American	Wilmot Breeden
		Lancashire Cotton Corporation	Mines	Whites (Timothy) & Taylors
				Woolworth (F. W.)

If you require further advice please consult your Bank Manager, Stockbroker, Accountant or Solicitor.

APPLICATIONS IN RESPECT OF THIS ISSUE
should be made on the attached form and must be for a minimum of forty Units and, above this number, in multiples of ten. Every application must be accompanied by payment in full for the number of Units applied for.

The Application List opens June 10th and closes not later than noon on June 19th.

FOR YOUR GUIDANCE

£5	will buy 40 Units
£20	160 Units
£50	400 Units
£100	800 Units
£250	2,000 Units
£1,000	8,000 Units
£2,500	20,000 Units
£10,000	80,000 Units
£25,000	200,000 Units

APPLICATION FORM To be completed and forwarded to COMMUNITY UNIT TRUST, Winchester House, Old Broad Street, London, E.C.2.

I/We hereby apply for _____ *Units in COMMUNITY UNIT TRUST at the advertised price of 2s. 6d. per Unit, in accordance with the conditions contained in the Offer from which this form is detatched, and subject to the Trust Deed.*

I/We enclose cheque/money order/cash for £_____ *being payment in full for the number of Units applied for. I/We understand that the money will be returned to me/us in full if no Units are allotted*

**I/We declare that I/we am/are not resident outside the Scheduled Territories and that I/we am/are not acquiring the Units as the nominee/s of any person/s outside those territories.*

**If you are unable to make this declaration it should be deleted and the application lodged through an Authorised Depositary. (Note: Authorised Depositaries include Banks, Stockbrokers and Solicitors in the United Kingdom. The terms 'Authorised Depositary', 'Scheduled Territories' and 'Nominee' are defined in the Bank of England's Notice E.C. Securities 8, as amended.)*

COMPANY MEETINGS

SCHWEPPES LIMITED

CONTINUED PROGRESS AT HOME AND OVERSEAS

THE HONOURABLE R. HANNING PHILIPPS' REVIEW OF WORLD-WIDE PROGRESS

The sixty-second annual general meeting of Schweppes Limited was held on May 28th at the registered office of the company, Schweppes House, 1-6 Connaught Place, London, W.2, The Honourable R. Hanning Philipps, MBE (the chairman), presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1958:

For the first time in the Company's history the consolidated profits have passed the £3 million mark.

The actual figure of £3,235,897 was attributable in part to better business at Home and in part to improved results Overseas.

HOME TRADE

Schweppes.—Sales of our carbonated lines rose by 15.4 per cent as compared with 1957, which was better than at one time seemed likely, and reflected an unusually steep rise in the pre-Christmas period following the end of credit restrictions. The feature of these increases was the continuing popularity of our comparatively new drink, Bitter Lemon, which as a market leader enabled us to open many new accounts where previously our products were not on sale.

Rose Kia-Ora.—Our leading Home subsidiary experienced a decidedly difficult year in its fruit squashes and its cordials, both of which are especially susceptible to the vagaries of the weather.

As we expected when Rose and Kia-Ora joined forces, improved distribution has been achieved, and considerable economies in transport and office costs have resulted.

In addition during the year there has been [illegible] business with that of Schweppes (Overseas) Ltd.

On the brighter side we can report a growing public taste for Dubonnet whose sales have leapt ahead with an impressive increase of 33 per cent over 1957.

Jewsbury & Brown Ltd.—Operating mainly in the Manchester area, this important subsidiary has had another successful year due in large part to its rapidly developing sales of our standard Schweppes' lines which it now bottles for us and distributes.

Apollinaris Co. Ltd.—There has been a small but welcome increase in the sales of "Polly," which, among the more discriminating is still regarded as the outstanding mixer for whisky.

The Park Bottling Co. Ltd.—This Company which operates the valuable Pepsi-Cola franchise has continued to develop as planned despite the fact that the Cola drinks are also among those highly sensitive to the weather.

Now that certain international difficulties over bottle design have been cleared up the future of this business looks reasonably assured.

HOME PROFITS

Schweppes Home Profit, after charging £320,028 for depreciation compared with £273,066 in the previous year, but before charging taxation, amounted to £1,881,601, as against £1,427,348 in 1957, an increase of £454,253.

This improvement is accounted for both by a rise in the amount of dividends received from subsidiary companies and by an increase in Schweppes' own profit on trading.

CONSOLIDATED PROFITS

The consolidated Net Profit, after charging £625,717 depreciation compared with £528,671, but before taxation, is £2,525,353 compared with £2,118,925 in 1957. This is an increase of £406,428 for the year.

Taxation at the new rates of Income Tax and Profits Tax absorbs £1,182,749.

After writing off expenses in connection with the recent increase in Capital your Directors have placed to General Reserve the sum of £400,000.

BALANCE SHEET

There have been a number of changes in the Balance Sheet brought about mainly by three factors of importance.

(1) A re-valuation of the Company's pre-war properties which showed an increase in value of £650,000.

(2) An issue for cash of an additional £758,028 10s. Ordinary Stock by means of a rights issue.

(3) The capitalisation of £2,653,100 standing to the credit of Reserve Funds.

As a result, total consolidated assets, excluding Goodwill, now exceed £17 million, while Current Assets exceed current Liabili[illegible]

DIVIDEND POLICY

At the time of the Capital changes I have just referred to, your Board forecast a more liberal distribution of profits by way of dividends to our Ordinary Stockholders.

The reason for this change of policy was that whereas in recent years our capital development at Home had of necessity to be financed out of accumulated profits, the easing last October of Government restrictions on Capital Issues enabled us to approach our Stockholders for new money to meet the cost of our immediate planned capital development.

DECLARATION OF DIVIDEND

Having paid an interim dividend of 5 per cent on the Capital as it stood before it was increased last October, your Directors now recommend a final dividend for the year to December 31, 1958, of 7½ per cent and a further special interim dividend of 5 per cent in respect of the year ending December 31, 1959.

The cost of this special interim dividend will be met out of the profits for 1959, but will be ignored by your Board when the time comes to consider the normal interim dividend (usually paid in October) and the final dividend for that year.

In effect the rate of dividend has been raised to 15 per cent per annum on the £6,064,228 of Ordinary Stock as compared with the equivalent of 10 per cent.

If the final dividend for the year ended December 31, 1958, is confirmed, warrants for the payment of both dividends will be despatched on May 28, 1959.

FORECAST

After the initial spending spree following the removal of credit restrictions, the effects of expanding hire-purchase began to react on the sales of marginal products such as our soft drinks. In consequence the heavy Christmas sales were followed by a period of slack trading. These adverse effects now appear to be wearing off, and with the aid of a good Budget the outlook for our business should gradually improve. Up to the end of April, Schweppes Home sales showed a small increase of 6.2 per cent and given a reasonable summer we should be able to look forward to another good year.

GROUP ORGANISATION

For many years our Overseas activities have been conducted through our subsidiary Management Company, Schweppes (Overseas) Limited. In a Group such as ours it seemed to us an anomaly that there should not be an equivalent subsidiary Management Company to take care of our Schweppes Mineral Water business in the United Kingdom. We have, therefore, recently formed a new company named Schweppes (Home) Limited to which we have transferred all our home assets other than our properties which are leased to them. The advantages of this [illegible] organisation and at the same time enables us to raise to the boardroom a number of our top executives who otherwise would find their paths blocked for some time to come.

In effect from now on, Schweppes Limited as the parent will be confined to the role of a holding and property owning company, while all trading operations will be carried on through its subsidiary and associated companies.

OVERSEAS

It is interesting to record that the considerable sums we have invested in developing new markets since the war are beginning to show us a return. In fact, during 1958, for every two bottles of carbonated drinks we sold at home we sold one bottle overseas, either through the intermediary of our overseas subsidiary companies or through overseas franchises. We anticipate that our overseas trade will continue to make an increasingly important contribution to the profits of our world-wide organisation.

Schweppes (Australia) Pty. Limited, a wholly-owned subsidiary, has earned record profits for 1957-58. And under the able management of Mr A. J. Byron we are confident that this Company will continue to develop in a most satisfactory manner both through its branches in Sydney, Melbourne, Adelaide and Brisbane, and through fran-

chises in the outlying and more sparsely populated areas.

New Zealand, which is also under the management of Mr Byron has had another reasonably satisfactory year in spite of the economic difficulties which that country has been experiencing.

Schweppes (South Africa) Limited, in which we have a controlling interest, are to be congratulated on having maintained their previous year's good trading results in spite of rather more difficult conditions.

Recently, Sir Frederic Hooper had an opportunity of visiting their Cape Town, Port Elizabeth and Durban branches in company with their Managing Director, Mr J. McA. Harvey. We believe that these meetings provide valuable opportunities for exchanging views and where possible helping each other whether by the provision of expert advice or by exploring new sources of raw material supplies.

I would like to take this opportunity of expressing publicly our very great regret at the serious losses our South African Company has suffered during the past year through the death of their former Chairman, Mr Gerald Orpen, who had served them so loyally and well and through the death of an old friend and much esteemed Director, Mr Gordon Grant.

Schweppes (Central Africa) Limited, which covers the Federation of Rhodesia and Nyasaland, and in which we have a controlling interest, have found trading conditions exceptionally difficult. However, despite the effects of a trade recession caused by the serious fall in the price of copper, as well as some serious strikes, their sales and profits have been well maintained. Apart from any political difficulties which lie ahead of the Federation, the long term outlook for our business is encouraging.

Schweppes (East Africa) Limited, which covers Kenya, Uganda, and Tanganyika, has undergone some measure of reorganisation during the year and there is now every indication that in 1959 we can look forward to improved results.

Schweppes (USA) Limited have had their first year of trading with the USA franchises under their own control. I am glad to report a substantial increase in A.B.C. as compared with the previous year when I told you they did little more than break even.

This Company has still got important problems to solve before achieving country-wide distribution but I can assure you that Commander Edward Whitehead is tackling them with great vigour and we should be able to count on further progress in 1959.

Schweppes (Canada) Limited has now reached the profit-earning stage for the first time. Early this year I visited a number of our Canadian bottlers who are linked to us through Pepsi-Cola (Canada) Limited, the holders of our franchise. From British Columbia in the west to Montreal in the east, I was everywhere greatly encouraged by the confidence shown in our Schweppes' products.

To give us more complete coverage, additional bottlers will be handling our lines during the course of this year and our profits should be assisted accordingly.

OVERSEAS FRANCHISE

Our newest operations have opened in Portugal and Senegal (Dakar). Of the older franchises, Belgium and France have continued most successfully under the management of Mr John Martin and his two sons, trading through the independent companies Schweppes (Genval) Limited and Schweppes (Paris) Limited. It may seem an anomaly that independent companies holding our Schweppes' franchise should bear the Schweppes' name, but both companies were originally formed by us in the first place in partnership with Mr John Martin and we regard him and his companies as a real part of the Schweppes' family, though we rely for our share of the profit on royalties alone.

Good results have also been shown in Hongkong, Norway and Switzerland.

Schweppes Overseas now has franchise bottling operations in 26 different countries and a further three countries will be opened up in the coming twelve months.

OUR STAFF

Only last year, in my "Ten Year Review," I described in considerable detail the steady growth of our business. And even in 1958, which was, for our industry, in some respects a difficult year, there was no sign of a halt.

Our long-continuing expansion, however well we plan it, must inevitably place a tremendous strain on our established staff; and in particular on our senior members of management, who cannot be augmented by a wave of a wand to meet our ever changing demands.

With this in mind I would invite our many Stockholders to join with me in thanking all those who have so unstintingly served our Company in 1958 and by their efforts contributed so much to the success of Schweppes throughout the world.

OBJECTS OF THE COMPANY

The Objects of Schweppes Limited as set out in the Memorandum of Association have not been altered since the Company was incorporated in 1897 when the business of J. Schweppe & Co. Limited was taken over. These Objects after 62 years of modern business development are unnecessarily restrictive, and your Board recommend that the Objects clause in the Memorandum should be extended so that it will be adequate to allow for the continued expansion of the business of the Schweppes Group not only [illegible] but throughout the world. These expanded objects will permit the natural development of the business of the Group to be spread over a wider field of operation than that at present permitted. While your Board have no new proposals under contemplation they consider that the Group's business has expanded to a stage where it can now advantageously take up any opportunities which may become available, if not directly connected with the Soft Drinks industry, at least parallel with it.

If the Stockholders sanction these enlarged Objects, your Board will not, without sanction of Stockholders in General Meeting, put any proposal into effect which would materially alter the nature of the Company's business. A separate Extraordinary General Meeting of the Company will be held immediately after the Annual General Meeting for the purpose of passing the necessary Special Resolution.

The report and accounts were adopted and the final dividend of 7½ per cent on the Ordinary Stock, less income tax, making 12½ per cent for the year, was approved.

The retiring directors, The Right Honourable Viscount de L'Isle, VC, and The Honourable Richard F. Greville, were re-elected, and the remuneration of the auditors, Messrs James Edwards & Co., was duly fixed.

At the subsequent extraordinary general meeting a Special Resolution amending the Memorandum of Association of the Company was sanctioned.

THE CHLORIDE ELECTRICAL STORAGE COMPANY

MEETING THE CHALLENGE OF COMPETITIVE CONDITIONS

The sixty-eighth ordinary general meeting of The Chloride Electrical Storage Company Limited was held on June 3rd at Exide Works, Clifton Junction, near Manchester, Mr A. W. Browne, OBE, MIEE (Chairman and Managing Director) presiding.

The following is an extract from his circulated statement: From the Consolidated Profit and Loss Account it will be seen that the income from trading is about the same at £2,794,000. The income from investments, however, shows a considerable increase.

The balance available for appropriation is larger than the previous year by some £200,000. Your Directors therefore felt justified in placing £300,000 to General Reserve, and paying to the ordinary stockholders a dividend of 12½ per cent, which with the dividend of 5 per cent paid last October makes 17½ per cent for the year under review, which is the same as paid for the previous year. They have also decided to pay on May 29, 1959, a special interim dividend of 2½ per cent to the ordinary stockholders in respect of the year ending December 31, 1959.

SCRIP ISSUE

Your Directors are of the opinion that the issued capital of the Company should be brought more into line with the capital employed in the business. It is therefore proposed to invite stockholders to pass a resolution to increase the authorised capital from £5 million to £7,500,000. Approval will also be sought to issue 1,582,200 "A" Ordinary and 595,206 "B" Ordinary Shares by way of capitalisation of reserves, so that additional ordinary shares may be issued fully paid to the existing ordinary stockholders in the proportion of one new share for each £2 ordinary stock now held.

In recent statements I have stressed the growing competition in the battery industry [illegible] particularly in the markets for automotive batteries and for batteries for electric factory trucks.

We are meeting this challenge in two principal ways:

First, we continue to devote much of our effort and financial resources to technical research and development. This has resulted and will result not only in the continued improvement of our batteries, but also in increased efficiency of the plant to produce them. I am able to state with confidence that we are well placed technically to retain our traditional position as one of the leading battery manufacturers of the world.

Our second principal answer to the challenge is by concentration and the streamlining of our manufacturing, selling and service facilities.

Surveying the total picture, including the sound financial position disclosed in our Balance Sheet, I am satisfied that we are well equipped to deal with future competition. Additionally, I am greatly encouraged in my view of the future by the buoyant way in which our managements, and indeed all our employees, accept the problems arising from the changes necessary to meet that competition.

The report was adopted and at the subsequent extraordinary general meeting the proposed capitalisation of reserves and scrip issue were sanctioned.

VICKERS LIMITED

A YEAR OF GREAT ACTIVITY IN A PERIOD OF TRANSITION AND CHANGING CONDITIONS

VISCOUNT KNOLLYS ON THE PRESENT POSITION AND PROSPECTS

The ninety-second annual general meeting of Vickers Limited was held on June 1st at 21 Tothill Street, Westminster, London, SW1.

The Viscount Knollys, GCMG, MBE, DFC (the Chairman), presided, and in the course of his speech said:

We are again this year circulating to each one of our employees a condensed version of the Annual Accounts and of the Review of the Year for their personal information.

1958 was a year of great activity in a period of transition and changing conditions. Defence orders continued to decline, though general engineering was active and profitable; newly developing ventures and products at home and overseas did not yet contribute to profits; shipbuilding did well again; Viscount sales and profits held the ground while new private venture aircraft progressed steadily; demand for most steel products declined sharply; lower world demands increased competition.

A year ago I forecast rather lower trading profits. This proved true, but only to the extent of about 5 per cent.

SHIPBUILDING AND SHIP-REPAIRING

1959 should prove as profitable a year for our shipbuilding yards at Barrow and Newcastle as was 1958. We are fortunate in being able to rely on a full order book, which should last into 1961. But no new orders have been received, though only one ship, a tanker, has been cancelled. Ship repairing has been and remains slacker and uncertain.

Our Yard and Works at Barrow are proud to have the responsibility of building the Royal Navy's first atomic submarine *Dreadnought*. We are honoured that HRH The Duke of Edinburgh is coming to Barrow on June 12th to lay her keel.

Last month the team of Vickers, Rolls-Royce and Foster Wheeler showed to the Lords of the Admiralty and to the Galbraith Committee their plans for a reactor suitable for large ships.

ENGINEERING

The sales and profits of our various and varied Engineering Works declined slightly in 1958 because defence orders fell off in some sections and demand slackened generally. Our efforts over the last few years to find and develop fresh commercial products and markets, with which to fill the gaps, continued actively and successfully and are already showing results. Since the year end the Engineering Company has received an encouraging amount of new orders.

At the end of 1958 we sent a team to Russia, as we did to China in the previous year, to size up the potentialities there. You will have seen that we have already obtained an order for the manufacture of a chemical plant worth in all about £2 million. We hope to conclude another contract for three large beet sugar plants in conjunction with Booker Bros., McConnell & Co. Ltd. If completed this would be worth some £11 million in all, though only a portion of this would be for our own Works.

We received at the end of 1958 and at the beginning of this year encouraging orders for our Earth-moving Tractor from the British Army. The contraction in construction equipment sales combined with an already fully equipped market has prevented us still from achieving the sales needed to cover the heavy production costs of this new development.

The overall prospects for our general engineering activities in 1959 are encouraging. We expect that sales will be increased and that profits should improve although probably with a smaller ratio. It is encouraging that generally speaking the percentage of our engineering products which we exported in 1958 remained at the same high figure as that of the previous year.

AVIATION

1958 was a year of intense activity for our Aircraft Company in all fields. In 1959, however, the Scimitar will be completing and the Viscount, after sales of over 400, is, not unexpectedly, tailing off. The 400th has just been delivered.

Since the first Vanguard flew in January it and the second aircraft have completed more than 160 hours in the air—an encouraging amount.

The design and development of the VC10 is going well.

Our Aircraft Company is gratified to have been chosen by the Ministry of Supply to develop, in co-operation with English Electric, the new Tactical-Strike-Reconnaissance aircraft for the RAF known as TSR2.

As regards the Swallow, our "variable geometry" experimental aircraft with movable wings, a joint research programme designed to prove its potentialities and practicability, is being undertaken by Vickers-Armstrongs (Aircraft) Ltd. with the Ministry of Supply and the United States Government.

Last year I made an appeal to the Government for the strengthening of Transport Command to be carried out in a way which would give the maximum benefit to the civil types already under consideration.

Without firm and early support by the Government, through RAF orders or otherwise, to back up the initiative of private enterprise in maintaining design and production facilities and in forward planning this country is more than likely, sooner than some people might expect, to find itself without a real aircraft industry at all. For it is clear that this initiative, so valuable to the country and to its whole industry, certainly cannot otherwise be continued or repeated by firms either alone or united.

The inevitable consequences would be the loss to this country of a great industry with its international prestige, the loss of technological talent, the loss of employment and the loss of its large, all-important exports. In our own case we have, in the last four years, sold to overseas customers aircraft to the value of £100 million.

STEEL PRODUCTS

The slackness in the Steel industry in the latter part of 1958, described in our Annual Review, has continued into 1959.

METROPOLITAN-CAMMELL CARRIAGE & WAGON CO. LTD.

Some good orders have been received by Metropolitan-Cammell since the beginning of the year and the Carriage Section of their Works should be well employed for the rest of this year. The outlook for Wagon orders is, however, unpromising.

CANADA

The sales and profits of our Canadian shipyards and engineering works, in common with other comparable heavy engineering concerns in Canada, declined during the past year as a delayed result of the general recession in Canada.

AUSTRALIA

I was able last February to see for myself the progress of our large interests in Australia.

I was once again very favourably impressed by our prospects.

COMPUTERS AND TABULATORS

The merger of Powers-Samas Accounting Machines Limited and The British Tabulating Machine Co. Limited into International Computers and Tabulators Limited, referred to in the Review, has been completed smoothly. Your interests in this growing and forward-looking industry are now represented by a holding of 38 per cent in the ordinary capital of ICT.

I am optimistic of our Group's not inconsiderable investment in this field.

PERSONNEL

We are grateful for the efforts of all our employees of every grade who have produced the results of 1958. We are fortunate in being able to count on their efficiency, keenness, and loyalty as we face the difficult and highly competitive conditions which lie ahead.

CONCLUSION

1958 was a better year than might have been expected. In 1959 our General Engineering and Shipbuilding Companies can be expected at least to maintain their turnover and profits. Our Aircraft Company, which is reverting to its more normal proportionate position in the turnover of the whole Group, has to face a more difficult time.

Overall it is clear that we must expect considerably reduced profits in the current year, due to the need to provide further large sums for the development costs of our new private venture aircraft and to a lower level of activity in our Steel and Canadian subsidiaries, which themselves should, however, respond soon to the improving prospects which I believe are in sight.

The report and accounts were adopted.

The National Bank of New Zealand Limited

Extracts from the Statement by the Chairman Mr. Arthur H. Ensor, to be presented at the Eighty-seventh Annual General Meeting on 25th June, 1959.

Current, Deposit and other accounts at £60,357,000 show a decrease of £2,550,000 which is primarily due to the contraction in bank credit generally and in particular to the fall in advances made by the Reserve Bank to the Government and the marketing organisations.

In my Statement last year I referred to the possibility of our earnings being affected to a limited extent by the severe import restrictions. This proved to be correct and our trading profit before tax declined although the fall is more than offset by a reduction in the amount required to meet the United Kingdom taxation. This permits a net profit of £301,000 to be shown, being an increase of £26,000 over the previous year.

From the net profit we have allocated £100,000 to General Reserve and have also transferred to General Reserve a further £150,000 from the balance of profits brought forward from previous years. In January last an interim dividend of 4% less income tax at 8/6d. in the £ was paid and the Directors now recommend for your approval a final dividend of 5% less income tax at 7/9d. in the £ on the new capital figure of £3,500,000 leaving a balance of £150,000 to be carried forward.

Business Development

Despite the quieter conditions of the past year, there has again been a satisfactory increase in the number of customers on our books. Our branch offices now total ninety-four branches and sixty-four agencies. In recent years we have opened offices in a number of new and developing areas in order to maintain our share of the total banking business and to provide a service where it appeared to be needed. A considerable part of the increase in our business has come from those new branches. A progressive building programme is still necessary and a number of new branch buildings are under construction, whilst others are being modernised.

Last year I referred to the difficulties which had beset New Zealand as the result of the adverse balance of payments and commented upon the energetic measures which were then taken with a view to stabilising the position.

Bank Advances

Credit restrictions remain an essential part of financial policy. They are designed to ensure that an excess of purchasing power will not be released at a time when the supply of goods has been restricted and this has no doubt played its part in the preservation of fairly stable internal conditions. It is still the official policy to reduce bank advances to a somewhat lower level, provided this can be done without undue disturbance to the economy. The banks are co-operating fully in this policy but it has proved difficult to reduce advances further to any marked extent, mainly because of the needs of the farmers who have required additional assistance from the banking system during the past year or so, following the sharp fall in their incomes, but also on account of advances which are considered to be in the national interest and therefore should be granted by the banks.

New Markets

The special characteristic of the New Zealand economy which makes it particularly susceptible to conditions abroad, as events this last year have again illustrated, is its dependence on a narrow range of primary export products. It is, therefore, of the greatest importance to foster the growth of new markets, to develop new products and to establish sound internal conditions with reasonable levels of prices and costs.

Industrial Development

The present import controls have provided a stimulus to overseas manufacturers to consider the feasibility of establishing their own factories in New Zealand in order to maintain supplies of their products on the local market, and during the past year experts from many companies have visited the country to examine prospects. As the establishment of new factories adds to the demand for imports, the most desirable industries are those which will utilise the country's own raw materials or which will add substantially to the value of imported raw materials.

New industries which are being developed will benefit from the very large volume of capital investment which has been made in New Zealand in the last ten years. A considerable part of this investment has been in the extensive electricity power projects and it was most gratifying to learn last December of the lifting of all power restrictions after three new power stations began to contribute to the supply. It must, however, be borne in mind that the maintenance of the large volume of investment in public utilities and private undertakings imposes a strain not only on the external balances but also tends to put an upward pressure on internal costs.

This is the kernel of New Zealand's problem. The requirements of a young and rapidly developing country call for a high level of both public and private capital formation, but the inability of a narrow range of primary industries adequately to support consumption and investment at their present levels becomes apparent when the terms of trade are adverse. In these circumstances, it is essential to uphold policies which will preserve the stability of money values and thus provide inducement to a steady volume of private savings, otherwise the high level of capital formation could well produce such pressure on internal costs that exporters would find themselves priced out of their markets.

The Immediate Future

The outlook for the immediate future appears moderately encouraging. The meat market has been good but unfortunately it has weakened in recent months. On the other hand dairy produce returns have improved and are steady at a reasonable level, and although wool prices have been low for most of the season, there has been a decided improvement in the market during the past few months. In general, the picture appears to give reasonable grounds for moderate optimism about prospects for next season.

New Zealand will continue to be faced with the problems associated with rapid development but the prospects before the country are such that they should encourage the best efforts of her leaders and people. For there can be little doubt that the marked progress made in the development of electric power stations, the improvement made in the roads, railways and port facilities and the efforts made to bring new land into production and to improve the health, education and general welfare of the community, will all contribute to the country's ability to take full advantage of more favourable conditions as they emerge.

THE CONSOLIDATED ZINC CORPORATION

NET INCOME WELL MAINTAINED IN SPITE OF REDUCED REVENUE FROM MINING OPERATIONS

The tenth Annual General Meeting of The Consolidated Zinc Corporation Limited will be held on June 23rd at 37 Dover Street, London, W.1.

The following is an extract from the Statement by Mr L. B. Robinson, the chairman, which has been circulated with the report and accounts for the year ended December 31, 1958:

The low lead and zinc prices prevailing at the end of 1957 continued during the first three quarters of 1958 and showed only a slight improvement in the last quarter. The average London Metal Exchange prices for prompt delivery of these metals during 1958 were £72 16s. for lead and £65 18s. 1d. for zinc, compared with £96 13s. 4d. and £81 12s. 4d. respectively during 1957, and at the 1958 price levels there can be little profit from mining these metals. In the circumstances I feel we are entitled to regard the results for 1958 as being satisfactory and reasonably encouraging.

The Group profit, before mining royalty and taxation, fell by £1,594,251 which was fully accounted for by the fall in the profit of the Zinc Corporation's mine at Broken Hill, New South Wales.

Consolidated Zinc Proprietary Limited again had a satisfactory year and showed an increase in profit which was largely brought about by the sale of rutile and zircon by Titanium and Zirconium Industries Pty. Ltd. at prices arranged under contracts entered into during previous years.

In the United Kingdom, although the profits from zinc smelting and sulphuric acid production by Imperial Smelting Corporation Limited were lower, the profits from the other products, in particular zinc oxide and other pigments and zinc alloys were reasonably well maintained.

Income from trade investments at £996,293 again showed an improvement.

The consolidated net profit for the year at £1,617,876, was, as a result of the considerably reduced charge for mining royalty and taxation, only £152,110 lower than the net profit for 1957.

The directors recommend a final dividend of 2s. per share, compared with 2s. 6d. per share last year, giving a total distribution for the year of 3s. per share compared with 3s. 9d. per share for 1957.

Expenditure during the year on mining property, under development outside the Broken Hill field, amounted to £49,004. In 1957, this heading included expenditure by Commonwealth Aluminium Corporation Pty. Limited but during 1958 50 per cent of the Group's shareholding in Commonwealth Aluminium was transferred to the British Aluminium Company Limited.

Capital expenditure commitments at the end of the year amounted to £4,434,000. These include the erection of a zinc smelting plant using the Imperial Smelting process at Swansea, a ferrous sulphate treatment plant, also at Swansea, and an extension of the acid producing capacity at Cockle Creek, New South Wales.

The consolidated balance sheet shows a cash position of £6,002,869, comprising Treasury Bills, Government and other short term securities and bank balances.

Since the end of 1958 the Group's resources have been augmented by the "rights" issue of 1,455,100 ordinary shares at 48s. per share.

LEAD AND ZINC MINING

In view of the prevailing conditions in the metal markets, both the Zinc Corporation and its associated company New Broken Hill Consolidated, budgeted for a reduced production of ore and recoverable metal in 1958 and in February, 1958, working time was reduced by 10 per cent throughout the Broken Hill field as a positive contribution towards the solution of the world problem arising from the fact that the output of lead and zinc is running in excess of demand.

Accordingly, in 1958, the Zinc Corporation treated a total of 659,268 tons of ore for a production of 79,098 tons of lead, 2,033,955 ounces of silver and 115,348 tons of zinc concentrate compared with 767,069 tons of ore for a production of 90,820 tons of lead, 2,198,457 ounces of silver and 139,684 tons of zinc concentrate in 1957. The 1958 outputs therefore represent reductions of approximately 13 per cent of recoverable lead and 17½ per cent of zinc concentrate.

The policy of reduced production will be continued in 1959 until such time as a more favourable outlook for metals justifies the return to full and normal operating conditions.

ZINC SMELTING

The output of zinc from the United Kingdom plants of Imperial Smelting Corporation was slightly lower than in 1957.

The modernisation and expansion programme which was begun in 1957 on the vertical retort zinc distillation plant at Avonmouth, was continued during the current year. By the end of 1958 eight of the eighteen retorts had been modified. Zinc metal output from this plant already shows a marked increase.

Operation of the Imperial Smelting process at Avonmouth continued satisfactorily during 1958. The decision to close down the obsolete and uneconomic horizontal distillation furnaces at Avonmouth was carried out by mid-1958.

At Swansea, the construction of the new Imperial Smelting process plant to replace the horizontal distillation plant was commenced in June, 1958, and such excellent progress has been made that the plant should be ready for operation at the end of the present year which is considerably ahead of the preliminary planning schedule. The new plant should add materially to the profitability of our zinc smelting operations in the United Kingdom and will also have the ability to recover lead-metal from the treatment of mixed lead and zinc concentrates.

In Australia, further progress was made during the year with the design of the new smelter to be built at the works of Sulphide Corporation Pty. Limited, at Cockle Creek near Newcastle, New South Wales. The original plans have been revised in the light of improved results obtained by the Imperial Smelting process plant at Avonmouth.

LEAD SMELTING

Lead smelting operations by the Broken Hill Associated Smelters Proprietary at Port Pirie continued satisfactorily throughout the year. The Company's results reflect the effects of the lower metal prices but these have been offset to a marked extent by further gratifying increases in operating efficiency. Since July, 1958, some reduction in lead production has been necessary to conform with the reduced mine production at Broken Hill.

IMPERIAL SMELTING PROCESS

The success achieved by the Imperial Smelting process continues to attract considerable attention among lead and zinc smelting interests throughout the world. During 1958 an option agreement to acquire a licence for the process was signed by the Société Minière et Métallurgique de Penarroya and after full investigation this company has decided to exercise its option and has now entered into a licence agreement. Under this licence the process will be installed at Noyelles Godault in northern France and the new plant is expected to come into operation there in 1961. In January last an option agreement was signed by the Rhodesia Broken Hill Development Company Limited. The metallurgical and operational standards of the process have been proved to the satisfaction of this option holder who is now carrying out in Northern Rhodesia a thorough economic assessment of the process as applied to their currently mined ore and available stock of high-grade oxidised products and dump material.

Inquiries from some of the other interested parties have already advanced to the stage of detailed discussions and in a number of cases a fuller appraisal of the process is already being carried out.

ZINC ALLOYS

The production of Mazak zinc alloys was the highest of any peace-time year, due mainly to the continued expansion of the demand from the motor car industry.

COMALCO

Commonwealth Aluminium Corporation (Comalco) during the year continued investigation of the many factors involved in the economic assessment of alumina and aluminium production based upon the bauxite deposits at Weipa on the west coast of Cape York Peninsula.

CONCLUSION

The world prices for lead and zinc continue to be the major factor in determining our fortunes. At the time of writing this statement a United Nations Conference on these metals in New York is about to terminate and, until the result of this Conference is known, it is difficult for me to make any useful observations on the future outlook. I hope the picture will be clearer by the date of our Annual General Meeting, when I propose to review the position in the light of our knowledge at that date.

While the trend of market prices is outside our control there are other factors of great importance to the well being of the Group which we can influence, namely, the cost and efficiency of our operations. In this connection the improvements in 1958 in practically all branches of our operations have continued to be encouraging.

STONE-PLATT INDUSTRIES LIMITED

EXPORTS TOTAL £20 MILLION

MR KENNETH PRESTON'S STATEMENT

The Annual General Meeting of Stone-Platt Industries Limited will be held on June 25th.

Mr Kenneth Preston, the Chairman, who will preside, reports as follows in his review to shareholders:

The consolidated profit for the year 1958, after deduction of taxation, amounted to £1,297,825. In common with other manufacturers of capital goods we were adversely affected by the credit squeeze in the home market, but in spite of the general world recession the value of exports from the subsidiary companies for 1958 was £20 million.

On the export side in all sections of the business we are up against severe foreign competition and profit margins are tending to narrow. In spite of the diversifications of our interests, textile machinery remains a large part of our business and prospects for the home market are encouraging. Arising from the Government Cotton Plan, the Federation of Master Cotton Spinners have estimated that the full cost of re-equipping and modernising the spinning capacity that will remain after contraction might amount to £40 million. It is, however, far too early yet to assess to what extent the textile industry will avail itself of the Government offer or when the first orders under the Plan will be placed.

Although our subsidiary companies manufacture a very wide range of products, their activities can broadly be classified under four major headings: textile machinery, electrical engineering, mechanical engineering and marine products.

TEXTILE MACHINERY

Orders from North America received by Platt Brothers (Sales) Limited during the year, amounting to well over £250,000, substantiated the company's claim that its machinery is competitive both in quality and price with anything produced in the USA. Two orders, the first for many years, were received from China, also contracts totalling nearly £1½ million from Poland and over £500,000 from Iran.

Plans have been approved for a major rebuilding scheme to cost £600,000 at Globe Works, Accrington, the principal Works of Howard & Bullough.

Prince-Smith and Stells enjoyed a very successful year, its output of worsted machinery equalling the record turnover of 1957.

ELECTRICAL ENGINEERING

Notwithstanding foreign exchange difficulties J. Stone & Company (Deptford) Limited continues to be the leading supplier in the world of train lighting equipment, and substantial orders have been received from India, South Africa, Pakistan and Chile. Valuable orders were also obtained from British Railways.

During the year an order was received for 500 Stone-Faiveley pantographs and these are in the course of being fitted on all the locomotives and multiple unit trains for the first phase of British Railways' 25 kV. electrified services.

The most notable order received by Stone-Chance in its lighthouse division was a new light for Eddystone.

Austinlite Limited, a subsidiary of Stone-Chance, has continued to expand and at the end of the year the company's order book was the largest in its history.

At Epsylon Industries the computer high-speed tape unit satisfactorily completed its trials at the National Physical Laboratory and series production is planned for this year.

MECHANICAL ENGINEERING

British Railways have ordered from J. Stone & Company (Deptford) 30 sets of Stone-Maybach hydraulic transmissions and axle drives, valued at over £600,000, for fitting to locomotives and there is every prospect that further substantial orders will shortly be received. To provide heating in the coaches, they have also ordered large numbers of Stone Vapor steam generators for fitting to diesel electric and diesel mechanical locomotives.

Hayward Tyler & Company has maintained its position as the pre-eminent manufacturer of glandless pump/motor units for nuclear and thermal power stations. Orders have been received for units for delivery to Canada, Denmark, France, Germany, Italy, Norway and Sweden, as well as for all the nuclear power stations so far contracted for in this country.

MARINE PRODUCTS

J. Stone & Company (Charlton) Limited has now supplied over 5,500 tons of propellers manufactured in its patented "Novoston" alloy. During the year propellers have been supplied in this alloy to the two "Queens" and other ships to be similarly fitted are the new Orient liner *Oriana* and the newest CPR Empress liner, as yet unnamed.

NEW INTERESTS

In conjunction with Carrier Corporation of Syracuse, New York, the largest manufacturer of air conditioning apparatus in the world, with a turnover of £90 million, we have formed a new company—Carlyle Air Conditioning and Refrigeration Limited. It is anticipated that this link with Carrier Corporation will in due course bring substantial increased turnover to our subsidiary companies.

In association with Carrier Corporation we have also purchased the Winsor Engineering Company Limited of Glasgow, which for many years has specialised in the installation of air conditioning, ventilating and refrigeration equipments on board ship.

NORTH BRITISH & MERCANTILE INSURANCE COMPANY LIMITED

ANNUAL GENERAL MEETING

The One hundred and forty-ninth Annual General Meeting of the North British & Mercantile Insurance Company Limited was held on May 28, 1959, at the Registered Office of the Company, 64 Princes Street, Edinburgh.

Mr Cyril H. Kleinwort (Chairman of the General Court of Directors) presided.

The Chairman said:

First of all there are some personal matters which I would like to mention. Mr Crichton, one of your Deputy Chairmen, has decided to retire from this position. He joined the General Court in April 1934 and became Deputy Chairman in March 1941, taking the Chair during Lord Brand's absence on Government service during the War. Mr Crichton's great experience in the investment world and his sound judgment have been of the utmost value to your Company. The benefit of his advice and experience will not be lost to us because he is remaining as a member of the General Court.

Mr Phillimore, who joined us in September 1950, has been elected a Deputy Chairman in his place.

I also have to tell you that Mr Wark, our Manager for Australasia and Chairman and General Manager of our Associated Company the "Insurance Office of Australia," is retiring at the end of next month after over 47 years of service with the two Companies. During this long period he has become one of the leading personalities in the insurance world in Australasia where he is much respected and liked. He takes with him on his retirement our thanks for the invaluable service he has rendered us and our best wishes for his future happiness. We shall still have the benefit of his wide experience and knowledge as he will continue in the position of Chairman of the Board of the "Insurance Office of Australia."

Mr E. C. Farley has been appointed to succeed him in the Management of the two Companies, with Mr K. I. Grey as his Assistant. We wish them every success in their new positions.

ROLE OF INSURANCE

Insurance is playing an increasing part in the rising standard of living which is gradually spreading throughout the Western world. Fortunately, the last year has again seen a tendency for inflationary pressure on most currencies to decline, thus creating conditions more suited to the continued progress of our industry. Only perhaps in the United States are there signs that industrial costs are rising faster than international prices. In the world of today, no country outside the Iron Curtain can afford to price itself out of the export trade for any length of time—a fact which will eventually enforce restraint on Trade Union demands and ensure further economies in research and development expenditure which has tended to get out of hand in recent years. Last year when I addressed you, I expressed the hope that for us 1958 would show an improvement on 1957, but I added that the year had not started well and it would be unwise to expect too much. You will have seen from the figures before you that this rather depressing forecast has been borne out by experience. Unfortunately, particularly on the Casualty side, our United States business has again caused us heavy losses. We have taken and are continuing to take steps to improve our position in that field though our comparatively recent entry into Casualty business in the area and the need to build up an organisation to handle that business has inevitably entailed in the early years expenses out of line with those of companies with an established Casualty organisation. Premium rates in certain States have risen but in others official sanction has not yet been forthcoming to an extent which enables the position to be regarded as satisfactory. Fortunately, apart from the United States, we can look back on a broadly satisfactory year particularly in Australia and on the Marine side of our business.

I will not refer in detail to the offer which has been made by the "Commercial Union" for your shares since you have already heard that this offer has the support of your Board. I would, however, like to express my personal appreciation for the unstinted support I have received from my colleagues and, in particular, from our General Manager, Mr Harman, and his Deputy, Mr Moore, during the negotiations which have culminated in the offer which you have before you.

On the motion of the Chairman, seconded by The Honourable A. O. Crichton, the Report and Accounts were approved and adopted.

Following the re-election of the Directors, Extraordinary and Ordinary, and the adoption of the resolution regarding the fees and expenses of the Auditors, Messrs Lindsay, Jamieson & Haldane, CA, which was proposed by Mr G. W. Mackie and seconded by Mr J. H. Eddison, the proceedings terminated with a cordial vote of thanks to the Chairman and Directors, proposed by Mr J. A. Yeaman, WS.

BILLERUDS AKTIEBOLAG

Säffle — Sweden

Founded in 1883

Share Capital: Kr. 105,000,000

Board of Directors: Landshövding Bo Hammarskjöld, Chairman, Godsägare G. Liedberg, Direktör K. I. Hising, Riksdagsman L. Cassel, Direktör L.-E. Thunholm, Direktör Anders Smith and Bruksdisponent Å. Pihlgren.

Registered Office of the Company: Säffle.

Managing Director: Åke Pihlgren.

Annual Production for Sale: *116,000 metric tons of dry, bleached sulphite cellulose* (rayon cellulose), 120,000 metric tons of paper and 38,000 standards of sawn woodgoods. These figures include the production of Hellefors Bruks AB, since 1958 a subsidiary of Billeruds AB.

BLOCK & ANDERSON LIMITED

CONTINUED EXPANSION OF SALES

MR W. E. BLOCK'S STATEMENT

The twenty-eighth annual general meeting of Block & Anderson Limited, was held on May 29th at the registered office of the company, Banda House, Cambridge Grove, Hammersmith, London, W., Mr W. E. Block (chairman and joint managing director) presiding.

The Secretary (Mr W. Crosskey, FCWA) read the notice convening the meeting and Captain R. M. Peat, of Messrs. Peat, Marwick, Mitchell & Co, read the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year ended November 30, 1958:

While your Company's sales have continued to expand during the year, orders have been more difficult to obtain and this factor together with rising costs of production, sales and service has resulted in a higher expense ratio and a moderate decrease in profits.

The full benefits of the concentration of Head Office activities in our new premises at Hammersmith have not yet been realised, but progress has been made in reorganising some departments and the work is continuing.

DEVELOPMENT ACTIVITIES

In order to maintain our position it has been necessary to increase our development activities. Good progress is being made but it will be appreciated that the benefit of this work cannot be felt immediately.

In consideration of all these factors the results are satisfactory, and much has been done towards ensuring our position in the years to come.

The group profit this year, before taxation of £188,187 compares with £219,213 the previous year. Your Directors consider the recommendation of a final dividend of 25 per cent, less tax, in addition to the interim dividend of 10 per cent paid last December, fully justified. The dividend on the present paid up capital of £215,000 together with the dividend of 6 per cent on £80,000 of Redeemable Preference Shares requires a total amount of £80,050 before Income Tax. After writing back £5,000 surplus tax provision from preceding years, and deducting £4,957 additional amount written off leasehold property, there is £324,977 undistributed profit to be carried forward, as compared with £276,732 brought in.

Continuing our policy of expansion we opened a new branch in Middlesbrough last year.

OVERSEAS ACTIVITIES AND EXPORTS

Both London and provincial sales were satisfactory. Our South African subsidiary had a very good year and our Canadian subsidiary also improved sales and profit compared to the previous twelve months. Export of our Banda Spirit Duplicators, Systems machines, Bandamail Letter Openers and Sealers decreased slightly, partly due to greater competition but mainly on account of import bans or severe restrictions enforced by a number of important countries. In some foreign markets, however, we have been able not only to hold our own, but to increase sales, thanks to the high quality of our machines and our wide range of models.

Since my last review we have taken up the sole agency in this country of the Facit Typewriter, Odhner Calculator, Odhner Adding machine and the Facit Office Furniture. I feel that after an initial period these quality products will benefit the standing and results of your Company.

Finally, I wish to express, on behalf of my co-directors and myself, our thanks to all members of our organisation at home and abroad, and to our agents and suppliers for their valued help and co-operation.

The report and accounts were unanimously adopted and the proposed dividend was approved.

The retiring director, Mr E. S. Dumont, was re-elected and the directors were authorised to fix the remuneration of the auditors, Messrs Peat, Marwick, Mitchell & Co.

REED & SMITH LIMITED

INCREASED PRODUCTION

The annual general meeting of Reed & Smith Limited, was held on May 28th at Exeter.

Sir Arthur C. Reed, chairman, in the course of his speech said:

The accounts for 1958 show a profit somewhat higher than 1957. With competition becoming even keener than in the previous year and a further narrowing of profit margins, it is gratifying to be able to report increases in the total production and turnover of the Group and that is so after making allowance for a full year's figures being included for the Mill at Taplow which was acquired during the previous year.

So far as the increased trading profits are concerned, this year has benefited from a full year on Taplow as against seven months a year ago; otherwise the figure would have been rather less than the earlier year.

The increase in production and turnover has been made possible by the improvements and extensions which we have made to the Mills during the past few years and in all the circumstances the Directors feel that the result this year is satisfactory.

RESERVE STRENGTHENED

The need for conserving the resources of the Company for further development is still paramount and your Directors feel it desirable to transfer £150,000 to General Reserve, bringing the Group total to £725,000. An Interim Dividend of 6 per cent has been paid during the year and the Directors feel justified in recommending a Final Dividend of 10 per cent, making a total of 16 per cent, less income tax, for the year, as against 15 per cent last year. There has been an improvement in our liquid position, the excess of current assets over current liabilities having increased by nearly £90,000 to the present figure of over £800,000.

Trading in the first three months of 1959 was reasonably satisfactory, though rumours of reductions in pulp and paper prices in Scandinavia kept the market uneasy. Since the end of March, when these reductions were confirmed, our prices have had to be reduced, resulting in a lowering of our profit margins, due to the fact that pulp prices in Scandinavia were not reduced to the same extent as paper prices from the same source. However, with our policy of continuing expansion and modernisation and the great variety of our products, we hope to maintain our full share of trade.

The report and accounts were adopted.

BANK OF WEST AFRICA

SATISFACTORY INCREASE OF BUSINESS

The sixty-fifth annual general meeting of Bank of West Africa Limited will be held on June 25th in London.

The following are extracts from the circulated statement of the Chairman, Mr Sylvester Gates, CBE:

In the Balance Sheet, Current, Deposit and other Accounts at £73,144,794 show a very satisfactory increase of some £5,670,000 on the year. This increase is well spread amongst our branches and indicates a real growth in the number of people we serve.

On the other side of the Balance Sheet, Loans, Advances and other Accounts at £23,172,515 show a contraction of £1 million. Seasonal advances have been repaid rather earlier this year, with the result that Treasury Bill holdings are substantially higher.

The Profit and Loss Account shows that our experience has been reasonably satisfactory in somewhat difficult trading conditions.

Repeated invitations to overseas investors have been made by Dr Nkrumah, the Prime Minister of Ghana, and Alhaji Abudakar Tafawa Balewa, Prime Minister of the Federation of Nigeria, and latterly by the Sierra Leone Government to participate in the industrial development of their countries. Financial measures have been taken in all territories to encourage industrial enterprises. The West African Governments have emphasised, however, that partnership in the industrial development of their countries implies willingness to impart new skills to Africans. The degree of warmth with which any enterprise is welcomed is conditioned by the arrangements proposed for the employment, training and promotion of Africans.

It is noteworthy that it is principally the United Kingdom whose firms have reaffirmed their confidence in the future of the West African territories by setting up new industries either on their own account or in partnership with Government.

SAFEGUARDS HAVE BECOME SHACKLES

With the growing part played by the African businessman as a merchant and produce buyer, there is an increased demand for advances from customers in this category. This is a development which the Bank naturally welcomes and desires to foster. I must therefore mention a difficulty which is apt to arise in this connection. West African land law frequently puts obstacles in the way of an African pledging as security his land and buildings. Such legislation originally designed to protect the African from exploitation and to preserve local custom and tradition, has now outlived its usefulness: the safeguards have become shackles. All too often an African businessman, unlike his counterpart elsewhere, is handicapped by finding his main or only asset virtually frozen and unable to be mobilised for the development of his business. This question is one which merits the early attention of West African Governments, for the introduction of land registries and the replacement of the present multifarious, intricate and uncertain laws by something like a uniform system of land tenure would be a boon to the business community.

In conclusion, I wish to repeat our belief in the prospects of West Africa. Given stable world prices, at reasonable levels, for basic export commodities, the determination and zest of its peoples should bring about economic progress worthy of their new political responsibilities.

MELBOURNE AND GENERAL INVESTMENT TRUST LIMITED

SIR DENYS LOWSON'S REVIEW

At the Annual General Meeting of the Melbourne and General Investment Trust Limited held on May 26th at Estates House, 66 Gresham Street, London, E.C. Sir Denys Lowson, Bart (the Chairman) in the course of his remarks said:

The last twelve months marks a year of notable progress in the history of your Company. During that time, as you will have seen from the Report, the capital has been reorganised. We have issued by way of a free capital bonus to the Ordinary stockholders 150,000 6½ per cent Preference shares, and we have also issued £150,000 6½ per cent debenture stock 1978/83.

The valuation of the investments show a substantial appreciation both over the book value and over the position ruling twelve months ago. While similarly our revenue at £67,600 is a record in the history of the Company, and compares with £57,260 twelve months before.

The proposed Ordinary dividend of 21 per cent together with the Preference dividend gives a total effective distribution of 27½ per cent, as compared with 25 per cent last year. This Ordinary dividend entails a priority percentage distribution of 24.4 to 77.7 per cent of our total revenue.

As shareholders will be aware, it is the policy of the Board to diversify your portfolio; which is now well spread both geographically and in the amount of individual investments. The unquoted investments at £219,000 are entirely represented by your holding in Carlton and United Breweries Limited. This important Company with headquarters in Melbourne, Victoria, not only has a wide spread of business throughout the State of Victoria, but has also recently expanded into Queensland where they have an important new brewery at Cairns, as well as at Darwin in the Northern Territory.

The dividend paid by that Company last year amounted to only about 41½ per cent of the actual cash flow accruing to the Company after all expenses and taxation, and the balance amounting to no less than £A1,504,000 has been ploughed back into the business of that Company. We look therefore for the continued steady growth and expansion of this investment which should also be assisted by the continuing development of the Australian economy.

Since 1939 the output of secondary industry in Australia has risen from £A500 million per annum to £A3,763 million in 1956; and since 1946 the number of factories has increased from 31,184 to 52,000, while the number of individuals employed in these factories has risen from 745,000 to over 1 million. This increase in secondary industry represented 80 per cent of Australia's consumption in those goods as compared with a negligible percentage twenty years ago.

Wool is still Australia's principal export. During the five years ending 1955/56 it averaged 48 per cent of the value of the exports; while the manufacturers of secondary industry only accounted for some 11 per cent.

The population of Australia today is now over 10 million; and it has been conservatively estimated that Australia can safely support in the near future a population of at least twice that number; which in turn must help the growth of one of Australia's leading Companies like Carlton and United Breweries Limited.

The resolution for the adoption of the report and accounts was seconded by Sir Keith Officer and carried unanimously; and the proceedings closed with a hearty vote of thanks to the Chairman, Directors and Staff.

THE DRAYTON REGULATOR AND INSTRUMENT COMPANY

POLICY OF EXPANSION

The tenth annual general meeting of The Drayton Regulator and Instrument Company Limited was held on May 28th in London, Mr P. H. Lloyd, TD, DL (the Chairman), presiding. The following is an extract from his circulated review:

The profit for the year ended December 31, 1958, before taxation, amounted to £244,794 compared with £253,717 a year ago, but after provision for taxation, amounting to £125,801, the net profit was £118,993 compared with £110,136.

Notwithstanding an Expenditure during the year of £79,000 on Capital Account the margin between Current Assets and Current Liabilities has increased from £509,504 to £525,302. This is a clear demonstration of the growing strength of the Company's financial position.

During the latter part of the year, your Sales Staff obtained what is certainly the largest single order for space-heating controls ever placed in this country, and probably the largest ever placed in Europe.

The equipment covered by this order comprises principally the recently developed range of pneumatically-operated controllers, the production of which has placed us in a position of leadership in the space-heating field.

The Company has continued the development of its automatic control system for autoclave-type sterilizers. This is now engaging the interest of medical authorities and hospitals throughout the country.

Considerable progress has been made in our sales to the Shipping Industry.

ARRANGEMENTS WITH AMERICAN COMPANIES

A subsidiary company, Drayton Johnson Ltd., has been formed in conjunction with the Johnson Corporation of Three Rivers, Michigan, USA, to market in the paper, textile, rubber and plastics industries, the products of the Johnson Corporation which will be manufactured under licence by your Company.

We are about to enter into an arrangement with the Thomas A. Edison Industries of America to manufacture under licence their Omniguard equipment. This development will enlarge the scope of the Company's activities, particularly in the industrial instrumentation field, in association with an American Organisation of the highest standing.

During the first quarter of the present year trade has continued to improve and I therefore feel that the Company can face the immediate future with confidence and that the policy of expansion carried out during the year will be justified unless the economy of the country is upset by a political catastrophe.

The report was adopted and a total distribution of 20 per cent was approved.

JOHN BRIGHT AND BROTHERS

The thirty-sixth Annual General Meeting will be held on June 24th in London.

The following is an extract from the Statement by the Chairman, Dr E. P. Andreae, circulated with the Report and Accounts for the year ended March 31, 1959:

After deducting Taxation and Depreciation and crediting Taxation adjustments and after transferring £60,000 from Stock Reserve there remains a net Profit of £255,893 to compare with £269,139. After bringing in the surplus from last year, the total available for allocation is £506,621. That is to say only £24,513 less than the corresponding figure for the previous year. During the late summer and early autumn the volume of our business had reached the lowest level experienced for many years and in view of the uncertainty then prevailing your Directors deemed it prudent to reduce the interim dividend by 2½ per cent. Towards the end of the financial year volume tended to increase and this recovery, though modest, is at present being maintained. Your Board is now therefore recommending the same final dividend as last year, namely 15 per cent on the Ordinary Stock, whilst at the same time again transferring £100,000 to General Reserve.

Our particular industry in all its various sections has been and is still going through a very critical period. As I feared when I made my Statement to you last year, the struggle for survival in a falling market overshadowed by excessive productive capacity, has been carried to extremes.

Some measures of assistance to the industry is now forecast by the Government. If the major object of that assistance is to reduce inefficient and excess productive capacity it is to be welcomed and should be of some benefit to your Company if only indirectly, but until more details of the proposal are available, I am unable to express an opinion. Your Company is a proud and outstanding example of modernity and efficiency achieved without outside assistance by years of foresight, planning and courage. I can only hope that the Government assistance now to be offered will not be allowed to take, in effect, the form of a subsidy to the inefficient at the expense of the efficient.

During the whole of this long period of depression in the manufacturing side, our Spinning Mills were not affected to any great extent and were the one bright spot in our organisation enjoying a degree of stability due to the effect of the Yarn Spinners' Association Minimum Price Agreement. As Stockholders are aware, in February of this year the Restrictive Practices Court ruled out the Association's Price Agreement and this decision brought about immediate chaos in the Spinning Industry.

For the ensuing year I am not able to look forward to increased profits, if only because the effect of the ruling out of the Spinners' Price Agreement will not be apparent until the end of the current financial year.

On the other hand, however, the improvement in the volume of Trade has been maintained and it is satisfactory to know that we have been able to increase our percentage of available business.

I joined this Company as a Director 29 years ago and have been Chairman for the last 26 years. I think the time has come when I should relinquish the Chairmanship and make way for a younger man. I shall, at the request of my colleagues retain my seat on the Board under the Chairmanship of Mr Fred Train, who will succeed me in that capacity.

NORTH MALAY RUBBER ESTATES

The twenty-seventh annual general meeting of North Malay Rubber Estates Limited was held on May 28th in London, Mr R. F. Burt (the Chairman) presiding.

The following is an extract from his circulated statement:

In spite of the very substantial drop in proceeds of our crop, no less than 2.1d. per lb, a rather larger estate working profit has been realised. This was of course attributable to an enhanced crop by nearly 9 per cent. In spite of vigorous replanting we hope to exceed this crop in 1959 by more efficient intensive tapping, prior to replanting and from younger areas. Our cost of production shows a welcome decline.

On the face of it the Company did not earn sufficient to pay a total dividend of 20 per cent, and we have had to draw on our carry forward by a substantial margin. Nevertheless we have felt justified in recommending this dividend because in fact our net current assets, even after paying 20 per cent, at £70,000 (or £10 per acre planted) are some £4,000 in excess of the previous year's when allowance is made for the capital repayment made to Stockholders (£65,200). Your Board consider the reserve funds adequate for all normal circumstances, for we have no exceptional capital commitments in view and replanting is met out of revenue.

The profit on estate working of £44,974 represents 3.01d. per lb. The value of rubber today is some 4d. per lb higher and we see no reason to suppose this higher value will not be maintained.

The report was adopted.

LUNUVA (CEYLON) TEA AND RUBBER

INCREASED CROPS

The annual general meeting of The Lunuva (Ceylon) Tea and Rubber Estates Limited will be held on June 25th in London.

The following is an extract from the circulated address of the Chairman, Mr H. W. Horner:

The year 1958 proved satisfactory from the point of view of crops: 10,944,681 lb of tea were harvested, an increase of more than half a million pounds on the previous record crop in 1957, which was nearly a million pounds higher than that of the previous year, while the rubber crop was, at 1,475,562 lb, slightly in excess of that of the previous year, although harvested from a smaller acreage in tapping.

The amount transferred to the Appropriation Account is £94,913. The year's total profit, after deduction of £79,700 in respect of that profit, is £112,648 but a provision amounting to £15,177 has also been made for retrospective taxation included in the Ceylon Budget on the profits of 1957. The Board recommend a final dividend of 7 per cent, which, with the 5 per cent paid in November of last year, gives a total of 12 per cent for the year.

Our crops for 1959 are estimated at 10,028,500 lb tea and 1,290,000 lb rubber. An unusual drought at the beginning of the year has slowed down the tea crop for the early months but, given normal weather for the rest of the current year, no serious shortfall of the estimate need be expected. Quality teas, wherever produced, seem assured of a ready sale at high prices, but those from Ceylon have to face the heavy *ad valorem* export duty.

LISBON ELECTRIC TRAMWAYS

The sixty-first annual general meeting will be held on June 24th in London.

The following is an extract from the circulated statement of the chairman, The Right Honourable The Lord Rathcavan:

Once again the total number of fare-paying passengers carried on the Company's vehicles has increased during the year. In 1958 passengers carried totalled 374,373,878 as compared with 368,909,106 in 1957, an increase of 5,464,772 or 1.48 per cent, whilst the mileage run by our vehicles (comprising both trams and buses) at 30,475,174 compared with 30,178,386 in 1957 shows an increase of 296,788 or .98 per cent.

Each year we continue to expand our services in conformity with the growth of the city and each year shows a new record of passengers carried.

Our total fleet now consists of 798 vehicles divided between 517 trams and trailers and 281 buses of which 152 are double-deckers.

Capital expenditure during the year increased by £300,466. This represents the cost of the new station at Cabo Ruivo and of 38 double-decker buses.

In January, 1959, the price of fuel oil for our buses increased again by $40 centavos per litre and in a full year will cost the Company some £35,000.

During the year the Company contributed £477,079 to the State Revenue of Portugal and to the Municipal Revenue of Lisbon an increase of £13,390 or 3 per cent over 1957.

The year's operations show a profit of £66,589 after providing all charges and for General and Depreciation Reserve. The Directors recommend an Ordinary Dividend for the year of 6 per cent net.

BARRY & STAINES LINOLEUM

IMPROVED TRADING RESULT

The annual general meeting of Barry and Staines Linoleum, Limited will be held on Thursday, June 25, 1959, at 12 noon, at 6 Old Bailey, London, E.C.

The following is an extract from the statement of the chairman, Mr T. J. Cavanagh, which has been circulated with the report and accounts:

In the year now under review the result of the group's trading in linoleum was better than a year ago. Home sales increased, but there was a reduction in export sales, due mainly to quotas and other restrictions, but due also in part to more intense competition. The reduction of £34,000 in group trading balances is more than accounted for by adverse factors, which I hope will not recur.

In the first place, as I stated a year ago, we had to bear the cost of running in the new paper mill and ancillary installations; this proved to be a greater burden than we had hoped.

In the second place the devaluation of the French franc appreciably reduced the sterling value of the profits contribution from our French company; this devaluation has also necessitated deductions for exchange depreciation as shown in the consolidated balance sheet.

The French company has again taken advantage of a legal permission to revalue fixed assets and the surplus on this revaluation is also shown in the consolidated balance sheet. On the whole, prospects for the current year are better than they were a year ago, and we hope to expand our business, both at home and abroad.

RUBBER PLANTATIONS INVESTMENT TRUST

SIR ERIC MACFADYEN'S ADDRESS

The fiftieth annual general meeting of The Rubber Plantations Investment Trust Limited, will be held on June 24th in London.

The following is an extract from the circulated Address of the Chairman, Sir Eric Macfadyen:

The Accounts we present for the year to March 31, 1959, show gross revenue (without including £6,022 on our Subsidiary Company) of £285,466, being a decrease of £6,540 on that for the previous year; the gross yield representing 16.51 per cent (16.89 per cent) on the Trust's issued Capital. After taxation and expenses, our net revenue is £142,312 (compared with £149,133 a year ago) and including the balance brought forward we have £248,530 available for appropriation. The Directors recommend a dividend of 12½ per cent (the same).

We are able once again to record continued improvement in the valuation of the portfolio. The net cost of the investments, including those of our Subsidiary, at the balance sheet date was £1,802,320 and their valuation at £2,415,728 shows a surplus of £613,408; (last year the surplus was £117,302 and the year before that £78,289). The net asset value of the Trust's 2s. Stock Units at the year-end had improved to 3s. 1¾d. (2s. 6¾d.).

It remains the policy of the Board progressively to widen the spread in our investments and during the year the total cost of Industrial and Commercial Holdings has increased by £230,514 to £771,909; this section of our portfolio now represents 39.3 per cent of all investments.

LONDON ASIATIC RUBBER

SIR ERIC MACFADYEN'S ADDRESS

The annual general meeting of The London Asiatic Rubber and Produce Company Limited will be held on June 22nd in London.

The following is an abstract of the address of the Chairman, Sir Eric Macfadyen, circulated with the report and accounts:

Our crop was 17,282,072 lb (including 160,264 lb purchased) and we hope to harvest about 18 million lb in 1959. At Telemong we have sold the Timah division of 498 acres and 1,191 acres of reserve land for just over £42,500. Replantings and new plantings during the year totalled 1,356 acres and about a similar acreage will be dealt with in 1959.

Profit after tax is £381,031 (£439,023). Including £100,720 brought forward we have for disposal £481,751 (£537,824). We transfer £169,530 to Replacement Reserve, being the amount expended during 1958. This year we shall harvest the first fruits of our oil palms on Nordanal estate: next year we shall start on the construction of an oil palm factory there. Capital expenditure of about £250,000 will be incurred for this purpose in 1960-62. We are therefore increasing Capital General Reserve by £50,000 mainly by transfer from Profit and Loss Account. The steady progress being made with our modernisation programme as a whole calls for the employment of considerably more working capital and in order that dividend policy

may not be prejudiced and that we may have resources available for taking advantage of any special opportunity that may arise we have decided to make now a rights issue under which shareholders are given the opportunity to subscribe for three new shares in respect of 20 now held at a price of 3s. 6d. per share.

In January last we paid a 5 per cent interim dividend and we now recommend a final dividend of 25 per cent, thus distributing at the same rate as last year. If you approve the dividend we shall then carry forward £102,707.

REFUGE ASSURANCE COMPANY LIMITED

The Chairman in a statement submitted with the 1958 accounts mentioned that the Centenary of the Company had been celebrated during the year.

He referred to the increase in provision being made by the State for Old Age, and suggested that any Government Scheme by whatever political party it is sponsored, should stop at the provision of basic needs, benefits in excess of these being left to the free choice of individuals. The Company for 100 years had assisted its policyholders to provide for retirement and for their dependants on the premature death of the breadwinner. It would be the Company's aim to continue to give at least equal service during its second century to the holders of its eight million policies which assure in all £378 million.

Payments made during the year to policyholders were nearly £13,700,000, of which nearly £10 million were payments to living policyholders and £3,800,000 payments on death.

Advances of £3,400,000 were made during the year under the Company's House Purchase Scheme and there are 18,600 House Purchase mortgages outstanding for total advances of £28,300,000.

The underwriting results in the Motor Account of the Company's subsidiary had been unfavourable, and even though premiums had been progressively increased claims had been such that over a number of years' profits had been negligible.

ALLOCATIONS TO POLICYHOLDERS

In the Ordinary Branch surplus of £1,924,000 was allocated to policyholders to provide a bonus on with-profit policies at the rate of £2 per cent on the sum assured in respect of each year's premium due in 1958 and paid.

In the Industrial Branch £1,600,000 was allocated to policyholders to provide a reversionary bonus on premium paying policies (with certain exceptions) at the rate of £1 8s. per cent on the sum assured for policies dated 1953 and earlier, and £5 4s. per cent for policies dated 1954, it being the first time that the latter class has participated. The granting of paid-up policies at advanced ages and certain other increases in benefits have been continued.

INVESTMENTS

The Company's assets of £156 million include £50 million invested with the British Government and Local Authorities, £40 million in Debentures and Preference Stocks, and £19 million in Ordinary stocks. Mortgages and other advances, largely in connection with House Purchase, total £32 million.

APPOINTMENT

STATISTICIAN

THE MULLARD RADIO VALVE CO. LTD.

has a vacancy in its Statistical Advisory Service for a qualified Statistician.

The Statistical Advisory Service works on behalf of all development and production departments in the organisation and the work includes all aspects of quality control of component parts and of finished products, and is concerned with the design of experiments and the analysis of experimental results. Training will be given in the techniques used in the organisation.

This is a senior position and the man appointed will be required to meet staff with similar qualifications and will also be required to prepare and deliver lectures and conduct training with small groups in order to further an appreciation and understanding of statistical techniques. Suitable qualifications would be from either qualified statisticians with an interest in mechanical engineering or, alternatively, from mathematicians or physicists with a strong bias towards statistical work.

The position offers further scope for development, and application should be made in writing to

Mr. J. C. Ross,
Plant Personnel Officer,
The Mullard Radio Valve Co. Ltd.,
New Road, Mitcham Junction, Surrey,

quoting ref. R.127.

RCN ARE LOOKING FOR A GRADUATE . . .

preferably with about two years' experience in Market Research, for their expanding Marketing and Market Research Department. He or she should have statistical training and be capable of planning and reporting on Research projects mainly in the consumer goods field. The position calls for an intelligent person capable and experienced in working on own initiative and able to cope with large volumes of work at peak periods.

Please apply in writing, giving details of age, experience and salary required to :—

Head of Marketing & Market Research, Rumble, Crowther & Nicholas, Ltd., 184 Strand, W.C.2.

THE ROYAL SOCIETY desires to make early appointment of a professionally qualified ACCOUNTANT to assist in the Society's administration. Man, aged 35-45 years, with university degree preferred. Salary according to experience.—Applications to be sent to the Assistant Secretary, Royal Society, Burlington House, London, W.1.

ORGANIZATION AND METHODS
ASSISTANT TO DIRECTOR OF FINANCE AND ADMINISTRATION

A leading control engineering company, with Head Office near London and factories in Scotland, wishes to appoint an Organisation and Methods Assistant to its Director of Finance and Administration.

Candidates should have ability to work on own initiative in close co-operation with other executives and personnel. They must have had previous experience of O. & M. work and be willing to travel to the company's U.K. Branches and Factories. Office management experience and a knowledge of accountancy will be an advantage. The age of the successful candidate will probably be between 30 and 40.

A starting salary in the range of £1,500 to £2,000 p.a. is envisaged. The company practises modern personnel policies which include a pension scheme.

The business environment is one of continuous and successful expansion, which will provide increasing scope for O. & M. work, together with ultimate prospects of promotion into the executive field. There are also important associated companies in the U.S.A. and Europe.

Applications should be addressed in the first instance to URWICK, ORR & PARTNERS LIMITED, who have been asked to advise in connection with this appointment, at 8 Buckingham Palace Gardens, London, S.W.1. All particulars will be treated by them in strictest confidence until disclosure is authorised at an interview. Please indicate a telephone number through which contact may be made, and quote reference HEW/1306 on the envelope.

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the post of Junior Research Officer in the Social Science Department. The appointment will be for three years from a date to be arranged but not later than October 1, 1959. Subject to satisfactory qualifications and experience, the salary will be £700 x £50 to £800 per annum. The appointment is in connection with an enquiry into family life and kinship in the Swansea area and will have special reference to the position of old people.

Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, by whom applications (five copies) must be received by Monday, June 15, 1959.

BROWN & POLSON GROUP require for their Finance and Administration Division, a young man, 23-28, with an Accountancy or Cost and Works Accounting Qualification. Experience in an industrial concern would be an advantage but applicants with solely commercial or auditing experience should not hesitate to apply. Experience within the Company will not be confined to its London headquarters but will include periods at the Manchester and Paisley Works. Salary, profit payment, life assurance and pension schemes are good and the Company is progressive in outlook and expanding.—Replies to Group Personnel Manager, Brown & Polson Ltd., 125-130 Strand London, W.C.2.

CAMBRIDGESHIRE EDUCATION COMMITTEE
CAMBRIDGESHIRE TECHNICAL COLLEGE AND SCHOOL OF ART
(Principal: D. E. Mumford, M.A.)
(Re-advertisement)

Applications are invited for new appointment of VICE-PRINCIPAL to assist in general administration of College. High academic qualifications and responsible experience in administration and teaching essential; some industrial experience desirable.

Salary scale: £1,837 10s. x £52 10s. — £1,995 a year.

Application forms and full particulars from the Principal, Cambridgeshire Technical College and School of Art, Collier Road, Cambridge.

It is not necessary for candidates who have already applied to make fresh application.

G. D. EDWARDS.
Shire Hall, Cambridge. Chief Education Officer.

FOURAH BAY COLLEGE—SIERRA LEONE
(UNIVERSITY OF DURHAM)

Applications are invited for Chair of Economics. Salary £2,500 p.a. F.S.S.U. Outfit and family allowances. Passages for appointee and family on appointment, annual leave and normal termination. Part furnished accommodation at rent not exceeding 7½ per cent of salary.

Detailed applications (eight copies) naming three referees by July 7, 1959, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

VICTORIA UNIVERSITY OF WELLINGTON
NEW ZEALAND
SENIOR LECTURER AND LECTURER IN ECONOMICS

Applications are invited for the above posts.

The salary for a Senior Lecturer will be £1,315 per annum rising by annual increments of £50 to £1,615 and for a Lecturer £1,025 per annum rising by annual increments of £50 to £1,275. The initial salary in each case will be determined according to the qualifications and experience of the appointee. An allowance is made towards travelling expenses.

Further particulars and information as to the method of application should be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close on July 31, 1959.

For further appointments see page 987

COMPANY AFFAIRS

BICC

THERE is excess capacity in some sections of the cable-making industry and the industry has now to adjust itself to the break-up of some of its trade associations in this country and to the formation of the European common market. In his statement the chairman of British Insulated Callender's Cables, Mr W. H. McFadzean, has examined some of the implications of these developments for the industry in general and for BICC in particular. The break-up of the trade associations will, Mr McFadzean believes, probably lead to "more fiercely competitive conditions" and possibly to some price cutting. In the short run, this may adversely affect BICC's profits, but Mr McFadzean draws attention to the power of BICC to compete: it is probably the largest group of its kind in the world; it has spent a good deal on re-equipment, research and development; and it covers a wide range of products and operates and trades in many countries.

The application of the Restrictive Trade Practices Act will also, in Mr McFadzean's opinion, probably lead to more mergers in the cable-making industry. Those that have already taken place, he suggests, have been prompted not only by the Act but also by a desire for "rationalisation." BICC itself may acquire other cable-making concerns (indeed it has just made a bid for Scottish Cables) if "special circumstances" apply; but Mr McFadzean says the directors' policy on expansion is still to widen the range of products and to extend its territorial interests.

BICC faces a more competitive future in good shape. Last year, thanks to a steadier price for copper and an improvement in demand in the latter months for consumer items, its consolidated trading profits rose by nearly £1 million to £8.8 million though the value of total sales was £1 million lower, at £110 million. Net profits were £622,938 higher at £3,292,989 and the ordinary dividend of 13½ per cent was thus covered 2½ times. The strength of the group is reflected in the yield of 4¾ per cent offered by the £1 ordinary units at 55s. 6d.

VICKERS

LORD KNOLLYS expects that the 1959 profits of the Vickers group will be "considerably reduced," because the group will have to find its own finance for civil aircraft development and because the level of activity of the steel and Canadian subsidiaries will be lower. But Lord Knollys does expect the engineering sector to earn higher profits this year from an increased turnover. Shipbuilding, too, should prove as profitable as it did in 1958, and it may be that, as contracts take some time to complete, the effects of the shipping slump will not be fully felt in Vickers' shipbuilding yards until 1960 and 1961. Immediately it looks as if the extent of the setback in profits will depend largely upon the pace at which the activity of Vickers' steel and Canadian subsidiaries can recover from the recent recession, and clearly for the future it is upon steel and engineering, rather than on aircraft and armaments, that Vickers will have to build.

GUEST, KEEN AND NETTLEFOLDS

LAST year, Guest, Keen and Nettlefolds barely maintained its consolidated trading surplus at just over £24 million, and unless there is a general revival in industrial activity the chairman, Mr K. S. Peacock, says that the current year's results may not reach this level. In the latter part of last year, GKN's profit margins were reduced and the deterioration in trading conditions which was then experienced persisted in the first few months of the current year. In particular, Mr Peacock seems concerned about the level of activity in the engineering section of the group, where turnover and earnings have fallen. Elsewhere, however, there are some signs of a revival in demand. The steel and re-rolling subsidiaries have been operating at a reduced rate but now there are "indications of an improvement in demand" while some of the manufacturing subsidiaries are beginning to benefit from the cuts in purchase tax and the lifting of hire purchase restrictions. The motor industry is one of GKN's principal customers and it continues to boom. The profits of the group's overseas subsidiaries have been "well maintained."

To buy the GKN ordinary shares at 63s. 7½d., yielding just over 4 per cent on a 13 per cent dividend covered about 3¾ times by earnings, is to look beyond this immediate prospect to the full utilisation of capacity and, even more perhaps, to a further growth in that capacity. Over the last eight years the growth of GKN has been remarkable, reflecting not simply the re-acquisition of the steel companies but also the big retentions of profits used to finance the extension and development of the group's engineering and manufacturing activities. Over this period, turnover has trebled to £209 million; stocks have risen from about £16 million to over £46 million; and the net worth attributable to the equity has gone up from £41 million to nearly £106 million. Yet, the group's liquid assets at £20.1 million are only £3.1 million lower than they were eight years ago and over the whole period the ratio that the trading surplus bears to total net assets has fallen below 15 per cent only once. GKN still has a big development programme to complete but with new money and retained profits it should not need to come again to the capital market.

ROYAL DUTCH/SHELL

AS was foreshadowed by Lord Godber in his statement to stockholders, the first quarter results of the Royal Dutch/Shell group show that it is now selling more oil. But quite how far strong competitive conditions are continuing to affect profit margins is less clear from the figures, which are complicated by changes in Venezuelan tax and in the basis for computing depreciation. Hence the latest results can be compared only with the adjusted figures of the first quarter of 1958 and not with unadjusted figures of the later quarters. Not that the comparison with the first quarter of 1958 is discouraging: total sales, net of excise duties and sales taxes, came to £458.3 million (against 437.9 million) and a gross profit of £86.0 million (against £73.9 million) was earned, so that the gross profit margin has risen from 16.9 to 18.8 per cent.

Net profits at £37.1 million, however, are less than one per cent higher and the net profit margin has come down from 8.4 to 8.1 per cent, because £42.3 million (against £31.3 million) has been charged in tax. This increase is not due to the change in Venezuelan tax; rather it reflects the differing tax laws ruling in the countries in which the group operates which can result in exceptionally heavy charges in a particular quarter.

No detailed comparison can be made between these results and those in the later months of last year, but it is clear that since the middle of that year the group has been selling and producing more oil and oil products and that it is continuing to spend just as heavily on capital account. It seems probable at least that the decline in profit margins has been arrested. At 136s. 9d. the ordinary shares of "Shell" Transport yield 4½ per cent gross on last year's tax free dividend of 18¾ per cent.

CONSOLIDATED ZINC

SUPPLIES of lead and zinc still exceed demand and Consolidated Zinc, which cut back production in 1958, will continue to do so until there is a more favourable outlook. But the directors have not been deterred from long-term development. Capital commitments at the year-end stood at £4.43 million and the group held more than £6 million in liquid assets. The recent rights issue of 1,455,100 ordinary shares at 48s. per share, raised almost £3½ million to

finance a new zinc smelting plant at Swansea and a similar plant in Australia (which will treat the lead and zinc concentrates produced at Broken Hill which are now sold to smelters outside Australia).

Shareholders have had no hesitation in reaffirming their faith in the company after a year when trading profit fell by £1½ million to £3 million and when the ordinary dividend was reduced from 3s. 9d. to 3s. per share (even though, thanks to a lower tax charge, net profits declined by only £150,000 to £1,620,000). The chairman, Mr L. B. Robinson, is reserving his comments about the immediate prospects until the general meeting, but, as he says, profits are dependent on world prices and there is little that the individual company can do—except to cut back production and to try to lower operating costs—to affect them. But Consolidated Zinc is powerfully entrenched within the industry and it would be among the first to benefit from any revival in demand. At the moment, however, with the £1 ordinary shares yielding only 4⅜ per cent at 68s. 6d., investors must realise that they are buying for the long pull—not only in zinc but also in Australian development.

STANDARD OIL OF NEW JERSEY

THE Standard Oil of New Jersey report refers to the effect that the increase in Venezuelan tax had upon earnings and to the reduction in profit margins that occurred when the supplies of oil outstripped demand. Consumption, however, was still rising at about 5 per cent throughout the free world; about 800,000 more barrels a day being consumed than in 1957. Consumption should rise further this year and by about 1 million barrels a day. The group, like Royal Dutch/Shell, sold more and earned slightly more in the first quarter of this year than it did in the corresponding period of 1958.

UNIT TRUSTS

THE continuing popularity of unit trusts was again in evidence this week with the over-subscription of the First Provincial Unit Trust's "block" offer of 500,000 "Reserves" units at 10s. 6d. (or at the managers' selling price when the application is received), and with the launching of a new trust to be known as Community Units (Participating in Industrial Development)—or, in short, "Cupids."

The managers extended the "Reserves" offer beyond its original closing date on the same terms until this Wednesday. This is a flexible cash fund, offering a gross yield of £4 3s. 6d. per cent. On June 10th Community Units, sponsored by a brand new management group, will offer 20 million units at 2s. 6d. each—the lowest price so far offered to the public by any unit trust—with the initial purchase of at least 40 units and subsequent purchases in multiples of ten. The managers hope in due course to introduce a savings scheme. This is an open-ended cash fund whose portfolio will consist of over 100 well-known industrial equities; not more than 5 per cent of the total fund being invested in any one company. The yield on the units at the offer price will be about 4 per cent.

TURNER & NEWALL

THE interim statement of Turner & Newall for the year to September 30th pleased the market and the ordinary shares were marked up by 1s. 4½d. to 74s. They yield 4 per cent on the 1957-58 ordinary dividend of 15 per cent, covered three times by earnings. The interim dividend has been left unchanged at 5 per cent, and though profits have fallen the directors say that the decline in the six months to March 31st was "not of a significant character." The manufacturing companies have faced more competitive conditions and in some cases profits margins have been shaved but in general turnover has been "well maintained." The manufacturing companies in India and Southern Africa apparently continued to trade at satisfactory margins, but the North American subsidiaries earned smaller profits while the earnings of the mining subsidiaries were affected by the fall in the demand for raw asbestos.

TRUST HOUSES

THE issue of 358,991 ordinary shares of Trust Houses in the ratio of one for five at 35s. each put a value on the rights of 14s. 3d. and as the directors intend to maintain the ordinary dividend at 10 per cent on the enlarged capital the new shares are being offered on a yield of nearly 5¾ per cent. The chairman, Captain A. R. S. Nutting says that gross profits for the year to March 31st should be at least £780,000 (against £717,000), so that the dividend is covered about 2½ times by net earnings. Shareholders have already approved of a scheme which, *inter alia*, raises the maximum limit on the ordinary dividend from 10 per cent to 20 per. But, in considering the implications of this step, they should note Captain Nutting's statement that future dividends would depend not only on trading in any one period but also on the desirability of building up reserves. Trust Houses controls about 240 inns and hotels throughout Britain and the £600,000 in new money will be used largely for further acquisitions and new building.

London Stock Exchange

FIRST DEALINGS:	May 20	June 3	June 17
LAST DEALINGS:	June 2	June 16	June 30
ACCOUNT DAY:	June 9	June 23	July 7

MARKETS had another buoyant week with markings reaching a new peak on Monday at 21,279 (against the previous record of 20,451 on April 6th); *The Economist* ordinary share indicator rose 2.5 to a new "high" of 274.9 The gilt-edged section was again quiet, but prices rallied slightly on Wednesday following the publication of the gold reserve figures. Among undated stocks War Loan 3½ per cent closed unchanged on the week at 65⅛ and in the short-dated issues Conversion 4¼ per cent gained ⅝ at 101. Little interest was taken in Dominion and Corporation loans and 78 per cent of the £5 million 5½ per cent South African conversion loan 1974-76—issued on Tuesday at 97—was left with underwriters. By Wednesday's close the discount had widened from 1 to 1½. Among foreigners, Baltic bonds were all marked up. Riga were 10½ better at 51 and Wilno gained 13½ at 51. Greek bonds were still active with the Greek 7 per cent stock rising 10 to 44.

Industrial equities were helped by news of the revival in machine tool orders and the hire purchase figures. Over the week to Wednesday's close, investment and speculative demand offset end account profit taking. Unilever N.V. gained 7s. to 136s. 9d. on United States buying through Amsterdam and other continental bourses and Unilever Ltd. rose 9s. 6d. to 136s. 9d., largely on switching from the N.V. shares. Liebigs went ex all and jumped 8s. to 59s. 6d. on investment buying in a market short of stock. Metal Box gained 7s. 9d. before the results, but on Wednesday profit taking put them back 9d. at 59s. 6d. Breweries remained active with a fresh spurt on Wednesday after the announcement of the Ind Coope-Taylor Walker merger. Watney Mann fell back 1s. 3d. to 73s. pending the directors' statement. Courage and Charrington showed gains of 6d. and 9d. respectively. Store shares came in for a good deal of speculative buying with the GUS voting shares in the lead, jumping 10s. to 59s. 6d. on hopes of a scrip issue. Harrods rose 6s. to 99s. 6d. on vague take-over rumours and House of Fraser gained 5s. to 47s. In property shares, Eron Investment touched a new peak at 35s., but then fell back 5s. 9d. to 29s. 3d. Channel Tunnel were marked up on hopes of an early statement on the survey.

Oil shares were quiet but Anglo-Egyptian gained 3s. 6d. to 30s. 6d. on the desequestration news. Shell were 1s. 3d. better following the quarterly figures. Kaffirs were again well supported by United States buying through Johannesburg and the *Financial Times* gold mines index gained 0.6 to a new peak of 94.8. Western Holdings gained 8s. 3d. to 167s. 6d. on the higher interim dividend and Middle Wits rose by 9d. to 25s. Ofsits were 3s. 7½d. better at 105s. 7½d.

This cable cost a fortune

The jib structure of the excavator appeared to be in good working order. Suddenly the bridle rope broke. Down came everything and up went the daily costs owing to production delays and loss of profits.

—and two people could have prevented the accident

An accident like this, caused by the fretted corrosion of a strong-looking bridle rope, need never happen — if a qualified Engineer Surveyor regularly inspects machinery. But first it is the responsibility of someone at top-level — a director, the secretary or chief engineer — to see that all their industrial machinery is inspected *and* insured by specialists.

1859 1959

Vulcan inspects and protects

Vulcan, who this year celebrate a century of experience—and look forward to learning more every day—provide just such a service. It costs no more than insurance and inspection by 'general practitioners'. Our appointment is always welcomed by company engineers and insurance brokers — because they know that if defects are to be found, a Vulcan Engineer Surveyor will find them, and prevent the accident that would have happened.

MAY WE SEND YOU FREE

APPOINTMENTS

AN ECONOMIST
is required by
A.E.I.-HOTPOINT LTD.,

to assist in the establishment of a marketing information service for the Company's expanding export group.

Applicants should be between 25 and 30 years of age and preferably have had some experience in market research, including the assembly of published information, and the assessment of national economic potentials.

Candidates should be willing to carry out routine work in collaboration with others, but be capable of assuming a large measure of responsibility himself.

Attractive salary will be offered to really suitable applicant.

Write, giving full details of personal history and business experience, to:
Employment Officer,
A.E.I.-Hotpoint Ltd.,
33 Grosvenor Place,
London, S.W.1.

GOVERNMENT SOCIAL SURVEY

A Senior *Research Officer* is required for the SOCIAL SURVEY DIVISION of the Central Office of Information. This unit, which is responsible for official sample survey enquiries, covers a wide field of social and economic problems, employs a variety of research methods and maintains high technical standards. Specialist sections are available for *sampling, interviewing*, coding and mechanical tabulation, but *research officers* have full responsibility for the design and reporting of survey work, much of which is published.

Applicants must produce evidence of previous work involving the use of accepted methods and ability to devise new techniques where appropriate. The post is graded *Senior* Information Officer (unestablished); salary £1,395 to £1,660 (men); £1,345 to £1,600 (women).—Write, giving age, full details of qualifications and previous experience, to Ministry of Labour and National Service Professional and Executive Register (PE 461), Fairingdon Street, London, E.C.4. Only those applicants selected for interview will be advised.

AN FORAS TALÚNTAIS
(THE AGRICULTURAL INSTITUTE, DUBLIN, IRELAND)

has a vacancy for a HEAD OF THE DEPARTMENT OF STATISTICS. Salary: £1,600—£1,900 a year or £1,250—£1,500 a year, depending on qualifications, experience, etc. Assistance — and [illegible] — with removal expenses. Superannuation scheme. ESSENTIAL QUALIFICATIONS: A Degree in Mathematics and/or *Statistics and/or Science* and/or Agricultural Science, and at least five years' research or related experience in the design and analysis of *experimental* and survey work using modern statistical techniques.

Further particulars, application forms, etc., from the Director, An Foras Talúntais, 33 Merrion Road, Dublin. The latest date for the receipt of completed *application forms is Friday*, June 26, 1959.

MARKET INVESTIGATIONS LIMITED have a vacancy for a YOUNG MALE GRADUATE to be trained in all aspects of market research with a view to promotion as a Research Officer responsible for the conduct of surveys and other marketing operations. Some commercial experience would be an advantage. Initial salary £650-£700 p.a.—Please write with full details to S. J. Orwell, Director, 1-2 Berners Street, London, W.1.

THE AGRICULTURAL RESEARCH COUNCIL require a SECRETARY for their Radiobiological Laboratory [illegible] Wantage, Berkshire. Duties include general administration, [illegible] management and finance. Age limits 30-45. Salary scale £1,000 x £30 (approx.)—£1,290. Contributory superannuation scheme.—Applications, with names of three referees, to Secretary, Agricultural Research Council, Canard Building, 15 Regent Street, London, S.W.1, not later than June 15, 1959.

For other appointments see page 980

THE UNIVERSITY OF MANCHESTER

WARBURTON SCHOLARSHIP IN LOCAL GOVERNMENT

Applications are invited for the above Scholarship for research in local government, the law relating to local government, or comparative local government. The Scholarship is tenable for one year and is of the value of £400. It is open to graduates of this or any other approved University, and applications are acceptable from students who expect to graduate this summer. Applications should be sent not later than July 1, 1959, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above studentships and grants for research in Economics, Economic Statistics, Government, Social Administration, Social Anthropology or Sociology, tenable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £450. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University, and applications are acceptable from students who expect to graduate this summer.—Applications should be sent not later than July 1, 1959, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

ACTUARIAL OPPORTUNITIES IN AUSTRALIA

Universal Flexible Trusts Limited (Victoria), Universal Flexible Investment (N.S.W.) Pty. Limited, and the Consulting Actuarial Practice of A. M. Parker, F.I.A., F.S.S., offer attractive actuarial opportunities at all levels of Institute and Faculty qualifications, for men who want an interesting and lucrative career in a country with one of the best climates in the world and where the standard of living at all cultural, material and political levels is excellent.

Salary offered for Fellows between the ages of 25 and 35 is £2,000 to £2,500 (Australian) per annum with excellent prospects. Salary offered to non-Fellows is comparable. Under a generous contributory pension scheme there is a retirement pension of 50 per cent average of highest five years' salary, and a widow's pension of half of this amount on death during service or after retirement, plus children's pensions on death. A bonus is payable, depending on profits, and this has always been generous. Transfer cost to Australia will be paid on appointment.

Both the Unit Trust companies and the Actuarial Practice are latire and rapidly expanding. Amounts invested in the Unit Trusts are currently approaching £2 million per annum and the Actuarial Practice is the largest in Australia with leading British/Australian companies included in its clients.

Men interested should write or 'phone to Mr. A. M. Parker, F.I.A., F.S.S., at 3 Chester Row, Belgravia, London, S.W.1 (Phone Sloane 6508), from May 26, 1959, when a personal interview can be arranged.

WORKERS' EDUCATIONAL ASSOCIATION—Yorkshire District (South). Applications are invited for the post of *organising-tutor* in the West Riding of Yorkshire. Applicants should be honours graduates in subjects appropriate to adult education. Salary scale £650 x £50 to £1,200. *Closing date twenty-one days after the* appearance of this advertisement.—Application forms and further details from District Secretary, W.E.A., 26 Campo Lane, *Sheffield, 1.*

APPOINTMENTS REQUIRED

YOUNG MAN, 26, experienced in Foreign Trade, seeks employment, preferably in London, with an organisation with overseas contacts. Proficient in office procedure (typing, etc.). *Spanish.*—Write Box 1178.

M.B.A.—Engineer, 33, chemical industry supervisory experience U.K., Canada and U.S.A., desires post involving international liaison and travel preferably based in North America.—*Terry*, P.O. Box 16, Medford, Mass., U.S.A.

TWO Indonesian *Students of Accountancy*, graduating 1959 from University of South Wales and L.S.E., require articled *clerkships, preferably no premium*, to commence autumn 1959.—Please contact the Cultural Attache, *Indonesian Embassy*, 38 *Grosvenor* Square, London, W.1.

CANADIAN *JOURNALIST*, *British educated*, seeks newspaper or magazine post. Age 38; 15 years' experience. *Broadcaster, photographer*, taped interviews, etc. Special knowledge North American political and economic affairs and their *relationship to the international* scene.—Air mail replies P.O. Box 783, Station B, Montreal, Canada.

FINANCIAL NOTICE

PRE-ANNOUNCEMENT NO. 228/8

JUNE 1st, 1959

In Implementation of Article V of the petroleum Act of July 31, 1958, and by virtue of the powers vested in N.I.O.C. by the said Act, it is hereby announced that:

(1) With a view to carrying out the operations defined in the petroleum Act, District VIII of the petroleum districts of Iran, situated on the south of the orbit of latitude of 32.0'0" north, between the meridians of longitude of 51.0'0" and longitude of 54.0'0" east of Greenwich and bounded on the south and southwest by straight lines starting from Point 1 at longitude 51.0'0", latitude 30.45'0", thence on a straight line to:

Point 2 at longitude 51.30', latitude 30.45', thence on a straight line to:

Point 3 at longitude 52.0', latitude 30.30', thence on a straight line to:

Point 4 at longitude 52.0', latitude 30.0', thence on a straight line to:

Point 5 at longitude 54.0', latitude 29.10', with the exception described below, shall be declared as "*Open*" with effect from September 1, 1959.

(2) For the whole area situated within the boundaries described below:

From point (a) at longitude 51.0', latitude 31.45', thence on a straight line to:

Point (b) at longitude 51.20', latitude 31.30', thence on a straight line to:

Point (c) at latitude 51.25', latitude 30.45', thence on a straight line to:

Point (d) at longitude 51.0', latitude 30.45', thence on a straight line to point (a), mentioned above;

although considered as part of district VIII, no proposal shall be accepted since it has previously been committed.

(3) Any person or company desiring to carry out one or more of the authorised operations defined in the petroleum Act within the abovementioned open district may communicate, as from June 1, 1959, with the Chairman of the Board of Directors of N.I.O.C., Central Office, Tehran, Iran, *applying for questionnaire* which shall be sent to him/it, to be filled in and returned, in order to enable the N.I.O.C. to ascertain his/its technical and financial competence.

Questionnaires received up to September 1 will be considered first, but others received after that date will be considered later on.

Note: For any person or company who has, in the case of previously opened districts, obtained, completed and returned the said questionnaire, and whose technical and financial competence has already been established, repetition of this procedure is unnecessary, and should only act according to the following sections of *Pre-Announcement*.

(4) As soon as the applicant's competence shall have been established, this fact will be notified to him. He may thereafter, and as soon as the *declaration* referred to above shall have been issued, obtain from the N.I.O.C. (address as given above) against payment of the sum of Rls. 200.00 (two hundred thousand), a copy of the *specifications* booklet, as well as the specimen agreement forms together with such other supplementary information as *may be required*, to enable him to submit his written proposals to the N.I.O.C. in accordance with the provisions of *the petroleum Act*.

(5) The proposals received between September 1 and November 1, 1959, shall be examined by the N.I.O.C. within two months beginning from November 1, 1959, and the outcome shall be announced in due course. Proposals received after November 1, 1959, will be considered only when the outcome of the above mentioned proposals has been announced, and until such time as the District may be announced as "Closed."

(6) The submission of a proposal shall not create any right for the applicant, the N.I.O.C. being free to accept or reject, all or some of the proposals received.

NATIONAL IRANIAN OIL COMPANY.

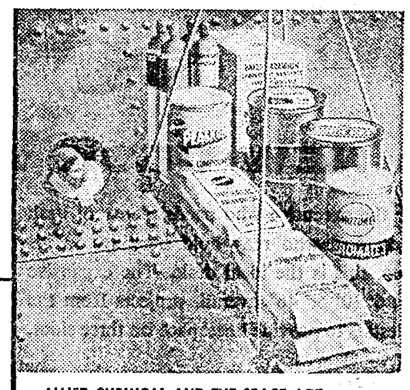
Another "100 Chemical Plants" swing ashore

When you buy from Allied Chemical, it's like having a chemical company in your back yard—over 100 plants turning out more than 3,000 chemicals for world-wide industry and agriculture . . .

It takes a large industrial complex to manufacture one of the most complete chemical lines in the world . . . Allied's seven manufacturing divisions operate over 120 plants, mines, technical service and research laboratories. And these facilities, plus a wealth of technical skill and experience, are as close as your Allied Chemical distributor.

PLASTICS



Allied makes A-C Polyethylene, a low-molecular-weight polymer that adds brilliant color and gloss to molded products; imparts toughness and mar resistance to waxes, paints and coated board. Then there's Allied's new type nylon—PLASKON nylon molding and extrusion compounds based on caprolactam. For other plastic applications, PLASKON provides urea, melamine, alkyd, polyester and other resins.

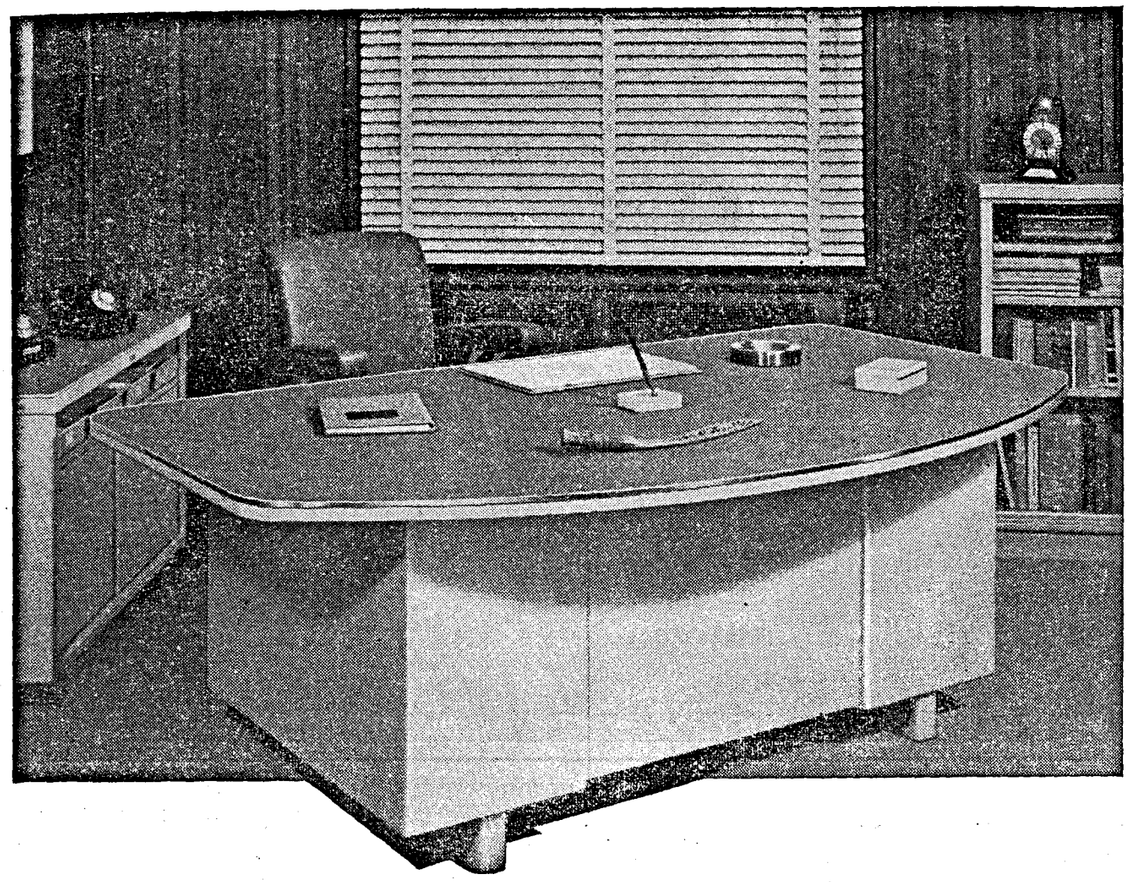
THROUGHOUT INDUSTRY

Allied's chemicals are basic to most processing needs. Be it tons of SOLVAY soda or custom lots of B & A biochemical reagents, world-famous Allied Chemical quality is in every shipment.

IN AGRICULTURE

For more than 50 years, Allied has been serving agriculture in fields, pastures, orchards and ranches the world over. ARCADIAN fertilizers today are raising the yields of virtually every type of crop. PROCADIAN urea feed supplement builds healthier, meaty cattle. And, ORCHARD BRAND spray materials protect crops and animals from insects and disease.

ALLIED CHEMICAL AND THE SPACE AGE



Allied Chemical offers some 30 products for the space age. A new easy-to-read booklet entitled "Allied Chemical and the Space Age" is available without cost. Just write for one.

You can get more information on Allied in our booklet, "Introducing Allied Chemical International." Ask your Allied Chemical distributor, or write for it on your company letterhead to your nearest Allied Chemical International office.

The capitalized names are trademarks of Allied Chemical.

Nuclear Ships First Published Design Details in

NUCLEAR ENGINEERING

Now on Sale

In the June issue of *Nuclear Engineering*, the new reactor system incorporated in the Vickers Nuclear Engineering proposal is described in full. With steam-cooling, heavy-water moderation and thermo-compressor circulation, this novel and entirely British concept opens up an exciting field of development. Details of six other British industrial ship propulsion designs are also revealed.

Additional features include:

Chapelcross; Fuel Elements for Dresden (U.S.A.); Thermal Storage in Rock Chambers; Electronic Instrumentation for Nuclear Power Plants; The Hanover Fair; O.E.E.C. Conference in Stresa.

Monthly: Three shillings and sixpence.
Annual subscription: Forty two shillings.

Special subscription terms are available for students—please write to the subscription department for details.

TEMPLE PRESS

Temple Press Limited *BOWLING GREEN LANE, LONDON E.C.1.*

Sixty Eight Years of Specialized Publishing

Countess Marion Dönhoff, Political Editor of *Die Zeit*, in her office in Hamburg. Below she tells why she reads—and quotes—*The Observer*.

"The most remarkable British newspaper of all"

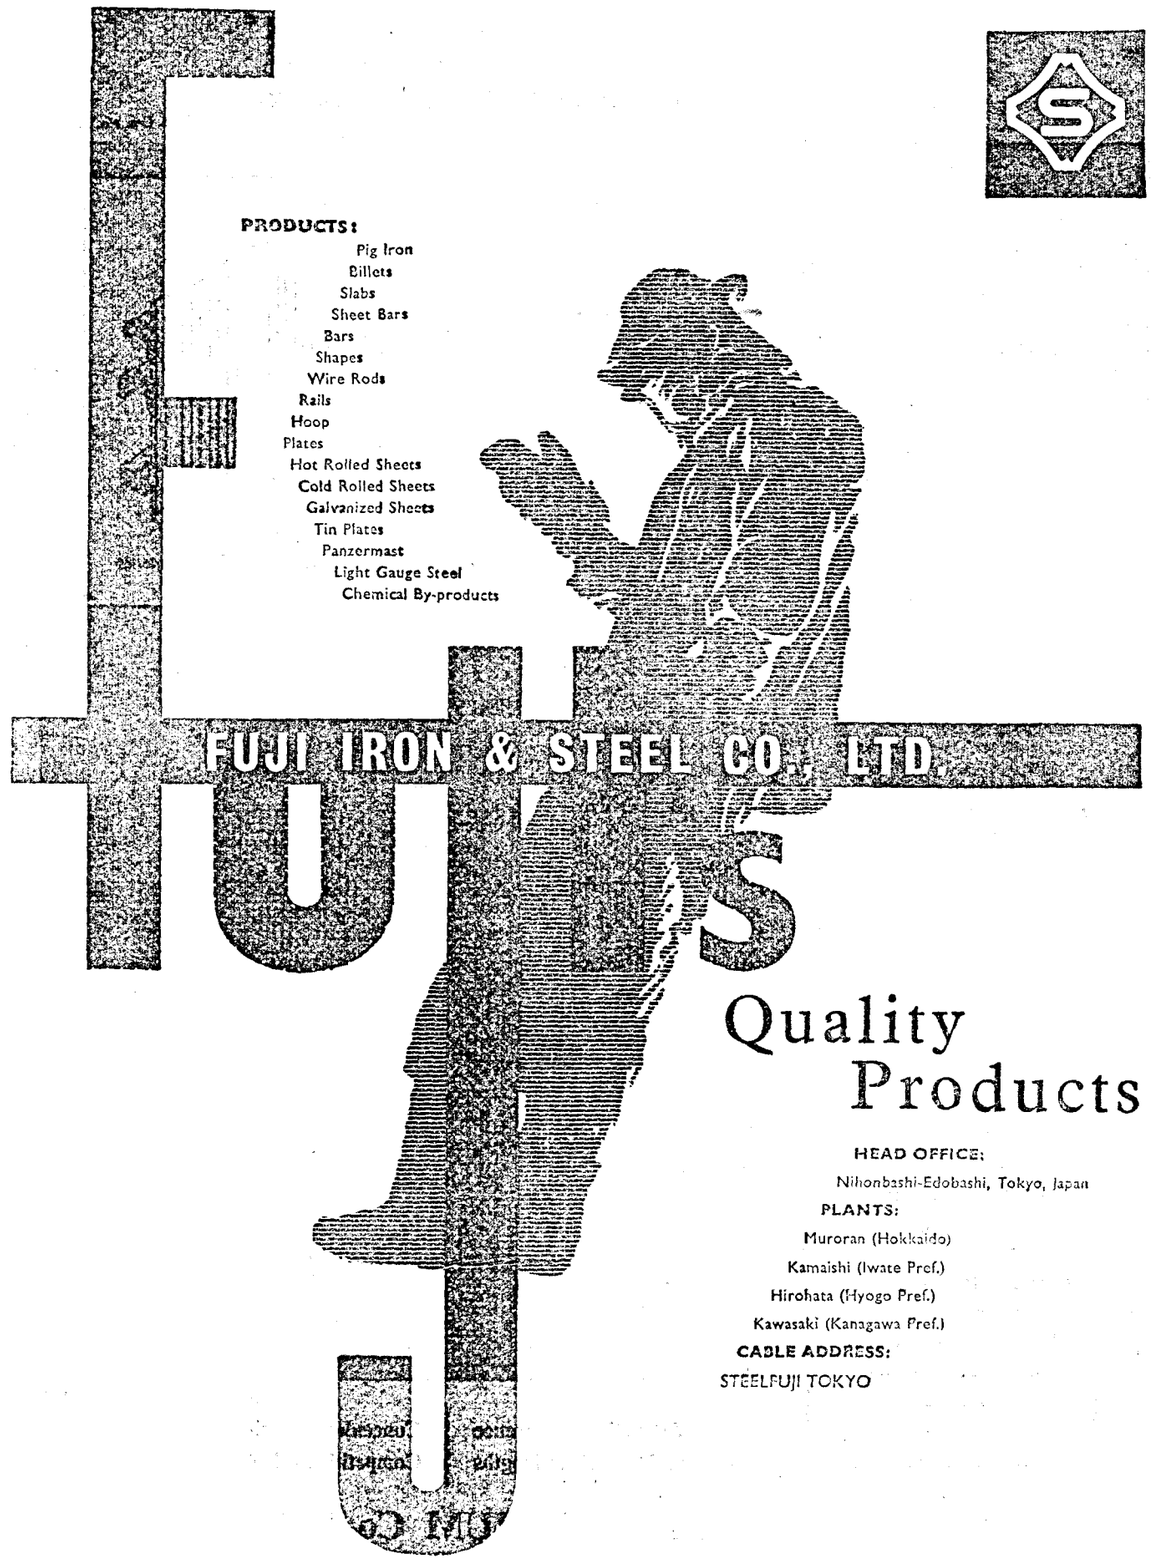
says the political editor of Die Zeit

Countess Marion Dönhoff is political editor of the leading German weekly, *Die Zeit*. Asked why her paper so frequently (and so fully) quotes *The Observer*, she replies in words which deserve a paragraph to themselves.

