# FOREWORD

> It is impossible that our merchants and our missionaries can course up and down the inland waters of this great region, and traffic in their cities and preach in their villages, without wearing at the crust of a Chinaman's stoical and skeptical conceit. The whole present system in China is a hollow thing, with a hard brittle surface: we try in vain to scratch it; but some day a happy blow will shiver it. It will all go together.[1]

As the China correspondent of England's most influential newspaper a century ago, Mr. Cooke wrote in those far-off, fortunate days when observers of Far Eastern affairs prepared their dispatches at leisure and sent them off by fast clipper ship clearing Shanghai or Canton every fortnight. His judgment that the "whole present system in China is a hollow thing, with a hard brittle surface" has lingering echoes today, though a "happy blow" which will "shiver" mainland China appears to be the least likely solution to the problem of Chinese Communism.

The present situation on the China coast is at once more complex, more refractory, and more explosive than any which existed in the nineteenth century. It has grown out of a half century of Chinese history and out of four specific developments in the Far East during the past decade:

First, the Chinese Communist Party has consolidated total political and military power on the mainland of China.

Second, Communist China has emerged as a major Asian power.

Third, the Sino-Soviet alliance has become a key factor in the structure of world politics.

Fourth, Nationalist China has been driven from the mainland to a new base in Taiwan.

As a result of these changes, the Chinese political landscape has altered drastically and decisively. This issue of THE ANNALS, designed to update the *Report on China* issue of September 1951 edited by Professor H. Arthur Steiner, presents the results of some current thinking and research on some of these alterations. The first three articles provide perspective: they review the trends in China during the 1900–1950 period, appraise the general dimensions of the present situation, and delineate the assumptions underlying current United States policy. The major portion of the volume is devoted to the domestic scene and to the international relations of Communist China, and the final papers deal specifically with Taiwan and with the overseas Chinese in Southeast Asia. While this volume appears at the beginning of 1959, all articles were of necessity completed in the autumn of 1958.

The overwhelmingly dominant segment of the China scene today is Communist China. During the past decade, the Chinese Communists have welded the mainland into a single political unit for the first time in the experience of living Chinese. They have established a unified structure of organizational control embracing roughly a quarter of the earth's population. And they have embarked upon a program of total mobilization of mainland China's energies and resources

[1] George Wingrove Cooke, *China: being "The Times" special correspondence from China in the years 1857–58* (London: G. Routledge and Company, 1858), p. v.

to attain their long-term domestic goals: modernization and industrialization. In the economic sphere, the Communist leaders in Peking are following, basically, the course taken by the Russians a generation ago. They aim at a high rate of national economic growth characterized by a high rate of net investment and by a pattern of investment allocation giving priority to heavy industry. Against this background of economic expansion, mainland China during 1958 launched another major political and social transformation through the establishment of large-scale "people's communes" designed to be the "primary unit" in the reorganization of Chinese society on collective terms. While the long-range implications of the new communal system are unclear, its immediate utility is apparent. The system provides Peking with a nationwide series of huge labor units, mobilized and regimented, to carry out state projects—agricultural, industrial, or military—as required.

The price of totalitarian advance toward the goal of maximum national power has unquestionably been high. Many frictions, inherent in the wrenching processes of political, economic, and social reorganization, have become apparent; an unknown quantity of discontent has accompanied the intensive changes pressed in both countryside and city. Yet the Communists retain a firm grasp upon the essential levers of control and upon the loyalties of substantial groups in the Chinese population, with the result that dissatisfaction and resentment have not burgeoned into active resistance sufficient to affect the viability of the regime.

The record of the past few years indicates that Communist China has, on balance, expanded its national capabilities at a more rapid pace than that attained by Russia during the comparable period after the Bolshevik Revolution of 1917. This coercive effort aimed at the accelerated development of a strong base for Chinese national power—industrial, technological, and military—has manifold international implications. Allied with the Soviet Union, Communist China is committed to maintaining the unity and increasing the strength of the Communist bloc. At the same time, the rulers in Peking are pursuing an active foreign policy aimed at consolidation of national security interests, at extension of Communist influence and authority in Asia, and at attainment of international status as a major power.

So far as the United States is concerned, the emergence of Communist China as a major factor in the politics of contemporary Asia has posed critical problems both of national policy and national understanding. Yet (outside the American government) the search for an adequate and expanding body of reasonably reliable data and for informed interpretation on contemporary China has been only intermittent and inadequate. In part, this lag has been due to a domestic milieu which tended to make China an issue for partisan controversy rather than a subject for detached appraisal. And, in the universities, serious work has been hindered by propinquity in time, by paucity in trained manpower, and, not least, by the fact that the study of China has traditionally been oriented toward historical and humanistic inquiry.

In this situation, the universities of the United States now have a unique opportunity to develop more empirical and analytic studies of current Chinese problems and to expand the application of the social science disciplines to a major and still relatively unexplored sector of the non-Western world. Since the Chinese Communist system promises a relatively high survival potential, the problem of understanding its present structure and of estimating its future course of devel-

opment constitutes one of the primary issues facing the United States today. The papers in this issue of THE ANNALS reflect both the strengths and the limitations of our present state of knowledge. While they provide no final answers to the dilemmas inherent in a subject at once contemporary and controversial, these articles suggest the range of problems remaining to be explored and indicate again the growing need for increased programs of training and research attuned to current as well as past perspectives in Asia.

# Modern China in Transition, 1900–1950

BY MARY C. WRIGHT

ABSTRACT: Contemporary China can only be understood in relation to its recent past. During the half century before 1950, Chinese history was marked both by the vigorous persistence of tradition and by the emergence of powerful revolutionary drives. With the final collapse of the imperial system, China sought meaningful values and effective institutions which could realistically link past, present, and future. Chinese nationalism, combined with traditional xenophobia, was a major impelling force during these years. Nationalism manifested itself in the widespread desire for political stability and for a strong central government capable of effective action both domestically and internationally. The struggle for modernization affected both countryside—where fundamental institutional changes were required to ameliorate the living standards of the peasant base of Chinese society—and city—where the process of social and economic change had drastically uneven results in human terms. The control of military power was a key element in Chinese politics throughout the republican period. The spreading of political awareness through broadened programs of public education brought with it a sharpened realization of how much more could be done to modernize China given a strong and efficient government. The trend toward democracy—in some senses of the word—was apparent in China; but neither of the major political movements, the nationalist or the communist, stressed two elements considered essential in the West—civil liberties and government by majority decision.

*Mary C. Wright, Ph.D., Stanford, California, is Associate Professor and Curator of the Chinese Collection at the Hoover Institution, Stanford University. She is the author of The Last Stand of Chinese Conservatism: The T'ung-chih Restoration, 1862–1874 (1957), has published a number of articles on modern and recent Chinese history in professional journals, and is an Editor of the Journal of Modern History. She spent seven years in study and research in the Far East.*

MOST Americans had little occasion to think seriously about China until Communist China began to emerge as a major power. Even those who were especially interested in China seldom gave systematic attention to the current scene. Scholars nearly all studied periods before—usually very long before —1900. Missionaries, government officials, businessmen, and military personnel were absorbed in pressing daily tasks. Most lacked the training, even if they had the time and inclination, to observe perceptively and to gauge accurately the momentous changes occurring around them. A handful of journalists made outstanding efforts to find out what was really happening, to set it in its epochal context, and to report it in readable English. Yet even among these, a working knowledge of the Chinese language and a familiarity with recent Chinese history were rarities. No one doubted that a grasp of the background was essential, but the background grasped was a strange blend of conflicting myths that have remained to block our comprehension of contemporary China.

## COLLAPSE OF THE MIDDLE KINGDOM

Everywhere in the world the headlong changes that marked the first half of the twentieth century dwarfed the slower changes of earlier centuries; but nowhere did these changes so stagger the imagination as in China. The longest lived and most populous polity in world history had changed so slowly over millennia that sometimes it seemed not to have changed at all. Certainly there had been nothing remotely comparable to the steady and accelerating transformation of European life beginning in the late Middle Ages. Then suddenly and nearly simultaneously China was struck with equivalents of the Reformation, the French Revolution, and the Russian Revolution. Marx and Darwin were new, but no newer than Aristotle and Rousseau. Young Chinese discovered them all at the same time.

This unprecedented telescoping of history was at first obscured by the continued and obviously vigorous persistence of the many ancient ways that so delighted all visitors. In the midst of a living antiquity unparalleled in the modern world, the signs of the progressive stages of a great revolution were generally discounted. Our experience had not prepared us for a society marked both by strong tradition and by powerful revolutionary drives. The signs of tradition were plain to see and comforting. The signs of revolution could be dismissed as superficial. There were such very wide troughs between the waves that at the time we could not see that there was any cumulative build-up. Today in retrospect, the classic French and Russian sequence is clearly outlined. The Chinese timetable, however, was so different that by the time we began to suspect that we might be seeing the beginning of a great social revolution, the revolution was already far advanced.

The basic thread of Chinese history during the first half of the twentieth century was the search—sometimes ebullient, often heartbroken—for new institutions in every sphere of public and private life, institutions which would connect the pride in a great past to high hopes for a great future. In the tumultous controversies of fifty years, the Chinese centered their attention on one or another facet of a few great questions: What of the old is worth keeping? Can we keep it and survive in the modern world? What of the new is desirable? Must we take the undesirable too in order to survive? Or can China make a future for herself on lines not yet tried elsewhere? These questions were of mounting urgency, for the

Chinese state was prostrate and Chinese life seemed to be disintegrating.