"To my mind," she says, "*The Observer* is the most remarkable British paper of all. Its straight reporting, its reasoned and courageous opinions and its fresh, original handling of the news are as enlightening as they are indispensable to anyone in my kind of job. Frankly, I know of no newspaper that untangles the skein of world events with equal discernment and authority."

It is not common for the editor of a journal, itself influential, to write of a contemporary in such terms. But the quotability of *The Observer* is indeed a fact; the world's press and the world's political leaders constantly cite its opinions.

Not only in Germany, but in all countries. Not only top journalists and politicians, but public men and women in many fields. Such people shape events. And a newspaper with that calibre of reader has great responsibilities—for what it thinks and says is likely to become news in its own right.



More than two million readers in Britain would agree with Countess Dönhoff, both as an Editor and as a person, when she adds: "The very few Sundays I have had to go without The Observer just did not seem complete..."

How complete are yours, by the same reckoning?

★The Observer's political freedom (there's an election coming)...★its news sense... ★fashion sense...★coverage of books, plays, films, gardening, travel and ideas... ★coverage of sport... all these could be a godsend to you.★Not to mention The Week, that masterly review of seven days.

Order it through your newsagent—in time for this Sunday!

Grinding to a Stop

IT now looks sure that by the end of next week almost all the printing and publishing of newspapers and periodicals in Britain, apart from the national daily and Sunday newspapers published in London, will come to a standstill. Between now and then production is becoming more difficult every day. This is the cumulative effect of the ban imposed last week by the printing trade unions upon the working of overtime, and of other restrictions. The facts of the dispute are given in a Note of the Week on a later page. The upshot of it all is that the normal publication of *The Economist* looks like grinding to a stop.

We can only apologise again for the many serious defaults that this must inevitably mean in the discharge of our obligations to the paper's readers, subscribers, and advertisers. Every effort will be made to bring *The Economist* out as adequately as may be. But the paper will, in any case, be truncated in size and late in delivery; and there cannot be any certainty that it can continue to come out in any form. We must emphasise again, too, that *The Economist* is itself a victim of this dispute in the printing trade over pay and hours, and not in any way a party to it. We employ no printing workers; we simply contract for our printing with a printing house which the dispute, unless there is some new turn, will stop next week: the employers in the industry will lose their business, the workers their employment, and *The Economist* its printing facilities.

It is a melancholy prospect for everybody. On the dispute itself we, who have no voice in it, can repeat only this. A settlement is much to be desired, in the interests of the printing industry itself, of the press and of the public at large. Both sides of the industry will be much to blame if they flag even now in the search for one. But, again, it would be preposterous to say of any industry that any settlement at all now would be better than the impending unhappy stoppage. A settlement, to be real and worthwhile, must make sense: it must, while meeting the satisfiable requirements of the workers, be one which can be afforded by the industry; and, above all in this case, it must be one which offers good hope that the industry will be thereby enabled to adapt its methods and its organisation to urgent new technical and economic needs. The crux now, on all counts, is productivity.

This is the challenge to both masters and men in the industry. The challenge to those of us who are directly the victims of the failure so far to find such a settlement is different. It is not simply that all of us stand to make important business losses from a stoppage of publication —or indeed already from the shrinkage and slowing down. There is a much more important point of principle. To stop publication is to fail not only in our contracts but also in the fundamental duty that all the press owes to its readers. The right of the press to unfettered publication is a right not of journalists but of free citizens: to appear, while and how it can, is the press's duty.

Labour and the Bomb

Her Majesty's alternative government has been put on the horns of a dilemma by the welling-up of pacifist emotion again among some of its followers

REALISTS are going to have to spend a lot of time again this summer repeating the stark—but surely fairly simple—ABC of implications that arise for Britain from the existence of hydrogen bombs.

First, now that they know how to make the bomb, the leaders of either America or Russia would, in some circumstances, certainly use it. They would use it at the beginning of any major war if they thought that the other side might be about to bomb them. They would use it at the end of such a war if they found themselves in the position of Hitler in his last Berlin bunker. This grim human fact will not be dispelled by any motions condemning the beastliness of the bomb, or by any agreements about discontinuing its peacetime manufacture, which may be passed or signed in the meantime.

Secondly, given this, the main task is to prevent the outbreak of a major war between the major powers, which would roll inexorably towards a last bunker situation. The only ways in which such a war could break out would be through madness or miscalculation in the Kremlin or (much less likely) the Pentagon. If Britain were to withdraw from the western alliance, and were thus to open gaps for more communist infiltration around the perimeter of the free world, the chances of miscalculation or nervous madness would obviously be enlarged. Demonstrators against the establishment of American rocket bases in this country may be evincing a personal and courageous Christian pacifist feeling when they say that, for moral reasons, this country should have nothing to do with any device for throwing nuclear bombs on other people's children from British territory. What they are not doing is reducing the risk of bombs being thrown at their own and other people's children from other people's territory. They are increasing it.

Thirdly, this (to non-pacifists) overwhelming argument for maintaining and equipping American bases in this country does not necessarily extend into an argument for Britain continuing to develop the bomb independently itself. For one thing, it can be argued that Britain might make a more direct contribution to western defence by increasing its other armaments, rather than by making a marginal addition to America's much larger deterrent power. It is also argued that, if Britain were willing to renounce the manufacture of its own bomb, this might be used as a bargaining counter for securing a multilateral agreement: that other powers which are smaller than Russia and America should not start making their own bombs either. But the example of France, which is ready to stake its whole contribution to Nato on its bid to be a nuclear peer of the United States and Britain, is not hopeful for this idea. And, in any case, those who think that such a self-denying bargain is possible should logically oppose any unilateral renunciation of Britain's manufacture of the bomb beforehand, and they should certainly be more eager than anybody else to hurry forward the establishment of an American nuclear shield in this country.

THE reason for repeating this simple alphabet of security at this juncture is that it looks as if the old dreary muddle of emotionalism about the bomb is going to bemuse left-wing politics once again. Alarm signals are beginning to fly from Transport House, and for a familiar reason. While the Conservative party rigs its annual conference each October by picking for debate only ambiguous or laudatory motions which its leaders feel they can accept, the Labour party traditionally does its rigging in a different way—by allowing motions which are fiercely critical of official policy to come forward for debate, and then using the faithful block vote wielded by the big trade union leaders to vote them down. Very often at this time of the year it begins to look as if this device might put the Labour leadership in danger of defeat on some particularly critical issue. Last year it was the comparatively minor matter of the public schools; before that it was the demand for the nationalisation of a much larger number of industries than is on Labour's present list; and five years ago there was the narrowest shave of all on the explosive subject of "German rearmament." This year it looks as if the pre-conference storm is going to be on the touchiest subject of all—whether the next Labour government should unilaterally renounce the manufacture of hydrogen bombs.

A year ago the Labour leadership gained support for its policy that Britain should continue to make the bomb (but not to test it) by the handsome majority of 4,720,000 conference votes; it would therefore require a turn round of 2,360,000 votes to overthrow official policy this year. But last week, to the horror of the party leadership, the giant and very right-wing National Union of General and Municipal Workers nominally reversed its policy on the bomb; its annual conference passed a motion demanding that the next Labour government should take unilateral action to stop the manufacture of nuclear weapons and to ban their use from British territory. There is some evidence

that this turn-round was caused by the silliest possible mischance—the motion concerned was carried, against the executive's advice, by a majority of 24 delegates' votes, at a time when a number of right-wing delegates are said to have gone out to sun themselves on Scarborough beach. But the NUGMW wields 650,000 votes at a Labour conference. Add to this the million votes of the Transport and General Workers' Union, cast at Labour conferences by Mr Cousins, who joined in this year's Aldermaston march; add the votes of some other trade unions which are expected to change sides this year; and the mathematics could suggest that the Labour leaders are in a very awkward spot.

From past experience, there is little doubt that they will manage to wriggle out of it. The real question is whether they can do so by the easier expedient of "playing it soft," or whether they will eventually find themselves having to "play it hard," as Mr Attlee and Mr Morrison had to do about German rearmament in 1954. The tactics of "playing it soft" would involve Labour leaders in saying very little about the bomb between now and October—with that little laying emphasis mainly on Labour's existing pledge not to test the bomb. Leaders of unions which have still to hold their annual conferences might be asked, where possible, to try to see that H-bomb motions at their conferences are not too embarrassingly phrased. When the Labour conference arrives, the anti-H-bomb motion might well be an extravagantly left-wing one (anti-all American bases, anti-western-alliance and anti-everything else); unions leaders need not feel they were committed to vote for that.

If the Labour leaders can ride over this awkwardness without loudly advertising it, so much the better for both themselves and the country. That may seem an improper thing to say in a democracy that is based on honest differences of sober opinion, which generally need to be publicly debated and brought out into the open; and certainly there is no subject that more needs to be brought out into the open than the muddle of this nuclear disarmament debate. But the conference of the party that may shortly thereafter be called upon to form Her Majesty's government will not be the best place for exposing the muddle. It will be a minor national disaster if the last Labour conference before an election votes down a proposal to renounce the western alliance by only the barest majority and after a bitter battle.

But, as against that, it would be a bigger disaster if, as the price of suppressing the clash privately behind the scenes, the Labour leadership were itself to have to make concessions towards neutralism in its own public utterances. Rather than that, the Labour leaders should do it the hard way.

The Adenauer Question

The Chancellor's chopping and changing makes plain west Germany's need for responsible government, not personal rule

WHEN Dr Adenauer was last returned to power by the west German electorate in September, 1957, the comment was made in *The Economist* that his party, the Christian Democratic Union, had always, from its birth in 1945 to then, been Dr Adenauer's instrument, not his master. Its future evolution when the Adenauer era was over was uncertain, and would affect the western powers vitally; for, although for a period the basic national questions of German unity and Germany's eastern frontiers would remain shelved, while Bonn busied itself with the pursuit of union in western Europe, this was an interim period and would not last for ever. The threat of a divergence of German and western interests, latent in the unsolved German question, would come into the open at a later day when, more likely than not, the next generation of Christian Democratic leaders would be in power.

The Geneva conference and the manœuvres that led up to it, solemnly as they have concerned themselves with German unity and Germany's relationship with eastern Europe, have strengthened, not weakened, that prognosis. Bonn's interest in the Geneva conference is, naturally enough, that there should be no move in the search for a settlement of the German question until the balance of forces has somehow changed to the western, and in particular the west German, advantage. Indeed, it has been Dr Adenauer's insistence on this standstill that has brought into view the first signs of a divergence between the German and the Anglo-American interest in east-west relations; for the British are certainly, and the Americans probably, impatient of the total lack of diplomatic power of movement which Dr Adenauer's attitude imposes upon them. Evidently it is not only his concern for the dangers to peace if the Geneva conference fails, but also his concern lest British and even American restlessness might lead to some risky change of position at Geneva, that has now helped to decide Dr Adenauer to keep power in west Germany in his own hands for a while longer.

From the western point of view, it was generally to be welcomed when Dr Adenauer decided on April 7th to accept nomination to the federal presidency and allow another man to step into his shoes as chancellor. Dr Adenauer is 83, and his refusal to allow the emergence of any possible successor to himself

had long been a disquieting cause of uncertainty about west Germany's future course. The Christian Democratic Union without Dr Adenauer was an unknown quantity ; here, in the voluntary withdrawal of the great old man from active government to the position of head of state, seemed to be the heaven-sent opportunity to decide the succession calmly and in a manner that allowed the continuous evolution that German political life has usually, disastrously, lacked. Indeed, there was only one flaw; it did really seem a little too good to be true.

It was. Having been talked into his decision by the men most loyal to him, Dr Adenauer very quickly confused matters by talking as if he intended to continue to conduct the government from the presidential office. His thinking aloud on those lines found no echo in Germany. But almost as quickly, it became clear that he did not approve of his party's wish to put Professor Erhard in his place as chancellor (a wish dictated by the innocent desire to win the next election in 1961), but was resolved to have Herr Etzel instead ; and what was more, he intended so to arrange the timetable of office-changing that he could himself send Herr Etzel's name to the Bundestag. The party was obstinate, and the issue turned into a conflict between the old master and his suddenly recalcitrant instruments.

It was at this stage, at the end of May, that Dr Adenauer went to Washington to attend the funeral of Mr Dulles. There, as it seems, he was not only moved to gloom about the future by contemplating the loss of the powerful Secretary of State who had been his friend; he also was confirmed in the view that his own retirement would be a great loss to the West. On returning home, he decided to simplify the whole matter by staying in office, and told his stupefied party on June 4th that they would have to find not a new chancellor after all, but a new presidential candidate to oppose the formidable Social Democratic candidate, Professor Carlo Schmid. Professor Schmid would have made—may yet make—an excellent president. The Christian Democrats are paying dear for the hubris that will not let them contemplate a political opponent in the presidential office.

In the end—if the strange story can be said to have reached an end yet—the desire to keep Dr Erhard out of the Chancellorship has weighed more heavily with Dr Adenauer than the desire to keep Dr Schmid out of the presidency. Embedded somewhere in the chancellor's chopping and changing there is a lesson to be learnt by the western statesmen, who have put so much of Germany's and their credit on the person of the oldest of them all. Dr Adenauer's great services to the Atlantic alliance, and the firm western alignment and pulsing material recovery that have marked west Germany in the ten years of his party's rule, have caused them to assume, and to make the assumption too plain to the world, that Germany's value to the west depends on Dr Adenauer and his party exclusively. This is a fallacy. The free world's true interest in west German politics is that the Germans should learn for the first time to govern themselves in a responsible, continuous and civilised way. If this is happening just now, it is without Dr Adenauer's help ; for, as the present events in Bonn show, the result of staking too much on the rule of one man has been, in the end, what might have been expected: personal rule.

Whipping at Westminster

An examination, not into whether party whips are too much like scorpions, but into what they do

THAT occupant of the extreme right hand place on the Government front bench, silently pensive while other ministers speak, flitting inconspicuously in and out of the chamber, pausing to bend his head in a brief whisper to a junior minister or a parliamentary private secretary, and once in a while tugging the coat tails of a minister who has slipped up over procedure, is Mr Edward Heath. As Government Chief Whip, he is stage manager of the Conservative parliamentary party. As Patronage Secretary to the Treasury he is principal conduit to the fountain of honour that directs the carefully regulated shower of baronies, baronetcies, knighthoods bachelor, KBEs, MBEs and OBEs which falls twice a year on the well tailored shoulders of Conservative politicians in Parliament and in the party organisation in the constituencies.

As Parliamentary Secretary to the Treasury, with the aid of a small highly skilled staff of civil servants, he is an indispensable servant of the House of Commons, responsible, under the Leader of the House, for scheduling the business of Parliament. He has offices in 12 Downing Street, cheek by jowl with the Prime Minister, as well as in the Palace of Westminster.

The extent to which Mr Heath's three jobs interact with each other is a controversial and delicate matter. Since the pervasive influence of political patronage was made a current issue by Mr Grimond its purveyors have become even more bashful than usual about its extent and function. The most that can be said in its favour is that since some degree of party coherence is an advantage to the country and since voluntary party work is evidently not in all cases its own reward, snobbish baubles like political knighthoods are less harmful incentives than the embassies and judgeships which are the equivalents in the American system. The patronage of the Patronage Secretary is supplemented by that of

Mr Heath's second role as Chief Whip. In this capacity Mr Heath and his assistant whips parcel out places on many, but not all, parliamentary delegations (with Mr Bowden, the Opposition Chief Whip, supplying names for the Labour party's share), official trips abroad, and advisory committees. It may also be taken for granted that Mr Heath has more weight than Sir William Haley in advising the Prime Minister over Government changes. Most Prime Ministers, of course, are themselves familiar with their Cabinet material. The Chief Whip's main role is to pick out likely backbenchers for their junior ministerial chance.

But patronage is only the seasoning. The real meat of the whips' task is to direct parliamentary play, in such a way that, within mutually understood limits of propriety, their side dishes the other. The actual scheduling of parliamentary business is done, under the direction of the Leader of the House and Mr Heath (this time in his capacity as Parliamentary Secretary to the Treasury), by Sir Charles Harris. It is thirty-seven years since he first undertook this delicate task, which was made a civil service job in 1939. The great trick is to get as many bills as possible read for the second time and sent to committee in the early weeks of the session before the Opposition has any supply days at its disposal. Sir Charles keeps in close touch with officials of departments which have won a place for their measures on the list drawn up by the Legislative Committee of the Cabinet, and furnishes them with deadlines for producing their drafts.

In addition to the Chief Whip, Mr Heath, and the Deputy Chief Whip, Mr Redmayne, there are eleven government whips, of whom four hold titular ministerial office as Lords Commissioners of the Treasury, three are officers of the Royal Household—the Treasurer, the Comptroller and the Vice-Chamberlain—and the remaining four are unpaid (except of course as MPs). For the most part the Palace duties of the "royal whips" are purely nominal. But they act in a minor way as liaison between the court and parliament by, for example, introducing members to the Queen at garden parties. And the Vice-Chamberlain, now Mr Edward Wakefield, is the most privileged parliamentary journalist in Westminster. Sitting just behind the Chief Whip, at the end of the second bench in the ministerial row, he is to be seen every day busily jotting down notes for a parliamentary "sketch," usually covering question time and the first two speeches of the debate, which has to be delivered to the Queen by 7 p.m.

FOR the purpose of being whipped, members of each party are grouped according to the geographical area of their constituencies. Each group has its own whip, who advises the new members about procedure and proprieties, attempts to shepherd his charges away from dangerous courses and reports back to the Chief Whip any special current malaises. The arrangement of pairs is probably the most frequent matter on which a member will need to consult a whip. Pairing (or the gentleman's agreement by which one member says to another of the opposite party : "I'll push off and not vote if you promise not to either") is fixed directly between two members, but each will have to register the pair with his own whip. The whip (human) will be guided in his attitude to a pair by the whip (written) which is a document circulated each week to all party members, listing the forthcoming parliamentary attractions and indicating their degree of importance by the number of times the summons to attend and vote is underlined. If the whip is underlined once approval of paired absence is automatic ; if it is underlined thrice disapproval is certain except in the most pressing circumstances. In the case of a two-line whip the main concern of the government party's managers will be to see that there are at least 120 members in or within easy call of the House, so as to have available, with a small margin of safety, the 100 votes needed to carry a motion of closure.

The whips are the eyes and ears of the party's leaders. It is through them that groups of the rank and file normally make known either their uneasiness or dissatisfaction with leadership or policy. The practice is somewhat different between the two large parties, because even when the Labour party is in office its leaders attend full meetings of the parliamentary party, whereas in the Conservative party they do not. For this reason the Conservatives need to arrange for a whip to be present at all regular meetings of specialist party groups, so that the opinions which come up in private discussions can be conveyed to the leaders. In addition, the government whips will always retain close working relationships with the members whom ministers appoint as their parliamentary private secretaries. One of the PPS's jobs is to keep his minister's nose clean with his parliamentary supporters, so that he will need to know from the whips of any murmuring of dissent. It is also part of his job to see that his minister is in position on the front bench when he is needed to answer questions or reply to a debate. A whip will prod the PPS into action if there is any danger of the minister missing his cue. In the House itself the whips' most publicised activity is to line the entrances to the division lobbies to ensure that no sheep stray into the pen assigned to goats—a precaution that is usually necessary, not so much to prevent consciously unorthodox voting but because the hundreds of members who stream in from the library and tea-rooms for a division have little idea what they are voting about. Between divisions whips play a constant, uncontroversial and indispensable part in the parliamentary pageant. They mount guard on the two front benches, so that there is always at least one official representative of the Government and the Opposition present to take swift action if an unexpected situation arises and, in the case of the government whip, to move the procedural motions without which the parliamentary machine would halt.

Whatever the personal relations may be between

other protagonists of the opposite front benches, the amenities between the Government and Opposition Chief Whips must, if parliamentary life is to be at all livable, be preserved. Together, Mr Heath and Mr Bowden constitute the "usual channels" through which the business of the House is arranged. Mr Bowden is given the Government's plans for the forthcoming week on Wednesday in time for the regular meeting of the Labour party's "shadow cabinet." Afterwards he sees Mr Heath again to find out if the Opposition's wishes can be accommodated. If they cannot reach agreement there may be a public exchange between Mr Gaitskell and Mr Butler on Thursday, when the Leader of the House has made his weekly announcement about business. This often leads to an undertaking by the government to have another shot at sorting things out "through the usual channels."

What makes a good whip? He must get on well with other members of his party. He should not be too closely associated with any particular faction. He must have the kind of mind that responds quickly to a double negative (since a typical parliamentary motion will be "that the words proposed to be left out stand part of the question"). He must be intensely loyal to his party and its leaders—the case of the government whip who launched the "Attlee Must Go" campaign in 1947 by an anonymous letter in the press was distinctly unusual—and he must be prepared to work extremely hard in the precincts of Westminster without ever getting a speech into Hansard.

NOTES OF THE WEEK

NATO

The General's Claims

FRANCE'S row with Nato, which has been simmering for months, has again come into the open. General de Gaulle's refusal to allow the Americans to stockpile nuclear weapons for Nato bombers on French territory unless France can share directly in their control is part of an old story. The same dispute arose over the installation of intermediate-range missiles, and the American reaction has been identical. The missile squadrons went to Italy, where strategically they are more useful. General Norstad now seems to have decided to shift the American bombers out of France, too. It is a necessary precaution for a military commander to take. All the same, it is manifestly not the way a military alliance should be run.

General de Gaulle has already made it quite plain that he is dissatisfied with both the Nato command structure and the deliberate exclusion of France from the nuclear club. The refusal to integrate his tactical air force and the withdrawal of his Mediterranean fleet have earned him hard words in plenty. But the debate has been useful. There are sensible doubts about the practical efficiency of the Nato system, and the French stand on the political control of Nato's nuclear capability is certainly supported elsewhere. But General de Gaulle's real concern is to share in Anglo-American policy decisions, and for this he needs nuclear weapons of his own. M. Soustelle told British MPs last week that France had the right to press ahead with its own tests in the Sahara. Yet even these will leave France well behind Anglo-American development. The realisation of this lag, rather than belief in the strategic desirability of separate deterrents, seems to have prompted the vehemence of the French claims for sharing secrets, which notably failed to shake the Atlantic Congress in London on Tuesday.

As if to make sure that the allies were properly aware of just how hard and cold a look General de Gaulle is giving Nato at the moment, M. Debré made a further stipulation in his statement of Algerian policy before the National Assembly last week. He demanded "total solidarity" with France in Algeria; if France's allies did not make its cause their own, everything else—including European union and Atlantic solidarity—might have to be reconsidered. It is plainly Nato's misfortune that it is the whipping boy closest to hand.

FRANCE

The New Culprit

ALGERIA has been the subject of the first important debate of the new French Assembly. Although the fate of the government was not at stake, it was an occasion to see the shades of opinion within a majority committed to the slogan of "French Algeria," and particularly the shades among its Moslem members, who have now spent six months away from their military "sponsors." It also provided M. Debré with an opportunity to restate the official line and to prove himself, in the process, General de Gaulle's faithful lieutenant. Choosing his words carefully to please the partisans of "integration" without hurting those of Algeria's "personality," he proclaimed that there was no other policy than the general's.

The official line can be summarised briefly. The army is carrying out its task successfully. The FLN is not "representative," but there is a standing invitation for it to send envoys to Paris to discuss a cease-fire—though nothing more. The final solution for Algeria will be both political and economic. Politically, France has inaugurated democratic practice in Algeria through a series of free elections

(a claim that *Le Monde* has found rather exaggerated). The economic transformation of the country should win over the Moslem community and strengthen its ties with France. The unofficial line seems to be that, faced with strong military pressure and with no hope of a change of government in France, the "moderates" in the FLN will bow to French conditions. Speaking in Angers last Saturday, M. Debré asserted that the end could have been reached within the next few months "if the rebellion had not been receiving increased foreign aid, particularly from the communist world."

The tune sounds familiar. M. Mollet used to put the blame on President Nasser. For M. Debré, Chairman Mao is the culprit. And, like his Fourth Republican predecessors, the prime minister is not satisfied with the behaviour of his allies. In his Assembly speech he even threatened western firms which "make nice profits with the blood of others." This was taken as a reference to certain Swiss banks.

GENEVA

War of Nerves

JUST as the three-power talks on nuclear tests were starting up again in Geneva on Monday, the Soviet delegation spokesman at the foreign ministers' conference in the same city declared that the conference was nearing its end. He declined to say whether his delegation expected it to end with any tangible results, or without any. Nobody else was inclined to commit himself about that, after the general freezing up of positions towards the end of last week.

At Geneva, Mr Gromyko had steadily refused even to discuss the question of guarantees for West Berlin or of allied access to the city. In Washington on Wednesday, Mr Eisenhower had been asked if the foreign ministers' meeting had as yet shown enough progress to justify a "summit" meeting, and had answered: no. The President added that the head of "any self-respecting government" could hardly go to the conference table in response to an apparent threat; and he called for a "clear commitment" that allied rights in regard to West Berlin would be respected. Mr Khrushchev was quick to counter with a declaration, apparently equally categorical, that Russia could in no circumstances agree to the "perpetuating" of the allies' rights in Berlin. Meanwhile he summoned the east German leaders to Moscow, and let it be known that talks there would concern the conclusion of a separate peace treaty between themselves and Russia. At Geneva, Mr Gromyko devoted Tuesday and Wednesday to garnishing freshly Soviet demands on Berlin that had already been rejected—and adding another time-limit.

The Geneva conference, and the long-range exchanges conducted over its head, had thus arrived this week—the fifth week of the foreign ministers' talks—at a stage of more or less open nerve war. But the British delegation, at least, was demonstrating a Drake-like phlegm by holding a private sweepstake on the eventual duration of the Geneva meeting; and its head, Mr Selwyn Lloyd, was enjoying an unexpectedly early release from the focusing of attention on his person that *The Times* had brought about the week before—for Dr Adenauer's future had become a priority topic on the front pages.

EDUCATION

The Teachers' Tenner

BY astonishing the Burnham main committee, and more especially by scandalising the teachers, Mr Geoffrey Lloyd last week precipitated the agreement which had hitherto eluded the committee. The upshot is that the National Teachers' Union have accepted (albeit under protest) the maximum offer of the local authorities. It was their previous reluctance to do so which had finally driven the committee to call in the minister to help (broadly on the precedent of 1944 when the Burnham committee, finding itself in difficulties, called in Mr Butler). Mr Lloyd, as expected, gave the committee a broad figure which the Government was prepared to pay in additional teaching salaries and allowances—about £15 million a year. But instead of then urging the two panels to hammer out a new scale on that basis, he audaciously proceeded to lay down that the starting salary for a teacher straight from a two-year training course should not exceed £510 in his first year. The authorities had already offered a scale of £520 rising to £1,000 (compared with the present scale, including the 5 per cent increase yielded last December, of £498 to £945). After Mr Lloyd's speech the teachers' panel promptly accepted this, and abandoned their demand for something nearer to their previous bid of £600-£1,200.

If Mr Lloyd merely wanted to get the teachers to accept the local authorities' top offer, then (at some cost in opprobrium to himself) it was neatly done. But it is more hopeful to assume that the minister means exactly what he says when he declares that £510 is quite enough, at the moment, as a starting salary. The minister is not, in fact, niggling at a tenner. What he is presumably doing is to try to check the way in which the basic scale is used unduly to boost the pay of the majority of women in the profession, to the grave detriment of a proper pattern of incentives for qualified and experienced men. Of course, he did not come right out with this anti-feminist argument. But he is right in thinking that even for a male non-graduate teacher a starting salary of £510 (in London nearly £560), at the age of 20, after a two-year course, is not below the market rate for such talent; for nine out of ten women the comparable rate (a little less, but women will get equal pay by 1961) is almost certainly above the market rate. Simply as a starting salary, even the £650 to £700 which the graduate teacher commands on this basis, at the age of 22, is not poor.

The public easily forgets that these are not teachers' salaries but starting salaries—there is an annual increment of £27 10s. on top of them. The brutal market facts are that all the teacher-training college places, as expanded, are quite heavily over-applied for. On the other hand, to spend the £15 million in this way will leave too little to improve the lot of married teachers, and to extend the incentives for scarce skills and higher responsibilities (the committee's ideas on these will emerge at the end of this week). If the Government does dig in its toes at £510 for a starting salary, and says that the money thus saved should go to increased incentives for higher responsibilities, it will deserve loud applause. But one rather doubts, in the last analysis, whether it really will have the courage to turn down any agreement ratified by the committee.

PRINTING DISPUTE

Full Stop?

WAGE bargaining at the end of the three year wage contract in the printing industry is always liable to be settled only after an explosion, as events in both 1950 and 1956 showed; 1959 looks like being no exception. In part, this is a reflection of basic attitudes in the industry; in part, it stems from the disinclination of the unions, whose workers are among the highest paid wage earners and thus least well-placed to touch a mediator's soft heart, to submit their case to arbitration. As a result, adjustments in printing wages take place through a process of straight bargaining. Each side uses its full tactical strength (especially strong on the highly organised union side) and hardly bothers with the moral assertions common in most industries. There is little question of any settlement setting a precedent elsewhere.

The present dispute began with the expiry of the unions' three year contract in April and their demand for a new contract incorporating a 10 per cent wage increase and a 40 hour week. This was a display of panache, and so was the employers' outright rejection of the claim; the question was whether a compromise agreement could be reached as a stoppage came near. After a long series of meetings, the two sides were not far apart; it was rumoured that one major employer was prepared to offer 5 per cent and the unions prepared to accept this figure. Mr Willis, one of the union leaders and also chairman of the TUC, has always had good reason to act with restraint. But the employers generally felt they could not compromise beyond their original offer of 2½ per cent. The conflicting interests of, on the one hand, the provincial masters (who really are squeezed by higher costs and who lose little from an overtime ban) and, on the other, the large integrated periodical houses in London (who stand to lose much more from any interruption of work) gave the federation little room for manœuvre. A fortnight ago the union stepped up the pressure with a "non-co-operation" policy and a ban on overtime; the employers replied by saying that they will withdraw existing employment contracts after the middle of next week, and a full stoppage then seems only too likely.

One thing that could avert it is disunity among the master printers; if, as the unions would like, any large number of employers secede from the federation and settle individually, they are almost certain to set the pattern for the industry as a whole. Waterlow—which had important bank note and security printing contracts, carrying heavy penalty clauses in case of late delivery—has already left. But the real test will be what the giant Amalgamated Press decides to do, now or once the stoppage has started. When this house was taken over earlier this year by the Daily Mirror Group (never a stickler for the tough line) a major new element was introduced into the bargaining balance. Self-interest will—fairly enough—now be the determining factor. On the one hand, some of the magazine owners who in 1956 decided to print abroad have already let it be known that they would not find it economic to do so this time; they might thus find paying higher wages at home less harmful than a stoppage. On the other, the provincial masters are determined to stand firm. As for the unions, while being keen on the best bargain, they will not wish to risk the political repercussions of a long strike against this widely diffused industry. In this apprehension, perhaps, lies the only hope of a quick settlement.

PENISTONE BY-ELECTION

Bogey for a Bogy

PENISTONE—a constituency in the Sheffield area, dominated by heavy industry and steel—was polling on Thursday. It seemed a fairly safe assumption that the Labour majority (11,636 in 1955) would be reduced, if only because the relatively heavy turnout in 1955 (80 per cent) is unlikely to be repeated in a by-election. But the real statistical interest in this straight fight was what would happen to the two parties' share of the vote.

In 1955 Labour got 62.3 per cent of it against the Conservatives 37.7 per cent. The series of by-elections during last winter and up to last March seemed to indicate an average swing across the country of between 2 and 3 per cent to Labour compared with 1955; the significance of this was that a general swing to Labour of anything over 2 per cent in a general election would just bring Labour to power. In the municipal elections at the beginning of last month, however, the average swing to Labour compared with 1955 seemed to have fallen to below 1 per cent, which inevitably meant that in some areas Labour had not improved its position at all and in some it had actually lost ground. Some Conservatives on Thursday believed that Penistone might prove to be one of these latter areas; they rested their optimism on the (as yet unproven) assumption that the nationalisation of steel is as unpopular with steelworkers as with anybody else. It may seem rather absurd to worry too much about how the odd 1 or 2 per cent of the electorate vote in these Pennine foothills, but the party organisation themselves are at present statistics mad. If Penistone should therefore prove to be the first by-election for four years in which the Conservatives have actually improved their share of the vote the effect on party attitudes could be latently quite significant: it will make the vote-collecting part of the Transport House machine crosser than ever that the bogy of steel renationalisation has been hung by party zealots around Labour's neck.

GATT

Europe and the Rest

WHILE the four foreign ministers have been holding the limelight at Geneva, another conference, normally staged in the white Palais des Nations, has been pushed into the wings. It is the session of the General Agreement on Tariffs and Trade which ended last week. These gatherings rarely bring spectacular results. Indeed the unkind may say that the latest Gatt meeting has not so far produced much more than the foreign ministers have. Nonetheless, in their limited economic field, the protagonists have been fencing around a major issue.

That issue concerns the policies the developed countries of western Europe, now grouping together into larger

economic units, are going to pursue towards the rest of the world. For some time the poorer, undeveloped members of Gatt have been complaining that its tariff machinery served the interests of the richer members more than those of countries dependent on exports of a few primary products or from a few new industries. The creation of the European community has intensified their problem and posed the question whether the community's birth is to be the start of a broader movement to free trade including the United States, or of a new cycle of restrictions in world trade. These problems have found a special focus in the problem of west Germany, which has infringed Gatt's rules by maintaining quota restrictions, despite the fact that its balance of payments is in surplus.

On the tariff side the Gatt meeting has one concrete achievement to its credit. It was agreed that a new round of world-wide tariff talks should start in 1960. But a great many other issues remain unresolved. The Germans agreed to remove and enlarge certain quotas, but were given three-year and five-year periods of grace for others. Before the latest crisis in Bonn, Dr Erhard was expected to come to Gatt in October, to announce a new west German policy on imports of industrial products from the undeveloped countries. The west Germans point out that though they infringe the letter of Gatt, they are in fact more liberal in their general import policies for industrial goods than many other countries. Bonn was beginning to take up the idea of making further progress in its own liberalisation dependent on a common policy by all the European states for a regulated increase in imports from undeveloped areas.

The suggestion shows that Gatt's current labours have an urgent bearing on the problem of agreement within Europe itself. If Europe could agree on a policy permitting a real and steady increase in imports from the new industrial countries, on a common programme of technical aid, and other measures to help them, then an important condition for agreement within Europe itself would be established. For the conflict between Britain's relatively liberal treatment of certain undeveloped countries, and the more autarchic habits of some of the Six, has lain behind all the technical debates about the Commonwealth.

INDONESIA

Guided Undemocracy

WHILE President Sukarno continues a leisurely world tour, the Indonesian army, apparently with the government's blessing, has intervened decisively in civil affairs. The president's hopes of extending the scope of his constitutional powers were defeated on June 2nd, when the government failed for the third and last time to get the necessary two-thirds majority in parliament for the reintroduction of the 1945 constitution. The army chief of staff, General Nasution, immediately asserted his authority by banning all political activity. Although this may well be no more than an interim measure pending the president's return, recent events elsewhere in Asia inevitably raise the suspicion that the chief of staff may be thinking of joining the ranks of generals who have come to be heads of state.

Yet the position in Indonesia presents special obstacles to a military coup. The senior officers include men who have had a taste of power of their own in outlying districts; they might not be disposed to follow the lead of a chief who wished to impose strict central control. Nor can General Nasution press them too hard, lest they transfer their allegiance to the rebel forces in Sumatra and Celebes. There is, too, a doubt about the chief of staff's own position. He has been displaced before now, and only recovered his post under the premiership of Mr Harahap, who has since defected to the rebel cause and become minister of defence in the rebel "government."

President Sukarno himself is a more likely candidate for authoritarian powers than his chief of staff. He has been a consistent advocate of "guided democracy" with himself as the guide, and his attempt to revive the revolutionary constitution of 1945—which unites the offices of president and prime minister, and provides that half the legislature shall be appointed by the army and other groups—was a means to this end. Now that this expedient has failed through the united opposition of the Moslem parties, he may, when he returns, dispense with all constitutional forms and rule instead by decree.

SOVIET UNION

The Other Mr K

AT the end of June New York will have its second distinguished Soviet guest of the year. Mr Kozlov, who will travel there for the opening of a Soviet exhibition, is much younger than that earlier tourist, Mr Mikoyan. But he, too, is a full member of the party presidium, and shares with Mr Mikoyan the dignity of a first deputy premiership. It is normally assumed that Mr Mikoyan is Mr Khrushchev's chief adviser on foreign affairs, including foreign trade, and that Mr Kozlov's field is economic and industrial.

The assumption is based on Mr Kozlov's career. Now 51, he spent a large part of his life in industry, graduating at the Polytechnical Institute in Leningrad and then working for quite a time as an engineer. His rise to prominence started after the war and, in fact, after Stalin's death. In 1953 he became the head of the party in the Leningrad region. Four years later he was successively a candidate and then a full member of the presidium, the party's highest body. He also became prime minister of the Russian Republic, a job he relinquished in March of last year when he took up his post in the Soviet government.

A technocrat is well suited to head the Soviet delegation for the New York exhibition. While the Americans, in a parallel show to be held in Moscow, want to impress their spectators with American standards of living (Moscow is already arguing that the American home to be exhibited is far from typical), the Russians want to show New York that they are a great industrial power, the land of sputniks, automation, electronics and other technological achievements. But, while presenting his own wares, Mr Kozlov is bound to take an interest in the latest industrial developments in the United States. He is also likely to urge American businessmen to follow in Sir David Eccles's footsteps. For his own sake, the Americans would be well advised to take a good, long look at him: Mr Kozlov is a prominent figure in the younger Soviet generation.

ELECTRICAL TRADES UNION

Comrades Together

THE Electrical Trades Union's annual conference this week has not proved to be the occasion for a powerful and disputatious attack upon the union's present communist leadership. As a fair proportion of the 400 official delegates are communists and fellow travellers, there was never any real reason to expect that it would be. Two more interesting tests of the real rank and file's feelings lie ahead. First, Mr Foulkes, Mr Haxell and the rest of the union's communist executive are due to come up for re-election by mass vote of the membership late this year. With voting procedures working in the communists' favour and no well-canvassed alternative members, they are said to be confident that they will secure it. The turn-out at most ETU elections tends to be low even by union standards; meanwhile the communists will see that they poll all the members they can muster. Anyway, in the last analysis, it is the present communist leaders who decide which votes "legitimately" count. But they must have some doubts about how flagrantly this last advantage could be utilised, after the rows of last year, without at last provoking a thorough investigation of the union's internal affairs by the TUC.

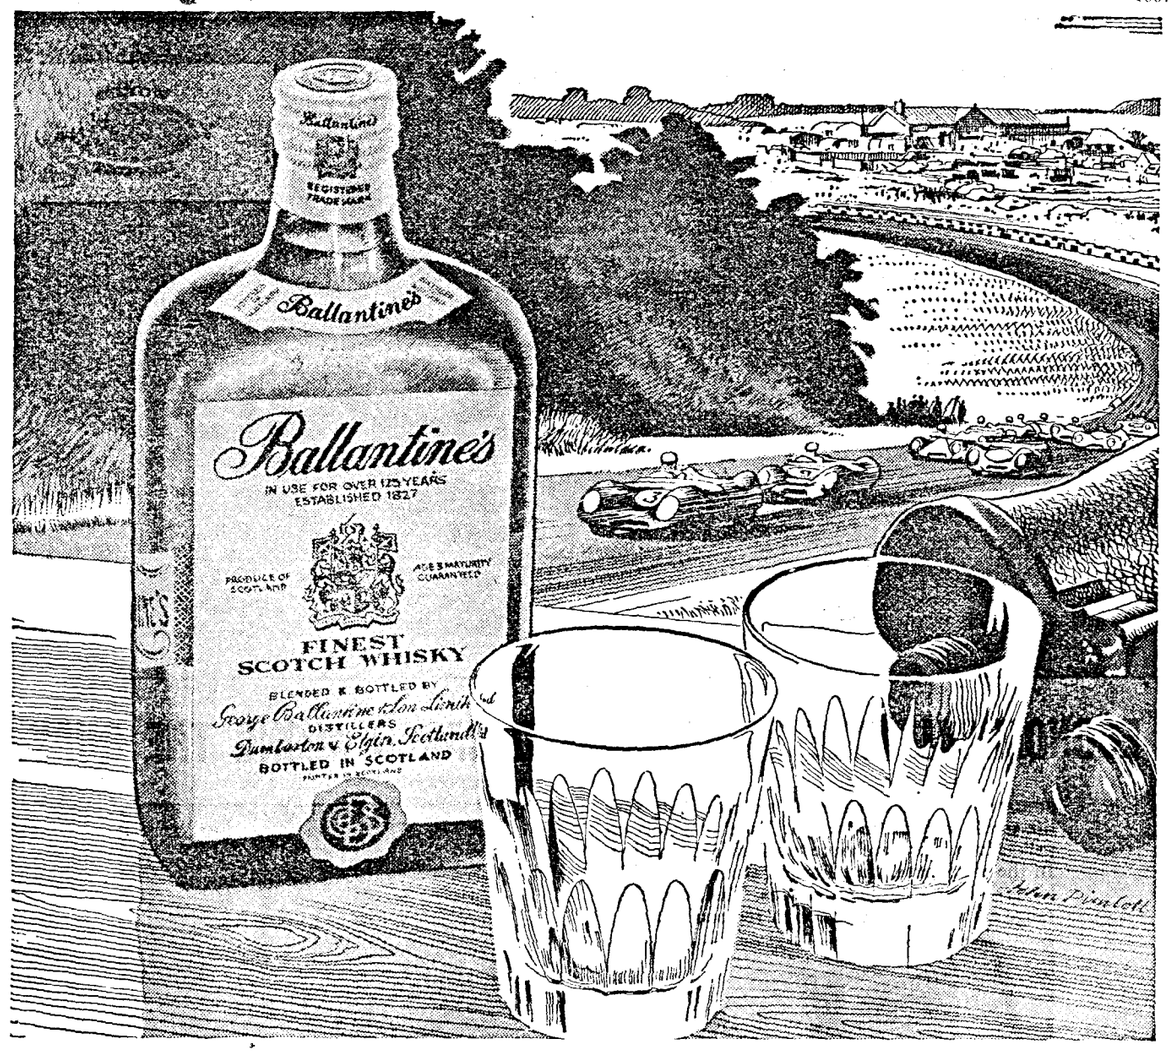
The second possible test of the communist leadership's strength could come earlier. The ETU leaders are anxious to be able to go into their election claiming that the reason why they are being "slandered" by the Tory press is that they alone, in the trade union world, are standing up forcefully for the workers. In general engineering, the union's policy is co-ordinated with that of others through the Confederation of Shipbuilding and Engineering Unions; although Mr Foulkes, an able enough bargainer, is president of the confederation this year, he has little hope of causing immediate trouble there. But electrical contracting, a small industry employing about 40,000 men mainly on electric wiring, is another matter; wages there are settled between the National Federated Electrical Association and the ETU alone. Mr Haxell has therefore submitted a substantial wage claim to the association and said that, if it is not settled by the week after next, he will call for a ban on overtime or a strike.

The ETU has been ostentatiously replenishing its disputes fund, but it still could not finance a prolonged, all-out strike. Presumably, therefore, any strikes that it called would have to be of the guerrilla sort; even in militant areas these are not popular with men who are thus called upon to lose their pay for other people's sake. The union leadership may therefore be in a delicate quandary. It would like to sound a trumpet blast to arms. But it must know that its position would be a desperate one if it sent out a loud call and then found, just conceivably, that not all of the fed-up membership obeyed it.

MILK

The Market Works

LESS than two years ago, a large, rising, and forbiddingly uneconomic surplus of milk was signalling to all concerned—except, of course, the milk producers—the need for a cut in the officially guaranteed price. At the February price review of 1958 the cut was duly made, in face of indignant protests and prophecies of disaster from the farmers. What has happened since, as reflected at the annual meeting a fortnight ago of the Milk Marketing Board's registered producers, is worth noting. First, the production of milk has dropped by about 100 million gallons a year; with liquid consumption well up, and still rising under the influence of a lively publicity campaign, the board's chairman was able to report that current output was now "about right." Secondly, this approximately "right" production has come about not through a slackening of standards and fall in yields (the national milk recording data show a steady rise) but through a reduction in the numbers of dairy cattle and the exodus of several thousand farmers, especially small producer-retailers, from the dairy business. Thirdly, this decline in daily production has been balanced by an increase—which rising beef prices had signalled as desirable—in the home output of beef cattle; the ex-dairy-farmer's part in this process can reasonably be assumed to be substantial. Finally, it is worth noting that this swing to beef shows no sign of being overdone and initiating another "cycle"; the records of artificial insemination centres, after showing last year a steep rise in the proportion of beef inseminations, now indicate that that admirably versatile breed the Friesian is proving increasingly attractive to farmers with an eye to the future adaptability of their herds.

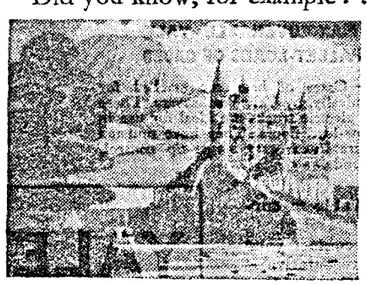


The satisfactory and rather entertaining pay off, at the milk marketing board's meeting, was a motion to increase the chairman's pay as a mark of the producers' esteem and confidence; this was in contrast with indignant demands, on previous occasions, for a cut by way of rebuke. The cheerful moral may be drawn that market forces can after all, even in the sacrosanct field of agriculture, be invoked to good effect. That moral should, in fact, be not merely drawn but emphatically hammered home. In three words, economics does work.

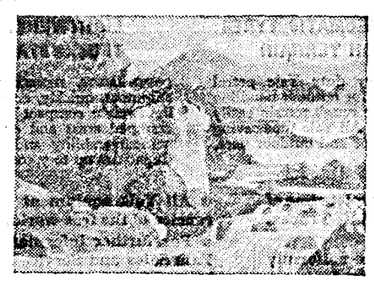
SUEZ CANAL

Cat and Mouse

GLOOMY, and at times malicious, prognostications about Egypt's inability to run the Suez canal on its own have proved to be off the mark. A sign of general confidence in the Egyptian canal authority and its head, Mr Mahmoud Younes, is the negotiation now going on about a World Bank loan for widening the canal. According to Cairo sources, the loan may be for as much as $40 million; the bank itself says that a final decision will be made next month after a group of experts have prepared a technical report.



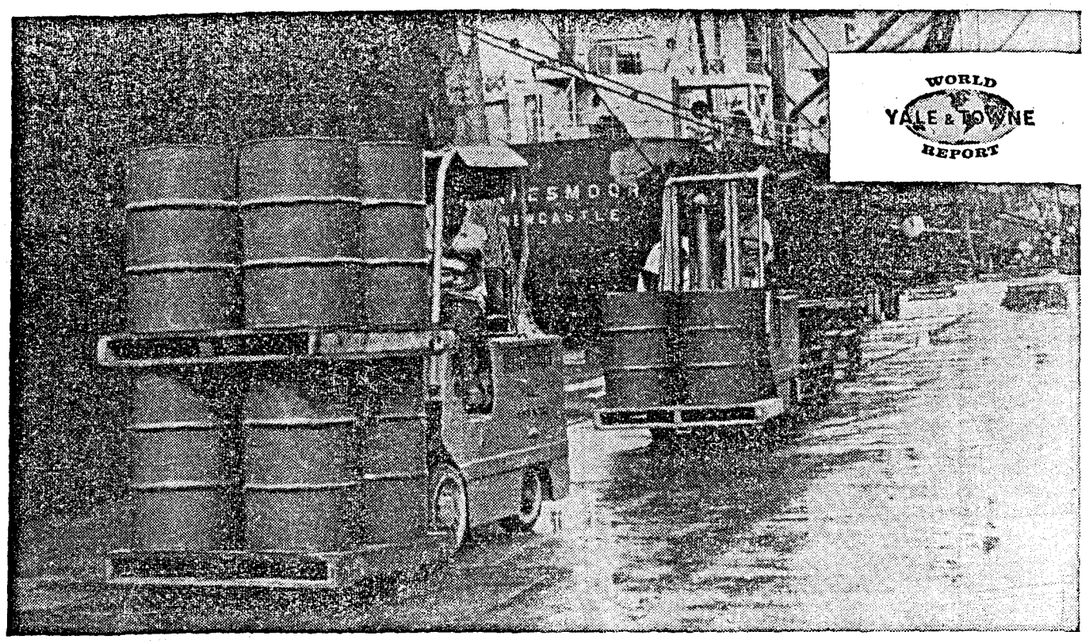
But in one respect, the Egyptians have continued to default on their obligation to allow free shipping through the canal. Early in 1957, Mr Hammarskjöld extracted, separately, an unwritten agreement from the Egyptians and the Israelis. Cairo undertook to allow ships carrying Israeli cargo through the canal, while, for their part, the Israelis agreed to use chartered vessels for their trade with the Far East and not to force the issue by sending through an Israeli ship. All went moderately well, and 27 ships carrying Israeli goods were allowed, with only minor discomforts, through the canal. But in February and March this year



The more you know about Scotch, the more you like Ballantine's

THE SUPERB SCOTCH

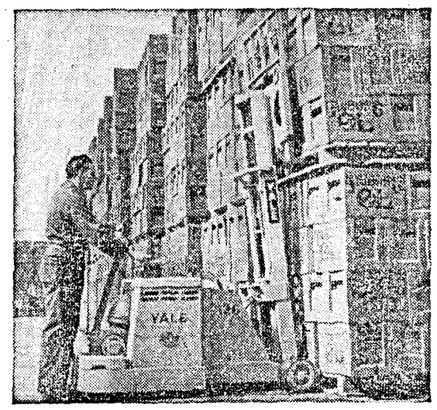
Did you know, for example? ...



that in homes like this, Ballantine's was first drunk over a century ago. The knowledge and appreciation of really good Scotch has been handed down with the family escutcheon — the same famous names appear in the order books of to-day.

that sparkling streams bubbling down the heather-clad hills are used in the making of Ballantine's. Their crystal-clear waters impart their own unique character to the flavour of this fine Scotch.

that Ballantine's is one of the best liked Scotches in the world. In the United States, Sweden, France and many other countries, it is a top seller. The world over, when friends meet together, they naturally prefer the superb Scotch.



ECONOMICAL YALE TRUCKS SPEED CARGO ALONG THE QUAY

SINGAPORE — These efficient, versatile Yale fork lift trucks quickly move unit loads of goods on pallets from pier warehouse to shipside for loading. In the warehouse, they lift and stack loads of all kinds — bags, crates and cartons. Their capacities range all the way from 1,000 to 100,000 lbs.

YALE PETROL TRUCK WITH PNEUMATIC TYRES MOVES TIMBER OVER ROUGH TERRAIN

VANCOUVER, BRITISH COLUMBIA — Heavy duty Yale petrol trucks with pneumatic tyres prove ideal for outdoor handling operations. They move heavy loads over rough terrain easily because of their high degree of stability. All Yale time saving and cost saving petrol trucks have indoor and outdoor uses. Capacities: 2,000 to 20,000 lbs.

LIGHTWEIGHT MANŒUVERABLE YALE TRUCKS STACK PALLET-LOADS OF CASES

COPENHAGEN, DENMARK — Cases of beer are stacked for shipment, quickly, economically, by Yale Worksavers. These lightweight compact Yale electric trucks are ideal for use in cramped areas and on low-load floors. They have unusual manœuverability and operate with easy finger-tip control. Capacities up to 7,500 pounds.

● Yale makes the world's most complete line of Petrol, LP-Gas, Electric and Hand Lift Trucks.

● All Yale Industrial Lift Trucks are uniformly high in quality, wherever manufactured.

● All Yale equipment available in currencies of the free world.

● For further information contact your Yale Sales and Service Representative — located in principal cities of the world

The Yale & Towne Manufacturing Company, Wednesfield, Staffs., England • Chrysler Building, New York, U.S.A. Manufacturing Plants: Velbert Rhld., Germany • Phila., Pa., U.S.A. Licensed Manufacturer: FENWICK—Saint-Ouen, Seine, France • Milan, Italy • Barcelona, Spain

two vessels were stopped and their cargo impounded, and on May 21st the Danish freighter, *Inge Toft,* was detained and later placed in custody when its captain refused to unload the cement and potash that he was carrying to Hongkong and Japan. In between, a Greek ship carrying Israeli goods had been allowed through unmolested.

Egypt's cat-and-mouse behaviour could completely disrupt Israel's hope of commerce with the Far East and South Asia. Trading is still on a very small scale but for political and psychological reasons, as much as for economic, the Israelis set great store by it, and are therefore trying to whip up international indignation. Mr Hammarskjöld, in one of his more delphic utterances, has advocated a legal rather than a political approach. But the essence of the problem being political, it is difficult to see how it can be resolved by courts or arbitrators.

Instead the Israelis have taken matters into their own hands by detaining a small Egyptian coastal schooner carrying onions and garlic to Lebanon. This sort of retaliation is familiar, potentially dangerous, and probably not much use. The pressure on Cairo would be much greater if the world bank insisted before granting its loan that Egypt should honestly, and in full, carry out its obligations.

LATIN AMERICA

Uneasy Lies the Head

A SERIES of popular revolutions has swept away most of the Latin American strong men. The two isolated survivors on the mainland, General Stroessner of Paraguay and President Luis Somoza of Nicaragua, are fighting a tough rearguard battle. After Señor Castro's Cuban victory, both rulers tried to check the revolutionary wave by gestures towards a more liberal regime; when it quickly became evident that if they allowed in a little freedom they would themselves be out, they resorted to more traditional measures.

In Paraguay, General Stroessner has dissolved the chamber of deputies and arrested a number of party leaders who had protested against police methods of torturing political opponents. The tide of popular revulsion has been slow to reach this isolated, land-locked republic but a month ago the president, under pressure from the church and political leaders, agreed to repeal the state of siege under which Paraguay has existed since its civil war in 1947. But it did not take him long to change his mind again. On May 30th the state of siege was clapped back once more and, for good measure, the cavalry has moved into the capital, Asuncion, to take care of the threatened student riots.

President Somoza runs his small Central American republic of Nicaragua like an old-fashioned estate. His family owns most of the land and he slipped easily into the presidency when his father was assassinated in 1956. Although insisting that he is a liberal at heart, President Somoza has declared a state of siege in order to break up a general strike—Nicaragua's first large-scale sign of protest for some 25 years. And despite the vigilance of the new President of Costa Rica, Señor Echandi—who, unlike his predecessor, Señor Figueres, is friendly to the Somozan regime—a couple of aircraft carrying arms and insurrectionary exiles crossed into Nicaragua a few miles from the Costa Rican border.

The signs are that President Somoza, and perhaps even General Stroessner, might be wise to start thinking about their arrangements for a trip to the Dominican Republic, that stronghold of deposed dictators. But even when the die-hard type of ruler is gone, some of the Latin American republics are having a stiff climb towards a more liberal regime. In Ecuador, martial law has been declared after a clash between police and students; in Peru, all the opposition leaders have been arrested. The back-wash of the revolutionary wave is still turbulent.

RACE RELATIONS

Coping with Notting Hill

MR BUTLER produced the right tone in his statement to the House of Commons last week on race relations in Britain. The authorities are no longer all contriving to sound complacent and disorganised. One of the main difficulties in dealing with trouble spots like Notting Hill has been the fragmentation of responsibility. Several government departments have a hand in the maintenance of law and order and the settlement of immigrants, while a concerted drive on the social problems in Notting Hill and elsewhere require the simultaneous prodding of numerous branches of the London County Council and of several metropolitan boroughs.

Now Mr Butler is himself presiding over a ministerial committee to keep an alert eye on instances of racial discrimination. At the official level regular sessions are held with the West Indian High Commissioner's staff, in order to get down to hard cases, and everyone in Whitehall in a position to take some action on them is said to be represented. The West Indians themselves are beginning to learn the advantages of strong organisation. The standing conference of West Indian leaders and organisations, which was convened by the High Commission's Migrant Division in order to bring the immigrant leaders together at least once a month, is now getting into its stride. The orderly and dignified way in which the funeral of Kelso Cochrane was organised without incident was a tribute to the growing maturity of some of these local leaders. Thanks to a few—far too few—energetic individuals, notably Mr Donald Chesworth, an LCC councillor for the Notting Hill area, something is also moving at the local political level. The recent series of successful actions by coloured tenants against a group of rackrenting landlords before the West London Rent Tribunal was an "inside job." A coloured rent-collector, Mr Michael de Freitas, was sufficiently impressed with the efforts being made by Mr Chesworth to give up his distasteful employment and to help plan the bringing of rent cases.

These cases were regarded by the West Indian community at Notting Hill as a test of the impartiality of white authorities, and the results were such as to raise its morale. But throughout the hearing before the Rent Tribunal there were repeated allegations of intimidation. Nineteen of the twenty-five tenants who brought cases withdrew them before the hearing, most of the withdrawals being apparently written on the same typewriter. One tenant cancelled her withdrawal, alleging that she had made it under duress. It would be wrong to conclude that the police are unaware of these undertones of violence, and they must be given a chance to set about things their own way. But the public

also must not forget about the state of affairs on which the Rent Tribunal cast a lurid flash of light and before too long must check up on what is being done about it.

SERVICES FOR THE AGED

No Truck

LAST week's parliamentary debate on "the plight of the aged" contributed nothing, apart from a great deal of repetitive rhetoric, to the question of the proper level of retirement pensions or of additional national assistance payments on proof of need. Its interest lay rather in the very full, though necessarily piecemeal, discussion which it elicited of the direct services and special facilities available to the old: from the "granny flats" and other pocket-sized dwellings provided by local authority building, through home helps and chiropody, to the voluntarily organised "meals on wheels" and social centres which local authorities are empowered to subsidise. There is everything to be gained (despite the objections of one otherwise sensible Conservative speaker who assimilated all specific aid to the truck system) by looking at the real needs of the aged in this way, instead of simply at their money equivalent. For the fact is that money, unless in amounts astronomically beyond any pension income envisaged by any party and indeed well beyond the average earnings level, very often simply will not buy, on the ordinary market, what is required to meet those real needs. What pension rate, paid out all across the board, would be needed to ensure that every old person who needs "looking after"—not nursing, merely basic domestic help—should be able to hire that help at the going private level? Or to make it profitable to provide a commercial "meals on wheels" or shopping service for the more or less completely housebound? Yet the difference between continued independence and an enforced resort to institutional life often turns on the availability or lack of just such services as these—and on the equally "real" question of ground-floor or lift-serviced accommodation.

It is no doubt far too much to hope that both parties will drop their discreditable auction-manœuvres around the basic pension rate. But if national assistance standards (under that name or, for the sake of the beneficiaries' sensibilities, any other) were adjusted with even a part of the generosity now being paraded about that rate, at posterity's expense, before the electorate—and if the energies thus released were devoted to improving, extending, co-ordinating and publicising the specific services which enable the old to remain happily and safely part of the community—the prospects of the growing cohort of the retired would be a great deal brighter.

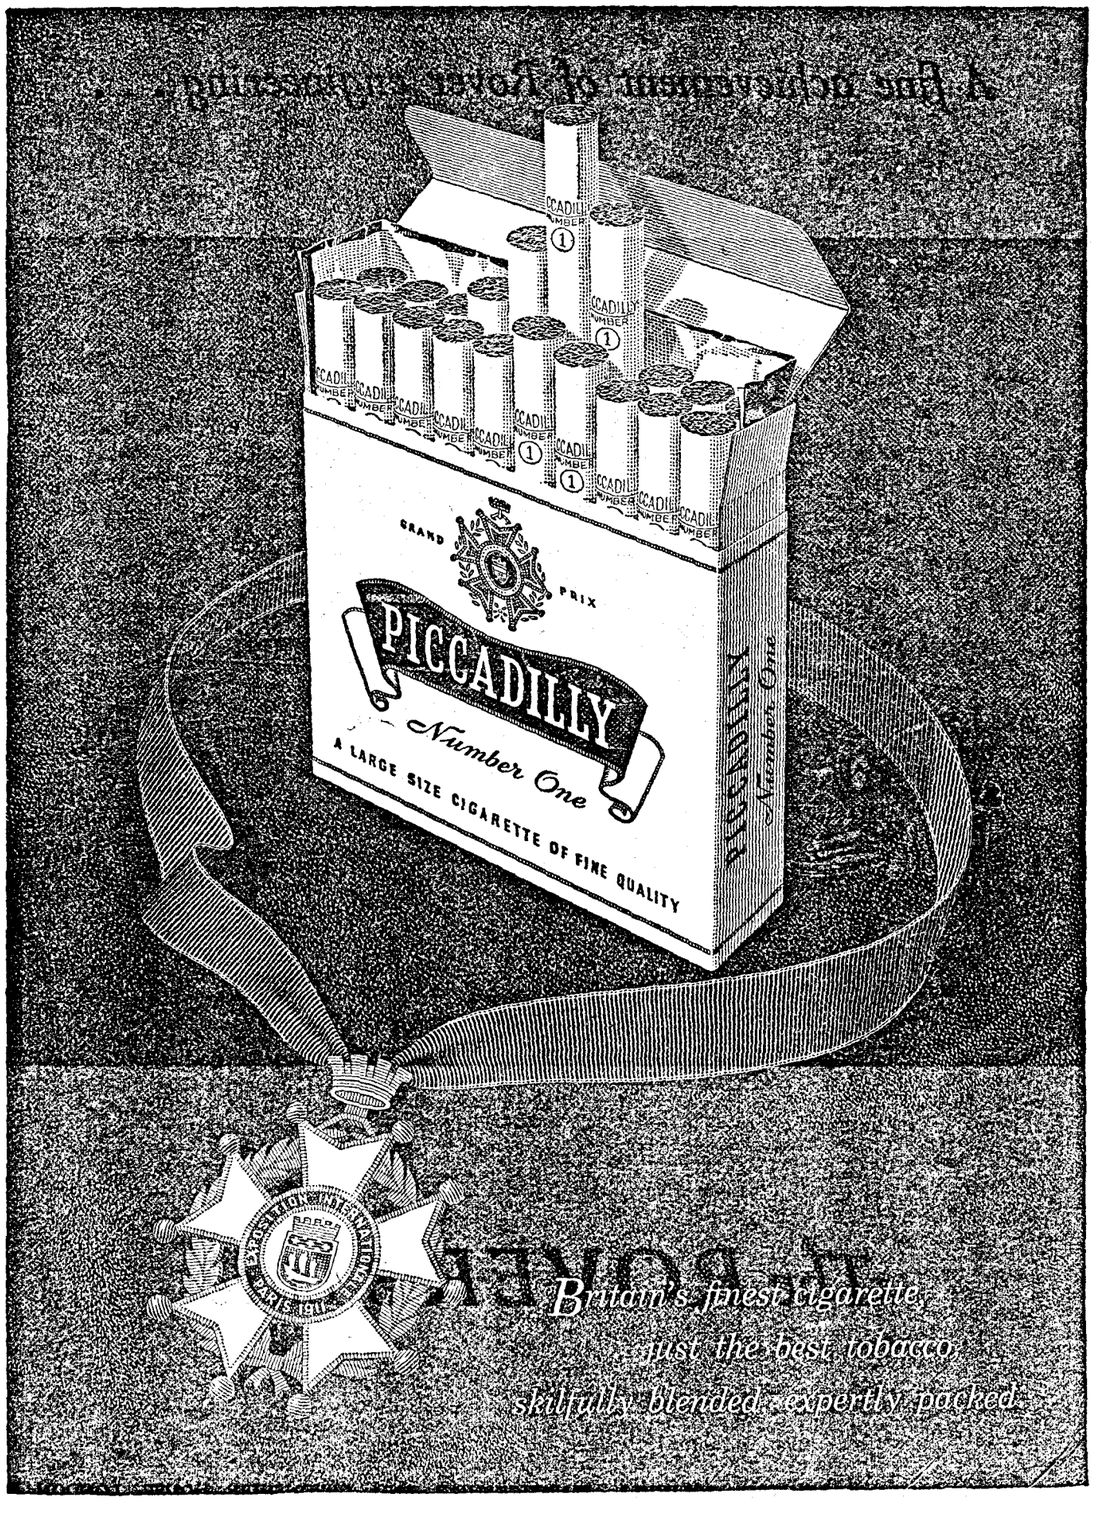
PERSIA

Babel Over Bahrain

THE Persians, who have not been there, claim that Bahrain is Persian by language, history, tradition and religion. The Shah and his foreign minister, Dr Hekmet, give the same answer whenever they are questioned on the subject. Maps printed in Teheran include Bahrain as part of Persia, but anyone familiar with Bahrain knows that, whatever the Persians say, Bahrain is Arab.

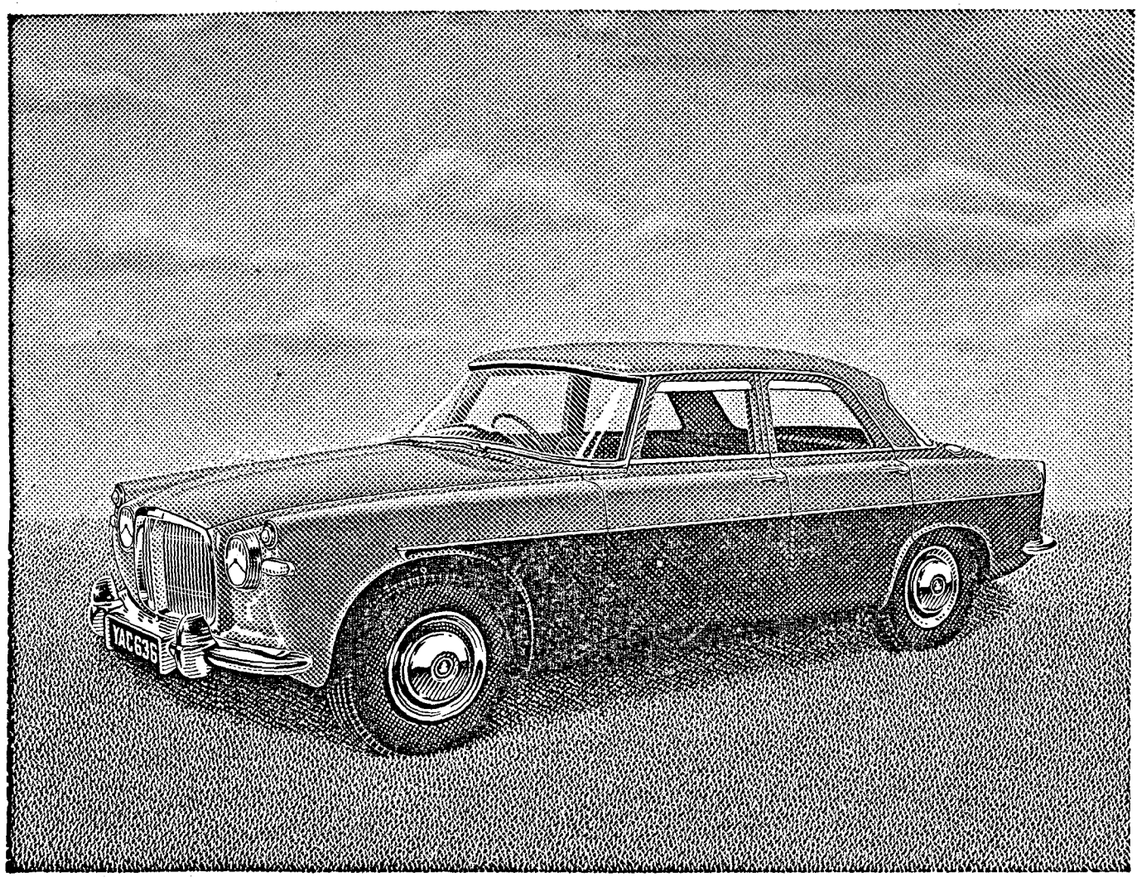
Officially, the Bahrainis have little to say about the Persian claim. Their foreign relations have long been entrusted to the British government. Unofficially, they regard it as complete nonsense. There are many people in Bahrain whose admiration for President Nasser knows no bounds, but there is no agitation for a return to Persia.

Now the Persians have discovered a new plot against them. Radio Moscow recently broadcast, in Arabic, that Anglo-American imperialists were conspiring to cede Bahrain to Persia but that their efforts would be of no avail against the desires of the Arab masses who look upon Bahrain as Arab territory. A week earlier, this time in Persian, Radio Moscow accused the Shah and his cabinet of ignoring the desires of the Persian people to wrest Bahrain from the clutches of Anglo-American imperialism.



When the Persians discovered that the Russians were giving them Bahrain in Persian and taking it away from them in Arabic, they were naturally more pleased than chagrined. At last they had something which they could answer directly and expose as Soviet hypocrisy, fraud, lies and trickery. It is unfortunate that the Persian claim to Bahrain is such a weak one. When Teheran can reply as straightforwardly to Russian criticisms of waste in government circles or of the high cost of meat in Teheran bazaars, it will be on safer ground.

The Economist



JUNE 11, 1859

LIBERAL BASIS FOR LIBERALS

¶ It is now generally admitted that any Liberal Government which can expect the cordial and organised support of the Liberal party must be constructed on wider and less sectarian principles than any that have been hitherto admitted. . . . We believe this is the one way, and the only way, to heal the dissensions of the Liberal party. It is very natural and very right that the middle classes should object to the exclusion of their ablest representatives from the Administration, when men—honourable enough, indeed, but of no note for capacity, and themselves representing no characteristic interests or convictions in the nation—are admitted in considerable numbers merely to echo the opinions of their chief. . . . It is of little use that the House of Commons should adequately represent the various classes of English society, if the Government does not more or less adequately represent the various classes in the House of Commons. This is the one difficulty with the Liberal party which does not in any perceptible manner extend to the Conservatives. The interests of the Conservative party are almost all identical: it is the party representing the landed gentry and the national church. But the range of the Liberal party extends over many very different and widely separated social elements, including commerce and manufactures and the various denominations of dissenters. . . . We believe it would be found that a Cabinet, thus composed, not one founded on any coalition amongst men of really conflicting principles and sympathies, but one composed of the men of strongest and most comprehensive capacities, who are not at present identified with extreme views in the various Liberal coteries, would soon come to a complete and cordial understanding as to the practical basis of their co-operation. . . . Nor would this be all. We believe also that some of the more moderate Radical leaders, who do not rest their principles on abstract 'rights of man', would find their convictions modified and their anti-aristocratic prejudices much softened by practical participation in those responsibilities of office which they are accustomed to represent as so systematically abused; while the aristocratic chiefs themselves would often be compelled to widen the range of their popular sympathies, and to admit the value of that administrative energy which the ablest men of the middle classes so often possess in far greater degree than those whose training has been less practical.

A fine achievement of Rover engineering . . .

LETTERS

The Parking Meter Scheme

SIR—The 1956 Act lays down that the Minister shall pay regard to "the need for maintaining reasonable access to premises." The effect of the parking meter scheme is that a resident in a quiet street will have to pay whenever he drives up to his own front door in his own car, even at 8.30 a.m., when the whole street is deserted, unless he does so only for so long as is necessary for loading or unloading, or picking up or setting down passengers. "No parking" restrictions are also to be enforced from 8.30 a.m., which in many streets is quite absurd. Does this really constitute reasonable access either for the resident or for those visiting him for business or social purposes?

The installation of many thousands of parking meters in the streets, squares and, presumably, parks of London will hardly add to their amenities and on a foggy night may even be dangerous. About 20 per cent of the available parking space will be wasted in order that each parking bay may be able to accommodate a large American car. The rate-paying motorist living in Central London will have to pay through the rates for the purchase and installation of the meters, a cash payment whenever he stops his car anywhere in the area, besides rent and rates for his own garage. Any profit on the scheme after meeting the capital cost will go to provide garages for other people who wish to come into the area.

The only possible alternative to parking meters seems to be an adaptation, but not an exact copy, of the parking disc scheme used so successfully in Paris. It is probably too late for it to be given a trial in London, but there is no reason why a provincial city should not do so. If it failed there would be nothing lost and no money wasted. The basis of this scheme is a revolving cardboard disc placed on the inside of the windscreen which is set at the time the car is left unattended, and shows automatically the time by which it must be removed. Parking would of course be prohibited during certain hours in certain streets, but elsewhere it would be permissible provided no obstruction was caused, and free if the permitted period was not exceeded. Anyone failing to set his disc at the correct time or leaving his car in excess of the permitted period would have a ticket affixed to his windscreen requiring him to pay 10s. to the local authority within a prescribed period. After say four hours, the motorist would be liable to prosecution and the removal of his car. It would of course be an offence to re-set the disc so as to extend the time.

It will be obvious that enforcement would be just as easy as with the parking meter scheme. In fact it might be easier as it would attract the goodwill of motorists, and the hours to be covered by supervision might be considerably reduced. If it is insisted that the motorist must pay for the whole cost of supervision, this could be achieved by making the parking disc subject to an annual charge, instead of providing it free from garages as is done in Paris. The whole cost of the provision, installation and the maintenance of parking meters would of course be saved and 20 per cent more parking space would be made available.

This scheme provides in effect free parking for a reasonable period, subject to the possession and correct use of a parking disc. It would secure the full support of motorists and ratepayers, and lend itself to adjustment to meet changing circumstances. It would be easy, for instance, to issue a parking disc showing different free periods in different zones and at different times of the day, as in the Paris scheme, which allows of two hours for lunch and one hour at other times.—Yours faithfully,

London, W.1. THOMAS J. HUTTON.

Can Coal Compete?

SIR—It is perhaps a pity that your article of May 30th presents no estimate of the cost of holding useless stocks, nor the cost of unprofitable mining. It can easily be shown that it would be very good business for the NCB to pay enormous sums simply to stop the mining of coal.

Take first useless stocks. These may be put at 20 out of the total of 30-35 million tons which you foresee for many years ahead. You say they will cover 1,000 acres if piled 12 feet high; at £4 an acre that is the negligible sum of £4,000 p.a. But the interest cost of carrying these stocks is quite another matter. Average pithead cost is £4, and marginal pithead cost at least £5. Thus the useless stock cost at least £100 million to produce. Since the cost cannot be recovered the board must have borrowed that much. At 4½ per cent, then, useless stocks would cost it £4.5 million p.a. interest. The useless stocks must also depress the price of the coal that is sold. A very conservative estimate would be that their mere presence knocks 1 per cent off the board's general sales revenue, or £0.8 million p.a. Thus the total drain is £5.3 million at the very least.

If all this were applied by the board to the retraining and pensioning off of miners and to subsidies to new manufacturing firms settling in mining areas, an expenditure of £5 a week per man would enable it to lay off 20,000 men (who could well receive ordinary unemployment pay as well). Since these will be marginal men in marginal pits we might put their output at 0.9 tons a man-shift, say, 220 tons a year. This would be a further cut of 4.4 million tons a year, which would clear the useless stocks in 55 months.

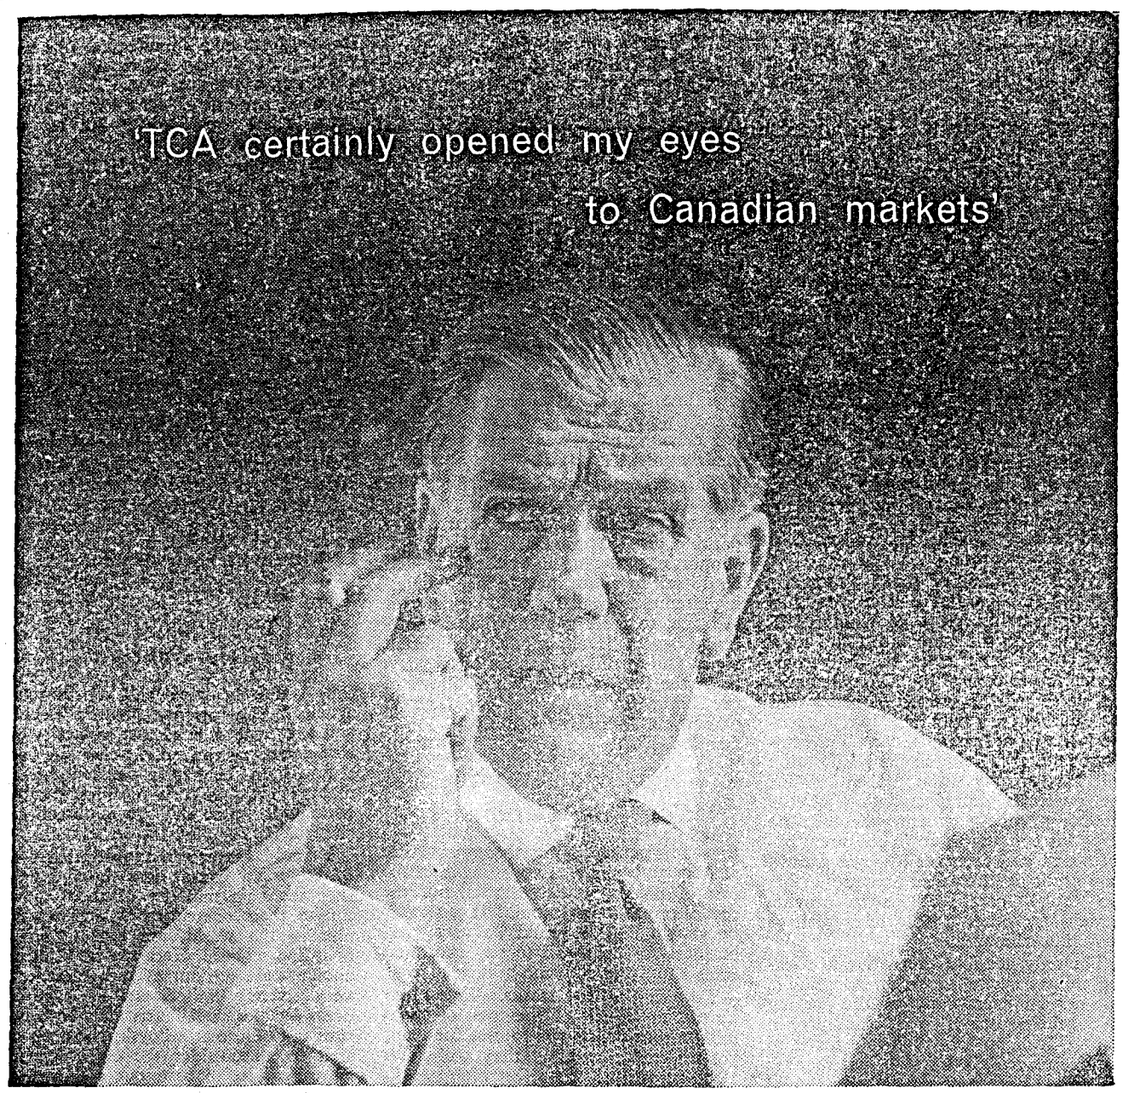
To start such a scheme the board would, of course, have to go further into debt. But on the other side there is a very large item not yet taken into account: the worst 4.4 million tons are in any case mined at a loss, say, of 30s. a ton. This would give the board a quite separate gain, in that by the time useless stocks are cleared the particular output referred to will not in any case be required, for far more efficient schemes will have come to fruition. Thus the board would benefit permanently by £6.6 million p.a. This is of the same order of magnitude as its annual deficit.—Yours faithfully, P. J. D. WILES

New College, Oxford

[The National Coal Board's provisions against costs of extra handling, and interest on its stocks, for 1958, were £13 million: *i.e.* it valued the coal and coke it added to stock at this much less than their market prices.—ED.]

Girls' Schools

SIR—I entirely agree with you in your article, "The Finished Product," when you say "one of the great mysteries of British upper- and middle-class life has always been the way in which it keeps many schoolgirls such repellently awkward girls up to the age of fifteen or sixteen."



I would venture to suggest that one of the main causes may be the fact that the vast majority of these girls, unlike their contemporaries anywhere else in the world, are sent to girls' boarding schools. Here the freedom of choice and freedom of movement are very severely limited, and the type of dress, games and curriculum are so similar to those at a boys' public school that to an outsider the object would appear to be to turn out young men rather than young women.

But more important than these matters is the central question; is it really beneficial for a girl to live the major part of her adolescent life in a community consisting exclusively of other girls and of women teachers? If the answer is yes, then there is a further question; assuming a similar academic standard, is a boarding school more beneficial for a girl than a day school?

A large number of today's younger parents, including many who attended such schools, are asking themselves these questions. I do not pretend to be competent to answer them, but there are those who are.

A thorough research study by a group consisting of a psychologist, a sociologist, an educationist and others would, I am sure, command the support both financial and otherwise of many genuinely worried parents.—Yours faithfully, MARCH

Rugby

Something quite a few British businessmen are discovering: Canada's not only a place of vigorous and expanding markets—*but it's just a smooth overnight flight away by TCA.* Nothing could be more straightforward for you... with Canadians more than willing to buy British, and TCA ready to fly you overnight, any night, to wherever your markets are in Canada.
Delivery dates? They're something you can confidently leave to TCA's Air Freight service—especially now the freight capacity is much greater on every TCA flight.

FLY TCA—DE LUXE CLASS
Relax aboard your TCA flight to Canada. Take it easy on fully reclining seats. Enjoy good food and drink and wonderful service. And it's more than possible that you'll meet some of Canada's many business men who always travel TCA.

BOOKS

Promise and Performance

Soviet Economic Aid: *The New Aid and Trade Policy in Underdeveloped Countries*

By J. S. Berliner.
Oxford University Press for Council on Foreign Relations.
247 pages. 35s.

THIS is an admirable compilation, both in the statistics and in the political analysis, considering the speed with which it must have been made. But though a very intelligent piece of work it suffers from an excusable incompleteness and incoherence.

The statistics show clearly the insignificance of Soviet aid in comparison with American, and indeed of Communist aid in comparison with Western, when the actual annual deliveries of each are compared rather than Communist promises, stretching over long periods, with Western annual deliveries. In addition private Western investment must be, and duly is, considered. A further point is that most Western public aid consists of grants, and on the Communist side only China makes grants. A grant is economically many times as valuable as a loan of equal size—a point emphasised in the text but unfortunately obfuscated in the tables, which continually make the meaningless addition sum of grants plus loans.

The statistics of foreign aid are very complicated, for at least three further difficulties remain. The first is debt service: public aid and even private investment figures are nearly always given gross of debt service, which is surely incorrect. Professor Berliner has not broken with this bad habit, and to this extent unfairly biases the comparison Westwards; for in his tables Communist aid is still very new and growing fast, so that debt service must be a much smaller proportion of new deliveries than on the Western side. Figures for debt service are hard to come by: but the United Nations Statistical Yearbook gives them for Western public aid, and also sets grants apart from loans. It is too bad that this admirable statistical presentation appeared too late to influence Professor Berliner.

The second difficulty is short-term credit. Underdeveloped countries have tended on the whole to build up considerable short-term liabilities in the United States and Britain, to mention only countries whose banks publish figures for international transactions broken down by areas. But what of Switzerland? What, indeed, of China, whose south-east Asian trade drive in 1958 must surely have been financed on credit? All this escapes Professor Berliner's net, except one rather recherché but still very large American item. Third and last, one must not accept as aid whatever a particular government chooses to call aid. Thus French figures omit the huge private disinvestment in North Africa, and Soviet press releases dignify with the name of aid a good deal of straight exchange, which involves no lending on the Soviet side.

These objections are serious, but they do nothing, in your reviewer's opinion, to qualify the picture of a Western effort more than twenty times as great as the Communist. Space precludes a long analysis of the political side of the book. Here too the author brings the subject forward without exhausting it. What, after all, do the underdeveloped countries really think about their competing helpers? Does the receipt of Communist, or capitalist, aid incline them even at all towards Communism or capitalism? Will they not go their own sweet way regardless, which may indeed in some cases be a Communist way, but cannot be influenced by any material help short of armed force? The classic case is China, which received great Soviet aid in the twenties and massacred its Communists, and almost none at all in the forties but is now *plus royaliste que le roi.* Indeed there is altogether not enough about China, which on the author's own showing renders more aid (grants, not loans) than the Soviet Union.

Capitalism's Trumpet

Something in the City

By John Benn.
Allen and Unwin. 153 pages. 12s. 6d.

The Seven Fat Years

By John Brooks.
Gollancz. 240 pages. 18s.

WALL STREET and the City are the most important capital markets of the world. The first, because of domestic politics, does not fight shy of publicity. The second, because of domestic politics, does. Sir John Benn, looking affectionately at the City from the chair of an insurance company, has written an amateur's book: discursive, pleasant, good natured—something of a tranquilliser. Mr John Brooks, looking caustically at Wall Street from the columns of the *New Yorker,* has written a professional's book: taut, factual, ironic, occasionally irreverent, yet not over-critical—a hard covered chocolate with a soft centre.

Sir John asks that the City should be more self-conscious and ready to publicise its importance. Mr Brooks takes the importance and the bally-hoo for granted and pokes a little fun. Sir John deliberately simplifies, explaining what happens at a board meeting or what a balance sheet means, and generalising so as to explain what the City does. Mr Brooks uses the professional jargon, particularising to show how General Motors and Ford Motor came to the market, how Mr John Magee makes a comfortable living but not a fortune by reading charts, how Mr Cavin Bullock runs a mutual fund and how Mr David Jackson as a "specialist" bore the consequences of Mr Walter Winchell.

Sir John, of course, is right: the City must be prepared to beat its own drum. But, if it does, it must not be offended if another Mr Brooks comes along and good-temperedly pulls its leg. The City must counter the ill-informed snarl, but it must also accept the critical comment. It cannot live in the warm, stuffy atmosphere of a glasshouse for ever. How many journalists, for instance, have as free access to the merchant bankers' parlours as Mr Brooks had to the platforms of New York's issuing houses?

Incentives

Payment By Results: *A Psychological Investigation*

By Sylvia Shimmin (in collaboration with Joan E. Williams and L. J. Buck).
Staples Press. 167 pages. 21s.

THIS description of an investigation jointly sponsored by the Department of Scientific and Industrial Research and the Medical Research Council has considerable contemporary significance. It is often overlooked that payment by results has grown rapidly since before the war and applies today to nearly one-third of industrial workers.

A regrettable feature of the inadequate research into industry's heaviest cost—human beings—is that whereas opinions and assertions about wage incentives abound, little concrete con-

firmation is available. It is therefore a tribute to Sylvia Shimmin and her associates that they have provided a much-needed factual frame of reference. Although the subject-matter and its treatment necessarily make this a study for the specialist, it is lucidly and simply written. The author's main concern is twofold: workers' understanding of their incentive-payments systems and their possible effects, and the reasons given for introducing or changing an incentive-payment scheme and its success or failure. The instruments for this investigation are a number of field projects relating to various undertakings and drawing for their sources on both company records and interviews with managers, supervisors and workers. From a methodological standpoint, appropriate technical standards have been met in the design of these inquiries, and in the collection and analysis of data. If there is here and there a tendency to describe results impressionistically, this is a blemish which in no way detracts from the general objectivity of the analysis. Moreover if the findings are diverse rather than decisive, it is because conditions often vary from company to company, indeed, from department to department. But certain principles emerge: the fact that a bonus system cannot be evaluated without reference to the whole factory situation; the fact that "the personality and general approach of the chief executive seems to have a far-reaching effect"; the importance of giving workers adequate information if an incentives scheme is to be successful. Such conclusions, while not disproving the utility of direct financial incentives, give welcome emphasis to the human factor.

Last year's national statistics show a halt in the upward trend of payment by results. Further investigations could shed more light on how far stability and regularity of pay are not, from many standpoints, more effective incentives.

HMSO

History of the Second World War

The Economic Blockade

VOLUME II

by W. N. MEDLICOTT

The second and concluding volume of the history of the economic blockade in the Second World War. Covering the period from June, 1941, to the summer of 1945, it deals with the place of economic warfare in the grand strategy of the Allies, and with the application of the detailed plan to strangle the economy of Germany, Italy and Japan.

HMSO

U-Boat Commander

Admiral Doenitz Memoirs of Ten Years and Twenty Days

Translated by R. H. Stevens in collaboration with David Woodward.
Weidenfeld and Nicolson. 490 pages. 36s.

BY April 1917 unrestricted submarine warfare had brought the Allies to the brink of defeat. A similar situation was reached in the early months of 1943 because neither side had learnt the lesson. Britain mistakenly believed that the convoy system, which had saved it in 1917, together with the asdic, had solved the problem of U-boat attacks on shipping. Hitler and the German High Command, possibly equally misled, failed to appreciate that by an overwhelming submarine campaign they could win the war at sea.

Appointed as Officer Commanding U-Boats after the London Naval Agreement, in the four years before the war Doenitz had created a highly efficient small force imbued with a fine morale, and he had developed and taught the wolfpack surface attack at night as a counter to convoys and asdics. Realising full well, however, that only numbers can annihilate, he had estimated that to be decisive the need was for 300 U-boats in commission to allow 100 to be always on patrol in the Atlantic.

Despite his strong and repeated representations, when the war started there were only 57 U-boats, of which but 22 were suitable for operations in the Atlantic, and even this small number was further handicapped by unreliable depthkeeping mechanisms and pistols for their torpedoes. A year later the number had even shrunk, and thereafter the low proportion of steel allocated, slow work in the repair yards, and the call of extraneous requirements elsewhere, never allowed the operational strength in the Atlantic to rise to Doenitz's figure until it was too late. By then the numbers and range of British aircraft were at last adequate to patrol the whole Atlantic; three and a half years' output of escorts had joined the convoys; short wave radar was mounted in both ships and aircraft to spot the surfaced submarine; improved weapons had been fitted; and the Battle of the Atlantic had been lost and won. If Doenitz had had his way its outcome might have been very different.

In 1943 Doenitz succeeded Raeder as Commander-in-Chief. His outspokenness, while a shock, was immediately successful with Hitler, even to the extent of getting him to reverse the decision to scrap the capital ships over which Raeder had resigned, and he gained the Fuehrer's confidence, perhaps unknowingly, so much that at the end he was designated his successor. Lacking the necessary documents Doenitz's account of this period is less complete, but not the least interesting parts of his book are his views on the Submarine Agreement, the Neutrality Act, the *Laconia* incident, the events of July 20, 1944, and his reactions during the Twenty Days.

Doenitz's strongly nationalistic outlook will not always please his readers; but at a time when the size of the Russian submarine fleet shows they have not failed to learn the lessons of two world wars between land and sea powers, and when the West German Government has just placed its first orders to reconstitute a second time the U-boat arm, this book is of more than usual significance.

A Natural Leader

Prince and Premier: *A biography of Tunku Abdul Rahman*

By Harry Miller.
Harrap. 224 pages. 18s.

THE first prime minister of independent Malaya is a surprising example of the born leader—for until he was 45 "the Tengku" (or "Tunku," as he prefers to spell it) had given no indication that he had either the capacity or the desire to lead. He graduated in Arts at Cambridge, but only just, and "failed his Bar examinations because he preferred horse-racing, the 'dogs' and dancing." Returning to the Temple after two decades, he finally made it and, on being called, said:

> Tonight is an unique occasion for the Inn, because it is the first time a student has been called after staying with it for twenty-five years. Tonight I not only celebrate my being called to the Bar, but also my silver jubilee as a student at this Inn.

Three years later, in 1951, after an indifferent career as a law officer in his native state of Kedah, Tengku Abdul Rahman was persuaded to take the leadership of the United Malays' National Organisation. To the surprise of some of his oldest friends, he revealed an unusual instinct for politics. Tactful rather than forceful, persuasive but without demagoguery, he had the capacity to bring the Malays and Chinese together in electoral amity. His Alliance party, which combined the principal Malay and Chinese organisations, was swept into power in July, 1955; two years later, the Federation of Malaya was independent.

It is fair to say that the Colonial Office would not have handed over power so willingly to anybody else. Why this is so emerges clearly from Mr Harry Miller's biography which, though undistinguished in style, is readable as well as painstaking. In some respects, this first biography of a modest but important Asian complements the same author's "Menace in Malaya," a valuable account of the Emergency, which Tengku Abdul Rahman has not yet succeeded in ending.

UNITED NATIONS

STATISTICAL YEARBOOK 1958

A comprehensive collection of economic, demographic, financial and social statistics covering the principal data of more than 250 countries and territories. New tables have been added on the broader economic aspects of international trade and its relation to changes in the production of primary commodities and of manufactured goods. A number of tables, particularly in the agricultural, industrial production and public finance chapters, present country statistics on a more comparable basis. Data on the important subject of international economic aid to under-developed countries are shown for the period 1954-1957. 612 pp.

paperbound 46/- (48/- incl. postage)
clothbound 57/- (59/- incl. postage)

ECONOMIC SURVEY OF EUROPE in 1958

The Economic Survey of Europe in 1958 provides a comprehensive analysis of recent developments in the European economy and of world economic changes having an important bearing upon economic policies in both eastern and western Europe. It includes special studies of the relationship between economic expansion and balances of payments in western European countries and an analysis of longer-term and post-war trends in private consumption, with special reference to food and durable consumers' goods, and their implications for the patterns of consumption in the coming years. 231 pp.

paperbound 18/- (19/2 incl. postage)

1959

Organised by the Ministry of Works

Poodles, puddles and plastics

Protection from the weather is but one very minor contribution of plastics to the greater personal comfort of men, women and lucky dogs. But we must start somewhere . . .

In a few short years these gay, lightweight materials, with their quick-clean, corrosion-resistant surfaces, their unsuspected strength and astonishing manufacturing versatility, have become part and parcel of domestic and industrial life. Already we find ourselves taking them for granted, yet their potentialities are still far from fully explored.

Shell have invested, and will continue to invest, large sums in plastics research and development. At Carrington, Shell chemists are now producing a new high-density polyethylene, stiffer and stronger than conventional polyethylene. In addition to 'Carlona' polyethylenes, 'Carina' P.V.C.'s and 'Carinex' polystyrenes, Shell output includes solvents, intermediates and other chemicals important in plastics manufacture.

Whatever the needs of industry for plastic raw materials, Shell can almost certainly supply them. In fact, if you have any problems concerning the use of chemicals, industrial or agricultural, Shell may well be able to help. You can easily find out.

Write to the Sales Promotion Manager, Shell Chemical Company Limited, Marlborough House, 15-17, Great Marlborough Street, London, W.1.

AMERICAN SURVEY

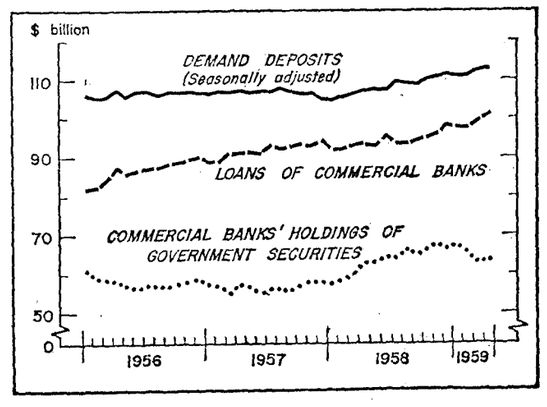
AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Inflation's Stubborn Allies

WASHINGTON, DC

IF only the baffling problems in the sphere of finance could be solved, the American economy would be close to rejoicing in the best of all possible worlds. There was a great deal of talk earlier this year about the failure of employment to respond to the recovery in business. But the great increase this spring in the numbers at work has demolished almost completely the idea that there is a new problem of any significance in this area. It now seems virtually certain that employment, like everything else, will continue to improve in the classic way as long as the business cycle remains in an expanding phase and that by the end of the year unemployment as a political issue will be practically forgotten.

The course of other economic indicators resembles closely that taken during the recoveries which followed the last two recessions, and it would be a daring and ingenious economist who tried to prove that the present revival is anything but a normal and pervasive one. It is true that the expectation of a steel strike has given a modest additional fillip to the accumulation of stocks, and hence to industrial production, but there are increasing signs that consumers are using much more steel than once seemed likely and that consequently they have not been able to put by as much as they wanted to. Whether there is a strike or not, the steel situation cannot help but slow down the upward movement of the economy in the third quarter. But it would probably take a strike of two months or more to cause any actual change in the direction of the economy.



It is also typical of this phase of the business cycle that there has been a considerable period of price stability. During the past year consumer prices—the cost of living—have scarcely changed at all because declining food prices offset small upward movements in the prices of a few other goods and of almost all services. The wholesale price average has also been stable, though the pessimists can detect in it some causes for alarm. The average of all prices other than farm products and processed foods has been rising steadily since the middle of last year and it is claimed that this rise is taking place somewhat earlier and more rapidly than it did in previous recoveries. Still, nothing has happened so far to make it inevitable that prices in general should start creeping up again. The men who are determined to halt inflation—and the government is full of them—cannot complain of being handicapped from the start, except where finance is concerned.

The financial problem takes three forms. The first involves the money supply itself. The Federal Reserve Board made money extremely easy for about six months late in 1957 and early in 1958, and then last summer turned with unusual, if not unprecedented, speed toward a policy of neutrality followed by one of restraint. At first the active money supply responded very little, although time deposits rose steeply. Later demand deposits joined the rise, but for the whole of 1958 the increase was anything but alarming, particularly in the light of the virtual stagnation of the money supply in the two previous years.

Last December, however, the money supply after seasonal adjustment suddenly began to grow at a worrying rate, in spite of the courageous policy of restraint by the Federal Reserve Board. In the main expansion appears to have been a result of credit extended by the banking system to private borrowers, rather than of financing by the banks of the huge Budget deficit (although the deficit has probably weakened somewhat the ability of the central bank to enforce its policy of restraint). The response of the central bank has been to tighten its curb somewhat, on the ground that, if the supply of money continues to expand, the job of keeping prices stable in an expanding economy will become far more difficult.

Next there is the perpetual problem of managing the public debt. The Treasury takes pride in the fact that the largest peacetime deficit in history has now been financed with surprisingly little resort to the banking system and with some modest success in extending maturities beyond the very short term. On the other hand, the floating debt—defined simply as the volume of Treasury bills—has risen very steeply since the middle of last year and is now at a record level. What is worse, the Treasury can no longer sell any issues maturing in more than five years; the law forbids it to pay interest of more than 4¼ per cent, and the prices of most of its outstanding bonds are so low that they yield more than this.

Mr Anderson, the Secretary of the Treasury, at last

has made up his mind reluctantly to ask Congress to change the law, but this means a big battle. Even if the Administration wins it, the Treasury will have difficulty in selling many long-term issues in the nervous market for bonds which has existed for nearly a year. Hard though the Treasury has tried to find a way out, the economy remains too liquid, as a result of the massive financing operations of the past eight months, to please those anxious to avoid inflation ; this will not be easy to correct.

Finally, there have been disquieting signs in the financial markets of the sort of speculative psychology that has brought disaster in the past. The Securities and Exchange Commission has issued an official warning, and so has the Stock Exchange, but warnings seldom deter the man who is determined to gamble with his money or the man who is only too delighted to help him to lose it. A vigorous debate over the "unsoundness" of the level of stock market prices has been inconclusive, but the situation is causing fairly widespread uneasiness and the President's request for removal of the ceiling on interest rates and a higher one on the national debt, although generally expected, set off a wave of selling. Certainly earnings have been discounted, in many cases, over a long run that may well find the discounter dead before they are achieved. There is even another real estate boom in Florida, much like the one that preceded the 1929 crash.

Meanwhile, interest rates on practically everything but the shortest-term Treasury instruments are already as high as, and in some cases higher than, they were during the last boom. It is believed so widely that rates are bound to rise further that the Treasury had difficulty recently in selling even a one-year issue with a coupon of 4.05 per cent. In a sense this situation is a tribute to the determination of the Federal Reserve Board not to let inflation take hold, but it also reflects much scepticism about the central bank's prospects of success. Belief in the inevitability of inflation helps to account for the fact that bond yields are now noticeably higher than those on ordinary shares—a situation all too reminiscent of the late nineteen-twenties. It may be that the government's determined monetary and fiscal policy will soon restore order. But it cannot hope to avert all the consequences if enough people are determined to be foolish.

Wheat's Political Harvest

LAST week the Secretary of Agriculture, Mr Benson, announced that the government will continue to support the price of wheat at about the same level which has already made it the costliest offender of all the crops now in surplus. Mr Benson had no choice, under the law. Congress postponed his announcement for two weeks to give itself time to draw up a new wheat scheme, but by the deadline, June 1st, it had failed not only to produce a better alternative, but even to agree on any Bill at all. The end of this month would still not be too late to act before the farmers start to sow next year's crop, if the President, the Senate and the House could agree on what should be done. But this seems remote ; both the stop-gap scheme which the Senate has passed and the one which the House was considering this week are likely to provoke a presidential veto because both offer even higher support prices to farmers who reduce their plantings.

President Eisenhower hinted as much when, for the sixth time this year, he urged Congress to continue past the deadline its efforts to replace the present "discredited wheat legislation" with a programme which would reduce the incentives to overproduce, not make matters worse. The Administration's own proposals for a permanent scheme to melt the wheat surplus involve a sharp reduction—from about $1.80 a bushel to $1.40—in the support price ; controls over production would be done away with in 1962. But no Republican member of the Senate Agriculture Committee would sponsor this plan and the Republican leader could not even rally enough votes to demand a roll-call. Both houses have agreed to put a ceiling of $50,000 on loans to individual farmers, one or two of which have reached the headline-producing size of $1 million, but the effect on the programme's total cost will be negligible.

The Democrats, with their big majorities, can hardly blame the President for making so clear where the responsibility lies for a crushing burden on the Budget and on the non-farm taxpayer, although admittedly he has not gone out of his way to seek a compromise. Many fear the reckoning to come in the election year of 1960, but the farmers, who make up only about 11 per cent of the population, are overrepresented in Congress and unable to agree even among themselves on a new farm programme. Potential Democratic candidates for the Presidency such as Mr Symington prefer, moreover, to train their guns on the Commodity Credit Corporation rather than offend farmers who will fight back. The party which complains of lack of leadership in the White House will have to act quickly if it does not want to regret, next year, that it did not display more itself.

Congressmen at Arms

MR EISENHOWER'S defence budget for the coming fiscal year is now half way through the congressional sausage machine formally known as the appropriations debate. The House of Representatives has approved, almost unchanged, the suggestions of its subcommittee which inspected the defence budget in detail during the spring ; the matter now moves to the Senate, the junior of the two chambers where money Bills are concerned. The House, as has been expected for some weeks, gave the President roughly the total he asked for—it cut it by $400 million, or one per cent—but it chopped and changed the component items more than observers in Washington thought it would. The changes constitute a medium-sized victory for those who want money spent on missiles ; and a real defeat for the generals who are more worried about America's readiness for conventional wars.

Paradoxically, it is the Army, the prime concern of the limited war theorists, which has fared best. An extra $200 million can be used to speed the Arm's anti-missile missile the Nike-Zeus, which—if it turns out to be workable—might cancel part of the 3-to-1 superiority in intercontinental missiles which the Russians are expected to gain in the next few years. The Army is also given more money to keep its reserve forces at their present level ; but this is a kind of Danegeld paid to the political influence of the reserves, and a Congressman's attempt to restore the Army's active forces to last year's size conspicuously failed. The Air Force gets an additional $170 million to help close the "missile gap," half of it for eight more squadrons of

THE GHANA REPORT

Economic Development and Investment Opportunities
Legal Problems Relative to Investment
Sociological Factors Relative to General Economic Development

The Ghana Report is an impartial and detailed study of the economic, sociological and legal factors influencing development in Ghana. It includes an analysis of the problems likely to confront the foreign investor and entrepreneur, and also explores those areas of the economy which tend to lend themselves to development by foreign business capital and private investment. The Report also takes into consideration historical and contemporary political pressures. The result of twelve months of study and research, the material will be periodically updated with supplementary reports.

Price available upon request. Inquiries should be addressed to:

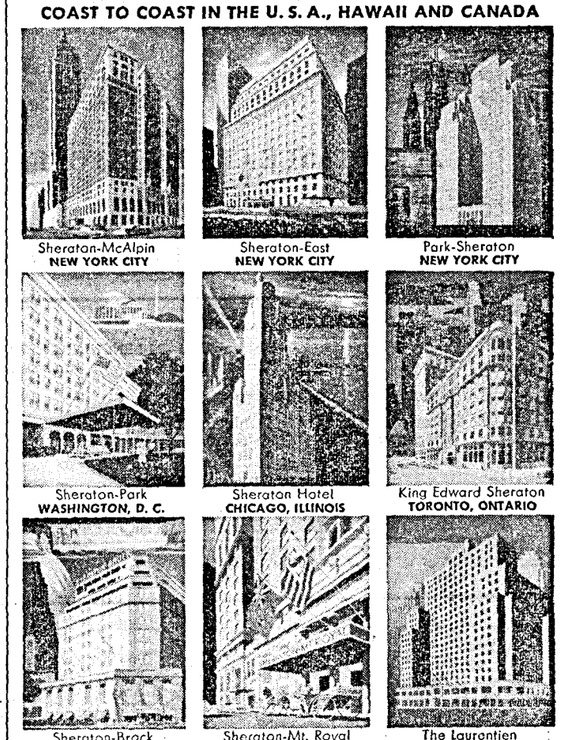
I'm a world problem you can help now...

Hunger and sickness cannot wait for the world solutions refugees need. Someone must come to the rescue *quickly* to save the undernourished children and to rescue those who need help in places like Algeria and the Near East, Hong Kong and Korea.

Will you send your special gift this World Refugee Year to help a refugee who would otherwise go without? Please send now to: **Economist Relief, Barclays Bank Ltd., Old Bank, High Street, Oxford.**

SUGGESTIONS FOR PEOPLE OF GOODWILL



1. 5/- provides 24 good meals for orphans.
2. Encourage any organisation to which you belong to adopt and help to *close* a refugee camp for good.
3. Help train a refugee to be self-supporting. For 30/- you can support an Austrian refugee for a week while he is being trained.
4. Send any good discarded clothing to *Economist* Relief, Oxfam, c/o Davies Turner & Co., 50a Bourne Street, London, S.W.1.

OXFORD COMMITTEE FOR FAMINE RELIEF

Supporters include: Lord Halifax, Lord Hailsham, Sir Oliver Franks, Sir Gladwyn Jebb, Sir Frank Whittle.