## THE FORCE OF NATIONALISM

Because vigorous nationalism provides built-in incentives which a successful government can use to spur and control its people, the growth of nationalism was one of the most significant features of China's recent history. When the twentieth century opened, the power of the Chinese Empire was a very recent and live memory. Hence the shattering series of stunning defeats at the hands of the Western powers and Japan was especially galling. We did not give enough attention to the sharp and swift rise of fighting nationalism. Daily observation of the polite and humorous Chinese, plus a little dabbling in Chinese philosophy, led to the myth that the Chinese were only interested in their own families, that they had no conception of country. Everyone could tell a story to illustrate the point, from the embassy to the kitchen level. Opposite conclusions were drawn from this alleged basic characteristic of twentieth-century China: The Chinese were venal and lacking in decent feeling for the public good, or the Chinese were charming sages happily free of the lusts for power that had wrecked what had been European civilization until 1914. But in either case, the basic analysis was dreadfully faulty.

There was in fact a genuine groundswell of Chinese nationalism during the first half of the twentieth century, and for its element of xenophobia there were clear historic roots. So much has been written lately of Chinese popular good will toward foreigners until they were brain-washed en masse that at the risk of gross oversimplification, something should also be said of Chinese bitterness and hatred toward Americans and Europeans in recent decades. The crude fear of the white peril that the last imperial dynasty had been able to exploit in the Boxer Rebellion of 1900 had been submerged but not overcome, and the expanding special privileges of foreigners were irritants in increasingly wide spheres of Chinese life. These fears and irritations provided a mass sounding board for what might otherwise have been rather arid denunciations of imperialists. It is well to remember that both Nationalists and Communists have struck this note; that Chiang Kai-shek and Lenin described the tangible effects of imperialism in remarkably similar terms.

## THE SEARCH FOR POLITICAL STABILITY

The increasingly patent ineffectiveness of political leadership and institutions was a no less important characteristic of twentieth-century China. This phenomenon was obvious to all, but it was misinterpreted because we did not attach enough importance to the fact that political decline was accompanied by repeated efforts to reconstitute a powerful central government. When government was weakest, the pressures for strong government were greatest, for it was then that both traditional culturalism and modern nationalism were most offended. The various movements and programs that expressed these pressures struck us as rather silly, and the myth grew that Chinese politics was horseplay among warlords with silver bullets. Warlordism was of course a fact, but we were wrong to conclude from this that the Chinese people opposed strong government, or that no central power could be effective throughout so vast and undeveloped a country. The imperial tradition of strong central government never died, and now in retrospect one is struck by how much authority the central government did in fact retain until 1917. Even the "warlord period," 1917–27, was no era of general collapse of cen-

tralized authority, for the warlords themselves operated effective political machines over substantial territories. More important, the major contenders for power aimed consistently at the reconstitution of a powerful central state. As external dangers and internal crises mounted, the population of the country did not remain as apathetic and cynical as was thought in Treaty Port circles. On the record of performance it is clear that increasingly wide sectors of the population were prepared to throw their support to whoever gave most promise of effective central government.

The terrible strains of the period notwithstanding, the country remained vigorous, and tremendous new potentials were created in spite of war and inadequate leadership. We were too given to pity for a suffering and downtrodden people, and the pity irked. Widespread suffering there was indeed, but at its lowest point twentieth-century China was no beaten and stagnant country. Rather it offered the world the remarkable spectacle of a people whose ancient institutions had retained great vigor and effectiveness until very recent times; a people with a well-justified pride in the record of a great and prosperous state as well as in their intellectual and artistic heritage; a people who were learning modern skills rapidly and well and yet who with all this promise felt themselves in danger of national extinction because they had found no way to mobilize this latent strength for defense against aggression and foreign special privilege, for raising the standard of living, for a cultural renascence.

## AGRARIAN CHINA: PEASANTS AND POLITICS

During the first half of the twentieth century, China remained an overwhelmingly agricultural country. Although the proportionate position of the agrarian sector of the economy declined somewhat, the peasant's produce remained the chief source of revenue and his tax burden increased steadily with the rising cost of more elaborate arms, proliferating government offices, and the service of foreign loans. The terms of rural credit were devastating and tenancy increased, especially in the vicinity of modernized cities. The increased acreage planted in cash crops undermined the traditional self-sufficiency of the village, and cottage industries, once an important source of supplementary income, either disappeared or were bought by merchants. The self-employed artisan all but disappeared, and there was little to mitigate the harsh consequences of the imbalance between the high market value of manufactured goods and the low market value of agricultural products.

No patriotic Chinese could remain insensitive to the plight of the peasant base of society, even if the interest was only theoretical. The programs of the warlords regularly mentioned the need for reforms. The Kuomintang, which came to power in 1927, also had an elaborate rural program; its implementation was unfortunately delayed until threats from the Chinese Communists and from Japan could be removed. Perhaps more important as a symptom of the same kind of guilty uneasiness that drove prerevolutionary Russian intellectuals into populist movements, there was a rash of local experiments in rural reconstruction, sparked mainly by liberals of the minor parties whose programs lay somewhere between the Kuomintang and Communist poles. These efforts were important signs of the times; yet the country was so vast that major accomplishment could not really have been expected without strong government support. They were obliterated in the holocaust of the Japanese invasion.

One barrier to the implementation of the Kuomintang land reform program was the landed wealth of its members. There were exceptions of course, especially among Kuomintang members from the modern business and professional classes. Even among these, however, there was fear that a land reform program, once launched, might gain too much momentum and turn against the Kuomintang. After 1937, with the loss to Japan of the modern cities these men represented, the Kuomintang became increasingly dependent upon the rural economy and thus upon the support of ultraconservative landlords in the hinterland.

Meanwhile, the Chinese Communist Party, founded in 1921, moved rather quickly away from the classic Marxian distrust of the peasantry. The party line shifted tortuously on this as on other points, yet within a few years Mao Tse-tung and others were demonstrating their skill in peasant agitation. Kuomintang realization that peasants when aroused would almost certainly swing to the Communists was a major cause of the breakup of the first Kuomintang-Communist united front and of the Kuomintang's swing to the right after 1927. Driven back into the countryside by the victorious Nationalist armies, the Communists began a long series of land reform experiments, varying according to circumstances from moderate rent reduction to wholesale confiscation. By degrees the Communist party learned how to mobilize peasant support. The Chinese peasant loved his land, but by the third and fourth decades of the twentieth century it could no longer keep him alive without radical changes, and only the Communists offered these.

During the civil war, 1946–49, the Communists succeeded in using land reform as a major political and military weapon. The national government, threatened on all sides, was not prepared to take any very drastic steps. The Chinese-American Joint Committee on Rural Reconstruction struggled manfully to improve agrarian technology in the hope that, with an increased harvest, the peasant's plight could be eased without damage to landlord interests. The conclusion of the outstanding Chinese official chiefly responsible for the effort was that nearly everywhere technological change proved impossible without fundamental institutional change; that indeed without social reform, the peasant could not take advantage of improved methods, and his position often actually deteriorated.

## URBAN DEVELOPMENTS

Before 1950, the modern sectors of the Chinese economy lagged so far behind the West, Japan, and even India that one did not usually notice how great the development had been between 1900 and 1950. Beginning in the 1890's, Chinese of a new type, scholar-officials who were also entrepreneurs, began to build substantial modern factories. Mining, railroads, and shipping developed rapidly. The physical plant, the labor force, the managers and technicians required for a modern economy began to appear in increasing numbers. The potential was there for anyone to see, and yet it could not be realized. To the Chinese, this was infuriating. The chief barriers seemed to be inept and predatory government, fragments of traditional social institutions, drainage from the country of the profits from the enormous foreign investment in China, and the special protection that the unequal treaties provided for foreign interests, often directly against Chinese interests. Many Chinese businessmen, who enjoyed a boom while privileged Western competition was deflected by World War I, became in a sense revolutionaries, precisely because they were

patriots and businessmen. They supported the Kuomintang in its bid for power, 1924–27, because of its program to abolish imperialism; to create an effective, modern, centralized government; and to campaign relentlessly against the shreds of the Confucian order.

During this period, strikes and other signs of labor unrest were widespread, especially in foreign-owned enterprises. The foreigners' customary retort that their labor was at all events much better paid than other Chinese labor was irrelevant. Chinese peasants coming to work in factories for the first time suddenly saw much greater gaps between poverty and wealth than they had ever seen before. The poverty, and it was still extreme poverty by any standards, was theirs; the wealth belonged to foreigners and to a few Chinese who could readily be labeled running dogs of the foreigners, and it was often displayed in a manner that could scarcely have been better calculated to offend.

This frustration was felt in many spheres of Chinese society. The professional diplomats of China, skilled though many of them were, made only limited and gradual progress toward abolishing the unequal international status that outraged Chinese of every political persuasion. The Japanese invasion of the mainland struck at the very core of China's national integrity, and the international complications of the war period left a tangled legacy of misapprehensions and misunderstanding. Western relinquishment of extraterritorial privileges during the war came far too late, and the continuing major role of the United States in the postwar period convinced many Chinese that the national government was incapable of independent action. To these Chinese, the situation seemed further proof that diplomatic resources, like economic resources, were useless to a weak government and that military power was essential to political effectiveness.

## The Key Role of Military Power

The new importance attached to military power was another major characteristic of modern Chinese history. Chinese had never been the pacifists that we often fondly imagined them to be, and it had been clear to them since their first contact with the military power of the West that only a country with strong armed forces could elect its own policies. For a century there was a steady sequence of military reorganization programs. Every program failed; never was the required fighting strength achieved; never was a war won. Yet what was accomplished in inadequate bits and pieces convinced nearly all Chinese that China need not forever be a pawn in world politics; that there were no insuperable obstacles to genuine great power status. Experience had shown that Chinese peasants could be trained to use modern weapons efficiently and that they could on occasion fight with unsurpassed valor. Why was the opposite so often the case? Experience had shown that the country had the natural resources and the technological aptitudes needed for a modern arms industry. Why had one not developed? China had a small number of skilled strategists and effective line officers. Why were they not better deployed, and why had not many times their number been trained? The popular feeling as defeat followed defeat was less one of despair than of anger at the waste of opportunity. To a desperate government, massive outside aid seemed the only answer. To many Chinese, so much foreign aid to so weak a government seemed bound to lead to spiraling dependence. The suggestion that this was the intention of the aid fell on ready ears.