AMERICA'S WELCOME TO THE WORLD

Sheraton Hotels have become first choice of International visitors, as well as Americans, for many reasons. Here are a few:

- Reservations held if ship or plane delayed
- Facilities for banquets, business meetings and conventions
- Sheraton's family plan (*no room charge for children under 14 in same room with adult except in Syracuse, French Lick and Austin*)

For reservations see your travel agent, or write Mr. Albert de Leon, Director, International Department, Sheraton Hotels, Sheraton-McAlpin, Broadway and 34th Street, New York 1, N. Y., U. S. A.

THE WELCOME IS WONDERFUL AT
SHERATON HOTELS
"The Diners' Club card honored for all hotel services."

Atlas missiles in addition to the nine planned by the Administration, and half to hasten the advent of the solid-fuelled Minuteman. However, the airmen lose more than they gain through cuts in their funds for a tactical missile and for transport and trainer aircraft. The Navy comes out all square. It loses an aircraft carrier, but it gets the money back for extra anti-submarine equipment.

The additions to the missile programme may well be accepted by the Administration. But the Secretary of Defence, Mr McElroy, must be rueing his recent suggestion that Congress should resolve the long dispute between the two rival anti-aircraft missiles now being developed—the Army's Nike-Hercules and the Air Force's Bomarc—by "holding our feet to the fire." The House, deciding that the Bomarc, though potentially the better weapon, is too far from readiness, has sharply cut the funds for it; at the same time a Senate committee, more sympathetic to the Air Force, suggests cutting the funds for its Army rival. Mr McElroy will have to get the congressional firebrands to put out one of these blazes.

Parting Shot on Schools

It would be a mistake to read too much into the resignation of Dr James Killian, President Eisenhower's science adviser, immediately after the President had given a somewhat noncommittal reception to Dr Killian's report on the state of American education. Dr Killian made it clear some months ago that for personal reasons he wanted to leave his post about the middle of the year. He will return to the Massachusetts Institute of Technology, from which the President summoned him late in 1957 when the Russians' triumph in getting a satellite into space made it clear that the Americans had better get a scientist of the front rank into the White House. Dr Killian quits amid general praise for a job well done. He nerved the Administration into trying to reach an agreement with the Russians on the suspension of nuclear tests; and the Science Advisory Committee which he headed has just prodded the President into spending more money on basic research into the atom.

Nevertheless, the last fruit of Dr Killian's work, the report on education produced by the Science Advisory Committee, may fall on stonier ground. Its main conclusion—that the Americans ought to spend at least twice as much on education as they do now (which is roughly $15 billion a year from all sources, governmental and private)—drew from the President the comment that it was an "excellent statement of educational needs," a remark which the liberal *Washington Post* found disappointingly vague. Mr Eisenhower is understandably wary of committing himself. A good deal of the extra money would almost certainly have to come from federal funds—which now play only the most minor part in education—and this is anathema to his conservative soul. The cabinet officer in charge of education has just warned Congress that the President will veto any Bill which commits the Administration to helping education permanently.

But the report does not fall into the fallacy of assuming that all the ills of American education can be cured simply by injecting more dollars. It believes that the brighter pupils should be made to work harder and take more academic subjects in place of "life adjustment" courses. Some school districts—the District of Columbia, for example—have recently stiffened the curriculum for their best students, and, greatly daring, are even replacing simple "tests" with thorough examinations. But the National Education Association, the powerful teachers' organisation which would be delighted to see more federal funds flowing in, casts a chill eye on anything which it thinks to be a step back to old-fashioned theories of education. To use an Eisenhowerian mixed metaphor, between the devil of the economisers and the deep blue sea of the "progressive" educationists, the Killian report will have a hard row to hoe.

Librarians Take Care

FROM A CORRESPONDENT IN CALIFORNIA

The recent banning of a children's book from a public library in Alabama because it featured a wedding between a white rabbit and a black one raises questions not only about the ridiculous lengths to which southern prejudices may be carried, but also about the part played by librarians in deciding what books shall appear on their shelves. Some factual answers are contained in a forthcoming study conducted under the auspices of the University of California by Dr Marjorie Fiske Lowenthal, with the help of a grant from the Fund for the Republic. This reveals that the librarians themselves, although theoretically opposed to censorship, are in practice the most active censors and that censorship is by no means always, as had been assumed, the result of pressure from outside groups or individuals, such as state legislators.

One librarian, for example, asserted firmly that she was so completely opposed to outside censorship of books in public libraries that

> when someone complains about a book, in our library, I just put it aside in a locked room. Right now, we have more than two thousand books locked away like that.

To this librarian and to many of the more than 200 others interviewed in 26 Californian cities, it did not seem contradictory to lock books away from readers while at the same time deploring censorship. This attitude is, evidently, very common throughout the profession. Even though they were not subject to outside pressures or complaints, nearly two-thirds of the librarians reported cases in which they had decided not to buy a book, not because of its questionable merit, but simply because it or its author might possibly be considered "controversial" at some future time. One-fifth of the librarians reported that they always avoided buying such books. Yet there is no consistent pattern about what books librarians believe to be "controversial." The range of forbidden authors includes Mrs Dorothy Canfield Fisher and Mrs Pearl Buck as well as Dr Alfred Kinsey, while the list of books considered "controversial" takes in not only "The Ninth Wave," but even the saccharine "Gone With The Wind."

All these cases of censorship by librarians are quite apart from the very special problems involved in selecting books for children or young people and the legitimate difficulties faced by librarians with only limited budgets who must choose between buying books that educate or those that entertain. Even under the best of circumstances, the problems of book selection are not easy. One librarian, according to the study, said that she would not purchase "Peyton Place" just because the public asked for it; "after all, a

library is supposed to fill the community's needs, not just supply what the public wants." But another disagreed violently:

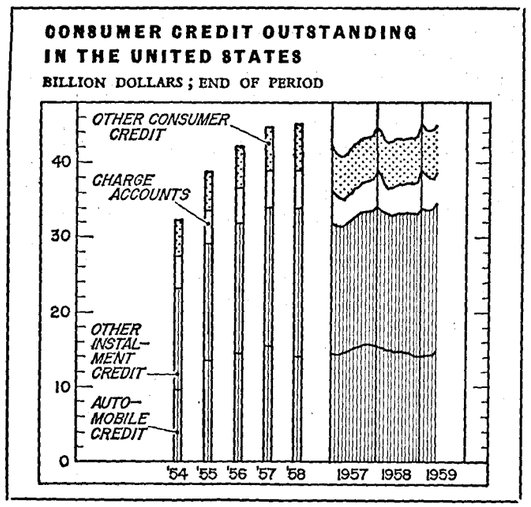
> Most of our purchases are on a popular basis. Our job is to get the borrower of the book together with what he wants.

Between these two alternatives, there is a whole range of questions which have engrossed the attention of professional librarians for many years. How many scientific works should be bought and how many copies of Shakespeare? Should the library stock books of quality which may be taken out only once or twice a year at the cost of excluding some of the best-sellers established by popular taste? But these problems are of a different order from locking "controversial" books away from readers, not purchasing them or even, in one case, actually burning them.

THE study did not find that the censorship of books by librarians was the result of complaints about books on political grounds. In spite of the well-publicised McCarthy controversy, the fight over the use of Unesco materials in the free schools in Los Angeles and the activities of a self-appointed and puritanical book censor in northern California, the largest number of complaints—50 per cent of all those received—still involve allegations of immorality and profanity. But even though there is no political pressure on the librarians, they behave timidly because they are afraid, according to the study, that they will be persecuted if they buy controversial books. This fear often has no basis in fact, but whenever there is a public incident like the rabbit wedding librarians in every part of the country react by becoming more fearful. In California, there have been only eight such incidents since the early nineteen-thirties and in only two of these did the librarians accede to the pressure from outside. But most librarians behave as if such defeats were the universal rule, rather than the exceptions.

Librarians also feel that they are isolated from their community.

> I can't think of a single community organisation that we could turn to for help if this library ever got into a public dispute over our book selections,



sadly reported the head librarian in a large city and not one of the head librarians and school administrators who were interviewed expressed any different feelings. Nor does the press appear to be of much help, for it only publishes news about libraries when there is an incident like that of the rabbits or when some reporter actually creates a story by checking library shelves to see if any "controversial" books are in circulation.

Many librarians also believe, with some justice, that the public has little respect for them or their work. If the public's attitude towards them is tested by the salaries they are paid, their working conditions and their professional status, then the librarians are right in thinking that their work is not considered especially important to the community. Public librarians are generally low-paid, while those who work in schools are frequently given additional duties to perform. This in turn creates staff shortages; in New York City, for example, library hours and services have had to be curtailed because of a lack of trained personnel. If the tradition of libraries free from fear as well as fees is to survive, there must be more sustained support from the public for their librarians.

Borrowing to Buy

CONSUMERS are going into debt for the things they want to buy more rapidly than at any time since 1955. The figures for April, which were released last week by the Federal Reserve Board, show that instalment credit, the largest item in consumer debt, rose by $423 million after seasonal adjustment, the biggest monthly increase since the great boom year of 1955. More than half of this—$220 million—was to buy cars; this is not as big as the increases of $300 to $400 million a month in 1955, a 7 million car year, but it is a considerable advance on the $169 million average of recent months. Other durable goods accounted for most of the rest of the increase as families decided at last to buy the new furniture and appliances which they went without during the recession and the new clothes which were easier to resist when the sack was queen.

To go lavishly into debt, consumers need to feel prosperous and like to feel that they are not paying excessively high prices. They were slow to resume buying on credit last year, concentrated on paying off old loans, and only returned to the pre-recession pace in December. Since then, however, unemployment has fallen rapidly, prices have remained stable, and personal income has continued to rise month by month; in April it reached a seasonally adjusted annual rate of $373 billion, nearly $10 billion higher than in January, with most of the increase going to wage and salary earners.

Consumer buying, whether for cash or on credit, is obviously of the first importance for further economic expansion. But some government officials are beginning to wonder whether consumer credit, with repayments taking 12½ per cent of peoples' disposable income, is not growing too fast; they remember the expansion in 1955 and suspect it paved the way to the decline which followed in 1957. There is no likelihood, however, that controls over consumer credit will be restored in the near future, although excessive borrowing by consumers may bring its own penalty. Such credit, which has grown in all by over $2 billion in the past year, is one of the Treasury's great rivals in the money market and a factor in forcing interest rates up. The people who called the tune soon may have to help to pay the piper. The big banks in New York City are considering, for the first time in over three years, an increase in the rates consumers pay for instalment credit. Outside New York, some of the big finance companies are also on the verge of raising their charges. Whether this will slow down the expansion of consumer credit is another matter. Buyers usually only ask themselves if they can afford the monthly carrying charge—and today most of them can.

And Then There Were Four?

SINCE Virginia seceded from the ranks of "massive resistance," only six states still keep coloured children and white wholly segregated in their tax-supported schools. One of the six, Florida, expects to admit a token number of young Negroes into the schools in Miami next September; and now a federal judge in Atlanta, Georgia, has ruled that racial segregation in the city's schools must cease and has asked the local Board of Education to draw up a plan for ending it. The crisis to which this will almost certainly lead is still some time distant. The judge has yet to issue his final order. When he does so the inevitable delaying action which the segregationists will fight can hardly reach the Supreme Court before October, when it comes back from its summer holidays; and the Negro children are unlikely to present themselves at the school gates before the autumn of 1960. But when the bang does come it may well be a big one. The Georgia State Legislature, one of the most intransigent in the whole South, armed the Governor this year with the power to shut not only any school to which coloured children are admitted but also, cruelly, the Negro schools from which they come.

If Governor Vandiver, who has said that he will not countenance even token integration, invokes this power, the courts may well decide that it violates the Constitution's guarantee of "equal protection of the laws." The Governor will then have to decide whether he is ready—as the Governor of Virginia was not—to defy the federal government. Atlanta itself is probably willing to compromise. Unlike the steel centre of Birmingham, for example, in neighbouring Alabama—where a population of poor-white migrants from the countryside, alarmed by the economic rivalry of Negro workers, keeps the city teetering on the edge of violence—Atlanta has a record of moderation. It contains a respected community of middle-class Negroes; its Mayor, who is generally believed to be kept in office with the aid of Negro votes, has let the races mingle on the golf courses and in the buses; and white parents who want to keep the schools open have set up an organisation called Help Our Public Education (HOPE).

The Mayor of Atlanta wants the people of the city to be allowed to decide for themselves whether to admit Negroes to the schools or to close them. In any case, because the races live in different parts of the city, no more than a tenth of the city's Negro children would be affected. But a proposal for local option, introduced by one of the city's representatives in the State Legislature early this year, never saw the light of day. The Governor may find that the racialist faith of the rural conservatives, who hold a huge majority in the Legislature, presses him more urgently than the demands of either HOPE or charity.

Background Music Pipes Up

NEW YORK

AN unusual import will be introduced to the British market this summer. A non-stop service of background music, recorded and dispatched from New York City, will bring to the London area the ultimate in music-while-you-work. Thanks largely to the Muzak Corporation the American, like the fine lady of Banbury Cross, tends to have music wherever he goes. Whether he is at work or at play, shopping, eating or cashing a cheque, ascending in a lift or visiting the zoo, strains of "Stardust" or the latest hit song are liable to filter through the immediate chatter and clatter. And a more recent innovation finds Muzak installed in a number of aircraft, trains and buses. About 54 million Americans are exposed to it in the course of each day, according to one bold estimate.

Most subscribers to Muzak (98 per cent of the total) receive their programmes through the telephone network. More recently the operation of the 17 FM radio stations has helped to gather the remote rural customer and others into the Muzak fold. The programme originates at the company's headquarters in New York City and tape recordings are dispatched to five regional offices, which circulate them to local stations for piping into the telephone circuits. Only the New York area is serviced directly by the Muzak Corporation; elsewhere distribution is handled by franchise-holders of whom there are at present 185. Muzak has already made itself heard abroad. It has penetrated most Canadian cities, and has gained footholds in South America, Cuba, Puerto Rico, Singapore, Siam, Hongkong and the Philippines; it preceded the flag to both Alaska and Hawaii. The London franchise has been awarded to ATV.

Launched in the middle of the nineteen-thirties to supply light music to restaurants, the Muzak Corporation turned its attention to offices and factories during the war, largely as a result of British research into the stimulating effect of music on war production. Since then Muzak has never looked back. Subscribers, whose numbers have trebled over the last decade, now pay over $12 million a year for Muzak, and the company claims that of the 100 largest corporations in the country 95 are on its lists. Rates to individual subscribers vary according to the amount of amplifying equipment required and the number of listeners; a small office may pay $15 a month, a large plant $800. There are a handful of competing companies in the field, but none has yet challenged the leading position of Muzak. The great selling point of all piped music of this type is its freedom from advertising.

Muzak's collection of records now numbers 50,000, to which about 20 new titles are added each month. The company, which pays over $250,000 a year in royalties, commissions its own orchestras and makes it own recordings. Musical programming is taken very seriously. Each recording is meticulously rated for its degree of emotional stimulation, and the day's programmes are plotted on charts and noted on punch cards. Although it attends to the requirements of the lunch hour, the cocktail hour and the dinner table, Muzak's main concern is to offset, through its programmes, the hour to hour fluctuations in workers' energy and application. To feed the new British network, Muzak has to run off a special programme; copyright regulations and release dates for new "numbers" vary on the two sides of the Atlantic.

THE WORLD OVERSEAS

Apartheid in Action—and Reaction

FROM OUR CORRESPONDENT IN SOUTH AFRICA

With a liberal use of the guillotine, the National party government has just pushed through parliament two measures of fundamental importance. The first is the Bantu Self-government Act, which ends what meagre representation the African people have in parliament, provides for the establishment of eight ethnic units corresponding roughly to the present areas reserved for African occupation, and gives to each a degree of self-government that will, however, be subject to the overriding authority of the Union parliament.

Mr Verwoerd said categorically during the bill's stormy passage that the Nationalist party were fully prepared to face the consequences of granting ultimate independence to those areas. The measure, he declared, was in the spirit of what was happening elsewhere in Africa where black people were demanding self-rule. But there is little disposition, outside the Nationalist upper crust, to believe that complete independence for these scattered areas will be practicable even in the middle future. Critics of the measure have condemned it both as a fraud and as potentially dangerous because, by raising false hopes, it might produce a bitter reaction. Already a territorial authority in eastern Cape Province, anticipating the promulgation of the measure, has asked for arms with which to fight opponents of the government's policy.

Sir de Villiers Graaff, leader of the United party opposition, has warned against the grave danger of breaking up the Union, balkanising the country and creating divided loyalties. The government retorts that this is a risk to be run, but it is optimistic about being able to work harmoniously with the independent black states when the day comes —which nobody believes to be anywhere near at hand yet. Perhaps the gravest criticism of this revolutionary measure is that while it purports to tackle the political aspect of the race problem, it leaves wholly out of account the sixty per cent of the African people who are not accommodated in the two hundred or more separate land units, spread over only thirteen per cent of the land surface, which constitute the reserved areas.

As the Tomlinson Commission showed, there will always be millions of Africans in the so-called white areas, plus some two million Coloureds and nearly a million Asians. These Africans are the most advanced, and therefore have the most clearly formulated political ambitions, as expressed in such bodies as the African National Congress. Without their labour the country's economy would collapse overnight, but they are now utterly voiceless in the legislature which controls every detail of their lives. Even their legitimate spokesmen, like Chief Luthuli, have been silenced or banished. This will probably drive the whole movement underground and hand the leadership over to extremists who will turn their backs on the co-operation with liberal whites that Chief Luthuli still preaches.

Without specifying its plans in detail, the United party opposition has made it clear that it believes in giving the Africans a voice in parliament, that it is prepared to extend the present token representation to the northern provinces and that it believes in consultation with the non-white leaders. Although this timid approach wins little, if any, sympathy with the African leadership, it does have the support of at least one Nationalist MP. Mr Japie Basson, one of the leading intellectuals of the younger school of Afrikaner Nationalism, has paid the price for this view by being expelled from the parliamentary caucus of his party. He speaks, however, for a minority of Afrikaner intellectuals who are disturbed by Mr Verwoerd's headlong plunge into uncharted constitutional seas, his bland disregard for political realities, and his utter intolerance of opposing views. The effect of this minor revolt on the climate of Nationalist opinion may be significant.

It is in this Afrikaner quarter, too, that there is most unhappiness over the second measure which has upset the country: the Extension of University Education Act. This measure denies non-whites the right to attend universities which have hitherto admitted them, transfers the one existing non-white college—Fort Hare—to the control of the Bantu Education Department, and provides for the establishment of universities for different ethnic groups on a basis that will subject them to the strictest ministerial control. These, the critics say, will be nothing but tribal colleges established to carry out the government's Bantu education policy. By closing the "open" universities' doors to all other races, the Nationalists have not only struck at academic freedom, but have taken their most decisive step towards isolating the races at the level at which understanding had its best chance of developing. The government's reply is that only in this way will be it be possible to maintain separate development. The critics retort that this is simply another attempt at pushing the African back into tribalism.

Paradoxically, the government's ruthlessness in pushing ahead with these measures has, for the first time in eleven years, given the anti-Nationalist forces among all racial groups some hope that at last Verwoerdism is overreaching itself. They believe that the country may still be saved from its worst excesses if the forces of moderation can hold together and act decisively when the time comes. As one experienced commentator expressed it last week:

> Mr Verwoerd has done the wrong thing at the wrong time. His fantastic Bantustans amount to nothing, for there is a limit to our political madness. The group of extremists who pretend to rule the country are rapidly undoing themselves . . . there is neither reason nor logic in their plans. Perhaps it is just as well it is happening now, while there is still some semblance of sanity left.

In that mood of anxiety, if not of near-despair, South Africa awaits the next act in the unfolding drama of Verwoerdism.

Double-Take on the Rhine

FROM OUR BONN CORRESPONDENT

Dr Adenauer is miscalculating if he still believes that his somersault at the top of West German politics has left him standing just where he was before. He is still Chancellor, still chairman of the party which commands a majority in the Bundestag; but the high prestige he has hitherto enjoyed in parliament, within the Christian Democratic party, and throughout the country, has been drastically diminished. He has lost what might have been much comforting support for his attempt to ensure what he calls "continuity of policy," and has kindled a great deal of antagonism that is bound to find an outlet in both overt and covert obstruction of his aims.

Since April 7th, when he first announced his intention of standing for the presidency, he has achieved prodigies of estrangement. He has conspicuously slighted two of the most respected figures in German public life—President Heuss and the vice-chancellor and economics minister, Dr Erhard. He has continued unsparingly to belittle the importance of his foreign minister, Herr von Brentano. He has disregarded the counsel of his party's most influential leaders, including Herr Gerstenmaier (the president of the Bundestag), Herr Krone (leader of the parliamentary party), and Herr Hocherl (of the touchy Bavarian Christian Democrats). He has let the limelight fall on the humiliating spectacle of his parliamentary party being stampeded into submission at a single crack of the whip. At the same time he has disappointed countless politically more detached Germans who, while wishing him well, were already thinking that it would probably be in the country's best interests if Dr Adenauer made way for another at the Palais Schaumburg, and consequently had welcomed the gracious manner of his proposed exit from active leadership.

The 83-year-old Chancellor seems to have been deluded by the courtesy which many people had exercised in speaking of the succession. The blunt question "how do we get rid of him?" will now be posed more openly and more often. Dr Adenauer speaks of putting himself forward in the 1961 elections for a third five year term as chancellor. Since last week he has made sure that it will not be only the Social Democrats who will make it their business to prevent him succeeding.

As yet, the potential conspirators have scarcely had time to collect their faculties, let alone muster their forces. Some of them have been waiting for the return of Herr Erhard, who arrived on Tuesday night visibly smouldering with a wrath that Dr Adenauer's soft answers could not turn entirely away.

At the party meeting in the Bundeshaus at which he announced his changed plans, Dr Adenauer challenged some dissentients to resort to the opportunity provided by article 67 of the Basic Law. This runs:

> The Bundestag can express its lack of confidence in the federal chancellor only by electing a successor by the majority of its members, and requesting the federal president to dismiss the federal chancellor. The federal president must comply with the request and appoint the person elected. Forty-eight hours must elapse between the motion and the election.

The prospect of such dire rebellion seemed at that moment to have been overwhelming in its awfulness. With the passing of time it may appear less terrible. Some Christian Democrats hinted at first that they would support a motion of no confidence sponsored by the Social Democrats provided it proposed that Herr Erhard or Herr Gerstenmaier should be Dr Adenauer's replacement. The Social Democrats themselves are deep in councils of war. Indignant whoops and clashing of spears can be heard within; but new decisions, if any, had not been made public at the time of writing.

Meanwhile, some Christian Democratic deputies are toying with the idea of voting on July 1st for Professor Carlo Schmid, the Social Democratic candidate for the presidency. Professor Schmid's chances of success have improved considerably. Probably a number of Free Democrats, and even members of the right-wing German Party, will vote for him now that the alternative has changed. The Christian Democrats are again just as much at a loss to produce a certain winner as they were before Dr Adenauer stepped into the breach in April. The meeting of the party committee appointed to find a presidential candidate has been postponed until June 15th. The names of the possibles mentioned most frequently are those of Herr Krone, Herr Etzel, and Dr Gebhard Müller (formerly chief minister of Baden-Württemberg and ex-president of the German Red Cross). Herr Etzel, who until a few days ago was Dr Adenauer's favourite for the chancellorship, is said to have remarked, on hearing of his changed prospects, "Why not pope?", and to have declined the proffered presidency with thanks.

One ambitious Christian Democrat has been markedly silent throughout these latest excitements—Herr Strauss, the brash and lusty minister of defence, whom this week's *Simplicissimus* caricatures looking at photographs of his new baby and saying: "No, don't let the press get hold of these. He looks here as though he were a housing minister's son." Herr Strauss is certainly not least among the party malcontents whom Dr Adenauer will be watching uneasily from now on.

The de Valera Double

FROM OUR DUBLIN CORRESPONDENT

On June 17th the electors of the Republic of Ireland will cast their votes on two widely different issues. The first concerns the election of a new president. The presidency may be held for not more than two terms of seven years each. It has been occupied since 1945, with conspicuous success, by Mr Sean T. O'Kelly. In that year Mr O'Kelly won a contested election. He was re-elected, without a contest, in 1952; and there is considerable regret that he cannot be put in again. He has succeeded in raising the office above party politics.

There is no possibility that he will be followed, as many electors would wish, by some personality drawn from outside politics. The opposition have put forward General MacEoin, who was an unsuccessful candidate in 1945 and since then has held office in Mr Costello's governments. The other candidate is Mr de Valera himself. His decision to stand caused some surprise: he notoriously likes to keep the reins in his own hands. But the presidency is furnished with some powers that have not been exercised since its institution and, provided that Mr de Valera's successor as head of the government is sufficiently docile, there may be new fields of activity to explore.

Equally, it should be remembered that Mr de Valera is

approaching 77, and has suffered from failing sight for some years. The prospect is that before the end of the month he will "go up to the Park" (where the president occupies the residence of former viceroys), and a long career in active politics will have come to an end. Mr de Valera first came into prominence when he was condemned to death after the rising of 1916. The first of a succession of British premiers with whom he has conducted negotiations (usually, with the exception of Neville Chamberlain; acrimoniously) was Lloyd George. He has been the head of the Irish government for twenty-one of the last twenty-seven years. Even Dr Adenauer, who comes irresistibly to mind in such matters, cannot beat that.

Victory in the presidential election will give Mr de Valera only the first leg of his double. The second issue to be decided is whether the system of voting by proportional representation should be retained or abolished in favour of straight voting on the British model. PR was written into the original constitution adopted in 1922. It was retained, to his subsequent embarrassment, by Mr de Valera when he produced his own version, at once more republican and more personal, in 1937. Last autumn he announced that he would introduce legislation to secure its abolition, on the ground that it led to weak governments. His proposals were fought over during the winter months. They were carried through the Dail; but they were rejected by the Senate and became law only when the consequent period of delay had expired. A referendum must be held because an amendment of the constitution is involved. Not surprisingly, the referendum will be held on the same day as the presidential election, so that Irish voters will be invited to distinguish sharply, if they feel so inclined, between Mr de Valera's personality and Mr de Valera's policies.

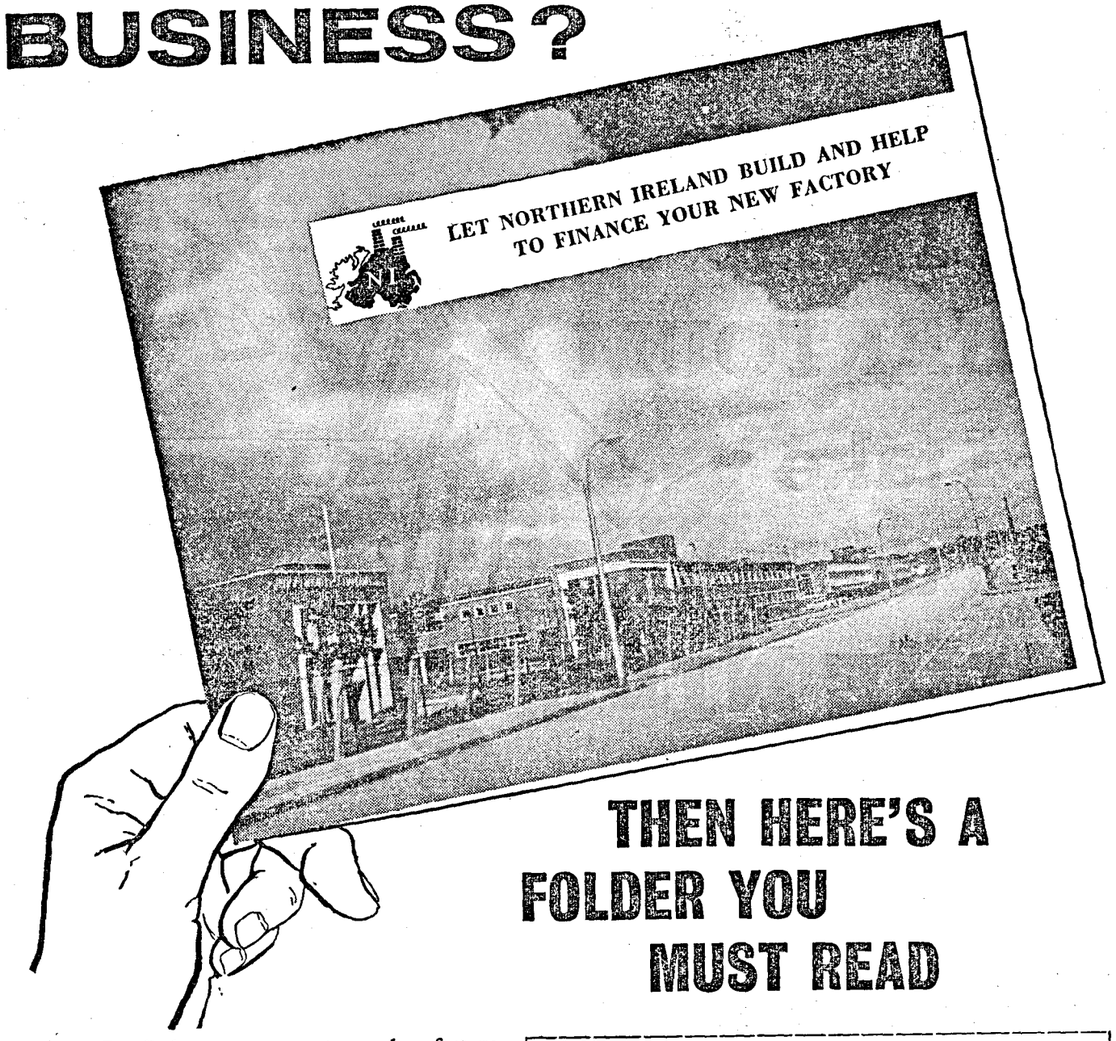
In so far as the decision will be influenced by parliamentary debate, it must be said that the government got the worst of the arguments in Dail and Senate. The case against PR was based on the fact—which is regarded as a great virtue by a slight overall majority of the electorate—that it caused Mr de Valera's defeat in 1948 and again in 1954. Further arguments were drawn, not always happily, from the example of France, Weimar Germany and pre-fascist Italy. The straight vote, it was claimed, gave decisive results; and flattering references were made to the sagacity of the British, who had never experimented with PR. These arguments were taken up by the Opposition. They pointed out that since 1922 there have been only five changes of government, and three premiers. Mr de Valera's present majority is the largest ever enjoyed in that period. Certainly, a number of small parties had appeared, and mostly disappeared; but they had not produced confusion and in any case it was proper that they should be given their chance. In particular, it was important that "physical force" parties, such as Sinn Fein at present, should be given an opportunity to make their case in parliament. The abolition of PR, it was argued, was designed to keep Mr de Valera's party in office after its chief vote-getter had retired.

On the showing of general elections, Mr de Valera has rather less than a majority of the electorate. It may be significant that most independent deputies and senators voted to retain PR. It goes without saying that the opposition parties did so. The Trade Union Congress, which rarely enters the political field, has announced its opposition to abolition. Among the unattached, there is a feeling that this is an attempt to snatch an unfair advantage. It is perhaps notable that nobody seems to be interested in what the members of Sinn Fein think about it. In some quarters, however, the fact that the Belfast government lost no time in abolishing PR in its area is regarded as a *prima facie* reason for its retention in the Republic.

However things go, this month will see the ending of a long era in Irish politics which has been dominated by the events of forty years ago. Mr de Valera's retirement is an apt symbol of the re-casting of thought on such matters as partition and economic policies which has been notable in very recent years. It remains to be seen if this is carried a stage further by his successor. Mr Lemass, who is minister for industry and commerce, has been speaking as if he is the heir-apparent, but there are sections of the party who believe, possibly rightly, that he is insufficiently interested in matters dear to Mr de Valera's heart, such as the revival of Irish. But events in Germany show how unwise it is to be sure of what may happen when the central personage is an old man who is not in a hurry.

CANADIAN PANORAMA—I

The Modern Frontier



FROM OUR OTTAWA CORRESPONDENT

The royal tour, like any other long journey, invites the fascinating, though futile, game of speculating what places or incidents will live most vividly in the travellers' memories when it is all over. From June 18th, when the Queen and Prince Philip arrive at St. John's, Newfoundland, by air from England, until August 1st, when they embark at Halifax in the royal yacht *Britannia*, they will cover a more varied itinerary than any previous royal tour of Canada. For the Queen, though not for Prince Philip, this tour will provide a first visit to settlements on the northern frontiers where many of Canada's material resources are under development.

After St. John's she will fly to the west coast of Newfoundland to "Bowaters' town," Corner Brook, where most of the inhabitants work at the Bowater pulp and paper mills. Then come two more frontier towns—Schefferville, an iron ore town, and Arvida, centre of operations for the Aluminium Company of Canada. Schefferville gets its name from a highly-respected Roman Catholic bishop who served the lonely Ungava outposts long before iron ore brought the world to them. There live the men—and their families—who this year will shovel out twelve million tons of ore and dispatch it by rail for the 350-mile journey down to the Gulf of St. Lawrence at Seven Islands.

This is the most logical place for the Queen to start her trip up the new seaway. At Seven Islands, where she joins the royal yacht, she will find huge lake vessels, like barges, lying alongside the high jetties where railway wagons can tip 19,000 tons of ore straight into their cavernous holds. The destination of most of this ore is the south shore of Lake Erie, close to the United States steel mills of the famous "inland empire." But for this ore traffic, the seaway might not be completed now. This was the principal reason for the Canadian decision back in the early nineteen-fifties to build the waterway alone, provided the

IS YOURS A GROWING BUSINESS?

THEN HERE'S A FOLDER YOU MUST READ

It tells how you can rent a modern factory or how the Government might build one for you. It tells about special low rentals, of repayment terms and about grants toward plant and machinery, buildings and the training of labour. In fact, this booklet is the first step toward an expansion project tailored to suit you.

Please send me ..... copy/copies of your booklet "Let Northern Ireland build and help to finance your new factory".

GO TO NORTHERN IRELAND—AND GROW

Dept. E.16, NORTHERN IRELAND DEVELOPMENT COUNCIL (Chairman, THE VISCOUNT CHANDOS)
13 Lower Regent Street, London, S.W.1 (*Tel: WHItehall 0651*)
or 99 Park Avenue, New York 16, N.Y., U.S.A.,
or THE MINISTRY OF COMMERCE, BELFAST. (*Tel: Belfast 28271*)

Every Monday a Sudan Airways VISCOUNT 831 (maintained and crewed by Airwork) will fly from London to the Sudan. **This will be the only air service to cater specially for the Sudan.** Passengers who wish to break their journey at Rome, Athens, or Cairo may do so* and continue their journey by the next plane at no extra cost. The return flight from Khartoum will be on Thursdays.
VISCOUNT comfort . . . Rolls-Royce speed
The latest Viscount—the 831—is larger, much faster and even more luxurious than its predecessors. In a perfectly relaxed atmosphere, you can eat and drink, read and talk (nearly everyone on board will have a common interest in the Sudan) or simply sleep, lulled by the soothing hum of the four Rolls-Royce jet engines. An unusual feature of this flight will be a Free Information Service on all matters relating to Sudanese business, political, and social life. This will be very helpful to newcomers and to those returning after a long leave of absence. If you have business in the Sudan, ask your travel agent about the new Blue Nile Viscount.

**Subject to the approval of the Governments concerned.*

United States would make it possible to instal the necessary dams by joining in power development.

The transport of ore from Seven Islands to Lake Erie provided a single source of upbound traffic equal to all the hypothetical oceangoing cargoes on which previous planning had been based. It was President Truman's decision to go first for joint power development, and President Eisenhower's later support of it, that broke the long-standing deadlock in Congress and thus, ironically, brought the United States in at the very time when Canada had decided it would rather go it alone.

The Queen's first taste of modern frontier life will be reinforced at Arvida, the centre of the great aluminium industry established during the second world war to apply the hydro-power potential of the Saguenay river and its tributaries to bauxite and alumina imported from Jamaica and British Guiana. Later in her tour she will see the frontier life again at one of the newest of the remote mining towns, Uranium City in northern Saskatchewan, and at one of the oldest, Sudbury. Their nearest British equivalent, the Queen will find, is Welwyn Garden City. That may be a surprise, but when a new community is planted in the bush to develop new mines or to mill forest products, the company wants to make it attractive. Whether the company owns the houses and civic buildings or whether it carefully avoids ownership, it is usually a generous contributor. The community is necessarily planned. It necessarily has to provide its own social life, entertainment and enlightenment. Local community life does not need to be invented: it is inevitable.

At Whitehorse, in the Yukon, and Yellowknife the Queen will find not company towns but budding metropolitan centres. In late July there will be no darkness. The sun sets for a short time, but the period which strikes the visitor as appropriate for sleep is about equivalent to that vouchsafed to transatlantic passengers eastbound by Comet.

(To be concluded)

Notes from Northern Nigeria

FROM OUR SPECIAL CORRESPONDENT

Economic Equation

EIGHTEEN million people ; a national income of £17 per head ; a revenue of £2 16s. per head, almost exclusively derived from two crops, groundnuts and cotton ; a rate of capital accumulation which must be far below the 8 to 10 per cent which would give it a really dynamic economy. Northern Nigeria is poorer even than Tanganyika. It would like to industrialise: and has made a promising start with a cotton industry. It needs to improve its agriculture, which requires, however, not only fertilisers but trained agricultural officers able to teach their use—at present there is one to every 22,000 farmers. The North is hungry for capital, but to borrow only another £10 million (which it hopes to do to finance a new development plan after 1960) would be the maximum its budget could carry in service charges. And self-government disqualifies it for Colonial Development and Welfare grants, of which it has had £18 million since 1940.

The Northern Region looks at the way other colonies have been treated and considers that it has a grievance ; it got less than its share of development finance in the past, though it was the poorest of all ; and now it is to have nothing at all —and this in exchange for being above all the region whose friendliness towards Britain, coupled with its preponderant voice in the federal legislature, will keep Nigeria in the Commonwealth, under the crown, and in the western camp. There are not wanting voices in Kaduna to give a warning that if the region returns to economic stagnation, the sort of revolutionary change which has overtaken other Islamic countries could happen here. But nobody knows the right extension numbers to ring in the Commonwealth Relations Office or the Treasury.

Northern Justice

When the southern politicians at the London constitutional conference last year produced a photograph of a man who had received 80 lashes for "slandering the emir" (he had been overheard in his own house to say that the Emir had spoken to a leader of the NEPU), the report of a panel of jurists on the reform of Northern Nigeria's penal code and court procedure had been published just three days. It was a close call for the northern delegates, who had, even so, to accept the statement of human rights in the constitution, and are now committed to the reform which will for the first time provide a written code under which a man will know exactly what is the offence with which he is charged and the penalty attached. Under the Shari'a law he did not (any more than did the British administrators, who contented themselves with modifying it: it is illegal to cut off hands, as the Arabic texts prescribe for theft, or indeed to give lashes—as opposed to *token* lashes—though it happens.)

Yet courts of first instance have power to impose fines of up to £150 and to impose sentences of three years imprisonment. Recently an alcali's court sentenced a man to death for apostasy ; the sentence was of course quashed. Your correspondent had read to him a case in which three men who walked round the village with "Vote Nepu" written in pencil on their registration cards got three months' imprisonment. In these courts evidence is not usually heard.

There are, of course, special courts to which non-Moslems may go ; but even this is recent. The new code at least provides that there will be no conviction for an offence except under written law, that there will be a system of appeal, and the magistrates and clerks will be trained. So long as British high court judges remain during the period needed to train a northern bar (it may take to 1970) there should be justice for Moslem and non-Moslem alike. But the bill introducing the code has not yet come before the northern legislature. Suspicion has grown that the emirs are fighting it because they want to enforce the Shari'a law in its former harshness under self-government. The government promises to pass the bill by August, and with the critical eyes of its own minorities as well as of southerners on it, any breach of faith would do more than present NEPU and UMBC with electioneering ammunition ; it would shake the North and the frail structure of federation to its foundation.

Overcrowding in Holland

FROM A CORRESPONDENT IN HOLLAND

WHOEVER has eyes to see must be disturbed at the rate of growth of the small mid-western district of the Netherlands. Some gloomy forecasters even prophesy a conglomeration of population and industry in this region within

a few decades that will be worse than in New York, Tokyo or London. They may be too pessimistic; all the same, the prevention of serious overcrowding in "Randstad Holland" is a problem about which official committees have already produced extensive and thorough reports.

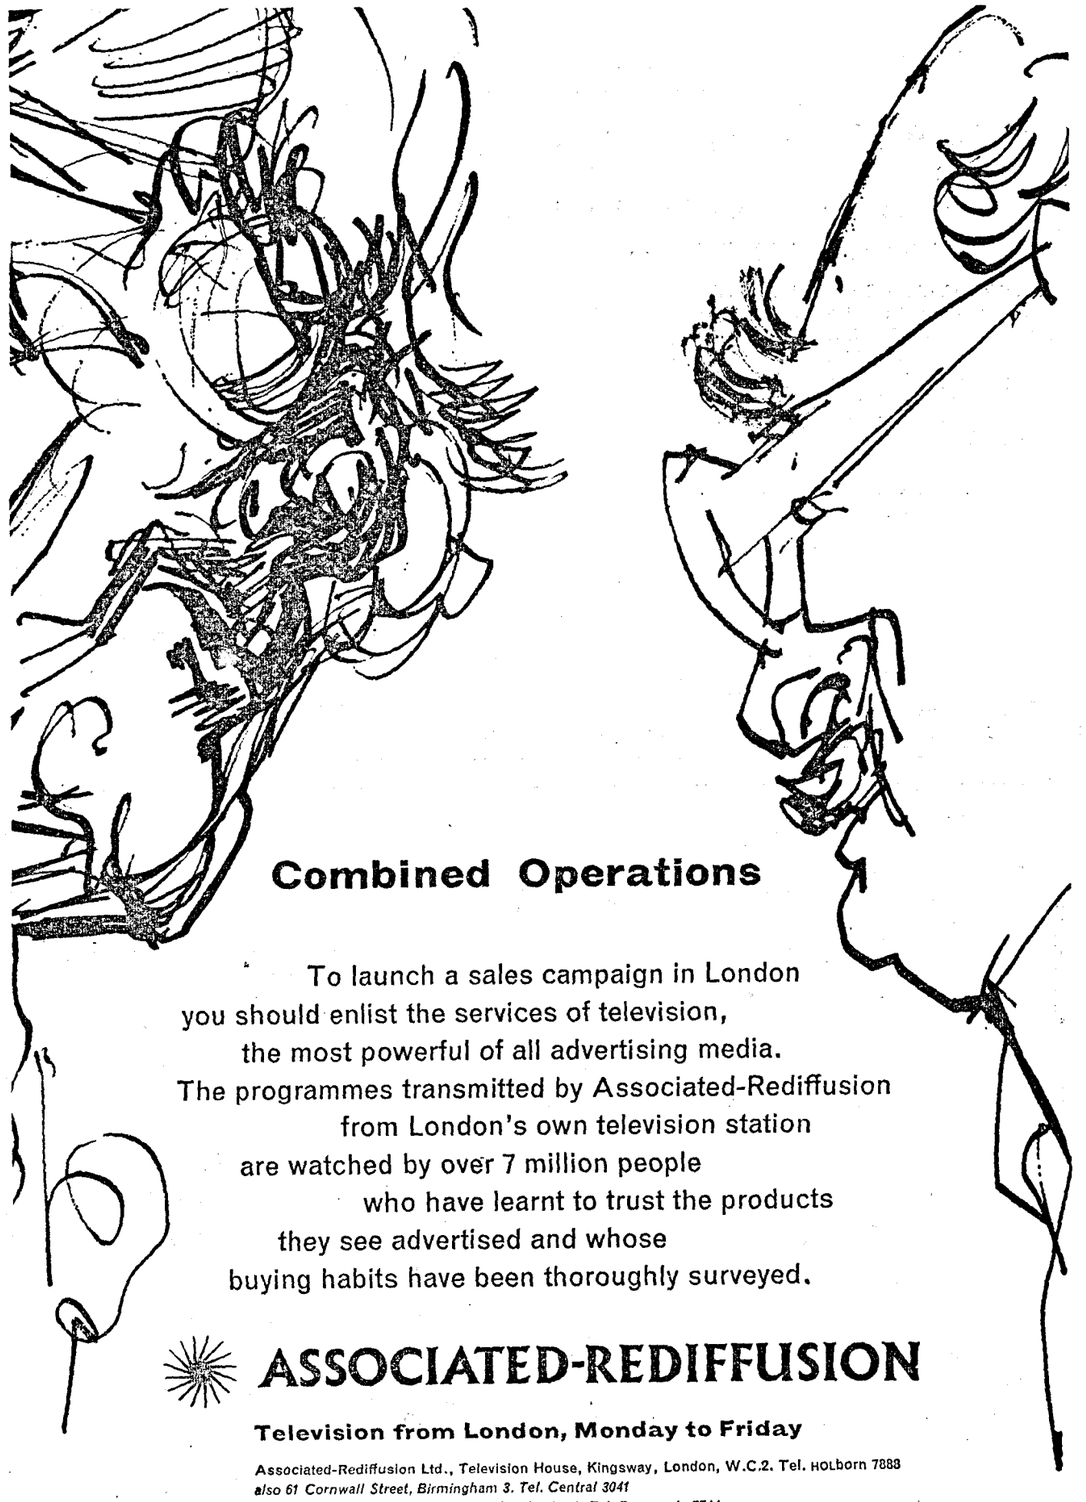
This "Randstad" roughly covers the area Amsterdam-Utrecht-Rotterdam-The Hague-Haarlem, and within this small territory are crowded together 4 million of the 11.3 million Dutchmen, the majority of the country's industries, the two biggest harbours, the principal town (Amsterdam), the seat of government (The Hague), as well as two airfields, the large Schiphol and the smaller Zestienhoven. Between the fast-growing towns and villages there are still areas reserved for agriculture and horticulture, for the famous bulb fields and for popular seaside resorts, as well as lakes and parks for recreation. Development of the area has recently forged ahead with such speed and ruthlessness that serious concern is felt about the well-being and even about the breathing-space of the present generation's grandchildren.

There are a number of reasons for this situation. First, the density of population in the Netherlands is among the highest in the world; it is 340 to the square kilometre for the country as a whole and some 2,000 to the square kilometre for "Randstad." On top of this there is an appallingly rapid growth of population; there are the continuously expanding harbours of Rotterdam and Amsterdam only 50 miles from each other; there is an intensive industrialisation programme designed to give the growing population food, shelter and employment; and there is the geographically favourable situation of western Holland on the continent of Europe's lines of communication. Rotterdam is building its huge Europort project which will provide shipping accommodation for the biggest ships, warehousing facilities for oil and ores, as well as (probably) big blast furnaces and a steel factory; other industries are naturally attracted to this development area. Amsterdam has just published similar plans for the extension of its harbours and for a better entrance to the Ijmuiden docks; here, too, Dutch and foreign industry is considering the advantages of staking a claim. There is also fast-growing Dordrecht, south of Rotterdam, which was recently delighted to hear that Du Pont de Nemours had decided to establish a big Orlon plant there. In short, more and more chimneys are raising their stacks in "Randstad."

ALTHOUGH the gloomy forecast of a Dutch "New York" need not be taken too tragically, it is a fact that by 1980 the population of "Randstad" will have grown from 4 to over 5½ million, as compared with an estimate of 13½ million for the whole country. It is also a fact that the outskirts of several towns are getting uncomfortably close to one another. The intensive industrialisation programme will require more and more houses: at the moment "Randstad" employs about 450,000 industrial workers out of a total for the whole country of approximately 1,070,000. Since the war new industrial enterprises, including foreign subsidiaries (largely American), have shown a decided preference for the "Randstad" area.

There are, however, signs of a tendency towards decentralisation. Good industrial sites in western Holland are becoming as scarce as tea was during the war; so is skilled and unskilled labour. On the other hand, in several regions, the so-called "problem" areas in the extreme north, east and south of the Netherlands, labour that has been driven out of agriculture and peat digging is available for other employment. Moreover the big Phillips concern has given a good example by avoiding "Randstad" as far as possible; it has scores of factories spread over the whole of the Netherlands, with other industries following in its wake.

This decentralisation is now being encouraged by the government by improving transport facilities, by establishing schools and training colleges, by stimulating the building of houses and by improving cultural amenities. Last but not least, there is a system of subsidies for enterprises prepared to establish themselves in these "problem" areas. This decentralisation is of course a long-term development, and so far the government is strictly confining itself to persuasion only.



Jordan's Threatened Lifelines

ON June 6th the Jordan government notified the United Nations that the United Arab Republic (Syria) had closed the border at Deraa. The Syrians said it was done in retaliation for Jordanian refusal to allow Syrian-dwelling farmers to cultivate lands they own on the Jordan side of the border. According to the Syrians, the Jordanians had refused to discuss the matter; according to the Jordanians, there was no truth in the Syrian charges.

Jordan's survival depends on keeping its lines of communication open through Syria. The country is blocked from the sea by Israel on the west, by Syria on the north, and by the inadequate facilities of its own tiny port at Aqabah on the south. To the east lies a hostile Iraq at the other end of the only paved road across the desert.

The traffic between Jordan and Israel is limited to one-way crossings by tourists, and to a certain amount of smuggling. Most of Jordan's imports come through Syria, by road or rail. Syrians were accustomed to exact tribute from those who had to use the trade routes of the east long before the artificial boundary was agreed upon by the British and French governments a generation ago. During the period of the mandatory governments there were occasional border skirmishes and frequent allegations of border violations, but crossing the border was not a complicated undertaking, on the whole—a traveller could often go in either direction by showing the officials on duty any bit of paper he happened to have in his pocket. The Syrian border was not so important in those days because Jordan's imports came in across Palestine.

Independence, the growth of national pride and the establishment of the state of Israel have changed all that. Jordan's new Prime Minister, Mr Hazza al-Majali, told the parliament in Amman last week that the country's relations with other Arab states should be based on the principles of co-operation and frankness in all matters concerning the common aspirations and interests of the nation. Border squabbles seem no more consistent with such brave words than with President Nasser's frequent assertions about Arab unity. Does this border incident represent just another minor misunderstanding between members of the Arab family? Or will it be remembered as the beginning of another summer of trouble in the Middle East?

THE BUSINESS WORLD

Unloading Strategic Stocks

RECOVERY in commodity prices has given the British government the opportunity to resume sales from its strategic stocks, and tempted the American government to try to sell some of its copper. Britain has started with wool, offering 9,000 bales at the latest series of London auctions. As it happens wool prices have fallen since the announcement was made. The fall was not the result of that decision, but it illustrates the difficulties that governments face in seeking a favourable time for disposal. And the 2,500 tons of tin that Britain first gave notice of selling 2½ years ago —before the market weakened—is now going to be sold through the international buffer stock.

The British government has never publicly qualified its statement, in the 1956 Defence white paper, that its strategic stocks of raw materials could be run down "to some extent without risk." Yet it seems in fact to have decided to get rid of the lot. Having sold, or decided to sell, all its copper, lead, timber and wool, there can be no strategic justification for continuing to hold zinc, rubber and other materials. Indeed by locking up its stock of natural rubber the government is probably hurting, not helping, the real interests of rubber growers—though most growers and the Malayan government would no doubt disagree. During the next few years the danger is that the world will produce too little natural rubber rather than too much, thereby encouraging the production of synthetic rubber.

The biggest spectre looming over commodity markets—some traders profess not to see it—is the United States' vast strategic stock. Little is known of the size of the stocks of individual materials, but it is known to have more than it needs of most items. The surplus has recently increased, not because buying has continued—it has virtually stopped—but because requirements have been revised. After considering the independent report that it commissioned on stockpiling policy in this nuclear age, the government decided that stocks need only be large enough for a three-year emergency, instead of the five years assumed before. The "basic objective" now assumes that the United States would not be completely cut off from normal sources of supply in an emergency, while the "maximum objective" assumes that it would have to rely on nearby sources alone.

In terms of value the basic objective is now $2.9 billion, to which stockpiling for the maximum would add $1½ billion, making $4.4 billion all told. Stocks held against the basic objective on June 30th were valued at $2.8 billion and stocks held against the "maximum increment" were valued at $800 million, making $3.6 billion in all. The last stockpile report, for the six months ending last June, disclosed that materials in group I (which covers most items) amounted to 26½ million tons, valued at nearly $5½ billion, and the surplus had soared from $100 million worth to $1.8 billion. Stocks of 63 items equalled or exceed the basic objective, and stocks of 50 items equalled or exceeded the maximum objective as well. This does not exhaust the American government's holdings; it has not one stock but three:

1. The strategic stock proper, valued at $5½ billion.
2. The supplementary stockpile, acquired more for political than strategic reasons (lead and zinc bought from domestic mines, tin bought from Bolivia and Indonesia, and lead, zinc and other metals obtained from foreign countries in exchange for surplus American farm products).
3. The stock acquired under the Defence Production Act, which gave producers of aluminium, copper, nickel and tungsten the right to "put" metal to the government in times of surplus. The value of this stock and the supplementary stockpile is not precisely known, but the two put together add up to about $2½ billion.

How soon could surplus materials from these stocks be offered to the market? The regulations for disposing of materials in the strategic stock proper apply equally to the supplementary stock, but there are no such legal restraints on the disposal of the DPA stock. The regulations lay down that Congress and the public shall be given six months' notice of sale, together

with details of the quantities to be offered, the plan of disposal and the date on which material is to be offered. Disposal shall pay due regard to the protection of producers, processors and consumers against avoidable disruption of their markets. Express approval from Congress is required unless disposal is carried out because of obsolescence (deterioration, development of new or better materials or no further usefulness in time of war). These provisions suggest that the government could not sell six months forward. It could invite bids and negotiate with buyers, but could not complete a contract of sale before six months had elapsed.

RUMOURS that some surplus materials might be sold circulated in Washington early this year. In April it was reported that the Administration intended to sell about 136,000 short tons of copper in the DPA stock. Prices in New York and London fell sharply, and Senators from the western mining states hastily rushed a resolution through the Senate claiming that disposal would do "incalculable danger to the national security and to the economic well-being of the nation." This brought an official reassurance that, if and when it was decided to sell this copper, a maximum of only 5,000 tons a month would be offered. Official policy, it was stressed, was to "exercise great care that our actions do not disrupt the market or adversely affect the industry involved."

Last month the House appropriations committee sent a shudder through the rubber market by refusing to sanction funds needed for replacing rubber and other perishable commodities in the stockpile. The Administration proposed to sell about $43 million worth of rubber and other perishables, to prevent deterioration, in the fiscal year beginning July 1st, and asked for $49½ million to buy replacements. The Committee stated that it wanted to force the government to reduce the stockpile. If the Senate were to support the House committee's action, no rubber could be sold before 1960. To sell without replacing would amount to disposal, and six months' notice would have to be given.

Official testimony before the committee revealed that half of the government's total stocks by value—$4 billion worth out of $8 billion—are no longer required. They include aluminium, cobalt, nickel, tin, tungsten, lead and zinc and rubber. "I think we ought to try to get rid of that which is in excess of the maximum need," said one official, adding that the Administration had been studying the problems of disposal for some time but had not yet taken a general policy decision.

A decision will have to be taken one day. The pressure for economy, within and without the government, is bound to grow. So is the volume of the excess stock. The revised objectives established last year are only preliminary ones, based to some degree on data that was several years old. As American requirements are reviewed again in the light of the latest information they are more likely to be revised downwards than up, as seems already to have happened to copper. Though the maximum objective for copper had not been reached on June 30th last year, it has evidently been reached now; otherwise the government would not have considered selling copper.

The Administration is now believed to be proposing to re-arrange its stocks into two compartments. One, the strategic stock proper, the other a new "materials reserve" containing all the excess materials. Regulations for disposing of materials in the reserve, it is thought, would be the same as for the strategic stock, except that a shorter period of notice could be given, say three months instead of six, and Congressional approval might not be required.

DISPOSALS FROM UK STRATEGIC STOCKS

Item	Size of Stock	Comment
Copper	85,000 tons	Almost all sold.
Lead	50,000 tons	36,700 tons sold before sales suspended in June, 1958.
Wool	96 million lb.	About 31 million lb. sold before sales suspended in April, 1958; resumed in May, 1959.
Softwood	230,000 standards	All sold.
Rubber	Est. 125,000 tons	No action.
Zinc	27,000 tons	About 18,000 tons sold before sales suspended in February, 1958.
Tin	2,500 tons	International buffer stock now appointed as agent.
Aluminium	52,000 tons	Over half sold before sales suspended early in 1957.
Nickel	1,600 tons	All sold.
Jute and jute goods	35,200 tons	All sold.

The American government, it can be assumed, will do its level best not to disrupt markets. It must consider the views of powerful interests at home, as well as those of foreign governments, and thus can be expected to be more sensitive to charges of "disruption" than it has sometimes been in disposing of surplus farm products abroad. Foreign producers of copper and some other metals have allies not only in the State Department, but among the American mining companies and Senators from the western mining states as well. Producers of natural rubber have fewer allies. The American rubber manufacturers are having to pay a substantial premium for natural rubber, and they would welcome the opportunity to buy from the strategic stock at a rate that, while not disrupting the market, would tend to keep natural rubber prices at a "reasonable" level. The stockpile of natural rubber is believed to amount to about 1¼ million tons, and the surplus is probably about half a million tons, equal to one year's consumption in the United States and to one-quarter of annual world production.

Few guesses can be made about the surplus of other materials. But for tin, at least, a broad indication can be given. The total stock is probably close to 380,000 long tons, and if it is assumed that the United States needs a stock equivalent to three years' consumption—roughly 175,000 tons—the surplus would be over 200,000 tons, more tin than the world produces in a year. Plainly disposal of tin, rubber and other commodities would have to be stretched out over several years, if serious disruption of markets is to be avoided.

UNITED STATES STRATEGIC STOCKS AT JUNE 30th, 1958

	Equals or Exceeds Basic objective	Equals or Exceeds Maximum objective		Equals or Exceeds Basic objective	Equals or Exceeds Maximum objective
Aluminium	X	X	Nickel	X	X
Coconut oil	X	X	Rubber (natural)	X	X
Copper	X		Sisal	X	
Diamonds:			Tin	X	X
Bort	X		Tungsten	X	X
Stones	X	X	Zinc	X	X
Lead	X	X			

Instead of trying to discourage the Administration from disposing of its surplus stocks, foreign producers and their government should accept that disposal is their problem too. They should insist not only on full consultation with the Administration, but should try to play a part in working out plans for disposal. The difficulties do not grow any lighter by being left alone.

BUSINESS NOTES

THE ECONOMY

Set Fair

NEVER since the Federation of British Industries began sampling industry's state of mind 16 months ago have the industrialists who answer its four-monthly questionnaire expressed such uniform confidence about the general business situation as in the responses they returned last week. Only 4 per cent of businessmen felt less optimistic at the beginning of June than they had at the beginning of February; 59 per cent were more optimistic. Sooner than one would have expected—though this survey refers to activity at least a month later than, for example, the production index published last week—a large majority of those reporting changes in their level of activity have switched over to showing higher output, a better rate of ordering than four months ago, and increases (though here the "majorities" are not so large) in employment and hours worked. Only one-eighth of all the firms replying said their output was now lower than in February.

Another unexpected and particularly welcome improvement is that firms reporting that export orders have improved over the last four months now definitely outnumber those whose orders from abroad have gone down. This is in line with the optimism about foreign market prospects expressed a few weeks ago by the professional forecasters of the National Institute of Economic and Social Research, and more cheerful than the caution about imports rising recently repeated, for example, by the Chancellor of the Exchequer. However, on balance, those businessmen whose level of stocks of raw materials showed changes during the last four months were still indicating a decline (though here, the non-quantitative nature of this kind of survey could be particularly misleading). If their output, and accordingly their work-in-progress has generally begun to rise already, there could occur rather a sharp turn in buying of imported materials to build stocks again.

Sixty per cent of the businessmen replying reported that they were still working below capacity, though nearly a third of these said not as far below as before. This was a sharp improvement since February, when the proportion was 80 per cent (though the change could be exaggerated, in that the FBI this time made its definition of the term, "a satisfactorily full rate of operation" rather more obvious). Even so, it suggests that the improvement in output, apparently achieved without a proportionate increase in hours worked or in employment (the labour market still seems soft to them), still leaves considerable slack. And this links logically with their hardly changed attitude towards creating fresh capacity. A majority of them still expect to authorise less capital expenditure on building in the next twelve months than in the last twelve (and that period, from mid-1958 to the late spring 1959, will probably have shown one of the lowest totals for new investment authorised in British manufacturing industry for several years). On plant and machinery, as many expect to spend less as expect to spend more.

How Industry Answers

THIS was the fifth such survey of business activity and attitudes that the FBI had carried out; the accumulated run of results is beginning to give its surveyors some indications of how its indications of performance compare with other statistical series that measure economic activity, and also how this performance compares with businessmen's general confidence, at any one time, about the business outlook. Since the FBI began doing this it has slightly altered some of its questions—separating questions about stocks of work in progress and of finished goods, for example, and dropping a question about the money likely actually to be spent on investment, as apart from that authorised. But one or two of their questions still, to the outsider, seem slightly to over-estimate the frankness, for publication, that can be expected from any businessmen with Labour MPs as well as competitors to consider. Is it entirely surprising that during a period when the index of prices of manufactured goods has hardly changed, a steady and large majority of these industrialists should have averred that their selling prices had gone down; that few have ever admitted to their costs per unit of output going down; or that heavy majorities,

	Eight months to Feb., 1958	Four months to June, 1958	Four months to Oct., 1958	Four months to Feb., 1959	Four months to June, 1959
	(Percentage Majority Reporting Plus or Minus)				
Average weekly hours	−18	−19	−11	− 9	+14
Numbers employed	− 7	−15	−17	− 9	+ 9
Rate of new orders	−20	−19	− 5	+ 5	+37
Export orders only	n.a.	n.a.	−18	−13	+ 8
Length of order books	n.a.	−38	−27	−16	+12
Level of Output	+ 3	− 5	− 6	+ 6	+34
Stocks of Raw Materials	− 3	−20	−17	−18	− 4
Work & Finished Goods	+11	+11	+ 1	+ 4	+ 8

in each of the five surveys, should dolefully have recorded that their profit margins were still going down ?

The federation has not devised any more satisfactory method of summarising these results than setting out the majorities who answer " Up " or " Down " (as in the table) ; nor, given the non-quantitative nature of this kind of inquiry, can one see that any better way is possible. But it has constantly to be borne in mind that the majorities who answer one way or the other are of people recording a change in activity or opinion ; the largest proportion of answers, in most cases, comes however from those who report or expect the same. A majority of 37 " Up " or " Down," for example, which happens to be the highest recorded in this latest survey and is a very high one for any question outside the debatable region of profit margins, could mean 38 per cent saying " Up," one saying " Down," and 61 per cent reporting no change. It would be an interesting exercise for students of economics and of industrial management, and perhaps salutary for the FBI's Economic Policy Committee itself, to find out whether a very large proportion of those reporting or expecting the same as before, over the whole run of these surveys, tend to be the same firms each time?

IN THE MARKETS

Speculators' Setback

No sober observer has been surprised at the setback in the stock markets in the past week, in Wall Street or London: the writing was on the wall. Wall Street reacted, inevitably, to the signs that America's monetary authorities were serious in their determination to set the bond market to rights and were prepared to do so by levering up the long-term rate of interest. The Dow Jones index of industrials fell from its dizzy peak of 644, reached at the end of May, to 618 on Tuesday. In London, the equity indices fell by almost the same proportion.

Investors here had to contend not only with Wall Street itself, but with their own exuberance in pushing average yields on leading industrials down to the yield on Old Consols, a point of traditional psychological weakness. The main falls were on Friday and Monday. As was to be expected, the big casualties were second grade shares, particularly in the property market, which had figured large in the speculative rise. Leading blue chips continued pretty steady ; the institutions were willing to buy as soon as prices were down. The undertone of the equity market was still considered firm—and by Wednesday prices were rising. But speculators who bought all and sundry have experienced the predictable setback.

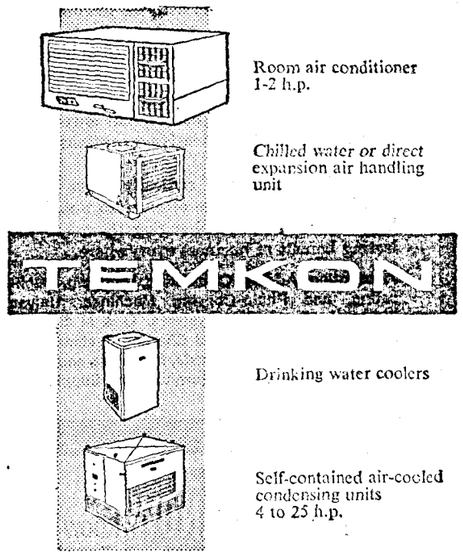
Rising Bill Rate

The gentle rise in the Treasury bill rate continued at the tender on Friday last week, when the discount market reduced its concerted bid by 3d. to £99 2s. 10d., raising its average rate of discount to £3 8s. 10½d. or about $3\frac{7}{16}$ per cent. Early in the year the bill rate dipped below 3 per cent ; but the current margin below Bank rate is still not unduly small, given the change in expectations about the Bank rate prospect. No early change is now expected either way ; most people would probably guess that the next move when it does come is more likely to be up than down. In these circumstances, bill rate at its present level does not look high.

These considerations in the discount market have been fortified by the rise in New York, by the first modest weakening of sterling and the approach of the summer strain, and by the seasonal rise in the supply of tender bills. This week's allotment is £40 million above matching maturities. Competition from industrial companies and others outside the organised market has been less intense in recent weeks ; as a result, despite the successive reductions in its bid price, the discount market has been getting good allotments. Outside demand for bills may conceivably grow as the rate becomes more attractive ; a more potent influence in this direction would be an increase in business liquidity, such as may well result from a revival in sales and in profit margins in advance of a revival of investment in fixed assets or stocks.

AEI REORGANISATION

A New Climate for Combines



Within six months of Lord Chandos's return from the Government to Associated Electrical Industries in 1954 he had carried through a major reorganisation of the company ; yet last year AEI decided to reorganise again. This was not the result of internal weakness in the structure adopted in 1954, but of changes induced from outside in the commercial circumstances within which such a big combine lives. Some of these changes, and their implications for AEI, were described by the group's company secretary, Mr G. E. Walker, in a paper he read last week to the Institute of Cost and Works Accountants ; he also outlined the new structure adopted in 1958.

When AEI was formed in 1928 by the amalgamation of Metropolitan-Vickers and British Thomson-Houston, each with their own subsidiaries, the constituent companies remained separate entities, overlapping in their operations. In 1954 the smaller and medium sized subsidiaries—AEI had added a number over the years—were grouped together into more or less equal-sized companies, still overlapping in some of their activities. But in the next four years, circumstances changed—primarily because of the Restrictive Trade Practices Act. While the electrical industry was organised on the basis of price-fixing agreements and quotas for contracts it paid the group to have several companies making the same product ; each might be allowed a contract where a consolidated division might get only one. Now that the price-fixing and quotas have gone, the arguments that had led AEI to retain its separate companies have gone too, and the extra cost involved in maintaining two design and sales staffs and two manufacturing establishments for similar ranges of products has no justification.

So instead of five operating groups—Metropolitan-Vickers, BT-H, Siemens-Edison Swan, Hotpoint and AEI Overseas—with the holding company responsible for finance and policy, and the groups for its execution, the group is now forming about a dozen operating divisions. Metro-Vick, BT-H, and Siemens-Edison Swan will act as management companies for the divisions placed in their charge, though the divisions will be divisions of AEI, not of the managing company. Two divisions already exist, and nine are being formed ; each will have a managerial and engineering staff. In general Metro-Vick will manage the divisions producing power generation and distribution apparatus ;

Extremes of heat, dust and humidity need not affect health or efficiency. Temkon air conditioning units make normal living possible in some of the worst climates in the world. Outside, the temperature may soar, but in Temkon-cooled homes and offices there's an air of comfort—clean, dry and temperate.

From cotton fields to calculators

Harvest of cotton—raw material for woven fabrics serving countless needs. Weaving is but one of the metamorphic processes leading to the end product: spinning, doubling, dyeing, bleaching are others. Each is a separate commercial transaction, speeded today by the use of calculators and other modern business aids. Since Remington introduced, over 80 years ago, the first-ever item of mechanised office equipment—the typewriter—the Company's range of products has expanded to take in virtually the whole field of office automation. Hand in hand, however, with the manufacture of Remington equipment and supplies has gone relentless research into every aspect of business practice. The results, applied by specialists in office systems and machines, are reflected daily in maximum efficiency achieved at lowest cost in routine and administrative operations, large and small.

Times have changed radically since 1873. Remington Rand, more often than not, have been instrumental in changing them—to the lasting benefit of business everywhere.

Accounting, Adding, Calculating, Dictating, Duplicating, and Photo-Copying Machines. Univac Electronic Computing Systems. O & M Service. Filing, Visible Record and Charting Systems. Fire Resistant Equipment. Electric, Noiseless and Standard Typewriters. Office Furniture and Supplies.

People who KNOW, know

Remington Rand

There is a branch in your area—consult your telephone directory

BT-H those concerned with the use of electricity in industry; and SES those covering entertainment, telecommunications and cables. Hotpoint, which was already in effect an independent division, and AEI Overseas remain separate companies managing their own affairs. Above the divisions and managing companies comes the executive committee of the AEI board, carrying out the basic policies that will continue to be laid down by the board of AEI itself. Lord Chandos has been prominent among industrial leaders in reorganising, and discussing, the deeper implications for big business of the changed public attitude towards monopoly and restrictive practices: AEI's new structure builds his recognition into practice.

COTTON INDUSTRY

Palliative or Cure?

In discussing the bill for reorganising the cotton industry the Commons did not produce any new facts, but it showed that the bill will have a pretty clear run. To Labour MPs Mr Harold Wilson's "Plan for Cotton" remains the salvation for this industry, but they could not bring themselves to oppose the government's proposals outright. Labour speakers and, perhaps more significantly, Conservatives, too, were properly sceptical of the prospect for rejuvenating the cotton industry. They recognised that subsidies for scrapping old machinery and for buying new machinery will not, by themselves, create an industry that can hold its own in world markets. They also saw that the government was setting a precedent that other industries could use to justify claims for assistance in similarly "exceptional" circumstances.

The response of management to the government's offer, as one Tory put it, will test Lancashire's confidence in itself. Labour members questioned whether that response will be sufficient when there is no assurance that the restrictions on shipments of Commonwealth textiles to Britain can be renewed, and no restriction on imports of yarn. And both sides of the House feared that the recent revival in business in cotton textiles might make it more difficult—or at least more expensive—to induce some mills to close down. But Sir David Eccles, President of the Board of Trade, argued that the reorganisation schemes can stand on their own economic merits. This is not, he said, "a retirement pension to an aged friend, but an advance payment to an enterprise of whose sustained capacity for expansion we have no doubt."

Sir John Barlow suggested that opportunity should be taken to remove the "many serious anomalies" in the wage structure, so that the new expensive machinery could be worked to capacity. Labour MPs argued, reasonably enough, that compensation payments to displaced workers should be made as a lump sum, irrespective of whether workers were able to get another job, and wanted the government to take more active steps to bring new industries to the cotton towns. A Tory discovered that one new opening for industry in Lancashire already exists: "there is a great shortage of smashers-up" of machinery.

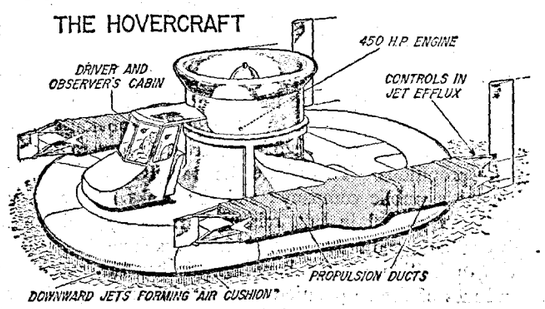
The Fledgling Takes Flight

The Industrial and Commercial Finance Corporation was set up in 1945 together with the Finance Corporation for Industry to provide finance for worthy borrowers who could not find a place in the market. ICFC was to concentrate on the small and medium sized businesses; the commercial banks provided its share capital, and for the most part they were not optimistic, financially, about the investment. In the event, under the guidance of Lord Piercy, ICFC has proved a real success; and the shareholders and their company have found themselves in serious competition. In the years of the credit squeeze, the banks were naturally reluctant to meet all the requirements of ICFC for finance while they were restrained in their own lending: and in recent months of freedom, ICFC has found that a number of applications for long-term finance which it would normally expect to receive have in fact been satisfied by commercial bankers unimpressed with the traditional (and by no means sacrosanct) maxim of the self-liquidating overdraft. It is not surprising, therefore, that an institution as vigorous as ICFC should feel the urge to a measure of independence. Hitherto, it has relied on the banks for the whole of its outside finance, loan capital and permanent capital alike.

The corporation now intends to seek loan capital from the market. A debenture issue, probably for £10 million, is contemplated "perhaps later this year"—obviously Lord Piercy is waiting for the fixed interest market to become more propitious. To prepare the way, ICFC has already become a public company; and the banks have paid up the share capital in full, raising it from £7½ million to £15 million, and reducing their advances from £25 million to £19 million. They have agreed that the assets and revenues of the corporation shall be a prior charge for the debenture issue. Once this is made, the hard core of bank borrowing will be reduced to £15 million. The corporation's total resources, including its £4 million of reserves, will then be some £44 million compared with £38 million at present; ICFC will feel free to take temporary additional advances from the banks, and may raise further capital in the market.



The way may therefore be open for a major expansion of business; and Lord Piercy intimates that he will be more flexible in interpreting the top limit of an advance, which has been around £250,000. New business in the

corporation's year to end-March was up from £3.8 million to £5.0 million—but that was still below the level before the credit squeeze. New applications, significantly, were down on the year, from 344 to 313; Lord Piercy feels this is partly because ICFC has had to keep its lending rate high, in line with long-term interest rates, while rates on bank advances have fallen sharply, in line with Bank rate. For whatever reason, it is evident that the time-honoured Macmillan gap in financial facilities is becoming very hard to find.

MARINE AVIATION

Earth-Bound Flying Saucers

THE "Hovercraft" that flew at Cowes this week is one among several designs of "ground effect vehicles" planned to exploit the extra lift that a flying machine obtains when air is compressed between it and the ground. There are two broad classes of these; the largest and potentially the most efficient types include this flying saucer-like Hovercraft invented in Britain by C. S. Cockerell and another invented by the Swiss engineer Carl Weiland. Similar machines are also being developed in the United States. The Hovercraft prototype was designed and built by Saunders-Roe and financed by the National Research Development corporation. It is shaped like an elongated, upturned saucer, and has one 435 hp engine that can lift its total weight of 7,500 lb up to 15 inches into the air, and propel it at about 25 knots. The engine drives a ducted fan, which supplies compressed air to two concentric rings of jet openings facing downward and inward around the circumference of the machine, which provide the air "cushion" beneath the machine that supports it, and function as a seal to reduce leakage of air from around this cushion, while rearward-facing jets propel it. Weiland uses a similar principle, but proposes to seal in the "cushion" by multiple downward jets produced by propellers, and to drive the machine—which resembles a "flying platform" more than a flying saucer—by propellers

also. Both these machines are envisaged as replacements for the ship, to weigh several hundred or thousand tons: the larger the machine, the easier it may be to maintain a seal around the circumference of the machine for the same flying height, or the greater the height at which the machine can fly. Early performance estimates suggest that a 400-ton Hovercraft might carry a 200 ton payload at 70-100 mph at an altitude of six feet on 33,000 hp. Now that the prototype is flying, it should be possible to determine their accuracy, and the practicability of operating over the sea.

The second type of "ground effect" machine is generally smaller and has no seal to retain the "cushion." Those that have so far been built in the United States are comparable in size with a car, and can fly from a few thousandths of an inch to 40-50 feet above the ground, depending on the power used. These include the Ford "Levapad" which can carry a man a few thousandths of an inch up on 1 hp; the "Spacetronics" car, flying 4-5 inches up on 12 hp; the Curtiss-Wright Air-Car, which can carry one to four men on 50-200 hp at a rather higher altitude; and others being developed for the US Army, which is seeking a cross-country vehicle, but wants to be able to fly at 50-100 feet outside the ground cushion. Avro-Canada's saucer-like "Avrocar," being developed for the US Army and Air Force, has recently been discussed in terms of this last category.

US BALANCE OF PAYMENTS

The Strong Dollar

LOOSE talk about the weakness of the dollar has been common currency in financial centres for about a year, and it shows no signs of abating. Yet virtually every serious study of the underlying influences emphasises the dollar's unique strength. Despite the outflow of over $2¼ billion of gold since the beginning of 1958, America's gold stock is still well over $20 billion—more than sufficient to cover all dollar balances owned by foreigners, which total some $15 billion, of which $8¾ billion belong to official agencies. It is true that the Federal Reserve is required to maintain a minimum of 25 per cent of gold as cover for its liabilities in notes and deposits, involving at present some $12 billion of gold. But the requirement is of little more than academic significance: America is not on the gold standard domestically. And the fact is that the ratio of its gold reserves to external banking liabilities is comfortably greater than unity: Britain has struggled through the postwar years on a ratio of one to three.

Nor is there weakness in America's current payments. The surplus did fall sharply in 1958, but that was largely a reflection of exceptional shipments at the time of Suez. The United States' share of world exports has remained remarkably stable in recent years; its share of exports of manufactures has declined no faster than Britain's; and its export prices have risen no faster (in both cases comparisons with Germany would be less favourable). American spending on imported goods has risen—but spending on domestic goods has risen more. As Mr Edward M. Bernstein says in a study prepared for the New York house of Model, Roland & Stone, none of this is a sign that American manufacturers have "priced themselves out of the market."

Mr Bernstein points out that the current surplus in 1958 excluding military expenditures abroad, reached no less than $5.2 billion. The gold loss is attributable entirely to military and other aid and to private exports of capital. Mr Bernstein's conclusion is that the United States should cut down sharply its aid to European countries, which can now compete and have rebuilt reserves to reasonable levels. This is not quite in perspective. The big trading countries of Western Europe proper no longer get any significant economic aid from America. Military commitments under Nato and help for "fringe" countries on the Mediterranean have no close connection with America's gold loss.

SCHWEPPES-CHIVERS

Moving Sideways

LAST year, Schweppes, the soft drink manufacturers, failed in a long struggle with the Beecham Group to secure control of Thomas and Evans, the makers of "Corona" mineral waters. That failure in their own chosen field did not deter its directors and managers from thinking of expansion in other fields and only a few weeks ago the memorandum of association was widened. The directors then spoke of the possibility of acquiring interests "which if not directly connected with the soft drinks industry might nevertheless be parallel to it." Schweppes has now moved sideways—though not too far—by making a bid worth about £1,200,000 for the £400,000 of ordinary shares in Chivers, the jam makers, fruit growers and canners. This is not diversification in the full sense: jam and fruit cordials are at least distant cousins. The jam and marmalade industry is dominated by a handful of firms and the merger between St Martin and T. G. Tickler brought about by Mr Richard Scott has introduced a fresh element of competition into it. How, then, will the jam makers react to the entry of another vigorously managed "outsider"?

The directors of Chivers have welcomed the Schweppes offer; they will accept it themselves and recommend other shareholders to follow their example. The terms are certainly generous. Before the bid, the £1 ordinary shares in Chivers stood at 47s. 6d. and with the Schweppes shares standing at 24s. 6d. the offer is worth about 61s. The Chivers shareholders are given a choice: they can take either five ordinary shares of Schweppes for every two Chivers shares they own or two ordinary shares of Schweppes plus 12s. 6d. in cash for every one Chivers. The 10 per cent dividend paid by Chivers is covered about twice by earnings and the bid is therefore being made on a dividend yield basis of only 3½ per cent. The offer price is moreover so close to the net asset value of this highly geared equity as to suggest to a bridge player that this is a pre-emptive bid.

COAL

Running Down Opencast

PRODUCTION of coal at opencast sites is being cut down this year to 11 million tons, against 14 million tons last year; next year it will probably be cut down again to 7 million tons. "If—I emphasise if; I am not saying that this will be the case," said Sir Ian Horobin in the Commons last week, "no further authorisations were given opencast would by 1965 come practically to an end with the exception of certain special, large cases, such as the Westfield site associated with the Lurgi gasification plant in Scotland, which presents special problems and which nobody would suggest should be discontinued anyway."

For all Sir Ian's "ifs," this is already the case; the National Coal Board is not letting any more contracts for new production of opencast coal for the moment, just as it is not starting any more major reconstructions at deep mines. With 25 million tons of coal in stock, and little to suggest that by the end of its current reconstruction programme annual demand for coal will be any more than it is now, it is not engaging in further commitments to increase annual output. Today there are still about 80 opencast sites producing coal, and there are a half-dozen sites where work has begun though coal is not yet being produced; these new ones may produce together about a million tons next year and in 1960, but from then onwards their production will fall. This controversial form of production provides the board's cheapest coal and, when sold, its most profitable; but about 14 per cent of all the coal produced at opencast sites, last year, went into stock. Considerations of political acceptability, flexibility, and cost must conflict in the board's decisions about running down opencast output. In political terms, this is certainly the easiest coal capacity to "retire" peaceably since the contractors engaged upon it employ mobile labour and capital and are organised for only a limited period on any one site anyway; miners and farmers would be glad to see it go first; and it is also the capacity from which the board could obtain extra tonnage most quickly, if that new need should arise. But it also removes low-cost tonnage; will the advances in productivity that the board is able to achieve from its new concentration of operations underground be enough to offset the loss of this element on the credit side of the industry's finances?

AIR TRANSPORT

Year of the Jet

LAST year will go down in the history of aviation, according to the United Nations' Civil Aviation Organisation, as the year of the jet airliner and also as The Year When Traffic Fell Off. Since the war, air traffic has increased at a steady 15 per cent per annum; in 1958 the increase was a mere 5 per cent. Most industries would be gratified to record a trading increase of this size, but the air transport business, which had geared itself to a much more rapid growth in traffic, regarded it as tantamount to a slump. The ICAO analysis of 1958 makes, however, a point that is frequently overlooked in discussing world airline results. It is that nearly half the air traffic carried outside Russia and China is internal United States traffic, and that American airlines, domestic and international, carry 58 per cent of the world total returned by ICAO. Last year's slump was very largely a slump on the internal air routes of the United States. In several other countries, notably Switzerland, Belgium, Scandinavia, Brazil and Canada, traffic increased by 14 to 18 per cent. This could be taken as a sign that the medium-sized airlines were expanding their business faster than the big, established international carriers in America, France, Britain and Holland—a trend that may easily be reversed again as the latter build up their big jet fleets.

ICAO considers that between 1953 and 1956 airlines were making a small but growing profit each year, which reached £30 million in 1956 on a turnover of £1,250 million. In 1957 this was turned into a loss of nearly £15 million on a 13 per cent larger turnover, and preliminary estimates suggest that the airlines may have ended 1958 as much as £60 million in the red although their total traffic that year exceeded 6,500 million ton miles. Perhaps the big operators have something to learn from a group of buccaneering airlines in Latin America which refuse to abide by the fares laid down by the International Air Transport Association (which does not belong to the UN) and operated flights from Buenos Aires to Miami for $251 last year against the $412

charged by airlines that are members of IATA. "This," reports the International Civil Aviation Organisation without a trace of a smile, "represents the latest development in the fare controversy between IATA and non-IATA airlines in this region."

TRADE PRACTICES REVIEWED

The Price of a Loaf

WHEN the Government ceased to subsidise the price of bread in September, 1956, the Scottish Association of Master Bakers made recommendations about the minimum prices to be charged for loaves and later for other bakery goods as well, and most retailers did in fact charge these prices, though the association made no attempt to enforce them. The co-operative societies, which control a third of the baking in Scotland, also followed these price recommendations though they are not members of the trade associations. The recommended prices were last changed in December, 1956—upwards—and have not been reduced since, though in the Restrictive Practices Court in Edinburgh last week one witness for the trade associations agreed that the average profit per sack of flour had risen from 7s. 4d. to 12s. 5d., with profits on wrapping and slicing at 2s. 6d. a sack and an average flour rebate of 2s. 6d. a sack. A halfpenny off the loaf would cut the profit margin by 9s. a sack. The trade argued that price competition in bread prices—which in Scotland have been fixed in one or another since the 16th century—would mean debasement of quality: and that an end to recommendations about prices might actually mean increases in the price charged.

Professor A. D. Campbell, Professor of Applied Economics at St Andrews University, said that in November, 1958, allowing for discounts, the average return on capital employed in Scottish baking appeared to be 21 per cent on the replacement value of assets:

> I think the trade is very unfortunate indeed in that it has had to present its evidence on these margins at this particular time. We are just at the point now where in my opinion, it becomes reasonable to recommend a reduction in price. Another six months would have made all the difference.

Professor Robert Browning, Professor of Accountancy at St Andrews and also chairman of a large group of firms in the trade, said he doubted whether prices were as likely to be reduced under freer competition as under the present arrangements. It was left to Professor Alan Peacock, Professor of Economic Science at Edinburgh University, to argue the orthodox case for price competition.

The Scottish court, however, after all the evidence was concluded and the final argument for the associations had been put, ruled against the price recommendations without calling on the Registrar to reply and made a preliminary order declaring this restrictive practice illegal. Lord Cameron, the president, said that it would issue its full judgment in a few weeks' time.

ENDOWMENT INVESTMENT

Middle-aged Spread

A NEW scheme for the purchase of shares on a loan secured against an endowment policy has just been launched by a leading firm of insurance brokers with the help of the London and Manchester Insurance group. Briefly, the scheme gives some tax advantages to the long-term shareholder who wishes to invest in a selected group of investment trusts (where the market is normally narrow), in unit trusts or in Government securities with less than ten years to run. But in coming into the scheme the investor loses much of his freedom to deal in the market at his own discretion. Only those who have an income of at least £1,500 are able to participate in the scheme, and would-be investors have to put up a deposit of 25 per cent of the value of the securities bought. The London and Manchester advances the remaining money against the security of an endowment policy without profits, so that the plan is analogous to the house purchase schemes run by some life offices.

Interest on the loan is at the fixed rate of 6 per cent, which is allowable for tax purposes in the usual way while further tax reliefs accrue on the endowment policy premiums. To offset these outgoings, the investor receives the dividends on the stocks he has purchased. But, given these costs, the attraction to him is obviously the capital gains that may accrue. On this score, if it had been launched ten years ago, this plan would have brought more into the investor's pocket than an endowment policy with profits. But the scheme has been launched at a moment when equity prices are high and though the attraction of buying shares on the margin for the long haul is obvious, its appeal must largely be confined to those who pay a high rate of tax. London and Manchester Insurance has initially set aside only £500,000 to provide for loans.

OIL TRANSIT PAYMENTS

More for the Lebanon

THE Iraq Petroleum Company has agreed to increase more than threefold the royalty payments that it pays the Lebanese government for the transit of oil through its 12-inch and 16-inch pipelines from Kirkuk which cross the Lebanon on the way to Tripoli, and in respect of its oil terminal and refinery there. The royalties, based upon transit of 7½ million tons of crude a year, were raised in 1955, retrospectively to 1952, to £380,000; now they go up to £1,235,000 a year, and the IPC is also paying a lump sum of £5,818,000 in settlement of past claims by the government.

The Lebanese government has announced, following this agreed increase, that it will be re-opening negotiations with Tapline, which owns the 30/31-inch pipeline that runs from Saudi Arabia to Sidon. Negotiations over transit payments to the countries across whose territories these pipelines run have gone on at intervals since 1955; at one time Tapline suggested that Saudi Arabia, Jordan, Syria and the Lebanon should decide between themselves on the shares they should receive. It was prepared to pay in total roughly half the saving made by pipeline transport instead of sea transport by tanker from the Gulf. This was the basis upon which IPC, in 1955, raised its payments to the Syrian government to £6 million, for an expected throughput of 26 million tons a year through the pipelines that go to Lebanon and the 30/32-inch branch line from Homs to Banyas. But the new agreement with the Lebanon, over whose territory the pipelines cover a comparatively short distance, may have altered this basis of negotiation for transit payments.

RETAIL TRADE

The Bigger Mark-up

BETWEEN 1950 and 1957, retailers' gross margins narrowed a little in food shops (from an average of 19.3 to 18.5 per cent of turnover) but generally increased in other shops (from an average of 23.7 to 26.2 per cent). These trends in the mark-up from the wholesale to the retail price emerge from the first batch of detailed results of the 1957 Census of Distribution, published in last week's *Board of Trade Journal*.

The changes between the two censuses largely reflect the effects of the freeing of controls. The abolition of the bread subsidy, for instance, which put up prices at both the wholesale and retail level and so reduced the percentage difference, was obviously a factor in bringing bakers' margins down from 41.2 per cent to 36.0 per cent of turnover; the growth, following derationing, in the sales of sweets, on which the mark-up is bigger than on tobacco, largely accounts for the

GROSS MARGINS AS PERCENTAGE OF TURNOVER

Type of Business:—	1957 No. of establishments in organisation:— 1–9	10 or more	1957 Total	1950 Total
Grocers	14·4	17·6	15·4	15·3
Butchers	19·4	23·0	20·0	20·8
Confectioners, tobacconists, newsagents	14·6	17·7	14·9	13·1
Boot and shoe	26·5	31·3	29·6	26·2
Men's wear	31·9	27·9	30·0	26·7
Women's wear	27·6	26·1	27·0	23·9
Furniture	28·7	36·8	30·6	27·4
Radio and electrical	28·5	46·6	31·9	28·7
Department stores	28·7	31·0	29·2	24·6

widening from 13.1 to 14.9 per cent in the margins of confectioners, tobacconists and newsagents; while the removal of the control on margins still maintained in 1950 on most clothing, textiles and furniture is the chief reason why the average margin of department stores, whose trade is mainly in these goods, has risen from 24.6 to 29.2 per cent.

The smallest margin recorded in 1957 was 14½ per cent for small grocers and for small shops in the confectioner-tobacconist-newsagent group; the largest was 46½ per cent for multiple retailers of radio and electrical goods—a figure swollen by the inclusion in the turnover of receipts from hiring on which the "gross margin" is 100 per cent. In most kinds of retail business, other than the clothing trade, the multiples obtained a larger margin than the small shopkeepers. But comparisons of costing between small and large shops cannot be taken much further, for nothing is recorded about the drawings of working proprietors or of family helpers in the small shops. For the multiples, however, the wage and salary bill represents practically all the labour costs and this amounted to 11.9 per cent of their total sales; set against a gross margin of 26.5 per cent, this left 14.6 per cent of their total turnover for other running costs and profits. The corresponding proportion for the co-operative societies was 11.0 per cent.

ATOMIC ENERGY

Writing Off Windscale

IN its balance sheet for 1958-59, published this week, the Atomic Energy Authority has set aside nearly £2 million to cover the loss of the first of the two Windscale plutonium-producing reactors. These reactors cost about £3,700,000 each to build, and they had been working for seven years when the No. 1 reactor caught fire in October, 1957. Like all experimental and research reactors of the AEA, these plants were being written off over ten years: reactors such as those at Calder Hall and Chapel Cross and the commercial power stations of the CEGB are written off over 20 years. The No. 1 reactor was totally destroyed by the fire and the figure of £1,979,826 charged to reserve to cover its loss includes a figure of about £200,000 to cover the value of uranium fuel in the reactor at the time of the fire, £70,000 for the cost of milk destroyed as a safety precaution while local cows were eating contaminated grass; £10,000 to cover the cost of sealing off the reactor; the expense of salvaging what could be recovered from the burnt reactor and, finally, the residual value of the reactor itself as it stood on the books at the time of the fire, which was something rather more than £1,250,000.

The loss of the No. 2 reactor will be carried forward to the current year's accounts; it was closed down, undamaged, immediately the first reactor caught fire and has never been reopened. Consequently the AEA has been able to salvage a great deal of its equipment, including the whole of the fuel charge, and the net loss will not be anything like so large a sum as that incurred on the No. 1 reactor. This book-keeping exercise cannot, however, measure the loss to the country caused by the closure of Windscale. The choice of ten years as the period over which to amortise any new and unproven reactor—as the Windscale reactors were at the time they were built—is an conservative figure, chosen as a reasonable life for any experimental piece of equipment. But there was no reason for believing that, properly handled, the Windscale reactors would not have continued to produce plutonium up to and well beyond that period. Certain experimental reactors at Harwell have long passed their notional ten-year life, and the nuclear weapon programme was drawn up on the assumption that the Windscale reactors would continue working long after the eight newer reactors at Calder Hall and Chapel Cross had come into commission.

FATS AND OILS

The Imperfect Market

FROM last June to May this year Philippines copra rose by nearly $110 to $297 a ton cif Europe; it has since dropped back to about $260. A rise of over 55 per cent may seem surprising when there was no shortage of fats and oils as a whole. One oil can be substituted for another, and if the price of a hard oil, like copra, gets far out of line a soft oil can be hardened and used instead. But markets are necessarily imperfect. Speaking to the international seed crushers' congress in Cannes last week Mr J. C. A. Faure, of Unilever, said that manufacturers "are loth to change their formulas, and if a commodity is likely to be in short supply for only a limited period they would rather follow the market." Even if the effect of drought on world production of copra had been correctly forecast, he doubted whether buyers would have believed it or acted in time. Manufacturers ran down their stocks and bought sparingly, hoping that supplies would increase. They did not, and when consumers eventually turned to substitutes, such as groundnut oil, prices of these oils rose too. But now, Mr Faure claimed, the readiness of consumers to switch from

one oil to another at short notice has been greatly stimulated, and this should ultimately bring steadier prices.

Are Western countries facing a secular decline in the availability of copra and its oil? This year, Mr Faure estimates, production of coconut oil will fall by a further 90,000 metric tons to 1,730,000 tons, which is 435,000 tons less than in 1957 (he expects this reduction, and a decline in output of other oils and fats in Argentina, Brazil and Western Europe, to be more than offset by higher production in China, the United States, India and Pakistan). The Asian producing countries and their neighbours are themselves consuming more, and the outlook for copra production, even in good weather, does not seem promising. Mr Duncan Ridler, of the Food and Agriculture Organisation, told the congress that productivity in Malaya "has already worsened, and it is believed that an extremely serious position will develop in the Philippines during the next ten years owing to kadang-kadang disease." Government help was needed, mainly for replanting programmes, genetical improvement, control of pests and diseases and better cultivation and rural processing. Fortunately the output of soft oils is more flexible than that of copra and other tree oils, and supplies this year are a record.

SHORTER NOTES

The budget came at the beginning of the April retailing period and so stimulated buying that sales in that month by furniture shops were 20 per cent above their value a year before and those by radio and electrical goods shops were 35 per cent higher. Since prices had dropped a little, the increase in the volume of business was even greater than the increase in value. Even allowing for the fact that April, 1958 included the quiet post-Easter week, this is a marked resumption of the buoyancy of trade in durable goods. Immediately preceding the budget, the growth in the sales of durable goods shops over a year before had come down to 7 per cent from 22 per cent last November when the hire purchase restrictions were first lifted.

* * *

London and Overseas Freighters' preliminary report shows that the operating surplus for the year ended March 31st has risen from £2,969,204 to £3,418,403 thanks mainly to the long-term tanker charters which the company entered into during 1956. The net profit is £1.8 million, compared with £1.4 million last year and the company is maintaining the ordinary dividend at 20 per cent; it is covered three times by earnings.

* * *

In a reorganisation to be put before an extraordinary general meeting on June 26th, the Davy-United group will be hiving off its productive activities under two new subsidiary companies. One, to be called Davy and United Engineering Company (the formal name of the present company), will handle the manufacture of rolling mills and forging presses in the group's works at Sheffield and Glasgow; the second, Davy and United Instruments, will take over development and manufacture of its range of instruments for automatic control of rolling mills and other steel processes. The holding company, which will be called Davy-United Ltd, will also control the group's present wholly-owned subsidiary, Davy and United Roll Foundry of Birmingham. Davy-United is also planning to double its present capital by capitalising £1,509,528 of reserves, allotting the new scrip on a one-for-one basis to present shareholders.

* * *

Selection Trust's final dividend for 1958 of 5s. 3d. per 10s. unit makes an unchanged total dividend of 70 per cent. The group's revenue of £3,389,971 compares with £3,224,591 and the net profit is £1,712,772, against £1,506,230.

Bowaters

"The continued development of a large organisation depends not only on the steady expansion of world markets but also on diversification of products"

Sir Eric Vansittart Bowater, speaking at the Annual General Meeting of The Bowater Paper Corporation Limited

Welcoming a very large gathering of shareholders (including a number from the United States, Canada, Ireland, Sweden and Holland) to the joint Annual General Meeting of The Bowater Paper Corporation Limited and Bowater-Eburite Limited at Ellesmere Port, Cheshire, on June 3rd, the Chairman, Sir Eric Vansittart Bowater, said that he was deeply gratified that so many should have found it worth while to travel such long distances.

The Chairman pointed out that the total capital cost of installations on the Ellesmere Port site alone amounted to £17 millions—though this was only one tenth of the value of the Organisation's total assets and manufacturing facilities throughout the world.

Reviewing operations during the past year, Sir Eric spoke of a general change for the better in the economic climate of the world since the last annual general meeting. While the paper industry, and newsprint in particular, has not yet responded in full to this general improvement, consumption of newsprint in both the UK and the United States is showing an increase over last year, and consumption of practically every form of paper product is now on the up-grade. It was reasonable to anticipate that from now on there would be a steady if not spectacular improvement.

DIVERSIFICATION OF PRODUCTS

Turning to more specific aspects of the Organisation's business, the Chairman spoke of the necessity, not only of a steady expansion of world markets, but also of the need for diversified production.

The Bowater-Eburite group had had a satisfactory year despite intense competition. The excess capacity existing within the packaging industry at present could be expected to be overtaken during 1960 by rapidly increasing demand. The growth of self-service stores and of supermarkets in Britain offers an increasing volume of business for the Bowater-Eburite group. Among plans for further expansion is the setting up of a new packaging plant in Kent to re-deploy and streamline production of waxed papers, paper and film bags, foilware, etc. Development of cartons for milk and fruit juices is also being actively prosecuted.

It has also been decided to establish footholds in the Common Market Area, where the Organisation has acquired or is in process of acquiring businesses, initially in Belgium and Italy, believed to be readily capable of development and strategically placed to give a wide coverage in that area.

While the basis of operation of the Organisation's four paper mills in the UK was at a slightly lower level than last year, due essentially to the lower demand for newsprint from UK and overseas markets, production of magazine and other printing and packaging papers was at a higher level than previously. Currently, all UK mills are operating substantially to capacity.

The Organisation's shipping interests now embrace ownership and operation of eleven ships, with a twelfth due for completion at the end of this year making a total deadweight capacity of over 80,000 tons.

These ships now ply over a very wide area—through the newly opened St Lawrence Seaway to the heart of the American continent, as well as up and down the North American coast; between that continent and Europe; between Scandinavia and the UK; and as far afield as South Africa and Australia.

THE NORTH AMERICAN SCENE

Turning to the North American scene, where more than 70 per cent of the Organisation's manufacturing assets are located, the Chairman pointed to the fact that while decreased consumption of newsprint was responsible for a general decline in earnings within that industry in Canada, consolidated trading profits of the Bowater Corporation of North America were only 5 per cent less than for the previous year, comparing very favourably with the rest of the industry. There is now a definite improvement in newsprint consumption, while North American inventories of newsprint at the end of April 1959 were 8 per cent lower than at the corresponding period last year.

Capital expenditures incurred by the operating subsidiaries of the North American Corporation during 1958 amounted to $44 million. This included expenditure on the construction of the new sulphate pulp mill at Catawba, South Carolina, which will come into production this summer. A new hardboard mill, scheduled for completion in 1960, is under construction on the same site. Its output will have a ready market in the nearby areas.

The Corner Brook mills in Newfoundland continued to be plagued by the aftermath of the fire which occurred in the previous year, but rehabilitation has presented an opportunity to effect improvements to the paper-making machines.

With the commissioning of its fourth machine last December, Bowaters Southern Paper Corporation, Tennessee, now operates the largest newsprint mill in the USA. The Southern Corporation's resources have been applied to the reduction of its funded debt since it began operations in 1954, but it is now expected that it may be in a position to commence payment of dividends to the North American Corporation (of which it is a subsidiary) in respect of the current year.

TWO-WAY TRAFFIC WITH THE UNITED STATES

Commenting on the question of American investment in Britain and of British investments in America, Sir Eric said: "I am forthright in my opinion that a two-way traffic in all the forms of activity between Europe and North America is of vital importance."

Bowaters' investments in North America, —essentially concerned with domestic trade— in terms of equity capital and reserves alone, amount to $120 million. Of the 800,000 tons of pulp and paper produced last year by the Organisation's North American mills, well over 600,000 tons, to a value of some $80 million was sold to American newspaper publishers.

In reverse, the Organisation has derived great benefit from its successful association with the Scott Paper Company of America through the Bowater-Scott Corporation in the United Kingdom. This association has now been extended to Australia, with the formation of Bowater-Scott Australia Limited which will control the first fully integrated operation of its kind in Australia, where, as in Britain, there is a fast-growing demand for household tissues.

Yet another joint arrangement is the formation in Brussels of Bowater-Scott Continental S.A., an association of the United Kingdom company in equal partnership with Belgium's leading paper-making organisation. Through this association, household tissues will be marketed throughout five of the Common Market countries, embracing a population of over 70 millions.

"A PROSPEROUS FUTURE"

Whilst stressing his belief that shareholders would endorse the decision, taken in the light of circumstances prevailing at that time, to retain the ordinary dividend at the same rate as for the preceding year, Sir Eric referred again to the general improvement now apparent in both Britain and the USA. "In my belief, everything points to a prosperous future for Bowaters and in the light of all that I have been able to report to you today, you will I hope find yourselves able to concur in this belief."

The report and accounts were adopted.

Stockholders will automatically receive copies of the complete speech by Sir Eric Bowater. Others who are interested may obtain copies from: The Secretary, The Bowater Organisation, Bowater House, Knightsbridge, London, S.W.1.

COMPANY MEETINGS

UNION CORPORATION LIMITED

(Incorporated in the Union of South Africa)

Extract from the Speech by The Chairman Sir Charles J. Hambro at the Annual General Meeting held in Johannesburg on May 26, 1959

The Chairman in moving the adoption of the Report and Accounts for the past financial year, said:

Before dealing with the formal business of the Meeting it is my sad duty to refer to the grievous loss we sustained last year by the death of Viscount Bracken who was Chairman of your Company for 13 years.

He was a man of outstanding ability, whose knowledge extended over a wide range of affairs. By his death we have lost a friend who was forthright in his views, wise in his counsels, generous in his actions and courageous to the end.

The Accounts of the Corporation for the year 1958, together with the Directors' Report, are submitted for your approval.

Reduced dividends from our base metal interests were not fully made good by increases from our gold mining investments, with the result that our consolidated dividend income for 1958 was some £92,000 lower than for 1957. On the other hand, profits on realisation of shares rose by £450,000, partly due to improved conditions in share markets and partly to the sale of 300,000 shares in Winkelhaak Mines, Limited, to the American South African Investment Company. Other income also showed an increase. Thus the consolidated profit, after taxation and after deducting the interest of minority shareholders in subsidiary companies' profits, was £1,904,000 as against £1,578,000 in 1957. The net profit of the Corporation itself was £1,373,000 which, together with £401,000 brought in from previous years, made £1,774,000 available for appropriation.

In view of the substantial increase in the undistributed profits in the hands of subsidiary companies your Directors have thought it unnecessary to increase the Corporation's General Reserve which remains at £2,650,000. £350,000 has been appropriated to Exploration Reserve—a little more than the amount of £337,000 actually charged to the Reserve during the year. After writing off the expenses of our Note Issue, amounting to £33,000, the Directors have declared dividends amounting to 3s. 6d. per share less United Kingdom income tax, leaving £54,000 to be added to the carry forward, which now amounts to £455,000.

In the Accounts now before you the rate of United Kingdom income tax has been taken at 8s. 6d. in the £. The recent United Kingdom Budget has reduced the rate to 7s. 9d. in the £. This welcome reduction in the Corporation's tax bill, will to a large extent be passed on to members since the net amount distributed in respect of the final dividend of 2s. per share and the bonus dividend of 6d. per share, both less United Kingdom income tax, will be increased from £535,000 and £134,000 to £570,000 and £142,000 respectively.

RESIDENCE

Members were advised last September that the Corporation's application to change its residence had been refused by the United Kingdom Treasury. As explained in the Press announcement, the Directors decided in 1956 that it would be in the interests of the Corporation for Board Meetings to be held in South Africa where it is incorporated, where the General Meetings are held, and where the main activities lie. The interests of the Corporation outside Southern Africa would continue to be administered from London. United Kingdom tax legislation, however, lays down that the permission of the United Kingdom Treasury must be obtained before taking this action. Your Directors are hopeful that they may yet secure the Treasury's consent to the transfer, more especially as it is not expected to lead to a significant reduction in the tax to be collected by the United Kingdom Inland Revenue in respect of the Corporation's post-1959 profits and dividends paid therefrom.

In this connection several members resident outside the United Kingdom have inquired what the effect of a change of residence would be on their dividends and I am glad to have this opportunity of clearing up what I believe to be a widespread misconception in regard thereto. If the Corporation had been resident in South Africa, its present dividend and bonus declarations of 3s. 6d. per share less United Kingdom tax thereon at the Standard Rate, giving a net distribution for the year of about 2s. 1¼d. per share, would have been replaced not by a declaration of the gross amount of 3s. 6d. per share, as is widely supposed, but by a dividend of somewhat more than two-thirds thereof—in other words, the dividends paid this year of 2s. 1¼d. per share would probably have been increased to about 2s. 6d. per share with a somewhat greater carry forward.

GOLD MINING INDUSTRY

As our principal interests continue to be in gold mining in South Africa I should like briefly to review the position of the South African Gold Mining Industry as a whole.

The ore milled in 1958 was 65,542,000 tons which was slightly less than in 1957, but as the average yield improved by 0.23 dwt to 5.23 dwt per ton, the gold output increased by over 3½ per cent to the record figure of 17,154,005 ounces fine. This is the seventh consecutive annual increase in gold production and is a good illustration of the continuing vigour of the Industry.

Owing to the increasing strength of Sterling in relation to the Dollar the average price received for gold was 5d. per ounce fine lower than in 1957. As a result of the greater output, however, working revenue increased by £7,477,000 to £215,183,000. Working costs absorbed £153,827,000 leaving a working profit from gold of £61,356,000 which is £3,523,000 more than in 1957. The estimated profit from the production of uranium increased by £4,434,000 and amounted to £37,742,000 so that the total working profit for the Industry was £99,098,000 or £7,956,000 more than for the previous year.