## Education

Some observers insisted that the Chinese attitudes described above were limited to a tiny and powerless fraction of the population. They failed to note how rapidly political awareness was spreading through education and propaganda. It would be difficult to find any period in the history of any country where education was expected to work the miracles it was expected to work in twentieth-century China, and very nearly did. The dominant Chinese tradition, in marked contrast to Western tradition, had always held that men are by nature good and that although their talents vary, the variation has nothing to do with class. Hence education, on which an enormous value was placed, was theoretically as desirable for the lower classes as for the upper. It had always been gratifying rather than terrifying to see the son of a peasant attain a high education with all its consequent rewards. His chance to do this was slim indeed, but the barrier was economic only.

With the twentieth century, the peasant's chance at education began to improve rapidly. The missionary schools and the new government schools provided only a fraction of the facilities that would have been required for universal public education. Even so, they were closer to such a system than they were to the traditional system of tutors and academies. The way seemed open in the not too distant future for every Chinese to be given a basic education and for the ablest Chinese to be given the highest education. But to attain this end, vigorous government action was needed. Successive governments made some contribution, but only under heavy pressure from the leaders of public opinion. Education had a low priority on all budgets, and as new ideas mushroomed, some of those in power came to cherish an illiterate population. Mass education movements found contrived obstacles rather than the support they needed. Too many schools remained under foreign control, and it was humiliating to realize how dreadfully the foreign schools were needed. There was almost no field in which China offered full advanced training, this despite the world renown of many of her scholars, once they were trained abroad.

## The Chances for Democracy

Thus in education as in other fields, progress led not to stable satisfaction but to a sharpening awareness of how much more had to be done, and, it was believed, could be done, if China had an effective and efficient government. There were fifty years of controversy over the kind of government China had and the kind of government she needed. The trends were frequently confusing, for in China political characteristics that the West regarded as inevitably associated were often in conflict, and others that the West regarded as mutually incompatible were sometimes fused.

During the first half of the twentieth century, the trend toward democracy was strong in China—in some senses of the word. Legally privileged classes had already disappeared, and as the upper classes continued to expand rapidly in size, there were in China millions of families of some little importance rather than a few hundred very powerful ones. The open classes of the traditional society became highly fluid during a period of such rapid change. The country had since early times been culturally homogeneous, vertically as well as horizontally. Of course there were popular cultures, elite cultures, and subcultures, but nothing resembling the cultural cleavage between classes that until recently characterized much of Europe.

With the spread of modern public education, few cultural stigmata of class origin remained. Traditionally, popular opinion had been taken seriously by the government and after 1919 the media for its expression expanded like the burst of a Roman candle.

In all these meanings—and they are valid meanings—twentieth-century China was democratic, and increasingly democratic. Yet this trend toward democracy lacked two elements considered essential in the West. There was no trend toward the establishment of civil liberties and there was no trend toward government by majority decision.

Neither of the two major political movements—the nationalist and the communist—showed any real interest in civil liberties, or even comprehension of what they were. As in traditional China, whatever purported to be the interests of the group remained paramount. In the 1920's there were flurries of talk about civil liberties, mainly among intellectuals, but these were crushed from both left and right. In the 1930's and 1940's, internal crises and foreign aggression seemed to require unfettered action by a powerful government if there was to be a viable future for anyone Chinese. In such circumstances, it is not surprising that a demand for civil liberties came to seem a demand for a right to wilful self-indulgence. There was no thought that individual Chinese ought to be guaranteed some small but irreducible minimum of privacy and originality, an area that the state could never touch, however great the alleged public interest.

Nor was there any trend toward representative government in the first half of the twentieth century. In Chinese tradition there had never been any notion that the wisest decision could be reached by counting heads, even in a select group. Statesmanship had been the art of selecting, training, and indoctrinating a small corps of able men who could then be trusted to run every aspect of the public life of a vast empire. To secure popular assent to official decision was essential; to ask the people what the decision should be never remotely occurred to anyone. Within the official hierarchy there were intricate checks and balances, impeachments, conferences, and compromises, but no idea of majority decision. After 1912, the few efforts at a façade of parliamentary government were fiascos, and most Chinese of all political persuasions saw the main problem as the creation of a competent new political elite to fill the gap left by the collapse of the imperial system. The idea of military tutelage followed by political tutelage meant exercise of power on behalf of the people by a nonhereditary, authoritarian political corps. It was as basic to nationalist as to communist political thought. During the first half of the century, neither party relinquished its control to popular elections. In 1950, the promise of ultimate full democracy offered by either seemed remote.

# The China Problem Today

By JOHN M. H. LINDBECK

ABSTRACT: No change in the last decade rivals that which has taken place in the situation of China. The military victory of the Chinese Communist forces on the mainland in 1949–50 and the removal of the Nationalist government to Taiwan have created a radically different milieu in which the China problem must be viewed today. Four elements in this situation are of key importance: the direction of developments within Communist China as the Peking regime seeks to impose its coercive, high-speed program of modernization and social transformation on the Chinese people in an environment far different from that confronting the Bolsheviks in Russia in the 1920's; the benefits and liabilities derived from mainland China's special relationship to the Soviet Union; the changes and pressures in China's Asian environment; and the influence of American military and political power on Chinese developments. Russia and the United States both exercise immediate and direct influence on China's domestic and international position, but neither can fully control the evolving relations between China and her Asian neighbors. In this area, signs of flexibility and change have appeared during the past decade. Committed to its Russian connection and opposed to all signs of neutralism within the Communist orbit, Communist China has been unable to yield to the appeals of Asian neutralism but has sought to find some accommodation with it favorable to its own ends.

*John M. H. Lindbeck, Ph.D., New York City, is Deputy Director of the researc project on Men and Politics in Modern China, Columbia University. From 1952 to 195 he served as Public Affairs Adviser on Chinese Affairs, Department of State, Washingto and before that was Assistant Professor of Far Eastern Studies at Yale University. H is the author of "Communist China and American Far Eastern Policy" in The Depar ment of State Bulletin (1955), China Missionaries and American Foreign Policy: Th Boxer Period to be published by Harvard University Press, and has contributed articl and reviews to the Review of Politics, Far Eastern Survey, American Historical Revie Air Force Quarterly, and other journals.*

CHINA, a decade ago the sick man of Asia, now looks like Asia's strong man. Problems of economic modernization, social change, and international relationships have replaced those of the establishment of domestic order and political unity and effectiveness. In 1948 China was racked by civil strife and suffering the agonies of economic and social disintegration and chaos. In 1958 the mainland of China is under the firm control of a powerful government, making rapid progress in industrializing key sectors of its economy, undergoing widespread social change under forced draft, and possessed of Asia's paramount military force. By the end of the same decade 10 million Chinese on China's Taiwan margin had moved out of postwar disorganization and neglect, were under effective political authority of the Republic of China and, proportionate to size and resources, were making equal or even greater economic progress under less stringent social conditions and maintaining well-trained and equipped defense forces of over a third of a million men.

The United States in 1948 was deeply involved in Chinese affairs on the mainland. On a hundred fronts Americans sought to assuage Chinese suffering. While still seeking to complete the removal of all vestiges of Japan's imperial intrusion in China and trying diplomatically to fend off Russian designs, the United States government at the same time was withdrawing from official involvement in China's domestic strife. By 1958 no trace of American influence was tolerated on the mainland of China, which was intimately and almost exclusively associated with the Soviet Union. In 1948 there was one Chinese government with international standing, albeit diminishing prestige; a decade later there were two effectively organized governments competing for international status and influence. Largely unaffected by the emerging cold war conflict in 1947 and 1948, each of the Chinese regimes in 1958 was militarily allied and in close partnership with one of the two major nuclear powers locked in cold war competition, each defended by but also subject to the restraints of the overriding global interests of its stronger ally.

The China of today is not the China of yesterday. What are some of the key facets of the present situation which are shaping the future?

In the course of a single decade, several interrelated forces have radically altered the Asian scene and China's situation—the resurgence of Chinese power, the development of Sino-Russian affinities, nationalism's re-creation of Asian states, the confrontation of Communist and Free World power in Asia, and the economic quandaries of all Asian nations urgently trying to meet needs for both more bread and more guns. For the first time Asian governments confront, not primarily a comity of Western powers, but Asian power and problems. Within the framework of these major forces, the particular issues embittering international relationshi and challenging national policies a being worked out: the issue of divid states and the future of the two China the regional countercurrents of neutra ism and anti-communism, China's pla and influence in the new world of Asi militarization and cold war tension economic development and trade r strictions, recognition and political pre sures, and anti-Westernism. Whatev the problems, the essential fact abo China, both to the Chinese people an to China's neighbors, is the rapid d velopment since 1949 of centralize Chinese power on the mainland.

## CHINA'S STRENGTH

China's great lethargic body has bee pared of many encumbrances and s into brisk motion by an exclusive, resolute, and implacable group of men. Their organization of Chinese capacities and forms of Chinese power reflects merciless determination and the rigid prescriptions of the operational code of technicians—specialists in conspiracy and revolution. They have already gone far to meet the essential requirements of Chinese nationalism: consolidating the power of the central government for decisive and effective action; asserting Chinese power and authority with other states; and setting the Chinese people again on the road to economic and social modernization. Within their widening grasp, China's metropolitan domain now stretches from the lofty reaches of Tibet to gun emplacements on islands off its seaward coasts. Possessed of a near monopoly of power on the mainland of China, the regime has made notable achievements in the areas of its leading priorities: military, political, and economic.

### *Military, political, and economic accomplishments*

Order and discipline have been im-osed on China's armed millions. Cenrally controlled Chinese armies man its rontiers. Its regular military forces, sia's largest and mightiest, said in 956 to number 2.7 million men, have een streamlined and reduced somehat in number. They are organized nto armies with over 160 divisions; into n air force with more than 2,400 Russian planes, about two-thirds of which re jets, including recent fighter and omber models; and into a small but rowing navy reported to have 17 ussian submarines in addition to its rface vessels. Tank, artillery, and echanized units, undergoing a connual process of modernization, impress hina's neighbors. The people within hina have seen an additional and chastening segment of Peking's military power—security forces of about 700,000 men, now being placed under the regular army, and local militia units with 10 to 12 million men giving effect to Peking's domestic mandate.

Political power is wielded, first of all, through a dominating party of more than 12.5 million members who control virtually all key administrative and governmental posts. In every institution and organization throughout the country—and no significant field of activity remains unorganized—the ubiquitous party members or their nonparty surrogates are present as the controlling elements. Whatever efforts have been made to instill some semblance of life into the minor parties which make up China's multiparty political façade, their voices merely echo that of the dominant party for, indeed, they have publicly "surrendered their hearts" to the Communist party.

Its sure hold on military and political power has enabled the Communist state to force the pace of economic development and social change. In those areas directly related to the creation of a base for modern industrial and military power, progress has been substantial. The single-mindedness with which Peking is now pursuing its programs of modernization suggests that China may be well on its way to becoming a world industrial power. Having achieved by 1957 an industrial plant exceeding Russia's in 1932, Peking, alert to Chinese aspirations and with a close eye on Asian sensitivities to propaganda appeals, now proclaims that its aim is to "catch up with and surpass Britain within fifteen years or less in the output of major industrial products." As an essential aspect of this process, China is being forced through a rapid social transformation in order to absorb as speedily as possible all the elements of modern technology.

*Basic problems*

Many problems and many precarious elements remain in the China mainland situation. Some, like the growing pressure of population and the lack or insufficiency of some natural resources, flow from the natural situation. Others relate to the nature and policies of the regime. The most sensitive problems appear to lie in four areas: its relations to the Chinese people, the character and utility of its association with the Soviet orbit, its place in relation to the emergent nations of Asia, and accommodations to American power. In each of these areas the vital interests of China are at stake no less than those of the ruling regime—namely, the consolidation and development of power on a national basis within China, the success of programs of economic and social modernization, national security, and China's status and influence on the world scene. If at these points the policies of the regime seriously jeopardized or failed to sustain China's interests, the pressures both within and outside of the party leadership for major policy changes might tend to make the regime vulnerable to assault from without or to division from within.

Within China, one overriding decision has been taken which affects all others. For the foreseeable future, the regime has committed itself not to leading but to driving the Chinese people by means of systems of organized pressure and persuasion to develop an industrial, political, and military base for Chinese power. As dedicated Communist totalitarians, the leaders of the regime, while showing occasional signs of wavering in the application of this policy, have never seriously considered any other course. Human needs, cultural traditions, and social preferences are subordinated to the regime's demands for maximum national power. So long as it makes progress in its programs of economic development and modernization and maintains administrative efficiency, the regime is likely to have the co-operation of key Chinese groups who benefit from the system or are willing to subordinate other values to China's modernization. There is no doubt, however, that the perpetual tension between the people and the party and the constant use of compulsion present the regime and the people with problems of the most dangerous and persistent kind.

In this context the existence of a rival Chinese authority on Taiwan has special meaning. If driven too far, the discontent of disenfranchised Chinese may find support and leadership from the government on Taiwan. While this possibility seems remote, Taiwan does increase the vulnerability of Peking in its reliance on pressures and force in its relations to the Chinese people. Another unexpected consequence of Peking's policy of compulsions is that it has re-created for its once discredited rivals a new political base of popular support, of unknown magnitude on the mainland and of visible proportions among Chinese elsewhere on Taiwan and overseas. Unable to destroy the Government of the Republic of China by force without going to war with the United States, Peking runs the risk that in areas outside its control and possibly on the mainland itself, it may, through its harsh policies, lose significant ground in political competition with its rival on Taiwan which seeks to penetrate the weaknesses of its political relationships with the Chinese people.

Thus, associated with the resurgence of Chinese power on the mainland, the totalitarian character of the controlling regime is a dominating feature of the Chinese situation.

## THE RUSSIAN AFFINITY

Developments within China during the past decade are intimately related to a major alteration in the Asian balance of power flowing from the creation of a special Sino-Soviet affinity. Defined and dramatized in the Sino-Soviet alliance, this relationship has far more meaning than a military partnership: it has placed its mark on virtually all the works of the new Chinese regime and drastically reduced the options open to Peking in fashioning new structures of authority, in seeking the recovery and extension of China's international influence and position, in developing economic and military strength, and in restyling the social and intellectual dimensions of Chinese life. In 1948 Russian power in Asia was limited essentially to its own Far Eastern provinces, Outer Mongolia, and the northern portion of Korea. Ten years later a vast extrusion of Soviet influence makes it impossible to consider any major aspect of China's internal or external situation apart from Russia.

The extension of Soviet influence over China came not through conquest by Russian armies, but as a result of the active policy of Chinese Communists who were desirous of the rewards and willing to pay the penalties of membership in Russia's "socialist camp." The advantages to Peking are clear. The Russian connection has provided: military support by a major power; an assured source of technical and economic assistance for its plans of industrialization; ideological reinforcement for maintaining and justifying its domestic and external actions; international support in pursuing policies of pressure and penetration among its neighbors; and support in efforts to expel and undercut United States and Western influence and co-operation in Asia.

*Strengthening of bloc ties*

Although China's growing power, vast size, and Asian affiliations would appear to permit a more flexible and independent Chinese policy, the connection with Russia has been strengthened, not slackened. Indeed, the Chinese seem to be leading proponents of closer integration within the Communist orbit, proclaiming the slogan of "unity and solidarity under the leadership of the USSR." Committed at this stage to the harsh programs of early Stalinism, Chinese Communist leaders appear to be the principal opponents of "revisionism" and the chief advocates of unity and orthodoxy within the bloc. Their experience with liberalizing and innovating tendencies or experiments in the world of communism apparently convinced them that their present interests and future objectives would be jeopardized should such movements continue and expand.

The unnerving consequences in Hungary and elsewhere of the move to desatellitize the minor members of the bloc, discords resulting from initial ventures along "various roads to socialism," disturbing cracks in Communist unity that appeared in the de-Stalinization movements, the revelation of anti-Communist hostility within China during the liberalization movement of "blooming flowers and contending thoughts" all threatened to bring major troubles down upon the Chinese Communists and to decrease the advantages they sought from membership in the Communist camp. These advantages are so important to them that in their own interests they seek to prevent the growth of disunity and to move toward closer integration with other countries in Russia's sphere.

In the economic field, the initial reorientation of China's trading and credit relations, which by 1957 directed 50 per cent of China's trade toward Russia and almost 80 per cent toward the bloc, is now leading to further co-ordination within the Sino-Soviet system. In long-range planning, the new effort is toward "specialization of production" by national economics, "taking into account

the interests of the whole socialist camp." Initial steps in this direction apparently have been taken under the aegis of the eight nation Council for Economic Mutual Assistance with which the Chinese and Asian Communist regimes have become affiliated.[1]

In the military field, the trend also appears to be toward greater Chinese co-ordination with Russia. Following the entrance of Communist China into the Korean conflict, Russia undertook to assist it in creating a powerful, conventionally modern Chinese military force. However, its capabilities and use for major war in this transitional period prior to the maturing of an industrial and technological base make it completely dependent on Russia at crucial points. China must look to Russia for continued supply of key military components and in its military policies must accept the restraints imposed by its Russian ally who cannot permit Chinese local interests to precipitate a lethal global war. The strengthening of political and military co-ordination between the Chinese and the Warsaw Pact organization by developing global appraisals and unified bloc strategy will discourage national Communist leaders from making the mistake of overemphasizing the importance of local interests.[2] However, this also enables the Chinese, as close partners, to influence the use of non-Chinese bloc power to their advantage. Impressed by the international advantages of Russia's thermonuclear and technological achievements, the Chinese, far from resisting this integration and co-ordination, are its active proponents and have given it their full endorsement.[3]

The political relationship of China with the other members of the bloc has been developed with the manifold completeness with which totalitarian systems seek to encompass all major areas of activity. Through the decade, corresponding national organizations—from noisy friendship associations and cultural bodies through conventional trade, educational, diplomatic, military and political agencies to scarcely detectable party and security organs—have developed channels of communications and areas of shared or parallel activity in China and the other bloc countries. Without losing their identity and organizational integrity, the Chinese Communists have pursued increasingly close identification with the Communist orbit and political unity with it.

### *China's interest in the Sino-Soviet partnership*

Underlying this association with Russia and reinforcing particular ideological, political, and economic considerations is a fundamental interest which the two partners hold in common: the reduction of Western, chiefly American, influence and power and the enlargement and less restrained exercise of Chinese and Russian power in the world. The common goal, to borrow Mao Tse-tung's phrase, is that the East Wind prevail over the West Wind, not the West Wind over the East Wind.[4]

This Sino-Russian affinity is clearly one of the major elements in the China situation. It may, however, present mainland China's rulers with their biggest problem. It is absolutely essential

that the Russian relationship pay off for them and for China. Their present basic national interests depend upon this. As a result, they have given top priority to two objectives: strengthening the bloc and influencing its policies to better serve their own needs. Their current view seems to be that a closer knit "socialist camp" is essential to assure them of requisite assistance. Their own influence would be diminished and their interests minimized in a "socialist commonwealth" in which each of the partners sought, within the loose bonds of ideological and political affinities, its own ends within and outside the camp. Clearly they feel that too many novel developments within Russia's orbit would threaten to reduce the benefits of the relationship for Communist China.