Provision for capital expenditure financed out of profits, loan redemption, including redemption of loans made available for uranium production, and for other items, amounted to about £37,500,000 of which about £7,600,000 was for interest and redemption of uranium loans. Taxation and Government's share of profits is estimated at £18,942,000 which is somewhat higher than in 1957. Net dividends declared by the Industry increased by £5,872,000 to £42,571,000.

With the new mines of the Orange Free State and the Transvaal expanding production and output, with Native labour in plentiful supply as it is at present and with further new mines about to be started the outlook for the Industry would fill one with confidence and optimism but for concern about one particular item, namely, the continuing and steady rise in costs.

Comparison of the average level of working costs per ton milled by the Industry in 1958 and in previous years tends to be misleading because of the effect on the average figures for the whole Industry of the increasing tonnage contributed by the new mines whose level of working costs is generally much above that of the older mines. Even a simple comparison of the costs per ton milled of a well-established producer today and, say, 5 or 10 years ago may also be misleading unless one allows for such factors as fluctuations in the Native labour supply which affect the tonnage treated, increases or reductions in the amount of development footage or changes in mining methods—all of which may affect unit costs.

The general picture, however, is that in recent years working costs, i.e., the cost of labour and stores including power, have been increasing by about 3 per cent per annum and capital costs, i.e., cost of shaft sinking, buildings, plant and equipment, at a somewhat faster rate. So far there is no sign of this rate of increase flattening off or of an overall reduction in costs. It has been disquieting for gold producers to note that last year in the middle of a recession in the United States of America retail prices there, paradoxically, continued to rise.

Many of the effects of such inflationary tendencies on an Industry which must work to a fixed price for its product are well known and have frequently been mentioned at these meetings. The principal ones are the shortening of the lives of older, low-grade producers and the elimination from ore reserves throughout the Industry of large tonnages which at lower levels of costs could have been profitably mined. A point, however, not so frequently appreciated, is the effect of inflation on the search for new gold mines. In spite of the development of new aids to prospecting, as time goes on and the more promising or accessible areas are explored, inevitably prospecting for all minerals, including gold, becomes progressively more difficult, uncertain and costly. Today, however, with capital and operating costs continuing to rise, there is added for the gold prospector

the major difficulty of finding deposits which can be expected both to justify the large capital investment required to bring a new gold mine to production and to be of sufficiently high grade to give a reasonable assurance of profitability over twenty to thirty years ahead, even under continuing inflation.

The recent development of a number of high grade mines in the Western Transvaal and the Orange Free State has tended to obscure the fact that the Witwatersrand System is in general, a medium to low grade gold carrier. The reports of the Transvaal and Orange Free State Chamber of Mines record the tonnage treated and gold output of 106 principal gold mines which have operated on the Witwatersrand and in the Orange Free State between 1893 and the end of 1958. It is surely significant that 67 of these mines had an average yield over their whole lives or their lives to date of less than 6 dwt per ton and that these 67 mines between them accounted for 87 per cent of the total tonnage treated and nearly 80 per cent of the total gold output of the Witwatersrand and Orange Free State goldfields. More than 45 per cent of the total tonnage treated and over 35 per cent of the gold production came from 37 mines whose average yield has been less than 5 dwt per ton. A major portion of the ore milled by these mines would be quite unprofitable under current conditions. Thus, the only attraction for prospecting for new gold deposits today is the hope of finding mines of a grade appreciably higher than the history of the Witwatersrand System leads one to expect or the belief that within the reasonably foreseeable future there will be a marked change in the present relationship of the price of gold to capital and operating costs.

THE PRESENT STATUS OF GOLD AND THE FUTURE OUTLOOK FOR IT

Your Directors continue to have faith in the future of gold and believe that, following the precedents of history, in due course it will have to be revalued in relation to other commodities, thus bringing about the change in the present relationship between the price of the Gold Mining Industry's product and the costs of producing it referred to above.

We would venture the view that the status of gold today is higher than at any time since the end of the last war. There is a growing recognition that gold has a fundamental part to play in monetary affairs, both nationally and internationally, which gives an assurance, at one time lacking, of a continuing and sustained demand for the metal.

Having reviewed the progress of the Corporation's mining interests, the Chairman turned to the other interests of the Corporation and said:

OTHER INTERESTS

Bay Hall Trust Limited, as you are aware, operates in the United Kingdom as an Investment Trust. Its Directors have decided to make an issue of new shares for cash with a view to enlarging and diversifying the Trust's investment portfolio and to offer a proportion of this issue direct to Members of this Corporation. Circulars were posted to you last night informing you of this.

If Bay Hall shareholders approve the detailed proposals, which include the substitution of four shares of 10s. each for each existing Bay Hall £1 share, you will, on or about June 23rd, be sent detailed particulars of an offer to take up one new Bay Hall 10s. share at par for every five Union Corporation shares you hold at the close of business on June 8th. The issue will give Members of the Corporation an opportunity of participating directly in one of its associated companies. Your Directors consider that this represents an attractive investment opportunity. Based on the present market value of the Trust's portfolio it is estimated that the shares will have a net asset value of about 16s. 6d. each. The new shares will be quoted on the London Stock Exchange, only, where a market in the rights will be established. We intend making suitable arrangements to assist South African members to deal in their rights during the offer period.

Last year the gross revenue of the Trust increased from £228,500 to £244,100. A dividend of 17 per cent was paid, plus a bonus of 1 per cent, both less United Kingdom Income Tax. A few days ago, the Directors of the Trust declared an interim dividend for the current year of 6 per cent, less tax, on the existing capital. They expect to recommend early in 1960 a final dividend for 1959 of 5 per cent, less tax, on the capital, as increased and anticipate being able to distribute not less than 8 per cent, less tax, in respect of 1960.

After referring to British Enka Limited and South African Pulp & Paper Industries, Limited, the Chairman continued:

EXPLORATION

The Directors Report stated that it was intended shortly to make application to the Mining Leases Board of the Government of the Union of South Africa for two new mining leases in the Kinross area and that a further possible lease area was still under investigation. I am pleased to be able to report that the application for the two mining leases was lodged with the Mining Leases Board towards the end of last month. The application is for two adjoining areas to the West of the property of Winkelhaak Mines, Limited. The Southern of these will adjoin the Southern part of Winkelhaak's Western boundary.

If these leases are approved the Southern area will be worked by a recently formed company, Bracken Mines, Limited. We felt it appropriate to commemorate in this way the keen and active interest of our late Chairman in the development of the Kinross goldfield. The Company operating the Northern of the two leases will be Leslie Gold Mines, Limited. It must be emphasised, however, that the location of the mine will be some miles from the town of Leslie.

As explained in the Report there is a further area of interest in the Kinross goldfield. This lies to the North-West of Winkelhaak Mines, Limited. Considerable further drilling will be necessary before we are in a position to decide whether a fourth mine in this area is justified.

Apart from our work in the Kinross area we have continued to be active in the search for new mineral deposits both in the Union of South Africa and elsewhere. In particular, in recent years, in the hope of extending the Corporation's interests in minerals other than gold we have carried out extensive exploration for base minerals though so far without success.

THE BRITISH SOUTH AFRICA COMPANY

Members have already been informed by Circular of the arrangement recently made with The British South Africa Company by which, subject to the approval of members of both Companies, 700,000 new shares in the Corporation will be issued in exchange for 455,000 new shares in The British South Africa Company. The acquisition of this holding will strengthen and diversify our investment portfolio and, in particular, will provide us with an attractive immediate investment in base metals. Your confirmation of the arrangement will be sought at the Extraordinary General Meeting which follows this Meeting.

Finally, I should like to thank on your behalf the Management and staff of the Corporation in South Africa and in London and the Managers, staffs and employees of the Companies under our administration for the strenuous efforts they have made during the past year to further your interests.

In reply to an inquiry by a Member about the portfolio of Bay Hall Trust, the Chairman said that that Company's investment portfolio was widely spread over United Kingdom concerns, a large holding of Union Corporation shares, other South African interests, and in base metal and commodity shares.

In reply to a Member's inquiries about the proposed two new mining companies, the Chairman indicated that details of capital proposals would be announced in due course, that the Corporation had sufficient finance as far as could be judged at present for the purpose and that while there were very few occasions upon which it was possible to offer rights in such business to the Corporation's own shareholders, the Directors had this idea under review. He also indicated in reply to a question, that about 85 per cent of the Corporation's investments were in South African securities and that about 12 per cent of the Corporation's share capital was registered with South African addresses.

The Reports and Accounts were adopted and the retiring Directors re-elected.

BENGUELA RAILWAY COMPANY

At the Annual General Meeting of the Company, held in Lisbon on 30th May, 1959, the following distribution of profits for the year 1958 was approved:—

	1958 Escudos	Comparative Figures 1957 Escudos	1956 Escudos
Net Revenue	151,544,921	194,846,255	221,311,968
Deduct:—			
Percentage to Portuguese Government	13,945,843		
Deductions in accordance with the Articles of Association	10,442,698		
	24,389,541	55,183,493	41,473,079
Balance available for distribution	126,955,380	139,662,762	180,323,879
Distributed as to:—Debenture Service:—			
Redemption of 4% Debentures	16,290,610	16,294,810	49,248,200
Interest on 4% Debentures for year 1958	9,011,621	9,663,413	11,557,345
Interest on 5% Debentures for year 1958	16,100,000	16,100,000	16,100,000
Dividend of 12½% on Share Capital	41,471,261	42,038,223	76,981,635
Transferred to General Reserve	82,500,000	99,000,000	49,500,000
Transferred to Dividend Equalisation Reserve	3,044,119	18,664,569	54,552,244
	126,955,380	139,662,792	180,323,879

Tanganyika Concessions Limited owns all the Debentures and 99% of the Equity of the Benguela Railway. 80.5 Escudos=£1

SPILLERS LIMITED

INCREASED TURNOVER AND EARNINGS

WHEAT MARKET—TWO SIGNIFICANT EVENTS

GROWING USE OF COMPOUND ANIMAL FEEDINGSTUFFS

CONSOLIDATION AND EXTENSION OF BAKERY AND OTHER ACTIVITIES

MR WILFRED D. VERNON ON CONTINUED EXPANSION

The seventy-second annual general meeting of Spillers Limited was held on June 5th at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, E.C.2, Mr Wilfred D. Vernon (the Chairman), presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended January 31, 1959:

FINANCIAL RESULTS

The result of the year's trading has been satisfactory, the continued expansion of the business being reflected in increased turnover and earnings.

The profit (after providing for depreciation and obsolescence) is £4,651,000.

Taxation absorbs £2,650,000 so that the net balance available is £2,001,000. If the Directors' proposals are approved £870,000 will be distributed in dividends and £1,131,000 retained in the business. The Directors are glad to be able to recommend increasing the full year's dividend on the Ordinary Stock to 10 per cent (as against the equivalent of 8¾ per cent for 1957-58) and thus give the stockholders some further return on their constantly increasing investment in the business.

FLOUR MILLING AND WHEAT MARKET

There was a small decline in our deliveries of flour and competition continued to be severe because of the existence of surplus milling capacity in this and other countries. I have referred in the past to the fall in the consumption of flour in the United Kingdom and in other highly developed countries, and to the efforts by the industry here to demonstrate to the public through the Flour Advisory Bureau the nutritional and economic merits of bread as a foodstuff. Recently there have been some indications that the sustained fall in consumption over the last ten years may have been arrested.

The financial outcome from milling operations was better than for the previous year and this was assisted by more stable conditions in the ocean freight market.

Two events of significance to the Wheat Market have taken place since the end of the financial year. The first is that the United Kingdom has undertaken to become a signatory to a new International Wheat Agreement, and the second is the opening of the St Lawrence Seaway.

In the past the milling industry was strongly opposed to this country's adhering to the Wheat Agreement in its earlier form, because the industry was convinced that to do so would have restricted freedom of buying which would have led to a higher cost to the consumer in the United Kingdom. Nevertheless, I think it fair to say that it appears that this new form of Agreement contains less objectionable features than the earlier Agreements, and so far as millers are concerned, I do not think that under existing circumstances we need fear any serious repercussions from it.

The St. Lawrence Seaway will bring about a considerable change in the methods of moving wheat from points on the Great Lakes both in Canada and the USA to the seaboard, and in addition will allow vessels of suitable tonnage to make direct sailings from the Great Lakes to foreign destinations. The Canadian Wheat Board have already made some adjustments in their marketing arrangements and conditions but it may be some time before the full implications are apparent. As far as one can judge at the moment, I would only say I hope that the resultant reduction in handling costs will be beneficial to the buyer as well as the seller.

It is appropriate that I should refer to the decision of the flour milling industry to terminate or modify existing arrangements within the industry which come within the scope of the Restrictive Trade Practices Act. These arrangements imposed no obligation on individual millers to observe minimum prices and were intended to maintain the supply of flour on an efficient and economic basis. While satisfied that they were not detrimental to the interests of consumers it was concluded that it would be difficult to establish the requirement of the Act that the withdrawal of the arrangements would deprive the public of a substantial benefit. It is my hope that despite the absence of guidance through recommended prices the general sense of responsibility within the industry will prevent prices falling to levels unrelated to the cost of efficient production.

ANIMAL FOODS

I am able to report that my confidence of last year, when I stated that we were in a position to expand our business, has been justified. Farmers are becoming more conscious of the value of using compound animal feedingstuffs, based as they are on intensive research, and I am pleased to add that we have enjoyed our full share of the resultant increased trade. The progress has been general, covering all fields of animal feeding and our deliveries have reached a new peak. Although the financial results improved this was wholly due to the increased volume of business as the keen competition in this trade has kept the margin on a rather narrow basis.

I must make particular reference to the great development of the broiler industry which has made such spectacular advances throughout the year. It is worthy of note that this newest branch of agriculture does not receive any subsidy from the Exchequer and I would pay tribute to the efficiency and farsightedness of its leaders. I feel that we have made no small contribution to this progress, for in addition to the providing of broiler foods in ever increasing quantities we are in constant touch with breeders, producers and packers in our endeavour to make it possible for the housewife to buy birds of an attractive quality at a reasonable price.

At our research centre and farm at Middle Aston, Oxfordshire, we continue to receive large numbers of scientists, farmers and agricultural merchants. We are happy to show them all that is being done both in the laboratory and in the field to ensure our foods always being in conformity with the most up-to-date knowledge of animal nutrition.

It is important that there should be a proper realisation of the position of compound animal feedingstuffs in relation to the national economy. There seems to be a belief in some quarters that it is contrary to the national interest to import large quantities of raw material for the production of these foods. If, as is the fact, all home-grown materials are absorbed, the alternative to importing the balance required is to import the end product in the way of farm produce. Our aim is to produce feedingstuffs whether based on home-grown or imported material of a quality and at a price which will enable livestock to be raised in this country on a basis competitive with overseas.

Last year I referred to the construction of a new animal foods factory at Gainsborough. This is expected to be in operation early next year, and we have now commenced building another new factory at Aberdeen.

BAKING AND OTHER ACTIVITIES

The bakery side of our business continues to be consolidated and extended and there was a further increase in production during the year. Rising costs, however, have somewhat reduced the margin of profit. This section of the business which now absorbs a significant part of the company's flour output is managed by experienced executives and we are confident that the further capital expenditure now being incurred will show an adequate return.

The organisation for selling products to the grocery trade has now been firmly established and steady progress has been made with our well-known dog biscuit foods and with the transfer of many local brands of self-raising flour and prepacked plain flour to single brands in the name of Spillers. The new package designs of our various grocery products have been widely commended and we look forward confidently to continued development in this section of our business.

RESEARCH AND DEVELOPMENT

In recent years our policy has been to extend our facilities for research in the fields of improvement in processes, handling and quality and in the evolution of new products. To this end we constructed new central laboratories at Cambridge and the animal foods research station at Middle Aston, Oxfordshire. We are now in the course of completing and staffing a new technological

research centre also at Cambridge. A short time ago we appointed Dr John Coppock, OBE, PhD, FRIC, as Director of Research to supervise and co-ordinate this work under Mr Rishworth, the member of the Board responsible for these activities. I am sure that this policy is essential to the conduct of a business such as ours and I am equally sure that it will contribute materially to expansion on sound lines.

In this connection I might comment on the pioneering work which we did on the bulk movement and storage of flour. It may not be generally appreciated that this Company was responsible for the first delivery of flour in bulk in a specially designed vehicle—the first of its kind in the world—as long ago as June, 1950. There is no doubt that this is by far the more hygienic method of handling flour and it is also more economic. This view is shared by those of our customers who have adapted their own premises and equipment for intake in bulk, and I hope that others will be similarly receptive. We are always ready to give advice to customers wishing to consider this step. It is not surprising that this method of delivery has been adapted for use in delivering animal foodstuffs to the farm in bulk and the first lorry to carry out this work took its load in July, 1956.

OVERSEAS INTERESTS

For many years we have, in partnership with the British South Africa Company, been interested in milling and allied activities in Southern and Northern Rhodesia. These operations are carried on by the Rhodesian Milling Company (Private), Ltd, and have been continually extended, particularly since the end of the last war. This Company now operates mills and factories in most towns of any size in the two Rhodesias and several of our Directors including myself paid visits to these centres in the course of the last year.

It is disturbing to external investors like ourselves that the Federal Government should now be exercising its price control powers to limit the return on capital invested in Rhodesian industry despite the lean years experienced by the Rhodesian company in the past and the devotion of all its earnings for some considerable time to modernisation and development in that country.

During 1958 we acquired a substantial interest in the capital of John Darling & Sons (Australia), Ltd, one of the oldest and most prominent milling concerns in Australia, and this largely accounts for the increase in the item "Investment in associated companies" in the Balance Sheet. The Darling Company operates or is interested in flour mills, feeding stuffs factories and bakeries in Melbourne and Sydney.

RIGHTS OF PREFERENCE STOCKHOLDERS

As will be seen from the Directors' Report and the explanatory circular, it is proposed to make certain alterations in the Company's Articles of Association, the object of which is to amend the rights attaching to the Preference Stock.

Stated shortly, the intention is to bring those rights more into line with modern practice. As part of the arrangement the sum of £55,208 of the Company's reserves will be capitalised and applied in issuing one fully paid up Preference Share to the holders of every £25 of existing Preference Stock.

GENERAL

It is difficult at this stage to make any reliable forecast about the outcome of the current year. Trading up till now has been satisfactory and although there are problems which may make it hard to maintain last year's level of earnings, I am confident that we are well equipped to maintain our position in the industry.

I am sure that the stockholders would like to be associated with my colleagues and me in expressing to the management, staff and workpeople of the Group our thanks for the contribution which they have made to the good results of the past year and our appreciation of their continued loyalty.

The report and accounts were adopted and the final dividend of 8 per cent making 10 per cent for the year on the Ordinary Stock was approved.

The retiring directors, Mr H. B. Vernon, MC, and Mr C. P. Rishworth, were re-elected and the joint auditors, Messrs Impey, Cudworth & Co, and Messrs Deloitte, Plender, Griffiths & Co, continue to serve.

Mr Macdonald of the Church Commissioners proposed a vote of thanks to the chairman, the directors and all employees of the company.

Resolutions amending the Company's Articles of Association, capitalising £55,208 of reserves and issuing fully paid one Preference Share for every £25 of existing Preference Stock, having been approved, the proceedings terminated.

BRITISH ISLES & GENERAL INVESTMENT TRUST LIMITED

SIR DENYS LOWSON ON THE IMPORTANCE OF INCREASED SAVINGS

At the Annual General Meeting of British Isles & General Investment Trust Limited held on June 1st at Estates House, Gresham Street, London, E.C.2, Sir Denys Lowson, Bt, the chairman, in the course of his remarks, said:

The gross revenue for the year £102,075 is again a record in the history of the Company, and compares with £98,138 for the previous twelve months. After allowing for management expenses and taxation, as well as crediting double taxation relief in respect of earlier years, there is a total balance available for distribution of £53,434. The Directors have declared a dividend of 9 per cent together with a bonus of 1 per cent, making a total of 10 per cent for the year; thus leaving £8,159 to be added to the carry forward, which will then stand at £51,991.

The investments with an approximate total value of £1,871,000 show an appreciation of 48.5 per cent over the book cost.

The outlook for the current year appears not unfavourable, and we have prepared an estimate which shows that our total revenue should be satisfactory; so I am hopeful that we shall be able at least to maintain our total payment to shareholders.

While in this country during 1958 production fell by 1 per cent, wages rose by about 3 per cent. Since 1951 the average weekly earnings increase in this country over previous years has always exceeded the annual increase in industrial productivity and output. In other words, since 1951 there has always been an increase in the wage costs per unit of output.

The total earnings of those employed in industry have risen in this country by approximately the same ratio as in Germany; but because German productivity has increased more rapidly, the rise in German wage costs per unit of output have been less than one-third of the rise in British wage costs per unit of output. If, therefore we could obtain the same rate of productivity as in Germany, it would go a long way towards making our exports more competitive.

Some three years ago when addressing you I referred to the importance of savings. The position pertains even more forcibly today. In order to achieve the higher productivity from our industries which is so essential we must also have a higher rate of investment in our factories and industries; which can only come through savings out of income from the broad masses of the population.

There have in recent years been great changes in the incidence of these incomes. For instance in 1938 just under two million people had net incomes of £250 to £500 per annum to spend; whereas at the end of the fiscal year 1955-56 there were four times as many people, namely just over 8½ million individual incomes with the equivalent purchasing power; which means at today's level of purchasing power incomes of £500 to £1,000 per annum.

It is from this section of the public that a great proportion of our future investments must come, and it is for them that Investment Trusts, such as our Company, and now today also Unit Trusts, so often afford the best possible medium of investment.

The Resolution for the adoption of the Report and Accounts was seconded by Mr H. R. S. Stewart and carried unanimously. The proceedings terminated with a warm vote of thanks to the Chairman, Directors and Staff.

WORTHINGTON-SIMPSON

The sixty-eighth annual general meeting of Worthington-Simpson, Ltd., was held on June 10 in London, Sir Samuel R. Beale, KBE, MIMechE, chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts for the year to December 31, 1958:

Results are better even than last year's record figures. The Trading Profit of £1,181,674 shows an increase of £56,034 over last year's figure of £1,125,640 and after making full provision for all charges, including taxation, a net profit for the year under review of £543,759 is shown against £493,095 for 1957.

The incoming business for our standard products so far this year shows an improvement over last year and our order book stands at its customary high level. Profit margins are, of course, narrowing due to increased production costs brought about by National Awards, and it is not always possible, or advisable, to pass these on by raising our selling prices. We can look forward to the future with every confidence and I have no reason to think that the results for 1959 will prove other than satisfactory.

In view of the record results this year and the very liquid position of your Company, your Board feels a slightly higher distribution of profits is justified and accordingly recommends that the final dividend on the Ordinary Shares be 10 per cent, less tax, making with the interim dividend of 7½ per cent, less tax, paid last December, a total of 17½ per cent, less tax, for the year on the Ordinary Share capital as doubled at the Extraordinary General Meeting held on June 11, 1958.

The report and accounts were adopted.

SUNDAY PICTORIAL NEWSPAPERS LIMITED

Increased prosperity for Sunday Pictorial

The thirty-ninth Annual General Meeting of SUNDAY PICTORIAL NEWSPAPERS LIMITED was held on the 3rd June 1959 at Brettenham House, Lancaster Place, London, W.C.2. Mr. Cecil H. King, Chairman and Managing Director, said:

As you will have seen from the accounts circulated to you, the Sunday Pictorial Newspapers Limited has made a profit before taxation of £1,663,803, which is £433,457 more than the year before. Increases in revenue from advertisements and from sales of the *Sunday Pictorial* at the revised selling price of 4d. are reflected in the trading profit which, after payments to directors, is £263,421 up on last year. On the other hand, costs continue to rise and the year has borne the full effect of the 5% wage increase awarded in December 1957. Dividends from trade investments and other income have also advanced and show a gain of £170,036.

During the year a share bonus was issued to stockholders in order to enlarge the capital of the company to a figure more in line with the value of its assets. A final dividend of 14½% has been recommended which, with the interim dividend already paid, represents 22½% on the present capital. While it is always unwise to make predictions, I think there should be no difficulty in maintaining this dividend.

Mr. Colin Valdar, the Editor of the *Sunday Pictorial*, left the company towards the end of the year and was succeeded as Editor by Mr. Lee Howard, an experienced journalist who was for some years Editor of *Woman's Mirror*.

The British public's recent tendency to read fewer Sunday newspapers was again apparent with a collective decline of over 4% on the circulation of all Sunday newspapers. The *Sunday Pictorial's* average net sale for the year ended 31 December, 1958, was 5,378,000. There is little doubt that intensified television coverage and bigger newspapers are affecting newspaper buying habits, but future trends are difficult to determine.

Amalgamated Press acquired by Daily Mirror

The dominating event of the year was the acquisition by your associated company, The Daily Mirror Newspapers Limited, of the equity capital of The Amalgamated Press Limited. As a result, the capital of the Daily Mirror was substantially enlarged. In order to maintain the Sunday Pictorial's interest in the equity of that company, and as part of the transaction, your company agreed to purchase 3,146,884 of the Daily Mirror ordinary shares issued to Amalgamated Press shareholders at a cost of £3,343,564. This will lead to increased investment income in future years.

The Amalgamated Press is the largest periodical publishing enterprise in the world. It controls a paper mill in this country and a pulp mill in Canada, several large printing factories, an engraving works and a bookbinding company. The group's publications include women's and children's magazines, encyclopaedias and reference books. Through a controlling interest in Kelly's Directories Limited and its subsidiary, Associated Iliffe Press Limited, a large number of successful technical journals and town directories are published. Some of the women's magazines are losing ground and time is bound to elapse before it can be regained. In the meantime, practical measures are being taken to strengthen their appeal.

Your associated newspaper, the *Daily Mirror*, has borne its share of the year's decline in popular newspaper sales. As with Sunday newspapers, the daily newspaper scene is unsettled, but the *Daily Mirror* remains the largest selling daily with an average net sale of 4,527,000.

You will now wish me to deal with the affairs of the companies in which you are concerned jointly with The Daily Mirror Newspapers Limited.

In the field of light entertainment weeklies competition is stiff, but the lively newspaper, *Reveille*, remains well ahead of its nearest rival with an average net sale of nearly two million copies a week. Competitive markets are expensive to sell in, however, and profits are reduced this year.

Further expansion in Scotland

The *Daily Record* in Scotland continues its remarkable expansion in circulation and in the volume of advertising carried. The average net sale of the paper for the six months ended 31 December 1958 was 437,455 copies per day —more than 100,000 copies per day up compared with the beginning of 1956. In examining this figure, it is worth bearing in mind that in Scotland the general trend in the circulation of morning and evening papers has been downwards—in some cases very steeply. In 1958 the *Daily Record* carried 28% more local advertising than in 1957. Compared with 1956, the increase is 74%. The *Sunday Mail* still achieves a sale in excess of 600,000 copies per issue. The year's results of the Scottish Daily Record and Sunday Mail Limited have been satisfactory and I look forward confidently to continued profitable trading.

Prospects bright in West Africa

Profits of the West African group of companies have been maintained, despite the more difficult trading conditions encountered in Ghana and Sierra Leone. Higher advertisement rates became effective during the year and income from this source, together with increased revenue from our commercial printing businesses in all three territories, should lead to considerably increased profitability in the coming year. The last penny newspaper in the group has disappeared with the increase in the selling price of the Freetown *Daily Mail* to twopence from the beginning of March of this year. From now on I expect this subsidiary to make a satisfactory contribution to the West African group profit. In Nigeria, the attainment of self-government in the Northern Region has paved the way to full independence within the Commonwealth for the Federation in September 1960. The value of our independent newspapers is understood in the territories where we operate. Prospects for our companies in Nigeria, Ghana and Sierra Leone are reasonably bright.

Breathing space in the paper industry

World productive capacity continues to outstrip demand in the pulp and paper industry, where you have a considerable interest. In spite of this, Anglo-Canadian Pulp and Paper Mills Limited showed improved results over last year, when profits generally declined sharply. I think the present slackness in the trade is no more than a breathing space and momentum will be regained within the next few years. Albert E. Reed & Company Limited is, of course, affected by the trend of events in the world paper trade. Broadly speaking, turnover is up but profit margins are narrower. However, the increasing diversification of this company's products, which range from paper tissues and sacks to printing papers and fibre drainpipes, enables it to look to the future with confidence.

Associated TeleVision progress

Associated TeleVision Limited continues to make remarkable progress. Dividends amounting to 70% have been received by us in the year under review and we anticipate that the total in the current financial year will amount to 100%. A small part of the companies' investment has been sold during the year for an amount which exceeds the total cost of the original investment. The total joint holding now amounts to 17.2% of the issued equity capital. Through its subsidiary, Incorporated Television Programme Company Limited, ATV has recently established links with the Independent Television Corporation of America, an association which is likely to prove very profitable.

Sale of Australian interests

Towards the end of the financial year, your company and the Daily Mirror disposed of their holdings in the Melbourne Herald and Weekly Times Limited. This followed the sale of radio and television interests in Sydney and elsewhere, and both companies' stake in Australia has thus been brought to a close. Since 1948, the two companies have invested nearly £2½ million in Australia. Although at one time it appeared that heavy losses would be incurred on the venture, I am happy to say that this has not been the case and we are able to show a small capital surplus.

Your company's endeavours are supported by a large number of employees at home and abroad. My thanks are due to them for the part they have played in an active and satisfactory year's working.

ELLIOTT-AUTOMATION LIMITED

INCREASED PROFITS FROM AUTOMATION ACTIVITIES

NEW LINKS WITH U.S. COMPANIES

MR R. E. F. DE TRAFFORD'S STATEMENT

The Annual General Meeting of Elliott-Automation Limited will be held on June 26th in London.

The following is the statement by Mr R. E. F. de Trafford, the Chairman, which has been circulated with the report and accounts for the year ended December 31, 1958:

The Accounts before you cover the first full financial year of the Elliott-Automation Group.

Shareholders will recall that some twelve months ago we disposed of the undertaking of Associated Insulation Products Limited and consequently the profits from that source were available to us only for the first four months of the year under review. In order to present the comparison between the year just ended and the previous year in the clearest possible manner, we have segregated the figures relating to Associated Insulation Products Limited both in the Consolidated Profit and Loss Account and the Consolidated Balance Sheet. You are thus presented with the comparative figures of trading profit and net profit before taxation for the Group as at present constituted, i.e., excluding AIP. In doing so we have used as comparative figures those relating to the whole of 1957, although the merger of Elliott Brothers (London) Limited and Associated Automation Limited was only effective from August 1, 1957.

SATISFACTORY ORDER POSITION

You will have noted that the aggregate Net Profit, after tax, of £458,628 for the Group as a whole is ahead of last year's figure, namely £411,651, and the loss of income from the holding now disposed of has thus been more than made good. In other words, there has been a substantial increase in the profits from our Automation activities.

It is gratifying that, despite increased output, and notwithstanding the recent recession in the capital goods industries generally, the Company's order book remains entirely satisfactory, and includes orders for many important projects covering a wide range of industries, such as Oil Refineries, Power Stations (atomic and conventional), Food Factories, Steel Works and Chemical Plants.

NATIONAL IMPORTANCE OF AUTOMATION

Automation is a development of urgent and rapidly growing importance to this country. Its importance has been recognised by the United States of America and Russia, and there are indications that its techniques are being adopted by Germany, Japan, France and indeed most industrial countries. Your Company covets its position as the most broadly based and the largest organisation in the Automation field outside the United States of America.

NEW ACTIVITIES

During the past twelve months your Company has taken further steps to widen the range of services it can offer. An agreement was entered into with Consolidated Electrodynamics Corporation of Pasadena, California, covering quality control instrumentation, a field of rapidly growing importance in Automation. In order to widen further the range of valves offered by the Group, agreements were also made with Farris Engineering Corporation of New Jersey, to manufacture and sell safety and relief valves and with Farris Flexible Valve Corporation for pinch valves. Additionally, agreements were made with Western Electric Company Inc., of New York, for the manufacture of specialised types of relays, and with Canadian Curtiss-Wright Limited for certain nucleonic instruments. In this connection, I would mention that a separate subsidiary, Elliott Nucleonics Limited, was recently formed to handle the nucleonic instrument activities of Elliott Brothers (London) Limited.

AUTOPILOTS FOR VICKERS VC10 AIRLINER

In past years our activities in Aviation were almost entirely concerned with aircraft for the armed Services, and our Aviation Division continues to be actively engaged in that field. In addition, we have now secured an important position in civil aviation and have been fortunate in obtaining the contract for the automatic pilots and flight instrument systems for the Vickers "VC10," the outstanding projected British civil airliner. These automatic pilots will be based upon patents under licence from our friends Bendix Aviation Corporation and were designed in co-operation with them This contract should ensure a valuable volume of work for the Division concerned for some years to come.

EXPORTS OF COMPUTERS

A number of successful installations of the National-Elliott "405" Computer have now been made and are in productive use. One such machine has been supplied to Germany and other export orders are in hand. At the first Computer Exhibition staged in this country last November, we showed, in conjunction with National Cash Register Company Limited, for the first time, the National-Elliott "802" a low-priced transistorised digital computer. This type of computer, in addition to its suitability for many business data handling problems, is an important tool for industrial applications, particularly in connection with the data logging system which our subsidiary Panellit Limited, makes in collaboration with Panellit Inc., of America, and I am happy to say that exports of this computer to the United States have commenced. This is the first time British designed computers have found a market in the United States.

ADDITIONAL PREMISES

Plans for additional premises at Borehamwood, to which I made a reference last year, were modified to provide increased space and the building is now nearing completion. Also, during 1958, new buildings came into use at Electroflo Meters Company Limited which, in addition to providing valuable productive space, have enabled that Company to expand the facilities of its Fluid Dynamics Laboratory, which is now in a position to offer a unique service to Industry.

On the other hand, we have, since the end of the year, disposed of a small factory at Weymouth, as it was found advantageous and possible to transfer its production to Lewisham. Just at the time of the transfer, we experienced severe flooding at the Lewisham factory which retarded production temporarily and, but for the excellent team spirit displayed by all the personnel there, might well have had a more long-term effect.

BALANCE SHEET

Turning to the Balance Sheet, the small increase in Issued Ordinary Share Capital relates to the balance of Shares in the merging Companies which had not been exchanged at the end of last year. This also applies to the increase in the Share Premium Reserve. The increase in Other Capital Reserves is brought about by a small book profit arising on the sale of the undertaking of Associated Insulation Products Limited. It will be seen from the comparative figures that the net addition to your Company's funds arising from that sale was of the order of £1,700,000.

The growth in the Balance Sheet figure of fixed assets, which has brought about a steep increase in our Depreciation charge, reflects the continuing development of our capital Expenditure programme. This programme will, of course, stand to benefit in future from the re-introduction of the Investment Allowance in the last Budget.

WELCOME FOR REINTRODUCTION OF INVESTMENT ALLOWANCES

In our opinion, the large scale adoption of Automation in this country has been retarded in recent years through the lack of such incentives. We feel, therefore, that the Chancellor of the Exchequer's decision to reintroduce them is a most constructive move and one which should give considerable impetus not only to us but to suppliers of capital goods generally.

I should like to draw attention to the fact that the Group Capital and Reserves now stand at a figure in excess of £6,300,000, and the excess of current assets over current liabilities amounts to over £4,300,000.

APPROPRIATION OF YEAR'S PROFITS

As stated earlier, the Net Profit, after taxation, attributable to your Company amounts to £458,628. It is right to point out in this connection that we have had the benefit of the new rate of income tax and also of the change in profits tax which took effect from April 1958. The preference dividend for the year after income tax takes £15,813, and the net cost of the interim dividend of 4 per cent less income tax on the Ordinary Capital amounted to £73,127. As foreshadowed at the time the interim dividend was declared, your Directors now propose a final dividend of 6 per cent on the Ordinary Capital which, after deduction of income tax at the new standard rate, will cost £116,844. The total cost of dividends for the year is thus £205,784, leaving from the year's profits a sum of £252,844 retained in the business. This sum, together with the balance from the previous year amounting to £96,426, making a total of £349,270, is being carried forward in the accounts of subsidiary companies.

As already indicated the Company's business showed satisfactory expansion last year and your Board see no indications why, subject to unforeseen circumstances, this trend should not continue.

One of the features of our organisation is the youthfulness of so many of our executives and senior staff. Their energy and enthusiasm have contributed greatly to your Company's success whose plans for further development would otherwise be difficult to carry out. On your behalf I would extend to them and to all employees of the Group our sincere thanks for their loyalty and co-operation.

HIGHAMS LIMITED

IMPROVED RESULTS

The fifty-first ordinary general meeting of Highams Limited will be held on July 1st in London.

The following is an extract from the circulated statement of the chairman, Mr Alec E. Higham, OBE, JP.

I am very pleased to be able to report an increased profit for the year just ended and it affords me equal pleasure to announce that your Board have thought fit to recommend that the dividend for the year be increased to 20 per cent. Another factor which gives rise to satisfaction is an increase in your Company's sales.

Production has increased according to a planned programme and quality has been fully maintained and, where possible, improved.

There are two important matters that have arisen during the year to which I should like to refer briefly. Firstly, the termination of the Yarn Spinners' Agreement resulted in the cheapening of your Company's productions and a consequent lowering of selling prices, which were immediately made available to our customers. Secondly, the Government's proposals for the reorganisation of the cotton trade have been made known. Unfortunately, at the time of writing this statement their plan is so nebulous and incomplete in essential details, that although I would prefer to refrain from any comment at this stage, I must say that in many respects the scheme savours much more of a memorial service than a revivalist meeting.

As to the year that lies ahead, I hope that your Company will maintain its proud record and I see no reason why it should not, unless unforeseen circumstances prevail.

UNION MINIERE DU HAUT-KATANGA

IMPROVED EQUILIBRIUM BETWEEN PRODUCTION AND CONSUMPTION

REVIEW OF COMPANY'S ACTIVITIES

The Annual General Meeting of Shareholders was held in Brussels on May 28, 1959, Mr Paul Gillet, Chairman of the Board of Directors, being in the chair.

The Meeting approved the accounts for the financial year ending December 31, 1958. The Profit and Loss Account showed a gross profit of 3,799,799,056 francs. After deduction of amortisation for the year, the provision for taxation on profits, the interests and the sundry taxes and royalties, the available profit balance totalled 2,410,626,892 francs.

The Meeting fixed the net dividend for the year 1958 to 1,500 francs per share (or 150 francs per tenth part of a share). Taking into account the interim dividend of 600 francs paid in January, 1959 (60 francs per tenth part of a share), the balance of 900 francs net per share, or 90 francs net per tenth part of a share, becomes immediately payable.

Messrs E. Sengier and A. Marthoz, Directors whose mandates expired, were re-elected. Mr P. Jadot was re-elected as auditor of the Company.

MR SENGIER'S STATEMENT

The 1958 copper production—235,586 metric tons—has been slightly lower than that of 1957. Deliveries however were superior to the production and have necessitated a withdrawal from the stocks.

Mr Sengier points out that whilst the amount of the dividends paid to the shareholders other than the Government of the Congo represents 1,547 million francs, the State has drawn directly 2,196 million francs from the Company's activity during the financial year.

The years 1956-1957-1958 have been a very unusual period as far as the copper market is concerned; the lower level, i.e., 20 cents per lb., has been reached in February, 1958. The quotations have since normalised and the equilibrium between production and consumption has improved. During this period, Union Minière characterised itself by the stability of its prices and the regularity of its deliveries.

The outlook for the near future is good, declares Mr Sengier, thanks to the increase in demand for various goods, containing copper, and to the rebuilding of the stocks in the consumption industries of the United States.

Long range optimism also prevails; the growth of the population and the rise in the standard of living will entail a more and more extensive recourse to electricity which, in its numerous applications, accounts for 60 per cent of the red metal's consumption.

A profit nearly equal to that of 1957 has been realised although the average price has been lower; this is due to a reduction in costs and to the formulas according to which the increase or reduction of profits resulting from the rise or fall in the price of copper is shared by certain organisations co-operating with the Company's activity.

Thus the results of Union Minière compare advantageously with those of other Companies carrying on the same activity.

If the copper quotations were maintained at the present level, the profit balance of the financial year 1959 would be favourably influenced, all the more so because the copper production programme for this year is 260,000 tons.

In conclusion, Mr Sengier paid tribute to his European and Congolese collaborators, and expressed his confidence in the Company's future.

MAIN POINTS FROM THE BOARD OF DIRECTORS' REPORT

Mining activity has still been concentrated on Prince Leopold Mine and on the mines of the Western region. Total extraction reached about 7 million metric tons of ore. Copper production was initially fixed at 90 per cent of that for 1956, which corresponded to a rate of about 222,000 tons for the year. The market's recovery allowed an adjustment of the programme during the second half of the year, so that the 1958 production, i.e., 235,580 metric tons, has been inferior to that of 1957 by 4,700 tons only.

Cobalt production was limited to 6,500 tons; the price remained at $2 per lb during the whole year 1958.

Zinc concentrates production amounted to 200,000 tons at 57 per cent zinc. The zinc market remained weak and the quotations reached their lowest level since 1946, to recover slightly at the end of the year.

The Shinkolobwe concentration plant produced 3,100 tons of uranium concentrates assaying 68.5 per cent U_3O_8. The agreements reached concluded between Belgium, the United States, and the United Kingdom for uranium deliveries are progressively nearing expiration. Union Minière is, from now on, in a position to offer to the private industry the products of nuclear quality manufactured by the Société Générale Métallurgique de Hoboken (Belgium). Furthermore, Union Minière delivered 69.7 grams of radium.

Germanium production amounted to 23,400 kgs of recoverable oxide; which necessitated the enlarging of the plants treating the germanium bearing products. Moreover, the Company also produced 140 tons of cadmium, 118 tons of silver and 56 kgs of gold.

Among the works under construction, the progress achieved at the Luilu copper-cobalt electrolysis plants should be pointed out; production will start during the second half of 1960.

Electric power supplied by Union Minière to consumers reached 1938 million kWh of which 705 millions were delivered to Northern Rhodesia.

The reduction of the Congolese labour force from 21,700 to 19,650 units has been carried out without let-up, but only through normal departures, and limitation of recruitment.

The Company has given constant attention to increasing the professional skills of its workers as shown by a series of new measures adopted in connection with the formation and promotion of its personnel. School attendances continued to increase: some 20,000 pupils attend the Company's schools.

The social atmosphere in the Katanga remained good.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:

The Company Meetings Department,
The Economist,
22 Ryder Street, S.W.1.

Extracts from the statement by the Chairman

MR. G. E. McWATTERS

to be presented at the 65th Annual General Meeting of John Harvey & Sons Ltd., to be held on 11th June, 1959, at the Grand Spa Hotel, Clifton, Bristol. 8.

JOHN HARVEY & SONS LTD

I commence by welcoming the many new shareholders who have become members of the Company since my statement to you last year. I should say how encouraged my colleagues on the Board and the members of the staff were by the immense success of the public issue.

THE COMPANY'S BUSINESS

For the benefit of new shareholders, I feel I must comment on the extensive list of Fortified Wines (Sherries, Ports, Madeiras and Marsalas) this Company carries. I believe it to be one of the most comprehensive in the country—wines to suit all palates and all pockets. This year we have made advances in Spain and have secured further stocks of fine old matured wines to meet the increased demands for our Sherries, particularly Bristol Milk and Bristol Cream. Great efforts have been made to extend our position in the Table Wine Trade. Here again our stocks are comprehensive and well balanced.

PROGRESS

The sales of the Group have risen during the year under review from £4,225,586 to £4,279,357. This is an increase of £53,771 or 1.27 per cent.

It is difficult to draw a comparison with the previous year's figures owing to the reduction in the rate of duty on Fortified Wines made in April, 1958. If this reduction had not taken place, the value of the sales would have increased by approximately £250,000. The quantity of wine sold during the year increased by 6.1 per cent.

THE HOME MARKET

To improve the service we are giving to our customers, arrangements are now in hand to establish depots in the main centres throughout the country. This will undoubtedly improve the delivery services we are able to offer.

We have further increased our sales force and there is now no part of the United Kingdom that is not adequately covered.

THE EXPORT MARKET

In spite of the business recession, we continued to make good progress in the American market. In Canada our agency is now in the hands of Messrs. W. & A. Gilbey (Canada) Limited.

The Company is playing its full part in export business and during the past year I have made an extensive tour of South Africa, the Rhodesias and Kenya. I am confident that these territories will be an expanding and developing market for many years to come.

Export Sales can only be achieved by constant visits abroad, and it is my Board's intention that, wherever it is possible for the sales of your Company to be developed, that market must be fully investigated by means of a personal visit from a member of the Company.

WHITCHURCH PROJECT

Our main reason for inviting you to become owners of this Company was to raise funds to enable the Company to erect new warehouse premises, with bottling plant and garage, at Whitchurch on the outskirts of Bristol.

We believe that the building will be one of the finest bonded warehouses in this country, equipped with the best bottling, storage and mechanical handling equipment obtainable. The building should be ready for occupation by the Spring of 1960.

FUTURE PROSPECTS

With the development at Whitchurch and with the home and overseas sales organizations at our disposal, I believe that your Company is well equipped, not only with financial and physical resources but with the calibre of its personnel, to increase further during the year the profitability of the shareholders' investments.

Copies of the Report and Accounts may be obtained from the Secretary, 12, Denmark Street, Bristol, 1.

THE UNITED SUA BETONG RUBBER ESTATES LIMITED

SIR JOHN HAY'S JUBILEE STATEMENT

The Fiftieth Annual General Meeting of The United Sua Betong Rubber Estates, Limited was held on June 10, 1959, at the Savoy Hotel, London, W.C.2. In the course of his Jubilee Statement circulated to Stockholders before the Meeting, the Chairman, Sir John Hay, said:

RUBBER OUTLOOK

In a statement I made in March last to the stockholders of an associated company, I described the outlook for rubber as "set fair." In the light of subsequent events that might now be regarded as an understatement. In the short interval rubber has risen substantially and commercial stocks have declined. This is due primarily to increased consumption in America and to large purchases by Russia and China, coming at a time when production is seasonally low. We have some basis upon which to calculate USA consumption but the further requirements of Russia and China can only be the subject of a guess. Production generally responds to the incentive of a high price, particularly so in Indonesia. In the disturbed political conditions in that territory, however, it is more difficult to assess their reaction. It is probably with these imponderables in mind that the Rubber Study Group with uncustomary restraint refrained on the occasion of their very recent meeting from giving any forecast for the year and confined themselves to the submission of global figures which have little relevancy to the present situation. Whilst sympathising with them in their difficulties, it would seem regrettable that such a widely representative body, with all its many sources of information, should not have essayed the task of publishing an objective analysis of the present situation with its implication for the remainder of the calendar year. It is left to less august institutions or persons to venture, if they should feel disposed. Allowing for the corrective influence of increased supplies of natural rubber and taking a moderate view of present trends, our own study points to the conclusion of a demand for natural rubber in excess of supply, leaving the shortage to be made good from trade stocks. In present circumstances it may be salutary to be reminded of the existence of Government stocks, but such announcements as have been made in respect of the USA stockpile seem, as far as they can be understood, merely to emphasise that under the law as it at present stands procedure for disposal is slow and cumbersome and so offers no early prospect of relief from a tight position.

Changes in the price of rubber are but a reflection of changes in the supply/demand relationship operating in a free market. There is no restriction on the production or supply of natural rubber. It is readily available on the world markets on equal terms to all buyers without distinction or discrimination. In these circumstances, a rise in the price of natural rubber is an ill-chosen subject for moralising. The natural rubber industry is not to be relegated to the inferior position of a marginal producer. It is well aware of the competition of the synthetic product but it also notes that despite the existing disparity in price the demand for synthetic is, in contrast to natural, well below productive capacity, a testimony to the unique qualities of the latter. The practical remedy for a shortage of natural rubber is an increase in supply which may well be stimulated by present prices. But if, to meet expanding demand, this increase is to continue into the distant future that can only be accomplished by an increase in capacity. The planting up of new estates now involves heavy capital expenditure and a long and patient wait for revenue. Such long-term development, with all its inherent risks, is not likely to be engaged upon unless there is an encouraging prospect of commensurate rewards.

A RETROSPECT

Under the above title there has been circulated to stockholders and others a brief but graphic account of this company's development over the past 50 years. The task of writing this history was undertaken and performed by my colleague, Sir Andrew McFadyean. It has been discharged with distinction and its reading should afford both pleasure and interest. The author has referred to my services and long association with the company in highly appreciative terms. But whatever may have been my influence, USB is the outcome of the labours of many people. Within the lifetime of the company one generation has succeeded another. Time has brought about changes in outlook and a new sense of values; in those respects there has on balance been improvement, and any belief that there has been any decline in talent or character is entirely unwarranted. We are splendidly served by our officers who share with all who work for the company a legitimate pride in its achievements, backed by practical and loyal endeavour for its continuing success. The rubber industry in Malaya has drawn many young men from the North East of Scotland and we have our share of recruits from that part of our country. Our four senior managers all hail from North of the Border. All members of your Board have a similar origin. Although there should be no sympathy for Dr Johnson's jaundiced view of Scotland I should give perhaps to those less favoured the assurance that this present national predominance does not imply any national or racial discrimination. Our officers, assistants and workers are drawn from many countries, with the citizens of Malaya playing an increasingly important part.

In the course of his review, Sir Andrew McFadyean rightly emphasises the benefits derived from the advances in genetic science in its application to rubber, but there have been advances of a different kind, not so spectacular but yet of perhaps equal economic significance. Improvements in method and organisation have resulted in enormous savings in labour and supervision. Formerly, one labourer to two acres was the accepted standard. The two acres have now become seven without any addition to hours of work but the rate of pay has multiplied many times. In the managerial and supervisory staff there have been more startling changes, aided of course by vastly improved communications. Our present numbers are 36; by old standards it would have been near to 300 and management and supervision is certainly no less effective than formerly. Supervision was a responsibility reserved for the European, now the Asian plays an increasingly important part. If in this backward glance I deal first with personnel, that is only an instinctive reflection of a profound social change which has radically altered the relationship of employer and employee. The worker on a rubber estate is no longer a "coolie." He is an individual whose dignity and independence are respected. Estate housing and the many other social services now provided for his welfare are quite beyond anything imagined 50 years ago.

USB came into existence too late to share in the rubber boom of 1909 when rubber sold at 12s. 9d. per lb. There was a widespread and feverish speculation in the shares of the few fortunate producing companies, and public sentiment towards rubber is humorously illustrated in the cartoons published at that time in *Punch*. In 1911 our elder associate Linggi Plantations Limited paid a dividend of 237½ per cent. I thought then and I still think it was a fabulous dividend. But that view was not by any means universal. At the Annual Meeting, a shareholder expressed keen disappointment. He explained that he had paid 70s. for his 2s. shares in expectation of a dividend payment of 300 per cent. Another associated company, Malacca, was promising dividends of 100 per cent and its shares were dealt in at £15 to £16 per £1 share. Meantime, USB followed a faltering course. By 1913 it had fallen short of funds and was forced to find fresh capital in the form of a 7 per cent Debenture. For the purpose of that issue, Mr (now Sir) Eric Macfadyen was engaged to make a report on the company's properties. In the light of the company's present position this makes strange reading. Much of Sua Betong Estate was described as "an open lallang prairie" and, with other lands, constituted "one of the biggest open wastes in the FMS." Such trees as were planted yielded only 1 lb per annum, which evoked the remark that "with rubber selling at a low price it (i.e. the plantation) would not pay well." Our cost of production in 1913 was reported to be 3s. 7½d. per lb. The most astonishing content of that report is that despite such poor performances 6-year old rubber was valued at £180 per acre. If such values prevailed today, translated into present currency, the modern USB, with its large areas of high-yielding stock, replete with equipment, would be rich indeed. But the Stock Market, even in 1913, did not take such a favourable view of our assets and the £1 shares of the company were only given a nominal quotation of 3s. 9d. to 8s. 9d.

In the year 1908 the possibility of a synthetic rubber was mentioned only to be dismissed as nothing more than a bogey. But even so, its mere consideration so long ago was imaginative. In the same year it was stated that "satisfactory profit should be ensured to the producer for many years, even should the price of rubber fall to 3s." In such a context that word "even" is significant. But the forecast made so long ago has proved in the main remarkably accurate. Although, in contrast to the general trend of prices, rubber has declined and the industry has suffered much tribulation, it survives as a thriving and progressive enterprise, adapting itself to change, equipping itself to meet the aggressive competition of a new synthesis. The confidence of the past generation might well be renewed in the present.

LONSDALE INVESTMENT TRUST LIMITED

SATISFACTORY RESULTS AND OUTLOOK

The twelfth Annual General Meeting of Lonsdale Investment Trust Limited will be held on July 1st in London.

The following is the statement of the chairman, Mr T. L. McC. Lonsdale, circulated with the Accounts:

The misgivings I expressed in my statement in June last year as to the imminence and scale of the upsurge in economic activity in the USA were in the event unjustified, and income from our investments there and in the UK has been increasing. The increase in the gross income from the general investments of the Trust of £27,649 to £351,476 as shown in the Report and Accounts is, however, only partly attributable to increases in dividend rates; it derives in part also from the investments made with the proceeds of the 245,000 Ordinary Shares of £1 offered to Ordinary Stockholders in August at 40s. per share (equivalent to 10s. for the stock now transferable in units of 5s.).

The gross dividend from Robert Benson, Lonsdale & Co. Limited increased to £140,000 as compared with £120,000 last year, and the total gross revenue of the Trust was £495,696 as compared with £447,900.

After the deduction of expenses and taxation the resulting net income of the Trust increased to £239,965 as compared with £206,444 last year and, in view of the satisfactory results and outlook, an increase in the rate of the total dividend from 15 per cent to 16½ per cent has been recommended on the Ordinary Capital as increased from £1,755,000 to £2 million, although the funds raised by the increase of capital have been productive for only part of the year. Such a dividend involves approximately the same percentage distribution of earnings of the Group as last year.

ROBERT BENSON, LONSDALE & CO. LIMITED

As regards Robert Benson, Lonsdale & Company Limited, the consolidated profit was £499,947 compared with £429,431 and after taxation amounted to £266,026 as compared with £188,601, of which £158,276 has been retained in that Company and its subsidiaries. The costs involved in the move to the Group's new offices at Aldermanbury House in November have been written off before arriving at the retained amount. In this connection you will observe that the Consolidated Balance Sheet of Robert Benson, Lonsdale & Co. Limited now shows a General Reserve equivalent to the Ordinary Share Capital of £800,000, and that there are additional Revenue Reserves of £133,786.

The comprehensive statistical statements attached to the Report need no elaboration; in summary they show that the Trust's policy underwent no change during the year and that investments remain preponderantly equity. On valuation approximately one-third is in dollars, though a considerably smaller proportion of the new money raised last year was invested in North America.

The valuation of our quoted investments reflects the considerable rise in market values of equity investments in Europe and the United States for which the present marked preference for equity investment of institutional and public investors alike has been responsible. This attitude, which is creating important financing problems for governments everywhere, is at least in part actuated by the expectation of an increase in dividends during the phase of increasing industrial activity which is generally confidently predicted, and of which there is evidence in some quarters here. Certainly our present experience to date is of a satisfactory increase in investment income, and I expect this tendency to be maintained during the year.

CAPITAL PROPOSALS

In each of the past two years the Trust has raised rather less than £500,000 of new money, in the first by an issue of Debenture Stock, and in the second by an issue of Ordinary Stock. These funds have been profitably invested. Since the end of the financial year further investment has involved us in commitments of some £350,000. To meet this and to take advantage of the attractive opportunities for investment during the coming year which your Board considers will be available, particularly in this country, it is intended to raise a further £800,000 by issuing for cash, by way of "rights" to the existing Ordinary Stockholders, Shares of 5s. each, at a price of 16s. in the ratio of one Ordinary Share for every eight units of 5s. held and the Board expect to be able to maintain the present rate of dividend on the capital so increased. Subsequently it is their intention to make a scrip issue in the ratio of one Ordinary Share of 5s. each for every three units of 5s. held on capital as increased by the "rights" issue.

In order to enable such issues to be made it will be necessary to increase the authorised share capital, which is at present fully issued, and notice is being given at this time of the requisite resolution. It is proposed to make this increase £2 million—i.e. from £3 million to £5 million, of which £1 million will be used in making the proposed issues.

TRIBUTE TO SIR REX BENSON

The many-sided and profitable activity of Robert Benson, Lonsdale & Co. Limited continues to increase. As from March 1, 1959, Mr G. P. S. Macpherson succeeded Sir Rex Benson as its Chairman. Sir Rex had been Chairman for over 22 years and the success of the company is in large measure due to his leadership and remarkable energy and range of activity as well as to his knowledge of business in the United States and Canada and in the United Kingdom. Our debt to him can to some extent be gauged by reviewing the Company's record over the last ten years as shown on page 12—a story of progressive achievement. We are all very glad that he remains on our Board. Mr Macpherson has been a Director of the Company since 1936 and a Director of Lonsdale Investment Trust since 1947. With his considerable experience and great business knowledge we are confident he will prove a worthy successor as Chairman of Robert Benson, Lonsdale & Co. Limited.

BICC meets greater competition with greater efficiency

In reviewing the world-wide activities of the British Insulated Callender's Cables Group for the year to 31st December, 1958, the Chairman, Mr W. H. McFadzean, stated:

"In a year during which competition has been more intense than ever it is gratifying to report that our Surplus on Trading has increased by almost £1,000,000 to £8,808,610."

★

"Many factors have contributed such as the more favourable trend of copper prices and the reduced dislocation caused by our Replanning and Re-equipment Schemes, but the greatest contribution has come from even more important sources, namely, the still further improvement in our overall efficiency assisted, of course, by our increased output."

★

"The improvement shown for 1958 as a whole was largely achieved in the latter part of the year and resulted, I am glad to say, from a general improvement in the results of several companies in the Group both at Home and Overseas."

★

"Your Directors propose an increase of 1% to 9½% in the final dividend making, with the interim dividend of 4% already paid, a total distribution for the year of 13½% all less income tax, on the Ordinary Capital."

★

"The overall strength of our Balance Sheet is emphasised by the disclosed Reserves of over £32,000,000."

★

"Although the monetary value of our Sales fell slightly from £111,000,000 for 1957 to £110,000,000 for 1958, this was much more than accounted for by the lower prices ruling particularly for copper, the average price per ton of which was some £198 in 1958 against some £220 in 1957. It is clear that the physical volume of our Sales for 1958 was appreciably in excess of that for 1957."

★

"We are particularly pleased that in a year when overseas business has been generally extremely difficult, one-third or some £37,000,000 of our Sales represented direct exports from this country and sales effected by our Subsidiary Companies overseas."

★

"The recent break-up of certain Trade Associations is a development your Board have seen as likely for some time past. Coming at a time when there is excess capacity in certain sections of the industry, it must almost inevitably lead, from the short-term aspect at least, to even more fiercely competitive conditions than have recently applied."

★

"We have no doubt of our ability to surmount our difficulties. We have over recent years carried out a large investment programme in the re-equipment of our factories at home and the acquisition and development of overseas interests. We have spent fearlessly on research and development and have a widespread range of products and above all we have a highly competent team of people."

★

"Our aim can be simply expressed. It is to lead technically, produce quality products at the right prices, give a service second to none, and earn the reasonable return on our capital and effort which is our due reward."

★

"As regards immediate prospects, I would be very optimistic were it not for the adjustments that must take place in our industry between present supply and demand in certain products at least. If such adjustments are made in an orderly fashion we have nothing to fear. If not, then short-term results must be affected and the immediate future viewed with caution. We have, however, a great fundamental strength and a wide range of activities in many countries."

"In the medium and long term future I have every confidence in our ability not only to hold but also to develop our position in an industry which, whatever its present problems may be is essentially one of an expanding nature."

BEYER, PEACOCK & COMPANY LIMITED

(Locomotive Builders and General Engineers)

DEVELOPMENT AND EXPANSION

The annual general meeting of Beyer, Peacock & Company Limited was held on June 5th in London, Mr Harold Wilmot, CBE (Chairman and Managing Director), presiding.

The following is an extract from his circulated review:

The accounts for the year 1958 indicate continued financial strength and liquidity. The difference in the excess of current assets over current liabilities may not be considered significant, but the detail of debtors, stocks and work-in-progress and creditors all indicate a reduction in overall Group factory activity. This was the final point I made in my last review. As then visualised trading has been seriously affected by international conditions, and the fears then expressed have been confirmed. The reduced profit reflects a combination of less activity and lower prices.

Group development has continued. With a view to further diversification the Company acquired the whole of the equity of Air Control Installations Limited. For the same purpose the equity capital of BJN Engineering Company Limited, was also acquired.

Your board do not propose any further acquisitions of the above nature in the current year.

SUCCESS OF NEW COMPANY

In my last review I mentioned the formation of a Company (Beyer Peacock (Hymek) Limited) to promote the sale of Diesel Hydro-Mechanical locomotives. The order book of this new Company already runs into some millions of pounds.

This year we hope to consolidate our Group organisation. With this in mind we propose to operate the parent Company as a holding Company whose Board will thus be relieved of much detail and so be able to give more adequate consideration to important aspects of Group policy.

Your Board has most carefully considered the question of dividend and bonus in respect of the 1958 accounts. An interim dividend of 3 per cent was declared on January 30, 1959. As the result of professional advice, and in order to achieve considerable tax economy, no final dividend or bonus for 1958 has been declared. Instead the Board decided to declare an immediate interim dividend for 1959 of 9 per cent which will be paid on June 5th. In order that the total distribution for 1958 and 1959 shall not be unreasonable in relation to the facts, and unless the accounts for 1959 are considerably worse than is at present expected, a final dividend for 1959 of not less than 12 per cent will be declared as soon as the accounts for 1959 have been audited and subject to approval in general meeting. It should be understood that the above conception of a distribution programme is on the assumption that the Board may feel satisfied in due course that at least 10 per cent will be earned in the year 1960.

It is difficult to forecast the future. The year 1958 was a year of diversification. 1959 will be a year of consolidation. Order books are filling up, and in the absence of unexpected deterioration it may be not unreasonable to expect that for 1960 and the following few years your Company should enjoy some measure of all-round benefit from improving general trade.

The report was adopted.

AMALGAMATED METAL CORPORATION

SIR PAUL BENTHALL'S REVIEW

The thirtieth Annual General Meeting of Amalgamated Metal Corporation Limited will be held on June 23rd, at Princes House, 93 Gresham Street, London, E.C.

The following is an extract from the Statement by the Chairman, Sir Paul Benthall, KBE, which has been circulated with the report and accounts for the year ended December 31, 1958:

Before reviewing the affairs of our company I should like to refer to the retirement of Mr Walter Gardner from the office of Chairman, and to thank him on your behalf for the distinguished services he has rendered.

Our turnover in terms of tonnage in 1958 was maintained at almost the same level as the previous year but in the case of most metals and commodities in which we deal the average prices were lower than in 1957. The profit for 1958 before taxation is £817,662 compared with £1,023,375 for the previous year.

The net charge for taxation is £412,502 compared with £590,472 in 1957.

After allowing for minority interests the group profit after taxation is £437,109 compared with £430,109 for 1957. It is proposed that the final dividend on the ordinary shares should again be at the rate of 6 per cent. Dividends will absorb in total a sum of £270,583.

SUBSIDIARIES' ACTIVITIES

As was the practice of my predecessor, I set out below some information about the activities during the year of our subsidiaries.

In Australia, The British Metal Corporation (Australia) Pty. Limited are the proprietors of a company called Moorside Investments Pty. Limited, whose objective is now to finance, by means of hire purchase, some of the sales of two of BMC (Australia)'s subsidiaries, i.e., Goodall & Co. Pty. Limited and Lapthornes (SA) Limited. These subsidiaries are engaged in the distribution of machine tools, woodworking machinery, etc. The business is proceeding satisfactorily.

The British Metal Corporation Limited investment in Rhodesian Asbestos Limited proved to be a disappointment, and it was sold at a loss last year.

In view of the substantial proportion of its total investments represented in the BMC portfolio by its shares in Norddeutsche Affinerie, it was decided to make a moderate reduction in this holding, and this transaction took place on profitable terms. BMC also sold at a profit its entire holdings in Lodge-Cottrell Limited.

The net result of the three transactions mentioned is a substantial profit. You will see part of this profit reflected in the increase of £101,844 in Capital Reserves, and the balance, an amount rather larger than the average profit on sales of shares in recent years, is included in trading profit as it was realised by a subsidiary finance company.

Henry Gardner & Co. Ltd. has continued to trade satisfactorily although, due to the low price of many commodities in which it deals, its activities and profits have been somewhat restricted.

METAL MARKETS

After falling persistently in the two preceding years, the metal markets in 1958 gave a steadier, but mixed performance, which largely reflected the character of the world's overall industrial showing. With the trend of demand less decisive than in previous years, supply and other factors peculiar to each metal had greater effect in 1958, and account for the divergent metal price movements.

The copper market revived from a low point of £160 5s. (for cash copper) in February to £259 15s. a ton in November, due mainly to the heavy aggregate restriction of output in the first three-quarters of the year and the big strike stoppages in Northern Rhodesia and Canada from September onwards. World production fell to 3,390,000 tons in 1958, against 3,525,000 tons in 1957. Consumption of copper, in total, showed little change from 1957. At the end of the year, cash copper was quoted at £220 2s. 6d. a ton.

The lead and zinc markets in 1958 were held down by a further decline in American consumption and by a check to further expansion in other countries. The outstanding event, for both metals, was the decision of the US Administration to impose quotas on imports, which took effect on October 1st.

Spot lead opened at £72 2s. 6d. a ton in 1958 and, although touching £78 in June and £77 in October and November, it was more often than not struggling, so to speak, on the floor. The lowest quotation was £67 18s. 9d. in August and the year's closing quotation was £71 16s. 3d. a ton. Zinc made a relatively better showing, especially in the last quarter of the year. Spot zinc opened in 1958 at £61 10s. a ton, fell to £61 3s. 9d. later in January, rose to £77 10s. in November and finished the year at £75 17s. 6d. a ton.

In tin, interest centred on the International Tin Council's efforts, by drastic curtailment of supplies and substantial Buffer Stock purchases, to hold the price at £730 a ton. The Buffer Stock manager accumulated in all, some 28,000 tons by September. He stopped buying on September 18th and the market broke that afternoon to £642 10s. (cash), but recovery followed quickly and, from the middle of October, prices ran comfortably above the £730 level. Consumers bought very sparingly during the year and sales of tin by the USSR played a big, depressing part. The tin industry is now in much better shape, with output restriction partly eased.

RUBBER

The average price for spot rubber in London during 1958 was 23½d. as compared with 26⅛d. during 1957. The highest price reached was 26½d. during November and the lowest 21d. during May.

World consumption of natural and synthetic rubber combined was approximately 3,220,000 tons, showing an increase of around 75,000 tons as compared with 1957. Natural rubber consumption at 1,990,000 tons increased by 105,000 tons, whilst the use of synthetic fell by some 30,000 tons. The increase in natural was due to strong demand from the USSR, who imported 209,000 tons as compared with 77,500 tons in the previous year.

COCOA

The Cocoa market experienced another active year and was subject to sharp fluctuations in price, mainly owing to poor crops in Ghana and Nigeria. The highest price for Accra was 400s. per cwt in June and the lowest 275s. in October.

ROYAL WORCESTER LIMITED

HIGHER TURNOVER AND PROFIT LEVEL

The twenty-sixth annual general meeting of Royal Worcester Limited will be held on July 6th at Worcester.

The following is an extract from the circulated statement of Mr J. F. Gimson (Chairman and Managing Director):

In spite of the recession in North America, the Group profit before taxation is £179,914 compared with a loss of £57,581 in 1957.

Consolidated Profit and Loss Account: We have available in the Group £301,194, carried forward from 1957, plus £91,365 in respect of the 1958 trading. The improved results have caused your Directors to recommend a final dividend of 10 per cent which, with the interim dividend of 2½ per cent paid on February 27, 1959, will make the distribution 12½ per cent less income tax for the year. Your Directors have transferred £20,000 to the general reserve, leaving a balance to be carried forward of £337,832.

All the manufacturing Companies comprising the Group showed improved results. The action taken by Welwyn Electrical Laboratories Limited had the desired effect resulting in a very successful year's trading. During the year this Company made further progress in the mechanisation of many processes, and in the development of automatic machines.

The Worcester Royal Porcelain Company Incorporated of New York increased its sales by 27 per cent which, in view of the recession in America, was no small achievement.

During 1958 it became apparent that we must give a better service to our customers in Canada by carrying stocks in that country for immediate delivery, as has been our practice in the United States. Accordingly on January 2, 1959 a new Company, Royal Worcester Porcelain Distributors Limited, was established in Toronto to carry out this service for the Worcester Royal Porcelain Company (Canada) Limited. The formation of the new Company will enable us to give a satisfactory service to the whole Dominion, and I am sure that this will be reflected in higher sales.

Welwyn Canada Limited: The factory of Welwyn Canada Limited adjoins the factory of Bach-Simpson Limited, a Company manufacturing Electrical Measuring Instruments, Electronic Control Apparatus and Electronic Laboratory Equipment for the Canadian market, and for some time it has been apparent to your Board that it would be in the Group's interest to acquire control of Bach-Simpson Limited in order to strengthen our position in the electronic industry in North America. Accordingly an agreement has been negotiated to acquire Mr J. R. Bach's controlling interest in Bach-Simpson over a period of years.

Since the commencement of this year the major Companies in the Group are enjoying a higher turnover and profit level than at this time last year. Although I must emphasise that expensive commodities such as we manufacture are very vulnerable to political or economic disturbances, I expect the results for 1959 will be at least as good as those for 1958.

GUARDIAN ASSURANCE COMPANY LIMITED

Annual General Meeting, June 10, 1959 (Chairman: The Right Honourable Lord Blackford, DSO, JP)

EXTRACT FROM THE REPORT AND ACCOUNTS

During the year the Group premium income from Fire, Accident and Marine business increased by £1,145,000 to £31,545,000 and the total surplus from underwriting and from the Life Department was £770,000 against £192,000 for 1957. Results show a significant improvement despite problems referred to in previous years of adverse conditions and expenses in Canada and the overall unprofitability of Motor Insurance.

Ordinary Share Capital	3,150,000	3,150,000
Ordinary Dividend :—		
Rate	13%	9%
Times covered	2.5	2.9

The Group has 7,400 shareholders and 7,000 employees.

MOTOR CAR DIVISION. Sales were a record. Indications are that output will shortly reach a new record level. The expansion and modernisation programme has been justified. New door locks are in large-scale production, and licensees in France and Italy have obtained major contracts for them.

FLIGHT PRODUCTS. Activity for military and civil aircraft remained at a high level. Applications of high precision sheet metal fabrication have been made to other fields and total sales should thereby be maintained in spite of the cut back in military requirements.

HYDRAULICS. The year was adversely affected by a recession in the heavy commercial vehicle industry. However, the order book is now at a record level. A new design of underbody tipping gear has been introduced, and a licence obtained for the manufacture of pumps and control valves for industrial applications.

ELECTRONICS. A majority interest was acquired in The Wayne Kerr Company Ltd., which specialises in electronic measuring instruments of advanced design for laboratory use and industrial process control some of which are without counterparts in the U.S.A. The famous tape recorder and marine products of The Ferrograph Company Ltd. have continued to be in high demand.

AUSTRALIA. The Australian company had its most successful year. A large programme of capital expenditure is being undertaken by some of the world's major car companies. Accordingly we are planning a new factory to keep pace with the expansion.

Principal Operating Companies in the group—
WILMOT-BREEDEN LIMITED — TELEHOIST LIMITED
THE FERROGRAPH CO. LIMITED — THE WAYNE KERR CO. LIMITED

NEW BROKEN HILL CONSOLIDATED

REDUCED OUTPUT AND LOW METAL PRICES

The twenty-third annual general meeting of New Broken Hill Consolidated Limited will be held on June 23rd at 37 Dover Street, London, W.1.

The following is an extract from the Statement by Mr L. B. Robinson, which has been circulated with the report and accounts:

The low level of lead and zinc prices prevailing at the end of 1957 continued during the first three-quarters of 1958 and showed only a slight improvement in the last quarter. The average London Metal Exchange prices for prompt delivery of these metals during 1958 were £72 16s. for lead and £65 18s. 1d. for zinc, compared with £96 13s. 4d. and £81 12s. 4d. respectively during 1957. At the 1958 price levels there can normally be little profit from mining these metals, but due partly to the average assay of the ore produced during the year being higher than that of recent years, partly to a reduction of operating costs and partly to some satisfactory forward contracts, a trading balance of £1,037,063 was achieved, compared with £1,904,035 for 1957.

The profit before taxation amounted to £696,303, compared with £1,591,313 for 1957.

The provision for Australian and United Kingdom taxation on the profits for the year amounts to £219,986 compared with £534,217 for 1957.

The result is a net profit for the year of £476,317, compared with £1,057,096 for 1957.

The directors are recommending a final dividend of 10d. per share, free of tax, compared with the equivalent of 1s. 8.7d. per share free of tax, last year. This gives a total distribution for the year of 1s. 4d. per share free of tax, compared with the equivalent of 2s. 10½d. free of tax for 1957.

In the prevailing conditions of world markets in which a surplus of lead and zinc had developed, the Company in conjunction with The Zinc Corporation, Limited, budgeted for a reduced production of ore and recoverable metals in 1958. This policy will be continued until such time as a more favourable outlook for these metals justifies a return to normal operating conditions.

There was a reduction of approximately 27 per cent in the tonnage of ore treated in 1958 and production of recoverable lead during the year was 12 per cent below the 1957 tonnage. Zinc concentrate output was lower by 23 per cent. Despite the substantial reduction in ore treated the average cost per ton of ore was only slightly higher in 1958 compared with the previous year.

The operating efficiency, measured by the output in tons per mining-department-employee-shift at 4.64 in 1958 is below the record level of 5.58 achieved in 1957. A lower tonnage from the sublevel stope and the reduced proportion of men on stoping operations caused this reduction. On the other hand, the output per contract-stoping-miner-shift (excluding the sub-level stope) showed further improvement at 19.58 tons as compared with 18.18 tons in 1957 and 16.54 tons in 1956.

The recoveries of lead and silver in lead concentrate and zinc in zinc concentrate showed a further satisfactory overall improvement.

APPOINTMENTS

STATISTICAN

The INTERNATIONAL FEDERATION OF COTTON & ALLIED TEXTILE INDUSTRIES has a vacancy for the newly created position of a STATISTICAL OFFICER at its headquarters in Manchester. The position will, after initial training, involve full responsibility for the Federation's world-wide statistical service. There is scope for initiative and development, opportunity for foreign travel and independent work in small, modern secretariat of expanding international organisation.

The candidate should have a good education (academic or practical) in statistics. He should be familiar with the techniques of collecting and compiling statistical data and have an adequate knowledge of economics to interpret statistics and observe and analyse trends. He should also be able to take charge of the Federation's accounts. In addition to English, a good working knowledge of French or German is required. Salary and pension by arrangement.

Applications, with full particulars, should be sent, marked "Confidential," to The Director, International Federation of Cotton and Allied Textile Industries, 567 Royal Exchange, Manchester 2, England. They will be dealt with in the strictest confidence by an Appointments Committee.

ADMIRALTY. A Temporary Assistant STATISTICIAN required for service in London. Applicants must normally be British subjects and possess either First or Second Class Honours Degrees in Mathematics or Economics with Statistics as a special subject. Salary (London scale) £655 — £1,150 (men) and £655 — £1,108 (women—rising to men's scale by 1961). Annual leave four weeks two days plus public holidays.—Write, giving age, full details of qualification and experience, to Ministry of Labour and National Service, Professional and Executive Register (PE 1293), Atlantic House, Farringdon Street, London, E.C.4. Only those applicants selected for interview will be advised.

A COST ACCOUNTANT

is required by

KUWAIT OIL COMPANY LTD.

for service in KUWAIT

Applications are invited from Associates of the Institute of Cost and Works Accountants who should be in the age range 23-28 and have not less than one year's experience in industry since qualifying.

Local salary according to qualifications and experience, but not less than £1,900 p.a. Initial kit allowance £85.—Write for application form, sending brief details and quoting K.2469, to Box B/65, c/o 191 Gresham House, E.C.2.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER OR ASSISTANT LECTURER IN ECONOMIC STATISTICS. Duties to commence on October 1, 1959, or as soon as possible thereafter. Salary scales per annum are as follows: Lecturer, £900 to £1,650; Assistant Lecturer, £700 to £850; initial salary and status according to age, qualifications and experience. Membership of F.S.S.U. and Children's Allowance Scheme.—Applications should be sent not later than July 6, 1959, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

WOOLWICH POLYTECHNIC LONDON, S.E.18.

Applications invited for:

(i) Lecturer in Management Studies with particular reference to Production Planning and Control, Work Study, Industrial Organisation, etc. Candidates should have a Honours Degree or other equivalent qualification and have had appropriate industrial experience.

(ii) Assistant Grade B to teach Economics (theoretical and applied), Business Statistics and Allied Subjects. Candidates should have an Honours Degree.

(iii) Assistant Grade B to teach Shorthand-Typewriting and Secretarial Practice to Advanced Standard. Candidates should be able to offer a modern foreign language, preferably German, as an additional subject.

Salary scale: Lecturer, £1,200 — £30 — £1,350, plus 5 per cent; Assistant Grade B, Men, within £650 — £1,200, plus 5 per cent, Women, £580 — £960, plus five sevenths of this and men's scale, plus 5 per cent, commencing salary according to qualifications and experience. All posts carry London Allowance of £36 to £48, plus 5 per cent.

Particulars and application form from Clerk to Governors, to be returned by June 27, 1959.

UNIVERSITY OF GLASGOW

ASSISTANTSHIP IN ECONOMIC HISTORY

Applications are invited for an Assistantship in Economic History. Salary scale: £700 — £850 per annum. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (three copies) should be lodged, not later than June 25, 1959, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

UNIVERSITY OF GLASGOW

ASSISTANTSHIP IN POLITICAL SCIENCE

Applications are invited for an Assistantship in Political Science. Salary scale: £700 — £850 per annum. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (three copies) should be lodged, not later than July 4, 1959, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON.
Secretary of University Court.

SOLICITOR

required in Legal Department at the London Headquarters of a large industrial corporation. The post, which offers good prospects, would suit a recently qualified man including a June finalist, of high ability and energy. The successful applicant will be engaged initially in work of a commercial nature, but will have opportunities of gaining wider experience in common law, parliamentary and other work. Appointment superannuable, initial salary between £900 and £1,000. Write, giving particulars of age, education, qualifications and experience, to Box 1180 before June 22, 1959.

FINANCIAL SECRETARY. The Society for the Propagation of the Gospel invites application for this appointment from professionally qualified men, with general administrative experience and knowledge of administration of trusts. Knowledge of mechanised accounting method desirable.—Applications must be accompanied by full details of qualifications and experience, and should be submitted by June 30th to the Home Secretary, S.P.G., 15 Tufton Street, Westminster, S.W.1, and marked Private.

LONDON COUNTY COUNCIL

BALHAM AND TOOTING COLLEGE OF COMMERCE, TOOTING BROADWAY, LONDON, S.W.17

Required September, 1959, two assistants, Grade B; graduates or professional diploma holders who can offer some of the following: Bookkeeping and Accounts, Commerce, Economics, Mathematics, Commercial Calculations, English, History.

For full-time and part-time day students taking "A" level G.C.E. and O. and H.N.C. courses.

Burnham F.E. salary scale within the range £720 6s. x £26 5s. to £1,336 13s. (men); £699 6s. x equal pay increments to £1,336 13s. (women). Commencing salary and maximum according to age, qualifications and experience.

Application forms from Secretary of College, to be returned by June 19th. (1320)

H.M. TREASURY (ECONOMIC SECTION). At least two appointments for work on economic trends at home and overseas are offered to men or women at least 21 and preferably under 30 with at least a 2nd class honours degree in Economics or related subject. Final year students may apply. Initial appointment for five years, or less by arrangement. Salary within the range £655 — £1,150 (men), the starting point being determined by age and experience. F.S.S.U.—Write Civil Service Commission, Burlington Gardens, London, W.1, for application form, quoting 4994/59. Closing date June 23, 1959.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

Applications are invited for an Assistant Lectureship in Social Administration. Preference will be given to those candidates with experience of or an interest in the social problems of developing countries or community organisation and group work. Salary scale £700—£850 plus £60 London Allowance, with superannuation benefits and family allowances. In assessing the starting salary consideration will be given to qualifications and experience.

Applications, with the names of three referees, should be received not later than June 30, 1959, by the Secretary, The London School of Economics and Political Science, Houghton Street, London, W.C.2, from whom further particulars may be obtained.

BRISTOL EDUCATION COMMITTEE

THE COLLEGE OF COMMERCE, UNITY STREET, BRISTOL, 1. (Tel.: 23016.)

Full-time Graduate Assistant, Grade B, for Accountancy and Economics to Intermediate level, and Commerce required to commence duties in September, 1959, if possible.

Full particulars of post and application form from Registrar.

THE UNIVERSITY OF HULL

Applications are invited for an Assistant Lectureship or Lectureship in Economics, tenable from October 1, 1959. Salary scale—Assistant Lecturer £700 to £850; Lecturer £900 to £1,650 per annum; with F.S.S.U. and children's allowances. Further particulars may be obtained from the undersigned, to whom applications (five copies) should be sent not later than July 6, 1959.

W. D. CRAIG,
Registrar.

SECRETARY. The Tavistock Institute, a social science consulting and research organisation, invites applications for the post of secretary to the Deputy Chairman of the Management Committee.

Competent shorthand and typing are essential and experience of general secretarial duties desirable.

Salary range £425 — £600; the starting point in the range will depend upon age and experience. Luncheon vouchers to the value of 15s. per week are given and there is a staff savings scheme to which the Institute contributes. Hours 9.30 to 5.30; no Saturdays; four weeks' holiday (existing arrangements will stand).

Those interested should apply in writing or by telephone for further information and application form to the Assistant Secretary, Tavistock Institute, 2 Beaumont Street, London, W.1. (WELbeck 5415.)

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

DEPARTMENT OF ECONOMICS AND SOCIAL SCIENCE

Applications are invited from graduates for the post of Research Assistant in Social Science. Salary £675 p.a. The appointment is for one year but may be renewable for a further two years. Duties will include work on personnel management and social administration problems. Experience of interviewing and of statistical method will be an advantage.—Applications (six copies) should be submitted to the Registrar, University College, Cathays Park, Cardiff, not later than June 30, 1959.

APPLICATIONS are invited for a senior post in an organisation with widespread overseas interests. Applicants must have had commercial experience, particularly in conducting negotiations and investigations. Age 35-40; contributory pension scheme. Applications, which will be treated as strictly confidential, should give full personal particulars, details of qualifications, experience and previous appointments, and salary required.—Apply to A.K., Adv., Box No. AA 783, 212a Shaftesbury Avenue, London, W.C.2.

NORTHUMBERLAND COUNTY EDUCATION COMMITTEE

ASHINGTON TECHNICAL COLLEGE

Applications are invited for the following post in this new and developing college. Training in teaching will be an advantage.

Responsible woman teacher (Grade B) to be responsible for general welfare of girls in the Commerce department. Applicants should be able to offer one or more of the following—English, Commercial subjects, Speech Training, Hygiene and Physical Education. A special interest in students in the age range 15-21 is essential. Salary £609 x £21 — £861 plus equal pay increments with approved allowances for graduation and training.

Forms of application and further particulars may be obtained by forwarding a stamped addressed foolscap envelope to The Director of Education, County Hall, Newcastle-upon-Tyne 1, to whom completed forms should be returned not later than fourteen days after the date of this advertisement. Registered Disabled Persons will be considered.

APPOINTMENT REQUIRED

YOUNG MAN, 26, experienced in Foreign Trade, seeks employment, preferably in London, with an organisation with overseas contacts. Proficient in office procedure (typing, etc.). Spanish.—Write Box 1178.

BUSINESS AND PERSONAL

Recently introduced ... the

COVENTRY CLIMAX UNIVERSAL fork truck offers-

- choice of power-**ELECTRIC** or **MECHANICAL**
- choice of fuel-**DIESEL · PETROL · L.P.G†**
- choice of tyres-**CUSHION** or **PNEUMATIC**
- maximum **STANDARDISATION** of parts

With the introduction of this versatile range of trucks the user is able to adopt standardised equipment throughout his organisation, employing electric, diesel or petrol driven trucks as circumstances dictate, with the advantages of a single source of supply and responsibility, simplified operation, reduced maintenance and servicing costs.

This development has been eagerly awaited and received in many organisations.

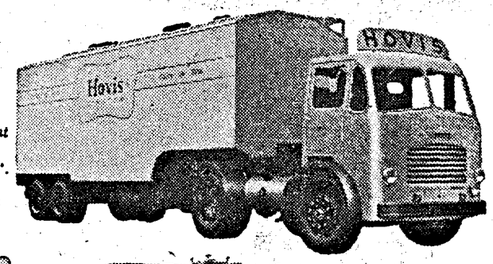
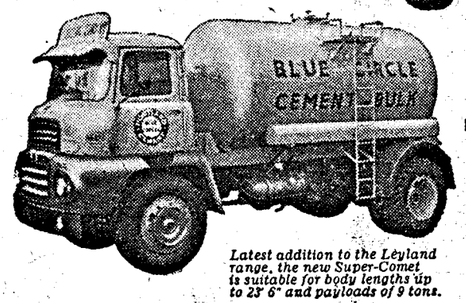
A Leyland Comet articulated outfit carrying a payload of 12 tons.



LET'S REPEAT IT...



The Leyland 6-wheeled Hippo, with its reputation for high mileages on low fuel consumption, enjoys a world-wide popularity.

That seems to be the slogan of most Leyland operators. Having once bought a Leyland, back they come for more. And no wonder. Experience has taught them that the wide margin of performance which characterises every Leyland ensures reliability, low maintenance cost and a very long trouble-free life... and, in fact, in the long run the Leyland gives greater transport economy than any other truck.

Whether it is in the 12-ton Comet or the big maximum capacity multi-wheelers and tractors, you will find that something extra which has made the Leyland supreme in road haulage transport. Ask the men who own them—or better still prove it for yourself with a demonstration.

Repeat orders for the Beaver tractor spotlight the increasing trend towards Leyland 'artics'.

Latest addition to the Leyland range, the new Super-Comet is suitable for body lengths up to 23' 6" and payloads of 9 tons.

...The Leyland is more popular than ever

Brunswick

a name established on customer confidence

The Brunswick trade-mark has earned customer confidence since 1845. It appears on products of unequaled performance for use in recreation and education. Today these products, constantly improved by research and development, are available on a world-wide basis through Brunswick International C. A.*

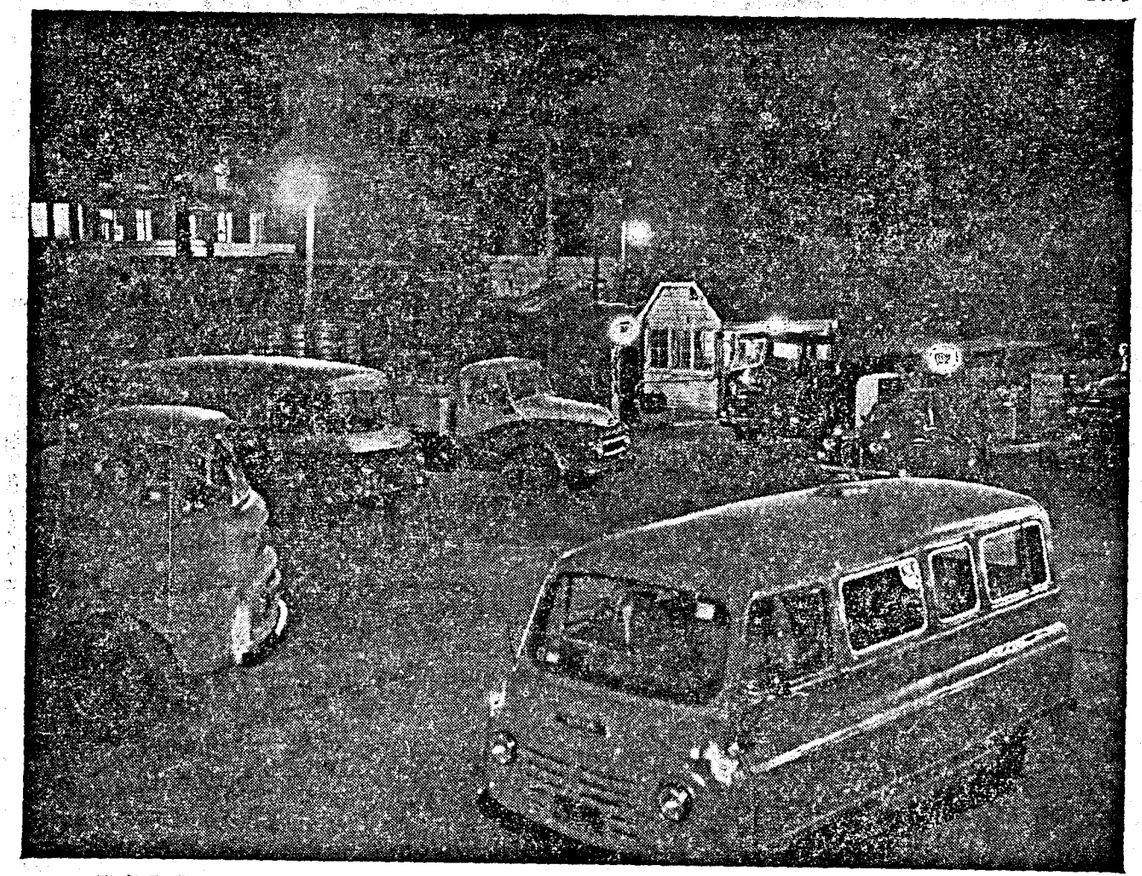
BOWLING: As an investor or proprietor, you are offered the equipment and assistance necessary for successful operation of bowling establishments around the world. As a bowler, you can choose your equipment from the world's most famous and complete line.

BILLIARDS: Both players and billiard room owners look to Brunswick for all the equipment they need, from one reliable source.

SCHOOL FURNITURE: Movable furniture and fold-away gymnasium equipment of advanced design increase the learning and recreational activities available to today's students.

GOLF AND ATHLETIC EQUIPMENT: Under the name MacGregor, "the choice of those who play the game" for more than 80 years, Brunswick offers you a quality line of athletic equipment for individual and group use.

Here are a few of the famous trade-marks of products of The Brunswick-Balke-Collender Company:



BOWLING • *Black Beauty* bowling balls • *Fireball* bowling balls • *Dura-King* bowling pins • *Red Crown* bowling pins • *Tel-E-Score* projectors • *Crown Imperial* bowling equipment • **BILLIARDS** • *Monarch* cloth and cushions • *Centennial* balls • *Challenger* cues • *Anniversary* tables • **FURNITURE** • *Brunswick school and office furniture* • *Brunswick gymnasium equipment* • **MacGREGOR** • *Tourney* golf balls • *Jack Burke* irons • *X10L official* basketball • *Official 97* baseballs

FOR MORE INFORMATION about Brunswick and MacGregor products, or to discover how you can take advantage of the opportunities in bowling center investment, write to Department EC-1

AUSTIN AND THE LONG NIGHT HAUL

NIGHT: 4 miles out of Worcester. On the A38, main artery connecting Birmingham and the North with the West Country, stands Kempsey Filling Station and Transport Cafe. Here, any night in the huge park, you will find 50 or 60 vehicles at a time—from giant tank transporters to light vans. They come from Devon and Cornwall, from Lancs. and Staffs., from Yorkshire, from Scotland.

Here the drivers stop—for fuel, for a meal, a cup of char, a look at the telly. Some stay to sleep—but from 3 a.m. the trucks pull out. Many are Austins—carrying anything from marmalade to machinery, going anywhere between the Lizard and Loch Ness.

Austin—the widest range

The picture shows 7 Austins. If the whole range were here, the vehicles would be no bigger than pinheads. *Because Austin offer a wider range than any other manufacturer in this country today.* The list includes vans from ¼ ton to 2 tons, trucks from 2 to 7 tons, with 5 and 7 ton tippers, prime movers for 15 ton gross train weights, chassis units for any type of bodywork. LWB or SWB. Normal or forward control. Petrol or diesel.

Austin—the greatest value

Austin value is a fact—measurable by *results. Take the F.C. 5 tonner at the pumps.* It is carrying boiler parts from Halifax to Bradford-on-Avon. In 2 years this petrol-engined truck has clocked up 107,000 miles. *Yet to date its engine has needed no repair or replacement.* It is no exception. Other Austin owners tell similar stories. Of value. Of economy—in initial cost, fuel consumption, maintenance bills. What's more, Austins are backed by the best service and parts organisation in Britain—B.M.C. Service. And warranted for 12 months. Why not find out from your Austin dealer what Austin commercials can offer *you?*

HOW MANY AUSTINS CAN YOU SPOT?

1. New 5 ton f.c. 2. 1½ ton diesel van. 3. 5 ton n.c. 4. 5 ton f.c. petrol. 5. ½ ton van. 6. 3 ton n.c. 7. 152 Omnicoach.

M. Gabriel-Robinet, editor of the famous Paris daily Le Figaro, *on the balcony of the newspaper's offices on the Champs-Elysées. Below, he gives some reasons why* The Observer *is respected by influential people in France.*

"Political leaders in France attach great importance to its opinion"

says the Editor of Le Figaro

"*The Observer* is a newspaper with which journalists and political leaders in France are very much at home," says Monsieur Louis Gabriel-Robinet. "If they do not always see eye-to-eye with it—particularly where the problems of their own country are concerned—they attach great importance to its opinions."

"*Ils attachent un grand prix à son opinion.*" The people he refers to are those who influence or control events at all levels... much of the future depends on the decisions they make. When a newspaper is able to influence *them*, what it says is itself news. In England, America, all over the world today, *The Observer* is quoted by public men and politicians, in speeches, in broadcasts, in the press.

Why? Because, in M. Gabriel-Robinet's words, "what *The Observer* has to say is said with scrupulous fairness; and with a respect, which we share, for the traditions of a free society."

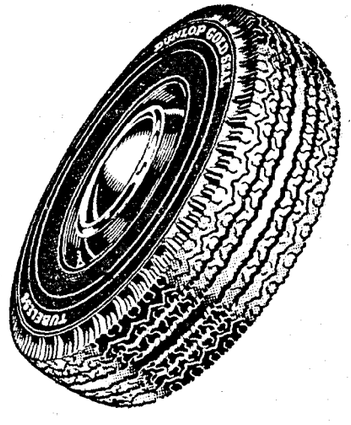
That is precisely why *The Observer* is read here at home by almost everyone who can be said to form opinion. As election fever increases, *you* will find it more and more helpful to have a weekly newspaper that is truly independent—free from the pressure of all political parties.

And you'll find the whole paper interesting—on stage and cinema and TV; on business and sport, on books and music and travel, on all that makes life worth while. Give your newsagent an order for *The Observer*—in time for this Sunday!

THE OBSERVER EVERY SUNDAY

Long days..

Long weekends..



Long runs..

...Above all the assurance of long and trouble-free mileage from your Dunlop tyres—these are the joys you are looking forward to this summer. Longer days invite longer journeys. The more you travel the more you'll be glad you chose Dunlop 'Gold Seal', the tyres which make motoring really carefree motoring.

DUNLOP

'GOLD SEAL'

Queen and President

NEXT week, the holders of the world's most important hereditary office and its most responsible elective office are to meet on the St Lawrence Seaway. The Queen's meeting with President Eisenhower prompts some nice reflections on the modern appropriateness of the British and United States constitutions. Usually such reflections take the form of gibes at the old-fashioned British; it might be more reasonable nowadays to switch criticism round the other way. While the British constitution originally seemed to have been born illogical, the United States constitution seems to be being increasingly rendered illogical by the force of modern circumstance. There is a strong case for arguing that the United States suffers disadvantages, in this day and age and in its proud duty as the free world's leader, through the historical accident that it does not enjoy a monarchical system of government.

This is not the result of superior wisdom on the part of any British founding fathers. The conventional republican critics of royal privilege are right in denying that. It is very nearly true to say that the concept (or at least the language) of modern constitutional monarchy was invented by a former editor of *The Economist* in an intelligent but slightly reactionary panic at democracy's advance. When Walter Bagehot in the eighteen-sixties wrote his famous precepts for monarchy, which future sovereigns since then have been made to imbibe in their nursery schoolrooms, the social class to which Bagehot belonged — "the people who have something to lose, and who do not intend to lose it" — were in a dither of fear lest the reasoning government for which they stood might be about to be swept away in the engulfing tide of a largely illiterate electorate, under the newly emerging system of "one man, one vote".

The straw at which Bagehot clutched to counter this fear was the peculiar idea of monarchy which he found among the lower middle classes and in his own kitchen. His theories about the potency of this straw were so comforting to reasoning men that they at once became immensely popular, and were acted upon by royal advisers. The emerging working classes, he felt, would like their minds to dwell upon Queen Victoria more than upon anything else in politics. A constitutional monarchy had "a comprehensible element for the vacant many, as well as complex laws and notions for the inquiring few", so that the inquiring few could get on with "the efficient part" of government while the dignified or theatrical part of government, over which the Queen presided, would excite the reverence and loyalty of the "narrow-minded, unintelligent, incurious multitude". "A family on the throne", he wrote, "is an interesting idea also", for the royal family could sweeten politics by the seasonable addition of nice and pretty events.

There was not the least reason, in the 1860's, to suppose that this sugar-plum theory of royalty would work. For one thing, hereditary royalty might not be willing to work things in this way. It is hard to conceive that so able a man as Albert the Good, who had died only a few years before Bagehot wrote, would have agreed to play merely the pretty puppet for long, at a time before it was generally realised that this might often be the proper role for monarchy; had Prince Albert lived it is very likely that, as he grew to be much more experienced than the political ministers changing before him and the Queen, he might have tried disastrously to shift the emphasis in Britain towards the sort of political monarchy that the Kaiser later operated in Germany. There was also the much bigger difficulty that the working people to whom the new Reform Acts were giving political power in the 1860's were very different from the conservative lower middle class or the traditionalist servants whom Bagehot found in his kitchen.

The potential Dr Bandas of England — the sort of men who, even as Bagehot wrote, were forming some of the first effective industrial trade unions among unskilled factory hands, amid some bomb throwing in Lancashire and Sheffield — did not seem at all the sort to find in the Queen a unifying symbol who would rally their support for traditionalist forms of government ;it seemed much more likely that they might regard her as a representative of upper class privilege, and want, like Mr Lee of Singapore now, to take her picture away.

Yet, miraculously, Bagehot's vision has proved right after all. On the side of royalty, this may have been the product of a series of unforeseeable accidents — the long widowhood of the elderly uninterested Queen; the growth during this period of an able civil service at the palace under the leadership of the monarch's private secretary; the fact that the first real clash between the new order and the old monarchical prerogative came when the representative of the new order was the smooth Mr Asquith and the monarch was the very new George V. So firmly entrenched is this constitutional tradition of Bagehotian monarchy that we can look out today upon the repetition of one part of the Albert the Good story — upon the fact that the consort of a woman sovereign is likely to be far above the average in ability — without anybody except the rather neurotic personal enemies of the consort's fosterfather supposing for a moment that there could ever be any danger in this. But it has been the growing-up of the people to fit in with the new concept of monarchy, rather than the mere growing-down of the monarchy to fit in with the new concept of government by the people, which has been an even more interesting development of the past century.

What has happened has been that the industrial economy has won the race towards making the rude multitude of the present day something of the same sort of people, in property holdings and through them in outlook on life, as the lower middle classes and above were in Bagehot's time. Admittedly the deep reverence which the ordinary Briton feels for the dignified part of his government today has also been strengthened by developments in the field of that "appeal to some vague dream of glory, or empire, or nationality", which Bagehot himself noted as being closely allied to the appeal of monarchy. Two bloody world wars, which were both won after once having seemed probably lost, have helped to tie the people ever more firmly to the crown; the growth of empire in the latter part of Queen Victoria's reign also had something to do with it, and then the shock of the decline of empire, which began with the unexpected difficulty in winning the Boer war, undoubtedly had very much more. (In more recent times, it is noteworthy that the few rash clowns who are rude to modern monarchy have had a much harder time in Britain immediately since the shock to national pride at Suez than immediately before it).

But possibly transcending these psychological factors have been the impetus and nature of modern material advance. The growth of well-being — making more and more people feel that they have something to lose, and do not intend to lose it — has gone hand in hand with the growth of literacy; with them have come the age of popular newspapers, women's suffrage, wireless, cinema, and television, all either helping to put the theatrical elements of government more intimately on show, or else making them politically more important.

THE point is, however, that many of these things which increase the appeal of the dignified part of government have also been going forward in the United States. This is true even of some of the psychological factors. America too was in both world conflicts, Korea was her Boer War, and her people are at present deeply and nationalistically hurt by exaggerated modern criticism of some of the aspects of the so-called "ugly American" abroad. It is even more true of what might be called the show business appurtenances of government; Americans have all of these in full measure, and Mr Jim Hagerty too. The trouble is that, lacking the inheritance of a hereditary head of the dignified part of their government, Americans seem increasingly likely to choose the head of the efficient part of their government at least partly according to his suitability in filling also the dignified role. And there are surely some great disadvantages in this.

There is the disadvantage that the qualities needed for the head of the efficient part of a government are not all the same as the qualities needed for the head of the dignified part of it, indeed in a dynamic society they may often be the opposite. There is the disadvantage that the dignified head of a nation tends to be protected by custom from brutal interrogation, which the political head of an executive ought never to be. Any British journalist, used to the hurly-burly of Prime Minister's question time in the Commons, must feel this strongly if he attends an American presidential press conference; he keeps on wanting a journalist to say "Mr President, you haven't really answered my question".

The age of the dignified presidency also seems likely to make the re-election of any incumbent for a second term almost automatic, to exert illogical influences on the question of the succession, and to aid (sometimes almost to necessitate) the continuance in office of a sick man. It is arguable that once in recent British history more influence might usefully have been brought to bear, through the utilisable medium of monarchical advice, to persuade a sick head of the efficient part of government to retire, just a few critical months before he did; if ever a similar situation occurred again a sick Prime Minister's cabinet probably ought to work more quickly to ask that such monarchical advice should be tendered. But at least Britain has never been in any danger of finding that the sickness of a governmental head appears as a positive political advantage in securing the sympathetic suffrages of the people.

To say these things is not to launch an attack upon President Eisenhower, in either of the two roles — the efficient and the dignified — which he is now called upon to fill within the American constitution. It is indeed a tribute to his unusual qualities that he was originally elected in 1952 as the best man to head a businessman's administration, and then in 1956 to stay on quite largely because he had won people's (perhaps especially women's) hearts as the nearest facsimile a politician could provide to the desired figure of a revered constitutional semi-monarch. But Britons can now explain why they are intellectually as well as romantically convinced that they have the apter, more virile and more workable form of constitution for the present day. And one wonders what — no doubt by some gradual change in functions rather than in nomenclature — the Americans are eventually going to do about it.

A Sin of No Commission?

The political future of the Central African Federation cannot be solved by politicians, either at Salisbury or at Westminster, riding on high horses

IT IS high time that the British Labour party and Sir Roy Welensky's cabinet in Salisbury had their obstinate heads knocked together. That is the dominant conclusion that emerges from a study of the difficulties that have beset and that may now wreck the Government's plan to send a mixed parliamentary commission to Northern Rhodesia and Nyasaland.

The idea of sending out a parliamentary commission originally arose out of Labour's rightly perturbed reaction to the declaration of states of emergency in Southern Rhodesia and Nyasaland last April. A strong demand welled up that a bipartisan delegation of British MPs should be sent to see for themselves what was happening there. This demand, at least on the Labour side, was partly motivated by pique over the expulsion of Mr Stonehouse from the Federation in the tense days before the emergency. Many other people, however, wanted British MPs to go. One of the soundest reasons for wanting this was to enable politicians to start thinking out what was to be done politically about the federation prior to the review of its constitution that is due in 1960 — rather than merely so that they should undertake detective work into what had or had not happened in the last days before Dr Banda's arrest.

Perhaps inevitably, this demand for an assertion of Westminster's duty to investigate the affairs of the protectorate met with behind-the-scenes opposition in Salisbury. In large part this was because of the local government's sensitiveness to widespread anti-Westminster feeling in the Southern Rhodesia electorate. But Salisbury also had its own ideas about the nature of the preparatory commission that needs to be set up to make proposals for the 1960 conference to consider. The Rhodesians' view is that this would be better done by civil servants from Britain and the Federation than by politicians; they point out that in the original creation of the federation the politicians failed for

years to frame a workable scheme, until the civil service preparatory commission under Sir William Douglass was set up to draft a constitution in 1952.

At this stage the lines became crossed. What had happened and what ought now to happen were obviously two separate issues, even though one bore upon the other; and the British government wisely decided to separate them. To deal with British public feeling and the Labour party, it sent out Mr Justice Devlin and his commission to report on "recent events" in Nyasaland; and to get Labour's reluctant agreement to the purely judicial nature of this inquiry it made a promise (which it apparently did not warn Sir Roy Welensky it had made) that later on, when passions had cooled, a bipartisan commission of British MP's, probably privy councillors, would go out. The MPs' job would be to report on current conditions in the two protectorates, with an eye to the constitution-making task to come. Labour, in return, promised to keep quiet in the House of Commons — a promise which it has kept.

SALISBURY has now, in effect, reluctantly agreed to receive the British M.P.s, but on two conditions. The first is that Rhodesian M.P.s should join the party; secondly, it continues to press for a "proper" preparatory commission of civil servants, to be drawn from Britain, the Federation and the three territories. Sir Roy now seems resigned to having the two commissions joined up in a sort of two-stage rocket, although whether the M.P.s would carry up the civil servants and then fall away, or the civil servants would boost the M.P.s into orbit, seems unsure. In either event he wishes Rhodesians to add fuel to the thrust in both stages. He reinforces this demand with the contention that it is impossible for M.P.s to appreciate the position in the protectorates without visiting the federal capital; but as Salisbury is the capital of self-governing Southern Rhodesia too, it would be an affront to Southern Rhodesian dignity to have a purely British investigating commission on its soil. One reason why Sir Roy does not really want any parliamentary commission, however, is that he has got no Rhodesian M.P.s (at least in his own party) who could hold a candle to a picked British delegation. The recent visit of Mr F.M. Bennett, Tory backbench member for Torquay, seems to have shocked Sir Roy and Sir Edgar Whitehead into humiliating proof of this.

The British Government's dilemma now is that if it accepts Sir Roy's nominees on the M.P.s' commission, Labour has apparently indicated that it will pull out of it; there will then be no bipartisan appreciation of the facts of the case in the Federation — let alone any approach to a political agreement on its future. On the other hand, if the British Government sent a purely British party of M.P.s to the two protectorates, the authorities in Salisbury would refuse to co-operate with them; the Rhodesians would then claim that the recommendations of this commission could not be regarded as a particularly well-informed or valid contribution to the constitutional talks that are to be held in 1960.

Labour's official explanation of its attitude is that if it sat down in a commission with white Rhodesian M.P.s only (even if it did not eventually agree with many of their views), it would "lose the confidence of Africans". Other people will allege that its true motives are an almost gratuitous insistence on humiliating Salisbury, and the personal animosity that has sprung up between some of its leaders and Sir Roy Welensky. It is suggested by some people at Westminster that Mr Callaghan, who used to be labelled as Sir Roy's worst enemy, is now becoming more sensible of the problems that would face him if he found himself colonial secretary next year, but that Mr Gaitskell himself is hardening.

This is a deplorable state of affairs. In the interests of Westminster's black constituents in the two protectorates, cannot Labour, even at the last minute, look at this matter again? Two things need to be driven into the party's head. First, if it does not win power in October or next spring (a possibility that makes it disinclined now to grasp the Rhodesian hot potato) to put members on a parliamentary commission is its best way of influencing Central African events. Radicals of the same persuasion as *The Economist* should be the first to say that Labour's influence is highly desirable. Without it, Sir Roy will be all too ready to think he can do a backstairs deal with Lord Hume and Mr Lennox-Boyd — a deal that might miscalculate African reactions appallingly, and end as disastrously for Sir Roy as for the British Government a year or two afterwards.

Secondly, if Labour should win the next election, there is no doubt that a Labour government would be better placed to impose a liberal solution in Central Africa if the split of personalities between it and Salisbury had not become still more exacerbated in the meanwhile. Nobody has yet explained what Labour thinks it will be able to do with Southern, or even Northern, Rhodesia if it comes to power next year with Sir Roy Welensky and Mr Callaghan still glowering at each other and the former by then perhaps refusing to talk.

In the end, of course, such a clash between Sir Roy and a Labour government would be resolved by a compromise. By joining in a tripartite commission now, in which Tory government supporters would be on Labour's side in trying to influence the Rhodesians on at least some issues, Labour would gain some ground for its views; and it need lose no ground in return, for its members could always dissent from any recommendations which they could not stomach. It is quite right, of course, that Labour (and other people) should say loudly that the Rhodesian members of the commisson, like the British, should be drawn from both government and opposition groupings; best of all would be for them to include members of both races, and certainly some compromise should be asked for whereby the opposition Rhodesian members should include representation of Sir John Moffat's liberal Central African Party (which has members only in the Northern Rhodesian territorial house) and not simply of the official Dominion Party opposition at Salisbury (which is even further to the right than Sir Roy).

Such a commission would be large, and on many issues its members would disagree. Any issues on which a reasonable degree of agreement could be reached, however, could then be promptly followed up by a committee of experts. On this point it is worth reading Sir Roy a warning: it is by no means sure that on this occasion a mixed group of civil servants, drawn from the three territories as well as from Salisbury and London, will agree; after five years of federation it is almost certain that they will not. (The British colonial servants from Northern Rhodesia and Nyasaland are likely to call for a far looser form of federation as the only chance of preventing complete dissolution, while the Southern Rhodesians would really like to call for final expulsion of the Colonial Office.) The constitutional choices will therefore, in any event, be very open when the conference meets in London in about eighteen months' time. But it is much more likely that the difficulties of federation in its present form, and the implications of any further steps to federal independence, will be better understood and more liberally implemented if the Labour party plays a sensible, unsulky and fact-finding role now.

Seven and Six

The "little" free trade area can be fruitful only if it looks outward, both to the common market and to the world beyond Europe

THE search for alternatives to the scheme for a European free trade area has moved into a new phase with the British Government's support for a "little free trade area" between seven West European countries left outside the six-nation common market. But there is now a lively chance that the scheme will be put into practice. Instead of a free trade area embracing all free Europe, British industry now faces the possible prospect of a smaller group embracing Britain, three Scandinavian countries, Switzerland, Austria and Portugal.

Nobody denies that in itself the scheme is no economic substitute for the big free trade area of all free Europe. Nor for that matter does it compare in scale with the common market itself. The group of Six itself is, after all, but a part of the rump of Europe that was left to the west in 1945; but at least it forms something like a natural entity, an economic unit centred upon the Rhine and its adjacent valleys. The scattered group of countries round the fringe of this entity has only one thing, for this purpose, in common — exclusion from the common market.

Against a population of 160 million within the Six must be set only 86 million in the outer group that is planned, 50 million of these being in Britain. Average national income per head is higher in these countri than in the common market; but the economies the Six have lately been, and seem likely to go growing more rapidly than those of the welfare nt of northern Europe. Today 9 per cent of Br nt exports go to members of the proposed new gr ases compared with 14 per cent to the common s as But the large volume of British exports to th ople free trade area" countries is partly due to ut in that most of them protect themselves relativ onic The new opportunities that will open up there if re barriers fall will not be so great as they would b the fences round France and Italy were torn dow Instead of the broad competition, opportunities, and stimuli to new investment throughout industry that would come from the merging of three or four great industrial areas, the smaller grouping will present special opportunities for only a few British industries, and fierce problems for a few others. The scheme is better than nothing at all, but it is a second best.

Economically, as politically, the first test must be whether the scheme will contribute to what must remain the participants' basic objective: that is, coming to terms with the Six. Those who have put forward the scheme feel that it will. If tariffs come

down in the little free trade area, the exporters of the Six will also begin to feel the effects of the split in Europe and will be given a corresponding incentive to close it. This argument has one weakness. The countries in the common market which export most to the new grouping are those that have tended in the past to support a free trade area precisely because their trading interests were broad. Some 27 per cent of German exports, but only 16 per cent of France's much smaller total of exports, go to the little free trade area. Those that feel the pinch will no doubt put new pressure on their governments to work for an agreement. But the political considerations which compel west Germany to put first its political ties with France within the community of Six will continue to limit the significance of German pressure. The French interest in these markets is far too small to have any radical influence on France's political, economic and emotional objections to the free trade area.

There is a danger, too, that such pressure might make agreement still more difficult to reach by arousing ill feeling amongst the Six. So far their reactions have been mild. But if the shoe begins to pinch there may be the a danger of a revival of tension within the Six between France and the rest, which will do nobody any good. In the long run, such unpredictable feelings are less important than the danger that, if two blocks are set up in Europe and stay put for some time, industrial interests and institutions will tend to settle down in the new pattern. The political gulf between London and the Paris-Bonn partnership would then be wider than ever.

Because of these dangers, it is good news that the seven have agreed, on British inspiration, to dismantle their tariffs at the same pace as in the common market, in stages to facilitate a later marriage between the two groups. But however prudently the scheme is framed, it is bound to some extent to deepen the split in Europe, diverting trade away from more natural channels. All the seven countries do more trade with the Six than with each other: Austria sends half its exports to the Six, Switzerland 40 per cent, Denmark 30 per cent. For all these countries, deeply interested even in provisional arrangements with the Six, the formation of the new group poses some difficult choices. The Danish Prime Minister, Mr Hansen, put his country's difficulties to Mr Macmillan last week.

If the formation of a free trade area of their own merely encourages the seven to sit and wait in hope that the Six will eventually see the light, then Europe will remain divided. A common interest may in the end prompt the two groups to do a deal, exchanging mutual preferences — and call a truce; this would not mean that trade barriers would be removed altogether, or the political breach closed. The new approach required from Britain must also have regard to the problem of Europe's trading relationship with the outside world. Here some thoughts are prompted by the latest meeting of participants in the General Agreement on Tariffs and Trade (Gatt) at Geneva. The special contribution and interest which Britain and the liberal Scandinavians bring to Europe is their liberal trading treatment of the rest of the world — and particularly of the young developing countries in and out of the Commonwealth. In the broader free trade area scheme all this was apparently to be preserved by retaining separate national tariffs and the right of Commonwealth free entry. But during last year it became plain that the double objectives — free trade within Europe and open doors to the outside world — were not to be obtained by this approach. The French, and a good many other people too, were not prepared to accept a double dose of liberalism in this form. It became pretty plain that the liberal objectives were only to be obtained on a European scale by accepting the principles of a common tariff and common external policies as starting-points.

QUITE naturally, the liberal-minded officials who have fought so rightly to preserve the one sane form of treatment for the undeveloped countries, free entry, are reluctant to give it up until they have got a good substitute. It is here that the discussions that have been going on in Gatt are significant. Gatt is already struggling with the problem of the European community's external policies, in order to influence them in the direction of broader and freer world trade, and to devise ways and means of concerting the efforts of the old industrial countries to help the poorer ones.

Fortunately there are signs that the people within the European community are beginning to recognise this need. A number of proposals are being zealously canvassed: coordination of capital exports; a programme of technical aid; a common policy for gradual enlargement of quotas on imports from the young industrial countries. There seems no field in which the Six and the Seven could more valuably make a start on developing a joint approach, as a means toward agreement in Europe itself. The argument for the grouping of seven that can be accepted without any qualification is that these countries should get together to agree on a joint new approach to the Six; and in that approach Britain will necessarily play the decisive part.

NOTES OF THE WEEK

GENEVA

The Importance of Being in Earnest

THE British delegation at the foreign ministers' conference in Geneva was reported, at the beginning of this week, to believe that by the end of June enough agreement could be reached to open the road to a "summit" meeting. This phlegmatic calm may have struck many people as surprising, in view of the alarms and near-excursions of the preceding days. Had not Mr Gromyko thrown a bucket of cold water over the whole conference, and issued a new "ultimatum" on Berlin? Had not Mr Herter replied that he refused to negotiate under threat, and that the American delegation was ready to leave Geneva at a few hours' notice if the Russians did not change their tune?

That was, admittedly, the impression left on many anxious newspaper readers' minds by the daily reports from Geneva. But the underlying reality was less simple. It has to be remembered that, right from the start, the Russians had made it clear that they would not seek any settlement at the foreign ministers' talks; if there was to be any settlement, it must be at the summit. The western delegations' attitude, on the other hand, was (in somewhat varying degrees) that the ministers' talks ought to yield some hopeful sign that a summit conference would be worth holding at all.

The Geneva meeting could thus be seen as essentially a problem in diplomatic disengagement. Neither side wished to be the first to break it up; but neither was willing to concede the points that would make it possible to bring the talks to an amicable end. Mr Gromyko's sharp thrusts last week may be interpreted as primarily an attempt to see if the western delegations could be provoked into stamping out in a huff. That would have restored the pre-Geneva situation, with its pleasing possibilities from the Soviet point of view. Either the West would in the end have to agree to a summit meeting without any preliminary progress having been made; or the West would be back in the position, which Moscow knows how to exploit in propaganda terms, of appearing to refuse to negotiate.

A temporary adjournment of the foreign ministers' talks would, of course, be a different matter. It is not the western custom to treat foreign ministers in the Soviet manner — as expendable officials who can be dumped indefinitely at a conference table without hope of release. Allowing for their other engagements, it might well be July rather than the end of June before any adjustment could be made between the West's insistence on retaining its rights in Berlin, and the Russians' refusal to "perpetuate" those rights — which does not exclude their extension. But the door is surely still, if only fractionally, open.

NATIONAL ASSISTANCE

The Right Reliefs

THE £32 million a year increase in national assistance payments announced by Mr Boyd-Carpenter on Monday represent a major and welcome shift in the emphasis of British social security policy. Hitherto, improvements in these payments have been designed to compensate for past increases in the cost of living, although usually with a margin to spare for prospective further increases. But this latest increase, coming after a year of approximately stable prices, is deliberately designed in order to give "the least well off members of the community... a share in the country's increasing prosperity". The subsidiary changes in determining "disregards" of assisted people's resources are intended to avoid penalising those who have laid up some small savings in the past, and to encourage younger members of the family to keep granny with them in their own home instead of boarding her out in an institution.

The result is that the national minimum income in this country goes up from 45s. to 50s. a week plus rent for a single person, and from 76s. to 85s. plus rent for a married couple. To have made equivalent increases in old age pensions would have cost several times as much, would have benefited around four million people who do not really need it, and would have left out in the cold some of the poorest people (such as the chronic sick and disabled) who will be aided by this measure. The Government is to be congratulated on resisting the political pressure to raise pensions at budget time, in order to concentrate on this more discriminate, more humane and more efficient form of succour.

AMERICAN IMPORT POLICY

Dams with no Faint Praise

ONCE again American liberals have shown that they have the last word in trade policy in really big matters, even after they have made a previous series of (perhaps preparatory) retreats over relatively small ones. The ruling of the Office of Civil and Defence Mobilisation that American security is not threatened by imports of heavy electrical equipment is much more important than such isolated individual backslidings as

the affair of the Greer's Ferry turbines five months ago.

There is some tendency for British opinion generally — and even ministerially — not to give sufficient credit to the Americans for this sort of thing. The United States are at present losing gold. It is, of course, very desirable that they should continue to do so for a while, in order to secure a more even redistribution of international reserves. It is eminently sensible that the Americans should take advantage of the wealth they have amassed in the past in order to enjoy the luxury of being able to buy cheaper imported goods now, by buying cheaper goods they are benefiting their own people, not just favouring foreigners. Since it is as essential to the Americans as to the rest of the free world that the race against poverty (and with it communism) in the backward areas should be won, they also have a sensible self-interest in continuing generous loans or grants to these areas. But it takes a great deal of enlightenment for a rumbustious political democracy to see things this way.

Everything possible should be said in Britain to fortify, not to mortify, those Americans who are struggling hard against heavy pressure, and usually with such astonishing eventual success, to maintain foreign aid, to resist protectionist demands that are inevitable in present circumstances, and to prevent a return to economic isolationism. At a time when the pound is so heartenингly strong (*vide* last month's excellent trade figures) it also behoves Britons not to evince so much apparent glee about the so called "weak dollar"; those who like to gibe that it might some day be the dollar's turn to be devalued seem to forget that there are so many other things that the Americans could do before resorting to that, and all of them singularly unpleasant for the rest of the world.

BY-ELECTIONS

Penistone and Whitehaven

THE Penistone by-election showed a straight swing of 1.8 per cent to Labour compared with 1955. For what it is worth, if that swing were repeated right across the country at a general election, and if there were no complications arising from increased Liberal interventions, the Conservatives would remain in power; but they would have an almost unworkably small, single-figure majority. In other words, the practical implication of this by-election is to suggest that an early general election would still be a very close-run thing. It is true that the Conservatives did rather better at Penistone than they did in most of the by-elections that took place last winter and up to last March, which suggested that the average swing away from them might be between 2 and 3 per cent. On the other hand, they must regard the result with less satisfaction than they could feel about the local election results last month, which suggested that the average swing away from them compared with 1955 was probably less than 1 per cent. The turn-out at Penistone (nearly 65 per cent) was remarkably high for a by-election in a safe Labour seat which had attracted comparatively little press attention. Some people will say that for that reason it is a better pointer than the local elections, in which the turn-out was often below 30 per cent; others will discount it as purely a localised result. As the steelworkers of Penistone went, so does not go the nation?

More light should be cast on electoral trends by the Whitehaven by-election, which was taking place on Thursday. Whitehaven is a constituency not unlike Penistone — heavy industry with some coal mining, safely Labour, its rather small electorate marked up an exceptionally heavy (over 80 per cent) turn-out in 1955, it is on the Cumberland coast whereas Penistone is in the Sheffield area. In last month's borough elections the northern counties were one of the few areas where the Conservatives actually did better than they had done in the equivalent borough elections of 1955, but as Whitehaven is a county constituency no direct line can be read on recent local trends there. This by-election, like that at Penistone, is again a straight fight. In 1955 Labour won exactly 58 per cent of the vote at Whitehaven against the Tories' 42 per cent. Because the very heavy turn-out of 1955 can hardly be expected to be repeated in a by-election, the general assumption must be that Labour's former majority of 6,194 is likely to be reduced; but the change in the two parties' share of the vote will be the thing to watch.

ASWAN DAM

Soviet Second Thoughts

BY making the right noises at the right time, the Soviet Union has skilfully and inexpensively managed to create an impression of international philanthropy. Russian aid projects for Egypt and Syria were announced with great panache and the terms sounded fine and generous. But the implementation of the schemes can, more or less unobtrusively, be as slow and as fragmentary as the creditors dictate. There was, therefore, a certain amount of glee among some western cynics when the Russian committed themselves to advancing the foreign currency for the construction of the first stage of the Aswan High Dam. Western governments, who had done themselves some disadvantage by first offering and then brusquely refusing the money, had visions of the Soviet Union clumsily falling into the same sort of trap.

But things are done differently by the Russians. They appear to have scaled down the project and are certainly going slow, but there is no evidence that they are trying to back out of it. Originally it was envisaged that the first stage in the construction of the dam would entail building two cofferdams and seven diversionary tunnels ,and would take four years; the second stage would last another six years. The Russians had promised 400 million roubles to pay for Soviet equipment for the first stage, and had contractually a decisive say in the choice of contractors; after a contretemps earlier this year, it appeared that west German and Japanese interest in the scheme would have to wait until the second stage. But now the Russians have produced an entirely new, and more economic, set of blueprints that merge the two stages together, provide for a single open channel instead of the seven underground tunnels, and put off any question of starting work until the end of the year.

At Aswan at the moment there is a party of Russian experts, the Egyptian high dam committee under Field Marshal Amer, vice-president and minister of defence, who originally negotiated the Russian loan, and a group of "international" experts, including representatives from Sir Alexander Gibb & Partners, who have been the consultant engineers for the project since 1954. The Egyptians consult with the West and negotiate with the East, but apparently the twain never officially meet. The political lifemanship has its curious aspect, but the main thing is, after all, that the Egyptians should get their dam — albeit a cut-down version — and so alleviate, or at least keep level with, their appalling problem of over-crowding. The way looks clearer now that Egypt and Sudan have both said they are ready to resume talks on the distribution of Nile waters — so long, that is, as the Russian go-slow is not the prelude to a full-stop.

CHURCH SCHOOLS

Round the Dangerous Corner

MEMBERS on both sides of the House of Commons breathed a sigh of audible relief on Thursday when Mr Gaitskell stood up to welcome the Government's compromise on increased grants for denominational schools. Thank heaven, everyone was saying, it will be kept out of the general election; and the electorate may well echo their representatives' reaction. In itself, the compromise is simple and will be embodied in a short bill, which will still leave the administration of Church grants a complex affair.

In effect, this bill will ensure that wherever a grant is made available in existing aidable categories of church school, the figure "seventy-five per cent" will replace the present figure of "fifty per cent"; the churches will also get the seventy-five per cent grant to complete, if they desire, the secondary school tier in their pyramid of denominational education. As before, however, grants will not be given to build new denominational primary schools; and the minister has taken care to warn the churches that he retains his right under section 13 of the Butler Act of 1944 to adjudicate on grants to any proposed new secondary school. This means that he is, very rightly, promising that he will not approve grants to denominational secondary schools in "single school areas", which might lead to little Methodists being indoctrinated by Anglican clergy or Jesuit-trained teachers. Apart from this reassurance, however, the free churches have plainly come off worst in the argument that has been going on for the last three or four months.

The most notable conclusion to be drawn from this compromise is that the non-conformist vote is losing its terrors. Even Mr Clement Davies came out wholeheartedly for the new bill. No doubt there will be some blustering from Wales; but the free churches attracted unusually little sympathy in their recent campaign. No votes are to be won nowadays by clamouring that the "dual system" of state and voluntary aided church schools, which was set up for good or ill in 1902, should be pulled down. The extension of the church schools system which the new bill will finance in the next 20 years, at a cost of £40 million, will be marginal; and, indeed, the Roman Catholic church must be expected to ask for more in due course. But the Roman Catholics have proved good enough politicians to be glad to take what they are offered (it will keep them busy for some time), while the Church of England has got what it wanted — the increased subvention without which it could hardly keep its present schools going. Of the £40 million of additional Exchequer money to be spent over the next two decades, it is estimated that about £15 million will accrue to the Roman Catholics, another £15 million to the Church of England and that the other £10 million will strengthen the finances of the local authorities.

HOLA CAMP

Censure on Whom?

THE Kenya magistrate's findings on the deaths of the eleven hard-core Mau Mau detainees at Hola camp, which were published as a white paper (Cmnd 778) last week and the subject of a censure debate in the Commons this week, make terrible reading. The magistrate sifted a mass of conflicting evidence, produced by an evident desire of nearly everybody to cover up or explain away an atrocity — however unpremeditated an atrocity. It is this which shakes confidence in the entire good faith of the Kenyan authorities. It is true that the Kenya government appointed a judicial enquiry; but the truth had to be dragged out of it. It is some comfort that the coroner was quite definite that he had no evidence that the beatings of the prisoners were anything but an isolated incident. But they arose out of a highly defective prison procedure under

which the principle of beating rebellious prisoners to compel them to work was accepted, even if it was never intended to be applied on so wholesale a scale; the procedure might have been erected into a system if tragedy had not intervened; and it is hard not to conclude that something of the brutal state of mind of the last irreconcilable prisoners (of which there is no question) was tainting the mentality of those put in charge of them, both European and African.

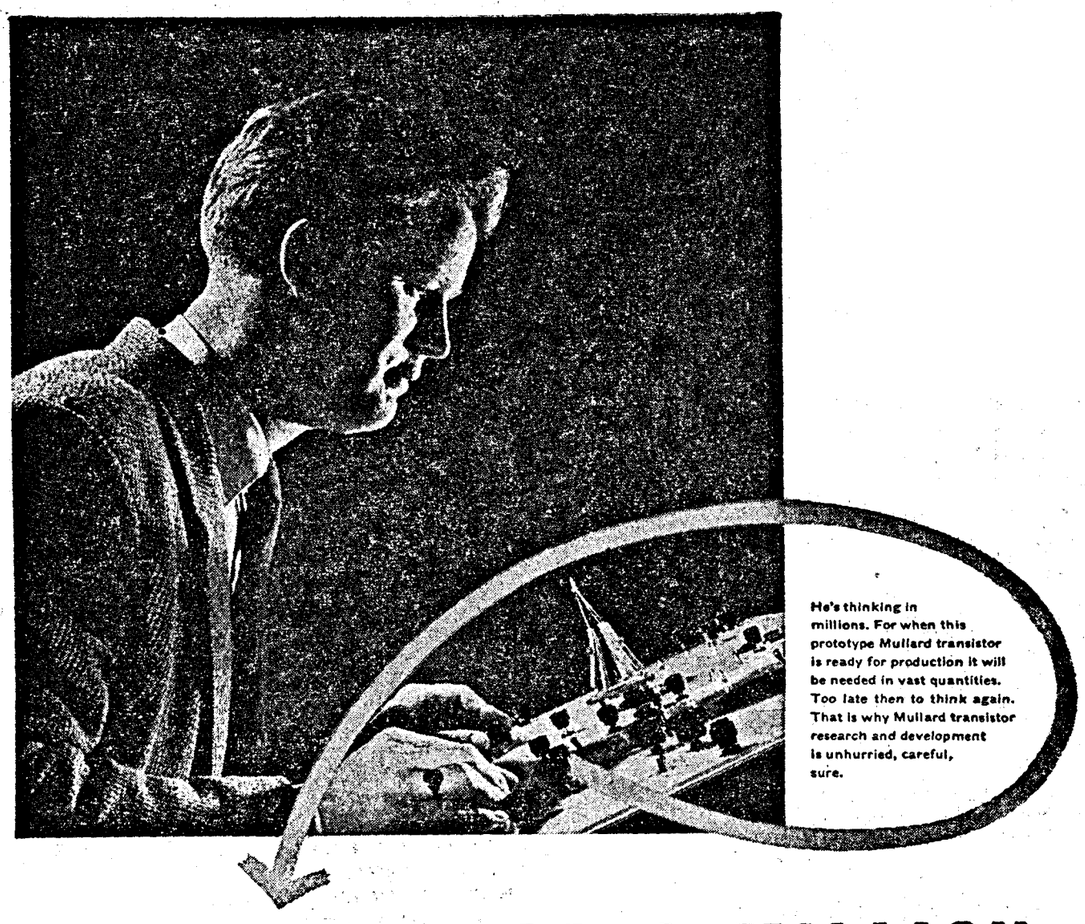
The coroner decided that he could not apportion the blame or put the criminal law in motion, because he could not distinguish between lawful and unlawful blows, or fix individual responsibility for them; but he was "unable to record that no offence has been committed". In the event the commandant and deputy commandant of the camp face disciplinary charges, now of course *sub judice*. Mr Lennox Boyd deserved to be given an uncomfortable time in the House on Tuesday, for the ultimate responsibility is his. But it is an ultimate responsibility only, and it is in the Kenyan government that there should surely have been prompter recognition that ministers are responsible for the mistakes of their subordinates. Admittedly, both the ministers concerned are officials; and the one most directly concerned, Mr Cusack, minister for internal security, was already retiring. However that may be, the world gets an unfortunate impression that the Kenyan authorities think of this ghastly affair merely as an unfortunate incident to be set against their great achievement, for example, of returning the 77,000 other detainees to civil life. That is an inexcusable attitude. Authorities, no less than individuals, should do penance when they share guilt.

ATLANTIC CONGRESS

Words and Deeds

ALTHOUGH General de Gaulle's quarrel with Nato was inevitably one of the main talking points during the last days of the Atlantic Congress, a critic of the Atlantic club's exclusiveness might have been more impressed by the emphasis laid on the dangers of western isolation in some of the final speeches and resolutions. At the last plenary session, the leader of the British delegation, Sir Thomas Dugdale, described Nato's relations with countries that belong neither to the Atlantic community nor to the communist orbit as the first major challenge for the future: "We feel that we must have a definite and consistent long-term policy towards them so as to ensure that their political independence is firmly based on economic independence".

The committee set up to study relations within the free world went further: "In Africa, Asia and Latin America the tide of national independence is today running very high; it is of the utmost importance that the Atlantic community should be, and should be seen to be, its friend and implementor, not its critic and frustrator." This is all fine. The danger is that delegates, having released these wise and generous sentiments on the world, may now return home in a too rosy glow of duty done. The dangers of uncoordinated colonial policies, of the gulf between the relatively well-off and the undeniably poor, between white and coloured, have been aired before now; there is still pitiably little evidence of boldness or coordination in western attempts to do something about it.



PORTUGAL

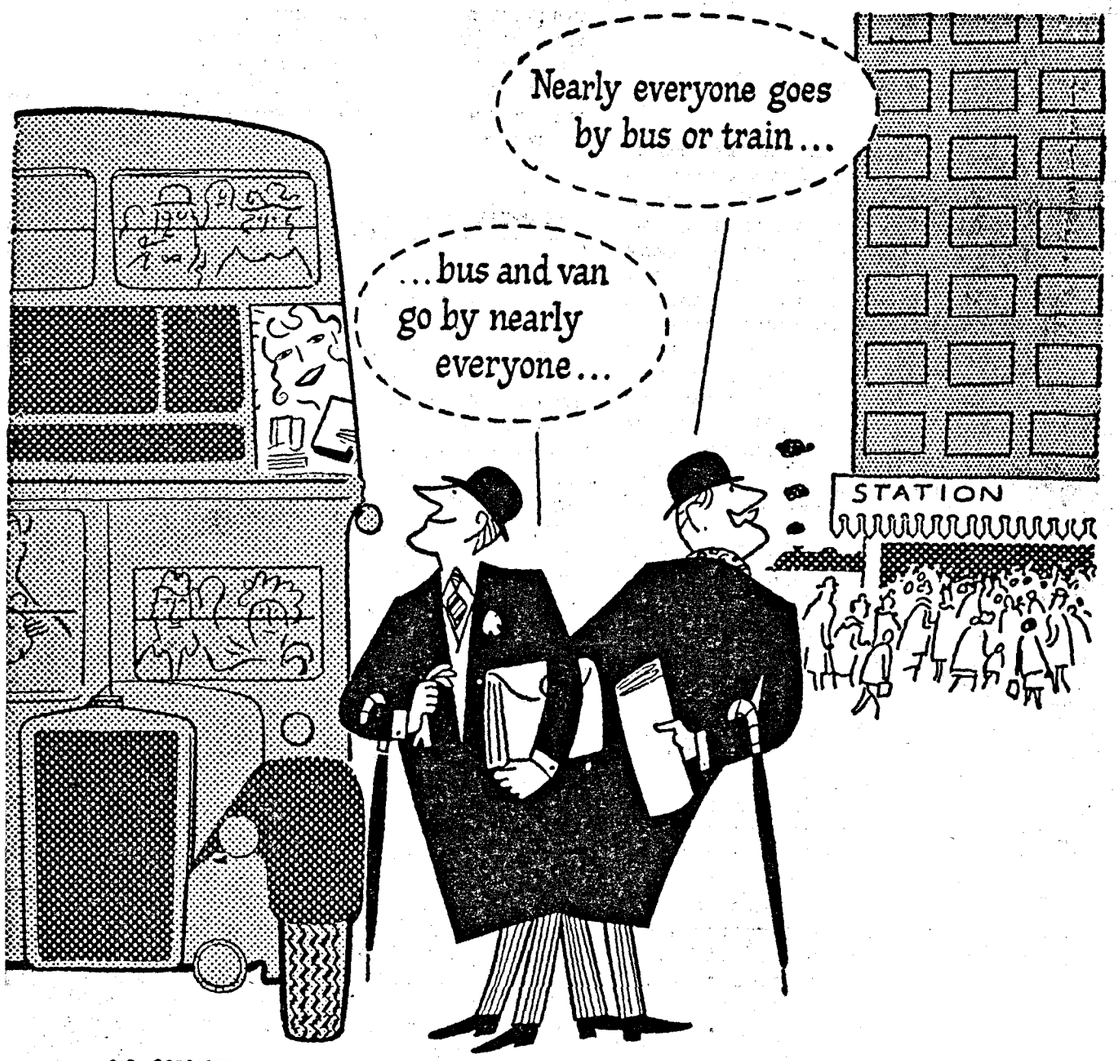
Awkward Atlantid

PROFESSOR Salazar's regime has been meeting with a double outburst of criticism in this country. At the Atlantic Congress of parliamentarians and other representative personalities held in London, Mr Oldenbroek, speaking for the free trade unions of the world, complained that Portuguese labour was not free to organise itself, and there was unfavourable comment, too, on the absence of any Portuguese parliamentarians at the congress. In the British press, Princess Margaret's visit to Portugal and the other ceremonial adjuncts to the current British trade fair in Lisbon have prompted some questions about the wisdom and morality of thus appearing to endorse and sustain an authoritarian government.

Hostile comment from outside is the more awkward as it coincides with signs of claustrophobic stirrings inside Dr Salazar's stiflingly restrictive regime. The country has not yet really recovered from last year's clumsy dabble with democratic practices — for an authoritarian state run for close on thirty years by a tidy-minded professor of economics, there are a surprising number of constitutional anomalies. Although there was never a chance of the opposition candidate, General Delgado, actually winning the presidential elections a year ago, there was nothing in the constitution to prevent him from standing or from declaring his intention of finding, if elected, a new prime minister. Dr Salazar is now apparently taking steps to amend the constitution and so close this awkward loophole. But General Delgado's outspoken criticism gave heart to a numbed opposition, although to the outside world the only evidence of this is the wave of political arrests — accompanied by the usual announcement by the government of "communist" plots — that has been taking place in the last month or two.

General Delgado himself has found it wise to seek asylum in Brazil. Dr Salazar's indignation with the Brazilian government for refusing to hand him over indicates that the Portuguese prime minister is out of touch with the change of temper in the Latin American republics. There are now Portuguese exiles in Argentina, Venezuela and Cuba, all countries which have recently rid themselves of absolute rulers. Dr Salazar took control at a time when his kind of strength was needed; he is now having to use all this strength to keep the Portuguese clock at a standstill.

GOOD FOR A MILLION



In a few short years the whole science of electronics has been transformed by the invention of the transistor, the tiny device that performs a similar function to a radio valve but has the added advantages of small size, low current consumption and almost unlimited li Transistors are used extensively in a great variety of applications, from hearing aids and pocket radios to computers and guided missiles. Their rapid adoption by equipment manufacturers in Britain is due in no small measure to the Mullard Design Philosophy. From its conception in the laboratory, every Mullard silicon or germanium transistor is realistically designed for large scale production thus giving the equipment manufacturer the assurance of consistent quality and performance, ample and continuous supplies, and low cost.
In this way industry is able to apply the benefits of transistor research quickly, safely and economically.

TRAFFIC OFFENCES

Lords and the Road

THE House of Lords was at its best last week in discussing the appalling toll of road accidents — 300,000 people were injured on British roads last year, and 6,000 were killed. As Lord Moynihan said, there are now four main actions that can be taken against drivers who break the rules of the road — endorsement of licences, fines, prison sentences and disqualification from driving. The first two of these have become largely ineffective as a deterrent. In the case of fines, this is because magistrates continue to impose much lower fines than they are allowed to do. The average fines imposed last year were just over £22 for drunken driving, just over £14 for dangerous driving, and just over £5 10s. for careless driving; under the Road Traffic Act the permitted maximum fine for the first two offences is £100, while for careless driving magistrates can (but never do) impose a fine of £40 for the first offence or £80 for the second.

The third possible punishment, imprisonment, is also largely ineffective because the courts are naturally even more loth to impose it. As Lord Mancroft put it, "magistrates and juries do not commit murder or bigamy or arson in a royal dockyard, but they are motorists", and feel that there but for the grace of God go they. The courts' unwillingness to send drivers to prison is also, although their lordships did not dwell on this point, a reflection of the fact that the laws of England are illogical; they offend against most people's sense of justice by trying to make imprisonment a more common punishment according to the degree of injury done to the victim instead of simply according to the culpability of the driver. This same argument applies against one "reform" in the law which Lord Goddard proposed in the debate, namely that the motorist himself should have to bear a proportion of the financial damages awarded as a result of his driving, instead of piling the whole bill on to his insurance company.

There remains, then, the fourth possible penalty: disqualification from driving. It is quite obvious that this ought to be more frequently imposed, together with the sanction of forcing convicted motorists to take an additional driving test. For drunken driving, disqualification is now a compulsory punishment; it may be no coincidence that this is therefore the only driving offence which, as statistics show, has recently been decreasing. But elsewhere the penalty of removing a man's licence is being far too infrequently imposed and for far too short periods. Of 4,889 convictions for dangerous driving last year, some disqualification was imposed in just under 2,000 cases and only in 375 cases was disqualification for more than a year. On this count, Lord Goddard did make a surely worthwhile suggestion. He believed that, where magistrates did not take away a convicted driver's licence, it might be a useful provision for the prosecution to be entitled to appeal to Quarter Sessions and say "we ask that disqualification be imposed". This right of appeal for the prosecution would be a considerable departure from anything that has hitherto been known in English law, but why not?

THE PRESS AND THE LAW

The Widow's Earnings.

RECENT cases in the courts that have won wide publicity enable a distinction to be drawn between those in which the press performs a public service and those in which it can be positively harmful. The kiss-in-the-car case belongs to the first category. Here, the plight of this particular acquitted couple was not overemphasised; the main point brought to light — though perhaps in an exaggerated way — was that an innocent person is unlikely to be awarded his costs against the police. This is a matter of general interest and one that was rightly given a public airing.

The publicity given to the widow who cheated the National Assistance Board was of a quite different order. Here, the press concentrated on the personal aspect of the case in the most emotional way possible, with an eye to turning out a sensational story to attract its readers rather than to raise a question of public interest. Yet there were questions that could usefully have been discussed. Is Britain's much vaunted system of social security generous enough in its provision for widows, particularly widows with children? Is the Assistance Board's earnings rule, which permits it to disregard only the first 20s. of earnings before it adjusts its weekly payments, too strict? If the Board were more generous to those who by their own efforts raise themselves above its minimum standard of needs, would this mean that less money than one would like would be available for the aged and the disabled who have only that standard to live on?

Instead, however, of raising these points, the press chose to write up Mrs Christos's personal mitigating circumstances, all of which were perfectly well known to the humane magistrate who sentenced her, and in so doing it made the conduct of her appeal against sentence, heard last week, virtually impossible. According to the press Ronald Marwood should have been reprieved, not because capital punishment is wrong, but because some of those who knew him said he was a pleasant young man. Mrs Christos should have gone unpunished not because the National Assistance regulations are too strict or because she ought not to have been on assistance at all, but because she was a widow with four young children. Hard cases do not only make bad law; they also make the wrong sort of publicity.

POLAND

Unholy Alliance

SINCE the open breach between the church and state in Poland last summer, relations have remained unsettled. Mr Gomulka's government has used a policy of frequent pin-pricks to harass the Catholics. At a large religious meeting last month, for instance, Cardinal Wyszynski was forbidden to use loudspeakers; his words reached only a handful of the assembled faithful. Economic sanctions have also been applied. The rule that former German ecclesiastical property in the new western territories should pass under Polish church administration was recently rescinded; and no more credits are being granted to the church for the restoration of monuments damaged in the war. But perhaps the most significant development has been the meeting between Mr Gomulka and Mr Piasecki, the leader of the Pax movement, at the end of last month. Although no official news has been released, their talk apparently took place in a friendly atmosphere.

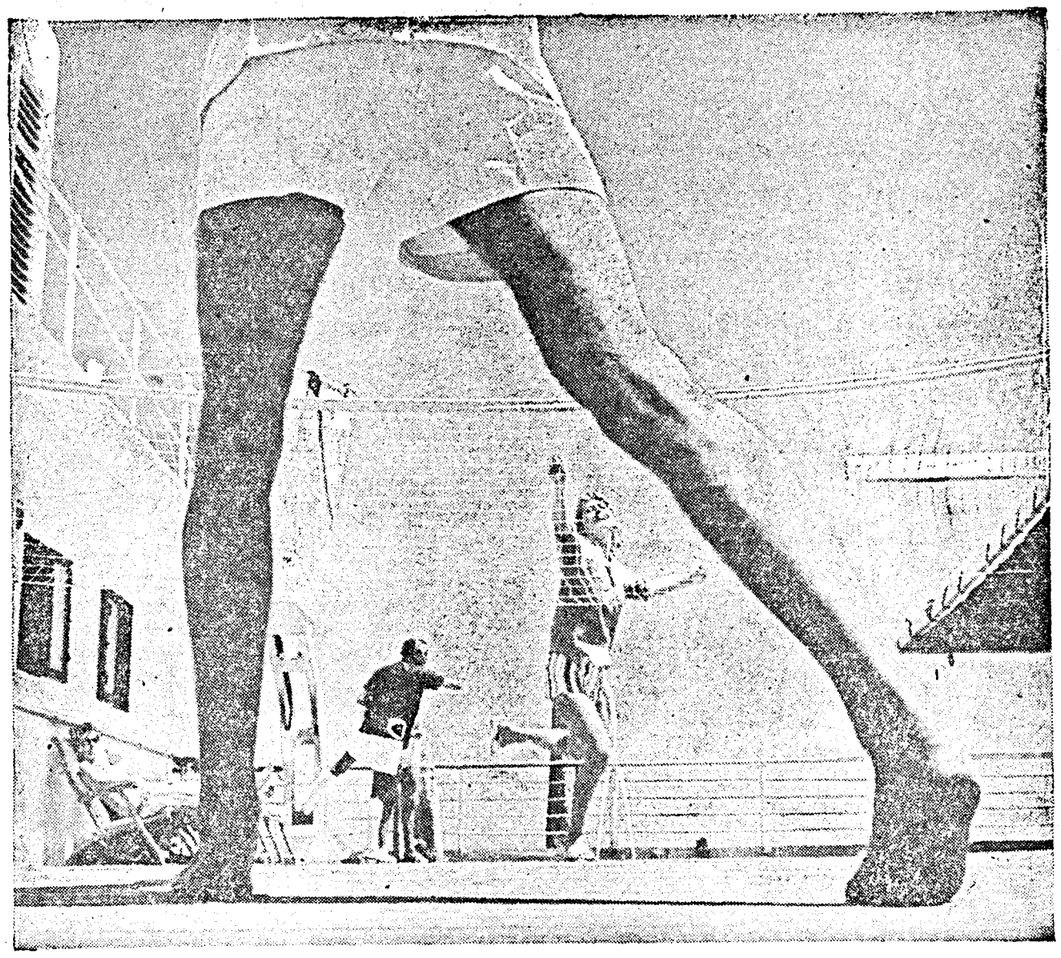
Mr Piasecki is possibly the most controversial, and certainly the most colourful, figure in contemporary Poland. (He is one of the few men on the other side of the curtain to own a Jaguar car.) The Pax movement which he leads is a body of Catholic fellow-travellers, recruited from both laity and clergy. Before the peaceful revolution in Poland in October, 1956, he had gathered ample, and in a communist state rather unusual, rewards for his refractory activities among the Catholics. He was allowed to run a newspaper, a publishing house, a building company and other industrial enterprises. In 1956, at the time when the Russian Embassy in Warsaw conducted a sharp campaign against Mr Gomulka, Mr Piasecki did likewise in his newspaper. Even since, many Poles, including the communists, have regarded him as an agent of Moscow. Last year his young son disappeared, the body being eventually discovered in a Warsaw cellar.

Until their meeting last month the relations between Mr Piasecki and Mr Gomulka were far from cordial; it remains to be seen whether rapprochement will now follow. The Polish leader may well be tempted to break the deadlock between church and state by using the Pax organisation; but Mr Piasecki would certainly prove a dangerous and unreliable ally.

BOXING

To Ban or Not?

THE medical case against boxing is unanswerable. The sport — if such it can be called — may not be the most hazardous when the deaths of the participants are compared with deaths from, say, motor-racing or rock-climbing. But boxing is unique in that the main object of the fighter is to damage his opponent's brain. Deaths may be comparatively few — though a world total of 64 in four years, 22 of them after amateur fights, cannot be called trifling; but punch-drunkenness, a state of progressive deterioration of the personality, with dementia and perhaps loss of speech and blindness, is more common. Should a sport be tolerated that has any chance of turning its participants into imbeciles?



The *Lancet* thinks not and is appealing to doctors to press for its total abolition. Such a ban would be premature. The public as a whole is not yet stirred up sufficiently by the case against boxing to support a ban, which would be strongly opposed by critics of any proposal that sounds namby-pamby, by the depressingly large audience that enjoys a bloody fight, as well as by the big financial interests involved. Boxing should be made to wither away rather than be knocked out; it needs to be discussed at conferences of headmasters and youth club leaders, in the pub and over the air before an attempt is made to ban it. At the same time, other forms of man *versus* man contests should be popularised — as, in another sphere, the dogs have replaced cockfighting.

The Economist

JUNE 18, 1859

NEW FOREIGN SECRETARY

THE appointment of Lord John Russell to the post of Minister of Foreign Affairs will mark a new epoch in the politics of the war. Hitherto there has been no representative, among the great Powers, of any hearty sympathy with the *constitutional* party in Italy. Lord Malmesbury, indeed, professed such sympathy, but the form it takes, throughout the blue-book recently published on Italian affairs, is that of sermonising Sardinia, generally in the scolding language of an indignant schoolmaster, on the wickedness of her intention to disturb the peace of Italy... Lord Malmesbury naturally lost influence with France by the dictatorial tone in which he intimated that the Italian cause was either a dream or a pretext for something worse. Lord John Russell has shared the dream, and therefore, has more chance of preventing its becoming a pretext for something worse. Lord John Russell is comparatively untried at the Foreign Office; but what trial he has had there is eminently creditable to his firmness and sagacity. The well-known "secret correspondence" with Russia concerning the "sick-man" was conducted only in part by him. But the despatches which came from his hand were almost the only ones in that correspondence of which England had no reason to be ashamed. As a diplomatist he has not been successful. But the qualities necessary for the success of a diplomatist and of a statesman are very different. We look to him with confidence to re-establish our influence in the counsels of France, without forfeiting the dignity and independence of England; and to give the true sympathies and wishes of the English people their due effect in determining the future of the Italian Peninsula.

Executive returning from £1m. Conference

He has earned his holiday. He *needs* the relaxation of Union-Castle travel home. No 'Executivitis' for him! In the second week, perhaps, he will open his brief-case and dictate a report or two to one of the ship's stenographers. But just now he is letting the sun coax the tensions out of his joints. And, after those Conference weeks of alternate sandwiches and banquets, he is letting Union-Castle chefs coax blissful sanity back to his digestion. He is *not* looking forward to wearing a stiff collar again. But when he does get his sun-tanned knees in their City trousers under a City desk again, he will romp through his work at a good rate of knots. *Mare*, as the doctors say, *nostrum*.

TO SOUTH AFRICA, TO EAST AFRICA AND ROUND AFRICA

the going's good by UNION-CASTLE

Every Thursday at 4 p.m. from Southampton for Cape Town. By certain sailings there are reductions in First Class return fares. About twice a month from London for the Round Africa trip.
Chief Passenger Office, Dept. No. 5, Rotherwick House, 19-21 Old Bond Street, London, W.1.
Tel. Hyde Park 8400 or Travel Agents.

Men with imagination

BOOKS

City Life

The Third Statistical Account of Scotland, Vol. V : *The City of Glasgow*
Edited by J. Cunnison and J. B. S. Gilfillan.

Collins. 1,008 pages. 55s.

Reshaping a City
By T. Brennan.

House of Grant. 221 pages. 25s.

THE first of these books is a full-scale portrait of Glasgow life, the fifth and most ambitious of the thirty volumes of the "Third Statistical Account" of Scotland. It is not only many times the size of the earlier Accounts, but is an altogether more professional job, however much it may rely, like its predecessor of 1793, on "the communications of several respectable persons." The unit is now the city, not the parish, and the authors are no longer ministers of religion but, in the main, university lecturers.

In spite of the weight of scholarship and statistics in its thousand pages, the volume has all the raciness that its subject requires. Here are the gangs and the slums, the distinctive crimes à la Manuel and all the rawer side of Glasgow life : the 66 pubs in one street; the 100,000 houses without a watercloset of their own; the 700,000 citizens crowded into three square miles. Here also is something of its warmth and humour, its resilience and local pride, especially in the contributions by Jack House and John Mack. There are chapters on education, health and religion, on working conditions and leisure interests, on the machinery of government and public services. The story of Glasgow's industrial development is told in some detail and, for once, commerce and finance are given more than a passing reference.

The picture that emerges is of a town of Lowland Scots, strongly reinforced by Irishmen and Highlanders, growing head — long until about forty years ago and then almost ceasing to grow. Although the relevant table omits the figure, Glasgow then already had a population of over one million within its present boundaries and the population has probably never risen above 1.1 million. The city is now in the throes of urban renewal, thinning out from the central areas, and ringing itself round with council housing estates. Its economy is also changing : the shipbuilding industry that gave it momentum in the nineteenth century has ceased, like the city, to expand; and newer industries, many of them American and English enterprises, are pushing to the front. Glasgow is thus a case-study in the problems of adaptation that beset many large industrial cities when their growth begins to slacken.

It is in its treatment of these problems that the book, otherwise so fascinating, disappoints the reader. They are referred to only incidentally and without any summing-up. Attention is concentrated on the decaying central areas, not on the growing suburbs. The motor-car and the television set, which are revolutionising town life in Glasgow as elsewhere, are hardly mentioned. Overspill does not appear in the index, but is the subject of some brief and illuminating comments by Mr Gilfillan, who shows that, in relation to its whole area, Glasgow is, on the average, no more densely populated than Liverpool or Manchester. The main difference lies in the large proportion of undeveloped land, much of it unusable for building purposes because it is undermined and liable to subsidence. Similarly, apart from a gallant attempt by Dr and Mrs Orr to explain the failure of the motor-car industry to take root in Scotland, the problems facing the newer industries are dealt with rather sketchily.

Mr Brennan started out to undertake a social survey of Govan, a predominantly working-class area of Glasgow known to most people as the home of Rangers Football Club. This brought him face to face with Glasgow's housing problem, and with the plans of the corporation for the redevelopment of the city. He was not satisfied that the corporation had given sufficient thought to alternative methods of redevelopment or to the problems that large-scale transfers of population would bring, and after further study of two other areas of Glasgow, Gorbals and Pollok, he elaborated his views in this book. The duality of his interests is to some extent a handicap, since he has written neither a forceful tract on overspill nor a full study of working-class life in Glasgow. But he has undoubtedly been able to approach town-planning with a firm understanding of the town-dweller's attitude and circumstances.

Mr Brennan first disputes the contention that life in the Glasgow slums is as appalling as it is customarily supposed to be; he points out that regular work and higher incomes have enabled many tenement-dwellers to improve their living conditions enormously, and that what is often blamed on bad housing is more commonly due to poverty. The launderettes, prepared foods, new fireplaces, cafés, and the rest, of which the typical household now makes use, have worked a revolution that has passed largely unnoticed. He goes on to suggest that a do-it-yourself lavatory installation, if available cheaply, would remove one of the chief remaining blots on tenement life, and argues for a "Brighten up the City" campaign in Govan and places like it. His figures also bring out the very considerable movement of population from the crowded riverside areas since the war because of the large number of new houses erected by the corporation; the new housing estates at Pollok and elsewhere may prove in 1961 to be at least as overcrowded as Gorbals. Finally, there is the simple fact that the jobs are in Glasgow and likely to remain there.

These arguments are not likely to find ready acceptance. Once an area is labelled "slum," the pressure for its early demolition becomes progressively stronger, however little disposed its inhabitants are to move; and a high proportion of Glasgow houses have in fact been condemned by the sanitary authorities. There is also a strong aversion to high density building, supported by figures of net residential density that are not necessarily relevant to urban life : the gross density of population in the riverside wards of Glasgow averages about 50 to the acre, but, in some, the net residential density approaches 500. As for jobs, it is still one of the dreams of town-planners that overspill will be accompanied by an almost automatic surge of industry out of Glasgow to the most unlikely places.

It is not Mr Brennan's purpose to argue that there should be no overspill of population, but rather that it should not be allowed to overshadow other possibilities, as the building of new houses did in the postwar decade. In emphasising this point he has rendered an important service. The real danger is that overspill, regardless of cost and of practicability, will be treated as a cure-all, without adequate reflection on the future shape of the city and its place in the structure of the Scottish economy.

Philosophical Biography

My Philosophical Development

By Bertrand Russell.
Allen and Unwin. 279 pages. 18s.

THERE is available no adequate general account of Bertrand Russell's philosophy. He himself has now stepped into the breach and given an account of his own work. It is not to be expected that anything very new should emerge from this autobiographical study. He is mainly content to summarise the contributions made to different philosophical discussions by the numerous books which he has written. For a thumbnail sketch of these contributions this book could hardly be bettered.

Bertrand Russell is, however, not one to be very self-critical, and the book is therefore no substitute for a critical discussion of his philosophy. Indeed, one thing that emerges from the book is his imperviousness to criticism. There is a great air of confidence about it, coupled with an impulse to put things firmly in their place. And Lord Russell reacts sharply against those who, like Wittgenstein, maintain that things are not so tidy as all that. In one passage he writes, "I have found, to take an important example, that by analysing physics and perception the problem of the relation of mind and matter can be completely solved. It is true that nobody has accepted what seems to me the solution, but I believe and hope that this is only because my theory has not been understood." This is not untypical. It is both Lord Russell's strength and his weakness.

Yet his true greatness definitely emerges: his ability to take a general view of a vast field, and the clarity and precision of his thought. He is certainly one of the philosophical giants. Apart from an early conversion from idealism to realism, there has been not so much a development in his philosophy as a sharpening of his attitude towards specific subjects. He is still ready to ride into the battlefield although his weapons have not changed much during the last forty years and although (dare one say it?) the armour now perhaps squeaks a little. But his contributions to philosophy in general and logic in particular have undoubtedly been enormous. Most if not all of these will be intelligible to the layman from the account now given. The story of the birth of "Principia Mathematica" and the discovery of the logical paradoxes which threatened that system are, while technical, particularly fascinating.

The book contains certain replies to criticisms reprinted from philosophical journals. These add little to Lord Russell's stature. Philosophical fashions have changed, and his work has already become part of the history of the subject. He is clearly very unwilling to acknowledge the fact. One reacts to this with a mixture of regret and immense admiration.

The Business of Publicity

Advertising in a Free Society

By Ralph Harris and Arthur Seldon.
Institute of Economic Affairs. 212 pages. No recommended price.

THIS book is offered as "a contribution towards remedying the neglect of advertising by professional economists": for the "hostility" to advertising that economists often display, it proposes to substitute friendly criticism focused on "ways of checking excesses without curtailing the substance of free expression." Its authors are, certainly, better informed about the details of advertising than most economists who have ever discussed the subject: most of its value, indeed, lies in its compact but well-documented account of the way this publicising but relatively unpublicised business works. The quality of its own analysis and argument is a little patchy, and concerned mainly to assemble arguments for and against rather than to contribute new ones.

Messrs. Harris and Seldon are among those who reject, convincingly, the distinction often made between "informative" and "persuasive" advertising (or other variants of the same distinction). They recognise the argument that advertising may tend to make competition more imperfect, in that money spent on establishing brand loyalties (rather than sacrificed by reducing prices) strengthens the large firm as against the small, from which process the disadvantages for the consumer can be argued to outweigh the gains. But they argue that in the real world competition usually is imperfect: indeed, that such competition "has become the ideal." This argument may come a little oddly under the imprint of the Institute of Economic Affairs, and from the authors who "for inspiration and insight into the fundamental truths of economics and political philosophers [have] turned to the classical economists:" still, albeit Panglossian, it is perhaps on balance a concession to realism.

The authors' own preference is for "constructive criticism," and they offer an interesting array of proposals, some original. They think advertisers and agents would be wise to go with the tide of public opinion and abandon resale price maintenance of any kind — hence, engagingly, their refusal to recommend any bookseller's price for their own volume. They want more objective economic study of the costs and effects of advertising (of the kind upon which Mr Taplin has already begun at the London School of Economics) and freer access to business data for such students. They would like an Advertising Council to do what the Press Council is supposed to do (but having an independent chairman and lay members, as the Press Council was originally supposed to have).

The little book concludes with many recommendations, so that its final effect is admonitory rather than purely analytical (incidentally, it appends some interesting case histories of marketing and advertising, naming names). But one's varied reactions to these recommendations should not overshadow judgment of the whole discussion itself. Its strength lies in the treatment of advertising as part of a real business world, with all the powerful convenience of that world as well as its imperfections; and in its approach to improving what might be altered in this imperfect world, rather than postulating another unreal one, bereft of human depth, mixed motives, and history.

Adversity's General

The Campaigns of Wavell 1939-43

By Robert Woollcombe.
Cassell. 232 pages. 21s.

IT was Wavell's fate to command in the defeat in the Mediterranean and in the *débâcle* in the Far East. It was his misfortune to fail to command the full confidence of Sir Winston Churchill. The duty he bore stoically, the pain silently. Having heard from the soldiers who swept forward to victory after the tide had turned, one is glad to hear of a leader who did not try to justify himself in retrospect and who in his despatches had the courage to say: this was my responsibility, this was my failure. There is much to admire in this aloofness and behind the reticence a sensitive and likable humanity.

How great a general he was, it is too early to judge. His biography — and no one more richly deserves one — has still to be written. Mr Woollcombe has produced an interim defence, writing a straightforward and clear analysis of the campaigns which Wavell fought. He establishes a reasonable, good-tempered case, which certainly sustains the negative proposition that Wavell cannot be condemned as a commander simply because he suffered defeat, and worse. But the positive proposition of greatness is not proved.

Audacious, intelligent, civilised, wide ranging in thought and interests, articulate on paper but reserved in speech, Wavell seems to deserve something more than the epithet brilliant. His ability to command over vast areas of space and time were tested to the full and no one dare say that he failed utterly. He did what he could when Britain did not have the arms or the men to do more than to hold on. He cannot be blamed because the weight of events was too heavy to be borne. Yet he misjudged the possibility of the German intervention in the Western Desert and supported the expedition from which the evil flowers of defeat in the Mediterranean blossomed. His riposte, Operation Battleaxe, in the desert went sadly off the mark. In the Far East he miscalculated again when the Japanese invaded Burma, seemingly throughout the period of supreme command under-estimating the fighting qualities of the Japanese army and over-estimating the British army's capacity to hold off the attacks.

But the risks had to be taken and Wavell took them: the criticism that he plotted the campaigns too much off the map or that he fought too far forward is irrelevant. His name is associated with defeat, but he had his victories. His incisive victories against the Italians in Libya and Abyssinia explain why Rommel said Wavell had a touch of genius about him. Perhaps he did, but it was only a touch. Yet from Wavell admiration cannot, as it can from other generals far more successful, be withheld.

The Bible in its Context

The Ancient Near East:

An Anthology of Texts and Pictures
Edited by James B. Pritchard. *Princeton University Press.* London: *Oxford University Press.* 395 pages. 40s.

Archæology and the Old Testament

By James B. Pritchard. *Princeton University Press.* London: *Oxford University Press.* 274 pages. 30s.

IF the general reader with a taste for knowing the historical context in which to place the Old Testament can afford only one of these two companion books, he is advised to choose the first. It is richly worth its extra cost, for nowhere else within reach of his purse, if ordinary, will he find the range of texts here translated. They run from Sumerian proverbs to Egyptian love lyrics, Hittite myths and utilitarian documents such as Hammurabi's code of laws. Wherever a matching Bible passage has occurred to Dr Pritchard, the reference is given in the margin. Newcomers to the subject will find staggering the extent to which not only stories but also literary forms were interchanged and borrowed all over the ancient east; here are other Adams, other Noahs, other Moses in the bullrushes, an Egyptian Psalm 104 and songs close to Solomon's. The major contribution of the Hebrews towards this mass of ancient literature is their greater genius as poets and writers. Dr Pritchard's pictures are excellent but, unlike the text, are to be found in other accessible books.

His second book seems to be intended as a history of the archaeological enterprises that have supplied all this knowledge. But it is rather a rag-bag of information. It cannot make up its mind whether to describe the ventures or to dissertate on what was found. It is arranged neither chronologically nor geographically, and anyone unacquainted with the dates and locations of successive civilisations will find himself at sea. There are many better arranged, and therefore simpler, background books.

The Scrolls in Pictures

The People of the Dead Sea Scrolls

By John Marco Allegro.
Routledge and Kegan Paul. 192 pages. 30s.

THIS is a "picture book" rather characteristic of the great number that publishers are now issuing to satisfy the interest of the layman in archaeology or art history. The brief, introductory text contains little of importance. In it, Mr Allegro re-states, in yet more simplified form, the propositions he advanced in his Pelican volume, "The Dead Sea Scrolls." He takes account neither of scholarly queries raised about his initial thesis (the link between the Essenes and early Christianity) nor of doubts cast by recent scholarship on the true nature of the Qumran "monastery." Reading the captions to the 189 photographs in this book, the layman can hardly guess how complex and controversial the whole matter of the scrolls still is.

But it is the pictures that count, and many of these are indeed excellent.

Channel Tramp

The Narrow Seas

By Reginald Hargreaves.
Sidgwick and Jackson. 543 pages. 45s.

IT is difficult to see exactly what purpose this long and expensive book serves. A history of the English Channel from a geographical standpoint would be very desirable because, even if geopolitics is not a true science, too many historians neglect the dictum of old Purchas that "history without geography is sick of a dead palsy." Except for an introductory description, the Channel itself disappears in this book under a deluge of miscellaneous historical facts. Admittedly the subject is vast and intractable since, as the author says, the story "must be unfolded against a background of general history"; but that is no excuse for limiting it to the activities of the English — the Channel has always been a bridge and an international waterway as well as the moat of this island.

The result is a book in which it is interesting to dip, but which lacks a point of view. The reader who might legitimately hope to find in it an analysis of the reasons for the decline of, say, Dartmouth and the rise of Plymouth, or the reason for the importance of Deal in the age of sail, will be disappointed. If the author had stood aside from the flow of events from the days of Julius Caesar to the Normandy landings in order to make explicit the strategic or economic issues presented by the geography of the area, the result would have more meaning.

Too Simple Man

The Story of Man:

Human, Evolution to the End of the Stone Age
By H. E. L. Mellersh.
Hutchinson. 256 pages. 21s.

LIKE its predecessor, "The Story of Life," this sketch of man's history to the end of the Stone Age is intended for a popular market. The author sails above the niceties of anthropological detail and terminology to present a broad picture of man's vicissitudes and triumphs. The result is a vivid account, well calculated to arouse the interest of those to whom the subject is new, but with inevitable inaccuracies and superficiality. Starting with a brief review of man's animal ancestry, the author traces the successive appearances of Australopithecus, Pithecanthropus and Neanderthal types, and then the appearance of true man. Naturally the central theme is provided by the progressively more elaborate and specialised tools used, but the author discusses also the probable culture at each stage, and the development of art, religion and magic. This helps to give life to the archaeological evidence, but much of the discussion is highly speculative, and the distinction between fact and presumption is not always clearly drawn. Indeed the story of man's evolution could have been given a more three-dimensional vividness if the nature of the evidence had been discussed, and some indication given of how palaeontologist, archaeologist and anthropologist work.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Democrats without a Winner

WASHINGTON, DC

THE Democrats are a party in search of a hero. They have several leaders who would make acceptable candidates in next year's presidential election and probably would serve with credit in the White House, but they lack what they most desire: a figure a bit larger than life-size and with the intangible glamour that sets off the exciting candidate from the merely acceptable one. This preoccupation with personality is partly the result of President Eisenhower's continued ability to command the devotion of the voters in spite of the decay of his party's fortunes. Governor Rockefeller's extraordinary personal victory last November in New York, which he recaptured for the Republicans although the country as a whole turned away from them, has heightened Democratic anxieties.

After having won three congressional victories in a row, the Democrats are convinced that in a straight party contest they would win again. But they are haunted by the fear that Mr Rockefeller or even Vice President Nixon, who is a strong candidate although he may not appeal to every-one's taste, will trump their natural advantages. The party's convention, which chooses its candidates, is still a year away and impartial observers may feel that the Democrats are viewing their own presidential possibilities in too nervous and too perfectionist a spirit. The fact remains that there is a mood of frustration within the party, which has brought the preliminary struggle for the nomination to a temporary stalemate.

There is no doubt that Senator Kennedy of Massachusetts comes close to possessing all the qualities of personal attractiveness and vitality which the party's managers are seeking. He is well in the lead in terms of support from potential delegates to the convention and must be regarded as the candidate with the best present chance of winning the nomination. He is young and attractive, with a record of heroism in the war; he has adopted a liberal stand on major domestic issues and shown that he is deeply concerned with important problems of foreign policy, particularly with aid to India; and he is the author of "Profiles in Courage", a prizewinning and best-selling work of popular history. To many millions of young ex-servicemen and their wives, who dominate the generation now coming into control of the nation's affairs, Senator Kennedy and his attractive wife must seem to be an ideal couple in public life.

The biggest obstacle to Senator Kennedy's nomination is his Roman Catholicism. The only Catholic ever nominated for the Presidency by one of the two major parties was Al Smith, who stood in 1928. Any Democratic candidate probably would have been defeated that year, but the campaign against Smith was a disgraceful exhibition of religious bigotry and bad feeling. Mr Kennedy, whose personal style is totally unlike that of Smith, is optimistic and believes that his candidacy would not arouse this kind of ill-feeling. Most of the party's managers, many of them Roman Catholics themselves, are wary and sceptical. Governor Lawrence of Pennsylvania is one of the most influential and most sceptical. Mr Lawrence, a veteran party boss, was elected last November as the first Catholic governor of his state. It is his belief that his religion cost him votes and that the loss would be much greater if it were the Presidency that were at stake. Senator Kennedy's youth (he is 41) and his boyish countenance are less important disabilities. But his appearance conflicts with the image many Americans have of a President as an older, more solemn, fatherly figure.

Mr Kennedy's other minor handicap is his weak record on McCarthyism. His courage, like the courage of many others, failed when it was a question of defending the civil liberties imperilled by McCarthy. When the Senate voted to censure McCarthy, Senator Kennedy was absent because of a major illness. It was nearly two years before he publicly explained how he would have voted if he had been present. Mrs Roosevelt and some other liberal Democrats, who bore the brunt of the fight against McCarthy, are determined to block Senator Kennedy's ambitions because of what they regard as his pusillanimous conduct in that battle. Their scorn detracts from his appeal as a candidate cast in a heroic mould and could conceivably be decisive in a closely divided convention.

Because of the characteristic caution of the party bosses and because of the articulate opposition of such liberals, Mr Kennedy has no chance of being a compromise candidate agreed upon at the convention after negotiation among the leaders. His only chance of victory lies in taking the convention by storm on the first two or three ballots. For this he needs to demonstrate intense popular support by winning many state primaries, the elections at which members of the party show where their preferences lie. For a time this spring, it seemed likely that Senator Kennedy would be able to enter enough contested primaries (uncontested primaries do not help much) in various states to permit him to prove his popularity. In two critical states, that is now doubtful.

IT had been expected that Senator Humphrey of Minnesota, next to Mr Kennedy the most active of the candidates, would oppose him in Wisconsin, Oregon, and perhaps California. These are traditional testing grounds for presidential prospects in both parties; Mr Stevenson's victories over Senator Kefauver in the Oregon and Californian primaries in 1956 made his nomination that year a certainty. Senator Humphrey has a strong regional base among the farmers of the upper midwest. He is also much admired by the officials of the trade unions whose support, in terms of money and manpower, is important to any Democratic nominee.

However, the prospect of a Humphrey-Kennedy clash in Wisconsin has begun to divide Democrats in that state into enemy camps; to some extent it set Catholic against Protestant, city-dweller against farmer. This development alarmed the Democratic Governor, Mr Nelson, whose party recently won control of the state government for the first time in twenty-four years. Fearing that a struggle over the presidential favourites will blight the party's renaissance, the Governor is organizing a "unity slate" of delegates to the convention who would not be pledged to any serious contenders.

Governer Brown of California, meanwhile has not only made it clear to the major candidates that he intends to hold the Californian delegation for himself as a "favourite son" but has also been acting more and more as if he intended to become a serious candidate himself. If the primaries of Wisconsin and California are closed to them, Senator Kennedy will not be able to enter the convention with an invincible lead nor will Mr Humphrey have the opportunities to score the upset victories which he needs.

These developments encourage those whose hopes from the first have depended on the prospect of a stalemate and the choice of a compromise candidate. The three in this category are Mr Lyndon Johnson, the leader of the Democratic majority in the Senate, Senator Symington of Missouri, and Mr Stevenson. There is said to be an agreement between the Johnson and Symington forces to work together at the convention and to unite eventually behind whichever one seems the stronger. This understanding has the blessing of ex-President Truman and the House Speaker, Mr Rayburn, the two grand old men of the party who like to think of themselves as kingmakers. It is hard to see how the Johnson and Symington candidacies can progress very far without one killing off the other. Both rely on the support of the same conservatives and moderates, both have laid heavy stress on the issue of national defence (Mr Symington is a former Secretary of the Air Force and Mr Johnson is Chairman of the Senate Preparedness subcommittee); both have moderate views on the racial issue and both are acceptable to the South. They share a common weakness: neither has demonstrated any power to win votes in the great cities of the Northeast and along the Pacific Coast where national elections are usually determined.

The most remarkable feature of the political situation as it has developed since the election last autumn is the total eclipse of the State Governors, from whose ranks presidential candidates are usually recruited. Mr Meyner of New Jersey has failed to catch the public imagination in his appearance outside his state. Mr Williams of Michigan has become bogged down in an embarrassing fiscal struggle with his legislature. With the tenuous exception of Mr Brown of California, none of the other Democratic governors seems remotely of presidential stature.

One former Governor remains a distinct possibility. He is Mr Stevenson of Illinois, who led the losing campaigns of 1952 and 1956. He professes not to be interested in standing again and the evidence suggests that he would be content to serve as Secretary of State in a Democratic Administration. But at 59 he is not too old; he appears increasingly on the front pages of the newspapers; and he retains a devoted following among the rank-and-file and among a surprisingly large number of politicians. Since he is clearly a man of presidential stature and is acceptable to almost every faction, the party may yet turn to him a third time. But can a twice-rejected leader qualify for a hero's part?

Investment by Letter

NEW YORK

THE cold wind that blew in Wall Street at the beginning of the month may have more success in damping down speculative fever than the concerted campaign being waged against it in the news columns of the financial journals and newspapers. Certainly there has been little sign of this campaign on the advertising pages. Indeed, the public's temperature is being constantly raised by a variety of bold advertisements suggesting that how to make money is more or less an open secret available at comparatively little cost. "If you are interested in making each $1 do the work of $100 or even $1,000 ...", runs a typical headline, while on the same page another asks: "How Can Daring Investors Pyramid Profits?" For a small sum, usually from $1 to $5, the reader is offered "17 Space Age Growth Stocks" or "9 Market Sleepers for Big 1959 Gains", with a "Special Situation Mystery Stock" thrown in for good measure. For the most part, these alluring claims are not the work of brokerage houses in search of commission business but of an influential

though somewhat uncharted fringe of the financial world — the investment advisory services.

Always bound to wax and wane with public interest in the stock market, these services have been booming. The Securities and Exchange Commission — with whom they have to register — now lists more than 1500 investment counsellors of one sort or another; in addition, there are a number of fly-by-night operators, taking advantage of the current speculative fever to tout stocks like bookies at a race course.

The weekly market letter, made up of factual information and crystal-gazing in varying proportions, is the main product of the investment services. Similar in format to those distributed free by many brokerage houses, most advisory letters sell at an annual rate of around $75, though the weightier can cost up to $144 a year. At the same time many investment advisers undertake the direct management of individual accounts; most of these handle their clients' portfolios with appropriate caution, but a few adopt a more imaginative approach. "We specialise", a recent advertisement ran, "in applying millionaire management objectives to clients whose funds are in the $8,000 to $25,000 bracket when we begin". The prospective millionaire is charged in this case the unusually stiff annual fee of 2 per cent of his assets.

The first investment advisory letter was sold in 1904 by Mr Roger Babson; today there are several hundred in circulation but only about thirty have achieved any sort of prominence and permanence. In numbers of subcribers, five services dominate the market and represent its more factual and conservative wing. Two of the most influential in this group are those put out by Moody's and Standard and Poor's, but United Business Service (with another Babson at its head) has built up the largest readership of any one service. Outside this group are a host of small services, many of them centred round the enterprise of one man, and with subscribers numbering from a few hundred to, at the most, 10,000. A few hang — somewhat tenuously as a rule — on specific interpretations of the stock market: the Dow Theory, Odd Lot Studies, Buying Power versus Selling Power, and other "chartist" movements. The majority, however, have no theoretical pretensions and simply concentrate on producing, like rabbits out of a hat, an endless flow of "undervalued issues", "low-priced stocks" or "split candidates". Yet another type of service confines itself to unearthing "special situations" which are sold at $100 or more a year for twelve.

Subscribers to all these services — of whom there may be a quarter of a million — are a fickle group, and their numbers can only be sustained by relentless advertising. To cash in on this year's wave of enthusiasm for the stock market, advertising programmes have been stepped up and full page, and even multi-page, spreads are common. Costly ventures such as these rarely bring an immediate cash profit, but from those responding to this initial package offering some will succumb to an annual subscription after a subsequent mail-order barrage. One of the largest advisory services puts half a million pieces of promotional literature into the post each month.

SOME of the more conservative and established services have proved useful guides to the small investor, distinguishing between long range "investment" selections and what are termed "business risks". But a pre-war survey of 16 leading services, which was brought up to date in 1944, reached the disparaging conclusion that, while some did far better than others, their recommendations as a whole were scarcely, if at all, an improvement on random selection. Furthermore, it pointed out that, over a long period of generally declining market prices, optimistic forecasts had outnumbered pessimistic utterances by four to one. But for this the public is at least partly to blame. While one or two services have won a small but faithful following among the less sanguine with persistent predictions of impending disaster, experience teaches that in this field the public will only pay cash for good news.

So far the services have steered remarkably clear of government regulation. Unlike the investment trusts, for instance, which are limited by law to highly conservative advertising, the advisory services have a free rein. Such censorship as there is is applied by the newspapers and periodicals themselves. Some of these — notably the *Wall Street Journal* and *Business Week* — ban all such advertisement or restrict it to the two or three most respected services. Others such as the *New York Times* and *Barron's* — the two major outlets for advisory services — blacklist individual ones from time to time but more frequently insist on changes in wording.

Of more immediate concern to the law, however, is the loophole provided by market letters for the touting of stocks by promoters or manipulators. In the past isolated cases have come to light in which an adviser has recommended to his clients a stock which he himself is busily unloading. But with the public unusually receptive to tips and rumours more investigators are being thrown into the field. While the intergrity of the larger and better services is not being questioned, there is little doubt that at times like these market letters provide some extra fuel for the speculative fire.

Missiles into Ploughshares

FROM A CORRESPONDENT IN CALIFORNIA

INTERCONTINENTAL postal deliveries at supersonic speeds were brought a step nearer when the Post Office succeeded recently in sending some 3,000 letters from a submarine at sea to the Navy's auxiliary air station at Mayport, Florida, over a hundred miles away. The "postman" was a 36-foot Navy Regulus missile, which can be guided during its flight. Like other air-breathing types such as the Air Force's Snark and Navajo, it is slower than the speed of sound; all have been outmoded, for military purposes, by the supersonic intercontinental ballistic missile.

But these earlier prototypes may not simply end on the scrap-heap. On the contrary, they may well be snapped up, for there is likely to be a host of useful jobs for a projectile that can be fired over a distance of several hundred miles, controlled in flight and brought down at a chosen place, especially if it can also embrace the principle of the helicopter. Some of the potential civilian uses of guided missiles lie in fire-fighting, crop-dusting, surveying, prospecting and cable-laying. For example, a missile designed by the Northrop Corporation for wartime use by the Signal Corps can be fired to a selected spot, where it will take pictures, and then brought back to its base, depositing the camera by parachute on the way if this is desired. Such a device would relieve the pilot who now flies back and forth monotonously for days and even months on end making aerial surveys for geological or other purposes. Many hours now spent in laying wire cables could be saved using missiles.

Missiles also seem to have a future in dealing with fire in aircraft crashes. One idea is to maintain missiles on airport control towers, where they would automatically keep an eye on each aircraft as it took off or landed. If there were a crash, the missile would "home" on the aircraft and spray it with fire-extinguishing chemicals. An extension of this idea is to maintain regular missile "fire stations" from which they could be directed, armed with extinguishers, to a crash anywhere. The Solar Aircraft Company of San Diego is reported to be working on an electronically controlled missile that would speed to the site of a crash and then descend by means of a parachute — a gentler prospect for any survivors. The Northrop Corporation is said to have on its drawing boards a pilotless aircraft that would combine the features of a missile and a helicopter and which could be used in the same way, as well as for spraying insecticides.

One of the first ways in which missiles will be put to constructive use is in fighting forest fires, which cause heavy losses every year. The missiles not only could carry fire extinguishers into the very heart of a blazing forest; equipped with an infra-red device sensitive to heat, they may even be able to search them out as soon as they start. The results of tests carried out by the Forest Service have been so good that it is ready to provide a market for any missiles which the armed services declare obsolete.

The Postmaster General is equally enthusiastic about the potentialities of missiles for his department. The demonstration in Florida was not the first experiment of its kind. In May a package of letters was dispatched from the Pacific Missile Range near Los Angeles to the Point Mugu airstrip, a 30 minute journey, and in a test last September the post was delivered although the missile which carried it burned on landing. According to testimony at congressional hearings, letters have been sent over much greater distances. Some were carried in the nose-cone of a supersonic missile that travelled 1,600 miles out to sea at a speed of 9,000 miles. The nose-cone was recovered and the letters, in a plastic bag, proved to be unharmed. The day is therefore coming when it will take only minutes, instead of hours, to deliver the post from one continent to another. Unfortunately, in America at least, the journey from the Post Office to the addressee probably will continue to be attended by the usual delay and frustration.

Montana's Press Goes Free

FROM A CORRESPONDENT IN COLORADO

AMERICA's longest experiment with a controlled press has ended. For more than half a century eight major daily newspapers in Montana have been owned by a corporation which in turn was owned by the giant Anaconda Copper Company. They have served its interests and those of its corporate allies, notably the Montana Power Company. The newspapers, which were established or bought originally to cement the company's domination over the state, and to further its political interests, include the *Billings Gazette*, the *Butte-Anaconda Montana Standard* and *Post*, the *Missoula Missoulian* and *Sentinel*, the Helena *Independent* and *Record* (the only daily ones in the state capital), and the *Livingston Enterprise*. Thus five of the state's largest communities have read the "company press" or no daily newspaper at all.

The total circulation of the controlled press has been about 100,000 in a state of 600.000 people, while the non-company newspapers had only about 55,000 subscribers. In the state capital the only vigorous opposition has been offered by the weekly "People's Voice," a co-operative enterprise, whose editors recently received a Sidney Hillman award for outstanding service to journalism. In its early years Anaconda's tame press boldly upheld the company's point of view on both candidates and issues. Recently it has grown more passive and has followed a rigid policy of printing practically no comment or interpretative reporting. Instead it relies largely on colourless agency dispatches and campaigns only against communism and the common cold.

As a political investment the controlled press has paid few dividends of late. The company's preference usually has been for Republicans, but both of the state's Senators and both of its Representatives in Washington are Democrats; only the Governorship remains in Republican hands. As money-makers, the newspapers have also been a disappointment. Altogether they had become a liability rather than an asset. This month they were sold, lock, stock and barrel to the Lee newspapers, a chain which may be conservative in the middle west, but which is likely to shake up Montana's papers and their readers in a way not far short of revolutionary.

THE WORLD OVERSEAS

Buganda v. Uganda

FROM OUR SPECIAL CORRESPONDENT

THE Kabaka of Buganda and his government now seem to be making a determined attempt to stop the march of lawlessness in the "disturbed area" which their territory has now been declared by the Governor of Uganda. But it is necessary to say "seems", for nothing is clear either in terms of motive or of action in this, perhaps the most difficult of all African countries to subject to a rational political analysis.

The boycott of non-African goods has continued, against all expectation, since February. The Uganda National Movement has changed its front as well as its name more than once and is certainly today quite a different animal from what it was. The Kabaka and his ministers have hitherto been either openly equivocal in their disapproval of violence and intimidation, or have been interpreted by UNM adherents to be equivocal. There is a way of appealing to the Baganda which is easily seen as a piece of ventriloquism, with the beloved monarch sitting on the Governor's knee; and then everyone knows what to do. Does the Kabaka want the disturbances to continue? If he does, it can only be because he feels that his own position has become, once more, as difficult as it was at the beginning of his dispute with Governor Cohen: that he is, unlike Charles II, ready to go on his travels again. "As far as Buganda is concerned", say some officials, "we are back to square one".

Present signs are that the Kabaka and his court are not prepared to push matters to extremes. But their position is difficult, and it is necessary to understand why. To do so, the boycott and disturbances must be separated from the underlying political situation. This is, briefly, that Buganda has, ever since the Kabaka's return, been seeking either full independence, or such a privileged position in Uganda that it would dominate the whole protectorate. Instead, however, of sending Buganda members to the central legislature in order to lead it, the opposite course has been taken of refusing to send members on the ground that the composition of the legislature violates the Buganda agreement of 1955 (which enabled the Kabaka to return). But the East African Court of Appeal has now rejected Buganda's case; and it only remains for it to be taken to the Privy Council (if permission is granted) where it may equally fail. While the case is being argued at the Privy Council, Buganda can perhaps continue to refuse to be represented in the central legislature, but it might be shown to be in breach of the 1955 agreement if it did. The Buganda government has now dragged up a new argument, already rejected by the Colonial Secretary, that the original treaties of 1894 and 1900 should be abrogated; and there is talk of taking this demand to the International Court at The Hague.

But an end to prevarication can be foreseen, and meanwhile Buganda, for all its considerable autonomy, remains bedded in Uganda — and the time is approaching for a review of the constitution. A committee is being set up for this purpose, and the Governor has offered to have discussions on the Buganda constitution at the same time. This may seem reasonable enough; but it frightens the traditionalists of Buganda. For it brings nearer the time — according to all normal African precedents — when there will be a black prime minister in Kampala who will prove stronger than the Kabaka in his court at Mengo. Dr Nkrumah's march to absolutism in Ghana has produced even more alarm in Mengo than in London. To such a development, Mengo is firmly opposed — unless it can get control of the legislature first, as it has control of the Lukiko, the purely Buganda parliament.

IN a rather inchoate sort of way, the UNM seems to have been an attempt to rivet Buganda leadership on the vague, fissiparous nationalism of the whole protectorate, which finds expression in a variety of short-lived political parties. When it was formed, it was indeed taken for a coalition of traditionalists and progressives, Baganda and non-Baganda. It is now, quite clearly, a purely Baganda movement, and not necessarily a progressive one. Moreover, its politics have become submerged in two other elements: first, a well-organised and very profitable attempt to divert trade from Asian and European hands to a few African hands, by intimidation if necessary; and secondly, an instrument for general robbery and paying off of scores by the kingdom's spivs and thugs. So from giving the Baganda a political party that could take power in the other provinces of Uganda, UNM is repudiated in them (and is inoperative in the non-Baganda counties of Buganda itself). After several months of activity, the party has done more to unite the rest of Uganda against Buganda than anything that has previously happened. But does this suit the Kabaka's book?

If it persuaded the British Government that a unitary Uganda was impossible, it might. But the whole policy for Uganda, economic and political, is based on Buganda's participation; to make any sense, it must be. Unfortunately, the organised separatism of Buganda is matched by the political disorganisation of the other provinces. They have voted good men into the legislative council; they have got on with local government and Africanisation; but they speak with no single voice on the future of Uganda. Their opposition to Buganda leads them to think of setting up little Bugandas of their own, rather than of fighting Buganda pretensions in a central parliament.

Nevertheless, the constitutional review may well end with an African majority in the legislature; and just as the unhappy Asians are a minority in Buganda, so the Baganda are a minority in Uganda. Moreover, once Africans can rule, men will surely emerge who will wish, as leaders of organised nationalist parties, to rule. The present kaleidoscope could be suddenly and roughly shaken. It is certainly wrong to think of the Kabaka as a calculating master-mind plotting to turn all this to his advantage; the trouble partly is that he does not know how to, and turns from one expedient to the next. Where all is clouded, the impulse to stir the mud a bit more seems to be the dominating one.

No Time for Ghosts

FROM OUR OTTAWA CORRESPONDENT

NO doubt the Queen's sail up the St Lawrence seaway after sharing the opening ceremonies with President Eisenhower will be memorable. The magnificent setting of Ottawa's Parliament Hill will give unusual grandeur to the familiar military ceremony when the Queen presents new colours to three Canadian regiments on Dominion Day. The Rocky Mountains on the third or thirtieth visit are always impressive. But before all these come two stranger contenders for the most memorable occasion of this royal tour. They are Dawson City, with its ghosts of the 1898 Klondike gold rush, and Chicago, with the ghost of Big Bill Thomson and other flamboyant insulters of kings of England.

They are still flamboyant in Chicago and they love celebrities. Their ideas about what they could fit into a one-day visit by the Queen have been slightly moderated after consulations with Canadian officials, but the programme which remains will assuredly make it a day to be remembered. The *Britannia* will sail up to Embarkation Point, directly opposite the downtown district ,and the Queen and Prince Philip will immediately drive down State Street in the heart of the shopping and business quarter. The ticker tape parade, with bands galore and drum majorettes and tons of streamers and hundreds of thousands of excited people, has been reduced from the original plan to something under one hour's drive. Fireworks are to be organised by daylight as well as in the evening. There will be a ceremonial luncheon with speeches in Guildhall, and the evening is to be given to a state dinner.

Dawson City will be rather different. Chicago's anti-royalist and anti-British ghosts have been exorcised. If they linger on it is in obscure backwaters. Civic and industrial Chicago is now internationalist, firmly intends to gain more from the seaway than anybody else, and probably will do so. But Dawson City is still the home of ghosts. They share the place with the living in a tolerant regime of peaceful coexistence. The official programme, allowing a ten minutes' visit to the old men's home and twenty minutes to see modern gold dredgers, gives the Queen little chance to gain their acquaintance.

The dredgers are mechanical monsters whose deafening screeches echo through the valleys like the wailing of souls in torment. They live on the leavings of the pioneer gold panners, transforming a whole valley bottom into barren gravel heaps in their ruthless lust for tiny pickings of overlooked gold dust. It would be better to skip all this and let the Queen and Prince Philip spend the time with a surviving old-timer in the dancehall that still stands unchanged. Threadbare curtains screen the stage, but the old man's mumbled recollections can people it again with musicians, singers and dancing girls, and they can hear the swish of the curtain falling as the miners let out shouts of applause from the dusty wooden floor where they stand.

Pointing up to the circle of boxes still lined with red plush and hung with plush curtains, the old man will chuckle and say: "That's the place to take your girl". He'll wake the milling crowd around the empty bar at the back of the hall, where ghostly feet still rest on the brass rail, recalling the night he came in broke. That was when his girl pulled a fat roll from the top of her stocking to "stake him" for another try up Klondike Creek. "Oh they were good," he'll say, "they often used to do things like that".

Never mind the screaming dredges devastating the creeks. Give the ghosts a chance to meet the Queen. They are loyal subjects and they have waited a long time.

(Concluded. The first article appeared on June 13th.)

The French Line

FROM OUR PARIS CORRESPONDENT

THE latest turn in French differences with Shape has merely brought a long-standing controversy into the open again. The prospect of a progressive removal of over 200 American fighter-bombers from their bases in France (at Toul, Chaumont and Etampes), because of the French refusal to stockpile nuclear bombs if they do not share in their control, is in keeping with the trend of the last nine months. It was on September 24th that General de Gaulle addressed his memorandum to London and Washington, asking for a reorganisation of Nato, a bigger French share in its direction, and help for France's accession to nuclear status. French co-operation was made conditional on

the response to these demands. Despite the setting up of an American, British and French consultative committee at ambassadorial level in Washington, it cannot be claimed that the general has got much response so far. And so he has kept his word : the French government has resorted to passive resistance.

Previous instances of French obstruction are well-known. General de Gaulle has refused to accept American missile bases (unless his government were given a share in the control of the nuclear warheads). He has persisted in opposition to the integration of Nato's tactical air command. Last March he announced that the French Mediterranean fleet would be withdrawn from Nato's command. Not all the general's cards have been aces. With the present scarcity of intermediate missiles, Shape was quite pleased, for strategic reasons, to set up bases further south (in Italy and Greece) rather than in France. As for the fighter-bombers, General Norstad has been looking out for alternative bases for some time.

General de Gaulle, however, need not be unduly perturbed if the planes do finally go. The French government knows that, in the event of an east-west clash American aircraft would move into action. But the gradual dissolution of Nato's military ties fits in with current French conceptions. General de Gaulle has made it plain that, both in European economic cooperation and in Nato affairs, he prefers national coalitions to integrated structures.

The French government's demand for control of the nuclear weapons on its soil is not prompted by fear that the Americans might rashly provoke world conflict. France wants a deterrent which can be used for its own political ends. Hence General de Gaulle's insistence on an atom bomb of his own, even if it be of Hiroshima vintage at the start. There is now a new condition for French cooperation with Nato — that the allies must faithfully back French policy in Algeria. This was not specifically mentioned in the September memorandum, but M. Debré talked about it to Mr Herter in April and proclaimed it publicly and emphatically in the National Assembly earlier this month.

Both sides want to avoid a showdown. Nato believes that it can carry on reasonably well even if the French refuse "to undertake any new commitments". The military commanders are not unduly perturbed, because there are virtually no French troops left to "disengage" from Shape anyway. General de Gaulle certainly does not contemplate any agonising reappraisal which would lead him to Moscow, although the Quai d'Orsay seems well aware that Mr Gromyko hopes to profit from Nato's present dissensions. The Algerian war puts General de Gaulle in an awkward dilemma. He wants allied backing for his stand, yet the war deprives him of the troops which could strengthen his stand within the alliance. When no one is eager to call anyone else's bluff, a game of poker can go on for a long sitting. This diplomatic poker game may, in fact, end without too heavy losses for anyone.

The Saudi Scene

FROM OUR MIDDLE EAST CORRESPONDENT

For eighteen months Saudi Arabia has been trying a new course, marked by a passive foreign policy and internal reform. Largesse, once the main instrument of Saudi diplomacy, is no longer scattered freely among friends and supporters abroad. King Saud has let the various Arab quarrels of the past year go by without attempting to take the lead in mediation. Internally, a serious effort has been made to exert deflationary pressures, notably by curbing royal expenditure and discouraging the import of luxuries. The effort at retrenchment has been so far successful that the Saudi *riyal* now stands at slightly less than five to the dollar (at the nadir of the financial crisis last year, it had fallen to more than six). Officials of the Saudi Arabian Monetary Agency are even advocating a relaxation of deflationary measures, with a view to putting more money into circulation. Payment of the royal debts would be the easiest means of achieving this, though their amount seems impossible to etablish. Estimates put out by debtors and creditors respectively vary between £3 million and £12 million.

It would be idle to pretend that these departures from the old way of life have been effected without bickering and friction. King Saud and his immediate circle are not accustomed to cutting their coats according to their cloth; and Amir Faisal, who is virtually a one-man government, is insisting on rigid observance of budget estimates. The Amir is said to be irritated by the delay in clearing up obscurities in the royal finances, since the King apparently approved this year's austerity budget only on condition that the government assumed responsibility for his past indebtedness. Another source of annoyance to the Amir is the manner in which religious authorities appeal direct to the King in matters for which regular governmental procedure have been laid down. Last month, a government crisis leading to the resignation of Amir Faisal was averted only by the intervention of other members of the royal family.

In the field of foreign afairs, there is a welcome lull. The bitter quarrel with Egypt early last year has died down. As Amir Faisal remarked on his peace-making visit to Cairo : "The cloud has passed". Saudi Arabia relies too heavily on Egyptians and Syrians in the government services, notably in education and health, to afford a breach with President Nasser. Meanwhile, the Saudi authorities are watching with anxiety the course of events in Iraq, hoping that General Qasim will find enough support among moderate Iraqis to check the rise of communism. Labour in the Saudi oilfields is under strict government control, and is still nationalist rather than communist in sentiment. But with an expansionist communist party working outward from Iraq, the climate might change; and Saudi Arabia has already enough essential adjustments to make to dread further complications.

Among Saudi problems in the sphere of international relations are the inland and offshore boundaries in the Persian Gulf area, their importance consisting partly in the oil that may or may not underlie the regions concerned, and partly in the amount of national pride at stake.

Starting from the north the offshore boundaries with Kuwait have not yet been determined, though Saudi officials think that no great obstacles to agreement exist. Related to the Kuwait offshore problem is an obscure little dispute with Persia, concerning two tiny islands near the middle of the Persian Gulf, al-Farsiyah and al-Arabiyah. These islands were uninhabited until 1955, when the Persian government established garrisons on them. Both Saudi Arabia and Britain protested against the Persian action, Saudi Arabia on her own behalf, Britain on behalf of Kuwait. When the Shah visited Riyadh in 1957, a temporary agreement was patched up. While both sides reserved their full rights, the Persians agreed to abandon al-Arabiyah, which has since been occupied by Saudi troops.

Further to the south-east, the Bahrainis are getting restive at the delay in exploiting the offshore area lying between Bahrain and Saudi Arabia. By the terms of an agreement concluded between the ruler of Bahrain and King Saud early last year, the Saudis were given the right of exploiting the area on condition that the Bahrainis got half the profits. Since then, the Saudis have done nothing about it, doubtless considering that they would be better served by the exploitation of other areas where all the profits would be theirs.

The frontier between Saudi Arabia and the British-protected shaikhdom of Qatar is still undrawn, but the lack of definition is of little importance in practice. Relations between the Shaikh of Qatar, Ali ibn Abdullah Al Thani, and King Saud are cordial; there is a local saying that "the frontiers of Saudi Arabia extend to Doha (the capital of Qatar) and those of Qatar to Riyadh". In other words, the actual frontier has no real significance. Nevertheless, the Saudi authorities are incensed by past efforts of the British to push the boundary southward to include within Qatar watering-places which are claimed by the Saudis.

The dispute between Saudi Arabia and the most westerly of the Trucial Coast shaikhdoms, Abu Dhabi, is much more contentious. Abu Dhabi claims the whole coastline of the Persian Gulf west of Abu Dhabi as far as the Gulf of Udaid, near the base of the Qatar peninsula. The claim of Abu Dhabi to Udaid is also contested by the Shaikh of Qatar. When an Abu Dhabi police post was set up last year at Udaid, on the southern promontory enclosing the gulf, the Qatar authorities set up a rival post on the northern promontory. Insults and a certain amount of not very angry shooting have been exchanged by the two posts across the narrow strip of water dividing them.

In the nineteen-thirties, when relations between Britain and Saudi Arabia were still cordial, the Saudi government proposed a frontier line that would have given them some thirty miles of coast south and east of Qatar. When the British government rejected this proposal, the Saudi attitude hardened; and an attitude that was hard then has become much harder since. The thirty-mile proposal, judging by current Saudi statements, has been buried for ever. The Saudis now claim about 160 miles of coast south and east of Udaid. Present indications are that the ruler of Qatar would recognise the Saudi claim to Udaid.

In the east, the Saudi quarrel with Abu Dhabi merges into a parallel quarrel with the Sultan of Muscat over possession of the Buraimi oasis. The Saudis claim the whole oasis on the basis of intermittent control ever since the eighteenth century. By contrast, Abu Dhabi claims six of the eight villages of the oasis, Muscat the remaining two; and their claims ave been enforced by British arms. Much of the dispute concerns exceedingly obscure matters, such as the nature of past *de facto* control, traditional tribal loyalties, the payment of taxes, and the conflicting statements of local notables. In one recent case, a tribal chief in the disputed area stated, without apparent awareness of the contradiction, that his people owed allegiance to King Saud and the Shaikh of Abu Dhabi.

The dispute between Saudi Arabia and Muscat goes beyond Buraimi, and embraces the whole interior of Oman. King Saud claims no sovereignty over Oman, but he rejects the pretensions of the Sultan of Muscat in that area. Ghalib bin Ali, the Imam of Oman, is now a guest of King Saud in the Persian Gulf port of Dammam. With him are his brother Talib, who led the revolt against the Sultan's authority in 1957, and Suliman bin Himyar, one of the tribal chiefs of the Oman area. The three men escaped from Oman when the revolt was crushed by the intervention of British ground troops and aircraft, after nearly two years of intermittent fighting.

The Saudis claim that the authority of the Sultan of Muscat over the tribes of the Oman interior has seldom been more than nominal. More often it has been the tribes that have threatened the Sultan in his own capital. British writers of the imperial age seemed to take pride in stressing that the Sultan owed his position, even in Muscat and its imediate vicinity, to British moral and material support. Twice in the past five years, British troops have had to intervene to assert his authority beyond the coastal strip. In view of such circumstances, the Saudis argue, it is vain to presume that the Sultan has a right to direct the affairs of the Omani interior. It seems certain that the Omanis will continue to enjoy Saudi support, unless the British-protected shaikhdoms go far towards meeting Saudi claims elsewhere. Even if that happens, the Saudi government may continue to back the Omanis against the Sultan so long as they regard him as being weak and dependent on British support.

Waiting for Khrushchev

BY A CORRESPONDENT IN HELSINKI

In Helsinki in summer the political observer usually finds little of interest. The Diet takes a three-month holiday, a truce is declared on the home front and most Finnish politicians retire to island or lake-side for a nature cure. But this year will be different.

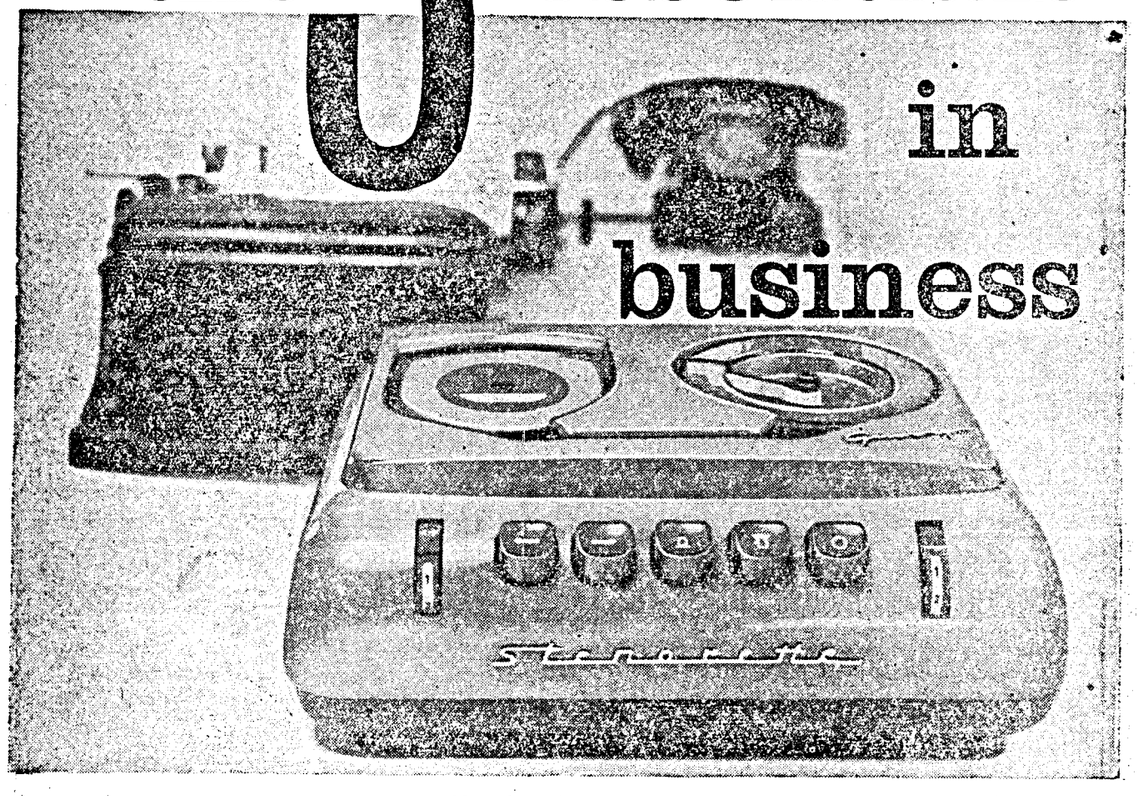
Mr Khrushchev will round off his Scandinavian tour in August by a two or three day stop-over in Helsinki. Talks have already started with the Russians on a new long-term trade agreement for 1961-65 and are expected to continue for some weeks. Both these events will test the Finns' "brinkmanship", their ability to satisfy the big neighbour without becoming isolated from the West.

The Finnish government is genuinely pleased that Mr Khrushchev extended his Scandinavian trip to Finland. It implies that he recognises Finland as part of the Nordic bloc. Moreover, it is possible that his Scandinavian hosts — in particular the Swedes — may intimate to him that their friendliness could be disturbed by undue Soviet harshness towards Finland. A Scandinavian tour could be a good psychological preparation for the settlement the Finns hope to have with Mr Khrushchev in Helsinki.

The meeting between President Kekkonen and Mr Khrushchev in Leningrad last January formally ended the winter crisis in Finnish-Soviet relations, but left some unsolved questions. The most prominent is whether or not the Soviet veto on Social Democrat participation in the Finnish government is to be lifted and Finland thus enabled to form the majority government so badly needed.

Last month, in the columns of *Pravda*, Mr Khrushchev accused the Social Democrat leaders of collaboration with western imperialists. Sanguine Finns point out that he specifically named the four leaders, Messrs Tanner, Leskinen, Pitsinki and Lindblom, but did not attack the party itself. The more sceptical regard the *Pravda* interview as a bluff designed to encourage the moderate Social Democrats to effect another split in the party, already weakened by the withdrawal of one Socialist opposition group last year. They remind each other that the splitting of the Czech Socialist party was a preliminary to the take-over in Czechoslovakia.

However, Mr Khrushchev's attitude has had an effect. Concern for national unity has led to talks, into which the president has been drawn, between moderate Agrarians and moderate Social Democrats. It has been suggested that, when Mr Khrushchev arrives in Helsinki, President Kekkonen should tell him firmly that in the autumn Finland will have to replace the present Agrarian minority cabinet by a majority coalition embracing the Agrarians, the Socialist opposition, moderate Social Democrats and the two small Swedish and Liberal parties. The Conservatives would be left out to balance the exclusion of the Communists, and Mr Khrushchev's four *bêtes noires* would not get cabinet seats. In return, Mr Khrushchev would be asked to accept the fact that Mr Tanner and Mr Leskinen have such firm control over the Social Democrat party organisation that little can be done to evict them before the next party congress in 1960.



President Kekkonen will certainly not consider this suggestion until he has seen the results of the Geneva conference and any summit meeting, and is in a better position to gauge Mr Khrushchev's likely reaction. It would appear, however, that the days of the four Social Democrat leaders are numbered. More and more Finnish politicians, even within their own party, now regard them as unfortunate victims of Finland's enforced "brinkmanship" and believe that they will sooner or later have to be induced to withdraw from the limelight.

The current negotiations for the third long-term trade agreement with the Soviet Union offer the Finns another exercise in "brinkmanship". The Finns were pioneers in concluding this typically east block type of agreement and admit that the trade has proved advantageous, in particular in providing a market for their shipbuilding and engineering industry, originally built up to pay Soviet war reparations. The crisis last winter, however, showed that it does provide the Russians with a means of exerting pressure. In negotiating the new agreement for 1961-65 the Finns have once again to try to reach a balance between their own economic advantage, the Soviet desire for increased trade and the political consequences of too great a dependence on the Soviet market.

A new factor complicates the issue: the Soviet drive to expand trade with western Europe. The Finns believe that the Russians now regard the Finnish market as a shop-window. It has become a matter of prestige for them to sell in Finland, a typical "western" market, more of the goods they are seeking to export to western Europe. They have already intimated that they want to place more cars, machinery and consumer goods in Finland and less of the raw materials — oil, solid fuels and grain — that have been Finland's staple imports. Finland can scarcely agree to increased quotas for these items without imposing restrictions on western imports. This in turn would endanger Finland's multilateral agreement with the OEEC countries, due for re-negotiation in September or October, and possibly also the prospects for a Nordic customs union, regarded by many Finns as their last hope of retaining solid economic ties with the West. Reports that the Russians had asked for restrictions on western imports have been officially denied by the Finns.

The Finns may also lose the 40 million roubles' worth of free currency paid annually by the Russians under the prevailing agreement for certain Finnish ships and engineering exports. The Russians evidently regard this payment as a dangerous precedent for their dealings with other west European countries. If they insist on dropping it, the Finns will have difficulty in finding sufficient imports to balance the trade.

the 3 essentials in business

GRUNDIG

More than a business asset, the Stenorette Dictating Machine is now a business essential. A machine made to make business easier, to make office work go faster. Nearly half a million Stenorettes are now in use in offices everywhere, handling correspondence, recording telephone conversations and conferences verbatim. Providing, in fact, all the facilities for rapid time-saving dictation and easy, accurate transcription. Providing them at a fraction of the cost of any other form of dictation on the market—including old-fashioned shorthand. Have your secretary post the coupon for details.

Stenorette

DICTATING MACHINE

Price 53½ Guineas *including these accessories:*

TAPE CASSETTE AND SPARE SPOOL, DUAL-PURPOSE DYNAMIC MICROPHONE, TRANSCRIPTOR EARPHONE AND CLIP, TRANSCRIPTION FOOT CONTROL AND DUST COVER.

GRUNDIG (Gt. Britain) LTD

Advertising & Showrooms: 39/41 NEW OXFORD ST., LONDON, W.C.1

Trade enquiries to: NEWLANDS PARK, SYDENHAM, LONDON, S.E.26

How many pfennigs make a fpound?

Before you go on holiday abroad the National Provincial Bank will put you 'in the know' on currency matters and deal with the necessary formalities. We can tell you the best way to take your money: in currency or travellers' cheques . . . where to change it and what are the present rates of exchange. If you are travelling abroad on business, then the experience of our specialists in overseas business is at your disposal.

National Provincial *for friendly service*

NATIONAL PROVINCIAL BANK LIMITED

British Banking in Asia

These are the territories served by THE CHARTERED BANK and its wholly-owned subsidiary, The Eastern Bank Limited, through a system of one hundred branches extending to most centres of commercial importance in the Middle East, South and South-East Asia and the Far East. Those branches provide complete and up-to-date banking services, sustained by expert knowledge and long experience of Eastern trade, finance and industry. In London an effective credit information service and skilled assistance and advice are available to merchants and manufacturers seeking new business connexions in Asian markets.

THE CHARTERED BANK

(Incorporated by Royal Charter 1853)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2.

Branches in the United Kingdom at Manchester and Liverpool Agencies at New York and Hamburg.

THE EASTERN BANK LIMITED

Head Office: 2 and 3 Crosby Square, London, E.C.3.

THE BUSINESS WORLD

COMPUTERS ON THE COUNTER — I

How does One Choose?

BY A CORRESPONDENT

WHEN a company considers buying a computer, it usually asks two questions : what kind do we need for our particular jobs ? Is it worth waiting because new ones available in a year or two may make the present generation of computers out of date ? There is no simple set of rules which one could apply to answer the first question, for though one can pay a consultant's fee for a 'feasibility study', the real answer may need one or two man-years of work; the most that can now be offered here are some sketchy suggestions that will help the prospective customer to ask a salesman the right questions before getting to the stage of calling in a consultant. To the second question, it has been possible for several years to reply that with proper use one of the first-generation computers should show a handsome return on capital before anything radically new was available; and that it would continue to serve as a useful tool for some years after new types had become available just as one keeps in use other capital goods such as machine tools, typewriters, and cars, long after the appearance of technical improvements. Recently, however, appropriately enough about the time that the first British computer exhibition was held, one began to hesitate about this advice. The design of computers is on the move again. In some fields computers now advertised, and perhaps available in 12 to 18 months, will have new features and facilities attainable only by a radical departure from earlier ideas and techniques.

The computers now commercially available may be grouped into a rough pattern :

1. Machines of modest size and speed, for which the programme of instructions is set up in a mechanical form such as a plug-board. This limits the number of steps in the programme to somewhere between 70 and 200, and involves slightly more trouble and cost in changing the programme than does the machine into which one feeds the programme of instructions through the same medium (say punched cards or tape) as one puts in the data. Such machines constitute an intermediate stage between the electronic multiplying punch in the traditional punched-card installation and the more versatile electronic computers.