The Sino-Soviet affiliation also introduces major problems into the relations between China and her Asian neighbors. These are distinct from those related to the resurgence of Chinese power in Asia. The cold war line of conflict has now moved into the center of Asia. It has become a major factor in the relations with China for all Pacific and Asian countries which, irrespective of their inclinations, are brought closer to the range of Soviet pressures and hostility, and to the necessary counteractions by Free World forces.

From whatever aspect it is viewed, the Sino-Soviet relationship is a salient and obtrusive feature of China's problems and of the problem of China for its neighbors.

## CHINA'S ASIAN ENVIRONMENT

Geography, history, culture, and national experience make China a part of Asia; the choice of its present rulers makes most of it a part of the Soviet world. What happens in Asia may in the long run be more important for China than what happens in Russia. But aside from such possibility, the transformation of China's Asian environment is a critical new element in China's situation. The resurgence of Chinese power and drive toward modernization is not an isolated development, but part of a much broader movement in Asia.

At the time when Communist victory on the China mainland dominated the Asian scene, new untried and feeble governments were rising from the debris of war and the loosening hold of Western empires in the surrounding countries. The tremendous shift of major areas of Asia from colonial to independent status reshaped the power contours of the continent. Accepted, reluctantly or applaudingly in the West, this change also forced itself upon the exclusive world of Communist powers. The new Asia was recognized, in effect, by the sharp alteration in policy of the Russian and Chinese Communists who after 1950 abandoned their earlier direct attacks on the new Asian states and their leaders and set out to find new accommodations with Asian nationalism in ways favorable to themselves and unfavorable to the Western powers.

In the arc from Afghanistan to Japan lie China's fifteen Asian neighbors, eleven of whom have achieved independence since 1947. Of Asia's one and a half billion people, over 650 million now live in new states, the largest, India, making the nearest approach to China's population with 400 million inhabitants. Of other neighbors, Japan is pre-eminent in economic capacities, ranking as Asia's only modern industrial power, and the world's fourth largest. Within a ten-year period substantial progress has been made in developing political stability under governments varyingly democratic in character, some employing wartime types of authoritarian controls and others less restrictive measures. Economic progress has been considerable and in some areas, such as Japan, Taiwan, and Malaya, notable. Except

for coal, over three-fourths of Asia's electric power, petroleum, steel, and cement, for example, are produced in non-Communist areas of Eastern Asia. India's economic plans rival those of China for the development of natural and human resources which are roughly on a par with those on the China mainland.

Asia's revolutionary leaders, reflecting the progress of Asia, have achieved political stature and world influence. Their words and actions have increasing bearing on China's interests and the future character of China's Asian environment. Within the area of traditional Indian influence, eight nations have sought in varying degrees to escape the embroilments of the cold war struggle and to use neutralist pressures in securing their own interests.

*Military forces*

In a world where military strength is a measure of national influence, the tremendous changes in the military situation in Asia mark both the direction and the distance which Asia's new states have traveled in the past decade. In 1949, when Chinese Communist military power became pre-eminent in China, there were no significant Asian armies in being to contest her might or to impede her direct or indirect military moves. Now there are major aggregations of military forces in Asia, about 1,800,000 linked with the United States almost as closely as mainland China's forces are with those of Russia. American power, sufficient to provide an immediate offset to Russian power based in northeastern Asia, has been restored to the Western Pacific. On the critical frontiers of Chinese power—Korea, Taiwan, and Vietnam—about one million well-trained, well-equipped troops stand backed by two United States divisions in Korea, the 165,000-man Seventh Fleet in the South China Sea, and American sea, air, and land units in Japan, Taiwan, the Philippines, and American Pacific bases. On the Pacific perimeter also are lesser but growing forces in the Philippines and Japan, with about 285,000 men under arms. For the most part this aggregation of Asian and American forces in the Western Pacific is the result and embodiment of the cold war in Asia.

South of China there is another complex of military forces whose purposes are not focused directly on countering Chinese Communist power. Those in Burma, Indonesia, Malaya, as in the Philippines, had early missions to suppress local Communist rebellions and continuing indigenous disorders. Regional tensions, such as those between India and Pakistan, have given impetus to the organization of other forces.

Whatever their origin, the core of the growing body of military power in Asia south of China is in the armies of India and Pakistan. Pakistan's regular army of about 180,000, supplemented by over 60,000 state and security police, has eight divisions, with cadres for three more. India's army is about three times larger, with over 500,000 men, plus security and reserve elements. It is supported not only by modern jet planes, comparable to Pakistan's F-86 Sabrejet fighter planes, but also by the nucleus of a modern naval force. In the surrounding area are additional forces of lesser international capabilities: Indonesia's 190,000-man army and Burma's 65,000 troops, both now chiefly concerned with domestic insurrectionary threats. Smaller forces are in Afghanistan, about 50,000 men, and Nepal and Ceylon, each having about 20,000 men in their regular units. Although a large proportion of Asia's non-Communist military forces of about 2.7 million men are not co-ordinated in the way in which the 3 million Communist troops of North Korea, China, and North Vietnam are, nonetheless they symbolize the resurgence of Asian states and give measure to their weight in Asia.

In no country have national security interests been slighted. Indeed, in a region where all available resources are urgently needed for economic development, the burden of maintaining war establishments with about half the world's military manpower, almost six million men, is assumed despite the cost. In terms of the percentage of the national budget devoted to defense in 1957, the figures range from 14 per cent for Japan, 18 per cent for India, 28 per cent for Thailand, about 33 per cent for Pakistan and the Republic of Korea, and over 70 per cent for Taiwan. Peking reported its military costs as 48 per cent of expenditures in 1951 and about 20 per cent in 1956, although the total amount spent has probably declined little, if at all.

*China in Asia*

Clearly Asia has reached a point where it is not to be mastered without resistance by the force of China's arms nor by the superior weight of her industrial progress or political competence. From resources within and outside of Asia, resurgent Chinese power wedded to Russian strength has been paced and in some respects outmatched by its Asian neighbors and a new power equilibrium attained. Moreover, as Asia has grown in strength, more of its states have sought to work out their relationships with each other and with Communist China on their own Asian regional terms outside of the Western context in which they were long held. Often sharply aware that Communist China parted ways with the rest of Asia in embracing an explicitly totalitarian system of force and a primary connection with the Soviet world, yet seven of China's Asian neighbors, whether through fear or other reasons, have developed diplomatic relationships with Peking. These new relationships include mainland China within the regional fellowship of Asian states—a fact accepted by even hostile Asian-African states at the Bandung Conference of April 1955. If by the preference of her present rulers on the mainland, China now belongs in the Soviet world, she remains perforce a part of Asia—a member of two worlds with divergent yet insistent pulls upon her. Hence, the association of China with its Asian environment is changing and dynamic; it introduces new and ambiguous elements and problems into China's relations with the Soviet world as it tries to reconcile different aspects of its interests in the "socialist camp" and the Asian world.

Thus far China's adjustments with its Asian neighbors appear to have been shaped by the general contours of Soviet policy. The Communists of Russia and China have recognized that Asia was not to be taken by force without risks to themselves. Having exposed their aggressive character and having discovered the futility and danger of sponsoring openly a series of Communist insurrections in Burma, Indonesia, the Philippines, and Malaya beginning in 1948 and Communist party-engineered assaults on order and authority in Japan, Hongkong, Singapore, and India which reached a climax in outright military aggression in Korea in 1950, the entire Communist approach to Asia was readjusted. Asian governments willing to put relations on conventional political, cultural, and economic bases were accepted, and the overt relations of the Communists of Russia and China to local Communist and revolutionary groups have been subordinated to interstate relations.

Now China and Russia are eagerly experimenting with political methods to gain influence and leverage over govern-

ments which, while often hostile to communism at home, are willing to work with and support the Soviet world abroad to achieve their own national interests. Acting together, they have a significant chance to affect the shifting forces at work in the transitional societies of Asia and Africa. Acting alone —China with economic handicaps and Russia with geographic and cultural remoteness—neither Moscow nor Peking could hope to achieve quickly the political and economic envelopment of these major and diverse regions. There is no doubt that the rulers of Russia and China have fixed their eyes on the reverberating awakenings in Asia and Africa. Their hope evidently is that if the twenty new nations of Asia and Africa with 700 million people now moving toward modernization can be brought under Soviet influence and into an effective working combination with the advancing technology of Russia and in lesser measure China, the structure of world power will be remade.

But within this framework there remain China's specific national interests centered in her immediate Asian environment which Russia has not been able, or perhaps with major preoccupations elsewhere even earnestly sought, to promote: normalization of relations with Japan and other nations; enlargement of trade, especially in certain strategic items, and other economic relations; reduction of United States and Western influence in the area; diminution and elimination of a rival regime on Taiwan; full international acceptance as an Asian power; influence and participation in regional developments; the shaping of political forces and institutions hospitable to her influence in neighboring countries. In these areas lie some of China's national interests which, if denied, will affect adversely the future well-being of mainland China and the interests of its ruling regime. One of the most dynamic factors, then, in the Chinese situation is the encounter of China and her Asian neighbors, for neither the Chinese people nor other Asians would deny that China's place is in Asia.

## China and American Power

But along the front where the cold war line divides the Chinese and their neighbors whose fear and hate of the Communist threat to their own national aspirations are now steeled by American arms, and in neutralist areas further to the south, the United States is involved in the Chinese situation. With the reduction of American cultural, social, and economic activities to the thin margins of China, political and military considerations have become paramount.

The American response to the Chinese Communist military alliance with Russia has been to develop, in the cold war context, a framework of alliances with six Asian governments and four governments in Australasia and Europe as the Asian part of a world-wide security program, involving collective defense arrangements with forty-two nations, to counter the military strength of the Sino-Soviet bloc. As in the divided states, this includes military guarantees and support for the non-Communist Chinese government. American military involvement in China is another manifestation of the response of the United States and other non-Communist countries reacting to the general threat of Communist hostility. In the Chinese case, however, United States forces alone, rather than in association with other non-Communist armies, are committed to stopping Communist forces from the military reunification of China. The problem of both Chinese regimes is that neither can take military action in disregard of the United States. Indeed, as a result of Asian and American apprehensions and determination to block any further extension of Sino-Russian power, Peking is confronted with American supported or encouraged military forces along much of its Asian boundaries.

No less important and far more complex is the bearing of the United States on China's political situation. As a result of Communist China's aggressive efforts to extend its power in Asia and to secure a dominant position in the region, the United States has, in effect, undertaken to counter the weight of China's mainland power by providing the government of China on Taiwan with the strength of American political support and international influence. What the government on Taiwan has lacked, the United States, within the limitations of the Chinese and international situation, has sought to provide.

This action has presented Peking with major problems, the most frustrating being its inability to secure the advantages of general international recognition and an uncontested place in world councils as China's spokesman. While Communist China's size, growing power, and the seniority of its party leadership have increased its standing in the Soviet sphere and in parts of Asia, its place on the world scene has been restricted by American power—reduced far below that of the USSR—through partial blockades, trade embargoes and controls, diplomatic isolation, travel restrictions, and exclusion from the United Nations and international bodies. For Free China, questions related to American policy and power are even more acute, for survival itself depends in large part on its American connection.

Politically, the critical aspect of United States policy for both Taipei and Peking is that China may be reduced by cold war priorities to a divided state. Any internationally underwritten cease fire between the opposing Chinese forces would bring the struggle for power in China to a halt and frustrate the political aims and hopes of both sides. Thus far, however, the United States has avoided a cold war stabilization of the Chinese political struggle which might reduce the political and international position of the government of Free China or decrease the pressures upon the Chinese Communists. Meanwhile, the United States remains involved in China's civil strife.

It is in this area that China remains a uniquely sensitive and difficult problem for the United States. A growing number of Free World countries and many of the closest allies of the United States seek to stabilize the front between Taiwan and the China mainland. The devices used at other points in the confrontation with Sino-Soviet power to achieve this—such as international conferences, cease-fire agreements, neutralized zones, international supervisory commissions—would certainly lead to a reduction in the position and claims of the Government of the Republic of China, for it is unlikely that any understandings could be reached with the Sino-Soviet bloc which left this government in a preferential position, enjoyed by no other claimant regime in the states divided by Communist power and ambition. Thus far the United States has not been able to bring sufficient pressure on the Chinese Communist regime by its own action, or through the now declining pressures of concerted Free World actions, to compel it to accept terms which would preserve the essential advantages of Free China's political and international position. But until there is some stabilization in the front between Taipei and Peking, China remains the dominant and most sensitive problem for the United States in Asia, governing and shaping all of its Far Eastern policies.

# United States China Policy

By Ralph N. Clough

Abstract: Communism has taken over much of East Asia and poses a grave military and subversive threat to the free countries of the area. United States policy is aimed at countering this threat by deterring military aggression through a series of security pacts and the development of indigenous Free World military strength; strengthening the economies and the internal security of the free nations; and opposing any action which would contribute to Chinese Communist power to conquer or subvert. Essential to the policy of limiting the external political effectiveness of the Peiping regime is our support of the Republic of China. United States China policy has been strongly supported by the American people, but there have been expressions of doubt as to the validity of the policy for the future. A "two-Chinas" concept has sometimes been proposed as an alternative. However, the concept is vehemently opposed by both Peiping and Taipei. Even if it were practicable, its presumed advantages are highly questionable and its adoption by the United States would seriously injure the Free World position in East Asia.

This article was written just prior to the renewal of the Chinese Communist artillery bombardment of Quemoy on August 23 and therefore does not reflect events which have taken place since then. However, it remains an authoritative exposition of United States policy towards China.

---

*Ralph N. Clough, Counselor of the American Embassy at Bern, Switzerland, wa Director of the Office of Chinese Affairs, Department of State, from June 1957 to Jul 1958 and Deputy Director during the two preceding years. He served in China an Hong Kong from 1945 to 1954.*

THE BASIC premises which underlie the policy of the United States toward China are easily understood and generally accepted by the American people. They are: that the Soviet bloc, of which Communist China is a part, is engaged in a long-range struggle to destroy the way of life of the free countries of the world and bring about the global dominion of Communism; and that East Asia,[1] where eight of the eleven countries are newly independent since World War II, is peculiarly vulnerable to the Communist offensive.

## The Communist Threat

The Communist movement has taken full advantage of East Asia's vulnerability. Since 1945 it has seized control in territories where live 660,000,000 people, close to 70 per cent of the population of the area. Today Asian Communist armies totaling over 3,000,000 men, well equipped with Soviet weapons, many of their soldiers seasoned in battle in China, Korea or Vietnam, pose a constant threat to their weaker neighbors. Communists are active throughout the non-Communist countries of the region, ranging in importance from the legally sanctioned, rapidly growing Communist Party of Indonesia to the proscribed, isolated infiltrators who are discovered from time to time in Taiwan or the Republic of Korea. Armed Communist aggression has been halted since 1954. The free countries of the area have made progress in reducing the internal Communist threat. Yet the ominous shadow of Communist power remains. No statesman or politician can omit it from his daily calculations. The writings of Lenin, Stalin, and Mao on the Communization of Asia stand as a constant reminder to the free countries of Asia that the struggle to maintain their freedom may be long and grim.

The giants of Asian communism are the Chinese Communists. Rulers of 640,000,000 people and proud originators of the "classic type of revolution for colonial and semi-colonial countries," they lend encouragement, moral and material, to their sister Communist parties. Their policy is, as Mao Tse-tung has declared, to "give active support to the national independence and liberation movements in countries in Asia, Africa, and Latin America."[2] This "active support" has manifested itself in the form of armed aggression in Korea, provision of arms and supplies in Indochina, and less overt means of assistance elsewhere.

The Chinese Communists' demonstrated military strength, underwritten by the still more powerful USSR, inspires both fear and respect. Reports —frequently inflated—of their rapid industrial development evoke admiration among those ignorant of or unconcerned with the cost in human lives. Chinese Communist propaganda blankets the area. Even where it is prohibited in written form, the ubiquitous radio broadcast in the local language gets through. Peiping's "peoples' diplomacy" brings thousands of influential Asians to Peiing annually for red carpet treatment. Offers of trade and economic aid have provided an effective means of gaining or expanding a political toehold. Where diplomatic relations exist, contacts are multiplied, encouragement of the local Communist and Communist-front opposition facilitated, and the use of Chinese financial institutions such as the Bank of China for subversive purposes made possible. Overseas Chinese communities then come under the domina-

[1] For the purpose of this article the term "East Asia" includes the following countries: China, Korea, Japan, the Philippines, Vietnam, Cambodia, Laos, Thailand, Malaya, Indonesia and Burma.

[2] Eighth Party Congress, Chinese Communist Party, September 15, 1956.

tion of pro-Communist elements. For, in the long run, the Chinese Communists are not interested in the development of good relations with existing governments and peoples. Their object is revolution and they promote it where and as it is possible without excessive risk, adapting their methods to local conditions. Their goal is to lead Asia to communism. As the Peiping *Peoples' Daily* declared on December 29, 1956, in an article prepared on specific instructions from the Chinese Communist Party's Politburo, "The issue is the future. However many twists and turns may await us on our forward journey, humanity will eventually reach its bright destiny—Communism. There is no force that can stop it."

An appreciation of the Chinese Communist revolutionary commitment is essential to an understanding of United States policy. There is ample evidence that we must deal, not with leaders whose aim is to promote the welfare of their people and live at peace with their neighbors, but with a group of men in power who are dedicated to extending revolution beyond their own borders, by force where necessary and feasible. As Liu Shao-ch'i phrased it in a book still regarded in Peiping as one of the Chinese Communist classics, "The most fundamental and common duty of Communist Party members is to establish Communism and transform the present world into a Communist world." [3] With mainland China now in their hands and with Communist allies in every country of East Asia, they are in a good position from which to promote what they consider to be the inevitable victory of communism.

## UNITED STATES POLICY

Our China policy has been, in part, a reaction to the hostile acts of the Peiping regime toward American citizens and American property. The American people have not forgotten the 142,000 casualties in Korea, the brutalities committed against American prisoners of war, the continued refusal to account for our personnel missing in Korea, the jailing and torture of American civilians in Communist China, the violation of the Chinese Communist commitment in September 1955 to release American civilians, four of whom are still held today, the confiscation of American property in China, and the indignities to which American officials were subjected. No other regime in modern times, not excepting other Communist countries, has demonstrated such violent, prolonged, and calculated hostility toward this country and its citizens. This grim record would, in itself, make it difficult to accept the Chinese Communist professions that they seek only "peaceful coexistence."

But the more fundamental reason why our policy has developed as it has lies in the threat, described above, of Chinese Communist aggression, direct and indirect, against its neighbors. United States policy in East Asia, as in other parts of the world, is aimed at promoting mutually beneficial progress in the free countries which can only take place so long as the Communist threat is neutralized. Therefore, our policy must, first, deter Communist military aggression; second, strengthen the economies and the internal security of the free nations; and, third, oppose any action which would contribute to the Chinese Communist power to conquer or subvert.