2. Machines which use an electronically-stored programme have much greater flexibility. One could immediately think of increasing the programme to a length of the order of 1,000 steps; and since the machine can take in additional instructions as readily as additional data, usually from punched cards, there is an absolute limit to the length of the calculations it can carry out. Amongst the earlier machines in this group, which were still "slow" in terms of actual calculating "digit frequency", were the Hollerith HEC 4 and the IBM 650; the basic designs of both are still in service, but with various refinements.

3. Machines that work much faster were in demand first from the scientific and technical users of electronic computers; there are several computers that calculate at from three to ten times the speed of those in Group 2, originally designed for scientific work, including the Ferranti Pegasus, Elliott 405, English Electric Deuce, and Leo II. All have since been arranged to work with the ancillary equipment needed for commercial work (magnetic tape input and output punched-card-readers, line printers, etc.) and provide the opportunity for "integrated data processing" as distinct from mechanised clerical work. This means that in doing payrolls, for

example, one prepares not only returns for PAYE, etc., and analysis of the coins required, but also analyses of job costs and perhaps statistics of absenteeism and sickness amongst different classes of employee.

4. Although they are very different technically, one can group together the Ferranti Mercury and the IBM 704-705, on the ground that each is a substantial step ahead of the same manufacturer's other machines, both in speed and in price.

The prospective purchaser may decide on the group from which he will select his computer (a) by fixing the sum of money which he is prepared to invest in an experiment in computing or (b) as a result of a detailed study of the work he wishes to put on the computer and of the characteristics of available machines. On the first basis, he should remember that the larger machine involves larger running costs. This applies not only to the annual cost of technical maintenance (say 5 per cent of capital cost) but also to the salary bill for programmers and operators to keep the machine busy. The second method requires a special study in each instance, but an outline of the way in which payrolls might be tackled on machines in the different groups may be instructive.

A plugged-programme machine (Group 1) would require two runs on the weekly payroll : the first would convert hours worked and wage rates into gross wages for the week and cumulative pay for the tax year; and the second run (after entering total tax due to date from tables outside the computer) would compute this week's tax and the net pay after all regular statutory and voluntary deductions entered on the employee's record card. On the other hand a Group 3 machine (several of which are being used for payrolls of 10,000 and upwards) would take in amendments to hourly rates, etc, at the same time as the record of hours worked, use an internal tax table, and deliver the statement of net pay and all deductions, accumulate totals due to tax and other funds, and prepare a coin analysis. The length of programme for payrolls on such a machine can range from 1,000 to 10,000 computer instructions according to the number of contingencies covered, e.g. holiday pay in advance, exhaustion of entitlement to sick pay, automatic increase of wage rate on birthday. The time would be from a half second to several seconds per pay-slip, according to the complexity of the programme, and a 100-line-a-minute printer would usually be able to take the output direct. A Group 4 computer would do the simple calculations involved in payroll, invoicing, or inventory control so fast that the output would have to be taken away on magnetic tape, for subsequent printing over a longer time. One would therefore not choose a Group 4 machine for "mechanised clerical work" alone, but only if one had in addition more sophisticated calculations, perhaps in linear programming or in actuarial work. Some prospective customers may incidentally need warning that they should check the floor loading, power supply and access for fairly bulky equipment in the office where they plan to put a computer.

IN the next generation of computers, due in a year or two's time, there are two new principles to be reckoned with : "parallel function" and "transistorisation"; their implications will be discussed in a second article.

The first of these is a method of still further increasing the rate at which a computer works, after engineering techniques have been pushed to their economic limit, by enabling other parts of the machine to work at the same time that calculations are in progress. The second, the substitution of transistors or other kinds of "solid-state elements" for electronic valves, besides being almost essential to the first, will in future have an effect on the design of computers of all sizes.

The first is therefore a pattern of design; the second, vital to it, is a more economical mode of operation.

In the search for higher computer speeds, one obvious approach was to raise the "digit frequency" or pulse rate of the machine; but this factor has now settled at an economic maximum of about a million pulses a second, so that a digit group or "word" of 40 digits takes 40 millionths of a second to move from one part of the machine to another ,or to add to another similar number, if the digits are handled serially. The second approach was to make every part of the machine handle all the digits of a "word" or number simultaneously. This is called a "parallel" machine but very few have been built during the era of valve computers. Since the active parts have to be multiplied forty-fold to handle all digits at once, such a machine using valves tends to be costly and bulky. But these difficulties are alleviated to some extent by transistor or "solid-state" techniques, and the new large machines are beginning to use parallel arithmetic units.

(*To be concluded*).

BUSINESS NOTES

THE ECONOMY

Employment Steady

REDUCTIONS in the number of people out of work during the last two months do not seem to have brought about any corresponding rise in the numbers in jobs. Employment did show slightly more than its usual seasonal rise in April; but the rise of 48,000 during May recorded in the figures published last week seems on the other hand to have been rather less than is usual at the time of year. The margins are so tiny against a total of 22,852,000 people in civil employment, that the safest conclusion is "No change". This in itself would not be difficult to reconcile with the slight tendency to rise recorded in industrial production, particularly as there does seem to have been, within the whole, a more than seasonal rise in manufacturing employment; people as well as machines are still considerably under-employed in many British factories. It is less easy to understand why the reduction in numbers unemployed does not show; can there still be significant numbers of married women, old men, and foreign workers losing jobs but not troubling to register as unemployed?

The new index of engineering output and orders produced by the Board of Trade showed production there as slightly lower than in February and 8 per cent below the level of March, 1958. Allowing for the incidence of the Easter holidays, however, it appears that the volume of output in these industries (which exclude shipbuilding, marine engineering and vehicles) was rather higher than a year before. It was also somewhat higher than the value of the orders obtained during the month, so that the amount of orders on hand declined; the fall was entirely in export orders. Early indications are that in April output in these industries was well above the level twelve months before. Industrialists in this sector of British industry, reporting to the Federation of British Industries a week ago, were as cheerful as in other industries.

Steel Demand Firm

THOUGH production dipped a little last month as the result of the Whitsun holidays, orders for steel have continued to come in at a higher rate than in the early months of the year, and the industry is still operating at about 81 per cent of steelmaking capacity, against lees than 75 per cent at the beginning of the year. The Iron and Steel Board has now published fuller results from its quarterly census of consumers' and merchants' stocks. These confirm that stocks were being run down in the first quarter of the year, but at a lower rate than before. They also suggest that actual consumption of steel, after allowing for seasonal factors, may have been fractionally higher than in the last quarter of 1958, which seems to have been the low point of the steel recession. (It may be noted that the board, following perhaps the bad example of the National Institute of Economic and Social Research, has begun publishing seasonally "corrected" estimates of steel consumption without either its estimates of the "actual" consumption figures or the seasonal adjusters that it chooses to apply; this is an example of particularly bad statistical manners in that the "actual" figures are published nowhere else.)

At the end of March, consumers held about 3,799,000 tons of finished steel, which the board reckoned to be 14.6 weeks' consumption at the low rate of the first quarter (which would imply that they estimate "actual" consumption to have been about 3,380,000 tons). At the pre-recession rate of steel consumption reached at about the end of 1957, however, this much steel in stock would represent less than 11 weeks' consumption. It is perhaps not surprising, given the comfortable kind of margins that British steel customers prefer, that a fair proportion of them appear at least to have ceased to run down stocks, if not necessarily yet to have started building them up again. Stocks of certain steel products, indeed, have been falling for some time; consumers' holdings of sheet steel, in particular, at 417,000 tons in March, were lower than at any time since early 1955. New steelmaking and rolling capacity for sheet is coming in at the Steel Company of Wales this summer ,and should be adding substantially to British output; but with the present boom in sales of cars and other metal consumer goods, imports of sheet have been rising this year.

Exports Beat Expectation

BRITAIN has fared unexpectedly well in its overseas trade so far this year. The sharp fall in exports to the primary producing countries has been more than offset by a further expansion in shipments to North America and by the recent recovery in shipments to Europe. In May British exports rose still further by £3½ million to a new peak of £299.2 million f.o.b., bringing the average for the first five months of the year to £277 million, two per cent higher than a year ago. That comparison masks the sharp improvement during the last two months, when exports were nine

per cent higher than in April and May last year and 13 per cent above the first quarter's average.

Imports in May fell surprisingly sharply by £35 million to £311 million c.i.f.; the average for April and May was seven per cent higher than a year ago, and the average for the first five months, at £319 million, was less than four per cent higher than a year ago. With re-exports £1.1 million lower at £10.2 million in May, the apparent visible deficit was almost wiped out, amounting to only £1½ million, the smallest ever. For the first five months the average deficit was just over £31 million a month, only £8½ million mone than the exceptionally small deficit in the first five months of 1958. As the Board of Trade remarks, if exports and imports are reckoned on an f.o.b. basis, and allowance is made for invisible earnings, Britain "must have earned a handsome surplus in May".

Though imports have gone up, and can be expected to rise further, the cost has been cushioned by lower import prices, especially of food and petroleum. Despite the general recovery in commodity prices British import prices in April were three per cent cheaper than in December last year. The official index of import prices includes items, such as bacon and butter, which are not covered by *The Economist* commodity indicator; both these items have fallen this year. And the index is weighted (as *The Economist's* is not) according to the composition of imports in the base year 1954. As market prices become reflected in prices of imports the index is likely to rise, but it can hardly rise very far in what is left of this year. And any deterioration in Britain's terms of trade from now on will start from an exceptionally favourable level. British export prices this year have held steady, and the ratio of import to export prices in April was more advantageous than at any time in recent years.

ATOMIC ENERGY

Fifth Consortium

No one can have felt any surprise that the Central Electricity Generating Board awarded the contracts for its 500 megawatt nuclear power station at Trawsfynydd in Wales to the consortium known as Atomic Power Constructions Ltd. This is the fifth big nuclear engineering consortium in the country. Formed two years after the other four, it never had a chance to bid for the first four initial nuclear power contracts. The "phasing out" of the nuclear power programme meant that the group had to wait for the best part of another two years before the CEGB invited tenders for its proposed Welsh nuclear power station; the award has, indeed, been announced rather sooner than expected. Although the CEGB did consider bids from the other consortia, these must have felt that it was doing so merely to have some kind of yardstick by which to judge the price and engineering of the bid submitted by APC.

The £60 million power station brings the amount of nuclear plant under construction in this country to nearly 1,900 megawatts out of a proposed nuclear power programme of between 5,000 and 6,000 megawatts. In other words, roughly a third of the programme is now in hand, leaving a further 3,000 to 4,000 megawatts to be built between now and 1967. With the CEGB now ordering nuclear plant in units of 500 megawatts and asking planning permission for stations of 1,000 megawatts, the most that the industry can expect is that contracts will be placed for eight more nuclear stations to complete the programme, and the actual number may well be less. There is no hope therefore that any of these groups will secure at home orders for one new station a year, which most companies consider the minimum needed to keep their nuclear drawing offices usefully employed. Lord Chandos has been the first member of any of the consortia to admit that his group was actually losing money on its nuclear investment. But none of them went into the industry expecting a quick return and two, the Nuclear Power Plant Company and General Electric Company, have shown that it is possible to secure export contracts even in spite of current second thoughts on nuclear power. The exchange agreement recently signed between GEC and the German MAN engineering group shows one way in which the British consortia may widen their market.

AIRCRAFT INDUSTRY

The Ministry Intervenes

In deciding to throw what amounts to a lifeline to the Handley Page Herald, the Ministry of Supply has chosen a course of action that airlines are tending to regard with some suspicion. The Herald falls into the class of aircraft loosely described as "Dakota replacements": i.e. a fairly rugged machine for feeder line operations in territory closed to aircraft like the Viscount. Handley Page has spent about £4 million in developing the aircraft as a private venture but has failed to sell it because potential customers want some evidence of how the aircraft behaves in commercial service — which they obviously cannot have while no airline will buy it. To end this stalemate, the Ministry of Supply has agreed to buy three aircraft from Handley Page, at a probable cost of about £180,000 apiece, which will then be operated next summer, by British European Airways on those parts of the Scottish services where BEA's Viscounts cannot go.

There is probably a great deal more to this arrangement than meets the eye. BEA has already resisted some fairly strong pressure to take the Herald under its wing and place a genuine production order for a limited fleet. The precise terms on which it will operate the Ministry's Heralds have yet to be worked out but

CAPITAL

can be a decisive factor

for industrial and commercial enterprises in their expansion and progress. I.C.F.C.'s function is to provide capital for small and medium concerns in Great Britain in the form of long-term loans and share capital.

Our booklet, J.4. 'Capital for Business and Where to Find It', will be sent on request.

In New Zealand he's a national institution . . . and so are we!

Power from natural steam. That's the significance behind the new Geo-Thermal plant at Wairakei, where maximum capacity is now 250,000 k.w., and where the knowledge and experience of the Civil Engineer is so indispensable. Yes, the Civil Engineer is a figure of national importance in New Zealand. And when he wants banking services he comes to us – for we are national too. We have more than 150 branches and agencies in the North and South Island, and our service is expert and comprehensive. If you live, work, trade or travel in New Zealand – or indeed if you wish to know anything at all about the country – isn't it logical to contact the *National* Bank of New Zealand?

THE NATIONAL BANK
OF NEW ZEALAND LIMITED

Head Office: 8, Moorgate, London, E.C.2. (MONarch 8311)
West End Branch: 14 Charles II Street, London, S.W.1. (TRAfalgar 6791)

I am the very pattern of a modern business fitment,
For forward-looking Companies essential equipment.
On paper or magnetic tapes, on cards replete with punches,
I provide the facts and figures to substantiate your hunches,
In fractions of a second I'll produce the right statistics,
I'm the crystal ball's successor in all matters of logistics.
I assist in forward planning, I assess each forward shipment,
I am the very model of a modern business fitment.

Men and Machines at your service

Whatever the size of your business, if you believe that your research, production, marketing or financial affairs are capable of improvement there are well-established reasons for thinking that International Computers and Tabulators can help you.

I·C·T is the largest manufacturer of data processing equipment in Great Britain. It offers you the widest range of this equipment in the world—punched card machines using 21, 40, 80 and 160 column cards — to small, medium and large electronic computers employing combinations of punched cards, paper tapes and magnetic tapes. This is backed by Hollerith's 50 years and Powers-Samas' 43 years of experience in this field.

Determining the optimum method of employing data processing equipment is a highly skilled task. I·C·T staff are experienced in these matters. The combination of I·C·T staff, equipment and training has proved valuable to enterprises of widely divergent character and size. It is currently saving time, cutting costs, assisting in production control and forward planning in firms with a pay roll of under 20, local authorities, nationalised industries and vast corporations.

We suggest that you get in touch with us.

I·C·T INTERNATIONAL COMPUTERS AND TABULATORS LIMITED

ALL THE RESOURCES OF HOLLERITH AND POWERS-SAMAS

the attitude of the corporation suggests that it has no intention of losing money on the deal. From the Ministry's point of view there are, however, several obvious advantages in the new arrangement. It is much more satisfactory for the Ministry to buy a small number of aircraft at a fixed price than to put money into aircraft development at a much earlier stage when the final product is just as likely to turn out a goose as a swan. The only problem is where, having bought the aircraft, to find an operator for them. Both nationalised air corporations are understandably sensitive to anything that looks like pressure to buy or use aircraft of the Ministry's rather than their own choice. If the Ministry of Supply decides to help the Avro 748 in the same way — this is a direct competitor of the Herald which is still under construction — the most likely choice of user will be either Transport Command or one of the independent airlines.

DIAMONDS

Spur of Competition

Just over four years ago the scientists of the General Electric Company of the United States manufactured a synthetic diamond of the same size as natural crushing boart. As the synthetics came into production, the price for them was reduced to around 21s. a carat, just above the 20s. a carat charged by the central selling organisation for crushing boart. Competition from outside the syndicate, however, was not confined to price. In resin bonded wheels, on which the grinding pressure is light, and where a fine and accurate finish is required the synthetic grit was probably superior to the natural grit, which consisted of solid blocky particles and tended to tear out of the resin bond. Now, after many months of research, De Beers has introduced a new natural grit for resin bonded wheels. The new grit consists of friable, irregularly shaped particles that will wear down gradually and not tear out of the bond so frequently. It is said by De Beers to be 40 per cent more efficient than the old natural grit, and it is likely to be as least as effective as the synthetic grit.

The central selling organisation is, in effect, offering a new grade of crushing boart, specially sorted for use in resin bonded wheels. The old grit will continue to be sold for use in metal and ceramic bonded wheels, where the grinding pressure is high. At the same time, the quality of industrial stones for drilling purposes (where there is no competition from synthetics) is to be improved. Here again it is largely a problem of selection and sorting, though in this case stones which are round in shape and which are not friable are re-

The Hovercraft at Sea

Offshore behaviour of the prototype Hovercraft, which skims the water on a cushion of air, on its early tests augured well for the future of the project on the first tests last week. The possibility of operating over the sea has been established, and performance fulfilled the estimates in advance. But this should not lead to the belief that ocean-going Hovercraft are just around the corner; much remains to be learnt before their technical and commercial feasibility can be determined. Estimates that have so far been published about the performance of large Hovercraft necessarily involve much guesswork, but the results of the present trials of the prototype will provide data for more reliable calculations — especially for the 40-ton machine that is the logical second step. Small upward steps in size are essential if expensive errors are to be avoided, as those responsible for the project have pointed out.

If nothing precise can yet be said about the performance of commercial Hovercraft, there are good reasons for believing that it will have genuine attractions compared with the aeroplane, the helicopter, and the ship. The chief of these are that it can lift ten pounds for each pound of thrust it develops, where a helicopter or conventional vertical take-off aeroplane can lift less than one pound; and that it can, on the basis of present knowledge, operate with a power/weight ratio of about 70 h.p. a ton. That compares with 200 h.p. per ton for an aeroplane, 35 h.p. a ton for a car and 2-3 h.p. a ton for a small, fast ship like a cross-Channel ferry, and the payload of the Hovercraft can form a high proportion of its total weight. This will depend partly on the routes for which the machine is intended and where an emergency landing might have to be made. For use over rivers or lakes, the structure need not be so strong as for use over the sea, and for use as a cross-Channel ferry the hull would not have to be as strong as for a machine to operate over the open sea. At present it seems that a Hovercraft may carry a payload of from 30 to 50 per cent of its total weight, as high a proportion as a cross-Channel ferryboat does, and much more than the 12 to 25 per cent of total weight that an aeroplane can take as payload.

A second factor complicating estimates of a Hovercraft's structure weight is ignorance of the type of structure that will prove most suitable. Its inventor, Mr C. S. Cockerell, believes that neither aircraft nor ship practice can be directly applied, and the Hovercraft does seem an inherently simpler machine to build than the aeroplane with its long, thin wing. Building costs will remain guesses until structural methods are settled; figures of £300,000 for a 40-ton machine seem to assume the use of aircraft methods of construction.

The Hovercraft has a great advantage over the ship in speed; it moves five to seven times as fast, on the basis of present figures, as the cross-Channel ferry. And it it is with the ship, especially on short crossings, that it appears likely to compete first. One safe assumption about the Hovercraft is that its efficiency and operating altitude will rise with its size, because the loss of air from around the machine is proportionaltely smaller; so if it enters commercial service, it will probably be most successful in sizes comparable to those of small ships. But its development is only just beginning, though so far progress has been remarkably swift and trouble-free, yet it would be surprising if it should remain so. Operational problems arising from the flying altitude of one to eight feet for 4 to 400-ton machines, and from the effects of waves, seem likely to be soluble, but further, so far unforeseen, difficulties may well arise.

quired. The new stones, "prepared to the specific shape and size required for particular diamond drilling operations", will give the drills, De Beers claims, a "considerably longer life."

Closing the Ring

THE diamond syndicate has thus demonstrated once more its willingness and ability to fight back on whatever front it is assailed from the outside. It prefers, however, not to see what it calls "the structure of the trade" disrupted : it would like to see the diamond producers, or even potential ones, inside the ring rather than outside it. And only recently De Beers has signed an agreement with Mr Jack Scott, giving it an interest in exclusive diamond prospecting operations in Basutoland. Mr Scott has been prospecting in that territory for three years and he has found some "blue ground" and a few diamonds, but as yet no payable deposits. De Beers will now aid Mr Scott in his further explorations and if any diamonds are produced they will be sold through the central selling organisation. If diamonds in payable quantities are found in Basutoland, finance and a quota will be waiting for them.

A new recruit is thus enrolled at a time when the contracts between the central selling organisation and the diamond producers will soon be due for renewal and when diamond sales have recovered from last year's setback. Gem sales at £25½ million in the first five months of this year compare with nearly £18 million in the corresponding period of 1958, and industrial sales of £12.2 million compare with nearly £6.9 million. The big increase in industrial sales seems o owe something to renewed buying by the United tates stockpile; but how long this will continue, ither for natural industrials or for synthetic ones, is roblematical.

NATIONAL SAVINGS

Unrepeatable Bargains

WHATEVER the effect of a reduction in rates on national savings on sales of the new securities would be, the Chancellor's hint at the possibility of a reduction has given the expected stimulus to sales of existing securities. Savings reported by the national savings movement in the week to June 13, which roughly reflect actual transactoins in the week after Mr Amory's speech, show net receipts of £11.7 million, compared with £1.5 million in the corresponding week of 1958. The most spectacular improvement was in savings certificates, with net receipts of £3.6 million compared with net repayments last year of £5 million. Defence bonds actually showed a slight deterioration. These appeal to more sophisticated investors, who may already have their full allocation. In the first ten weeks of the fiscal year, total net recepts from these securities, deposits in the savings banks and from premium bonds total £67½ million, compared with £25¾ million a year ago.

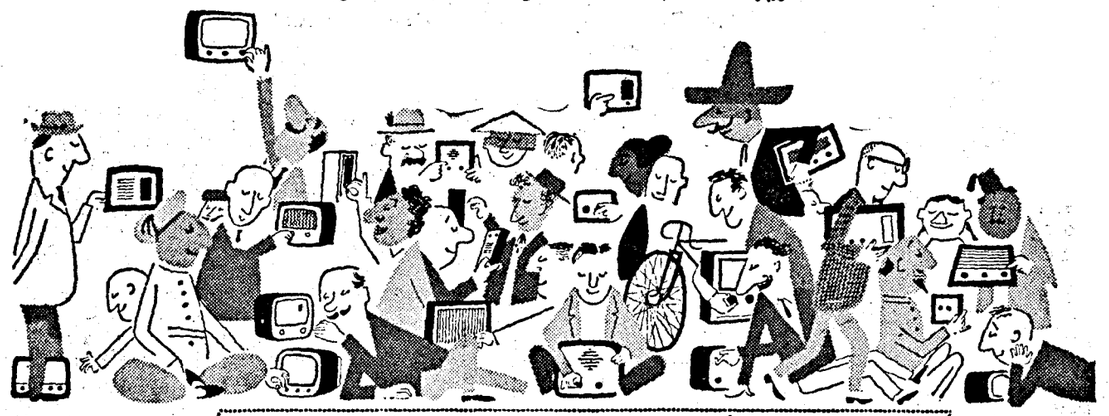
TATE AND LYLE

Share Shop

THE shop through which Tate and Lyle sells its own equity in bearer warrants of £1 each to its own workers has recently been opened. For Tate and Lyle, for Associated Portland Cement, which intends to follow in Tate and Lyle's footsteps, and for the sponsors of the scheme, Aims of Industry, the initial response from employees must seem encouraging. In the first week, the shop has sold 702 bearer warrants — 194 on the first day — at prices, based on middle market prices, ranging between 48s. 4d. and 50s. 9d. In all, therefore, employees invested about £1,750 in the capital of the company for which they work. With the proclaimed intention of avoiding speculation, it is provided that an employee can buy no more than five warrants on any one day and must put down cash.

As many as 300 other companies have expressed an interest in this scheme, and if ever they set up shops the employee-capitalist will be given some chance of diversification, for each shop will have the power to deal in the equity of any company participating in the scheme. If these ambitions are realised the stock exchange, which must remain the fulcrum of investment, will be by-passed. If they are not realised the employee will be investing his savings in the company which pays him his wages. Will many, even in the best managed of companies, be prepared to take this double risk? The scheme, with its bearer warrants and immediate tax relief on dividends, is certainly ingenious. But ingenuity misapplied can be a waste of energy.

SILVER



Frankfurt Undersells

FRANKFURT is becoming a more serious competitor of London in the European silver market. The German firm Degussa benefits from its proximity to supplies of silver behind the Iron Curtain; and it has secured a privileged position in buying Mexican silver. For some years. German firms' free access to dollars has given them more room for manoeuvre than their competitors. This particular firm is said to have obtained a contract that gives it Mexican silver f.o.b. Tampico slightly below Messrs Handy & Harman's published price in New York — now 91.5/8 cents. This pri-

Manufacturer's exports multiply 26 times in 10 years!*

From an export turnover of £81,000 to over £2,000,000 in just ten years! That's the success story of a manufacturer in the radio industry who went after the world markets in 1948 with the right sort of backing—ECGD insurance. In fact, had it not been for ECGD cover during these past ten years, a number of unforeseen losses might have cost him £236,000. What a good thing he was insured! For although £82,000 of this money has since been recovered, these are the sort of losses that no exporter, however big, can afford to face alone. There's money, big money, to be made in the export markets. But a few bad debts or a suddenly blocked currency could bring serious financial loss. If you're all set to launch out overseas, *first have a talk with your ECGD man.* With ECGD behind you, you get your money whatever happens. For consumer goods the cost averages less than 10/- for every £100 insured.

* This is a true story, but because business between ECGD and exporters is strictly confidential any details which could identify the exporter have been left out.

E·C·G·D

EXPORT CREDITS GUARANTEE DEPARTMENT

HEAD OFFICE: 59 GRESHAM STREET, LONDON, E.C.2. BRANCH OFFICES IN LONDON, BELFAST, BIRMINGHAM, BRADFORD, BRISTOL, EDINBURGH, GLASGOW, LEEDS, LIVERPOOL, MANCHESTER, NEWCASTLE, NOTTINGHAM, SHEFFIELD.

E.C.G.D. is a Government Department set up to help exporters. Its services are fully explained in the booklet 'Payment Secured'. Write for a free copy.

talk it over with your ECGD man

vileged contract enables the German firm to deliver silver in Frankfurt at a price equivalent to 78 3/8d a fine ounce net, compared with the London price of 78¼d to which costs of commission have to be added. Some of the offtake of silver for the Continent that would normally be satisfied through London has, in consequence, been supplied by Frankfurt.

This would have led to a reduction in the London price had it not been for the dearth of supplies in the London market. Official supplies of silver are still being fed by about 150,000 ounces a week from the demonetisation of silver coin in Britain. These supplies are being accumulated in a stock now amounting to about 1 million ounces, which is being made available in small amounts by the Bank of England to supplement the supplies of newly mined silver, the arrivals of which are apt to be highly erratic.

The slight divergence between the Frankfurt and London prices may disappear when the next instalment of the French silver purchasing programme comes on the market. So far no more than a comparatively small proportion of the 30 million ounces of silver needed for the new French coinage has been bought. The size of these requirements is such that they will swamp the immediately available supplies both in Frankfurt and London and call for some direct purchases from the United States. The US Treasury is still prepared to sell surplus silver at 91 cents, delivery San Francisco, which brings the New York quotation to the present published price of 91 3/8-5/8 cents.

CHIVERS

Money for Jam

EVENTS in the struggle for control of Chivers, the jam makers, fruit growers and canners, have confronted its ordinary shareholders with an extraordinarily awkward predicament. There are two rival bidders in the field: Schweppes, supported by the board of Chivers, and St Martin Preserving. Mr Richard Scott, the chairman of St Martin, says he indicated to the chairman of Chivers as long ago as last October that St Martin was prepared to make a bid. In January, the directors of Chivers informed Mr Scott that they would be embarrassed by having to tender advice to the shareholders until the company's full accounts for 1958 were published; Mr Scott ageed to respect the wishes of the board and did not make an offer.

Then on June 6th, on the eve of the publication of the accounts, the terms of the Schweppes offer for the Chivers ordinary shares, which commanded the full support of the Chivers directors, were announced. The offer, taking the form of either Schweppes ordinary shares or Schweppes ordinary shares plus some cash, put a value of about 59s. 6d. on the Chivers shares, compared with a pre-bid market price of 47s. 6d. The Chivers directors and the Chivers family interests, who together control 47¾ per cent of the equity, decided to accept that offer. They also received intimations from other shareholders of the intention to close with that offer, bringing potential acceptances of the Schweppes bid to above 50 per cent of the ordinary capital. Mr Richard Scott, the Chivers directors say, was informed of these facts. Nevertheless, St Martin Preserving announced its own bid: it was of 40s. in cash plus five St Martin 4s. ordinary shares for every one Chivers share and with St Martin shares quoted at 6s. 3d. put a value of 71s. 3d. on the Chivers shares.

Whoever wins or loses, this struggle poses some important questions of principle. On the face of it, the bid by St Martin, offering a better price for the shares, appears the more attractive one to investors. As shareholders, the directors of Chivers have a perfect right to sell their shares to whom they like at whatever price they please. But if, as in this case, this action may frustrate other shareholders from securing an even better price, are the directors *qua* directors acting in the best interests of the shareholders? As directors, they may claim they owe their duty to that intangible entity, the company, and not to shareholders; and as shareholders, to their own selfish interests. But does that give them the power to ignore the claims of the other owners of the company's equity? Mr Scott's statement left them the duty to explain to the Chivers shareholders why what seems to be a more attractive offer should be turned down for what seems to be a less attractive one. If they fail to satisfy other shareholders on this count, what meaning is to be attached to "equity" in Chivers?

ACCEPTING HOUSES

A New Member

THE chairman of Philip Hill, Higginson & Co, Mr Rudolph E.F. de Trafford, has joined the Accepting Houses Committee, bringing its membership to 18. The Committee is a select one, which newcomers to the City (where one tends to stay a newcomer as long as in any village) find hard to enter. Two years ago Warburg and Company, one of the most forceful of the merchant banks which has not always met the approval of the old-established houses, joined the circle by taking over an existing member, Seligman and Company. Philip Hill is a young and forceful issuing house; in 1950 it took over Higginsons, which had been a member of the Accepting Houses Committee before the war. Now the amalgamated firm has been taken into the fold. There are no clear-cut rules of eligibility; the deciding factor, as in acceptance business itself, is "feel". All members of the Committee, and a few others, enjoy the fine rate in the discount market on their acceptances, and the Bank of England will take their paper for re-discount.

COMPANY AFFAIRS

YORKSHIRE INSURANCE

HARD on the heels of the friendly merger between Commercial Union Assurance and North British and Mercantile Insurance has come another move towards consolidation within the insurance business, with Yorkshire Insurance making an offer to acquire the equity capital of Scottish Union and National Insurance. Economies should result in time from the merger of two such composite offices, and these the directors of both companies presumably had in mind in settling the terms of the merger. For the owners of the ordinary shares of Scottish Union and National the terms are attractive. The shares have enjoyed a strong rise in recent months, as Scottish Union and National was an obvious candidate for a take-over by a larger office.

For every two of the £1 fully paid ordinary shares in S.U. and N., three 10s. fully paid ordinary shares in Yorkshire Insurance plus 32s. in cash are offered, and for every four £5 "A" shares (10s. paid) in S.U. and N. three fully paid ordinary shares in Yorkshire Insurance plus 30s. in cash. With the 10s. (nil paid) shares in Yorkshire Insurance standing at 57s. 6d., this offer puts a value of 118s. 6d. on the S.U. and N. ordinary shares (compared with the pre-bid market price of 104s.) and of 58s. 9d. on the "A" partly paid shares (against a pre-bid price of 52s. 3d.); the offer for the fully paid shares is thus slightly more valuable than that for the partly paid.

Yorkshire Insurance, having along with other British offices suffered quite big losses on underwriting in North America, pulled out of that market and disposed of its interests there. One result of this merger may therefore be that S.U. and N. will also dispose of its American interests, for the choice that faces British underwriters in that market is either to be big or not to be there at all.

MARKS AND SPENCER

MARKS and Spencer's price-cutting campaign, launched a year ago, had a mixed reception. There were misgivings among those who thought profit margins would be squeezed, there was optimism among staunch believers in price competition. The full accounts and the chairman's remarks at the annual meeting show that the optimists were justified. Turnover has increased from £130,000,000 to £134,000,000 and net trading profits reached a record at £7,700,000 (compared with £6,200,000 in the previous year). These results are largely the fruits of the company's capital expenditure programme to provide more selling space for a rapidly expanding range of goods, which involves not only buying new sites up and down the country, but also improving existing stores. What the chairman, Sir Simon Marks, calls "the technological approach to merchandise" has also played its part: the research and development work carried out by the firm's 60 scientists and technologists has considerably "shortened the path between the advent of new man-made fibres and the production of the kind and quality of goods we think our public want," says Sir Simon.

During the year the company completed 11 major new extensions and there are 15 in hand. This remarkable building programme which "will require substantial investment year by year" (and is to be financed, as before from retained earnings) is in line with the general growth of capital investment in the distributive trades during the last few years, as the upsurge of investment in manufacturing began to subside. At the same time, Marks and Spencer's concentration on improving management in its distributive outlets — paralleled, no doubt, in the powerful influence that it exerts on its suppliers — exemplifies the change in the balance of power in the marketing sphere. Dominance by the manufacturer of branded goods is here, and not only here, being challenged by growing strength on the part of the distributor.

HOUSE OF FRASER

AS the profit figures of House of Fraser, the department stores group, for the year ended January 31st last included a full year's trading from the subsidiaries, John Barker and Wylie and Lochhead, and most of the year's profits of Arthur and Company, the improvement from £800,000 to £1,290,000 in the net profits of the group does not seem to indicate any marked expansion in the sales and profits of the group's established stores. The 1957-58 accounts included only five months profits from John Barker and three months from Wylie and Lochhead. Moreover, the change to a flat rate of profits tax and the lower standard rate of tax have combined to reduce the tax charge from £1,400,000 to £1,250,000 so that profits before tax are only £350,000 higher at £2,630,000.

Nvertheless, the directors seem to be reasonably confident about the future for they have raised the ordinary dividend from 35 per cent to 40 per cent by declaring a special interim dividend of 5 per cent for 1959-60. This payment will not be taken into account when the normal dividends for the current year are considered. The earnings cover on a 40 per cent dividend is only 1.2 times, reflecting not only the liberal dividend policy of the board but also the terms on which John Barker was acquired. The 5s. ordinary shares at 43s. 4½d. yield 4¾ per cent.

DAILY MIRROR

THAT the Daily Mirror will not be content to leave the magazine group, Amalgamated Press, in the same shape as it was when it was acquired from the Berry family interests seems certain. And now its balance sheet, drawn up on February 28th to include the assets and liabilities of Amalgamated Press and its subsidiaries, demonstrates that the Daily Mirror group has plenty of money to finance any developments it has in mind. The balance sheet, as it stood at the end of February, reflected not only the purchase of Amalgamated Press but also the sale of most of the Daily Mirror's Australian interests and enough of its shareholding in ATV to recoup the original cost of investment (leaving the Daily Mirror with a holding of 20,000 ordinary shares of £1 each and of 720,000 "A" ordinary shares of 5s. each in ATV). Thus over the year the net book value of fixed assets (including construction work in progress) has been increased from £3.1 million to £16.3 million, and the group was left with £9 million (including quoted investments) in liquid assets or just over £6 million (excluding them).

Since the end of February, the group has sold off the rest of its Australian interests; and its subsidiary, Amalgamated Press, has sold off its interest in Conde Nast, reinforcing liquid resources even further. Still to come, in whatever shape they may be, are the proceeds from the sale of Amalgamated Press's holding in Southern Television. The Daily Mirror now has a stake in popular newspapers, magazines and commercial television and it is difficult to believe that its directors will leave all this cash idle for long.

Investors buying the 5s. "A" ordinary shares at the present price of 23s. 6d. and on a yield of 5 1/3 per cent (on a dividend covered about 2 3/4 times by earnings, of

25 per cent) are buying an interest in something much wider than a popular newspaper with a big circulation. That, of course, remains the heart of the business. From the investors' point of view, that heart is sound: last year, reflecting the higher selling price of the paper, the "steady demand" for advertisement space and bigger dividends from ATV, the Daily Mirror's net income rose from £1.4 million to nearly £1.9 million.

STEEL COMPANY OF WALES

THOUGH the producers of heavy steel are still operating below capacity, the strip mills are continuing to work to full capacity and still failing to meet all the demands made upon them. Against this background the interim statement from the Steel Company of Wales has been issued. Shareholders should be satisfied with the increase in the interim dividend from 3 per cent to 3¾ per cent and the forecast of a final dividend of 6¼ per cent. This will raise the total dividend for the year to September 30th next to 10 per cent, compared with the 9 per cent paid last year (including a "profits tax" interim of 3 per cent). The directors expect that the net profit will show "some increase" for the year.

SCOW is clearly benefiting from the boom in the motor industry, which is one of the largest customers for its strip steel. Another important customer is the domestic appliances industry where output has been rising sharply. At the same time SCOW's capacity has been expanding quickly. The second stage of the development plan came into operation last summer and the third stage, which is expected to cost £52½ million, was scheduled to be completed by the end of this year. By the end of March, however, about £38 million had already been spent and the major production units are expected to come into operation by the end of this month.

COLVILLES

DWINDLING demand in the first half of the financial year for most of their products forced Colvilles, the Scottish steel makers, to cut back production. The group's output of ingots and casting in the six months to March 31st last fell by about a third compared with the same period in 1957-58 and net profits declined from £2,646,000 to £2,072,000. Nevertheless the directors have decided to increase the interim dividend on the capital, as enlarged by debenture conversions, from 5 to 6 per cent. They say that there has been some recovery in demand for their lighter products, reflecting, no doubt, the booms in the motor and consumer durable industries. At the same time, one of the company's principal customers, the shipbuilding industry, is still working through its order books. The hope, presumably, that the revival in demand for consumer goods will ultimately percolate through to the capital goods industries, seems to have prompted the directors to speak of "steadier conditions" generally and to expect "a gradual improvement" in production.

Construction of the Ravenscraig slabbing mill is making steady progress and the plans for the 500,000 ton strip mill project, which is expected to come into production in 1963, are nearing completion. The £1 ordinary shares were marked up 9d. to 32s. 9d. on the increased interim, and on the assumption of a total dividend of 14 per cent the yield is 8½ per cent.

ULTRAMAR

THE 1958 results of the Ultramar group are surprising in that they reveal a sharp rise in the operating profits of S.A.P. Las Mercedes, the oil extracting company in which Ultramar had an interest through its wholly owned subsidiary, Caracas Petroleum. In 1957 Mercedes' net income jumped from $2 million to $3.33 million and in 1958 it almost doubled to $6.12 million. As a result Mercedes has paid a dividend "in kind" by the transfer of concessions. This is entered at a value of £339,550 in the Ultramar profit and loss account. Without this payment the net profit of Ultramar would have shown a decline of almost £130,000, but as it is the net surplus is reported as having risen from £442,513 to £652,440.

In addition to its dividends, Mercedes has repaid $7 million (against $4 million) in cash in reduction of advances. How much of Caracas share of this payment has been transferred to Ultramar will not be known until the full accounts are published, but it is clear that a substantial exchange surplus has once again been made, for Ultramar is again making a capital distribution of 15 per cent. Though Ultramar is not one of the largest producers of Venezuelan oil, its £1 ordinary shares figure prominently in dealing in the market in oil shares; sometimes there are rumours of the possibility of a take-over bid and this has led to quite violent fluctuations in their price. Some of the speculative steam has now evaporated and the price has fallen from the year's high of 73s 6d to 67s 6d.

DE LA RUE

THE end of the credit squeeze and the easing of hire purchase restrictions last autumn have brought a turn-round in the fortunes of the De La Rue Company.

Following last year's fall in profits, shareholders are now to receive an increased dividend of 20 per cent, compared with an equivalent 17½ per cent; and the directors propose a "rights" issue of 740,800 10s ordinary shares on a one-for-five basis at 27s 6d each. With the existing shares quoted at 39s the "rights" are worth 1s 11d a share. The ex-rights yield on a dividend of 20 per cent is therefore 5.4 per cent.

The continued buoyancy of demand for durable consumer goods such as gas cookers and refrigerators, and the revival in the furniture trade, which gave a boost to "Formica" sales, is reflected in the increase in the group's turnover in the year ended on March 28th from £13,576,000 to £13,858,000. Profit margins have also improved, for trading profits have risen by 11 per cent, from £1,468,516 to £1,585,694.

A lower tax charge of £821,029 (against £918,648) results in a group net profit of £609,598, compared with £458,324. The present dividend is covered just under three times by earnings.

MASSEY-FERGUSON

WITH half of the current financial year over, Massey Ferguson Holdings, the North American tractor manufacturers, is well on the way to substantiating the forecast by Mr Albert A Thornbrough, the president of the group, that a net profit of more than $20 million will be earned in the full financial year. With sales up by 12 per cent to $234 million the net income for the first six months of 1958-59 was $12.61 million (against $1.79 million for the comparable period a year ago). The latest figure struck after including a tax credit of $ million, reflecting the period when group's North American operations w trading at a loss.

It is quite clear that the company has more than recovered from the 1958 recession in the North American industry for the sharply improved results largely reflect better trading in that area where sales rose by 42 per cent. After a slight setback in European sales in the first quarter of the year, demand improved, bringing sales for the half-year up to the 1957-58 level – a particularly buoyant demand in the United Kingdom substantially offsetting the effect of the devaluation of the franc. Smaller sales, however, were made in the group's principal markets in Asia, Africa and Latin America, but the more favourable economic conditions in Australia and New Zealand resulted in a 33 per cent increase in sales in those markets.

CANADIAN EAGLE OIL COMPANY LIMITED

(Incorporated under the laws of Canada)

The thirty-first Annual General Meeting of Canadian Eagle Oil Company Limited will be held in Toronto, Canada, on Wednesday, June 24, 1959.

The following is the Report of the Directors which is circulated with the Report and Accounts for the year to December 31, 1958, together with the special notice to shareholders relating to the recent offer for the acquisition of the whole of the assets and business of the Company:

Special Notice

Since the preparation of this Annual Report, Canadian Eagle Oil Company Limited has, as already announced in the press, received from NV Koninklijke Nederlandsche Petroleum Maatschappij (Royal Dutch Petroleum Company) and The „Shell" Transport and Trading Company, Limited, a proposal for the acquisition by them of the whole of the assets and business of the Company. The consideration offered is the allotment to the Company, for distribution in kind to its shareholders, of 3,971,012 fully-paid shares of Netherlands Guilders 20 each of Royal Dutch Petroleum Company and 5,956,518 fully-paid Ordinary Shares of £1 each of The „Shell" Transport and Trading Company, Limited. Bataafse Petroleum Maatschappij NV, a company of the Royal Dutch/Shell Group which owns approximately 21 per cent of the issued share capital of the Company, will waive its right to participate in such distribution. Shareholders owning the remaining 23,826,071 shares will, therefore, receive two Royal Dutch and three „Shell" Transport shares in respect of every 12 shares held. It is a condition of the proposal that the contract shall be authorized or approved by the shareholders of the Company at a Special General Meeting to be held not later than July 31, 1959, and that, after the shares of Royal Dutch and „Shell" Transport have been dissolved. The proposal is also subshareholders, the Company shall be dissolved. Tre proposal is also subject to the obtaining of necessary governmental and other approvals.

The Board of Directors has decided to call a Special General Meeting of shareholders at as early a date as practicable. The proposal will be recommended to the meeting, which will be asked to approve it and to authorise the necessary action, including the dissolution of the Company. As there is a large amount of preliminary work to be done it is not expected that the meeting can be held until the middle of July. Full particulars will be sent to shareholders in due course.

In the meantime, the dividend for 1958 has been declared and will be paid on July 1st. The Annual General Meeting will be held as planned.

The Board of Directors

At the last Annual General Meeting the number of the Board was increased from eleven to twelve and Mr I. D. Davidson was elected a Director to fill the vacancy caused by such increase. No other change in the Board has taken place.

The last election of the Board was in June of 1957, and the whole Board falls to be elected this year for a term of two years. Retiring Directors are eligible for re-election, and all members of the Board offer themselves for re-election.

ACCOUNTS AND DIVIDEND

Accounts

The profits for the year have been applied as follows:

	1958	1957
	£	£
The consolidated net profit for the year was.	£8,187,185	£11,505,490
Dividend paid by Eagle Oil and Shipping Company Limited on its 5½% Preference Stock..	—	14,420
Dividend of 2s. 3d. for the year on the Ordinary Shares of the Company	3,389,640	3,389,640
Earnings retained in subsidiary companies ..	3,322,819	6,203,873
Earnings retained in Parent Company	1,474,726	1,897,557
	£8,187,185	£11,505,490

Consolidated Balance Sheet

The combined assets and liabilities of your Company and its wholly-owned subsidiary companies, Eagle Oil & Shipping Company Limited, Venezuelan Eagle Oil Company Limited, Eagle Tanker Company Limited, Eagle Petroleum Company (Overseas) Limited and Eagle Petroleum Company (Kuwait) Limited, are shown in the Consolidated Balance Sheet.

As customary, the accounts of Epic Limited are not consolidated because of its business (marine and general insurance). The operations of this company to date have been entirely satisfactory.

Capital Assets

Investments in and advances to allied companies have decreased from £41,223,785 to £39,975,482.

There has been no change in the more important shareholdings in allied companies during the year.

Payments in advance and other outlays for crude oil represent the investment of Venezuelan Eagle Oil Company Limited in rights to acquire Venezuelan crude oil production under a long-term purchase and sale of oil agreement.

Consolidated Profit and Loss Account

The Consolidated Group profit on trading for 1958 was £10,658,313 compared with £12,979,039 for 1957.

The main causes for the reduction in trading profit are referred to in greater detail in the appropriate sections of this Report, but in general they may be summarised as increased competition, low ocean freights recovered from markets, and depreciation of local currencies in terms of sterling.

Dividends and interest on investments in allied companies were £333,379 as compared with £1,572,977 in 1957 and included dividends from Shell-Mex and B.P. Limited. Shell Colombia S.A., Compania Distribuidora Guatemalteca Shell, Lubricants Producers Limited, The London and National Property Company Limited and Cia. Mexicana de Petroleo „El Aguila" S.A.

In addition a dividend of £250,000 was received from Epic Limited.

TORONTO REGISTER OF SHARES

As mentioned in last year's Report, the Ordinary Shares of the Company were listed on the Toronto Stock Exchange early in 1958 and arrangements have been made whereby holders of shares on the Toronto Register are paid their dividends by Canadian dollar cheques and any bearer coupons which are presented in Toronto for payment are paid in Canadian dollars.

DIVIDEND

It will be remembered that, in presenting the Report for the year 1957, your Board regarded the outlook for 1958 as uncertain, and stated that it should not be assumed that the 1957 level of profits could be maintained. The profit figure now shown for 1958, while still at a substantial level, does indeed reflect the doubts expressed last year. Under current conditions, oil is in very free supply, all markets are extremely competitive and the tanker freight market continues its depression. While your Company is well equipped to obtain supplies, transport economically, and market competitively through its associated companies, the present circumstances do not warrant an optimistic forecast of any upward trend in profits during 1959.

After consideration of all factors, your Directors have decided to maintain the dividend at the same rate as last year, namely 2s. 3d. The dividend will be payable on July 1, 1959, in the case of registered shares by warrant to the holders appearing on the register at the close of business on June 2, 1959, and in the case of bearer shares against surrender of Coupon No. 29.

As mentioned above, holders of shares on the Toronto Register will be paid by Canadian dollar cheques at the rate of exchange current on the record date and bearer coupons presented in Toronto will be paid in Canadian dollars at the rate of exchange current on the date of presentation.

Under Section 201 of the 1952 Income Tax Act of the United Kingdom, relief from United Kingdom income tax is given to shareholders who are subject to such tax on 30/100ths of the dividend and income tax at the standard rate will be deducted from 70/100ths thereof. There is no deduction of tax from dividends to shareholders who are not subject to United Kingdom income tax.

EXPLORATION AND DEVELOPMENT

Venezuela

Under a long-term purchase and sale of oil agreement, Venezuelan Eagle Oil Company Limited has rights to acquire from Compania Shell de Venezuela Limited a share of the crude oil and liquid gas production which accrues to the latter from a number of concessions operated by others in Eastern and Western Venezuela.

During the year, a total of 25 exploratory and 342 development wells were drilled on these concessions resulting in 345 oil wells and three gas wells. In addition 173 „stratigraphic test" wells were drilled of which 94 encountered oil production.

As in past years, the drilling artivities were mainly concentrated in Eastern Venezuela, where 406 of the successful oil wells (including stratigraphic holes) were located.

However, exploration and appraisal drilling in the „deep" Lake Maracaibo concessions and in the Ceuta area was increased and a total of 10 exploration and 12 development wells were completed in these areas, of which 15 were producers and one encountered favourable production prospects. At the end of 1958, the potential of the Ceuta field amounted to 30,000 barrels per day compared with 6,400 barrels per day a year before.

As was expected, average production during the year from the concessions concerned was somewhat lower than in 1957, due to the world market situation. Venezuelan Eagle's share amounted to 11,489,811 barrels compared with 12,141,576 barrels in 1957, a decrease of slightly over 5 per cent.

Towards the end of the year, facilities in Eastern Venezuela for the manufacture of liquid propane/butane mixture were completed and Venezuelan Eagle's share of the production accruing under the above mentioned agreement amounted to 13,975 barrels.

On January 23, 1958, the regime of General Marcos Perez Jimenez was overthrown by a combined military and civilian uprising in Caracas. A five-man government Junta was formed and preparations were made for national elections for the Presidency and Congress. Elections took place on December 7th and resulted in a victory for the „Accion Democratica" party and its leader, Senor Romulo Betancourt, who thus became constitutional President-elect. The new government had not yet taken office by the end of the year.

On December 19th, the Government Junta issued a new income tax law, effective as from January 1st, and thus applicable to earnings for the whole year 1958. This represented a substantial increase throughout the entire scale of progressive rates, resulting in the maximum rate of income tax being increased from 28 1/2 per cent to 47 1/2 per cent. The new income tax law is of general application affecting all persons and corporations, whether national or foreign.

The effect of the new rates on Venezuelan Eagle's 1958 earnings was to increase the income tax payable by $2,740,000 (£979,000) over the amount which would have been payable in accordance with the rates of the previous law.

Colombia

Seismic operations were continued by one party in the Middle and Lower Magdalena Valley, and a second party began a regional survey (jointly with another company) of extensive concession holdings in the Llanos, east of the Andes. Seven exploration wells were drilled of which one, at Penas Blancas in the Yondo concession 6 miles south of Casabe, led to the discovery of a small field which was producing 1,000 barrels daily from two wells at the end of the year.

Two concessions in the Lower Magdalena Valley were surrendered.

Only three additional interspaced development wells were completed in Casabe before drilling in this field was discontinued at the beginning of the year. As expected, production then declined more rapidly and had dropped by 6,000 barrels daily to 22,800 barrels daily by the end of the year. In the Yarigui field, one drilling string was continuously employed and completed six wells, as a result of which the production was increased from 6,500 to 9,000 barrels daily.

Daily production from the Cantagallo and Difícil fields of 2,500 and 1,000 barrels respectively showed practically no change as compared with the previous year.

Your Company's share of the crude oil produced during the year amounted to 5,105,714 barrels, as compared with 5,962,728 barrels in 1957.

Cuba

The exploration well Manuy 1 No. 1, which started off the north coast of Camaguey Province in 1957, proved unsuccessful and was abandoned in April, 1958. Some additional geological surveys were carried out during the year.

Liftings of Crude Oil Accruals

Liftings of crude oil during 1958 from the Middle East, Venezuela and Colombia were 17,311,538, 11,753,153, and 5,039,441 barrels respectively.

REFINING

United Kingdom and Eire

The processing of the Group's accruals of crude oil under contractual arrangements continued satisfactorily throughout the year. The plants of Starhaven Refineries Limited showed a small increase in output during 1958, again with reasonable returns.

Construction of the refinery at Whitegate Bay, County Cork, in which your Company is participating with Shell, British Petroleum, Esso and Caltex, continued throughout 1958, and it is expected that the refinery will begin to meet local marketing requirements in July 1959—several months earlier than previously anticipated.

Cuba

The unrest in Cuba did not seriously affect refinery operations during 1958 but the plant was shut down for the first four days of this year on account of a general strike. No damage to company property was sustained.

During 1958 the level of crude oil processed was increased by 10 per cent to 24,000 barrels daily to meet the company's requirements for the local market, with the exception of aviation gasoline, lubricating oils and chemicals, which were imported. There continues to be a substantial surplus manufacture of gas oil and fuel oil available for export.

Guatemala.

As announced in the Press in September 1958, your Company has agreed to participate in a refinery venture in Guatemala, subject to certain conditions still finally to be settled. At the close of the year, negotiations with the Guatemalan Government were proceeding.

TRANSPORTATION

General Conditions

The marginal demand for tankers during 1958 proved insufficient to absorb all the tonnage available, with the result that a considerable portion of the world's tanker fleet remained idle. Laid-up tonnage amounted to just over 2 million tons deadweight at the beginning of the year, and rose to over 5 1/2 million tons by early July. Thereafter reactivation of ships for whaling purposes, for the carriage of grain and to meet a demand for winter tonnage, combined with the sale of tankers for breaking up or conversion, caused the idle tonnage to drop to about 4 million tons by the end of 1958. This idle tonnage represents some 7 per cent of the world's tanker fleet which, augmented during the year by over 6 million tons deadweight of new deliveries, reached a total at the end of 1958 of almost 55 3/4 million tons.

With supply greatly exceeding demand, many owners had to lay up some vessels and to reduce the operating speed of others. Thus it was not surprising that the average market rates, at least for single voyages, were the lowest experienced for nearly 20 years and seldom rose above unprofitable levels.

Not only was the demand for tonnage on spot charter at a very low ebb during the year but there was little business available for tankers on long-term charter, for which the tonnage reported fixed during the year on time charter for periods of 5 years or more totalled less than 500,000 tons, compared with the fixture of about 2 million tons during 1957 and about 7 million tons in 1956.

Compared with 1957 the average period time charter rates fell during 1958 by about 22 per cent, while single voyage rates, which during the early part of the previous year had been affected by the closure of the Suez Canal, fell during 1958 by 68 per cent, compared with the average for 1957.

Tonnage reported as on order or under construction at the end of December 1958 still totalled over 25 million tons deadweight, or about 46 per cent of the present world's tanker fleet.

The absorption of these new ships and the reactivation of the numerous tankers now laid up will, during the next few years, necessitate an appreciable increase in the world's present petroleum transportation requirements.

Eagle Fleet

It was not necessary to lay up any Eagle ship during 1958 but in the early summer months tonnage available slightly exceeded requirements and it was therefore necessary to reduce the speed of several of the smaller owned steamers.

In April 1958, Eagle Tanker Company Limited suffered the tragic loss of their newest 18,000 tons tanker, the „San Flaviano", which was bombed without warning by a rebel aeroplane and sunk, while the vessel was lying off Balik Papan waiting to complete discharge. Miraculously, no member of the crew was injured or lost, and it was a tribute to the discipline on board that the ship was safely abandoned in four minutes.

During the latter part of the year, Eagle Oil & Shipping Company Limited disposed of two wartime-bulit 12,000 ton diesel tankers for breaking up. Both vessels, the „San Venancio" and the „San Virgilio," were due for very expensive surveys which would have made them uneconomical freighters.

The reduction in the Eagle Fleet's trading capacity by the deletion of these three vessels was more than compensated for by the delivery of two new-buildings for Eagle Tanker Company Limited, namely the „San Edmundo" of 18,075 deadweight tons, commissioned in April, and the „San Gerardo" of 32,114 deadweight tons, commissioned in May.

The combined fleet of the two tanker-owning companies at the end of 1958 totalled 21 vessels of 347,255 deadweight tons. The average age of the vessels in the owned fleet is 8 years, which represents an appreciable modernisation since the first deliveries under our major post-war building programmes in 1953, when the fleet's average age was about 14 years per deadweight ton.

The addition of four new vessels—two 18,000 tonners and two 32,000 tonners—during 1959 will further modernise the fleet and enhance its carrying capacity and efficiency.

At the end of 1958, Eagle Oil & Shipping Company Limited had on period charter 21 British and Scandinavian tankers totalling 414,003 deadweight tons and in addition during the second half of the year augmented the fleet with a small amount of marginal spot chartering.

MARKETING

The year 1958 was one of rising sales by almost all your Company's marketing associates, and the total sales of 9,085,014 tons (66,727,500 barrels) represented an increase of 10 per cent over 1957.

In spite of this expansion, trading profits in sterling fell away sharply, due principally to a world-wide intensification of competitive conditions and, in the case of South and Central America, to the substantial depreciation of most local currencies.

United Kingdom and Eire

Although during 1958 there was little overall expansion in the economies of the United Kingdom and Eire and consumption of energy remained more or less static, the total inland trade in petroleum products increased by 22.9 per cent over 1957 and 18.7 per cent over 1956.

The main factors contributing to this expansion of trade were increased deliveries of gas and fuel oils for industrial purposes and oils for domestic heating, but one should bear in mind that the substantial increase in 1958 over 1957 reflects the exceptional conditions which prevailed in 1957 resulting from the Middle East emergency. During that year normal trade expansion did not take place (in fact, there was a decline of 3,4 per cent over the previous year) and 1958 saw, in addition to the resumption of the natural growth in the use of fuel oil for industrial purposes, the implementation of a number of projects which had been postponed in the previous year. It is unlikely, therefore, that the 1958 rate of increase in the total inland trade will be continued in 1959.

During 1958 sales by the Shell-Mex and B.P. Group (in which your Company has a 20 per cent interest) were the highest ever achieved and sales by Lubricants Producers Limited, the other joint marketing associate in the United Kingdom, also showed a satisfactory improvement.

It had been apparent for some time that the world over-supply position in certain products would lead to keen price-cutting competition, which would have a serious effect on profitability. The trading results, therefore, which were substantially less favourable than in either of the previous two years, were not surprising or unexpected.

Further considerable capital expenditure was made during the year in continuance of the programme for extending and modernising distribution and marketing facilities. Such expenditure derives from the need to meet the substantially increasing market and will strengthen Shell-Mex and B.P. Limited's competitive position.

In order to meet competition, the programme for modernisation of retail outlets and for improvements in the distribution network has required further injections of capital during the year. However, to reassure share holders that modernisation rather than multiplication is the guiding policy, it may be revealed that, whereas the "car population" of the U.K. has increased 134 per cent since 1939, the number of Shell-Mex and B.P. service stations has, in the same period, increased by no more than 1 per cent.

Argentina

In Argentina, the serious economic difficulties of former years still remained to be solved when President Arturo Frondizi began to tackle his country's problems in earnest after his inauguration on May 1, 1958. Strong measures followed in an endeavour to arrest inflation and to reduce the adverse international balance of trade. A stabilisation plan was launched towards the end of the year, designed to effect a progressive reduction in Government deficits, and this incorporated measures for the unification of exchange rates which became operative on January 12, 1959. The plan received the agreement of the International Monetary Fund and substantial financial assistance was provided by this body in addition to that made available from US sources.

During 1958, the volume of sales by the joint marketing company remained at approximately the same level as in the previous year, but trading profits declined appreciably in terms of sterling, due to the serious depreciation in value of the free peso of nearly 50 per cent during the course of the year, and also due to the fact that, during the second half of the year, the Argentine Authorities would not permit the full recovery in sterling of ocean freights.

Brazil

The fact that the 1958/59 coffee crop in Brazil is expected to be at a record peak level gives rise to more concern than satisfaction, since world coffee production, now also at record levels, substantially exceeds demand, while prices for this commodity have fallen appreciably. In consequence, as the country is still heavily dependent on earnings from coffee exports and despite new US financial aid and further restrictions on imports, Brazil closed the year with an appreciable deficit in her balance of payments. Nevertheless, the year was one of modest expansion in the internal economy, although the strong inflationary trend continued unchecked. Inevitably this resulted in a requirement for increased working capital by the joint marketing company and, although every effort was made to finance operations locally, it was necessary once again to inject further funds.

With regard to petroleum products, the Authorities adopted a more realistic selling price structure during 1958 which resulted in an improvement in local trading returns, although, in terms of sterling, profits were somewhat lower because of a decline in value of the free cruzeiro of some 35 per cent during the year. Sales volume showed a satisfactory increase over 1957.

Chile

During 1958 the wage policies of the Chilean Government succeeded in retarding the rate of increase in inflation, but the low price of copper continued to aggravate the country's foreign trade position.

Sales in 1958 by the joint marketing company showed a satisfactory increase over the previous year and results in terms of sterling also improved.

Sterling remittances in payment of oil cargoes were made regularly, and satisfactory progress was made in reducing the outstanding cargo and profit arrears.

Uruguay

Chiefly because of the lower international price of wool, which is Uruguay's principal export, 1958 was a year of serious economic difficulty. The balance of payments worsened and the external value of Uruguayan currency depreciated by some 57 per cent during the year.

Russia for the first time became a direct importer of Uruguayan wool, and trade with the communist block rose substantially. A barter deal concluded early in 1958 provided for imports of Russian crude oil in exchange for wool, and this arrangement, which extends into 1959, has resulted in postponement of certain crude oil sales by Eagle Group associates to Administracion Nacional de Combustibles, Alcohol y Portland (ANCAP), the Government petroleum entity.

Although total sales were only slightly lower than those of the previous year,

sterling returns declined sharply because of the depreciation of the local currency.

Paraguay

In 1958 sales by the joint marketing company showed an increase of approximately 10 per cent over the previous year, and profits were satisfactory.

Colombia

During 1958 a reduction in foreign exchange earnings from coffee exports made it necessary to maintain import restrictions, and consequently little change was apparent in the country's economy. Against this economic background it is satisfactory to report that sales by the joint marketing company were increased by nearly 20 per cent over the previous year, although sterling profits were slightly less than in 1957 since, in addition to further depreciation of the peso, there was keen price-cutting competition.

Cuba

Business in Cuba during the last three or four months of 1958 was depressed as the revolutionary movement reached its climax. Nevertheless, despite declining sales during this period, total sales of products for the year recorded an increase over 1957. Market returns were satisfactory.

Central America

Owing to the continued fall in world coffee prices, expansion in the economy of Guatemala was not maintained in 1958. Both sales and trading profits of the joint company remained at a steady level.

In British Honduras the results achieved through joint marketing interests continued to be satisfactory.

Ecuador and Peru

Results were once again satisfactory in both Ecuador and Peru, the other South American countries in which your Company has joint marketing interests.

STAFF

The shore and marine staffs of the Company and its subsidiary and affiliated companies continued their loyal and sustained efforts on behalf of the Group, and the Board has pleasure in extending its thanks to them.

PHILLIPS RUBBER SOLES LTD.

The 32nd Annual General Meeting was held on 11th June, 1959, the Chairman, Mr Peter Pettit, presiding.

THE ACCOUNTS for the year ended 28th February, 1959, showed :—

Group Profit for the year	£188,635
Add brought forward	92,730
	£281,365
Income Tax and Profits Tax	£90,000
Transferred to Reserve	23,809
Written off Investments	15,074
Net Dividends	53,944
Amount carried forward	98,538
	£281,365

The following is a brief summary of the Chairman's Review :—

RESULTS. Before providing for tax, Group profits were a little lower than last year, but owing to the lighter burden of taxation, net profits were nearly £15,000 higher at £98,635.

SALES. Total sales of PHILLIPS Soles and Heels were slightly higher than in the previous year, although sales in export markets were still severely hampered by import restrictions. Quality was fully maintained and prices have not been increased despite the pressure of rising costs.

PRODUCTION. Works' output was on a lower scale because of the inevitable dislocations associated with a rebuilding programme, but service to Customers was maintained without interruption by means of the ample stocks previously provided.

REBUILDING AND RE-EQUIPMENT. The new Press Room has been in operation for some months and will lead to smoother and more economical production; the new Mill Room will be completed during the current year.

PROSPECTS. There has been a marked improvement in sales since the year end, and the remarkable new EXTRA LIGHT Stick-a-Sole is steadily growing in favour. Profits will be affected to some extent by last September's substantial wage award in the Industry.

The final Dividend of 15 per cent (making 20 per cent for the year) was approved and the Report and Accounts were adopted.

MINERALS SEPARATION LIMITED

MR. J. N. BUCHANAN'S STATEMENT

The 54th Annual General Meeting of Minerals Separation Ltd. will be held on July 1 at the Chartered Insurance Institute, Aldermanbury, London, E.C.

The following is the Statement by the Chairman, Mr. J.N. Buchanan, which is being circulated with the Report and Accounts for the year ended 31st December, 1958.

For the year ended 31st December, 1958, the gross profit of the Group advanced to a new record of £818,000 as against £740,000 and the net profit after Tax to £406,000 as against £342,000. The profits attributable to outside interests rose from £44,000 to £79,000 leaving the balance available to the parent company at £327,000 as against £298,000.

In pursuance of our policy to acquire control of well managed companies, a majority of the shares of Angel Hill Investments Ltd. was bought by us early in the year. We also purchased control of Vosper Ltd., and Leigh Knight (Bradford) Ltd. These companies' profits and assets have been included in our consolidated accounts. Although we did not receive a full twelve months' revenue from them all, the contributions so taken in have helped materially to make good the lower return from dividends which, as anticipated, were down from £303,000 to £264,000.

We have declared the same dividend as last year of 1s. 6d. per unit, which is payable on the increased capital. We now propose to issue £150,000 new capital (600,000 5/- units) ranking in all respects pari passu with the existing capital. The price will be 15/- per unit, which will bring in £450,000 new money and will raise the issued ordinary capital to £1,250,000. It is then intended to issue a further £750,000 of nominal capital in the form of a free scrip issue of 3 new shares for 5 stocks units held. If this proposal meets with approval, the issued capital on completion will be £2,000,000. The further funds will be used to meet additional expenditure by Foundry Services and other of our subsidiaries in further development and for general investment purposes. I invite your attention to the summary of figures at the end of this statement which gives a picture of the progress of the company from 1950 to the present year.

Taxation. I dealt fully last year with the claim made by the Taxation Authorities in respect of capital gains resulting from the sale of some of our investments, and indicated that a compromise had been reached without prejudice to the future. Our liability has, therefore, been settled for the years 1954 1955, 1956 and 1957 at considerable expense to the company. It is too early to say whether or not the Taxation Authorities will now accept our contention that we are not liable for any Tax for 1958, but in any event, if a valid claim is eventually established against us, we do not consider the amount will be substantial.

I will now deal in more detail with some of our principal investments.

Mercury Securities. The published accounts of the company show further progress and satisfactory profits. Since I last reported on this holding, the capital has been increased, partly by an issue of shares for a new acquisition, partly by a rights issue and partly by capitalisation of reserves. Of the capital as now constituted, our holding amounts to a little over 15 % and this we propose to maintain.

Rhodesia. As forecast, the dividends we received were less than for 1957. In view of the improved price for copper, we look forward to a return of higher dividends. In anticipation of this we increased our holding in the British South Africa Company (Chartered) in addition to our existing holdings in Nchanga Mufulira and Rhokana.

Foundry Services. All the established companies in the Group made profits in 1958. The international trading experience of the foundry and steel industries was a difficult one in many countries; nevertheless, the Group's results were only slightly lower than in 1957. Bearing in mind the rise in costs and increasing expenditure on research and development, we can regard the year's activities as satisfactory. The broadening interests in many fields have been most marked in the increasing application of Foundry Services processes for steel production. In the U.S.A. marked improvement has begun to reflect the result of the planning and work of the last few years and progress there is continuing in the current year. The new factory in Cleveland will be ready for occupation in June and will give welcome assistance in dealing with the increasing turnover.

J.w. Jackman & Co. Jackman again had an excellent year, profits being only a little below those of their record year in 1957. Amongst other export orders, the Osborn automatic moulding and multiple station core blowing machines referred to in last year's report, were delivered to Russia and France and a number of large jolting machines were sent to India for the new steel works there. Orders in hand at the end of the year were less in value than at the end of 1957, and although we regard the future with confidence it is unlikely that the exceptional results obtained in 1957 and 1958 will be repeated this year.

Howard Potteries. The progress reported last year continued in 1958 and resulted in increased profits. The outlook for the current year is not clear at present, but unless conditions worsen we are hopeful that we shall at least hold last year's level of profits.

Angel Hill Investments. During the year ending 31st December, 1958, the results of this group have been very satisfactory despite the recession in industrial building activities. Modern Engineering were able to secure substantial contracts not only for structural steelwork but also for industrial buildings incorporating the Patented Roof Constructions based on the Silberkuhl System, in conjunction with their Associate Company, A.T.A. Industrial Co. Limited of Bristol. In September, 1958, the new Emery Works No. 2 was officially opened This building consists of an A.T.A. Large Span Building and has been described by the Press as one of the most modern factory buildings in the West Country. This increased productive capacity is already fully occupied and adds further to the efficient service given by this organisation, covering, as it does, not only steel frame buildings, but also composite steel and concrete large span roofs as well as hyperbolic concrete shell roofs. The company's order position foreshadows further expansion.

Vosper. This Portsmouth company of marine and general engineers specialises in the construction of small high speed craft. For some years we have held a substantial holding in the ordinary shares. During 1958 we purchased two thirds of the Deferred Shares and increased our holding to over 51%. We were led to this action by reason of our confidence in the technical and commercial skill of the management under their Managing Director, Commander Peter Du Cane, O.B.E. To synchronise with the accounting period of Minerals Separation, Vosper acounts were made up to the 31 st December last instead of 31st August, as had been their practice. In the 16 months covered by those accounts, they made a satisfactory profit, as can be seen from their published report. They have achieved very remarkable performance results from the initial running of the Brave class of fast Patrol Boat, from which it is confidently believed important contracts will develop. They have already received contracts from the Admiralty for the design and construction of two such craft. Their report states that at the present time they are not as fully occupied as is desirable, but we share their hope for an early improvement in their various activities.

Leigh Knight (Bradford). This is an old established firm of woollen piece goods merchants. We regard the management, under Mr. M.B. Leigh, as exceptional and gladly availed ourselves of an opportunity to acquire a majority of the shares in the company. They had a good year in 1958 and, with current turnover being well maintained, the prospects for the coming year are favourable.

Personnel. You will no doubt appreciabe from the above statement that for our company 1958 was an active year. Our thanks, therefore, are due and heartily tendered to all those in the various companies whose hard work and fruitful skill have contributed to the results. Here at our registered office, under our Secretary, Mr. C.J. Dorman, we have a staff small in number but stout in heart, who have met their added responsibilities in a manner to merit your most sincere gratitude, which I gladly convey to them on your behalf.

SUMMARY OF GROUP BALANCE SHEETS, PROFITS AND DIVIDENDS 1950 TO 1958.

YEAR ENDED 31st DECEMBER

DUNLOP RUBBER COMPANY

RECORD TURNOVER

MR. G. E. BEHARRELL'S SPEECH

The sixtieth annual general meeting of the Dunlop Rubber Company Limited, was held on June 8th in London.

Mr G. E. Beharrell, chairman, in the course of his speech said: In 1958 the volume of goods sold by the Group increased by about 7 per cent and turnover by 5 per cent to a record total of £243 million. Profit margins, however, were adversely affected by price reductions and wage increases which were only partly offset by lower commodity prices. Our earnings also suffered quite a considerable reduction in terms of sterling by the depreciation of local currencies in France and Brazil: otherwise our profit figures would have established a record. On the other hand, a small reduction in our profit before tax has been more than offset by the substantially lower taxation charge under various heads which are referred to in the Directors' Report. The Group profit after tax is the highest so far achieved.

Following the more realistic profits tax basis introduced in 1958 your Board welcomes the relief given by the Chancellor this year in reducing the standard rate of income tax and reintroducing Investment Allowances. The latter, of course, are of benefit only in the future. We appreciate these taxation reliefs, not only because they help your Company, but also because we hope they mark the beginning of the end of high taxation following the last war and will lead to further expansion of the country's economy.

OPERATIONS IN UNITED KINGDOM

Although our turnover in the United Kingdom has shown a satisfactory increase of 7 per cent, the actual profit from the United Kingdom section of our activities was lower than in 1957. This may have surprised many of you in view of the high level of activity of the British motor car industry. Perhaps I might clarify what effect this has on your Company. Our sales of car tyres to the British vehicle manufacturers are of great importance to us. Original equipment business, however, in general is highly competitive and margins are low, so the direct contribution to profit, even with the industry itself active, is relatively small. We have established the productive capacity with corresponding overheads to cater for the greater part of this business in the United Kingdom, and so, whilst profits in times of great activity are not large, losses in times of reduced activity can be serious, as was the case in the year 1956.

It is also appropriate in connection with 1958 to mention that whilst the motor car industry was buoyant the commercial vehicle and cycle industries were passing through a period of reduced activity. Consequently, on balance there was little change in our total original equipment business in comparison with 1957.

Before leaving our United Kingdom affairs, and in particular our profit position, there is one further matter to which I would like to refer, namely, the technical and development work which the United Kingdom organisation carries out on behalf of the Group. Naturally we receive useful contributions from our overseas subsidiary companies for this work, but these contributions fall far short of the actual cost to the parent Company. Last year the Group spent almost £2 1/2 million under the heading of research and development. In addition, there were heavy initial production costs in connection with new products, all of which were borne by the home side of the business.

I have already made reference to the effect of changes in exchange rates on profits expressed in sterling, but even allowing for this the overall picture of our overseas activities for the year was most encouraging. Turnover and profit were both higher and a greater proportion of the Group profit was contributed from this source.

OVERSEAS ACTIVITIES

Over half our capital continues to be employed in our overseas activities and because these activities mean so much to the Group, I thought you would like to have some indication of what has been, and is, our policy as regards growth and expansion. You will be aware that Dunlop was to the fore with overseas manufacturing activities in its very early days and then in the 1930's further factories were established.

Since the war all existing overseas factories have increased capacity to considerable extent and new factories have been opened so that in the last ten years, while modernising and expanding steadily at home, over 60 per cent of the Group's capital expenditure has been overseas and the profit earned overseas in 1958 was more than three times the figure in 1949 and twice the earnings at home during 1958. Our overall policy is wherever possible to export from our existing factories: but this becomes increasingly difficult in the case of developing countries because of import and exchange restrictions and the understandable desire to establish local manufacture even if sometimes prematurely. Thus we are frequently faced with a decision either to withdraw from a territory completely or to show our confidence in that territory by establishing a factory there.

The year 1958 has seen our policy in very effective operation in two ways. In France and India we have expanded our existing interests by establishing two new factories, both some distance from our original factories in these two countries. You will appreciate the advantages of this dispersal policy. In Rhodesia, however, we have built a new factory in a rapidly expanding part of Africa where no tyre factory has previously operated.

OPPORTUNITIES FOR EXPANSION

Opportunities for overseas expansion also occur where local interests establish a factory with technical aid and trained personnel provided by us. Such is the case in Turkey where an agreement was signed during the year to establish a tyre factory with Turkish capital, British machinery and Dunlop ..know-how." We also have the right to invest our technical aid fees in shares up to an agreed proportion. A somewhat similar arrangement has been made with an existing firm of general rubber goods manufacturers in Spain.

The rapidly expanding markets of Europe provide a good base for the growth of the Groups' five factories in France and Germany, but we regret that no association between the United Kingdom and the European Economic Community has yet been possible

NATURAL AND SYNTHETIC SUPPLIES

In Malaya the progress of our plantations which I was able to report to you last year has continued. The emergency is now practically at an end, and in consequence the current replanting programme of 37.300 acres will be completed on schedule in 1962. It is a great tribute to the devotion and tenacity of the staff that ten years of banditry and terrorism have not been allowed to interfere with the execution of this great programme. Consequently, by 1968 the whole of the Company's 67,000 planted acres will be mature high-yielding rubber.

Our plantations in Nigeria also continue to make good progress. A total area of approximately 10,000 acres of high forest has now been cleared of which over 8,000 acres have already been planted with high-yielding rubber.

We have also made headway on the small plantation in Brazil which includes an area of clonal rubber now approaching maturity. Here the trees are being cleaned and prepared for early tapping and satisfactory progress is being made.

The synthetic rubber plant of The International Synthetic Rubber Company at Fawley, initiated by your Company and in which we have a substantial interest, is now in efficient production and this country has at last the advantage of a domestic source for the bulk of its synthetic rubber requirements. In addition, a substantial dollar saving is already being obtained for our national balance of payments. It would, however, be a mistake to think that this is a development at the expense of natural rubber. In the expanding field of rubber consumption, there are ample opportunities to use the special qualities of each type of rubber which are complementary rather than alternative and neither can satisfy the total world demand for rubber today. The recent trend of natural rubber prices suggests that, in circumstances of expanding economic activity, a strong demand exists for the available supplies of natural rubber.

The report and accounts were adopted.

RAND MINES, LIMITED

(Incorporated in the Union of South Africa)

MR. CHARLES W. ENGELHARD'S VIEWS ON THE FUTURE OF GOLD

At the Sixty-Fourth Ordinary General Meeting of Rand Mines, Limited, held on May 28th at The Corner House, Johannesburg, Mr Charles W. Engelhard, the chairman, in the course of his remarks said:

Gentlemen,—This is the first annual meeting of Rand Mines, Limited, at which I have had the honour to preside, and it is my pleasure today to address you as chairman of the Company. The directors' report and the accounts for the year ended December 31, 1958, which are now submitted for your adoption, have been in the hands of shareholders for some weeks. In addition to details of your company's activities during the past year the report contains information about the various companies of the Group.

FINANCIAL RESULTS

As will be seen from the accounts, the profit for 1958 at £1,498,685 was £683,347 more than that for the previous year, but £409,396 of this represented a book profit on the exchange of certain shares for shares in Harmony Gold Mining Company Limited and The Corner House Investment Company Limited. Excluding the latter figure, the increase in profit was £273,951.

Dividends received from investments increased by £173,688, of which about £130,000 is attributable to new and additional investments and the balance to increased dividends paid by various companies. The company was fully invested at the year end, sufficient cash having been retained to meet current requirements while portion of its funds are in investments readily realisable when required for any proposition offering a favourable return. The increase of £84,196 in interest received arose mainly from a loan of £1 million to the Harmony Company.

After allowing for two dividends, one of 2s. 9d. and the other of 3s. per share, transfers of £450.000 to investment reserve and £250,000 to exploration reserve, respectively, an amount of £412,027 was carried forward in the profit and loss account at the end of the year.

Despite the large transfer to investment reserve the balance of £7,305,385 at the end of the year showed little change due to depreciation on certain investments being charged direct to the reserve.

The book value of the quoted and unquoted investments increased by £1,198,782 to £9,527,466 and the Stock Exchange value of quoted investments was £3,916,911 higher at £14,509,938. Our investments in certain of the newer mines have not as yet reached their full dividend potential, while some have still to reach the dividend paying stage.

EXPLORATION

The reserve for exploration has been substantially increased because it is anticipated that expenditure on prospecting and exploration will be greater than in recent years. The company has had many propositions before it during the past year and is at present investigating, either on its own account or jointly with certain other Groups, a total of nine prospects in the Union and neighbouring territories. Six of these are for gold, one is for coal, one is for copper, and one is of a general exploratory nature, principally for copper, cobalt and gold. Drilling is already being done or is about to begin on a number of the areas concerned. Since the close of the financial year a new company has been registered in Southern Rhodesia for the purpose of examining the mineral—particularly copper—possibilities of nearly 500 square miles in the Karoi District of Southern Rhodesia, over which two prospecting orders have been provisionally granted by the Government. Field work in this large area has been started. One borehole has been completed and a further borehole is in progress. It will be appreciated, however, that much more exploratory work will have to be done before the potentialities of this and other areas can be assessed.

I might mention that it is my view that the long-term future of uranium is unquestionably sound but that, on the other hand, there will be an interim period between expiration of the existing contracts and the full development of uranium for peaceful uses where there will, no doubt, be an oversupply.

There will also be an attempt on the part of uranium producers in various parts of the world to assure the sale of their material because uranium, unlike gold, will have to be sold just like any other commodity. I am convinced that the authorities, both in the industry and in the government are fully aware of this and are taking steps to develop the private sale of uranium and I would only like to add that any research which can be done towards the development of additional refining or manufacturing of uranium so that it can be produced in its most saleable form under Union auspices, either here or abroad, will inevitably result in a better sales potential.

FUTURE OF GOLD

Obviously of great importance to Rand Mines is the future of gold and the price of gold. You will, no doubt, however, appreciate that this is a controversial subject and that there is no man alive who can accurately foretell exactly when the price of gold will be changed. It is, however, clear that there has been increasing speculation and discussion on this question, stimulated to some extent by the substantial losses of gold which have occurred in the United States. If these losses continue they will become an increasingly serious matter to the United States and, quite clearly, will give rise to further discussion as to the advisability of changing the gold price. Although these losses are stimulated by foreign aid and loss of trade, it would be wrong at this time to say that there is any basic flight from the dollar because the dollar is still the world's strongest currency and in all probability will remain so. It is true, however, that it is not as strong as it was and is subject to increasing pressure from abroad where national banks are converting dollar holdings to gold. In my opinion, the basis of a change in the gold price is not, however, so much the possible weakness of the dollar or advantages that would accrue to South Africa by such an increase but rather that such an increase would be a tremendous boon to free world economy particularly if it were coupled with some form of modified gold standard which could result in the elimination of many current currency restrictions thereby greatly increasing the potential flow of trade. There is no question that the world looks on gold as the basic international medium of exchange and no paper currency can replace the value of gold in this regard.

FUTURE PROSPECTS

I, like my other colleagues on the board, am most interested in South Africa and its possibilities for industrial and economic expansion, and I feel that the future of the country, and for your company, is full of promise . It remains for us to seek new fields of investment, to conduct our exploration programme energetically and to take advantage of opportunities for expanding the company's interests and business whenever suitable opportunities occur. I can assure you that every effort is being made, and will continue to be made in this direction and it is my belief that your company, which contributed to much in earlier years to the economic development of South Africa, will continue to play a leading part in its future.

LA RINASCENTE

MILAN, ITALY

(Largest Italian Department Store Organization)

La Rinascente concern held the Annual General Meeting in Milan, under the Chairmanship of Dr Aldo Borletti.

The Balance Sheet, closed January 31, 1959, with a profit of Lit.690.306.451.—, was unanimously approved.

The dividend of Lit.5 per each of the 120 million shares—each of a nominal value of Lit. 50—is payable with effect from May 20th.

The detailed report presented by the Board of Directors, which was exceedingly well received by the shareholders present, outlined the further development of the Group's Organisation and the progress attained in the sales of both the La Rinascente department stores and the Upim chain stores. It also detailed the considerable efforts that have been made to develop the Company's social welfare provisions for its staff: trade schools, pensions, health schemes, special cures, help for new families, recreation and assistance for dependents, either under the Ina-Casa plan or directly through the Company.

The report also outlined the liquidity achieved in the Company's financial position in relation to the development plans that are now being carried out. All the outgoing Directors and Auditors, were re-elected by acclamation for a further period of three years.

THE CENTRAL PROVINCES MANGANESE ORE COMPANY

CHANGED PATTERN OF TRADING

EFFECT OF FALL IN STEEL PRODUCTION

MAJOR A.C. HERRING'S CONFIDENCE IN THE FUTURE

The 51st annual general meeting of The Central Provinces Manganese Ore Company Limited was held of June 10th at Winchester House, Old Broad Street, London, E.C.2, Major A.C. Herring, V.C., A.C.A., the chairman, presiding.

Mr. T.D. de Deney, FC.I.S., (the Secretary), read the notice convening the meeting and the report of the auditors.

The chairman said :

Ladies and Gentlemen, The Report and Accounts for the year ended 31st December, 1958, have been in your hands for the requisite period and with your permission I will take them as read. (Agreed.)

You will have seen from our Accounts that the profit for 1958 showed a considerable reduction compared with that of 1957. This was substantially due to the falling off in shipments during the second half of the year; this I rather foreshadowed in my speech last June. The trading profit for the year was £1,601,953 as compared with £3.046,635 for 1957 after transfer of £200,000 to Ore Stock Reserve. I think it would be wise, however, to look upon the year 1957 as an exceptionally good year.

Income from Investments and Bank Interest both showed a considerable advance. The latter, of course, being due to the fact that with a high Bank Rate "interest on deposit" was also at a high level, and that we then had considerable sums available which at a later date were required to pay the accrued heavy taxation on our previous profits. The net profit available after taxation is £511,357 as compared with £1,010,345 for the previous year. Your Board has considered it appropriate in present circumstances to make an addition of £27,091 to Contingencies Reserve.

Balance Sheet Features

Turning to the Balance Sheet, the principal points of interest are that our Ore Stock shows an increase of some £90,000. In view of the fact that deliveries during the latter half of the year were small I do not think this is unsatisfactory especially as we have an Ore Stock Reserve of £700,000 which is fully justified at this time.

British Government Securities and Cash at Bank both show appreciable reductions, owing primarily to the fact that we had to meet heavy liabilities for taxation on prior profits. Our reserve for future taxation, you will notice, is reduced from £1,334.000 to £476.000.

Trading Conditions

In my Speech in June last year I mentioned that the Steel Industry of the United States was passing through a difficult period and as you probably know, steel production in that country for 1958 showed a considerable fall To a lesser degree, I think it would be fair to say that this situation occured in all the main steel producing countries The Manganese Ore trade depends almost entirely upon the activity in the Steel Industry and consequently it is obvious that if steel production fall our Company suffers. During the first six months of last year in spite of the fact that steel production had already fallen considerably, our deliveries were good. The effect of this, of course, was that stocks of Manganese Ore were being accumulated by the steel producers; as a consequence our deliveries during the last six months showed a big fall.

Statistics indicate that there is now quite a substantial increase in steel production in the United States of America, but the inference from this must be treated with a certain amount of reserve as it is possible that production has been intensified for the last few months in anticipation of the possibility of a strike in the Steel Industry in that country in July. This, of course, may or may not occur.

Changed Situation

So far as we are concerned, I do not think it can be anticipated that the demand for Manganese Ore will increase very much until stocks at consumers works have been reduced and this will probably take some considerable time. Since the war the Manganese Ore Industry has been in a fortunate position—steel production has steadily increased whilst there has been a shortage of Manganese Ore. This shortage was accentuated in our own particular case by the non-availability of sufficient railway agons to move our Ore to ports. During the past year this situation has changed, steel production has fallen, new deposits are now in operation, and consequently there has been ample supply of Manganese Ore.

I think the above summarises the present situation and sounds rather doleful, but all businesses have their ups and downs and I am confident that steel production will, over the years, continue to expand and that there will be a full demand for our Ore, which has a world wide reputation. The Company has adequate financial resources for its requirements, our mines are in good shape, and we are working in close collaboration with the Authorities in India. They and we are most anxious to increase the export of Ore and I have no doubt that although deliveries so far this year have been rather moderate these will gradually pick up as the Steel Industry recovers. It will, however, I think require a little patience.

Mr. Hardy has paid visits to India in order to inspect the Mines and also to keep in close contact with the Indian Authorities. I am pleased to say that he found the mines in satisfactory condition.

Despite the lesser demand for ore we have so far been able to avoid dismissing any of our labour force by concentrating them on removing overburden with the consequent fall in our output of Ore. We hope that market conditions will improve in good time so that we may not be forced to consider any retrenchment of labour which has had to take place at the mines of many other producers, particularly those producing low grade ores.

Diamond Drilling

During the year diamond drilling took place at [illegible] Mine and this in conjunction with normal exploration work has proved that a large reserve of ore remains at this mine. Diamond drilling was commenced at New Tirodi Mine.

Shaft sinking continued at Balaghat Mine and a shaft station in now being installed at No. 6 level. The Tirodi Mine was connected with the Government electricity grid and the new equipment consisting of a crushing and conveying system for spoil has been brought into successful operation, as well as an electric shovel and compressors.

Wherever possible economies have been made in our operations which has meant the restricted use of mechanised plant on some of the mines, and the H.M.S. Plant at Dongri Buzburg Mine has been shut down until the demand for ore from this mine increases.

Tributes

We again have to thank our Agents in India, Messrs. James Finlay & Company Limited, for their valuable services throughout the year.

We are fortunate in having such an able and loyal staff, both in this country and in India, and I would like to extend to them our thanks for their continued efforts during the past year, which has been a somewhat difficult one.

I now beg to move : "That the Report of the Directors and Statement of Accounts as at 31st December, 1958, be and are hereby approved and adopted and that the profits be appropriated as recommended by the Directors." I will ask Mr. Holmes to second the motion and before putting it to the Meeting I will endeavour to deal with any questions which Stockholders may wish to ask.

Mr. H.R. Holmes seconded the resolution which was carried unanimously.

The Board's proposal of a final dividend of 1s. 8d. per unit, free of tax, and a bonus of 4d. per unit, free of tax, was also approved.

The retiring director, Major A.C. Herring, V.C., A.C.A., was re-elected and the remuneration of the auditors, Messrs. W.A. Browne & Co., having been fixed, the proceedings terminated.

YOU

MR. POLICYHOLDER

do better than you think

Security and a feeling of independence were probably what you were after when you took out your life assurance policy. You wanted to save—and here was an easy way to do it with lots of additional advantages. You wanted to have a bit of capital waiting for you when you retired. You wanted to feel that your family was protected. Your policy sees to all this.

But there's still more to it. Money from Life Assurance provides finance for Britain's industrial expansion which benefits us all. Sound investment makes it possible for the Life Offices to offer favourable premium rates—and 90 per cent or more of the profits are returned to policyholders in the form of bonuses on with-profits policies.

Through **LIFE ASSURANCE**

a better life for you and for everyone

Issued by The Life Offices' Association, London, and Associated Scottish Life Offices, Edinburgh.

TR SERVICES

provide more than

STAFF LOCATION

Although TR Services provide the most comprehensive and reliable Staff Location facilities—by internal broadcast from a central microphone or direct through the internal telephone system, or by light signals—this is only one of the Services. It is also only a part of the overall story of how TR Services benefit a business.

Because they enable information to be obtained more quickly and instructions to be passed more promptly; because they reveal and diagnose inefficient machine production, encourage a better sense of time and its value, help to achieve more accurate costings and, in many other ways, help to promote a better business climate, TR Services improve the whole economy of a Company.

They cut down waste—of time, effort and money—and *that* is their fullest justification. Send for details of TR Staff Location—and any or all of the TR Services. Do it today.

THERMOTANK IN AMERICA

Now they can give of their best

in a Detroit Research Laboratory

In a climate which is often uncomfortably hot in summer and cold in winter, administrative workers and scientists in this Detroit plant now enjoy temperate inside conditions right through the year. Careful control of the atmosphere for the work itself is provided in the cold-vaccine laboratory. This air conditioning installation is one of many important contracts secured in the United States by Thermotank. Others include the supply of 4,800 high velocity units to the New State Department Building in Washington.

Thermotank can plan, design and instal air conditioning equipment for any requirement in any part of the world.

A WORLD OF BETTER CLIMATES WITH THERMOTANK

Here are a few more examples of world-wide service from Thermotank:
UNITED STATES Contracts for Texas Instruments, Standard Oil, American Telephone and Telegraph Company, John Hopkins University, Ford Motor Company and General Motors.
BRITAIN Full conversion of the liner s.s. 'ORCADES' to be carried out, providing an installation with a capacity of 14,000,000 B.Th.U's per hour.
MIDDLE EAST Installations include the Fao Port Control and Wireless Station Building and the Iraq Spinning and Weaving Company's mills near Baghdad.
SOUTH AFRICA Thermotank installation for the new ten-storey headquarters of the United Building Society in Johannesburg, South Africa's largest office building.

"Something new in partitions, old chap"

"Tell me more."
"I knew you'd be interested in this, old chap. You're thinking of dividing up that big office of yours aren't you?"

"It's quite a possibility."
"Well, these new Stramit 'Movaflush' partitions really have something. It's all in the way they fit together, actually. They're ready-made panels with an L-shaped piece at each side and they simply butt up together, one after another. You put a screw through them—and that's that. They go up at simply astonishing speed. Knock pounds off the normal erection costs."

"What are they like, when they're up?"
"Eh? Oh, I see what you mean. Well, according to this leaflet I've got, 'Movaflush' partitions have all the virtues. They're over two inches thick, you know, for a start. They're strong and rigid. They deaden sound. And they're faced with hardboard so they can be decorated easily."

"How much, old boy?"
"Well, the surprising thing is, not much at all. Something like five bob a square foot, including things like timber sections, doors, screws and what have you."

"I must get one of those leaflets."
"Why not get your secretary to fill in a coupon, or something."

Please send me, without obligation, full details of Stramit 'Movaflush' partitions

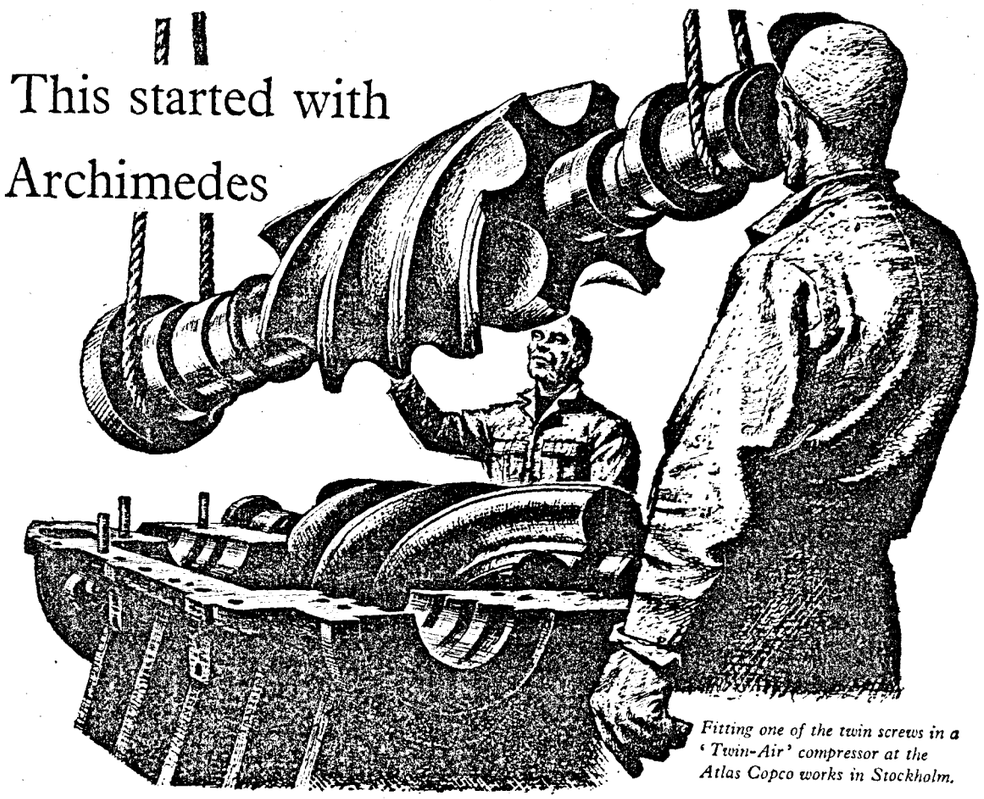
INTERLOCKING PARTS

The GKN Group is a jigsaw of companies—each independent, none so big as to be unwieldy, all concerned with steel in one form or another.

As far as Bayliss, Jones & Bayliss are concerned, the forms are many. B.J.B. produce forgings—with particular emphasis on railway fastenings; they build heavy machine frames and complete machines; they supply steelwork for power transmission lines; they make roof support equipment for mines; they have considerable welding capacity; and their reputation for railings and gates is worldwide.



A variety impressive enough in itself, but only part of the Bayliss, Jones & Bayliss output. And B.J.B., in turn, are themselves only part of the GKN whole. Take each of the GKN companies, fit them together and they form a picture of everything you want, or are likely to want, in steel.

THE **GKN** GROUP OF COMPANIES

FOR ANYTHING AND EVERYTHING IN STEEL

GUEST, KEEN & NETTLEFOLDS, LTD., (HEAD OFFICE) LONDON WORKS, SMETHWICK 40, STAFFS.

This started with Archimedes

Fitting one of the twin screws in a 'Twin-Air' compressor at the Atlas Copco works in Stockholm.

One of the most famous inventions of the great mathematician Archimedes (287-212 B.C.) was the Archimedean Screw, which he first demonstrated by removing water from a ship's hold. For centuries it was used for irrigating fields in Egypt. One form consisted of a helix or screw revolving in a fixed cylinder. As the screw was turned, the water was carried to the surface.

John Erikson's adaptation of this idea in modern times gave us the propeller, one of the outstanding inventions of civilisation.

The same principle was used by another Swede, Professor Alf Lysholm, when he invented the rotary screw compressor in 1934. As a result Atlas Copco have developed this rotary screw machine, in which air is compressed by the action of two intermeshing rotors, *which never actually touch.* There is no friction, no need for lubrication, and very little maintenance is necessary.

Atlas Copco 'Twin-Air' rotary screw compressors have already proved their worth in the Arctic Circle area of Sweden, where they have been running for two years under full operating conditions in the world's largest underground iron ore mine.

Air and antibiotics

Compressed air is versatile. Atlas Copco provides the means for all its many applications. At the Løvens Kemiske Fabrik in Copenhagen, one of the biggest chemical works in Europe, large quantities of sterile oil-free air are required for the production of penicillin and streptomycin. Because of their reliability, 8 Atlas Copco compressors are used for this vital supply of air to the cultivation tanks.

The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

Atlas Copco puts compressed air to work for the world

Keep Talking

DIPLOMACY may well prove more active and interesting now that the foreign ministers' conference is in recess than when it was in session. This seeming paradox is fairly easy to explain. While the ministers were facing each other across the table at Geneva, they were like boxers in a clinch; now that they have managed to break loose, they have more freedom to make the kind of moves and gestures that might bring about at least a change in the atmosphere, if not in the underlying realities.

Already there is ample speculation. Mr Eisenhower's remarks at his press conference last week about the possibility of his meeting General de Gaulle stimulated talk about a western « summit » conference. As to the four foreign ministers themselves, the gloomy predict that they will not in the event keep their rendez-vous on July 13th, while the ever-hopeful have suggested that they might come together merely to provide a brisk curtain-raiser for an *immediate « summit » meeting* with Mr Khrushchev.

Meanwhile, there is the imminent arrival in the United States of Mr Frol Kozlov, the relatively unknown Soviet first deputy premier, who is to have talks in Washington with Mr Eisenhower and Mr Herter — and presumably with Mr Nixon, who will be off to Moscow on July 23rd to inaugurate the American exhibition there, and will likewise have the opportunity of private talks during his visi

The Kozlov and Nixon visits will constitute talks at a pretty high level, if not exactly the highest. Mr Khrushchev will doubtless continue to insist that the supreme peak itself, the Everest of diplomacy, must still be scaled; but the ascent of K.2 (and of U.S.2) will already represent a conquest of formidable heights. And one may assume that there will also be many encounters and exchanges at more modest levels in the next few weeks; for it is obvious that something must change before a resumption of formal four-power discussion can be made with any hope of progress. The adjournment at Geneva left the opposing positions as far apart as ever.

In spite of that unhappy fact, however, the foreign ministers' departure from Geneva was not interpreted as a sharp turn for the worse in international relations. This is possibly the most significant aspect of the present situation. Nobody is inclined to underestimate the potential dangers of the situation itself. Mr Khrushchev, in his speech to his east German guests last week, spelt out once again his resolve to end the western allies' ability to protect the freedom of

west Berlin; and the western governments have severally, jointly and rightly reaffirmed their intention of retaining that ability. But the pushing back of chairs from the Geneva table has not automatically aggravated an already grave state of things. In part, this represents a deliberate and skilful diplomatic achievement. Exasperating though their experiences at Geneva have been, the ministers have managed to disengage from the conference without losing their tempers and setting off alarms and scares. In part, however, this surprising tranquillity reflects the rather curious mood of the moment : a mood which repays a little study.

The West's current approach to high-level exchanges with Russia could hardly be more different from the approach of 1955. In that year, the « summit » was climbed under the heady influence of a cocktail of Soviet gestures — withdrawal from Austria, withdrawal from the Porkkala base in Finland, rapprochement with Jugoslavia, cessation of various minor harassments on many diplomatic fronts. The Geneva spirit of 1955 seemed a potent brew. Even after the heads of government had had their meeting, and had had no success whatever in formulating satisfactory directives for their foreign ministers, public expectations lingered on. It took all of Mr Molotov's familiar intransigence to explode the gaudy bubble of optimism at the subsequent meeting of foreign ministers. Western attitudes to summitry have been coloured ever since by this disenchanting experience. But this year there has been no question of the West's representatives being impelled into unwary moves by an over-optimistic public opinion. It is the lowering Soviet pressure on Berlin that has brought the western governments to the conference table. Behind them lies a public opinion which never expected anything spectacular to emerge from Geneva this summer, and most of which has long ago become bored by the whole tortuous process of negotiation there.

While real dangers exist, it can be perilous for the public to lapse into complete apathy. But at the same time it is all to the good that nobody has got wildly excited over the Geneva conference or the prospects of further negotiation. If the foreign ministers have achieved nothing else, they have, by exposing the hard irreconcilability of the two attitudes to the German problem, taken a lot of the hot air out of the public's feelings about a summit meeting. Mr Khrushchev, for his part, has now cried wolf so often, and at such leisurely intervals, that his « ultimata » are increasingly seen for what they are — not direct threats of war, but instruments of diplomatic pressure.

The main lesson of this is, surely, that given a problem such as that of Germany, where no early and definitive solution is in prospect, there is everything to be said for making the dialogue a more or less continuous one. If it is allowed to lapse for long periods, public expectations may become unnaturally and dangerously excited at each approach of a seeming climax. If the dialogue is kept going, at whatever level, the plain realities are more easily kept in sight. It is obviously going to be a long dialogue; and neither the western heads of government nor even their foreign ministers can very well be spared for attendance at a virtually continuous Geneva conference. But the answer to that is presumably the appointment of senior deputies to sweat it out there, with their superiors looking in from time to time whenever shifts in the situation justify their appearance. It will not be glorious; it will hardly even amount to news; but it will be more like diplomacy.

A Non-Nuclear Club

Unfortunately, the Opposition's alternative to contracting out of the alliance by unilateral nuclear disarmament is not as good as it sounds.

THE Labour party is now sidestepping the demands of its left wing for the perilous policy of unilateral nuclear disarmament, by saying that its policy would be to found a non-nuclear club if it should win the general election. This proposal — that Britain should halt the spread of nuclear-armed powers by renouncing its own bomb, on condition that everyone else takes the pledge except America and Russia - looks much more respectable than unilateral nuclear disarmament. It can be presented as a great moral gesture for those Britons who congenitally hanker for one. Even in wider circles it has a certain *prima facie* appeal. When, some time this summer or autumn France announces (rather prematurely on the strength of one test) that it has become atomic power number four, renewed terror will be raised by the cry « think what it will be like when Nasser and Nicaragua have the bomb too ». The general idea of confining the bomb to the two superpowers is offered as a way of keeping the atomic genie half in the bottle. If it would work, it would be a good idea. But this new panacea, like others before it, needs a good hard look.

Unhappily a good hard look lands one back pretty quickly in some old familiar difficulties. First, it should be made clear what a very small change formation of the club implies. Membership of it would not mean for Nato powers (or others) renunciation of the provision of bomber aerodromes or missile sites for launching nuclear weapons; therefore it also would not mean contracting out of participation in agonising decisions about their use. Obviously, non-nuclear powers must participate actively in the control of nuclear weapons sited on their territory. The French at present want unilateral control of Nato nuclear bombers in their country; the British demand something less. But even the British envisage something more than just a negative veto on their use; they envisage positive co-operation in decisions to fire. All these controverses would remain.

Secondly, there is the problem of tactical nuclear arms. Conceivably, for a time, all Nato's nuclear weapons, tactical as well as strategical, could be kept in American formations. But this division between American artillery and Nato infantry and armour cannot last; technology is making these weapons steadily into personal infantry weapons, and their issue to national forces has in fact already begun. The prospect may be unpleasant; but it must be faced. The whole integration of nuclear weapons into modern formations, by land, sea and air, implies that the possession of these weapons will *de facto* become dispersed. In effect, in a measurable time, many countries outside the present nuclear club will not only control and use, but also possess atomic, weapons of a sort. Joining the non-nuclear club would not change this.

Thus all that the non-nuclear club stands for is the renunciation of manufacture - either of the bomb alone, or possibly of the delivery mechanism, the rockets and bombers also (the latter point is not always made clear). Here the obvious difficulty is that France seems set on having its home-grown deterrent. Would-be founders of the club argue that if there is a case for Britain renouncing a decade of nuclear development and a capital investment of over £1,000 million in bombs and bombers, an even better case can be made for France not undertaking such a burden. They argue that if Britain renounces the bomb, France will eventually come to realise this even if it feels that it must prove its virility in the meantime by one nuclear test.

The difficulty, however, lies in presenting such a case against the background of the advantages which Britain has already enjoyed through its membership of the nuclear club : and the constant practical reminders of those advantages in Nato when certain arcana can be discussed by the Americans only with their British colleagues. The Nasser-Nicaragua argument will not alone serve; because the French, and others, say it will be a long time before Nasser or Nicaragua can afford it and meanwhile they want what Britain *has had*. It is unnecessary to rehearse all the arguments used by the British Government for the possession of Britain's own bomb to prove that each and every one of them is exactly applicable to France or even Sweden - and certainly to Germany, even though Germany denied itself nuclear manufacture in the Paris agreement. Whether the argument is the ability to influence American decisions or to bomb our special targets, they fit almost any European country : and they continue to be used. In particular the vast advantages of exchanging atomic know-how with the Americans are constantly stressed, and as constantly nourish European envy. Moreover, everybody knows that there are economies to be gained in entering this field after some of the initial research work has been done; undoubtedly the French will get a small separate deterrent of a sort more cheaply than Britain, and atomic power number five will get it cheaper still.

It is this that makes officials so fatalistic about the spread in the number of independent atomic powers. Conservative ministers themselves are as worried as any body else about that spread; but so far they have absolutely failed to find what they want - a knock-down argument why Britain was right to join the nuclear club, but France and everyone else should belong *ab initio* to the non-nuclear one over the road. They long to prove this. The nearest they got to it was to argue that Britain uniquely benefited Europe by creating a home-grown nuclear deterrent this side of the Atlantic; this has merely prompted the French to insist that there should be one on their side of the channel. The moral gesture requires giving up something valuable; but it also confirms that having bombs is, or was in the short run, valuable - which simply tends to confirm the desire to possess.