In order to deter Chinese Communist aggression, it is essential to maintain sizable ground forces in the immediately threatened areas: the Republic of Korea, Taiwan, and Vietnam. It would be risky to rely on nuclear retaliatory power alone to protect these areas. These countries gladly supply the soldiers and a portion of the other requirements for the forces necessary to defend themselves. But because Communist military power is so great, the forces must be far larger than the economies of the countries can support, and the United States makes up the difference. It is a co-operative and mutually advantageous arrangement. The East Asian countries achieve the self-respect derived from making the major contribution to their own defense, while the United States is relieved of the burden of maintaining equivalent forces for the defense of these territories and peoples, the conquest of which by Communist power would have serious implications for the security of the United States.

The Communists are deterred from military action not only by the United States-supported indigenous forces in the area, but also by the knowledge that the United States has entered into security commitments with most of the free nations of East Asia. They know that we would consider any attack upon one of these nations as endangering our own peace and safety and that we would respond accordingly.

Behind the collectively created military shield which protects the free nations of East Asia from aggression, political, economic, and social progress is taking place. The United States through its mutual security programs has encouraged such progress by helping to maintain economic stability and contributing to economic development. From 1949 through fiscal year 1957, $3,737,000,000 was expended for these purposes, most of the total necessarily going to the three countries with the heaviest defense burdens. American assistance to police forces has contributed to the improved internal security in most of the countries of East Asia and the diminished Communist capability for creating disorder within these countries.

The fact that the Chinese Communists, deterred from further employment of military force, have resorted to a complex program of political action to achieve their ends, makes it more essential than ever that the United States oppose any action which would increase their prestige and influence. Their program relies heavily on convincing the people of each country that the United States is an unreliable ally and that Communist triumph is inevitable. Their task would be greatly facilitated were the United States to agree to the seating of the Chinese Communist regime in the United Nations, or should the United States itself recognize the Peiping regime, trade with it, or enter into cultural exchanges with it.

### *United States support for the Republic of China*

An essential part of United States policy aimed at limiting the external political effectiveness of the Peiping regime is our continued support of the Government of the Republic of China as the legitimate representative of the Chinese people. This government, which is recognized as the government of China by 45 countries,[4] has diplomatic relations in East Asia with Japan, Korea, the Philippines, Vietnam, and Thailand. Communist China has diplomatic relations with only Burma, Indonesia, and Cambodia in the area.[5] The Government of the Republic of China occupies territory vital to the defense of the area—the loss of Taiwan to the Chinese Communists would gravely threaten the Philippines to the south and Okinawa

[3] *How to be a Good Communist* (Peking: Foreign Languages Press, 1951).

[4] Communist China is recognized by 19 Free World countries, by Yugoslavia, and by the countries of the Communist bloc. Only six governments have recognized Communist China since 1950: Nepal, Egypt, Syria, Yemen, Iraq, and Cambodia.

[5] Laos and Malaya do not maintain diplomatic relations with either the Republic of China or the Peiping regime.

to the north. It also stands as a symbol of freedom to the restive mainlanders under Communist dominion.

The accomplishments since 1950 on the island of Taiwan and the smaller islands administered by the government in Taipei are in many respects a model of Asian-American co-operation. The Chinese government—taking advantage of a higher proportion of experienced, capable administrators and technicians than are available in most East Asian countries, a largely literate population (93 per cent of children of primary school age are now in school), and the rich resources of Taiwan—has made effective use of United States military and economic aid to progress in many fields. The armed forces—some 600,000 men—bear little resemblance to the disorganized, demoralized units which managed to escape from the mainland in 1949. Since 1953, by means of a universal conscription system, the average age of the troops has been brought down to 26. About one-third of the forces is now composed of young Taiwanese draftees. The Republic of China's forces today, well equipped, highly trained, with the fourth largest jet air force in the Free World, and a small but efficient navy, are an important part of the Free World deterrent force in the Far East. On the economic side, gross national product increased 66 per cent between 1950 and 1956, agricultural production 32 per cent, and industrial production 132 per cent. One of the most successful land reforms in Asia has broadened the social base. The great extremes of wealth and poverty which existed on the mainland are not present in Taiwan, and the standard of living is higher than that of any East Asian country except Japan and Malaya.

In recent years the Republic of China has made vigorous efforts to maintain its international position in the face of heavy Communist assaults upon it. During 1957 free China's diplomats reached agreement on the establishment of diplomatic relations with five countries with which it had previously not maintained diplomatic relations: Paraguay, Uruguay, Liberia, Saudi Arabia, and Jordan. Taipei has increasingly played host to Free World leaders such as the Shah of Iran, the Premier of Turkey, and the Prime Minister of Japan, as well as many parliamentary and trade delegations.

The progress which has been made on Taiwan is still relatively little known, but it is more and more coming to be recognized. That is not to say that no problems exist. The undiminished Communist threat, the heavy strain resulting from military expenditures, the rapid growth of the population, the scarcity of funds for capital investment, and the discouragement felt by many mainland Chinese at the continued domination of their homeland by communism all impose their limitations. Nevertheless, the dominant note is activity and progress. The United States is not simply helping to support a military bastion in Taiwan, but 10 million energetic, resourceful, resilient people, whose vigorous development and growing ties with the rest of the Free World make them increasingly effective contributors to our common objectives.

Our policy toward the Republic of China has a vital bearing on the influential overseas Chinese communities, some 10 million people scattered throughout Southeast Asia who are today divided in their allegiance and among whom there is continued strong resistance to efforts by pro-Communists to seize control. The Chinese Communists have directed their political activity particularly toward gaining control of overseas Chinese schools, newspapers, business organizations, and financial institutions. However, their failure to win general diplomatic recognition and oust the Republic of China from its international position has seriously hampered their efforts. Large numbers of business associations, banks, newspapers, and schools continue to look to Taipei as the temporary seat of the government of China and reject Peiping's efforts to assume that role. Particularly in the key field of education has Taipei scored striking successes, with more than 8,000 overseas Chinese studying in Taiwan's high schools and colleges as compared to fewer than 100 seven years ago. If the United States and its Asian associates were to deny the right of the Republic of China to represent Chinese abroad and were to acquiesce in the claim of the Communist regime to do so, the resistance to communism in the overseas Chinese communities could not long continue.

## ARE THERE ACCEPTABLE ALTERNATIVES?

United States policy toward China has received strong support from the American people. They have been willing to assume the heavy burdens necessary in order to prevent further Communist aggression in East Asia and to promote the peaceful development of the free countries. There has also been general support for opposing acts which would enhance the prestige and influence of Communist China.[6] Yet, there have been expressions of doubt as to the long-term validity of the policy. Critics do not usually attempt to prove that the policy to date has not served the interests of the United States reasonably well; they tend to concentrate on the alleged weaknesses of such a policy if continued into the indefinite future.

Of course, the future is obscure in East Asia, as it is in most of the rest of the world. It is not possible to predict with any degree of precision what the shape of the future will be if we continue generally along our present lines or, alternatively, if we should effect radical changes in our policy. However, when a given policy has been reasonably effective, the burden of proof must rest on the proponents of change that an acceptable alternative exists and that this alternative would be a better instrument for accomplishing our aims.

It is not feasible here to examine the many possible permutations of a policy toward China and their probable effects. One general category of proposal, probably the one which has attracted most attention, will be examined. This is the so-called "two-Chinas" concept. There are many variants of this concept, but in essence it is intended to provide a formula whereby the Chinese Communist regime would obtain general international recognition and seating in the United Nations as the representative of the Chinese people, while the Government of the Republic of China would be reduced to representing only the people of Taiwan and the Pescadores, either as a new independent state or under some form of United Nations trusteeship.

The "two-Chinas" concept is designed as a means of obtaining international sanction for the perpetuation of the present division of the Chinese people into two separate political units. One glaring flaw in the scheme, which invalidates the claim of "realism" advanced for it, is the fact that it has been vehemently denounced by both Peiping and Taipei. No Chinese leader on either side has given the slightest indication that it would be acceptable.

[6] For example, in 1956, Congress, by concurrent resolution of both houses without a single dissenting vote, expressed its opposition to the seating of Communist China in the United Nations.

*Two-Chinas concept vis-à-vis today's realities*

In the absence of any disposition on the part of the Chinese themselves to accept the "two-Chinas" concept, it becomes academic to discuss the advantages and disadvantages of applying the concept in practice. It becomes necessary to assume, at the very least, that the Chinese Communists would agree to the establishment of diplomatic relations with the United States, despite our continued maintenance of close relations with Taipei, and that they would join the United Nations, despite the continued presence of representatives from Taiwan. It is also necessary to assume that the United States would take this step over the vehement protests of its friend and ally, the Government of the Republic of China, and that we were willing to risk the consequences of what to that ally and other allies in the area would appear a betrayal for the sake of appeasing the Chinese Communists.

The fact that the requisite assumptions appear fanciful when held up against today's realities has not prevented advocates of the "two-Chinas" concept from discussing its advantages and disadvantages as if it were a practicable policy now or in the near future. Therefore, a brief commentary on the pros and cons may be in order here, bearing in mind that the essential conditions for placing such a policy into effect do not exist today.

The arguments for the "two-Chinas" concept fall generally into two categories: (1) that it is "realistic" to establish formal diplomatic relations with those in actual control of mainland China and that it is inevitable anyway, sooner or later; and (2) that there are definite advantages to be gained from such a step, such as reducing tension in the Far East, influencing the Chinese Communist leaders, driving a wedge between Moscow and Peiping or improving the relations between the United States and those Asian countries where a vocal element of the population is critical of present United States China policy.