Thus, even apart from Gallic chauvinism, the prospectus of the non-nuclear club is a dubious document. Labour must face it. To renounce the bomb

solves no problems — and it certainly raises the problem of the disposal of Britain's bombs, bombers, plants and scientists if one did; for these are now an important part of the deterrent and would presumably have to be handed over to American ownership, but under British control. It would seem more fruitful for Britain to renounce its unilateral control over its home-grown deterrent, but continue to contribute it (or whatever part of it is useful) to the common cause. In the end, therefore, one is brought back to the real issue: collective control of the growing ability everywhere to make nuclear weapons. To solve this will require hard, slogging negotiation; there are no panaceas.

France, our Ally

The United States and Britain have still to develop the knack of getting along with General de Gaulle.

IRRITATION at the French is a normal state of mind inside Nato and in Washington and London too. General de Gaulle's advent has merely inspired a new spate of Anglo-Saxon platitudes on France's proper—and, to Frenchmen, still intolerably subordinate—part in the Atlantic alliance. This does not add up to a crisis, yet. All that the latest squabble means is that, in Anglo-American experience, the new, resolutely wilful France is just as irritating as the old, wilfully irresolute one. Much of this Anglo American irritation comes from General de Gaulle's temerity in insisting on French prerogatives; but some of it has been prompted by his still greater temerity in confronting Nato (as the preceding article in this issue of *The Economist* shows) with questions that it has always preferred to leave unanswered. It may hurt the alliance to admit it, but General de Gaulle is right to raise these questions. If the air is going to be cleared at all, Nato's functions in the world and, in particular, the rights and duties of membership in a nuclear age, must be defined more clearly than they last were in December, 1957.

This is sufficiently important, and difficult, to warrant a top-level western conference this year—not merely another Atlantic jamboree. Because the alliance is one of fifteen countries, such questions as political control over its nuclear capability and the overhaul of its military command system must be settled by the fifteen allies together; they cannot be decided at a private meeting between Presidents Eisenhower and de Gaulle. Even so, a full Franco-American discussion of what France's particular prerogatives in the world should be is thoroughly desirable. Is France to be treated as a responsible power or not? On this, as Mr Walter Lippman has observed, only the United States can satisfy General de Gaulle—one way or the other.

It is certainly hard to see the United States, or anyone else, accepting the general as a first-class power just because he has a bomb of his own in prospect. It is not the Hiroshima bomb, but the full range of a moder'n nuclear armoury? which France cannot hope to develop for another five years—that really counts. Even then, it does not follow that a separate French deterrent will necessarily give General de Gaulle the seat he wants in those inner, Anglo-Saxon councils that Frenchmen envy and condemn. The reasons for France's present exclusion are not primarily nuclear. But a tactful ally does not express doubts about the political stability of the Fifth Republic—even the Fourth Republicans were touchy in their day. No one wants to weigh the prospects for French democracy after the general has gone. No one wants to talk too frankly about the effect of the Algerian war on Afro-Asian opinions of the West. It is easier to say that France has no bomb. So, for the past year, the bomb has become a frightful King Charles's head in Paris, and the sharing of atomic secrets the ruling passion of French policy.

General de Gaulle does not seem to realise that France cannot become a first-class power, or even a first-class western partner, simply by forcing his allies to share their atomic secrets. The world policy bureau envisaged in his memorandum to President Eisenhower and Mr Macmillan last September presupposes an intimate interstanding which cannot come about at pistol-point. There is a limit to what even an ally like the United States can do for French prestige. Nor would the Algerian war be ended, whatever M. Debré may think, if France were to enjoy unqualified western support in north Africa. But none of this means that France's claims to more allied consultation and trust are unjustified. There is a great deal that can be done to improve relations,

if the general is ready to co-operate. Even the suspicions of the United States Senate are seldom eternal. But some of the present realities of power politics must be put to General de Gaulle one day soon—and President Eisenhower is the only man who can do it.

THE prospect of a sensible outcome to the Franco-American debate will be improved if Britain contrives to keep out of the argument. Mr Macmillan is no help to the Americans if they want to refute the strategy of separate deterrents; and it merely riles the French to see this country giving itself unnecessary airs at the Americans' side. But France is our ally too, and part of General de Gaulle's quarrel, real or imagined, is with us. What can Britain do? The worst of the trouble is the petty jealousy that seems to surround Franco-British relations and makes the discussion of valid differences doubly hard to conduct. This has happened in the free trade area dispute. There is, too, a subconscious British desire to slam the door of the nuclear club in General de Gaulle's face for no other reason than that French membership would end this country's last claim to be a great power. But issues that seem to dominate French thought tend to bear even less relationship to reality. Serious contentions that Britain inveigled French Guinea into its new relationship with Ghana, or that a London court's decision upholding the label « Spanish champagne » was a deliberate blow at the French economy, sound ludicrous in English ears. There even seems to be an official idea in Paris that Britain is striving with might and main to dissuade Nigeria from joining the French community. Perhaps it may be necessary to point out that if Nigeria were to join a west African grouping it would so alter the community's structure that it would certainly not remain under French tutelage. The truth is that the mental energy that is expended on these trumpery arguments on both sides is badly needed to tackle the real problems.

Britain and France cannot afford to squabble needlessly between themselves; still less can they afford to divide Europe either politically or economically. It may seem to some British eyes that the Paris-Bonn axis has lamentably obstructed Mr Macmillan's climb to the summit. But one lesson that Britain may have to learn is that initiatives taken by London in isolation can cause more distrust in western Europe than they do good in East-West relations. The Americans are the only leaders that Europe is prepared to recognise. The urgent need now is to reconcile these differences in the light of events at Geneva. M. Couve de Murville certainly seems to have been conscious that allied unity was not assisted by M. Debré's demands for total western solidarity in Algeria. M. Debré made it quite plain that for him, at least, it is Algeria first and Nato and European union afterwards. This not only strained Anglo-American tempers; it also redoubled west German reservations on France's adherence to the European cause. The Gaullist ranks are still not ready to march under M. Monnet's banner.

It is important for the West that General de Gaulle should be given as great a share in policy-making as France's essential part in the alliance demands. His interventions on Germany have sometimes been very much to the point; his public refusal to support German claims east of the Oder-Neisse line has been particularly useful. He now seems to be more attracted to the summit as the champion of aid to the undeveloped countries: it is something to see him in the armour of M. Faure and M. Pineau. These are hopeful signs. But the allies must develop the knack of getting along with him as best they can. They may find that some straight speaking now will get them further than evasion ever will.

Room at the Top

The paucity of higher education in colonial and ex-colonial territories calls for emergency measures. But these should not deflect us from helping these countries to build up their own universities.

A GRAVE weakness of any newly independent state is the shortage of educated citizens able to take over the administrative and technical jobs that used to be done by the colonial power. This difficulty, one of the more important themes at the Commonwealth conference at Montreal last September, will be raised again at the Commonwealth education conference in Oxford in July. At Montreal, it was agreed to establish a thousand new Commonwealth scholarships, of which Britain undertook

to grant 500 and Canada 250. The Oxford conference is to determine, among others things, the distribution of these scholarships.

The long term remedy is to build up universities and technical institutes in the colonies and new dominions, so that eventually the new states can themselves provide sufficient further education for their people Ideally, no doubt, every student (and every teacher) ought to be equally welcome and equally at home at every university in the world, as once in Christendom they were; but, as things are, sending colonial students overseas for their university education is no more a permanent solution for the new nations than efforts to prevent the homeward drift of expatriate officials; both are stop-gaps. But the gap in colonial education is wide, and local universities and technical institutes can at present accommodate only a small fraction of the applicants. It costs an enormous amount to build, equip and staff a colonial university college. The colleges have to be mainly residential, as there are usually few private lodging houses nearby; it is customary nowadays to be lavish in design and materials; and in order to be fair to the local teachers, the staff are generally all paid at British expatriate rates. To begin with, a lot of the funds came from colonial development and welfare grants, but this source is gradually drying up, and the independent territories cannot rely on much new money from outside.

The shorter term policy is to help students from the colonies and new dominions to study abroad. This shows quick results, and sterling balances provide the finance. But Britain and the older dominions are grappling with an educational inflation of their own, and cannot rapidly increase the number of places for students from other countries. There are now some 11,000 colonial students taking full-time courses in Britain; 3,000 are university students, 3,000 student nurses, 1,500 at the Inns of Court, and the rest mainly at technical colleges and polytechnics. The problem is peculiarly Britain's, for although there is some peripheral circulation - West Indians going to Canada, Malayans to Australia - the United Kingdom alone draws students from all parts of the Commonwealth.

What can be done? The worst thing would be for more students to come here than can be properly looked after. As much trouble needs to be taken over the social life of an African or West Indian as over his studies. If he cannot live in college, he should, at least in his first year, be found a room in a multi-racial hostel. The British Council cares for students sponsored by the Colonial Office or by their own governments, but not for those who have reached Britain under their own steam; and although there are overseas welfare officers in some polytechnics, they are usually over-worked and under-staffed. A better system for the technical colleges might be some kind of tutorial arrangement, with a member of staff looking after, say, every ten or twelve overseas students. This precaution is quite as much in Britain's interest as in the student's, for if he is left to sink or swim in some lodging house on the edge of the university community, or to mix only with his own compatriots, he will go home, as others have done, embittered.

Even allowing for the proportion of the thousand new scholarships that will be allotted to students from backward territories, the room for expansion here is very limited — and very few students have the right qualifications to get in. Both the sponsors and the universities might wise to concentrate on the older students who have already had some type of further education in their own countries. Many young colonial students get as little out of their experience in Britain as an average English school child on a first trip abroad. A student who has already graduated or obtained a technical qualification at home will usually profit more from a western education; he is in less danger of losing touch with his own country; and, better equipped to deal with loneliness and landladies, he needs less nannying from the university authorities. True, this means giving double education to fewer people, building up an aristocracy of talent rather than raising the general standard. But a smallish cadre of professional men who have studied both at home and in Britain may prove at least as useful to an emerging country as a larger number of graduates who have digested western ways too raw.

Africa's shortage of graduates is the reverse of India's problem of a large educated but under-employed middle class; but, while one cannot yet visualise an excess of engineers in the new dominions, and it is hard to imagine too many doctors, there may come a time when lawyers, journalists or economists weigh down the scales. When making grants, the sponsor - whether it is the Colonial Office, or the colonial or dominion government - can keep an eye on the future balance of supply and demand. But most students come on their own initiative, and study what they fancy where they can. Law is a popular choice, both because the preliminary qualifications are relatively low and because it offers the prospect of an independent career. But lawyers are not a priority group; engineers, scientists and administrators are.

The immediate need is for trained technicians who know all about the machines actually available, even if they have not the theoretical background to take on new development. Colonial territories have followed British patterns of training, and there is very little opportunity for students to take short and specialised courses in their own country. Yet such is the emergency that forcing the pace in this way may be a justifiable expedient. An engineer, for instance, instead of going through a full seven year course, might be given an adequate grounding in, say, bridge-building, in two or three years.

For longer and more conventional training, the obvious expedient is to try to squeeze more suitable graduates into universities and, particularly, technical colleges, in Britain and other advanced countries. There is one serious disadvantage to this. If postgraduates are encouraged to stay away from home to continue their education, the universities in the colonies and new dominions, drained of their best talent, will become dull places in which to learn or teach. This would make the problem of tracking down good staff harder than ever. The ideal solution would clearly be a vigorous two-way traffic; a network of postgraduate exchanges between established and emergent nations, to the enrichment of both.

NOTES OF THE WEEK

PRINTING TROUBLES

Service to the Customers

As will be apparent from our format, this week as last. the current printing dispute in Britain is once again forcing us to print *The Economist* abroad. We are sorry for all the inevitable deficiences. Much of the comment on the dispute that has appeared in newspapers at home seems to us to be wrong-headed. Although we happen to be losing heavily through their decision, the printing trade unions are no doubt entitled to refuse to go to arbitration if they think that a strike will be more profitable to them; they still believe that it may be, because some of the biggest printing houses, they argue, will be anxious for a quick settlement. Against that, however, the newspapers which describe as « provocative » the decision of the master printers « to put the workers on a daily basis as retaliation for their ban on overtime » do not know what they are talking about. At the time the daily notices were issued, the workers were not merely operating a ban on overtime, but also a policy of non-cooperation which was making normal production impossible.

Perhaps the real criticism of the two sides in this dispute—which has produced an almost nation-wide stop-press, except for the London nationals—is that they remain artificially divided into two sides only. Some of the big printing houses could probably afford to enter into a new and possibly acceptable contract with their men, but they are indisposed to do so because this would be betraying their trade association. And, lower down the scale, some smaller country printing houses and local papers will go out of business, and their workers lose their jobs, if the unions' demands are even partially granted; but the unions refuse to let them contract out of any overall settlement. As for the 40-hour week, it would be possible to get through the work done in some parts of the British industry in considerably less than 40 hours, to everybody's advantage, if certain restrictive practices were withdrawn; but the unions will not withdraw them.

By printing abroad while the London houses are closed *The Economist* and other weeklies, who have been deprived of their printing facilities by a dispute in which they have no part, are not doing anything that harms the interests of the British workers who set us up in normal times. Indeed the British employers themselves, alarmed at the proposed exodus, have also tried to persuade the employers' trade associations in some continental countries not to take British work; they are afraid of British journals discovering that for some classes of printing (though not for weekly papers) it can be cheaper now to job out work in Europe than in Britain. But, apparently because they regard it as untidily provocative that

anybody should work while their own members are not doing so, the unions ave putting all the obstructions they can in our way. Those obstructions apply to the distributive and (attemptedly) the journalistic side, as well as to printing. For so long as we are able to do so, and with renewed apologies to subscribers and advertisers for imperfections in the emergency product, we shall strive to serve our customers (whose interests everybody else is forgetting), using such powers of improvisation enterprise and hard work as we posses.

We are asked to publish the following statement :

Estimant qu'il n'est pas possible d'empêcher la parution de ce journal, le personnel de l'imprimerie tient toutefois à assurer leurs confrères britanniques de leur « solidarité totale ».

LABOUR AND THE BOMB

Papering Nuclear Cracks

As this issue of *The Economist* goes unnaturally early to press it looks as though Mr Gaitskell will obtain the *imprimatur* of the Labour party's national executive and the general council of the TUC for the long statement he has drafted on the bomb. If so the party will go to the country as freshly confirmed non-nuclear clubmen—a ruse for baffling the unilateral disarmers which was commended to the executive as early as last March by Mr Anthony Greenwood. At the time the suggestion was wafted into limbo with a quick flick of Mr Gaitskell's accomplished wrist.

After the tremendous effort of gestation that went into all those policy pamphlets, Mr Gaitskell can hardly be blamed for showing little stomach for yet another round of these endless wranglings in committee over nuances or wording and the use of commas which particularly rejoice unemployed socialist minds. Indeed this should not be the leader's job. The withdrawal of Mr Herbert Morrison from politics into literature (and one hopes that Nuffield College, which was godparent to *Government and Parliament*, will jolly him to keep his promise to write seriously) calls attention to the fact that he has never been adequately replaced. For the last three years the leader of the Labour party has lacked an efficient political administrator at his right hand. The size of the Aldermaston demonstration and the psychological impact of Mr Bevan's undertaking in the Commons to stop (rather than suspend) nuclear testing ought to have signalled danger to the party leaders; they missed the signal, and the result was to let the season of trade union conferences begin without any firm political guidance.

Everyone knows that a last-minute conversion to the non-nuclear club does not sound too well either within the party or to the country. Many Labour MPs who now support it as the lesser of evils do not really believe in it. Many are made uncomfortable by Mr Grimond's taunt at the crudeness of this demonstration of the effect on policy of the card vote. Fortunately for Mr Gaitskell he did make a half-commitment to the idea of a non-nuclear club in one passage of his speech at Scarborough—the party's propagandists will just have to do as best they can with that.

Voices and Votes

UNDERSTANDABLY, the idea of a non-nuclear club does not appeal to the Labour party's unilateral disarmers, even though their movement's distinguished president, Earl Russell, has lent it his logician's prestige. Led by Canon Collins from pulpits sacred and profane and Messrs Zilliacus, Orbach and Silverman in the columns of *The Times*, they have put forward an alternative proposal. Britain, they say, should overawe the other nations of the world with this threat: either they disarm with Britain within two years, or Britain will disarm without them. The great merit of this approach over that of the non-nuclear club, as Mr Bern Levy explains it in *Tribune*, is that it appeals to peoples whereas the non-nuclear club appeals only to governments. Sensitive rulers like General de Gaulle and Mao Tse-tung will have to yield to spontaneous popular clamour to follow Britain's example.

The nuclear disarmers, who are victims of the chauvinistic fallacy of believing that just because Britain is Britain its moral gestures will be more effective than those of Mr Nehru over Tibet, do represent a definable body of sentiment this country. There unquestionably exists a vocal and probably growing minority of radical dissenters, who demonstrated at Aldermaston and for whose support several elements are now bidding. But Mr Gaitskell has too firm a grip on political reality to be deceived (as apparently many scornful Europeans have been) into believing that a protest group that looks numerous on the ground represents anything like a significant percentage of the total electorate. Fortunately for him Mr Bevan has reached the same conclusion and told the parliamentary party that it would face another 1931 if it overbid for the votes of the unilateral disarmers.

Will such arguments be enough to fix the Labour party conference next October? This will partly depend on Mr Frank Cousins. By personal commitment he is an Aldermaston marcher. But he has made a great point of allowing himself to be democratically bound by feeling in his union. This has usually been to the right of him, but after what happened at the municipal workers' conference, who can tell which way his rank-and-file union delegates

EUROPE'S BIGGEST GASWORKS SPECIFY JOY LIMBEROLLER CONVEYOR IDLERS

Many industries have taken kindly to the revolutionary Limberoller. Offering several advantages over conventional idlers in general, they have exclusive operating features appealing to specific industries in particular.

This is amply demonstrated by the impressive list of industries which Limberollers already service. 15 gasworks, 8 steel mills, 2 of the big 5 motor manufacturers, and in quarries, coal mines, foundries, chemical plants, etc. . . . these in Britain alone.

LIMBEROLLERS are demonstrably superior on most conveyor installations. See how they would cut your materials handling costs by writing for leaflet L125, and the address of your local distributor.

'And tell the chap at their warehouse...

A long haul, perhaps . . . but your last-minute verbal instructions won't get lost or forgotten. The Independent haulier doesn't forget the many details that matter to his customers. It's part of the *personal service* that Free Enterprise Road Haulage always offers.

And you get the same service in the smallest local haul. It's largely a matter of administrative freedom, with no red-tape snags. The Independent haulier's decisions are his own. He's answerable directly to *you*, the customer. Hence his promptness, his efficiency, his attention to detail. And remember—it's his competition that has held haulage prices down since de-nationalisation.

The Free Enterprise Haulier puts *you* first

Nationalisation means goodbye to all this!

Get in touch with your local area office of the Road Haulage Association or directly with the Head Office at: 146 New Bond Street, London, W.1. MAYFAIR 9050

will go without a strong lead from the platform? Nevertheless one feels that the consequences of doing to Mr Gaitskell what, for opposite reasons, the party conference did to George Lansbury in 1935 would be so obviously catastrophic on the eve of an election that some way out will be found. Perhaps the resolution put to the conference will be so worded that Sir Tom Williamson and others will be able to plead that a new situation has arisen since their unions fastened awkward mandates on to them. In any case Mr Macmillan may obligingly relieve his opponents of their agony. If there is an October election there will be time only for a two-day ra-ra conference before going into battle. It is for this that Labour now devoutly wishes.

GERMANY

The Christian Democrats' Crisis

As the German Social Democrats can testify, Dr Adenauer is no novice in the art of manipulating opinion outside Germany to damage his opponents at home. What is new in German politics is the turning of this technique against an opponent in his own party, and, indeed, in his own cabinet. Dr Erhard had seemed to accept Dr Adenauer's decision to keep him, the vice-chancellor, out of the chancellorship by hanging on to it himself. In return he got a handshake, a parliamentary party resolution expressing "particular confidence" in him, and a statement from the same quarter deploring any statements calculated to damage the vice-chancellor's public standing.

For Dr Adenauer this was a truce cheaply bought. Even so, he quickly threw it away: first, by his statement to the Bundestag on June 11th that Dr Erhard had known about Dr Adenauer's intentions all along; next, by a rapid series of interviews with American journalists, of which one given to the *New York Times* correspondent on June 17th caused stupefaction in the Christian Democratic Union and provoked Dr Erhard to say openly, before reporters, that the Chancellor was damaging Germany's reputation abroad and his party. Dr Adenauer in the interview had returned to his old imputation that Dr Erhard was too inexperienced to be trusted with the directon of high (which means, to him, foreign) policy. He had rebuked Dr Erhard and Dr Etzel together for "struggling" in a manner not good for the party, had denied that Dr Erhard had the support of the Christian Democrat majority, and had indicated that he, Dr Adenauer, was not going to think about choosing his successor until the elections of 1961 were over and his own fourth term of office had begun.

If it did nothing else, this kind of talk has ensured that the Christian Democrat electors will assemble for the election of the new federal president on Wednesday in a state of tension and disturbance which these usually unexcitable men have never known. The mere decision to hold the assembly in Berlin, delayed until June 19th to fend off any accusation against Bonn of sowing discord among the foreign ministers at Geneva, is a rebuff to Dr Adenauer. With his characteristic dislike of showy gestures, he has always opposed the demonstrative holding of west German state functions on soil which, strictly speaking, does not belong to the federal republic at all. He may be right; but the impulse for reunification is so damned up and frustrated that German opinion prefers an unreal gesture, even a risky one, to no gesture at all.

SOUTH AFRICA

Earth Tremors

THE violent outbreak of rioting in Durban had an immediate cause — but also a deeper significance. The immediate cause was the authorities' attempt to suppress the illicit decoction of liquor by African women, and force Africans in search of refreshment, or an anodyne, into the state-run halls that sell « kaffir beer ». Africans are tenderly shielded from Scotch, gin, and even Paarl champagne; but their thirst for something more than official « kaffir beer » is met in the manner adopted all over the world when a puritan government enforces prohibition or puts on an intolerable excise. The results are bad for health and morals; but they provide the women with an income, and a vested interest quickly springs up. Any attempt to suppress it produces violence, in the Union as in America or Ireland.

The Economist

JUNE 25, 1859

PLETHORA OF TALENT

THE New Administration is made up of men of no common ability; some of them eminently fitted for their respective fields of work; all of them heartily united on the great question of the day, the foreign policy of England; and combining, amongst them, the leaders of nearly every section of the Liberal party. ...When a Government comprehends too many men accustomed to act, and able to act, as independent leaders — statesmen whose capacity has been tried and not found wanting as independent leaders — it is extremely difficult to prevent an amount of independent thought and discussion which may seriously menace the unity of the Administration. Their very capacity for leading is often an incapacity for following a lead. ...They can no longer accept a result and merely consider the best defence of it: they examine it afresh as if there were no previous presumption in its favour. Now this is undoubtedly a great source of weakness in a Cabinet. The fresh lights and fresh arguments which the ablest men can always furnish to the common stock, are but slight gain in comparison to the dangers occasioned by their reluctant or wavering adhesion to the conclusion of their colleagues. A single first-rate statesman, with a number of less original but still firm and able adherents, will always constitute a far more stable Administration than a constellation of men of nearly equal standing and genius. The importance, however, of securing a large parliamentary support from the different sections of the Liberal party has rendered the present constitution of the Cabinet almost a necessity. The true course for the men who compose it is, to look the consequent risk fairly in the face, and to resolve firmly that nothing shall tempt them into rivalry while the great object for which they are combined still remains to be attained.

But Africans in the Union are also organising a boycott of the products of firms linked with the ruling National party; and this easily extends to government beer. Thus commercial advantage and race bitterness combined to produce an explosive mixture in Durban. On the other side, the police are only too happy to have occasion for making more of the endless raids on Africa premises that seem to reflect a feeling that it is never wise to leave Africans unawed for long. The government seems determined both to eliminate the moderates, whether black or white, and to strengthen the colour frontier by creating unalloyed bitterness. The result of this will not, however, be apartheid or peace : it will be collision. The road to anarchy by way of a police state is suggested by the events in Durban. It may temporarily suit the police to treat Africans as a sort of criminal tribe — and it may temporarily suit farmers if this situation can be exploited to yield convict labour, though that has been temporarly halted by a recent judicial decision which has caused the minister concerned to shelve the scheme. But how can these things possibly point towards a peaceful outcome ?

MINISTERS AND COLONIES

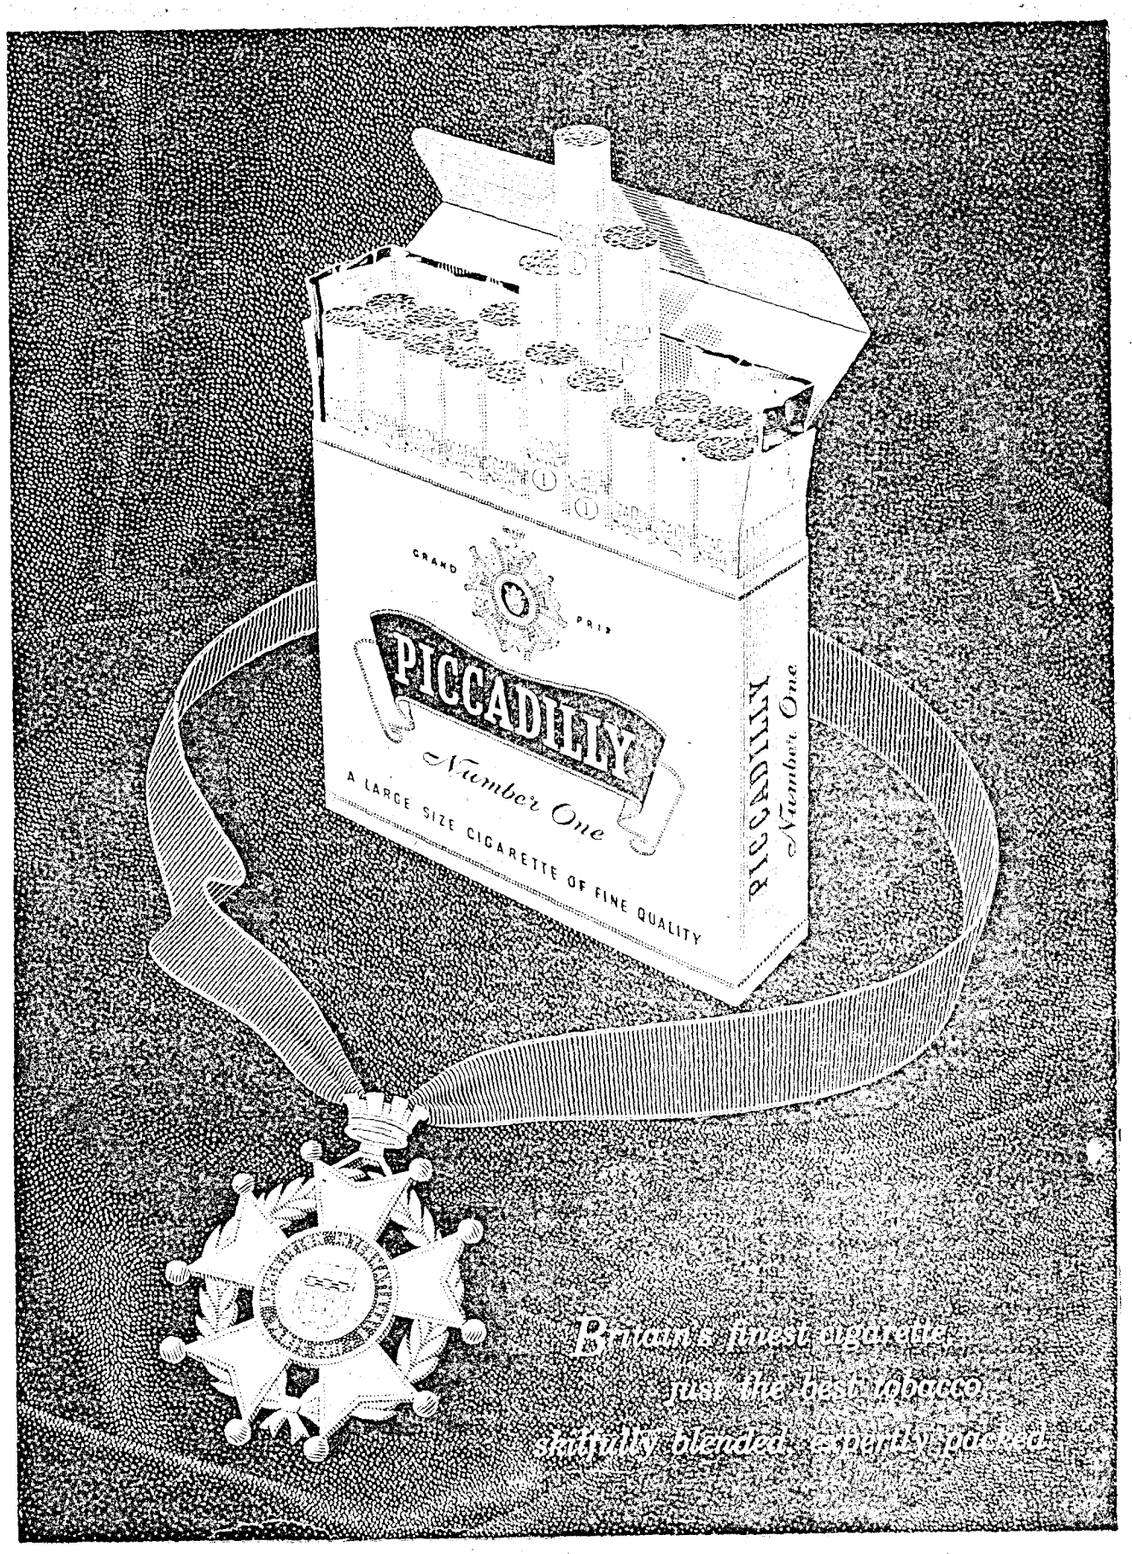
Whose Responsibility ?

THE Government has a duty to do some urgent rethinking about the relationship between ministers and colonial or hybrid territories. Nobody is satisfied with Mr Lennox-Boyd's shifty performance over the Hola deaths; and Labour spokesmen were perfectly right to seek last week to find someone, at whatever remove, to question about the decision of the federal government of Rhodesia and Nyasaland to ban the Rev. T. Colvin, a Church of Scotland missionary, from Nyasaland, even though he has lived there some years and has his home there. The Speaker ruled that he could not allow these questions ; under the 1953 constitution, control of immigration was vested in the federal government, which is deemed for such purposes to be as self-governing as Australia.

As things are, this is no doubt the correct ruling. But it does not and cannot end the matter. Within one week Mr Lennox-Boyd and Lord Home have been able to wash their hands of incidents whch have engendered the keenest disgust and resentment in the country. Kenya at any rate is still nominally a British colony, and though the Federation may be deemed independent in its jurisdiction, the Rev. Colvin lives in Nyasaland which is still a British protectorate. Labour did well to demand if the Colonial or Commonwealth Relations Office had no right (or intention) of lodging an emphatic protect. There need be no secret about the « undisclosed » reasons for Mr Colvin's banning, even from those who have not bene privileged to peruse the secret indictment of the Church of Scotland drawn up by the Nyasaland (or Federal) government. It is these alleged that Mr Colvin was once a member communist front youth organisation. In fact he ceased to belong to the organisation concerned before he was ordained or went to Nyasaland. But Salisbury has caught anti-communist paranoia exceptionally badly from South Africa ; and it is evidently determined to take up the cudgels with the Church of Scotland after the drubbing it received at the Assembly of that Church last month. This is making more and more liberals here determined that after 1960 it will not control immigration any longer. But Lord Home should do something about it now. And Mr Lennox-Boyd should be in no doubt that the good repute of the government of Kenya, which is his responsibility, is under a cloud which he has signally failed to dissipate.

WHITEHAVEN BY-ELECTION

The Last by-Election ?



MORE than 79 per cent of the electorate voted at Whitehaven last week, an extraordinarily high turn out for a by-election in a rather uninterestingly safe Labour seat. The result showed a 0.6 per cent swing to Labour compared with 1955. This was well below the average swing of just over 2 per cent which would be required to bring Labour back to office at a general election ; indeed an average swing of only 0.6 par cent would still leave the Censervatives in power with a majority of nearly 50 in the House. The area around Whitehaven, however, was one in which the Conservatives made a rather better-than-average showing in last month's local elections ; the general swing to Labour in those elections seemed nearer to one per cent compared with 1955, while the swing to Labour in the Penistone by-election the week before last was 1.8 per cent.

When the results of all these elections are taken together, however, they still present a reasonably homogeneous picture. It seems very probable that Mr Macmillan would have got bach to power, albeit with a moderately reduced majority, if he had called a general election for last month or this. What one cannot say is whether this necessarily provides a pointer to what is likely to happen if a general election is called next October ; the present apparent slight odds on the Tories will be reversed if more than one out every hundred of the electorate swings to Labour in the meantime. As it happens, however, Mr Macmillan may have no more by-elections in this Parliament by which to judge when to chance his arm. Although five seats are at present vacant through death or ennoblement, the holiday months of July and August are usually kept free from by-elections ; by the time the holiday season is over in mid-September, it is just conceivable that the announcement will already have been made that this Parliament is to stand dissolved.

MOTOR STRIKE

Standard Difficulties

IN the latest bout of unofficial stoppages in the motor industry the Standard Motor Company has had all the publicity with little trouble, and the British Motor Corporation and Rover all the trouble with little publicity. All three firms, and the British Motor Corporation in particular, have been beset by persistent unofficial stoppages recently. Standard, however, faced with slow working and a rejection

of their £20 a week interim offer (until piece rates for the new Herald were finally negotiated) decided to sack all the 117 men in the body-making department involved; they thereby risked delaying yet further the production of their new model, whose marketing has already suffered several serious setbacks, but succeeded instead in giving the men such a jolt that, within three days, terms acceptable to the management and the unions were agreed and work was resumed. In the BMC such managerial action, through threatened, has not so far been taken; the corporation is loaded down with orders and fears that any sackings would at once lead to a general stoppage. It thinks that this might cost more at present than any number of wildcat strikes.

The key difference—though not the only one—between the labour position at BMC and Standard, where the dismissals had few repercussions, is the much greater confidence existing at Standard between union officials, shop stewards and the rank and file. This confidence, rather than that between management and men, is always the first target of communist infiltrators on the spot; only once officials have been discredited can every grievance be turned into an unofficial strike. There are several grievances outstanding in the motor industry at the moment, such as the disparity between time and piece rates (the latter much inflated in the present boom), and the overlapping and rivalries between some of the 30-odd representative unions. In the BMC a strongly entrenched group of shop stewards (with some outside help) is making all the hay it can out of this industrial muddle, which looks just the way Briggs did before the 1954 showdown.

One footnote to the Standard dispute is worth adding. The level of piecework earnings over which the dismissals took place was not as high as many people outside industry, over recent years, have come to imagine—when one remembers that vehicle body builders are about the highest-paid men in the motor industry, that the motor industry is certainly the highest-paying industry in the country, and that Standard n the past has had the reputation of being the highest-paying firm in the motor industry. The management was proved coolly justified in its decision to stand up to the sricks, but the absolute level of £1,000-£1,250 a year from Standard's offer should bring no emotional overtones into public attitudes. Vehicle body workers, like neuro-surgeons and welders, are entitled to whatever the market will pay for their services.

THE POLICE

Impartial Investigations Needed

NOT everybody will share Mr Butler's confidence in the present method of investigating allegations into a breach of the rules of conduct by the Metropolitan Police. Last week, when questioned by a Labour member about two men who were said to have been severely assaulted and kicked in a police station, Mr Butler replied that the matter had been fully investigated by the police commissioner, who had found no grounds for disciplinary action or for criminal proceedings.

What evidently happens is this. A complaint against the police of manhandling, for which there is evidence in the form of, say, broken ribs or bruises, is reported to Scotland Yard, which has its own machinery for investigating alleged breaches of discipline. This machinery gets to work, without undue haste; the police are questioned and produce the plausible story that the complainant was very violent on being arrested, fought with the arresting policeman and in the course of the struggle fell against some steps. This is, of course, just the sort of explanation Scotland Yard wants to be given; it is accepted and passed on to the person who reported the complaint, and it may very well be true.

But how can one be sure it is true? Scotland Yard's investigators need not have questioned the person said to have been manhandled, or even anyone who might have given independent evidence, such as people who had seen the injuries. Independent witnesses of the actual assault, if it did take place, do not, of course, exist. It will be said that the police are having an extremely difficult task combating thuggery and that if complaints against them are made the subject of a prosecution, it will undermine public confidence. But public confidence is already shaken, and the only way to restore it is for an independent inquiry—in some form or another—into each case where there is *prima facie* evidence of assault. Investigations by the police into the police on behalf of the police cannot, in present circumstances, carry sufficient weight.

PREPARATION FOR RETIREMENT

How the Old Live

FOUR years ago, the National Old People's Welfare Council appointed a strong study group to consider, the question of preparation for retirement or adjustment to ageing. « Timely planning », in the words of the Chief Medical Officer of the Ministry of Health, « can do much to reduce hardship to the elderly at a later date » — in matters not only of health but in many others, from practical comfort to mental liveness and serenity. Later this year a full-length book is to be published embodying the results of this study; meanwhile, a short pamphlet* indicates the field which it covered and some of the conclusions which it reached.

What emerges most clearly from the group's work is the two fold nature of retirement; as opportunity and as misfortune. The man who ends his normal lifetime employment at sixty-five has ahead o fhim the possibility of fifteen or twenty years of other activities, none the less valuable to himself, his circle, and the wider community because in the nature of things they must be pursued *diminuendo*; so much for opportunity. He loses a considerable part of his income; he also loses his standing in whatever worHing team he belonged to, and very probably a number of other valued personal contacts as well; so much, initially, for misfortune — to which time sooner or later adds those of actual disability. Both public and private welfare policy has hitherto concentrated, naturally enough, on alleviating misfortunes rather than on enlarging opportunities. Public policy wll no doubt have to go on doing so — though, one may hope, with a more discriminating and intelligent attention to the real needs of the retired when these have been more systematically studied. It is part of the argument of this pamphlet, however, that the more positive approach, possible to the private, semi-private or cooperative agency, can do a good deal to alleviate or forestall misfortune itself. (To take the crudest possible example, it is not the life and soul of the local Darby and Joan Club who gets discovered, on the strength of a lengthening row of full milk-bottles, dying of neglected pneumonia in an empty house.) The study group lays considerable emphasis on education — both education for retirement itself and education as one use of its opportunities; and touches very lightly on other topics, such as part-time work, catering, housing, and preventive medicine. The full-length volume should, on the indications of this pamphlet, be extremely useful. It is all to the good that its potential public should do a little advance thinking about its theme; the largest decennial age-group in British history — that born between 1900 and 1910 — is getting uncomfortably close to the opportunities and misfortunes of retirement.

* « Preparation for Retirement ». Published by the National Council of Social Service, 26 Bedford Square, London, W.C.1., 18 pages, 1s. 6d.

AUSTRIA

Coalition in Difficulties

AFTER the Austrian elections at the beginning of May, the leaders of the People's party, one of the two pillars of the coalition, maintained a coy silence, allowing it to be understood that they would not mind letting the Socialists form a minority government and thus prove themselves once and for all unable to run the country single-handed. With the opening of the new parliament on June 9th, the differences between the two parties became more clearly defined.

The dispute came to centre on the ministries of foreign affairs and of finance. Of these, the latter is infinitely more important. Until the elections, Dr Kamitz, of the People's party, had ably conducted its affairs; he is widely regarded as Austria's Erhard. The Socialists had learned, though unwillingly, to accept the leadership of the People's party in economic affairs; their own power of initiative in this field had been hampered by their long drawn out, and in the end successful, attempt to renounce their Marxist inheritance. Nevertheless, a few months before the elections they showed signs that they had surmounted these difficulties : they produced their own economic programme and began to contest the economic decisions made by their partners more frequently and sharply. On June 14th Herr Raab, the Chancellor, offered them the finance ministry. Although he emphasised that it could be handed over only on conditions that represented strict safeguards for right-wing interests, the rank and file of his own People's party did not find these assurances adequate. The party executive decided next day to advise Herr Raab, who is also the party's chairman, that his offer should be withdrawn.

However, ever since the Socialists gained four seats in the elections and thus drew almost abreast of their partners and rivals, they had indicated that they would not be content with anything less than the finance ministry. Compromise projects have therefore been mooted. It would not be very surprising if an additional ministry for economic affairs were suddenly to emerge.

PARIS AIR SHOW

French Lesson

As the noise and dust of the Paris air show's closing days subside and Le Bourget gets back to its normal business as a civil airport, three strong impressions remain as reminders that these noisy jamborees—annual at Farnborough, biennial at Paris—provide much of the raw material for measuring the rightness and wrongness of any given aircraft policy. This is particularly true at Paris because the display is an international one. Aerodynamisicists of many countries, for example, must have gone home with food for thought after watching the flying and handling characteristics of the Swedish Draken fighter, which are quite unlike those of any other machine displayed.

The first mpression is one that, at this stage, concerns France only, namely the effort to develop a vehicle to carry the country's promised atomic bombs. This is being conducted on three fronts simultaneously: the designing of a Blue Streak type ballistic missile; the flight testing of a small 1,400 m.p.h. delta-winged bomber, the Mirage IV (which strengthens the privately owned Dassault company's already iron grip on military design in Francs), and the impending metamorphossi of a supersonic robot target aircraft into a ramp-launched, unpiloted atom bomb carrier on the lines of, but faster than, those in America.

The two remaining impressions are of the British industry's growing difficulties abroad. Since the French, the Italians and now the Germans revived their aircraft industries, the scope for British exports to the continent has steadily contracted. Now that the American company, Pratt and Whitney, has signed a licensing agreement with the French nationalised engine company and another American manufacturer has completed a roughly similar deal in Germany, a contraction in Britain's previously invulnerable aero-engine exports is on the cards.

Rolls-Royce fought long and hard to pull off the licensing agreement in place of the Americans, even to the extent of working in harness with its bitter rival, Bristol Siddeley. The company is now also watching, with other British manufacturers, the growing tendency for co-operation on joint projects between continental manufacturers in different countries. Many people felt that the most important exhibit of the show was an otherwise unexceptional model of an air freighter developed to a joint Franco-German specification, designed by, and to be jointly manufactured in, the two countries as a shared venture.

Pearls and Tapioca

EDWARD MARSH: A BIOGRAPHY
By Christopher Hassall, Longmans, 748 pages. 42s.

The art of patronage, these days, is largely put into commission; and inevitably it suffers. This is the story of a man who was not a creative artist but who devoted his life, with immense success, to the service of the arts and of scholarship. Sir Edward Marsh had three things which are necessary for success in that rare vocation: love of people, unwavering standards and some money. The last was plainly necessary, but it is clear that the amount which he had to spend was never large; nor did it need to be. The point was to spend well, at moments of greatest need. Sir Edward Marsh had two sources of money which he used for patronage: a share which he inherited of the grant voted by Parliament when his ancestor, Spenser Perceval, was murdered, and the royalties which he got for his memoir of Rupert Brooke. It is a pity—and this is almost the only criticism to be made of Mr. Hassall's biography—that the yearly amounts which he spent are not recorded: it would probably be a rare example of a little going a long way.

To have money to spend is only the beginning; what counts is to have an aim in spending. Sir Edward Marsh did not emerge from Cambridge with his vocation ready made. First came a period during which both "persona" and tastes were formed, and influences gladly accepted. But, by the time he was in his thirties, the man was fairly complete. He knew everyone and was ready to encourage talent in every form; his interests were legion; his affections were easily aroused and never turned to sourness; few people were so much loved. Yet the main impression left on one is of great strength of mind. He lived to encourage others and to help them where help was needed; but the process of selection and encouragement was not a passive one, and he left a strong impress. He was a complementary, not a secondary, character. In the preface to the last "Georgian Poetry" he wrote:

> "Much admired work seems to me, in its lack of inspiration and its disregard of form, like gravy imitating lava. Its upholders may retort that much of the work which I prefer seems to them, in its lack of inspiration, and its comparative finish, like tapioca imitating pearls."

So it was: throughout his life he collected pearls, genuine, cultured and occasionally artificial, and what may seem all of a class and all bore the mark of his taste: highly finished, sortable, with a good sheen, and even the tapioca the best of its kind.

He had a singularly strong command over the circumstances of his life. His charm and determination bent others to his pattern, and he did what he wanted. With the help of Sir Winston Churchill, he moulded even the civil service to his desire, and spent a distinguished but unique career without ever becoming an ordinary functionary; he was always, and solely, after his earliest days a personal aide to ministers—to Sir Winston Churchill when in office and to others when he was not there (it is perhaps significant that, among the myriad friends who are named in the text, not one civil servant is mentioned after he joined Sir Winston in 195)

Sociability, kindness and interest in the arts would not hav ebeen enough by themselves. He brought two other talents to bear. One was the wit and charm that meant that the company which he loved was never lacking, and the adaptability that enabled him to befriend the most variegated and often difficult characters; the other was the deep scholarship and the love of language that made his criticism useful. In his last twenty years, for the first time, his scholaship found a direct outlet in his translations and in the increasing time and labour that he gave to reading and correcting the proofs of his friends' work.

The product of his life was a string of pearls rather than a collection of individual germs, and there were few dramatic events in it. But there was one exception: his friendship with Rupert Brooke, the passionate labour which he gave to his reputation and his memory, and the unhappy and long-drawn-out quarrel with his mother after his death. This story, which Mr. Hassall tells with great sympathy to both sides, shows how much remains untold and inpublished, to the loss of Brooke's more lasting memory. It is time for a reassessment, and one hopes that this lacuna will soon be remedied.

Mr. Hassall's book is deserving of all praise. It is immensely long, and none the worse for that: one sinks into another world and is reluctant to leave it. It is charmingly written, with affection but uncritically; and the last hundred pages, which cover the period during which the author knew Sir Edward Marsh, are the best.

More Benefits and Fewer Taxes

The Control of the Purse: Progress and Decline of Parliament's Financial Control
By Paul Einzig.
Secker & Warburg. 344 pages. 35s.

Dr. Einzig's book is the detailed description of a great historical irony: the House of Commons won and perfected over centuries the right and the means to control public expenditure—and when it had done so, it lost the will to use them.

The mechanism of the drama is of an almost terrifying simplicity. Parliament could not successfully and consistently control finance as long as it was separate from the executive and opposed to it; for where control and responsibility are divorced, government becomes impossible. This was the typical medieval dilemma. It was solved in the seventeenth century by resting the executive itself upon a parliamentary majority, so that control and responsibility were married; but this in turn meant that the Government must secure, or try to secure, a parliamentary majority. In the eighteenth century the Government escaped financial control by its ability to "manage" the members of Parliament and their constituencies. With the extension of the franchise in the nineteenth and twentieth centuries the Government has had to "bribe" an electorate which increasingly stood to benefit from less taxation. Hence a situation where the Government's desire to spend is only exceeded by that of its parliamentary supporters and the official opposition, and where the perfected machinery of parliamentary scrutiny and Treasury control languishes for lack of the will to drive it.

This process Dr. Einzig describes and documents more thoroughly than has been done before. Probably he would have been wise to devote less space to the medieval period, where he suffers from inadequate specialised knowledge, and to give even more detail from 1660 or 1688 onwards. There is, however, one recent and important factor which he seems to have overlooked altogether. This is Keynes, or rather the belief, vague but widely and deeply held in the last two decades, that Government expenditure is in itself a Good Thing. The Conservative party's enthusiasm for retrenchment in the early fifties was never robust in comparison with what such enthusiasms had been in the early twenties or at times in the last century; but, such as it was, it disappeared without trace at the first whiff of unemployment. (Whoever hears a complaint nowadays about the size of the Civil Service?) Public spending was now the key to electoral success not only directly via benefits but indirectly via the "full employment" which (so it had been discovered) public spending could be used to produce or maintain.

The Greek inevitability of this drama forbids the hope, which Dr. Einzig is sometimes tempted to indulge, that procedural devices or safeguards —he is, for example, (rightly) a bitter critic of sending the Finance Bill 'upstairs"—will stem the trend towards higher Government expenditure, The social or political changes that would give the electorate a greater interest in retrenchment than in expenditure are not yet in sight: unless and until they occur, financial control may gain a battle here or there, but it will never win a campaign.

Stress and Sickness

Revolution in Medicine
By Brian Inglis.
Hutchinson. 279 pages. 21s.
Nature of Stress Disorder
Hutchinson. 298 pages. 25s.

Mr. Inglis is thoroughgoing in his denunciation of the methods and practice of medicine here and now. He wants a more realistic view of the prevalence of emotional causes of illness and a more open application of psychotherapeutic methods in the treatment of both neurotic illness and those conditions with prominent bodily symptoms like duodenal ulcer, essential hypertension, asthma and "rheumatism" which so many doctors now label psychosomatic. His revolution would entail a recasting of the medical students' curriculum and a reorientation of research and of the outlook of many family doctors.

There are, in fact, abundant signs in books, papers, the formation of societies (vide infra) and in general medical opinion that the ideas which the author summarises are gradually permeating medical practice. Even the teaching hospitals and research institutes, where in the last eighty years the extraordinary success of a clinical medicine based on the material sciences has led to a disregard of human and emotional contributions to the causes of illness, are changing their ways. More family doctors than the author seems to realise are as well aware as he is of the importance of emotional factors in the appearance of symptoms. But, very often, because they distrust their own ability to handle them or because of lack of time to listen, they fall back on short cuts or help to flood the psychiatric out-patient departments of hospitals.

There are those who are unconvinced by the need for Mr. Inglis's revolution and want scientific proof rather than the faith and assertions of the enthusiast. It is, however, exceedingly difficult to produce cast-iron evidence of the efficacy of psychotherapy, though every doctor who practises it knows of people he is sure he has helped. It is strange, too, how recalcitrant to treatment by psychotherapy many psychosomatic illnesses prove to be, though Mr. Inglis hardly gives this impression.

In a short book that deals with a vast subject, there are bound to be occasions when the author can be suspected of partiality, or choosing to refer almost entirely to those papers which support his argument. He quotes for example one paper unfriendly to leucotomy, but the balance of published material is probably the other way. He seems to condemn physical methods of treatment, including tranquillisers, in psychiatry without making it plain that these are only widely used in psychotic illnesses and not in the neuroses. Occasionally he makes an irritating remark that might provoke the medical retort that he has never treated a patient.

Both laymen and doctors can nevertheless be grateful to Mr. Inglis for gathering together the evidence and expressing it all so readably even if in his enthusiasm he is inclined to overstate his case. He is, although he does not seem to know it, flogging a half-dead horse.

"The Nature of Stress Disorder" is a report of a conference held last year by the Society for Psychosomatic Research, and interdisciplinary group of psychiatrists, other doctors, biologists and other scientists. The chapter headings, which include dyspepsia, hypertension, stress in aviation, responses of animals to stress, stress in society, stress in industry, the university student, stress in childhood and the influence of genetic endowment, indicate the wide scope of the inquiry. Each section is followed by a verbatim account of the discussion each paper aroused, a luxury usually met with only in American publications. The whole is summed up in a thought-provoking philosophical chapter by Dr. J. O. Wisdom.

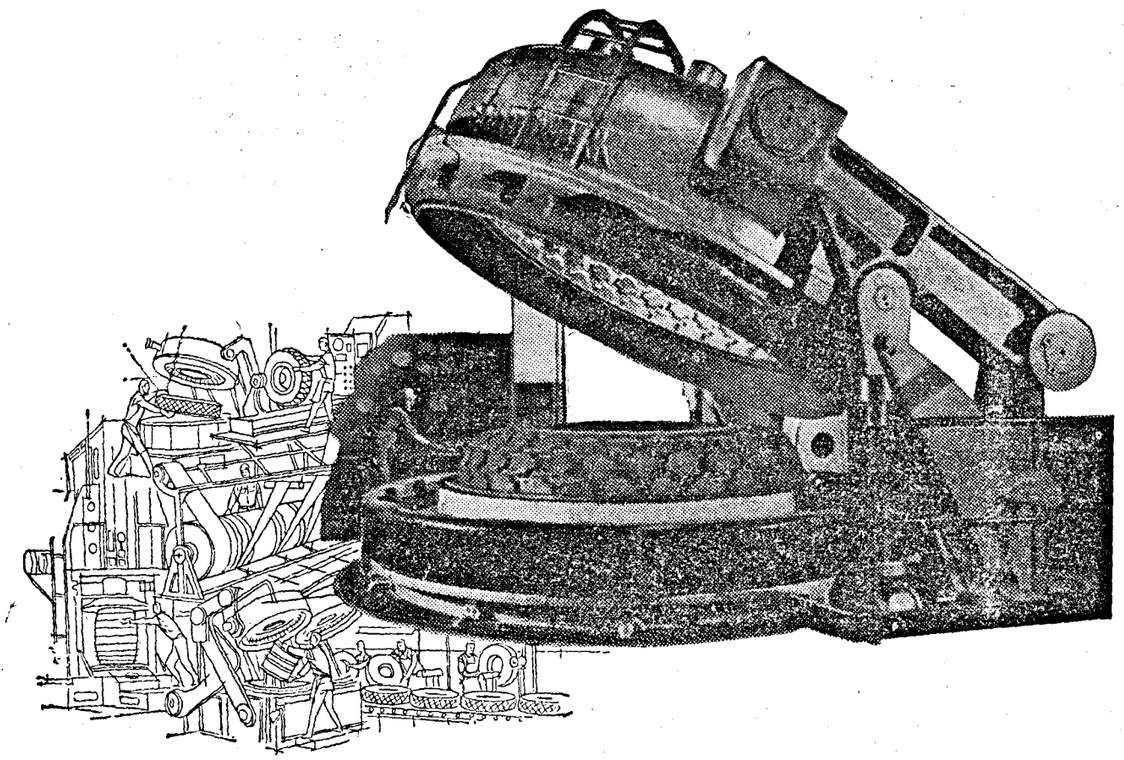
ESP

The Sixth Sense
By Rosalind Heywood
Chatto & Windus. 224 pages 21s.

This book has as its sub-title "An Inquiry into Extra-Sensory Perception," and is a readable survey of studies that have been made in the area since scientists began to take an interest in it. The author is objective, and approaches her material as an enquiring layman, so that the general reader who wishes to find his way about this odd region will find in Miss Heywood a congenial guide.

Although she does not stress the point herself, her biographical sketches bring out clearly the intense pre-occupation of some very distinguished scholars and scientists with queer, seemingly inexplicable fragments of evidence which, taken at their face value, would suggest that the orthodox scientific view of the material world is somehow, somewhere, mistaken. What emerges is a mixture of scientific precision, rigorous logic, and wishful thinking. The whole question is dealt with in terms of data which appear inexplicable but, on the whole, are fragmentary, and often trivial. Granted that the evidence is what it seems to be, it becomes significant only in terms of statistical notions which are themselves open to question. When one puts the massive integrated framework of physical science on one side and these odd data on the other, one is tempted, and this reviewer would certainly yield to the temptation without hesitation, to say that the data are not what they seem to be, or else the statistical assumptions which seem to give them significance are mistaken; but the workers in ESP are temperamentally champions of the underdog, compulsively fair-minded, and very anxious to be convinced. The interplay of these factors makes a fascinating story.

Other Books



The National Union of Printing, Bookbinding and Paper Workers. By C. J. Bundock. The University Press, Oxford. 588 pages. 5s. plus 2s. postage.

This is an authoritative and beautifully produced history of one of Britain's oldest craft unions. The union, whose family tree stretches back to the eighteenth century journeymen bookbinders (formed for "social and convivial purposes"), now has a total of 150,000 members and is by far the largest union in the printing and paper industry. The book is full of the close detail—of underground radical societies, of able leaders and their rivalries, of strikes, craft disputes and, ultimately, of the improvement in members' status—that makes the real stuff of union history. The printing unions, with their strong non-conformist conscience that has preserved to this day, their "chapels" and their "fathers," have contributed much to this. No one who reads this book, which is for the specialist, could doubt the value the union has given, and continues to give, to its members.

As Unions Mature. By R. A. Lester. Princeton University Press. London: Oxford University Press. 182 pages, 30s.

Unions in America. By B. C. Roberts. Princeton University Press. 146 pages. $2.00.

In this monograph, Mr. Roberts sets out simply and clearly some comparisons between unions here and in America. In many respects, such as the slow-down in union growth, the coming of union maturity (discussed at much greater length in Professor Lister's book) and the watering down of internal democracy, the position in the two countries is very similar. In others, and particularly in the unions' legal framework and in the breadth of their wage contracts, it is quite different. There is also the wholly different union ethos in America—much less in the radical non-conformist, and much more in the business, tradition—which has led to the rise in corruption there. Mr. Roberts discusses the corruption charges and raises the urgent question of a new philosophy for American labour; Professor Lister, by examining the institution developments inside the unions, gives the data on which any realistic philosophy must to based.

Are they making tyres... or tires?

Differences in language and customs, however small or subtle, can be important to people in Britain doing business with America.

As a U.S. bank with branches in London, Chase Manhattan knows the differences and similarities, can do much to make your dealings with the States more pleasant and more profitable. Chase Manhattan knows, too, the differences in customs and trade practices *within* the states... for its network of correspondent banks is the largest in America.

In fact, almost anywhere you do business, Chase Manhattan's network of more than 51,000 correspondent banks and branches around the world can get up-to-the-minute information for you, and provide you with every type of modern banking service—promptly, efficiently, and on a personal, *localized* basis that practically puts you on-the-scene yourself.

Why don't you talk to the people at Chase Manhattan ... in either of the London branches.

AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Protection Frustrated

WASHINGTON, DC

AMERICAN trade policy has in one sense a surprising consistency. It is not one that can be used to forecast the outcome of any individual case, but it gives a strong clue to the probable future movement of trade barriers in general and even of imports. The consistency lies in the policy being equally balanced between liberalism and protectionism, with the weight perhaps a shade heavier on the liberal side.

Victories for liberalism, of course, seldom seem as dramatic as decisions that go the other way. For one thing, American tariffs in the postwar period have been reduced in three or four large batches following the recurrent negotiations under the General Agreement on Tariffs and Trade; this means that a single newspaper story covers about 500 reductions in tariffs. But each individual decision that raises trade barriers is worth several stories, including one on the inevitable reaction from abroad. Moreover a number of liberal « triumphs » are not newsworthy because they are essentially negative. For example, a potentially dangerous movement by senators from western States to establish a permanent system of import quotas for the chief minerals, starting with fluorspar, now appears to have been headed off without fanfare.

Ever since the end of the war the protectionists in Congress have in fact been frustrated on the essential points. The law permitting the negotiation of trade agreements on a reciprocal basis has been extended regularly, with added, even if modest, new authority to cut tariffs, and far more trade barriers have been reduced than have been raised. However, none of this is of much comfort to the woollen manufacturers of Bradford, the oil men of Venezuela, the Japanese cotton textile exporters, the Dutch cheese industry, the lead and zinc miners of Mexico and Peru, the Swiss watchmakers, or the British and German bicycle manufacturers. Nor can it be disputed that the very recent record in America has been unusually protectionist. The mid-June decision not ta curb imports of heavy electrical equipment —a decision particularly welcome to Britain of which details are given separately,—was an exception to a rather depressing recent rule.

There have, however, been special, and rather compelling, reasons for the protectionist moves of the past year or two. The most important of these, as regards the volume of goods and money involved, was the imposition of mandatory quotas on petroleum imports (a decision, incidentally, which seems to have aroused far less protest in Europe than the single "buy American" ruling which excluded British turbines for the Greer's Ferry dam). There is one facet of this decision that is not generally understood. For many years the United States has had a disguised system of price support for crude oil produced at home, through the use of « allowable » quotas for output imposed by the oil states, backed by a federal law. It was only a matter of time until imports began to undermine this scheme, as they might have undermined the price support schemes for farm crops. The United States has had quotas for years on imports of wheat and cotton, and the oil quota has the same « justification ».

The depressed condition of the domestic textile industry is not peculiar to the United States, nor is the American reaction—in the form of the wool tariff quota and the « voluntary » export quotas of Japan—unique in the world, although the device used in the case of wool seems to have been peculiarly clumsy and discriminating. Western mining states produce a large number of senators, quite disproportionate to their slim population, and as a result restrictions on imports of lead and zinc were exceptionally difficult to avoid without unhealthy political consequences. Last year's imposition of quotas on imports of the two metals was the price that had to be paid for an extension of the reciprocal trade law that was essential to give Americans some bargaining power in the forthcoming GATT negotiations with the members of the common market—negotiations that will presumably produce another batch of tariff cuts.

MEANWHILE, American imports as a whole continue to boom. They were scarcely affected by last year's recession, and now they are at record levels. Apart from the lead and zinc quotas there have been only four minor increases in tariffs under the escape clause of the Reciprocal Trade Act since the bicycle case in 1955. Not only raw materials but manufactured goods are entering the United States in swelling amounts, as the European manufacturers can testify. But now men of good sense and good will are beginning to wonder if something will not have to be done about the persistent deficit in the balance of payments, with its accompanying outflow of gold.

Fortunately, up to now there has been almost no call for a general policy of protection for balance-of-payments reasons. As long as the United States continues to handle trade questions on a case-by-case basis, the total outflow of dollars to the world on commercial account will continue to mount. This does not help Bradford, but it helps the gold reserves of the Bank of England. The question for the future is whether protectionist pressures in the United States, always present in any case, will gain strength from the balance-of-payments difficulty.

The most certain prophecy is that the answer cannot be given before 1962, when the reciprocal trade agreements law comes up again for renewal. There is no chance that

the protectionists in Congress will be able to enforce a sweeping change in the present system on their own initiative. But they could conceivably muster the strength for a major onslaught in 1962 when the Administration must appeal to Congress for another extension of the law. Even then—given the near certainty that the new Administration of whichever party will be reasonably liberal on trade matters—it is unlikely that they would achieve anything worse than a stalemate: no extension of tariff-cutting authority but no major new protectionist devices either. The most likely prospect for American trade policy for as far ahead as can be seen is a continuation of the fairly consistent performance to date—a performance that has not done badly by the rest of the world.

No threat from Turbines

WHEN the long-awaited decision of the Office of Civil and Defence Mobilisation on whether imports of heavy electrical equipment are threatening the national security was finally delivered in the middle of June, it went with unexpected and welcome firmness against the domestic producers who had been demanding protection from foreign competition. British and other European manufacturers have been increasingly successful in recent years in underbidding American suppliers on contracts for hydraulic turbines, generators, transformers and circuit breakers. Since most of this heavy equipment is bought by government agencies, it is subject to the Buy American Act, which gives domestic suppliers an advantage of 6, and in some cases 12, per cent over foreign bidders. Moreover, allowance also has to be made for import duties and shipping costs. Even so, the difference between the bids from abroad and those of American manufacturers has frequently been far larger than can be accounted for simply by the lower wages in Europe about which the Americans complain.

However, a survey of deliveries and pending orders from foreign suppliers during the seven years ending last July showed that the total amounted to only 361 pieces of equipment, compared with over 30,000 produced at home during the period; of the 3,200 power stations in the country, only 102 had any foreign equipment. Therefore, while Mr Hoegh, the head of the OCDM, agreed with the American manufacturers that a healthy domestic industry was essential to the national security, he could not agree that security was threatened by he comparatively small proportion of foreign equipment now being ordered.

Nor was he prepared to accept the arguments that foreign equipment was less reliable than domestic and that it was difficult to repair and maintain, especially in the event of war. But as a precaution Mr Hoegh is taking steps to see that government agencies require companies bidding on federal contracts to provide repairing and maintenance facilities on the North American continent—as the English Electric Company, for example, already does in Canada.

Mr Hoegh gave particular consideration to hydraulic turbines, for which the demand is very limited, which are manufactured by only four American firms and which employ large machine tools and skilled labour also needed for heavy military equipment in wartime. While he did not think that imports of even this special class of equipment threatened the national security at present, he did recommend that the situation should be reviewed from time to time.

Although Mr Hoegh, in consultation with the State Department, considered the general bearing of the case on the foreign policy of the United States and decided that this would be harmed if imports of heavey electrical equipment were restricted, his complete rejection of the domestic industry's plea was firmly based on his failure to find any practical justification for it. Relatively little equipment has in fact been procured from abroad; the domestic industry has adequate capacity to meet the requirements of a national mobilisation; and there is no reason, in his view, to believe that it is not capable of adjusting itself to the changing environment of today, including foreign competition.

Now Mr Hoegh must go on to consider a similar plea from the producers of steam turbines. These supply about four-fifths of the electricity now consumed in the United States and therefore offer a potential market of far greater importance to foreign manufacturers than does hydraulic equipment. It is a market which they entered for the first time only this year when the Tennessee Valley Authority accepted a bid for a steam turbine from the British firm of C.A. Parsons Ltd.

The Court's Second Thoughts

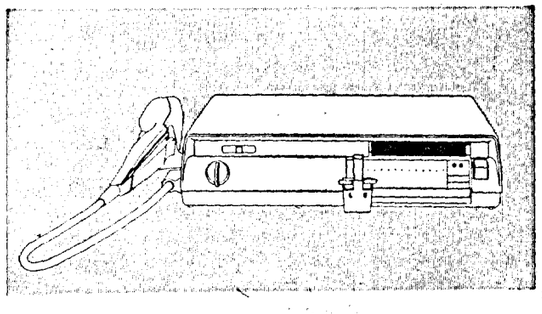
FROM A CORRESPONDENT IN WASHINGTON

LIBERAL-minded Americans who thought that the present Supreme Court was determined to supervise the behaviour of legislative investigators were rudely jolted by two recent decisions in contempt cases. By identical majorities of 5 to 4 the Justices upheld the convictions of Mr Barenblatt, a former college instructor who had refused to tell the House Committee on Un-American Activities whether he was a Communist, and of Mr Uphaus, a pacifist who had declined to give to investigators from the New Hampshire Legislature the guest list of his leftish summer camp. What made the decisions so surprising was that just two years ago, in the Watkins and Sweezy cases, the Court had seemed to put tight restrictions on the very same congressional committee and on the inquiry in New Hampshire. Inevitably, the new decisions raised sharp questions about the course taken by the court and its effect on the future scope of legislative investigating committees.

For twenty years the House committee and others created in its image have been ferreting out communists in government, in the theatre, in trade unions and in education. By now the pattern is familiar. A co-operative ex-communist describes the "infiltration" of some institution and names names. Then unwilling witnesses are asked: "Are you now or have you ever been a member of the Communist party?" They can avoid answering by invoking the Fifth Amendment to the Constitution, on the ground that answers may provide a link in their prosecution for some crime of subversion. But resorting to this guarantee against forced self-incrimination has the unpleasant result of leading the public to think that the witness has something to hide. For this reason efforts have been made to establish a broader

man-on-the-spot
in Vienna

Do your interests in Vienna call for first-hand supervision? This Bank of America man has the skill and experience it takes to handle the job.



Through its global facilities, our International Banking Organization offers you the services of such experts in leading trade centers all over the world. For credit information, foreign currency valuations, market reports—whatever your business requires—a phone call will put these financial specialists on the job, *on-the-spot*.

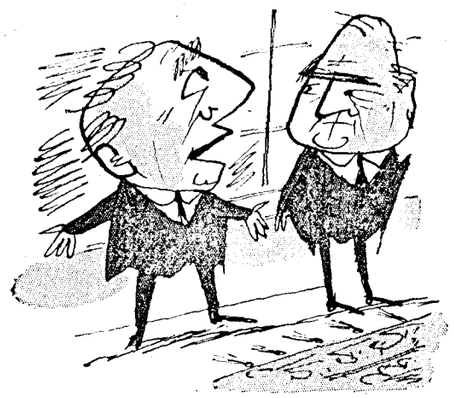
What this country needs

Look at all this stuff we're importing! More exports, that's what this country needs. I sometimes wonder if our manufacturers are putting their backs into it.



Some of them are, that's certain. Take I.C.I.—their annual exports have been running at over £70 million for some years.

Not bad. But do you think they can keep it up?

They think they can. They spend millions of pounds a year finding new things to sell: new dyes, new drugs, new plastics, or metals. They aim to keep ahead of foreign manufacturers, and so long as they do that they'll do good business.

The things they say!

ICI

constitutional ground for refusing to answer: that the committee has no power to force a private citizen to disclose his beliefs and associations.

Three members of the Court fully accept this constitutional argument. The dissent in the Barenblatt case by Justice Black, which was supported by the Chief Justice, Mr Warren, and Justice Douglas, could conceive of no circumstances justifying "use of the contempt power to enforce questioning by congressional committees in the realm of speech and association." The fourth dissenter, Justice Brennan, reserved his views on whether exposure of beliefs was permissible if incidental to some otherwise legitimate purpose of inquiry; in this case, he said, the exposure of Mr Barenblatt was not incidental but was in fact the only reason for the committee's questions.

The majority, speaking through Justice Harlan, considered that congressional investigations, whatever their occasional excesses, had performed important functions in American history. Moreover, Justice Harlan said, the government had a special interest—"the right of self-preservation"—in fighting communism. Balancing the public need against the possible private injury, the majority concluded that the committee in these circumsances must be allowed to ask its questions.

Many observers wondered whether Justice Harlan's opinion could be reconciled with what the Chief Justice had said for the majority in the Watkins case. In tone the two opinions could not have been more different, for the whole emphasis in the Watkins decision was on protecting individuals against unfair investigations. Consequently, it was widely suggested that the Court had beaten a deliberate retreat in the hope of placating its critics and staving off restrictive legislation of a kind still being actively pressed in the Barenblatt case,.

But that is too simple a view. Only two members of the majority in the Watkins case were also in the majority in the Barenblatt case. These two members were Justices Harlan and Frankfurter. And there is every reason to believe that they never really subscribed to the Chief Justices's broad language in the Watkins opinion which, without that controversial embroidery, was simply a narrow procedural holding that a committee must explain the purpose of its questions to a witness before demanding answers. Having found that requirement met for Mr Barenblatt, Justices Harlan and Frankfurter could claim to see no inconsistensy in the two cases. ,

THE latest contempt decisions expose, however, as the earlier cases failed to do, the deep division in the Court over how far it is justified in interfering with legislative policies. The cases also illustrate the unfortunate effect which such a strongly-felt philosophical conflict may have. Overstatement in Chief Justice Warren's opinion in 1957 led to the Watkins decision being given undue importance by both friends and enemies of the Court. And now Justice Harlan's denunciations of communism and remarks about the necessary breadth of congressional investigations may encourage an excess of zeal in investigating committees. More than one student of the Court wishes that the Justices could more often restrain their antagonisms and seek to agree on more moderate—and more lasting—opinions.

The Barenblatt and Uphaus cases do not by any means remove all limitations on congressional and state investigators. They still must behave with at least a minimum of procedural decency. The Court will not inquire into their motives, but they will be checked if it is plain that they are calling a witness only to punish him for example by trapping him into a prosecution for perjury. Justice Harlan also made it clear that the Court would strike down, as an unconstitutional invasion of academic freedom, an inquiry into what a teacher had taught in a classroom. Outside the area of communism the limits are stricter; southern investigating committees will have no free access to the lists of membership of Negro protective associations.

Such judicial restraints on legislative inquiry, desirable as they are, are unlikely ever to be decisive. The Watkins case helped, both legally and psychologically, to check the worst excesses of the witch-hunters, but the public's loss of interest has been a more effective restrant. The Senate's investigation of absuses in the field of labour relations, which is vigorously supported by public opinion, rolls on unimpeded by the courts.

Defence in the Air

FROM A SPECIAL CORRESPONDENT

THE Administration has now made public its new « master plan » for defending the United States and, incidentally, for resolving the struggle over competing weapons systems which has resulted, in recent weeks, in the House supporting the Army's Nike-Hercules and Nike-Zeus, the Senate Armed Services Committee supporting the Air Force's Bomarc, and the President striking out angrily against the « munitions lobby » for trying to influence the Administration's decisions. All three weapons are ground to air missiles, carrying nuclear warheads, but the immediate competition is between the Nike-Hercules which is already in operation at a few sites and the Bomarc which is not; both are designed to intercept intercontinental bombers. The Nike-Zeus in the only one being developed to deal with intercontinental missiles and at least three more years' work is needed to bring it to fruition.

In all, about $5.6 billion has been spent on the Hercules, the Nike-Ajax (its forerunner) and the Bomarc, and Congress clearly thinks that a money-saving choice between the Nike-Hercules and the Bomarc should be possible by now. Until recently Mr McElroy, the Secretary of Defence, seemed to agree. However, in its new plan the Administration continues to rely on a mixture of the Nike-Ajax, the Nike-Hercules and the Bomarc, in addition to manned interreptors, but with reduced numbers if the last three ; its case is that the continuing threat of manned bombers demands continuation of both the Hercules and the Bomarc programmes, though on a reduced scale. Under its scheme, spending on the Bomarc from now until 1965 is to be cut by $740 million and that on the Hercules by $496 million ; there is an outside chance, not rated very highly, that $1.5 billion in all may be saved. More money—$157 million in the next fiscal year—will be allotted to speed development of the Nike-Zeus, which alone promises any protection against missiles. This leaves the Army doubly satisfied; the Air Force, whose Bomarc after years of development is not yet past the testing stage, is less pleased.

THE Administration's critics in Congress, who want to concentrate the cuts on one missile or the other, are far from satisfied that the plan goes far enough, either in increasing funds for the Nike-Zeus, or in reducing spending on anti-aircraft missiles which they feel are on the way to becoming obsolete. Senator Symington declared that it is « at best only a compromise effort to satisfy each of the quarrelling services » and « guarantees a further waste of billions of dollars. »

The military men defend their failure to choose between the Hercules and Bomarc on the ground that they should complement rather than duplicate each other, assuming that both justify the claims for them. The Army's assigned of « spot » local defence would be served by an efficient 100-mile weapon and the Air Force's « area » defense mission by on with longer range. But in the competition between these two projects it is possble to discern something more : the basic competition of the Army and the Air Force to provide a large part of the country's continental air defence, from missiles as well as bombers. The Army holds resolutely to the view that it retains its historic responsibility for defending its own forces and such other installations as are assigned to it (including the air défence of the Strategic Air Command's bases). In their day the Army's anti-aircraft cannons ringed big cities and industrial complexes. As enemy bombers acquired greater speed and flew at higher altitudes, the cannons were replaced by Nike-Ajax missiles, guided to an evasive target by electronic guidance systems; in their turn these are giving way to the longer-range Nike-Hercules, which, with its atomic capability, marked a great advance. In the lately improved Hercules, the Army has a still more impressive weapon.

The Air Force, as energetic as it is ambitious, has consistently sought to extend its responsibility for « area » defence (originally discharged by aircraft) and to take over all air defence. The North American Air Defence (NOARD) includes elements from the US Air Force, the US Army, and the Royal Canadian Air Force, but it is commanded by an Air Force general and the Air Force clearly hopes to extend its present combat command powers over components from the other American services to a complete control of all processes. This is being stoutly resisted. The present dispute must be recognised as one aspect of abiding service differences which, instead of subsiding with time, have been vigorously restimulated by missiles technology and its tactical applications.

Congress uses its veto

WITH the help of two Republicans—Senator Margeret Chase Smith of Maine and Senator Langer of North Dakota—who are not amenable to party discipline, the Democrats last week rejected, by 49 votes to 46, the appointment of Mr Lewis Strauss to be Secretary of Commerce, a post he has filled, pending confirmation, since last November. This was the sharpest rebuff ever offered to President Eisenhower, who had nailed his flag to Admiral Strauss's mast by declaring that he would not withdraw the nomination even if asked to do so by the nominee himself. Moreover, the President's right to choose his own Cabinet, though technically subject to the consent of the Senate, has been over-ridden only once in nearly a hundred years, in 1925 when an Attorney General was turned down because his private interests seemed likely to conflict with his public duty.

No such charges were brought against Mr Strauss, though his Wall Street aura rankles with progressive Democrats. But the unforgiving enemy Mr Strauss made when he was chairman of the Atomic Energy Commission, Senator Anderson of New Mexico, felt certain—rightly as it proved—that if the committee hearings could be dragged on long enough Mr Strauss, for all his unquestioned ability, would exhibit the irritating qualities of evasiveness and self righteousness for which he is disliked even by some who share his highly conservative views. Potential Democratic candidates for the Presidency, moreover, did not care to support a man whose unbridled enthusiasm for " executive privilege "—the right to withold information from Congress—rubs so many legislators the wrong way.

Even so, Mr Strauss might have scraped by if many nothern and western Democrats were not deeply frustrated by the way in which the President, by threatening to use his veto, has forced the congressional majority to water down one liberal Bill after another. Because the conservative southern Democrats support the President, particularly when it is a question of spending money, the Democrats cannot find the two-thirds majority needed to over-ride such vetoes. But for the Senate to veto Mr Strauss required only a simple majority; the opposition could do without its southern members and even without the vote of Senator Fulbright, the only Senator not to vote or be paired. Senator Johnson, the Democratic leader, had held that the issue was one for each member's conscience, but he may not have been sorry to let the liberals have their way for once and to show that he is not averse to challenging the President, as the liberals want him to do, when he has the votes. The average American may feel, however, that the head of a devoted, if exasperating, public servant is a poor substitute for the constructive legislation which the Democrats promised last November.

Interest Deferred

CONGRESS is losing no time in giving the President most of the increase in the ceiling on the public debt which a $12 billion deficit—the largest ever in peace-time makes necessary. On June 30th, when the debt limit reverts to $283 billion, it is estimated that the debt will stand at about $285 billion. Mr Eisenhower asked for the permanent ceiling to be raised to $288 billion, to give the Treasury a little room for manœuvre, and for a temporary one of $295 billion, to enable it to get through the coming months when tax receipts are seasonally low. The House of Representatives refused any leeway in the permanent limit, setting it at exactly $285 billion, but it put the temporary one at $295 billions until June 30, 1960.

Because it is so urgent to deal with the debt limit, the Democrats have a good excuse for splitting it off from the other proposal of the Administration which they like very much less: the removal of the ceiling on the interest which may be paid on new issues of bonds which mature in more than five years. Mr Johnson, the majority leader in the Senate, where the going will be much harder than in the House, said recently that the Democrats will not be hurried into removing the 4 1/4 per cent ceiling « which has worked well for forty years. » But long-term interest rates are higher than they have been for nearly forty years. The limit is now preventing the government from selling longterm and forcing it to rely on short-term financing, which is free of any limitation.

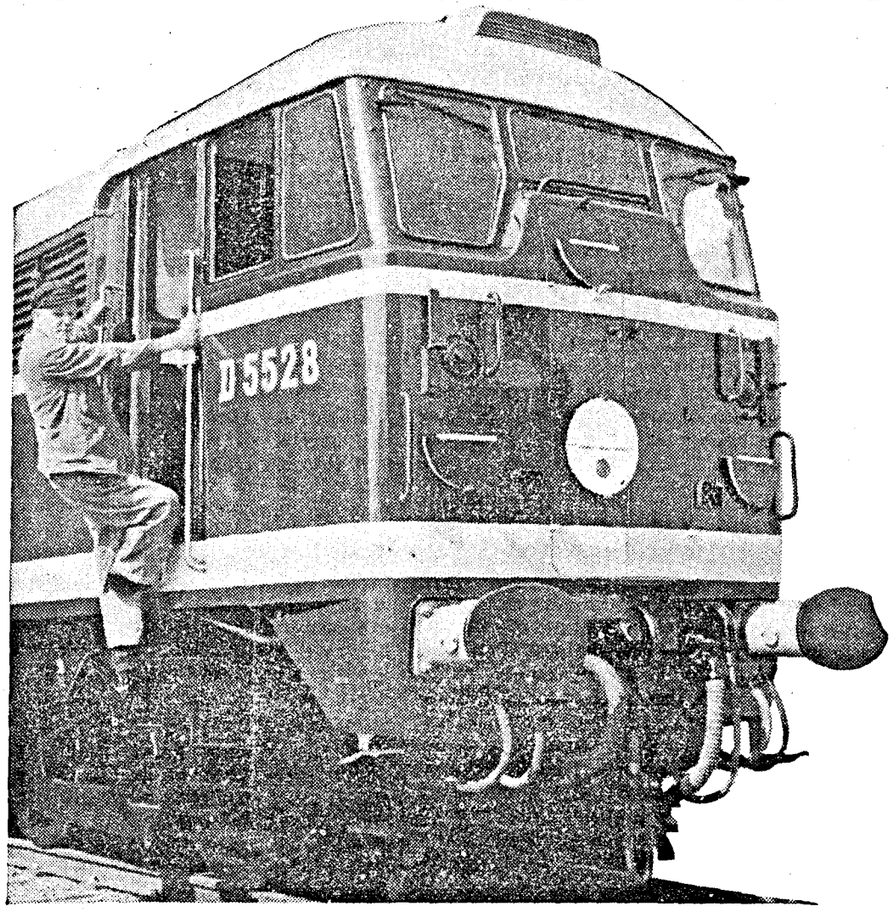
If the Democratic majority in Congress agrees to raise or remove this limit, which is far from certain, it will have to be convinced that allowing the government to pay more interest will not raise the cost of money for the small borrower, the man buying his house, and states and cities which must borrow to build schools and hospitals. The Democrats are traditionally the party of cheap money and many blame the rise in interest rates on the Federal Reserve Board's restrictive credit policy. Some who know better than to suggest that the central bank should return to its pre1951 policy of pegging the price of government bonds feel that there must be measures short of this which the board might take to keep bond prices up and interest rates down. Mr Martin, the clairman of the board, strongly opposes such suggestions and has insisted that there is little that the central bank can do to force interest rates down when the demand for money is pushing them up even if the bank were prepared to accept the inflationary consequences.

Showing the Russians

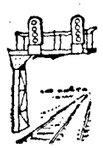
THE speed with which Congress has recently been acting on funds for the foreign aid programme is explained not so much by the realisation that the new 1960 fiscal year is almost here—it begins on July 1st—as by the desire to demonstrate to the Russians at Geneva that the United States is determined to go on supporting its allies. This year it seems to be taken for granted that the programme should be continued and so far the cuts made by Congress are smaller than usual. Indeed the Senate Foreign Relations Committee even offered the President more than he requested, an unheard-of generosity. However, the appropriations committees have still to get to work on the Bill with their parsimonious knives.

Meanwhile, the differences between the authorisation Bills in the two houses are greater than is habitual and Congress is also making an unusual effort to alter the actual shape of the President's programme. This is partly the result of some dissatisfaction with the way in which it has been administered. But mainly it is the result of a desire to counter Russian moves in the economic field and of a feeling that the Administration has lacked imagination in dealing with these. The Senate committee, while giving the President the full $1.6 billion which he asked for military assistance, stipulated that $1.1 billion of this was to be spent on strengthening the North Atlantic Treaty Organisation. This would divert $223 million from countries such as South Korea and Pakistan which, in the President's view, need arms more than does Europe. The House, giving him 10 per cent less than he asked for military assistance and related programmes, indicated by various special requirements that it was doubtful how far military help for the less-developed countries was desirable at all. These doubts have been fostered by a recent congressional investigation of the use made of foreign aid money in Laos.

But the chief blow for more economic help, and also for the replacement of outright grants by repayable loans, was struck by the Senate committee when it provided $1 billion for the Development Loan Fund this year, instead of the $700 million which the President asked and which the House has approved, and the same amount for each of the four subsequent years. To ensure that the attempt to put this scheme for fostering the long-term development of backward countries on a semi-permanent basis should not be frustrated by the appropriations committees, the Senators also proposed that it should be financed by borrowing by the Treasury instead of by tax funds from Congress. Even if this idea is approved by the full Senate it seems certain to be thrown out by the House, ever jealous of its power over the purse.



Boom Days are here again



THE employment figures for May, finally catching up with this year's improvment in other economic statistics, proved that the period of recovery was over and that the next boom had begun. Unemployment fell much more than it usually does between April and May and was below 5 per cent of the labour force for the first time since November, 1957. The number employed at just over 66 millon, was a record for the month, primarily as the result of the recall of factory workers to their jobs, a particularly encouraging factor since agriculture is normally responsible for most of the increase in work at this time of year. The index of industrial production—at the record level of 152 of the 1947-49 average in May—has gone up five points in two months and there has been a gain in all categories of output, but especially in the motor industry.

In May, working longer hours than for four years, another encouraging statistic, the average factory employee earned over $90 a week, for the first time in history. This was the chief reason for the rise of $3 billion during the month in the annual rate of personal incomes, which have been breaking records ever since the beginning of the year. It is not therefore surprising that retail sales have also been breaking records. Motor car dealers are particularly happy that their sales continued to climb during at least the early part of June, a month that usually sees the beginning of the slump. As the result of all this, businessmen are naturally stepping up their plans for capital spending, although as yet these show no tendency to return to boom levels.

The increase in sales, both by manufecturers and retail traders, has kept pace with the sharp gain in their stocks this year, so that these are not at all excessive. Nevertheless the building up of stocks is an economic stimulus which is likely to slacken from now on. Nor were as many new houses started as might have been expected in May, but this is largely explained by the congressional delay in approving new housing legislation. So far prices have remained stable but there are now signs that these too are going up. All in all, some observers are beginning to think that the steel strike which seems almost inevitable at the end of the month, may now serve the healthy purpose of checking inflationary pressures and keeping the boom from getting out of hand.

THURSDAY SPECIAL!

Every Thursday afternoon the signals go green to welcome the arrival of the week's most important "special" — the new Type-2 locomotive delivered to British Railways from the Brush works at Loughborough. This weekly delivery of Type-2 diesel electric locomotives is an important part of the modernisation of British Railways. The Brush locomotive now out numbers all other makes of this type in service. So successful has it proved — hauling passengers by day, freight by night — that HAWKER SIDDELEY INDUSTRIES has recently received a contract for a further 75 locomotives, which will double output at Brush until the end of 1960. Production capacity has been increased so that two locomotives can be delivered weekly without interfering with export or other home commitments. At home and abroad, Hawker Siddeley gives on-time, dependable delivery, supported by a vigorous after-sales service.

HAWKER SIDDELEY GROUP

International Sales: Duke's Court, St. James's, London, S.W.1.

HAWKER SIDDELEY INDUSTRIES Electrical & Turbine Division: Brush Electrical, Fuller Electric, Hawker Siddeley Brush Turbines; Nuclear Power Division: Hawker Siddeley Nuclear Power; Heavy Engine Division: Mirrlees Engines, National Gas & Oil; Light Engine Division: Petters, Hawker Siddeley Hamble; Light Alloy Division: High Duty Alloys; General Engineering; Building & Fabrication Division: McLaren, Templewood Hawksley, Kelvin Construction, Norstel.

THE WORLD OVERSEAS

Nyasaland at a Standstill

FROM OUR SPECIAL CORRESPONDENT LATELY IN CENTRAL AFRICA

"WE'RE in a vacuum in Nyasaland at the moment," observe British officials and unofficials, Asians and even such educated Africans as are not now being made into prison graduates behind barbed wire. In other words, administration goes on, and nobody believes that when the legislative council meets to debate the budget (for all that it may be an excitingly reflationary one) the occasion will have any real significance. To proclaim the emptiness of life without Dr Banda and three of the six African members of the council is to pay frank tribute to the importance of African political participation. Moreover, it is quite clear that the Colonial Office, like nature, abhors a vacuum. It is pressing the local officials at Zomba, that remotest, most imperial and Simla-like of African capitals, to get African politics going again—moderate politics, of course; pre-Banda, non-Congress politics; but still "authentic" politics in which Africans damn budgets and demand to represent their country at constitutional conferences.

This is the rub; and it is to the credit of the Colonial Office that it feels it: African politics must be resuscitated if Africans are to stand up for Nyasaland not only at the review of the federal constitution in London in 1960, but also in any preparatory committee work. The way is beautifullly clear at the moment for Sir Roy Welensky to suggest to the governor (with whom he gets on well) that a Nyasa federal MP, such as Mr Matinga, who was mainly elected on the votes of Sir Roy's United Federal party, is just the man for the job. The Zomba officials feel he is not. But what are they to do?

Their announcement that Dr Banda is to remain out of circulation must be seen in this light. It is an attempt to lure the "moderates" into the arena by removing their fears of reprisals; and by moderates—such are time's revenges—is pre-eminently meant Mr Wellington Chirwa, who was formerly Sir Roy's heaviest burden in the federal parliament, and whose present immunity from the round-up is so mystifying to the white farming classes in Southern Rhodesia. But Dr Banda was rude to Mr Chirwa, who was at odds with Congress when Dr Banda came home last year, and Mr Chirwa remained aloof; hence he is still readily to be found at his business address. To him (and they also try the other Nyasa politicians at liberty) the officials address the following blandishments, if not directly and not quite in these words:

"Why not come back to politics, Mr Chirwa? You'll be quite safe; we'll keep Banda and Chipembere inside. Your country needs you. Somebody convincing must speak for Nyasaland in London, and deal with Sir Roy. If you don't it may be Matinga. You know you're the most intelligent politician Nyasaland has ever had. Can't you start up a new party—moderate, of course, but with some teeth in it; we shan't mind that! We're ready to bring in a quick new constitution for you to operate in. Tell you what, if you don't quite like it, we'll specifically call it an *interim* constitution, which will be replaced after the London constitutional conference. Then nobody can say you sold out. What about it?"

Whether or not Mr Chirwa has ever had to reply officially, there is no doubt about his terms; and these are identical, as far as one can see, with those of every other extant "moderate" Nyasa leader. These terms are: a territorial house of 40, consisting of 32 elected Africans and 8 non-Africans; a responsible ministry; and full freedom to ask the electorate to choose between secession and federation, whatever variant to the present federation may be worked out in 1960. There may be other conditions too—but already the price is too high for the Colonial Office, Sir Roy or the local British unofficials.

So the vacuum continues. It would become even more complete if the Devlin commission reported that there had been no murder plot and no need to detain Dr Banda and his chief supporters—for then the senior officials and police would melt away like the mists on Mlanje. (This would please some white Southern Rhodesians, who ache to replace them with men from Salisbury's own native affairs department.) Assuming the officials do not go, however, the problem remains urgent; for although the relaxed condition of Nyasaland satisfies Southern Rhodesians that their policy of squashing agitators is just as effective in British protectorates, the British officials have a grim suspicion that the Nyasalanders are merely enjoying a holiday between two phases of the struggle to which Dr Banda called them, and will return to the charge as occasion suggests.

Such a view (which may be realistic) implies constant watchfulness. Security works overtime; Congress must be denounced; federation, on the other hand, must be sold—and loudspeaker vans tour the country selling it, telling the people what it would be like to live without the federal subvention, which is equivalent to £4 1/2 million a year. They blare out the statistics of higher African salaries, but lay less stress on the rise in African living costs and unemployment. But they appear to have little effect on a stubbornly sceptical population.

The reason for this consumer resistance has now been discovered, however. It is the irresponsible missionaries of the Church of Scotland, who have created a native kirk staffed by nationalistic dominies; who are indeed themselves, in many cases, men of "extreme left-wing political views", to quote the secret white paper which has unravelled their fatal role in Nyasaland's resistance to

federation. The Zomba officials, or some of them, clearly feel that the proper role of a church is to support the current requirements of the state. And it is a fact that the Scottish missions were not burned in the February disturbances, unlike the Catholic missions that suffered in the Leopoldville riots; this is no doubt the final proof of the Church of Scotland's guilt in taking sides—though oddly enough it is not used to clinch the arguments of the secret white paper. But that, too, was produced in a vacuum.

British Cars in Germany

FROM OUR BONN CORRESPONDENT

BRITISH motor-car manufacturers assessing the prospects of doing business in Europe cannot but be a trifle discouraged by their experience of the German market. In 1951 Standard alone sold some 2,000 Vanguards in western Germany. Last year, out of the total of 63,690 cars imported by the Federal Republic, only 1.853 were of British make. (During these twelve months Germany exported 9,222 cars to Britain). In January this year only 80 British cars were sold to Germany, in February, 92. Yet the German market is expanding steadily. The number of cars licensed in western Germany has been rising by nearly half a million annually from 1.05 million in 1954 to 2.97 million on January 1st last—roughly one car to every 17 persons living in the Federal Republic (one to 12 in France and Britain).

Last year west Germans spent altogether DM 4,570 milliard (approximately £443 million) on new cars. The pace of motorisation is expected to continue unchanged for several years. While for the time being British manufacturers are at no greater disadvantage than any other importers (all foreign cars with engines of two litres or less pay 13 per cent duty and 6 per cent turnover-equalisation tax; those with engines over two litres 16 per cent and 6 per cent) they are not competing at all successfully for the lucrative business that is going, if they can even be said to be competing at all. Fiat are confidently expecting to sell as many as 100,000 cars to western Germany this year, and Renault 40,000. Between January and April 30th Fiat had already disposed of 29,239.

It is sometimes said that British manufacturers, when contemplating the German market, have been too much influenced, if almost subconsciously, by proverbial warnings against carrying coals to Newcastle. It is true that, with an output last year of 1,495,000 vehicles, Germany displaced Britain (1,364,000) as the second largest car-manufacturing country after the United States (5,120,000). But British makers know well enough that, notwithstanding its own huge output, the United States imported 430,000 European cars in 1958, of which a handsome 96,000 came from Britain. It is more likely that uncertainty about the future of common market operations and of Britain's trading associations with Europe is making British manufacturers look as though they have given up hope of selling all but a few cars in Germany.

The president of the federation of German motor vehicle manufacturers, Herr Thoenissen, reckons that international differences in duties, taxation, and wages, are not in the long run going to play as important a part in the fortunes of European manufacturers as some of them seem to suppose. According to Herr Thoenissen, the deciding factors in competition will be quality of material and design, modernisation of production, efficiency of marketing, and dependability of service and maintenance. Herr Nordhoff, director-general of the prodigious Volkswagen enterprise, would largely agree with him, though not wholly. Herr Nordhoff has been sharply criticising France and Italy for taking advantage of Germany's liberalisation of car imports while maintaining prohibitive tariffs and quotas on vehicles entering ther own countries.. Thus the Volkswagen export model which sells for DM 4,600 in western Germany costs a French customer DM 6,740, an Italian DM 7,230. The Renault Dauphine sells in Germany for DM 4.990, the Fiat 600 for DM 4,330, and the Fiat 500 for DM 3,940.

Impartial German connoisseurs of the motor industry attribute British manufacturers' paltry share of the German market largely to their failure to fulfil three of the conditions of success laid down by Herr Thoenissen—superior design, intelligent salesmanship, and guaranteed service. Justly or unjustly, the opinion is widely held in Germany that British cars look old-fashioned and all alike. As a former Volkswagen executive put it to your correspondent: "Any ten-year-old German boy will tell you that British cars have good engines. But the bodywork, the seats! Those little black boxes! British designers go from one extreme to the other—and one of those extremes scarcely anybody can afford ". The prevalence of such views is due in part to the shortcomings of British salesmanship, in part also to the fidelity of many touring Britons to their " little black boxes ". The prime reason for the failure of Standard to maintain the good start made in 1951 was the lack of supporting service. This was an error of judgment; most manufacturers seem to find it impossible to get clear of the vicious circle: " no sales, no service: no service, no sales ". Fiat and Renault are fulfilling Herr Thoenissen's conditions. Above all, they are providing what many Germans of modest means want—something different from the ubiquitous Volkswagen, yet more or less as good and some DM 300 cheaper annually in taxes.

Graziers Hang On

FROM OUR CORRESPONDENT IN AUSTRALIA

AN economist recently tried to answer the question whether Australian wool growers get a fair return at present prices. The average operating costs of 335 farms of different kinds in New South Wales in 1957-58 were between 44 and 53 pence per pound of wool, and to this must be added between 32 and 38 pence as interest on capital and a modest allowance for the owner's labour. Prices are a little higher at present, so it would appear that the average wool grower still has his head above water—the more so as he usually produces other things besides wool.

The trouble about the average man, as usual, is that he does not exist. Wool growers differ widely in their incomes, skill in management, and the size and quality of their land. In recent weeks your correspondent has visited

three graziers whose background and problems could hardly be more different.

Donald has seven thousand acres of rolling country in the lee of the Australian Alps. His great-grandfather came from Scotland in 1840, attracted by the grants of land which the New South Wales government was making to free settlers as a means of building up a respectable citizenry. As you drive across his limitless acres cleared for pasture, you could only be in Australia. But the homestead, snug amid its trees and garden, flanked by a white walled yard that stables the Bentley and the station wagon, could be an English country house. The ground floor is dark and mellow with family portraits and old mahogany, the upper floor gay with white paint and flowered chinz. The owner, however Australian at heart, looks and speaks like the public school and Cambridge man that he is and that his father was before him.

The present wool prices do not shake his calm. He can remember worse times. He never imagined that the prices of two years ago would last, and he salted away a large part of the £20,000 or so that his station earned then. Some he invested in industry in order to spread his risks; some he used to buy new buildings and plant, thus taking advantage of highly favourable depreciation allowances; and some he used to improve his pastures by dressing them with superphosphate and sowing them to clover and legumes, a process which increases the capital value of the land although it is charged as running costs for tax purposes. Wool still fetches a good enough price to support a way of life that includes employing a manager and four men, owning a house in Sydney, and going to Europe every few years.

Roy's property, by contrast, is a mere twelve hundred acres. He got it under the soldier settlement scheme by which the New South Wales government, with certain assistance from Canberra, establishes selected ex-servicemen on the land, usually on parts of large estates which it has acquired by compulsory purchase. Roy was a naval officer, who decided to get out while he was still young to realise his lifelong, secret ambition to get back to the farm life of his childhood. But the government selection board would not approve him until he had undergone a year's training. The authorities are very careful these days, having learned a hard lesson from the scheme after the first world war when many a serviceman met ruin and heartbreak through his own, or the land's, inadequacy. Roy was finally approved and he moved in two years ago. He pays the government a mere 2 1/2 per cent on its capital, and holds the land on a permanent lease.

He has not made any income yet, but expects to do so in this, his third, year. One would have thought that, having entered the business when prices were at their height and having missed the rising market, his prospects were dim. But he seems to be a man of exceptional vigour who is happy in very hard work. It is harder for his wife. She has given up people and parties (her nearest friends and nearest good shops are in Canberra, seventy miles away); her comfort (their home is a plain little prefabricated homestead); and even schools for her young children (who she must now teach herself with the aid of the correspondence course supplied by the New South Wales government). But what with cows and cooking, chickens and children, she has no time to repine.

Dick, who used to be a wool buyer, bought for £1 an acre some three thousand acres in South Australia. The land was cheap because it was unproductive. Pasture would grow and look all right, yet sheep would not thrive on it. But the Commonwealth Scientific and Industrial research organisation had discovered that it lacked certain minerals known as trace elements. If these are added in the first two years to the superphosphate with which the soil is dressed, the deficiencies are made good.

To improve the land fully will cost Dick about £20 an acre, and after six years there is no sign of any return on his capital. But he has other satisfactions. He can contrast his smooth pastures, dotted with some two thousand sheep, with the rough scrub outside his boundaries, whence the kangaroos leap over the high wire fence in search of a better supper and an emu puts in an occasional ungainly appearance. Still more satisfying, however, is the thought that though he and his wife will have put about £60,000 into the property they will have saved thousands in tax on their private income, for the losses on the property can be set against it. But she, perhaps, would have preferred to pay the tax. After Melbourne it is a lonely life.

These three men alone are enough to show how impossible it is to generalise about the economics of wool production. Tax concessions play a big part in the individual's balance sheet. So, on the other side, does the extent to which he is obliged to develop his land at today's high prices. Some of those who were drawn into the industry by recent high prices will have to go, but it is safe to conclude that for the vast majority of woolgrowers no tears need yet be shed.

Cities of Siberia

THE Soviet Union is now roughly half rural and half urban. Nearly 100 million townd wellers account for 48 per cent of its total population. This social transformation, the mass migration to the towns which was a corollary of Russia's industrial revolution, is already well known. The results of last January's census, however, make it possible to measure the extent of the migration, while details published about the growth of individual towns give an idea of the main trends in this gigantic population shift.

The rapid growth of Soviet towns coincided with the beginning of planned industrialisation. In 1926, as on the eve of the revolution, the towns still accounted for less than one-fifth of the total population; the " land of the proletariat " was really a peasant country. Before the outbreak of the last war the proportion had risen already to one-third. Peasants uprooted by collectivisation moved first to the established industrial areas of Russia or the Ukraine, and then, progressively, to the new industrial centres of the Urals and beyond.

This eastward shift was vastly accelerated by the war. The German invasion did more than merely precipitate a mass evacuation of the people. To carry on the war, the Soviet Union had to set up new industries in unoccupied territory, and this drive towards the east continued in peacetime because the country's main mineral resources are to be found in, and east of, the Urals. Extraction of coal is cheaper in the eastern part of the Soviet Union, while the

rivers provide cheap sources of power. Soon, one-half of Soviet steel output will come from these regions, which already account for two-fifths of the country's coal. The steady development of secondary industries foreshadows the continued growth of the towns.

The Urals, a gateway to Asia and the East, were developed first. The region's biggest town, Sverdlovsk, was called Yekaterinburg before the revolution and was rather unimportant. By 1939 it had 423,000 inhabitants; now it has nearly 800,000. Chelyabinsk, a place of exile in Tsarist times, had 273,000 inhabitants before the last war and now has 700,000. Magnitogorsk, the pride of the planters, a new steel town erected with the help of American and German advisers, now has a diversified metallurgical industry and over 300,000 inhabitants.

Novosibirsk, with 887,000 people (or double the prewar level), is the biggest town of Siberia. A branch of the Academy of Sciences was set up there to encourage and supervise further developments in the area. Novosibirsk lies in western Siberia, but efforts are now being made to foster the eastern part of the region, which has vast mineral resources and cheap water power. It is there that the biggest Soviet power station is being built on the Angara river. The town of Angarsk did not exist in 1950; it now houses 130,000 people. The biggest town of eastern Siberia is, however, Krasnoyarsk, whose population has more than doubled since the war and now exceeds 400,000.

Urban development is most marked within the administrative frontiers of the Russian Republic. The republics of central Asia are still predominantly farming communities. Thus, both in Uzbekistan and Tadjikistan the rural population is still about two-thirds of the whole. Kazakhstan, with its population 44 per cent urban, shows the way to the industrial future. It can boast quite a few mushroom towns. One of them, Ust-Kamenogorsk, where Mr Malenkov was appointed head of a power station after his disgrace, is now a town of 117,000 people, six times its prewar level. The Kazakh Republic, with its coal from the Karaganda basin and a wealth of ferrous and non-ferrous metals, is bound to be the first showpiece of the Sovet Moslem world.

Russia's two historically great cities have not developed on parallel lines. Great efforts have been made to arrest the growth of Moscow. It is difficult to get permission to settle there and new industries are virtually forbidden. The managerial reform has also dispersed thousands of civil servants into the provinces. In spite of all this, there are now over five million Moscovites, compared with 4,183,000 before the war. On the other hand, Leningrad, including the suburbs, now has 3.3 million inhabitants—slightly less than in 1939. This stagnation reflects the terrible losses suffered by the city during the long German siege.

All in all, the Soviet Union has seen an unprecedented growth of its urban population. One known consequence is the appalling overcrowding which the government is trying to relieve by its housing drive. It will also have to do something about services. In many places, gas and water supplies, sewage systems, and public transport could not keep pace wtih the growth of the towns and further expansion will have to be accompanied by important works in this field.

There are now 25 Soviet cities of over 500,000 inhabitants and 146 towns with a population of more than 100,000. But the expansion is not expected to continue at the same extraordinary rate. The exodus of population from the countryside to the towns, if not entirely halted, has been slowed down considerably. Yet, with 100 million townspeople and the high Soviet birth rate, the urban population should increase annually by about 1.7 million, even without any migration from the countryside. The other side of the medal is that the Soviet Union is still a half-rural country with over 100 million people living on the land. The proportion of the population working to provide the means of subsistence remains very high. For the growth of the towns to resume its previous progress, Russia must solve one of its major problems—increasing its agricultural productivity.

Greece and Missile Bases

MR KHRUSHCHEV's warnings to Greece about the dangers of allowing the installation of rocket-launching sites on its territory, and the minatory diplomatic notes sent to Athens from Moscow, Bucharest and Tirana, could well have the opposite effect to that intended; the Greek government and people will hardly want to appear as victims of a war of nerves — especially when two of the centres of the war are, of all places, Tirana and Sofia. The communist warnings have, indeed, received short shrift from the Greek government. So has the Rumanian proposal for a Balkan summit meeting to discuss a Balkan neutral zone and collective security treaty.

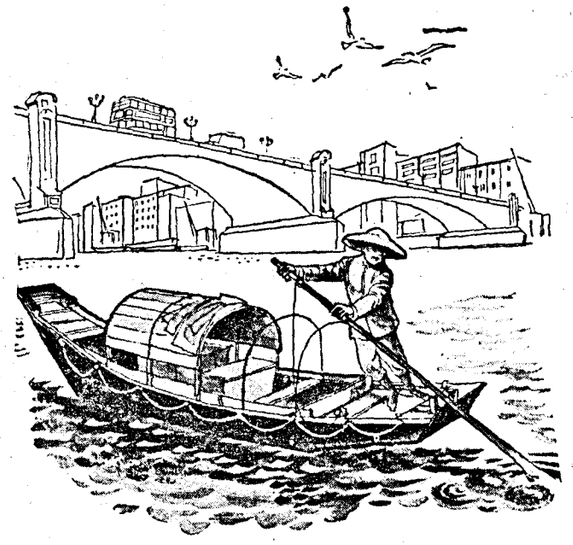
The Greek Opposition may well come to regret that Mr Khrushchev and his Balkan satellites have been agitating so strongly against missile bases in Greece. The largest opposition party, the communist-dominated EDA, is naturally campaigning enthusiastically against the sites. It has found two somewhat unexpected allies in the small Liberal and Progressive parties, who may think this a likely issue with which to prop up their sagging political fortunes. Mr Markezinis, the Progressive leader, has put forward a plan, supported by both parties, for the exclusion of missile bases from the Balkans; he devised it after a recent trip to Moscow, and insists that it would not be incompatible with Greece's membership of Nato and its existing Nato obligations.

That is as may be. The Greek gouvernment, for its part, takes the view that it is a fallacy to suppose that security may be found in a limited area free of nuclear weapons so long as other powers outside remain fully armed and capable of destroying countries within the area. This is not a view to which the Jugoslavs would subscribe; they have pronounced thenselves strongly in favour of a nuclear-free Balkan zone and have suggested that Italy should be added to it. This disagreement, however, did not prevent Mr Popovic, the Jugoslav foreign minister, from last week carrying out a long-standing engagement to visit Athens where he signed a dozen agreements on cultural, frontier, property and other outstanding matters. The *mésentente cordiale* of Greece and Jugoslavia is perhaps one of the sanest developments in the Balkans today.

Why Norway chose Holman

Reliability pays on the Upper Vinstra

Mica schist is tough—really tough. And through it, over 18,000 metres of tunnel will have been driven before the massive Upper Vinstra hydro-electric project is completed. For this gruelling task, Thor Furuholmen of Oslo, the contracting engineers, chose Holman. The contractors have standardised on Holman T60R compressors and Holman Silver Three Rock Drills, using tungsten-carbide tipped steels.



A reliable compressed air supply and reliable drills; these together are taking all the demands of punishing work and a tight time schedule without faltering. As a result, the work is being accomplished at high speed, and the tunnelling is now nearing completion—and, in fact, the Norwegian tunnelling record was broken with this combination.

In major projects all over the world, Holman units are proving their reputation over and over again. For sheer reliability and low running cost, you can't beat Holman.

HOLMAN BROS. LIMITED, CAMBORNE, ENGLAND
A company in the Holman Group which has branches, technical representatives and agents throughout the United Kingdom and the world.
Telephone: Camborne 2275
Telegrams: Airdrill, Telex, Camborne

COMPUTERS ON THE COUNTER II

Is It Worth Waiting ?

BY A CORRESPONDENT

Two new principles, as last week's article pointed out, are likely to distinguish the design of the computers that will be available in 12 to 18 months from those now on the counter. These are « parallel function » and « transistorisation. » The first is a pattern of design;the second, vital to it but likely to affect the design of all future computers, is a more economical mode of operation, with solid-state semi-conducting devices taking the place of the valves that have hitherto been generally employed.

One subtle approach to the problem of calculating speed was to improve the logical design of the computer so that it should calculate faster without an increase in the digit rate. More than one manufacturer claims that his « order code » is so far superior to all others that the speed of his machine is several times that of other machines of comparable digit rate. This often means incorporating special circuits in the construction of the machine, and the natural extension of this is to consider elaborating the structure of the machine in order to speed up those operations which takes 300 millionths of a second to multiply in « floating-point » while another machine with the same digit rate takes 2,000 millionths of a second to multiply in «fixed point. »

All the earlier computers used magnetic drums for storage. The time of transfer of an item of information from a drum is measured in thousandths of a second while that of simple manipulations in the computing store is measured in millionths of a second. Therefore, the first of the expensive extras was magnetic-core storage, from which information can be extracted as fast as the switches can be set—usually 5 or 6 millionths of a second for a word : according to the price of the computer, one can have core-storage for from 60 words to 10,000 words.

But by now the large computer is becoming a complex of apparatus rather than a single machine. Instead of an arithmetic unit plus storage, with some means of passing information in and out, one now thinks of an arithmetic unit, quick-access store, backing store, facilities for reading from and writing to magnetic tape, input from punched cards, output to card-punch or to printer. It is then economic to separate the control unit which organises the function of all these units from the arithmetic unit which performs the calculating operations and makes comparisons. This separation of control from arithmetic leads naturally to the principle which was referred to above as « parallel function » though it is sometimes known also as « parallel programming » : once there is a separate control unit the computer can do more than one thing at a time.

This idea of parallel function was foreshadowed in the NPL « Ace » and is now current internationally, for it is to be found in France in the Bull company's « Gamma 60 » machine, in USA in the IBM 7070 Data-Processing Equipment, and in Britain it is incorporated in the design of the forthcoming Emidec 2400. The arithmetic unit can then continue to work while simultaneously the machine is taking in new information or printing out results. A facility permitted by this parallel function is the inclusion in both the IBM 7070 and the Emidec 2400 of « enquiry stations. » i.e. electric typewriters through which the operator can secure input and output of urgent items

without interrupting the main programme more than momentarily.

THE most obvious change of computer technique is that from thermionic valves to transistors or more generally to « solid-state devices. » When the life of a thermionic valve was thought to be only a few thousand hours, it was feared that a computer containing 4,000 valves would be unworkable because one of this host of valves would fail every hour or so. But the valve makers learned to produce valves with an average life of several tens of thousands of hours, and the circuit designers learned the three vital principles : use valves kindly, design circuits to tolerate small changes in valve parameters, and provide facilities for testing to detect incipient failures.

But the ultimate block on this line of development is the amount of heat generated by thermionic valves. Widely- spaced apparatus, forced-air circulation and finally refrigeration have been called in to deal with the heat from a few thousand valves, but the complexity of such computers could not be increased by a further order of magnitude without making heat almost intolerable. The transistor, without a hot cathode and drawing its current at only a fraction of the voltage used in a valve, reduces the heat generated per unit by one or two hundred times. A large British computer that makes use of the new freedom from heat is the Emidec 2400, now in an advanced stage of design, and the IBM 7070 is a large American computer using transistors.

The present stage in the evolution of computers can be summarised for the prospective customer as follows. If one is thinking of a large-scale installation, with cost measured as a part of a million pounds, several of this new generation are already being advertised. Such a computer should be fully transistorised; it should have a substantial amount of quick-access storage (at present almost universally on magnetic cores); it should be capable of parallel operation of a number of functions; and it should have some kind of really large backing store (of the order of a million words) for keeping commercial files.

Already in the class of moderate-speed computers with electronically stored programme there are two of the new-styled machines which are competitive with the existing valve computers, namely the Metrovic 950 which is largely so. Ferranti has now shown its new Sirius computer which is completely transistorised and works in decimal notation : its price and speed are both rather less than half those of the Pegasus. The critical zone of development is that of the rather faster computers, which can be described technically as serial machines with digit rates in the range 300 kc/s to 1 Mc/s. Here there are well-established valve computers which have proved valuable for both scientific and commercial work and sufficiently reliable to be in service for up to 90 per cent of their working week. In view of the large development costs, the manufacturers will wish to continue to sell these as long as possible, which will be until some newcomer to the computer field offers a transistor computer of comparable performance at no greater cost. But on present showing it may be two or three years before this happens, and a valve computer in this particular class may still be a satisfactory investment.

(Concluded.)

BUSINESS NOTES

TAKE-OVER BIDS

Mr Clore Withdraws

NEVER has there been such a season of take-over bids and mergers as this. Any financial journalist who has to send his copy off early to strange parts must feel frustrated, with the battles half won and his story half told. But one battle at least is over : Sears Holdings has withdrawn the bid, worth 60s., for the Watney Mann ordinary shares after friendly discussions between Mr Charles Clore and Mr Simon Combe. By saying nothing, the Watney Mann directors defeated Mr Clore, because the market price of the shares rose beyond his bid price and stayed above it. The price has now fallen from 69s. 6d. to 65s.

Mr Clore has not said why he has withdrawn ; it may be that the scope for profit from the redevelopment of the Watney Mann properties was less than he had imagined, and that therefore it was not worth capping his first bid. His plans boiled down to nothing more than a promise to do what the brewers themselves were doing, only a little faster and, possibly, a little better. In the formal offer of Ind Coope for the ordinary capital of Taylor Walker, for instance, the directors of both companies say that they are satisfied there are only a very few properties where redevelopment values are materially in excess of values as premises for the licensed trade. If this agreed merger goes through, as it is likely to do, the chairman and managing director of Taylor Walker, Lieutenant Colonel W.H. Kingsmill will receive £60,000 tax free as compensation for the termination of his service contract. This merger will, no doubt, produce its economies of rationalisation and concentration ; even though Mr Clore has withdrawn, it will be up to the Watney Mann directors to demonstrate to shareholders that there are economies to be obtained and surplus values to be realised in that brewery as well. They can now lay their cards freely on the table and they should do so quickly — not least so as to show what truth there is in the rumour of a possible merger between Watney Mann and Bass.

Family Influence

APART from one moment of wrath, the directors of Watney Mann have acted throughout a period of anxiety reasonably and with restraint. The same, unfortunately, cannot be said of the directors of Chivers when they came to deal with two rival bids, one from Schweppes and the other from St Martin Preserving. On the face of it, the offer from St Martin was worth more to Chivers shareholders, even granted the limited market in St Martin shares, than was the Schweppes offer. Schweppes has not improved on its original bid and the Chivers directors, drawing attention to the long-standng associations between the two companies, urge its acceptance on shareholders. Moreover, in the formal offer, which will be declared unconditional once a 51 per cent acceptance is obtained, they reiterate their claim that with their own assents, those of the Chivers family and those of a few other shareholders, holders of more than 50 per cent of the ordinary capital will go along with the Schweppes offer.

The Chivers directors as shareholders have every right to accept which they choose. They have a right too to hold an opinion about the relative merits of the two offers. But their action does seem to have had the effect of frustrating other shareholders from accepting an offer which to them may have seemed more valuable. There is an obvious and not very happy moral in this for shareholders in family or director dominated companies : when a bid comes along for such a concern, it is the family or the board that has the decisive say. The bid, for instance, of Keith Prowse of 25 s. 8d. in cash for every ordinary share in Theatre Tickets and Messengers is practically a foregone conclusion, for the directors control over 50 per cent of the capital and have decided to accept it.

Harrods Picks Debenhams

TWO rival bids were considered by the directors of Harrods on Monday and, as had been expected, they preferred the proposed merger with Debenhams to the one proposed by the House of Fraser. Unanimously they recommended both ordinary and preference shareholders in Harrods, who have equal voting rights of one vote per £1 unit, to accept the Debenhams offer. In front of these proposals the market price of the Harrods shares has risen steeply, with the ordinary shares goings up from 95s. 3d. to 115s. 6d. and the preference shares from 28s. to 37s. Both bids give a turn on these prices but in terms of immediate market value there is not much to choose between the two offers, though with Debenhams ordinary shares standing at 32s. 9d. and the House of Fraser « A » ordinary standing 41s. 3d. the Debenhams offer has a slight edge. Its bid of four of its own 10s. ordinary shares for each Harrods ordinary share is worth about 131s. The bid by the the House of Fraser of 2 1/2 of its « A » ordinary shares plus 20 s. in cash for each Harrods ordinary share is worth about 123 s. 3d. Both bidders offer the preference shareholders a choice but in either case the least they are offered is 40s. in cash.

With offers as close as this, relative values can alter with swings in stock exchange prices and it is in terms other than immediate market advantage that the Harrods directors recommend the Debenhams offer. They consider it more favourable in terms of prospective dividends, earnings cover, net asset values and voting rights. Each of the Debenhams ordinary shares carries a vote while the « A » shares of the House of Fraser carry one vote for every twenty units. If Harrods shareholders went along with the House of Fraser they would control less than 10 per cent of the total votes, which the Harrods directors say, rightly, would be out of line with the relative value of the underlying assets of the two companies. This is a legitmate and a sound point to make and one that will appeal to institutional investors.

The Harrods directors go on to speak of friendly co-operation over many years between Harrods and Debenhams and say that the merger, which has been under discussion for some time, should result in economies from the pooling of resources including buying and internal adimnistration, even though Harrods and its subsidiaries would remain separate entities carrying on their traditional type of business. This, of course, is only the beginning of the story : much can happen before the formal offer goes out and shareholders have to make up their minds. But at least this can be said : the Harrods directors have put the facts in front of their shareholders and they have given their reasons for preferring one bid to another. In an awkward situation they have behaved fairly and decisively.

Rivals in Insurance

COMPETITIVE bidding, common enough in industry, has now spilled over into insurance, with two suitors asking for the hand of Scottish Union and National Insurance. The first that came to woo was the Yorkshire Insurance. Negotiations between the two companies ended finally with an offer by Yorkshire Insurance of three of its 10s. fully paid shares plus 32 s. in cash for every two £1 fully paid shares in Scottish Union and three of its 10s. shares plus 30 s. in cash for every four £ 5 « A » shares (10 s. paid) in Scottish Union. This bid, which puts a value of about 115 s. 9d on the £1 shares and of 57 s. 4 1/2d. on the « A » shares, rceeived the support of the directors of Scottish Union. They knew that Norwich Union, which made a tentative and informal approach after these talks had begun, was also interested but did not enter into negotiations with that mutual office. A few days after the terms of the Scottish Union-Yorkshire merger proposals were announced, the directors of Union.

apparently taken by surprise by the announcement, came forward with a counterbid. They proposed to make a cash offer of 135s. for every £1 share and 67s. for every « A » share in Scottish Union.
prices.

Until the formal offers are made, which could obviously contain an improved bid from Yorkshire Insurance, Scottish Union shareholders need not make up their minds. Their self interest will urge them to accept whatever finally is the best price and any decisions and recommendations by the Scottish Union directors ought to be framed in that light. Scottish Union is worth bidding for; both the Yorkshire Insurance and the Norwich Union see advantages in a co-ordination of their activities with its widely spread business throughout the world; both wish to preserve its separate entity; and both have to consider very seriously whether to keep its underwriting business in the USA alive. Their rivalry certainly suggests that consolidation in insurance is worth paying for but it also suggests that more can be made of Scottish Union than has so far been reflected in the market price of its shares. That underlines the principle that it is the shareholders' interests that must be consulted.

IN THE MARKETS

Quiet and Steady

THE speculative currents that were running alarmingly high in the London market and in Wall Street in the early summer have in the past two or three weeks received a predictable check. Take-over bidders for English companies are more active than ever; but investors have now felt loss as well as profit from following in their wake. Apart from the activity in shares directly concerned in take-over bids, the equity markets have been quiet and steady — as one would expect them to be on the eve of the summer holidays and in advance of the election. This pause has helped gilt-edged. The institutions have been buying, and the banks have for the time being stopped selling. The longer dated stocks with their attractive yields have been in particular demand. Prices have risen by a point or so, helped by the thinness of jobbers' books following many months of dull markets.

Another favourable factor has been the absence of marked seasonal pressure on sterling, which in past years has often depressed the rate below its parity with the dollar at this time of year. Substantial commercial demand for sterling persists, from New York, from most Continental centres, and from Russia; the rate has stayed firm at around $2.81 1/4. Sterling exports to North America now contain a greater admixture of manufactured goods from the United Kingdom, and are less dependent than they used to be on sales of seasonal products from sterling area primary producers.

The dollar remains under mild pressure from most European currencies. It would have weakened further were it not for some movement of short term money from Continental centres to New York. With a bill rate of around 3 1/4 per cent in New York and a small premium on the forward dollar against sterling, New York now has the edge on London as a centre in which to employ short term money. Ths makes the firm tone of sterling at this time of year all the more impressive.

BANK LENDING

The Term and the Rate

ONCE again Mr W. R. Ballantyne, general manager of the Royal Bank of Scotland, has ventilated far reaching and controversial issues in his presidential addr to the Scottish Institute of Bankers. In 1958, on the eve of the banks' acquisition in hire purchase finance companies, Mr Ballantyne was commending hire purchase to them and putting the case for direct participation in the business. This year he pleads for a departure from another classical banking principle, that of the short term self-liquidating overdraft. In practice, Mr Ballantyne says, the departure has been made already. All bankers have overdrafts outstanding that are technically repayable on demand but in fact are tied up for considerable periods. Annual renewal may become almost automatic; and in certain cases such as finance of medium term export credits or the building of tankers, bank money is tied up formally, for periods up to five years for export credits insured by the Export Credits Guarantee Department and up to eight years in the special schemes for building tankers. Some big banks are now also lending for two years on formalised « personal loans » and for considerably longer periods, in practice, on house purchase.

Mr Ballantyne argues that the banks ought to move further in long-term lending offering term loans repayable by regular instalments; he suggests that these could be matched by fixed-term deposits. Once banks openly recognise, and publicize, their entry into medium term finance, they will be able to charge appropriately for it; at present, the banks provide money for medium periods at rates well below the market level. The same complaint was made a few weeks ago by Lord Piercy, chairman of the Industrial and Commercial Finance Corporation, which now finds itself short of business because the banks and other City institutions are no longer leaving the « gap » in facilities that led ICFC to be set up. Many bankers would be reluctant to go much further in commitment of their funds, and now that market facilities are so much improved, there is no special reason for outsiders to urge the banks to do so. But there is real logic in the principle of a differential charge for advances of markedly different duration.

MOTOR BUSINESS

Cars and Rumours of Cars

WHERE was a time when motor manufacturerswere very careful indeed not to let any hints about the new models they planned to introduce, and when, leak into public knowledge; indeed, early this year Vauxhall circularised their employees warning them of the commercial dangers of letting such rumours spread in advance. But this spring, of their own volition or not, other manufacturers have been acting differently.. Rumours were widely abroad early this year, that Standard was altering its small car range in some way; so widely, indeed, that Standard felt obliged to announce its new Triumph Herald some weeks before it could arrange to have models on show at dealers throughout the country, or available for demonstration. Even then, most dealers could promise nothing better than three months' delivery (which fortunately for the Herald was little longer than customers were being asked to wait for most established models). Last week Sir Leonard Lord gave an unusual amount of detail about the new very small cars that BMC will be introducing this summer, and said just when, the end of August. The next day Ford, not to be outdone, confirmed that it had a replacement for the Popular " approaching the stage where it could be put into production ", but gave no idea of when this might reach the market.

Two peculiarities about the introduction of these cars may have made their makers readier to talk in advance. One is the current strength of demand for new cars in the popular range, which has meant that sales of existing models—and even their secondhand prices—have not been affected as much as usual by the announcement of new ones. The second is that of these three companies only Ford is talking frankly about a " replacement ". Standard has been anxious to emphasise that the Herald, which is in a somewhat higher price range, is not a replacement for the Standard 8 and 10 saloons—though these are now out of production. Talking of his coming 850 c.c. front-wheel-drive baby cars, Sir Leonard Lord was careful to emphasise that the Morris Minor will continue to be produced as well as the A.40 introduced last winter; only by omission, indeed, did he indicate that production of the Austin A.35, presumably, will be coming to an end. And Ford may well think that assurances that they have a replacement, probably rear-engined, coming fairly soon for the Popular, will not kill the remaining market for this old-fashioned but sturdy vehicle, which at £419 including tax is still far and away the cheapest orthodox car on the British market. It would perhaps be too much to expect to ask them just when they plan to put an overhead-valve engine into their Anglia-Prefect range, or indeed " replace " those models.

SUEZ CANAL

Government Sells SIM

THE Government retains its chareholding in the Suez Finance Company, but it has just sold for £1,800,000 the 70,760 shares it received last January in the *Société d'Investissements Mobilier* (*SIM*). Along with other shareholders in the Suez Finance Company it received the shares in this investment trust subsidiary and some cash from the parent company after the receipt of the first compensation payment from the United Arab Republic. It has nov sold them to Hambros Bank, which is acting on behalf of the Locana Corporation, for about 25 1/2 each. These shares will now be available to shareholders in Locana, who include Harrisons and Crosfield and a good number of investment trusts as well as Hambros Bank and the Suez Finance Company itself.

SIM holds shares in French and other European companies and as a route into investment in the Common Market has its attractions for institutional investors. A big block of its shares was thus well worth bidding for. The Government is satisfied that it has secured the best price obtainable at the present time. It did not want to sell the shares in an open sale in the stock market or by an open tender for fear of depressing the market price unduly. Instead of advertising its intention to sell, it invited a number of institutions which had expressed an interest in the SIM shares to make an offer. This sale by private tender, however, has led to some murmurings in the City. N.M. Rothschild, the merchant bankers who originally lent the British Government the money to buy the Suez Canal shares, were passed by. This discontent is understandable. But only if the Government turned down an offer better than the one from Hambros Bank is there real reason for complaint. Nevertheless, if the Government, following further compensation payments, receives more SIM shares and, having established a precedent, decides to sell them it might perhaps make it more apparent that justice is being done.

DIAMONDS

New Deal in Sierra Leone

DIAMONDS in Sierra Leone have been a constant source of trouble as well as wealth. Sporadic riots, poaching by African diggers in the area where Sierra Leone Selection Trust, a member of the syndicate, retained a monopoly right, the smuggling of stones across the border into Liberia all suggested that the concession under which Diamond Corporation Sierra Leone, the agent of the syndicate, had the sole right to buy the diamonds of licensed African diggers was not simply unworkable but also a cause of friction and tension. There was less smuggling last year but that was a reflection of the recession throughout the diamond trade. Policing was more strict but there were also signs that the illicit diggers were more highly organised, with one gang at least forming a skirmishing line to combat the police.

The diamond syndicate had to think hard and to think again. It has done so and has signed a new five year agreement with the Government of Sierra Leone. Under this agreement, the monopoly buying right of Diamond Corporation Sierra Leone disappears. Instead, the Government will set up its own buying office, managed but not controlled by the Diamond Corporation. All diamonds produced by African diggers will in future be exported and marketed solely through this office. But, if the African diggers are dissatisfied with the price offered to them by this office they have the right to ship their diamonds to London for sale by tender to the merchants. These sales will be arranged by the Central Selling Organisation, but it will be up to the merchants to bid for the parcels and not, as is the case with other diamind sales, to accept or reject a parcel at a price fixed by the selling organisation. As, however, the market price for diamonds is effectively fixed by the syndicate's control over the production and marketing of the bulk of the world's output, the African digger is unlikely to find the value put on his diamonds varying much from one buyer to another.

The disappearance of a monopoly buyer may be important politically and psychologically to the African digger but though he has been given greater freedom to deal with whom he likes he may thus still find himself dealing at monopoly prices. The choice therefore for him may be between those prices and those offered by Lebanese mer-

chants. These merchants provide the working capital for African diggers (both licensed and illicit) and it is through this hold on them that the Lebanese merchants can squeeze the prices they offer the diggers and earn their profit by dealing close to the monopoly prices or at the prices the Russians are willing to offer. Until this hold is broken, the illicit trade in Sierra Leone diamonds is unlikely to disappear for good.

THE ECONOMY

How Investment Has Changed

IN the first quarter of this year capital expenditure in Britain's manufacturing industries was about 11 per cent lower than a year before — in volume as well as in value, since the prices of capital goods had not changed significantly over the year. Only 9 per cent of the difference was due to lower spending by private manufacturers; the rest, stated the Board of Trade this week, was the result of lower Government capital spending on research and development facilities in manufacturing industry. (This implies quite slashing cuts in this Government expenditure, which in 1957 represented no more than 5 per cent of the whole). In « other industries and services », outside manufacturing, capital expenditure rose by 4 per cent, to the highest level ever.

ver the five year run of Britain's investment boom, which really began in 1954, there have beean considerable changes in the pattern of capital investment in this country. Most obvious has been the fact that this was essentially a boom in private investment; at 1954 prices, capital expenditure in the public sector last year was somewhat less than in 1953; it had exceeded it only in one of the years in between and then very slightly. Private investment, by contrast, had grown no less than 60 per cent in volume between 1953 and 1958; and from constituting 45 per cent of the fixed investment in Britain in 1953, last year accounted for 58 per cent. Within the investment of the private sector, too, he balance had shifted. Fixed investment in manufacturing reached its peak, about 43 per cent above the 1953 volume, in early 1957, and has since come down about 10 per cent. But private housebuilding is up about 60 per cent; and fixed investment in « other industries and services, though it has seemed to be levelling off once or twice, has always resumed its increase, and is now about 75 per cent higher than in 1953.

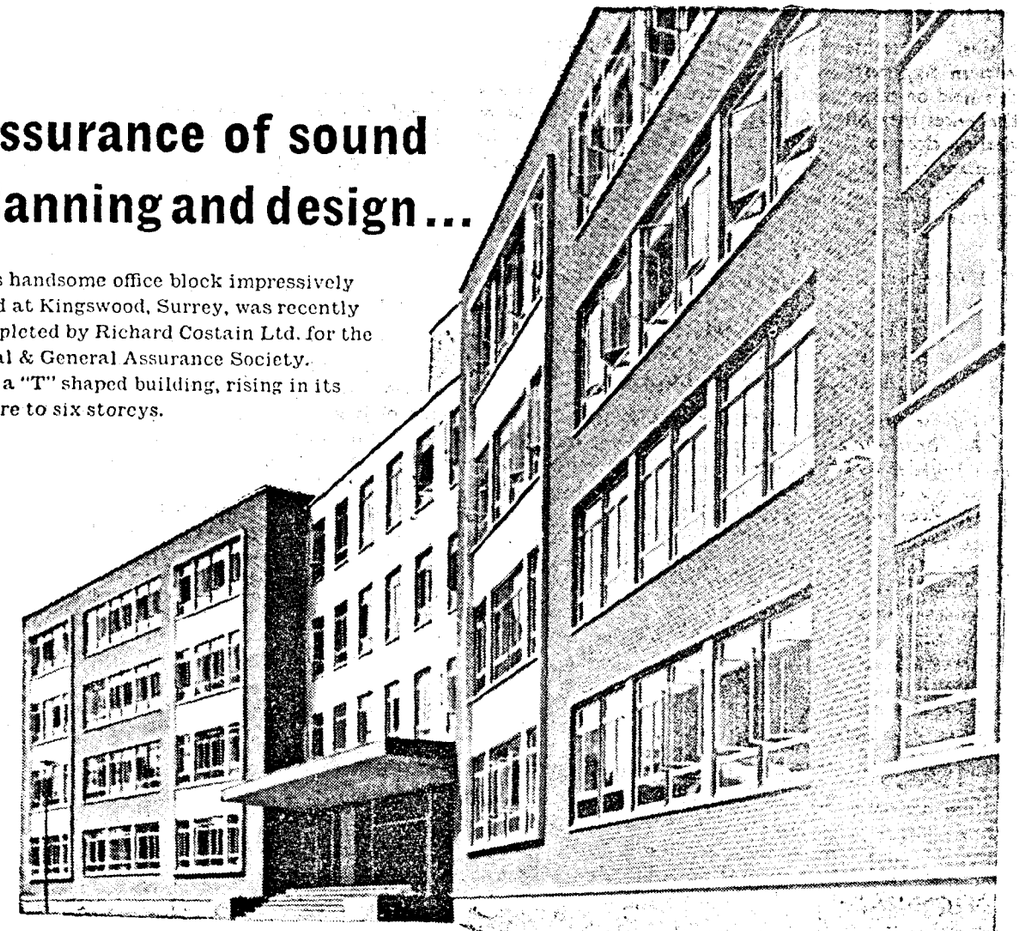
This continued growth is steadily bringing capital expenditure in these other industries and services — agriculture, forestry, fishing, building and contracting, distribution and other services — nearer to equalling the volume of resources going to increase manufacturing capacity; at current prices, in the first quarter of 1959, investment in manufacturing will have been of the order of £205 million, and investment in the other industries and services about £180 million. The first surge of fixed investment in this part of the economy no doubt reflected the end of restrictions upon commercial building as the proportion of constructional resources required for housing began to shrink; more recently, its continued growth has reflected the fact that the levelling off and recession in the British economy over the past few years has been confined almost entirely to manufacturing. In distribution and commerce there was much more to be done in arrears of replacement; and the new offices, garages and supermarkets have not been left idle.

COPPER MARKET

Waiting for the Strike

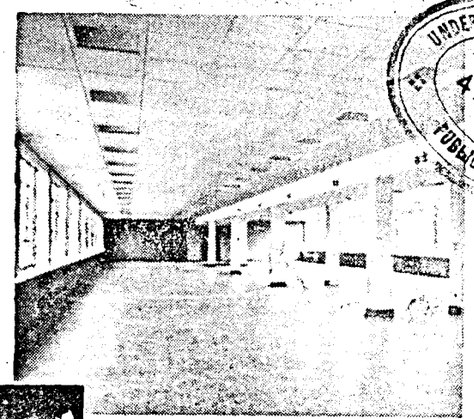
FOR months past the copper market has been dominated by the possibility of a strike in the American miming industry whem the labour contracts expire at the end of June. Until recently the fact that world production was running ahead of consumption helped to stabilise the market, not weaken it. The surplus in the United States was absorbed by heavy buying in anticipation of a strike; and though stocks in the rest of the world increased the strength of the American market kept prices in London up. But American demand is now largely satisfied and prices have weakened. The American custom smelters have had to cut their price by half a cent to 31 1/2 cents a lb, the same as the primary producer's price, and dealers are reported to be offering for July delivery at less than that. Prices in New York and London sagged further on news of a settlement of a wage claim in a Chilean mine, and of the first rise for several months in producer's stoœs of refined copper in the United States.

While output and deliveries of copper in the United States in May were almost as high as in April, stocks at end of the month rose by nearly 12,000 short tons to 86,000 tons. Stocks there are still low, being equal to only two-thirds of a month' deliveries and only one-third as large as a year ago. Stocks in the rest of the world rose further in May by 9,000 tons to 148,000 ton, equal to two month's deliveries and the highest for over a year In Britain and on the Continent consumers are evidently getting almost all the copper they need under their long-term contracts with producers; the bulk of consumer demand in the London Market is from Russia and other East European countries. Cash copper in London is now £230 a ton, having fallen by about £ 12 since the beginning of the month. Strangely, cash copper still commands a small premium over three months' delivery, though metal exchange stocks have now risen to nearly 13,000 tons. Some traders are presumably holding copper in the hope of being able to ship it to the United States at a profit. A long strike could bring a sharp rise in prices; without one copper seems certain to weaken further.



PLASTICS

Wrapped in Polythene



FILM for wrapping forms one of the biggest uses for polythene; last year it is estimated that about 10,000 to 14,000 tons of film were used in Britain, perhaps 90 per cent of it for wrapping, out of a total consumption of around 45,000 tons. This proportion of about 25-30 per cent is little smaller than that in the U.S.A., where film forms about 30 per cent of total sales. In both countries

Assurance of sound planning and design...

This handsome office block impressively sited at Kingswood, Surrey, was recently completed by Richard Costain Ltd. for the Legal & General Assurance Society. It is a "T" shaped building, rising in its centre to six storeys.

The Costain combination of sound preliminary planning plus technical experience and skill enabled the contract to be finished in less than 18 months.

...secured this 'Legal & General' contract for

Cloudburst crisis

Place: London. *Time:* Two-thirty p.m. *Weather:* Cloudburst. *Result:* Sky dark as night, every light and drainage pump turned on—and a suddenly soaring demand for electricity.

More power is needed fast, but this need has been foreseen. At Thames North Control an Assistant Control Engineer, aged 28, makes a decision, gets on to Norwich Generating Station. Within minutes extra power is being transferred to London. This is the kind of responsibility he likes, the reason for which he joined the Electricity Supply Industry, as a Graduate Trainee, five years ago.

HOW ABOUT YOU?

The demand for electricity doubles every ten years, so opportunities for promotion are outstandingly good. Careers are really secure, too, and the work is varied and interesting.

You can join as a student apprentice from the science sixth form of your school, or as a graduate with an engineering degree.

For full details, please write to the address below; tell us your age and what exams you've passed—that will help us to give you advice that's really personal.

The Education and Training Officer, The Electricity Council, 144 19 Winsley Street, London, W.1.

Young men get on, in Electricity

polythene manufacturers see film as one of their fastest-growing markets in the future; their eyes are set on the share of the wrapping market at present held by cellophane. So far polethylene sales have grown by exploiting new markets and cellophane has been almost unaffected; but the recent development of more transparent polythene films makes it suitable for the large « overwrappng » market — the outer wrappinqs of cartons of the wrapping of bread, for example — which is at present the preserve of cellophane and waxed paper.

Price is the advantage that polythene can offer; in Britain it is at present 10-35 per cent cheaper than cellophane,, depending on the grades used, in terms of area and int the U.S.A. the advantage is about 40-50 per cent. It could become greater: not only is polythene cheaper in itself, but one can use a thinner film the difference coming from the ability to use polyethylene thinner than with cellophane. It should be eventually possible to use polythene half as thick as cellophane, making it potentially less competitive in price with waxed paper. Problems in the design of wrappng machinery have to be solved before such thin materials can be used; new machinery is in any case needed for polythene, because it is less stiff than cellophane, and so has to be pulled through the wrapping machine where cellophane is pushed, apart from needing different methods of sealing.

Viewing this rich potential market — cellophane sales in Britain are still several times those of polythene film — the polyethylene makers are proclaiming the merits of the different types that they make as replacements for cellophane. There are the normal low-density materials, made by the high-pressure process of Imperial Chemical Industries and now widely used; the intermediate density materials, made by the same process; and the high-density materials, made by the Ziegler and Phillips low-pressure procesesses. *In general clarity and stiffness improve and price rises with density; high-density film is not yet in production in Britain.*

WORLD ECONOMY

The Best Survey

THE annual report of the Bank for International Settlements is less lively than in former years; that is due partly to the departure of Per Jacobsson, and partly to the fact that the principles of sound finance and free exchange which the BIS under Dr Jacobsson's leadership unremittingly preached are increasingly accepted throughout the world. But the report remains the best of the regular surveys of the world economy in its coverage of financial trends; and its synthesis of international material such as in Britain goes into the annual « Economy Survey », achieved with remarable economy of space, brings out important trends that day to day observers tend to miss. *Which two countries in Europe or North America between 1938 and 1958 together scored the smallest increase in national output per head? Britain was one; the other was* Western Germany. Agrainst the remarkable pace of expansion achieved by Germany since 1948 there have to be set, as this table reminds us, both the setback of the war and the increase in population.

PACE OF ECONOMIC EXPANSION

Annual rate of expansion of gross national product, in real terms

	1938-48	1948-58	1938-58 Total	1938-58 Per head

The BIS report again includes a useful survey of world gold production and gold hoarding. Its estimate of hoarding, which is obtained as a residual and apparently includes all private holdings for non-industrial purposes, is $180 million or just over 5 million ounces, less than one fifth of production outside the Communist bloc. By contrast, the annual report of Samuel Montagu earlier this year put total additions to private holdings at 12 million ounces, or two fifths of the total.

BANK CREDIT

Where it has gone

IN the twelve months to mid-May, advances by all banks in Britain rose by one third, from £2,032 million to £2,680 million. The detailed classification published by the British Bankers' Association shows how large a part of that remarkable spurt in lending has been to customers who previously bore the brunt of the credit squeeze. Advances to the personal and professional group rose by £163 million, a full 50 per cent; the total, at £487 million is still a much smaller proportion of total advances than before 1955. *But the hire purchase finance houses have increased their advances in the year from £31 million to* £83 million, a total almost twice the 1955 peak. *Moreover,* much of the increase of £70 million in advances to retail trade must have financed hire purchase. Together, these three groups increased their advances by £285 million, 45 per cent of the total increase. Agriculture and the « other financial » group both had big increases. Industry, which takes well over one half of total bank advances, accounted for only a third of the year's increase. The biggest proportionate increases there were in iron and steel, shipping and ship-building, and building and contracting.

In the latest three months to mid-May, total advances rose by £213 million. This follows the record increase of £245 million in the previous quarter. Demand for advances is now seasonally less strong, and it will be surprising if the pace of expansion does not slow down quite markedly.

From dictation to departures

Disturbing rumours from Rome. Top-level action urged. Confounded nuisance, but better see for self. Keep secretary busy in absence transcribing recorded directives, memos . . . If held up, may even record report, have it flown back. Time is money—spend it wisely. What would business be today without modern equipment!

Since Remington introduced, over 80 years ago, the first-ever item of mechanised office equipment—the typewriter—the Company's range of products has expanded to take in virtually the whole field of office automation. Hand in hand, however, with the manufacture of Remington equipment and supplies has gone relentless research into every aspect of business practice. The results, applied by specialists in office systems and machines, are reflected daily in maximum efficiency achieved at lowest cost in routine and administrative operations, large and small.

Times have changed radically since 1873. Remington Rand, more often than not, have been instrumental in changing them—to the lasting benefit of business everywhere.

RETAIL TRADE

Buying by Post

MAIL order sales in Britain reported in the 1957 Census of Distribution amounted to £128 million—nearly treble their 1950 value. But even this large figure is not comprehensive ; it excludes the mail order trade done by manufacturers, by department stores and probably that of some hundreds of small firms making specialist offers which would be likely to escape the census net. Something like 2 per cent of all retail sales must be made through the post, amounting, in a year, to about £ 3 per head of the population.

Although 387 mail order firms reported in the census, the field is dominated by a mere handful. Of the total, trade in 1957, 85 per cent was made by large clothing or general mail order firms each with a turnover of over £1 million and with an average turnover of around £5 million. Moreover, by no means all these firms are independent ; the report in last week's *Board of Trade Journal* discreetly avoids any names but it is well known that the two giants, Littlewoods and Great Universal Stores, own several firms each.

Mail ordering operates in nearly all branches of the retail busness but is most used in buying for the wardrobe and the home. Mail order houses' sales in 1957 of clothing at £48 million represented rather more than 4 per cent of all retail sales in this marker and of footwear at £14 million about 6 per cent. Their sales of household textiles and soft furnishings at £11 million were as much as 8 1/2 per cent of total sales and of floor coverings 4 1/2 per cent. Apart from clothing, shoes, and household goods, the remaining £ 22 millions was sprinkled mostly over seeds, toys, jewellery and fancy goods ; less than £1 millon went on food, drink and tobacco.

The fascination for women of catalogues, which get bigger and glossier, the lack of time to shop — there may be a dozen reasons why the appeal of mail ordering is growing. The attractive credit terms undoubtedly play a part : most of the large houses sell almost entirely on credit, making no extra charge for it, and customers were indebted to them at the end of 1957 to the tune of £26 million. Every effort is being made to spread this way of buying still further through agents and club organisers who show the catalogues around and may help in the collection of the money and ordering of the goods.

COMPANY AFFAIRS

GREAT UNIVERSAL STORES

Great Universal Stores has announced that no action is contemplated for the enfranchisement of the "A" non-voting shares of the company. During recent weeks hopes that GUS might do something about the non-voting shares have caused fluctuations in the price of both classes of shares: the voting ordinary shares touched 62s. 6d. on one occasion and the "A" non-voting shares touched 44s. 4½d. The discrepancy in prices reflected hopes that the enfranchisement of the non-voting shares would mean some conpensation for the ordinary shares for the loss of their voting privileges.

Following the annoucement the 5s. ordinary shares fell by 4s.4½d. to 48s.9d. and the "A" by 1s.3d. to 41s.9d.

As was expected, the group has announced its intention of tidying up the 24 preference share issues of 20 subsidiary companies within the group. The total amount of preference capital involved is between £8 million and £9 million and a scheme has been prepared by Helbert Wagg and the company's auditors and solicitors whereby the issues will be consolidated into the 7 per cent and 5 per cent preference shars of the parent company. Full details will be sent to the shareholders concerned in due course.

REDIFFUSION

Reflecting the reduction in the standard rate of income tax shareholders in Rediffusion, the radio and television relay firm which has a 37½ per cent interest in Associated Rediffusion, are to receive a tax-free dividend of 16 per cent the year to 31st March last. At the time of the rights offer just over a year ago, the directors forecast a payment of 15 per cent. The total distribution in 1957-58 was made up of a 9 per cent tax-free dividend and a special "profits tax" interim of 3½ per cent, tax-free. The increase of 1 per cent in th tax-free rate above that forecast when the standard rate of income tax was 8s. 6d. in the £ means, the directors explain, that shareholders will receive, allowing now for tax at 7s. 9d. in the £, approximately the same gross distribution as was then promised.

The group's trading profits and other income, which presumably takes in an interim dividend received from Associated Rediffusion, rose from £4,077,384 to £4,675,255 and the consolidated net profit rose even more steeply, from £914,092 to £1,423,239: after minority interests, the net profit attribuable to the parent company amounted to £1,417,600, against £815,382, so that the dividend is covered just over twice. At 36s. 6d. the 5s. ordinary units offer a gross yield of 3.6 per cent, reflecting Rediffusion's interests on both sides of the television screen.

ALLIED IRONFOUNDERS

Six months ago the directors of Allied Ironfounders said that sales and profits were then running at approximately the same level as in the same period a year before. But, apparently, the group's sales and profits had suffered a slight check in the first months of the financial year that ended on April 4th last, and for the full year the preliminary statement reveals that profits before tax have fallen from £2,461,532 to £2,185,057 and net profits after tax from £849,340 to £720,878, reducing the cover on the ordinary dividend, which is left unchanged for the third year running at 12½ per cent, to about 1.7 times.

Any disappointment with this result may be allayed by the statement by the directors that the fall in profits was confined to certain sections of the business "which are now showing an improvement." Clearly, as a producer of iron goods for the building trade, of kitchen and domestic equipment and of cookers, boilers and heaters, this group stands to gain from the relaxations in hire purchase regulations and from the schemes to encourage the re-equipment of older houses. Moreover, it has now cut its losses in Australia, which have been of the order of £270,000 a year, by closing the foundry there. At 46s., the £1 ordinary units yield 5.6 per cent.

ASHDOWN INVESTMENT TRUST

The new offer to the public of ordinary shares in Ashdown Investment Trust is of 2,500,000 shares at 17s. each. In this offer, the sponsors, Helbert, Wagg and Company, are trying to combine the advantages or an orthodox investment trust with the marketability of a unit trust by equating the issue price of the shares to the market value of the underlying securities that can be attributed to the equity of the trust. The shares are being offered on a dividend of "not less than 13 per cent" and on a yield of £3 16s. 6d. per cent.

WESTMINSTER BANK

The Westminster is the last of the Big Five to announce a rights issue, completing the round begun by the Midland Bank early this year. Of the Northern banks, the District has foreshadowed an issue, but Martins has said none is in contemplation for the time being. The Westminster follows Barclays in combining its issue of new capital with a capitalization of reserves. Both the rights issue, which is not being underwritten, and the scrip issue are on a basis of one-for-four for the £1 "B" shares. The issue price is 25s, compared with a market price of 70s before the announcement. The effective value of the rights per share was thus 9s, a bonus element among the Big Five issues second only to that offered by the National Provincial. Nonetheless, the shares fell after the announcement; as in previous cases, hopes had run too high.

The directors are paying an interim dividend of 1s3d a share on the existing "B" shares. The final dividend on the "B" capital as increased from £14.14 million to £21.20 million will be 1s, and for 1960 the directors expect to maintain the distribution at not less than 2s a share. The draft on published reserves is being made good from hidden reserves; the ratio of the bank's total capital and published reserves rises from 3.2 to 4.0 per cent of deposits at end-1958.

RONEO

Last year, in spite of record sales, Roneo suffered a setback in its trading profits from their 1957 peak: they fell from £840,701 to £776,976. A year ago Sir Greville Maginess, the chairman, said that existing production facilities were not adequate to meet the rising demand for office equipment and that the intention Was to erect a new factory at Norwich. There are also plans afoot to expand the range of products and extend production facilities at the Romford factory. To finance this programme the company is to raise about £1.5 million by a "rights" issue on the basis of two new ordinary shares for every three 5s. shares held. Before the issue the present £1 ordinary stock units will be sub-divided into four ordinary shares of 5s each.

The price of the issue will be announced shortly before the annual meeting on July 9th but the market expects a price of around 14s. The directors say that on the basis of trading results so far this year they expect to maintain the present total dividend of 15 per cent on the new capital, so that on the assumption of an issue price of 14s. the prospective yield ex-rights should be just over the current one of 4 per cent

MOSS EMPIRE STOLL

The proposed merger of Moss Empires with the Stoll Theatres Corporation was defeated by Stoll stockholders at the extraordinary meeting which the group called to pass proposals which required a 75 per cent majority to become effective. Opposition amounted to between 20 and 25 per cent of the holders, and about 200 shareholders attended the meeting at the Coliseum .The chairman, Mr Prince Littler, opened the proceedings with a proposal to with draw the resolution, but shareholders insisted on a discussion and a vote. When the vote was taken, the resolutions were rejected with very few dissentions. The opposition was not against the idea of a merger but one of its spokesmen , Mr Gerald Byre, described the terms of the Moss offer as "ludicrous". One Moss share and 1s 6d in cash was offered for every two Stoll shares and at pre-merger prices the bid put a value of 9s on each ordinary share. Since then the prices of both the Moss and the Stoll shares have reacted so that the offer was worth only 7s 7½d per Stoll share at the time of the meeting.

The merger would have resulted in the liquidation of Stoll, which the opposing Stoll al ready holds 44.6 per cent of Moss shares. Under the new group it would have contributed £ 3.7 million of the total assets of £ 6.4 million, or 58 per cent, and it would hold 61 per cent of theenlarged capital of Moss. Under the circumstances the opposition felt that any oid should have come from Stoll. A dividend of at least 25 per cent was forecast on the enlarged capital, or 12 ½ per cent, against 10 per cent, on the present Stoll shares. With prostects for the current year considered to be good and with earnings of 16 per cent covering the 10 per cent payment in 1958, Mr Gerald Byre, one of the leaders of the opposition, maintained that a 12 ½ per cent dividend could be « paid in any case ». He suggested that a shareholders' committee should be formed to work with the board on any new plans. Mr Littler said that he would consider the proposals. Following the decision the price of Stoll's shares rose by 3d to 7s 6d and the Moss shaves remained unchanged at 13s 9d.

BRITISH ELECTRIC TRACTION

Following a rise in its profits before tax by 25 per cent from £3,687,000 to £4,615,000 British Electric Traction, the industrial holding company, has raised the dividend on its deferred capital from 25 per cent to 35 per cent for the year to March 31st last. Net earnings cover this higher payment about 1.4 times. But this cover is likely to be improved in the near future, for the 1958-59 figures presumably include nothing more than the 11½ per cent interim dividend received on BET's shareholding in Associated Rediffusion. With that company now pursuing a "normal dividend policy" and earning a profit of £7 million in the year which ended on April 30th, the chances of a bigger income for BET from its interests in commercial television look good. Indeed, those chances are reflected in the price of BET's 5s "A" deferred shares, which standing at 38s. 9d. yield 4½ per cent.

WIGGINS, TEAPE

Tho ugh there is still surplus capacity in the paper industry, Wiggins, Teape achieved record sales last year and despite further import restrictions in its overseas markets its exports, too, were a record. Even so, the group's trading profits fell from £3,892,899 to £3.515,497, which must reflect shrinking margins in an increasingly competitive industry as well as the initial losses incurred on the group's new plants at Dartford, the Sudbrook pulp mill in South Wales and the new coating machinery at Treford. The chairman, Mr. L. W. Farrow, says that these projects, which, with working capital absorbed over £4 million, are now collectively running at a profit. To finance these ventures the company had to sell some of its investments and the consequent fall in investment income amounted to £130,000. However, a the tax charge of £1.4 million, against £1.8 million, left the consolidated net profit slightly higher at £2,129,979, compared with £2,127,670.

Shareholders of Wiggins, Teape are among the few investors who are kept informed of the true value of their company's properties. The full accounts reveal that the insured value of fixed assets is £31.5 million, compared with a book value of £20.6 million. On the basis of the insured value the net worth atributable to the £1 ordinary units is about 70s. compared with about 44s. on balance sheet figures. The £1 ordinary shares are quoted at 66s., to offer a yield of just under 6 per cent on a 17l/2 per cent dividend.

FINE SPINNERS AND BLEACHERS

The difficulties of the cotton textile industry are clearly apparent in the latest trading results of Fine Spinners and Doublers and Bleachers Association in the year to March 31st last. Fine Spinners is one of the largest spinning combines in the country and its profit before tax has slumped from £2.108,659 to £770,813. Smaller taxation and depreciation charges have left the net surplus at £102,104, compared with £515,128. In their interim statement last December, the directors said that the first six months was one of the most difficult of all the post-war periods and it seems quite clear that there was no improvement in trading conditions in the remainder of the year and itis likely that there have been further stock losses. Nevertheless, the directors have left the ordinary dividend unchanged at 10 per cent but to do so they have had to draw upon accumulated reserves.

Bleachers Association, on the other hand, has found it necessary to omit the 2½ per cent bonus which shareholders have received for the past four years, effectively reducing the total distribution from 12½ to 10 per cent. In view of the Fine Spinners decision to maintain its payments this reduction is a little surprising; for the net surplus is only about £27,000 lower at £277,630—thanks to a substantially reduced tax charge of £242,429 (against £358,416). As one of the largest textile finishing groups in the world, the group working on commission basis, cannot opt out of a depression in cotton and rayon goods. But its other interests, which include plastics, tanning, paint and dry-cleaning, offer it some protection. The relative vulnerability of these two companies is reflected in the dividend yields: at 14s. 1 1/2d. the Bleachers shares yield 7 1/8 per cent and at 24s. 7 1/2d. the Fine Spinners' shares yield 8 1/8 per cent.

HENRY HOPE

Despite a sharp setback in profits, Henry Hope, the metal window manufacturers, has left its ordinary dividend unchanged at 11 per cent for the year to April 4th last. A year ago the chairman, Mr. M. Hope, said that although the order book was reasonably full, he expected a moderate fall both in output and profits during the year. In the event, the trading surplus fell by £350,000 to £755,000; this was a bigger decline than investors had expected and the £1 ordinary shares were marked down from 53s. to 45s. At this price they tield 47/8 per cent on a dividend covered about 21/2 times by earnings.

London Stock Exchange

First Dealings ; June 17 July 1 July 15
Last Dealings : June 30 July 14 August 4
Account Day : July 7 July 21 August 11

SINCE June 9th, industrial equity prices have rallied from their earlier and short-lived setback; factors making for this recovery were the May trade figures, the FBI survey and the recovery on Wall Street. Turnover, however, slackened and interest was largely confined to shares concerned in take-over rumours and to those affected by profit and dividend an nouncements. Throughout much of this period gilt-edged prices were firmer,showing gains of up to 7/8 in a period of nine days trading. In long dated stocks 3 per cent Gas 1990-95 rome from 67 5/8 to 68. In the short dated issues 4 1/2 per cent Conversion 1964 moved up from 100 1/8 to 100 13/16. Among undated stocks 3 1/2 per cent War Loan improved 7/8 to 66 3/4. Corporation and Dominion loans attracted a certain amount of investment buying. Foreign bonds eased on profit taking but 7 per cent Greek bonds after falling to 44 1/4 reached a new peak at 48 1/4.

In a market still short of stock, the rise in industrial share prices was enough to carry the **Financial Times** ordinary share index up by 3.1 points to 237.4. By far the biggest rises occurred in shares subject to take-over bids: Harrods rose from 97s.6d. to 115s.6d. and Chivers from 58s.6d. to 59s.4 1/2d., having touched 68s. 9d. Interest in breweries fell off after their recent speculative activity, but Bass shot up from 51s. 3d. to 56s. 6d. In stores, disappointment with the capital reorganisation proposals put GUS ordinary back 2s. to 53s. 6d. The leading motor shares improved, with Ford 1s. 9d. better at 67s. 3d. while Standard jumped 1s. 4 1/2 d. at 11s. 4 1/2. The recent speculative flurry in property shares was followed by a good deal of profit taking, but just before the week-end the leading shares staged a recovery with Property Holdings gaining 5s. 9d. to 27s. 6d.

With the interim reports coming in from the steel industry no definite trend in steel share prices developed : SCOW, despite a higher interim and the chairman's forecast eased 9d. to 25s. 3d, while Colvilles lost 1 1/2d. at 31s. 7 1/2d. but United Steel rose from 32s. 1 1/2 d. to 32s. 6d.

Oils remained fairly quiet but prices eased on persistent selling from the United States. Shell declined 2s. to 132s. 6d., B.P. lost 6d. at 50s. 6d. and Burmah were 1s. 3d. down at 80s, 3d. The riots in Durban put Kaffir issues back at the end of the week but on Monday the market recovered on buying from Johannesburg. Typically, F.S. Geduld rose 2s. 3d. on Monday showing a net loss of 1s. 3d. at 19 rs. bd. in nine days trading. In diamonds De Beers continued to rise and, despite a setback on Friday when they fell 7s. 6d. at one time, they showed a net gain of 8s. 9d. to 160s. 7 1/2d. Coppers were mixed with no decided trend. Rubbers were quiet and firm; « Suas », which went ex-scrip advanced from the equivalent of 58s. to 72s. 6d.

COMPANY MEETINGS

BOOKER BROTHERS, McCONNELL & CO., LIMITED

(Commonwealth Merchants and Traders, Sugar Producers, Manufacturers, Shipowners, and Rum Distillers and Merchants)

LOWER WORLD SUGAR PRICES BRING EXPECTED REDUCTION IN TRADING PROFITS

VALUE AND JUSTIFICATION OF COMMONWEALTH SUGAR AGREEMENT

FURTHER DEVELOPMENT OF ENGINEERING, WHOLESALE DISTRIBUTION, AND OTHER INTERESTS

IMPORTANCE OF HUMAN RELATIONSHIPS

SIR JOCK CAMPBELL ON THE TRAGIC SITUATION IN CENTRAL AFRICA

The Fifty-Ninth Annual General Meeting of Booker Brothers, McConnell & Co., Limited, will be held in the Conference Room, 11th floor, Bucklersbury House, 83 Cannon Street, London, E.C.4, on Tuesday, July 7th, at 12 noon.

The statutory report and accounts for the year 1958 were posted to shareholders on June 13th. The full report, including the Statement of the Chairman, Sir Jock Campbell, is to be posted to shareholders shortly. The following is a shorthand version of the Chairman's Statement:

There have been two appointments to the Board since our last Annual General Meeting—Sir Henry Hancock, who brings us the experience of a distinguished career in the Civil Service, and Mr G. M. Eccles, who has devoted the whole of his 40 years' working life to sugar and to British Guiana.

We expected a fall in trading profits in 1958 because, as I said last year, 1957 profits gained from the exceptionally high world sugar prices. The Group's net trading profit after tax and all charges was £972,683 in 1958, compared with £1,084,343 in 1957; in addition there were capital profits of £240,567 in 1958, against £32,441 in 1957. Ignoring these capital profits, the return on shareholders' money went down from 9.4 per cent in 1957 to 7.2 per cent in 1958.

THE DIVIDEND

Your directors are recommending a final Ordinary dividend of 9d. per share, composed of 6d. per share free of income tax plus a cash distribution of 3d. per share from distributable capital profits not subject to U.K. income tax. We are also recommending a one-for-four capitalisation of capital reserves which would take £954,019. This is another step towards preventing issued capital from getting too much out of line with fixed assets. If profits go according to plan, your directors hope to maintain the total Ordinary distribution at not less than the present level. Thus, the total Ordinary dividend for 1959, on the increased capital, should be not less than 9½d. per Ordinary share free of income tax.

ANOTHER RECORD SUGAR CROP IN BRITISH GUIANA

The estates in British Guiana, for which Bookers are responsible produced 252,357 tons of sugar in 1958, beating the 1957 record by nearly 16,000 tons. But world sugar prices—on the basis of which we have to sell over 40 per cent of our production—fell from an average of £40 a ton f.a.s. Cuba in 1957 to an average of £28 a ton in 1958, and wages and many other costs increased. Consequently sugar profits were significantly down. That they were as good as they were was entirely owing to the success of management and workpeople in growing, harvesting and processing a new record crop with high efficiency in serious conditions of drought. The outlook for this year's sugar prices and profits is unpromising, but we are wholly confident in the ability and skill of our management colleagues in British Guiana to minimise the effects of the hazards of tropical agriculture. And I believe that we can rely upon our workpeople to play their part to the full again this year. This is not to say that the hazards will not occur; nor that the tensions in the relationships between management and workpeople and their trade unions cannot suddenly erupt into crisis. But I am sure that mutual understanding and respect and goodwill between management and labour are growing all the time in the sugar industry of British Guiana. Indeed all our senior management in British Guiana—Guianese or European, in sugar and our other busineness deserve the highest praise for the selfless way in which they combine, in keeping with the whole spirit of Bookers, practical capability with imaginative humanity in fulfilling their responsibilities to fellow-workers, customers and the community, as well as to shareholders. Even though we all realise that any big business anywhere is fair game for criticism, it is often discouraging to them that so many Guianese seem to carp and snipe at every imperfection; and to take all the good for granted.

With world sugar prices, as I write, nearly back, in terms of real money, to their abysmal prewar level, I know that the sugar workers of British Guiana, as well as management and shareholders, recognise the inestimable value of the Commonwealth Sugar Agreement. Without it the industry and all who depend upon it would today be threatened by ruin. As it is, the assurance for eight years ahead of the special Commonwealth Negotiated Price for about half of our sugar production enables us to hold our course even through the lean years. There are two things about world prices and the Commonwealth Sugar Agreement that I should recall. First: out of over 45 million tons of sugar that are made and eaten in the world every year, only 6 million tons are traded on the world market. All the rest is protected in some form or another. The United States domestic market alone deals with more sugar than the world market; at prices entirely unrelated to it. This acute narrowness of the world market leads to prices bearing no relationship to the cost of most sugar production; because the majority of countries selling on the world market have already sold so much, in many cases almost all, of their production at protected prices. Thus the Commonwealth Sugar Agreement only protects us against the protection of others. Secondly: the special Negotiated Price is neither a horse-trading nor a cost-plus arrangement. It is settled by a complicated formula designed to do no more than enable the value of a ton of Commonwealth sugar to keep pace with the price of supplies and services required by the sugar industry and its workers. The fact that some 40 per cent of our sugar has to be sold at unpredictable world prices provides both formidable sanctions against inefficiency and incentives for controlling costs. I believe that the people of Great Britain, whose exports and whose standard of living are directly imperilled by the drop in purchasing power of the peoples of the countries whose social and economic foundation is primary production, also recognise in the Commonwealth Sugar Agreement a measure as economically justifiable as it is socially enlightened. And here I want to add a few words about the preferential market which Commonwealth Sugar enjoys in Canada, a market of special value to the West Indies and British Guiana. The generous Canadian preference reflects a long-standing tradition of mutually advantageous trading between the

Dominion (particularly the Maritime Provinces) and The West Indies, a relationship which has contributed materially to the West Indian economy. All of us concerned with The West Indies must ensure that we do everything we can to earn the preference, and Canadian goodwill which is a vital background to it, by stimulating reciprocal trade.

VARIED SHOPKEEPING ACTIVITIES

Our Shopkeeping Group has had mixed fortunes during the year although some companies have done very well. Bookers Stores in British Guiana and our agency company there had a thoroughly good year's trading, and our stores in Trinidad made record profits. Our three automotive supply business in the Canadian Prairie Provinces all made their best contribution to Group profits since they joined forces with Bookers. I have seen for myself that they provide a shining exemple in practice of Bookers' philosophy of service through business. As I write we are examining with the Board of Taylor, Pearson & Carson (Canada) Ltd., who are doing the same sort of business in British Columbia and Alberta as our other companies in Western Canada, whether it would be in our mutual interest that they should join forces with us. I hope that we shall know the answer by the time of our Annual General Meeting.

Our Button Group of wholesale and retail grocery and provision businesses in London and the Home Counties disappointingly made a loss. In effect the reorganisation of management, and of shops and business methods, led to higher expenses and resulted in a temporary decline in profits, but this reorganisation is already bringing in plenty of new customers and new trade. In the Button Group we have a well-managed business which should again make its proper return on capital. Being backed by the strength of the Booker Group they were able to carry through the essential reorganisation more quickly than they could otherwise have risked. The risk was expensive but the fruits of reorganisation should come all the sooner.

Because of difficulties in the copper industry in Northern Rhodesia, our shopkeeping companies there did badly in spite of the best endeavours of the management. Our company in Nyasaland achieved record sales but made rather less profit than in 1957.

EVENTS IN NYASALAND

The tragedy of recent events in Nyasaland, and fears for the future, at present overhang the whole of British Central Africa. Although this is not the place to enlarge upon it, the fact that Bookers have some £1½ million invested there, and during 35 years have served the life and economy of the area, must allow us to have an attitude and to express it. When the Booker Group was reorganised after the war we extracted the London & Blantyre Company from its position as a subsidiary of our Northern Rhodesian Copper-Belt companies solely because we were convinced that the social, economic and political environment of Nyasaland differed so totally from that of the Rhodesias. We have thus consistently questioned whether it was right to force Nyasaland into the Rhodesian Federation. I think I can best summarise my view now, by quoting my letter to The Times which was published on March 30, 1959.

"Are not these the realities of the Central African situation? Nearly all the 300,000 Europeans in the area, and the overwhelmingly European Federal Government, believe that the social, economic and administrative interests of themselves and of seven million Africans lie in federation between the two Rhodesias and Nyasaland, and in present domination by the European minority of the African majority.

" In Central Africa, the attitudes of most Europeans towards Africans range from a few who regard them as God-given hewers of wood and drawers of water, to the many who benevolently regard them as the equivalent of school children needing firm but fair treatment from the school authorities, on the understanding that some of them may become prefects if they are industrious and obedient; and recognising that they will one day grow up. All this Lord Malvern and Lord Robins made clear in the House of Lords.

" Africans, as their education and knowledge of the world develops, and as they see the flowering of their peoples in West Africa—and their oppression in South Africa—increasingly resent and fear these European attitudes; and are prepared to sacrifice the economic and administrative advantages of European domination for the freedom to work out their own salvation.

" 'Keep the Africans in their place until they are civilised and capable, say the Europeans. 'Struggle for freedom and nationhood,' resolutely say the Africans. How is this clear conflict of views to be resolved? Certainly not by pride and prejudice and killing people.

" In Nyasaland, where there are only 7,000 Europeans and 2,600,000 Africans, can there be any other answer than for her Majesty's Government to declare Nyasaland an African State and to maintain the effective British protection of her people until forms of Constitutional advancement are worked out with her people which will enable them to decide constitutionally whether or not they wish to be associated with the Rhodesias—and, if so, in what form? It will, I know, need great imagination and courage to do this .

" In the Rhodesias the resolution of the conflict is far harder because Southern Rhodesia is self-governing; because there are 200,000 Europeans there; and because of the great copper mining industry in Northern Rhodesia under American, European, and South African ownership. To segregate Southern Rhodesia and the Copper Belt as miniature South Africas, with the rest of Northern Rhodesia and Barotseland following Nyasaland, would be rank apartheid—with the wealth going to the Europeans and the poverty to the Africans. Perhaps, therefore, the best that can be done is to maintain effective British protection for the Africans of Northern Rhodesia and Barotseland—within the Federation—while the Federal Government and the Europeans show the world what they mean by partnership.'

" It could be hoped that the creation of an African State in Nyasaland, combined with the right of her people to decide their own relationship with the Rhodesias, might encourage the Federal Government of the Rhodesias to provide proofs of partnership in practice which would restore real confidence to all the Africans in Central Africa that the full fruits of the future are theirs in full and fair measure—not only economically and politically but as free and first-class citizens of a new nation. "

The directors and staff of our Nyasaland businesses, and their families, are showing the greatest understanding and courage, and they are not allowing their work or their relationships with African staff to be thrown off balance.

UNITED RUMS REMAIN THE MOST POPULAR

Our Rum Group did very well in 1958. Our new distillery in British Guiana is coming fully up to expectations. Our **Lemon Hart** Jamaica and **Lamb's Navy** Demerara rums still lead the field as by far the most popular brands in the United Kingdom. Our rum trade in Canada is prospering so well that it cannot be long before Canada is the biggest market for our rums. **Tia Maria**—our Jamaican coffee-flavoured liqueur—is gaining popularity in more countries than ever and its prospects too seem good.

SHIPPING : BULK SUGAR INSTALLATION

Our shipping interests consist, first, of the Arakaka and Amakura, which ply between Liverpool and Demerara; secondly, of five coasters which trade mainly between Liverpool and Northern Ireland, and are supplemented by some coastal tramping; and, thirdly, of eight coasters serving our sugar estates in British Guiana and plying between some of the West Indian islands. Our shipping company in British Guiana is also responsible for our wharf and stevedoring businesses there as well as our ship and airline agencies, transport department and insurance business. Although our shipping interests taken together made less money than in 1957, they fared as well as anybody could have expected with freight rates so low and in the face of generally adverse conditions.

Work has started on the construction of the 40,000-ton bulk sugar store and wharf in British Guiana, to be operated by a company in which Bookers have an 80 per cent interest. This installation should be ready ear-

ly in 1961 and is required to meet the needs of our refinery customers in the United Kingdom and Canada. We are now giving much thought to the possibility of building and operating one or two bulk-sugar-carrying ships.

I am delighted that quite a few of our shareholders have decided to use our Travel Department in the entrance hall of Bucklersbury House. I hope they find themselves satisfied customers and that more will follow suit.

ENCOURAGING PROSPECTS FOR INDUSTRIAL AND ENGINEERING GROUP

Our Industrial Holdings Group (as it is now called) covers some assorted and mostly thoroughly profitable companies in the United Kingdom and British Guiana. The British Guiana companies—drug manufacturing, printing, stock-feed, petroleum products marketing, balata bleeding, and a lime estate—made an important contribution to Bookers' profits and set a vigorous example in training in the skills needed for light industrial development in British Guiana.

Our Engineering Group had an immensely encouraging year. Our two sugar machinery businesses—George Fletcher in Derby and Duncan Stewart in Glascow—further enhanced their reputation, and their prospects are good. Fletchers achieved record sales and profits last year.

The major development of the year in the Engineering Group was the acquisition of 90 per cent of the Ordinary shares in Sigmund Pumps Ltd. of Gateshead. This company has an international reputation for the excellence of its centrifugal pumps. Every thing that we have seen of the quality of its management and men, and of its plant and products, gives us confidence that this will prove a most fruitful partnership.

DIVERSIFICATION : FINANCE FOR THE FUTURE

The planning and development of Bookers engineering interests is part of our declared policy of spreading Bookers' risks ; and there can be no doubt that diversification is adding greatly to the strength and resilience of each and all of our companies, old and new. Our finance is on an even keel ; and we shall probably not have to raise new funds for the Group in the near future. This is not to say that circumstances, and requirements, may not change.

I find it very difficult to express my awareness of the extent to which Bookers' profits, the working out of our plans and the achievement of our purposes, are dependent upon all the men and women throughout the Group in the United Kingdom, British Guiana and The West Indies, Canada, the Rhodesias and Nyasaland, and the masters and crews of our ships. Without them there could be no production and no profits—and no purpose—in Bookers.

MANAGEMENT APPOINTMENTS FOR GUIANESE AND WEST INDIANS

In British Guiana and The West Indies it is our resolute policy not now to appoint anyone from outside those countries to any job for which we can recruit a Guianese or West Indian with the necessary qualifications and experience. However, through no fault of theirs, there is at present a serious shortage of qualified Guianese and West Indians for the many important administrative and technical jobs that have to be done. In order to play our part in putting this right, we are building up a concerted campaign for education and training for all kinds and levels of management. Nor are we neglecting such plans for the men and women in our companies outside The West Indies and British Guiana.

I find it is as impossible as ever to forecast this year's results with any expectation of being right. I cannot at the moment see why our 1959 trading profits should be better than 1958, if as good. On the other hand Bookers keeps on growing. Your directors and all of us in Bookers at home and abroad will go on, doing the best we can for all who have a stake in the fortunes of the company.

MARKS AND SPENCER LIMITED

SALES EXCEED £134,000,000

"ST. MICHAEL" BRAND A HOUSEHOLD WORD

99% BRITISH GOODS AND MATERIALS

The thirty-third Annual General Meeting was held on June 11th at 67, Baker Street, London, W.1.

Sir Simon Marks, DSc, Hon FRCS (Chairman and Joint Managing Director) who presided said :

Ladies and Gentlemen : This is the first Annual General Meeting to take place in the new offices and we bid you welcome.

May I take it that in accordance with our customary practice, the Directors' Report and Accounts may be taken as read?

Before we pass to the business of the Meeting it is my sad duty to report the death of Mrs. Spencer, which occurred on March 1st last in her ninety-ninth year. Agnes Spencer was the widow of Thomas Spencer, who was taken into partneship by my father. Michael Marks, in 1894.

Michael Marks had started his own business, the original Penny Bazaar, ten years earlier in 1884. When he was joined by Tom Spencer there came into being the firm of Marks and Spencer with a joint capital of £753. From this small beginning has grown the organisation on which I have the privilege to report today.

Agnes Spencer retained her interest in the progress of the Company throughout these many years, and in 1957 she made a magnificent gift to the Marks and Spencer Benevolent Trust as a measure of her interest in the well-being of our staff. Another link with the historic past is broken. I ask you to rise in honour of her memory.

PROFIT AND LOSS ACCOUNT

Our Profit for the year after Tax has amounted to £7,709,000 compared with £6,193,000 last year, an increase of £1,516,000. We have provided £7,350,000 for taxation against £7,950,000 last year, of which £5,850,000 is for Income Tax compared with £5,925,000 and £1,500,000 for Profits Tax compared with £2,025,000.

The total amount available for distribution is £9,921,000 which includes £2,212,000 brought forward from last year.

The Directors recommend a Final Dividend on the Ordinary and 'A' Ordinary Shares of 25 %, making with the Interim Dividend of 12 ½ %, a total for the year of 37 ½ % against 32 ½ % last year.

We propose to transfer £2,998,000 to the General Reserve which will then amount to £11 million. After the payment of dividends and appropriations as set out in the Directors' Report, there will remain a balance of £2,491,000 in the Profit and Loss Account to be carried forward to next year. The Revenue Reserves will then total £13,491,000 while the Capital Reserve remains at £19,323,000.

We propose to capitalise the sum of £3,618,793 from the General Reserve to enable a Scrip Issue to be made on the basis of one 'A' Ordinary Share for each five Ordinary or 'A' Ordinary Shares

PROPERTIES

Our expenditure during the year on the acquisition of sites and the development and modernisation of Stores amounted to £3,632,000 of which £1,051,000 has been charged as Repairs and Maintenance. A sum of £944,000 has been provided for Depreciation and our Properties, Fixtures and Equipment now stand in the Balance Sheet at £47,525,000 compared with £45,879,000 last year.

CASH

Our cash balances and our holding of Tax Reserve Certificates total £10,549,000 compared with £6,778,000 last year. We have received in bank and other interest £212,000 against £175,000.

The Loan of £1 million at 5 ¼ % has been transferred in the Balance Sheet to Current Liabilities prior to repayment on 1st April of the current financial year.

GENERAL SURVEY

The growth of the Company is once again revealed by the results presented in the Annual Report. Not only has the volume of business attained the record figure of £134 million compared with £130 million the previous year, but the net profits have also reached a new high level at £7,700,000 compared to £6,200,000 in the previous year.

Thanks to the reduction in the Profits Tax and in the standard rate of income tax made by the Chancellor of the Exchequer in his last two budgets ,the net profits have benefited considerably. This is the first substantial relief in taxation that we have enjoyed since 1939-twenty years ago.

The cumulative investment year by year in the acquisition of properties and their gradual development into fine modern stores is bearing fruit. The measure of this investment can be assessed by the fact that the Freeholds and very long Leaseholds are shown in the accounts at £ 43 million. The most significant feature of this policy is that the finance required has been drawn from retained earnings which do not carry any interest charge. It follows therefore that our Trading Profits benefit substantially as a result of this policy.

Each year, with the transformation of the Stores, a considerable extension of selling space is created which enables us to display an expanding range and variety of merchandise clearly and attractively. Our customers can select their goods in greater comfort, guided by a trained and courteous staff. The improved and convenient shopping facilities we provide are much appreciated by our public.

TECHNOLOGICAL APPROACH TO MERCHANDISE

We attach the utmost importance to our work of developing the range, variety and the quality of the goods we sell. The Directors, executives and technologists and their staffs are continuously engaged on the problems of how to improve the quality of materials, their performance 'value' and the styling of our goods to satisfy yet more fully the requirements of the public.

The quest for improvement is endless. Twenty-three years ago, in 1936, we established our Merchandise Research and Development section to aid us in this endeavour. We believed that the scientist and technologist could make an effective and creative contribution to our efforts in assisting our suppliers to produce still better values. Progress in this field was halted by the war, but when hostilities ceased, the activities of this section were resumed with a new impetus. A team of technologists was engaged to study the problems involved in adapting the growing variety of new and untried man-made fibres to our needs.

We are in close touch with the great basic textile firms which deal with the fundamental problems of their industry. It is the task of our technologists to keep abreast of all developments in that field which bear upon the quality and value of our goods. The work has been expanded to cope with the wealth of materials, fabrics and finishes now at our disposal. On these services we employ scientists and technologists whose special qualifications fit them for their task. They are supported by a numerous staff and have at their disposal laboratories designed for testing and evaluating new products. Our technologists establish quality standards and performance specifications with our suppliers and they collaborate in ensuring the necessary process control and testing during all stages of manufacturing. The utmost vigilance and attention to technical details is the necessary prerequisite for the creation of our high quality merchandise.

The practical effects of their efforts are to be seen in the many new and interesting fabrics which have already been incorporated in our St. Michael garments. There is no doubt but that the development work which has been carried out has shortened the path between the advent of the new man-made fibres and the production of the kind and quality of goods which we believe our public want. It enables our merchandising staff to select new and better goods and to organise their production with speed and assurance.

The results of this interesting work are seen in the mounting turnover we report from year to year. The confidence in our goods on the part of our customers, who are most discerning in their purchases, is cause for much satisfaction to your Board. The goodwill of the public is one of our greatest assets, which we prize most highly.

It is well to recall the great changes that we have seen in our range of merchandise in recent years. A large proportion of St. Michael garments today are made of fabrics entirely unknown to the public but a few years ago. Nylon, Terylene, Orlon, Acrilan, Tricel, etc. now fill many of our counters and racks, adding novelty and variety to the traditional fabrics, Wool and Cotton. They, in their turn, have been given new properties which improve their performance in wear and have eased the burden of washing and ironing. Naturally some of these new fabrics have up to now been in short supply, but they are becoming increasingly available to the public at prices well within their reach.

NEW LOWER PRICE CAMPAIGN

It has always been our policy to pass over to the public the benefits which accrue from lower raw material costs or more efficient methods of manufacture or from both. It is with pleasure that I can state that our suppliers are in agreement with us in giving effect to this policy and they co-operate most closely. Our "New Lower Price" campaign, which aroused great public interest when launched last year has continued with a series of important price reductions made at the beginning of this year. The measure of the gain to our customers is that since the beginning of this campaign in 1958 they have saved over £ 4 million on their purchases for the same goods in our Stores.

We have done more than stabilise our prices, we have substantially reduced many of them. It is not price cutting but sound business commonsense to extend to the public the results of efficient business operation. In this way our policy of better goods at lower and inexpensive prices makes a definite contribution to the cost of living and to the raising of living standards.

FOOD DIVISION

The Food Division continued to make good progress during the year. We work in close association with our friends who are among the leading suppliers in the land. Our executives and technologists co-operate most effectively with them and together they have established high standards of quality for the specialised foodstuffs we sell.

At all times we emphasise the importance of strict attention to hygiene and cleanliness in the Stores and in the factories. The social responsibility involved in this policy is recognised as of fundamental importance by all those concerned. There is, no doubt that our customers greatly appreciate our efforts in this direction. We are glad that our work in this field is highly regarded by Public Health and other important authorities.

CONTROL OF OPERATING COSTS

The efficiency of our organisation has benefited greatly from our efforts during the past three years in bringing under control the costs of operating the business. Since 1956 when we instituted our Good Housekeeping campaign we have substantially reduced the level of these costs, while the turnover has continued to increase. In bringing this about we have subjected every procedure of our administration to close scrutiny. Much that proved to be unnecessary was discarded and simpler methods have been evolved.

In my speech last year I told you that we were in process of transferring the administration into new offices in Baker Street. In March of this year that move was completed. The shortage of office accommodation since the war had imposed on us the inconvenience of operating from make-shift offices in seven different premises throughout London. This has now come to an end. Our Head Office staff, responsible for buying and administration, have been brought together under one roof for the first time in twenty years. The move into one building provides us with the opportunity of still further streamlining our operations.

STORE DEVELOPMENT

I have described the cumulative effect of our store development over the years. Each year we plan a building programme, having as its aim more and more selling space to display our growing range and variety of merchandise.

The size and the character of the building projects we have evolved since the war are costly and take a considerable time to complete — in many cases up to two years. It is thus clear that at any given time a considerable part of our investment has still to reach the productive stage. They are important buildings and are notable landmarks in the shopping areas where they are situated. It will require substantial investment year by year to carry out the policy of expansion we have in mind. As in the past these funds will be found from earnings retained in the business.

During the year we completed eleven major extensions involving considerable rebuilding and have in hand fifteen further substantial projects. New important schemes will be added to the list as soon as the necessary plans are completed. This work demands a continuous and concentrated effort on the part of the executives and staff of our building department.

TRIBUTE TO MANUFACTURERS

I am glad to pay tribute to our manufacturers for their splendid co-operation during the past year. They realise that our trade mark, St. Michael, stands high in the esteem of the public as the symbol of good taste, quality and value. It is with satisfaction that I can say that our friends have helped us not only to maintain but to enhance the prestige of St. Michael which is the most popular trade mark in the country and, indeed, has become a household word.

Our policy has always been to encourage British production to the umost. It is a source of great pride to us that we can state that 99% of our goods and the materials used in them are of British manufacture. This has been made possible by the close and understanding co-operation which exists between the suppliers and ourselves.

The knowledge that the development of our Stores year after year affords an expanding outlet for their production has encouraged our friends to install the latest machinery on a considerable scale. It is only by keeping their plants and equipment up-to-date that they can help us to satisfy the increasing demand of our customers.

TRIBUTE TO STAFF

It is with pleasure that I acclaim the fine spirit of service shown by our staff whether at Head Office or in dealing directly with the public in the Stores. I am always impressed by the friendliness which exists between our sales ladies and their customers.

Our staff, who are interested and enthusiastic in their work, find pleasure in selling the St. Michael merchandise which gives satisfaction to so many people. Their high standard of service greatly contributes to the reputation of the Company.

We are concerned at all times with the well-being of the staff and seek to create happy and congenial working conditions. We provide good pay and bonuses supplemented by welfare amenities on an impressive scale. This policy has led to the high degree of labour stability we enjoy and to the growing numbers who complete 25 years service with us.

Our staff know that when the time comes for retirement, appropriate provision will be made through our Pension and Benevolent Funds, and that their well-being will still be the concern of your Company.

We look upon our Pensioners, who now number 269, as members of the Marks and Spencer family, and in their retirement they enjoy many of the amenities which were available them during their active careers.

I ask you to join with me in thanking the members of our staff, both present and past, for their loyalty and devotion to our Company.

The report and accounts were adopted.

THE ORION INSURANCE COMPANY LIMITED

MR. DUDLEY R. SCHOLEY'S REVIEW OF DEPARTMENTAL ACTIVITIES

The 29th annual general meeting of The Orion Insurance Company Limited was held on June 25 at 70/72, King William Street, London, E. C. 4.

The following is the statement by the Chairman, Mr. Dudley R. Scholey, which has been circulated with the report and accounts for the year ended December 31, 1958:

The material figures and percentages relating to Departmental results which in previous years have appeared in the Chairman's Statement are now shown in the Directors' Report and it is my intention, therefore, to confine myself to comments upon these results and upon matters of interest concerning your Company's affairs.

MARINE AND AVIATION BUSINESS

Regarding our Marine and Aviation business, you will notice there is a reference in the Directors' Report to the change of basis in the closure of our Marine and Aviation Underwriting Accounts. For some years it has been apparent to us that the abnormal delays in the notification of Marine Claims which have been a feature of the post-war period, particularly in the Hull and Miscellaneous Sections, have made it increasingly difficult to assess the result of a world-wide Marine Underwriting Account at the end of its third year. Your Board has decided, therefore, as a matter of future policy, to defer the closing of the Marine and Aviation Account until the end of its fourth year and, accordingly, the 1956 Underwriting Account will not be closed until the end of 1959.

Since the time of my last review our 1956 and 1957 Underwriting Accounts have shown some deterioration. Although there are indications of improvement in some aspects of Marine business, it is doubtful whether either of these two Underwriting Accounts will turn out to be profitable.

The Marine Fund at £1,969,051 has been strengthened from time to time by the retention of profits earned in earlier years. In present circumstances we consider it prudent to conserve these additional resources and, accordingly, have decided not to make any transfer to Profit and Loss Account this year.

Our Aviation Business, which forms part of the Marine and Aviation Account, continues to operate on a satisfactory basis and to show a modest profit. It should benefit further from the anticipated improvement in Underwriting conditions resulting from the general Market Agreement now in operation. Our Aviation Underwriter, Mr. Graham Willett, was elected Chairman of the Aviation Insurance Offices' Association this year, and we wish him a successful term of office.

FIRE, ACCIDENT AND MISCELLANEOUS DEPARTMENT

In the Fire, Accident and Miscellaneous Department a substantial proportion of our business emanates from North America where, as is well known, results have been generally unfavourable. During the year under review our endeavours were concentrated upon the elimination or reduction of the apparently unprofitable Sections of this business whilst, at the same time, working towards the development of those Sections which, in our view, showed better prospects of an earlier return to a profitable basis. In spite of the pruning of these activities necessitated I am glad to report a modest increase in Premium Income to £1,144,625. Although the Account shows a Loss for 1958 of £40,359, the measures taken appear to be having the desired effect.

The Income from Investments at approximately £223,000 was some £40,000 more than last year and there was a satisfactory increase at 31st December, 1958, in the Excess of Market Value of Invested Funds over their Book Value.

Sir Strati Ralli, Bart., M.C., retired from the Board as a Director on the 30th June, 1958. Our appreciation of his valuable services to the Company was recorded last year when he relinquished the office of Chairman of the Board.

The year 1958 was an arduous one for your Company's Officials and I should like to place on record our thanks to them and to all members of the Staff for their loyal co-operation and services.

UNITED DRAPERY STORES

SIR BRIAN MOUNTAIN ON A YEAR OF FURTHER EXPANSION

The following are extracts from the statement by **Sir Brian E.S. Mountain, Bart.** (the Chairman), circulated with the Report and Accounts for the year ended January 31, 1959:

The Group Trading Profit of £7,912,927 shows an increase of £781,050 of which sum £460,000 relates to the profits of new businesses acquired during the year leaving an increase of £321,050 from the existing businesses. This satisfactory increase is due to a further substantial rise in Group turnover in a year which has contained a number of difficult trading periods.

The increase in turnover gathered momentum towards the end of the year following the lifting of the remaining Hire Purchase restrictions in October. This naturally meant a large rise in our Hire Purchase Debtors and a corresponding addition to our provision for unearned profit on these debts. It will be seen that the Provision for Unearned Profit on Hire Purchase Debts and for Debt Contingencies has risen from £72,579 to £503,832 for the year under review.

Taxation

For the first time for many years the charge for Taxation shows a substantial reduction in spite of the increased profits and this is very largely due to the Profits Tax reduction in the 1958 Budget and to the recent reduction of 9d. in the standard rate of Income Tax. We have still not reaped the full benefits of the Profits Tax reduction and next year should see a further saving of about £40,000.

Profits after taxation have increased by £542,840 to £3,252,973. Under normal circumstances your Board would have increased the total dividend on the Ordinary Stock to 35% less tax but as this would have increased the Profits Tax charge your Board proposes to pay a final dividend of 20 % less tax making 32 ½ % less tax for the year. Your Directors will also pay an interim dividend on account of the year to 30th January, 1960, of 2 ½ % less tax which will be paid at the same time as the final dividend for this year and which will not be taken into account when considering dividend payments for that year.

Consolidated Balance Sheet

Current Assets have increased by £2,287,368 to £18,563,022 and of this figure Stock has risen by £390,591 mainly due to the requirements of our new acquisitions. A major increase is in Debtors which after much larger reserves have risen by £2,231,249. This is due, as I have already stated, to the greater volume of Hire Purchase sales towards the end of the year and there is every indication at present that this trend will continue for some time. Our reserves for Unearned Profit have almost reached £2 ½ million and they will provide a good bulwark to profits in the event of any fluctuation in Hire Purchase business in future years.

Commenting on the request by Mr. Collier, made towards the end of the year, to resign his position as Managing Director on medical grounds, Sir Brian said: Whilst it is with the greatest regret that I have accepted his resignation it would be inconceivable to me that a man like Mr. Collier should not be fully employed so far as his health allows in controlling and directing the future destinies of the Company as he has done in the past. Therefore, in furtherance of the Company's interests I have offered the Chairmanship to Mr. Collier realising that while he will be relieved from the day to day details of management we can count upon his wise counsel and leadership in continuing to formulate the policy of the Group. I am more than pleased to inform you that Mr. Collier has acceded to my request.

To fill the vacancy of the Managing Director the Board propose to appoint Mr. J. A. Sampson who joined the Group in 1946 and has worked very closely with Mr. Collier ever since.

I would add that these changes in no way affect the interest of my Group of Companies, or myself, in United Drapery Stores, in whose future we have the utmost confidence.

The report and accounts were adopted and resolutions giving effect to the proposed rights issue were approved.

Mr. Collier proposed a vote of thanks to Sir Brian Mountain and paid tribute to his very valued services over a period of twenty-five years.

After the Annual General Meeting a Board Meeting was held at which Mr. Joseph Collier was appointed Chairman and Mr. J. A. Sampson was appointed Managing Director.

TWELVE YEARS' REVIEW

Year Ended January	Group Profit Before Taxation	Net Current Assets	Fixed Assets	Total Net Assets
	£	£	£	£

FARBWERKE HOECHST AG.

FRANKFURT (M)-HOECHST

The Annual General Meeting of Farbwerke Hoechst AG, was held in Frankfurt (M)-Hoechst on May 14, and the following is a summary of the Report presented by the Board of Directors:

Development

The Company's development during 1958 was satisfactory although expansion continued at a slower rate compared with the precious year. Capacity was well utilised and production continued without interruption. A number of new plants was taken into service and as a result of research work new and promising products were put on the market.

The total turnover of Farbwerke Hoechst AG, and its associated companies as compared with 1957, rose by 7,3% to DM 1,890m including 31% for exports. Dyestuffs, intermediates and textile auxiliaries accounted for 15% of the Company's total turnover, with the balance being distributed over pharmaceutical products (11%), nitrogenous fertilisers and inorganic chemicals including plant protection agents (22%), plastics, plastic intermediates, solvents (21%) fibres and foils (16%), welding techniques (8%) and miscellaneous products (7%). 74% of the total went to the countries which now form part of the European Common Market including the Federal Republic, and 82% to the planned Free Trade Area.

Investments

Capital expanditure totalled DM 248m. and brought investments for the period 1952 to 1958 to some DM 1,270m., with an annual rate of approximately DM 240m. since 1955. Investments during 1959 will probably be of the same magnitude as those in the previous year. Expenditure under this head up to 1958 was financed through depreciation to the extent of approximately DM 750m., with some DM 320m. coming from the Company's own resources and the balance of DM 200m. being financed by way of loans.

Overseas Interests

Investments abroad until the end of 1958 totalled approximately DM 76m. A large proportion was accounted for by expenditure in Central and South America, and the Company's interests in this area were combined in a new company, Trans-American Chemicals Ltd., set up in Montreal. In Brazil, Fongra Produtos Quimicos S.A. was fully taken over by Farbwerke Hoechst AG. in accordance with an agreement concluded with W. R. Grace & Co., the American partner in this firm. Electro Quimica de Flix S.A., one of Spain's biggest chemical plants, increased its capacity so as to meet the growing demand of the Spanish plastics industry. Expansion of the Company's foreign distribution organisation included three plants for the finishing of pharmaceutical specialities, thus raising the total number of such plants to nine; four further plants are being erected.

Research

Expenditure on research and development during 1958 totalled approximately DM 93m., an amount equivalent to 4,9% of the turnover. During 1958 some 20% of the turnover was represented by products which had only been put on the market during the last five years. The Hoechst Group as a whole employs some 1,800 scientific workers who have all had a secondary education.

Fields of Production

The production of inorganic chemicals, a large proportion of which is required for the Company's own use, continued to rise during the year. Sales of nitrogenous fertilisers increased further and conditions in foreign markets grew more difficult. The turnover in plant protection agents was on a level with that of the previous year.

As a result of the general crisis in textiles the particularly high dyestuffs turnover of the previous year could not be reached in 1958. The position was further complicated by the loss of business in important export markets. The turnover of textile auxiliaries improved appreciably during the year, particularly in the export field. It was also possible to achieve an encouraging rise in the turnover of intermediates.

The field of plastics, lacquer components and solvents has become one of the most important sectors of the Company's activities. The ethylene-based Hostalen brand of polyethylene is today one of the major products of the plastics industry, and its turnover considerably expanded during the year. „Hostalen" is largely used for the manufacture of household goods and its use for the production of tubes and hollow ware in general, particularly bottles, is increasing.

The raw material basis for the production of waxes in the Gersthofen plant was further secured by the new crude montan wax installation at Trevsa.

In the field of man-made fibres „Trevira," the polyester fibre, developed satisfactorily and capacity was fully utilised. The growing demand and the increasing field of application seem to ensure the sale of the increased volume of production in 1959. Sales of Perlon were also satisfactory.

Pharmaceuticals, one of the Company's traditional fields where it can boast of experience in production going back over 75 years, also developed satisfactorily during the year. Orally administered antidiabetic drugs, which had been put on the market as recently as 1957, increased their share of the market.

Associated Companies and Participations

Knapsack-Griesheim AG. largely completed the extension of the phosphorus plant with the expansion of the sintering installation. The works now have two phosphorus furnaces with a total capacity of approximately 40,000 tons a year, and installations for the production of red phosphorus, phosphoric acid and sodium ammonium phosphate. In September of the year under review the second 40,000kW carbide furnace was taken into service to replace a number of small furnaces. Sales of technical gases continued to increase.

Kalle & Co. AG. utilised its capacity to a large extent during the year. Plastic foils again showed the largest increase in production with an advance exceeding 40%.

Behringwerke AG. showed a favourable development during 1958. The company's wide range of products, which includes vaccines and sera, was extended by new preparations. The newly developed polio vaccine Virelon' was put on the market in the autumn of 1958.

Wacker-Chemie GmbH., München, distributed a dividend of 11% for the year 1957. In November 1958 1% of the company's capital was transferred back to Farbwerke Hoechst AG. and as a result the 50:50 ratio first created in 1920 was restored.

Duisburger Kupferhütte, Duisburg, in which Farbwerke Hoechst AG. participates to the extent of 30.1%, distributed a dividend of 7% for the year 1957.

Within the framework of the re-organisation of participations in respect of Ruhrchemie AG., Oberhausen-Holten, Farbwerke Hoechst AG. acquired 25% of the DM 60m. share capital of the company in April 1958.

Bunawerke Hüls GmbH, Marl, in which Farbwerke Hoechst AG. has an interest of 16 2/3% through Synthesekautschuk-Beteiligungsgeselleschaft mbH., Frankfurt (Main), completed its plant for the production of synthetic. The plant's capacity amounts to 45,000 tons a year.

Abieta Chemie GmbH., Gersthofen near Augsburg, a company with a capital of DM 2.2m. in which Farbwerke Hoechst AG. holds an interest of 50% began the production of auxiliaries for the manufacture of buna in September 1958.

Personnel

The Hoechst Group as a whole employed altogether 43,328 people at the end of 1958, compared with 42,739 at the end of 1957. As a result of rationalisation and of new automatic plants being put into service, there was no further increase in the Group's labour force during the second half of 1958.

Balance Sheet

The consolidated balance sheet at December 31, 1958, included the balance sheets of Farbwerke Hoechst AG. and of those of its German subsidiaries in which it has an interest of more than 50 %, with the exception of housing organisations and welfare institutions. Investments in plant installations of DM

the extent of DM 158.4m. Fixed assets rose by DM 137.4m. to DM 982.9m., including an increase of DM 47.9m. with the associated companies. They are covered by the Company's own resources as well as by the loans floated in 1957 and 1958.

Annual General Meeting

At the Annual General Meeting of May 14, 1959, when more than 78.7 % of the share capital was represented, it was resolved to distribute a dividend of 14 % for 1958. Turnover during the first few months of 1959 was again bigger than that of the corresponding period of the previous year.

Capital Increase

The Company's share capital was raised by DM 94m. to DM 556m. in the spring of 1959. The funds accruing from this increase are to be used to finance further investment projects and to facilitate the maintnance of a sound ratio of capital and reserves to credit balances.

Threlfall's Brewery Company

RESULTS EXCEED EXPECTATIONS

The 72nd Annual General Meeting of Threlfall's Brewery Company, Limited was held on June 11th in London.

Mr. F. Cornwall (Chairman and Managing Director) presided and, in the course of his speech, said:

The profit from trading and other Income of £1,066,833 bears a very favourable comparison with last year. These results, I am happy to say, proved to be considerably better than anticipated in the early part of the financial period.

Although the Gross Profit and Interest on Investments shows a small reduction, the Net Profit, after taxation and making the requisite adjustments in respect of prior years' tax provisions, is substantially higher at £445,062. These figures constitute a record for the Company, and amply justify the Directors in recommending a further increase of 1% in the Ordinary Sock Dividend.

It is very essential that the intensive work carried out at various Hotels since the relaxation of building restrictions should continue to conform to the high standard and reputation of the Company. Very large sums have been expended in modernising and improving them as I have previously informed you, and this activity is a continual process, the end of which is not yet in sight.

Budget: The reduction in the Beer Duty made by the Chancellor of the Exchequer in his last Budget has been generally welcomed. The Duty on Beer has undoubtedly been excessive for some years, and was having a detrimental effect on the trade, not only in our own areas, but throughout the country. The reduction of 43/7d. per barrel, which has enabled the price of Beer to be reduced by 2d. per pint, should definitely arrest the decline which had become apparent, although it remains to be seen whether the anticipated increase of sales will materialise. The reduction, as I have said, was generally welcomed by the Trade as a step in the right direction, although to some extent our profit per barrel will be reduced. This does not cause us undue anxiety, a much more important point being that many of our patrons working in Heavy Industries and at the Docks, after a hard day's work, can now satisfy their thirst at less cost.

New Hotels: At the present time, four new Hotels are in course of erection—two to replace existing premises, and two in new Housing Areas. Many of our Houses have been extensively altered and improved during the year. I am happy to report that the Strand Hotel at the Pier Head at Liverpool, which, as I informed you last year, was the largest project undertaken by the Company, has now completed a full year's working, and your Board are very satisfied with the result.

The Chairman gave an up-to-date picture of the progress of the Liverpool pool Brewery reconstruction, and said:

The expenditure involved in the work has been high, and considerable sums of money are still required to finance the carrying out of the alterations still to be done. During the year, some British Government Securities have been sold and the proceeds utilised for this purpose, and it may be that more will have to be disposed of during the current year. You may rest assured that this matter is one which is receiving my own close and personal attention.

The report and accounts were adopted and the total Ordinary Stock dividend of 22% for the year was approved.

Union Insurance Society of Canton

The annual meeting of the Union Insurance Society of Canton Limited was held on May 28th in Hong Kong, Mr. J. F. Macgregor, the chairman, presiding.

The following are extracts from the report and accounts and his circulated statement:

Marine.—The net premiums for the year amounted to £2,856,361. After realising £275,000 to Profit and Loss Account the Marine Fund stands at £4,698,224.

Fire.—The net premiums for the year amounted to £3,773,932. £203,854 has been transferred to Profit and Loss Account. The Fire Fund stands at £2,197,553.

Accident and General.—The net premiums for the year amounted to £5,559,187, £360,703 has been transferred from Profit and Loss Account. The Accident and General Fund stands at £2,624,986.

Profit and Loss Account.—Interest dividends and rents amounted to £607,361 and transfers from underwriting accounts to £118,151. The profit for the year appertaining to the Society is £339,103.

The general world-wide pattern of our business in 1958 shows improvement upon that of the previous year but in the Accident Department the profitable results have been insufficient to meet the losses arising from our operations in Europe and South Africa. However, it is encouraging to note that the overall trend in Canada is now much improved and results from this important field should in the future reflect the new rating structure and cover granted by policies. The Fire results in the United States of America are again unsatisfactory.

The report and accounts were adopted.

DAVIS AND TIMMINS

SUBSTANTIALLY IMPROVED RESULTS

The sixtieth annual general meeting of Davis and Timmins Limited was held on June 4th in London.

Mr F. Le Neve Foster (the chairman) presided and, in the course of his speech, said:

The results show a substantial and welcome improvement. The Group Profit for the year, after depreciation, Directors' emoluments and Loan Stock interest, etc., is £198,398, as compared with £164,236. The improvement which is apparent, is all the greater when I remind you that the figure for 1957 included a transfer from Stock Contingency Reserve of £32,000. The Net Profit, after provision for taxation, amounts to £106,071 as compared with £103,791 for the previous year which also included the £32,000 transfer I have mentioned.

The Directors recommend a final dividend of 14 per cent, making a total of 20 per cent for the year on the issued Ordinary Capital as against 18 per cent for the previous year.

The total net requirements for our Preference and Ordinary Dividends for the year amount to £57,069 which is amply covered by the net profit, after taxation, of £106,071 and the Directors consider that the proposed increase in the Ordinary Share Dividend therefore, is well justified by the results and the financial position.

The Consolidated Balance Sheet shows a strong position. Capital and Revenue Reserves (exclusive of the Reserve for Future Income Tax) total £652,090, which is considerably in excess of the issued Ordinary Capital of £442,500. This figure takes no account of the valuable goodwill of our business, or the fact that the present day value of Fixed Assets greatly exceeds the Balance Sheet figures. The Trade Investment shows an appreciation at market value at the end of the year of £46,875. Net current assets, less liabilities and provisions, show a satisfactory increase of £50,284 during the year.

We have taken further major steps to improve efficiency. The largest of our machine shops has been completely replanned to obtain more economic handling of materials and products. More special purpose machines of our own designs have been installed to replace less efficient machines of orthodox types. By these means substantial overall economies have been achieved and we have greatly reduced machining costs on a variety of products.

Particular attention has been given to extending our range of products and we have again successfully broken into markets hitherto outside our normal sphere.

The report and accounts were adopted.

AUTOMATIC TELEPHONE & ELECTRIC COMPANY LIMITED

Annual Report and Accounts of the Group for the Year ended 31st December 1958.

	1958	1957
	£	£
Profit (after depreciation, etc.)	1,554,139	1,981,905
Taxation	525,631	842,761
Net Profit	1,028,508	1,139,144
Dividends	*280,625	338,545

Fixed Assets	5,472,029	4,707,216
Trade Investments	733,114	534,798
Net Current Assets	8,661,965	8,291,097

* In making their recommendations for the Final Dividend on the Ordinary Stock and the Dividend for the year on the Deferred Stocks, the Directors have had regard to the provisions of the Finance Act, 1958, relating to Profits Tax on distributed Profits. They have declared a Special Interim Dividend of 6% less taxe for the year ending 31st December, 1959, on the Ordinary Stock and Deferred Stocks, payable on 6th June, 1959. The Special Interim Dividend will not be taken into account in considering the payment of other dividends for the year ending 31st December, 1959.

The following is an extract from the Statement to Stockholders made by Sir Thomas Eades, Chairman:—

"Although there was some diminution in the Sales turnover of the Parent Company in 1958, the turnover for the Group as a whole was comparable with that of the previous year.

At home our main customer is the Post Office, and as I told you last year, their expenditure programmes for 1958 and 1959 were reduced as part of the Government plan to restrict expenditure in Nationalised undertakings.

Whilst we see no immediate sign of the World Economic situation completely recovering, looking ahead there are hopeful signs of gradual trade improvement, and recognising that the saturation point in Telephone development has not been, and possibly never will be reached, we are confident that a promising future exists for the industry. In this the A.T.E. Group is well equipped to play its part."

THE INDUSTRIAL AND GENERAL TRUST

REVENUE SURPASSES ALL PREVIOUS RECORDS

The 51st annual general meeting of The Industrial and General Trust Limited was held on June 11th in London.

Sir Edwin S. Herbert, KBE, LL.B (the chairman), presided and, in the course of his speech, said:

In June last, £1,875,000 from Reserves was capitalised to enable us to issue to Ordinary Shareholders one new fully paid Ordinary Share for every two Ordinary Shares held by them on the 20th May, 1958. This should be borne in mind when considering the proposed Ordinary dividend for the year under review, or making comparisons with previous years.

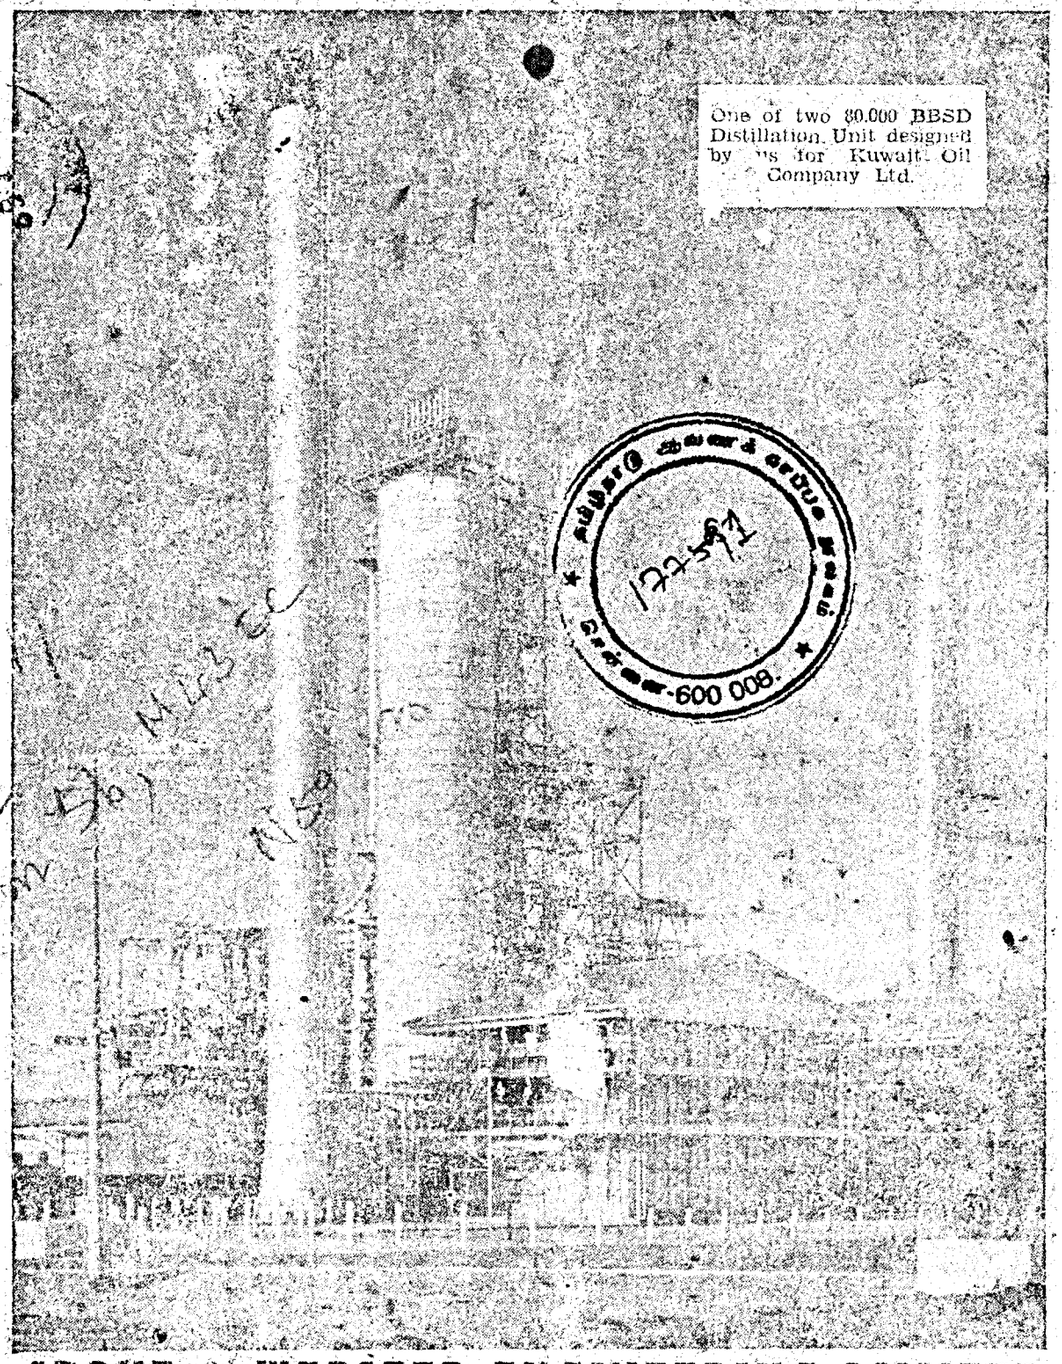
Our gross revenue this year at £1,812,000 is not only some £85,000 more than last year but also surpasses all previous records of the Trust. I might also add that this Revenue figure compares very favourably indeed with that reported by any other Investment Trust in the United Kingdom. In fairness, however, it should be noted that we have had some additional income from the new money raised by the Rights Issue in January, 1958.

After taxation and all other working expenses there remained £885,912, which, with the amount brought forward, gives an amount of £1,207,381 to be dealt with. We recommend a final dividend on the Ordinary Capital of 10 per cent, making 20 per cent for the year. This payment is not directly comparable with the dividend paid last year but if an adjustment is made for the changes in Capital then the dividend recommended for this year compares with about 18 ¾ per cent paid last year.

An outstanding feature of the financial world in the post war years has been the number of company mergers by one means or another and the year under review was no exception. Such arrangements are always difficult to negotiate and a certain degree of secrecy must surround them particularly in the initial stages, if the interests of the Shareholders concerned are not to be adversely affected. However, a tendency has been developing to carry reticence too far. We have seen cases where Boards ask Shareholders to increase the capital of the company by a substantial amount, with such an object in mind, but no information is, in fact, given to the Shareholders with regard to the Board's intentions. The Shareholders are subsequently presented with a "fait accompli" which they may or may not approve.

This must be wrong in principle. Nobody wishes to curtail unnecessarily the powers of a progressive Board but where any change in the control of a company is envisaged or the nature of the company's business is to be changed then, in my mind, there is no doubt that Shareholders should be first consulted before such changes are made.

Much prominence has been given recently to the development and expansion of the Unit Trust movement. Undoubtedly this serves a useful purpose but so much has been written about it that it has tended to obscure what has been done in recent years to bring the Investment Trust, with all the advantages it offers to the small investor, within his reach. In this Trust the Ordinary Capital has been converted to 5/-shares which are quoted and dealt in on this basis. The result of this improved marketability is that since 1950 the number of holders of Ordinary Shares has increased from some 4,200 to over 7,800; of this number nearly 21 per cent hold 500 shares or less. Moreover, in our experience the small investor, who has bought a holding, is generally speaking, content to retain it indefinitely, presumably well satisfied with the return on his investment and the growth which has taken place over the years.



You will remember that in the past I have been one of those who deprecated the issue of non-voting shares. The arguments against them are, no doubt, familiar to you but the principal objection to them is that those who hold them are disenfranchised. It is, therefore, with interest that I noted in the press this morning that the Committee of the Birmingham Stock Exchange has decided that in future it will not, except in special circumstances, grant an official quotation to an issue of non-voting shares in ceses where Birmingham is the principal market for the shares of the company concerned.

The report was adopted.