Neither so-called realism nor alleged inevitability constitutes a persuasive argument for the "two-Chinas" concept. The final test must be whether the acceptance of such a concept would serve the enlightened self-interest of the United States. It is realistic to deal, when necessary, with those actually governing an area. We dealt with the Japanese administrators of Manchuria for years, but never recognized "Manchukuo." We have dealt with the Chinese Communists in Korea and have held eighty-three meetings with them in Geneva and Warsaw at the ambassadorial level, but we have not considered it necessary nor desirable to accord them the advantages which would accrue from diplomatic recognition. As to the inevitability argument, it smacks strongly of the Communists' own thesis that their system of government will endure forever and will inevitably take over the world. They may well consider recognition of the Peiping regime by the United States inevitable (and if they do, it would be naive to expect them to make any concessions in order to bring it about), but there is no need for the United States to succumb to this argument.

*Effects of diplomatic concessions to Communist China*

There remain the arguments that there are positive advantages to be gained from establishing our diplomats in Peiping and bringing Communist China into the United Nations.

Would recognition of Red China by the United States, under the conditions mentioned, lead to a reduction of tension in East Asia? Only if one were to make the unrealistic assumption that the Communists would thereupon give up their designs on the free countries of the area. It is certainly far more likely that the Chinese Communists would take advantage of the severe blow to the people of free China and the sudden enhancement of their own power and influence to redouble their subversive activities directed toward Taiwan and the other free peoples of East Asia. Communists and pro-Communists in each of these countries would exploit to the utmost this telling evidence that even the United States was bowing to the inevitable and recognizing communism as the wave of the future. As Communist power grew throughout the area, tension would rise, not decrease.

Would seating in the United Nations exert a beneficial effect on the Chinese Communists and make them easier to deal with? It would be disastrous to the United Nations system and to the role of the United Nations as a guardian of the collective security to seat a regime which stands condemned as an aggressor by that very institution, which defies the United Nations itself and refuses to admit its competence to play any part in Korea. For Red China to be seated under these circumstances would prove to the Chinese Communist leaders the effectiveness of their present strategy, rather than temper their hostile attitude toward the Free World.

Would recognition of the Peiping regime by the United States and its seating in the United Nations contribute to the weaning of Peiping from Moscow? There is no evidence that the bonds between the two chief Communist powers are so weak that a broadening of Chinese Communist diplomatic contacts with the Free World could have any perceptible effect on them. On the contrary, the evidence available to us since the Hungarian revolt indicates that the two powers' primary concern is to maintain the solidarity of the Communist bloc and that their ties today are probably as strong or stronger than they have ever been. They view the world through the same ideological frame and hold common objectives. So long as Communist China remains heavily dependent on the Soviet Union for its military strength and so long as Mao and his lieutenants remain satisfied that "the east wind is prevailing over the west wind," only the gravest sort of crisis between Peiping and Moscow could lead to significant alienation.

It is hard to conceive of any inducement the Free World could offer which would at this time attract Mao toward what he regards as the losing side in the world struggle. Only growing disillusionment at the top as a result of the failure of communism to make further headway in Free World areas, to resolve the problems of intrabloc relationships and to overcome internal problems in China could create the conditions favorable to such a shift. Far from promoting such disillusionment, recognition of Communist China by the United States or seating it in the United Nations would be much more likely to confirm to the Peiping leadership the correctness of their present course and the advantages of continued close cooperation with the USSR.

Would recognition of Red China by the United States and our support for its seating in the United Nations improve our relations with the neutralist countries of Asia? It is true that there are many advocates of such action in these countries. However, most such advocates would not be satisfied unless the United States also agreed to withdraw its support from the Republic of China and permitted the 10 million Chinese in Taiwan to be taken over by the Chinese Communists, a disastrous betrayal of a free people which few Americans would accept. Whether any significant improvement in our relations

with these countries would result from the lesser step of embracing the "two-Chinas" concept is questionable. United States policy is not a major issue affecting the state of our relations with the neutralist states. Whether these relations are good or bad depends far more upon other issues much closer to home than how the United States regards China. On the other hand, in such countries as the Philippines and Thailand, and even more so in Korea, Vietnam, and the Republic of China, under the immediate threat of Communist armed might, United States China policy is a vital issue. We could not adopt the "two-Chinas" concept without causing the most serious and far-reaching repercussions in these countries. We certainly have much more to lose by demoralizing our close allies, who live under the shadow of Communist guns and whose military strength is vital to the maintenance of the Free World position in East Asia, than we could possibly gain in the more distant areas where the China problem is not a matter of life and death to the people.

### THE FUTURE

Looking toward the future, the American people would like to see an early settlement of some kind, a relaxation of the tension between the Free World and the Communist world, so that the threat of war would be diminished and a larger share of our resources could be turned to the uses of peace. But in East Asia, as elsewhere, there is little prospect that this will happen so long as the Communist movement has the will and the power to seek further accessions to its empire. The Chinese Communists hope that we will tire of the continual struggle and the cost of supporting our friends of the Free World against their pressures. They hold that the United States will inevitably, sooner or later, give in. But there are currents within the Communist world which, far from sweeping communism on to inevitable victory, are sapping the strength of the Communist system. In time, if we hold steadfast, we can confidently look forward to a relaxation of the pressures. In the meantime, we must cleave staunchly to our friends and resist any move which would increase the ability of those hostile to us to do them harm.

Our China policy, although it has so far served us well, is not, of course, a perfect instrument. There are doubtless many improvements which can be made. The policy, like other policies, is under constant review to see where it could be improved. But proposed improvements must be able to meet the tests of practicability and realism and must clearly serve the long-term interest of the United States.

# Ideology and Politics in Communist China

By H. ARTHUR STEINER

ABSTRACT: The relationship of "ideology" to "politics" is an important question of general Marxist-Leninist thought which seeks to identify the two. The "party-line" is the practical, operational device for analyzing new or changing situations in Marxist-Leninist terms and for issuing pertinent policy (action) directives to party cadres and other administrators. Mao Tse-tung's views on the relationship of ideology and politics ("theory" and "practice") were developed in the 1920's and 1930's and strongly influence practice today. The recent completion of the processes of socialization in Communist China has created a new situation in which the Communist party is moving to identify and bring under control the "rightist" and "antisocialist" elements, and to undertake a "big leap" under the aegis of a new General Line of Socialist Construction. The current political and ideological discussions in Communist China, centering on the theme of "revisionism," are directed toward action against "bourgeois rightists" at home and abroad and are related to the attack on Titoism and the drive to develop greater "socialist solidarity." In this connection, the Politburo has defined five principal ingredients of "the universal truth of Marxism-Leninism" as a means for judging the correctness of action.

---

*H. Arthur Steiner, Ph.D., has been Professor of Political Science at the University of California at Los Angeles since 1931 and was in China as a Fulbright Research Scholar during the year of the Communist takeover (1948–1949). He is the author of several articles and documentary collections relating to Chinese Communism and was Editor of "Report on China," THE ANNALS, Vol. 277 (November 1951).*

WHAT the Chinese Communists are after and how they go about getting it are actually our present themes, but "ideology" and "politics" have been in conscious interplay throughout the history of the Chinese Communist Party since 1921, and the relationship of the two must be seen in that light. Mao Tse-tung emerged as a leader of unquestioned authority in 1935 after a succession of ideological-political struggles in the 1920's and early 1930's, and his analyses of "ideology" and "politics" are required reading for all party cadres. Issues and attitudes of party concern became, with the conquest of power on the Chinese mainland in 1949, the principal determinants of state law and public policy for the world's most populous society. Other articles in this issue of THE ANNALS will deal with specific aspects of Chinese Communist policy; here, we are concerned with broad perspectives.

During 1956, the collectivization of agriculture, the establishment of "joint" state-private operation of capitalist industry and commerce, and the co-operative movement in other salients of national productive activity produced a substantial socialization of Chinese life. To create ideological and political "superstructures" corresponding to the new situation, the party leadership decided to "rectify thoughts" and "resolve contradictions" through gigantic mass movements that dominated Chinese public life in 1956–58. Almost simultaneously, an ideological ferment within the entire "socialist camp" had been unloosed by N. S. Khrushchev's denunciations of Stalinism early in 1956, by political difficulties and disorders in Poland and Hungary, and by Marshal Tito's particular challenge to "socialist solidarity." The Chinese Communist leadership grasped the situation to establish its ideological hegemony within the Communist world by laying down the ground rules for reconciling "national roads" to communism with the requirements of solidarity within the entire socialist camp.[1] The internal ideological-political struggle in China coalesced with the ideological-political struggle for basic unity within the Communist world when the Chinese Communists launched a far-reaching attack upon "revisionism" at home and abroad in May 1958.

The nature of the international Communist movement renders it unlikely that ideological-political issues raised in 1956–58 will be definitively settled in the immediate future. Meanwhile, the approaches taken toward these ideological-political questions in 1956–58 can be expected to dominate the ideological and political development of Communist China and the rest of the Communist world in 1959 and the several years following.

## DEFINING THE PROBLEM

Some of the mystery surrounding the tortuous problems of Communist ideology will be dispelled if we keep in mind three basic Communist attitudes: (1) "Ideology" = "Politics"; the twain are inseparable; (2) the sphere of political (state) action in emergent Marxist-Leninist societies is illimitable, which means that all state and social action ("politics") is colored by directional considerations ("ideology"); and (3) nothing in a Marxist-Leninist society simply "happens," everything must be induced (or, if something *has* "happened," it must be explained, brought under control, and induced to serve the objectives of the leadership). What we are actually dealing with, then, as we examine the relationship of "ideology" and "politics" in Communist China, is nothing less than the fundamental apparatus of the regime: its programmatic objectives, the range of its operations, and the methods and techniques of its leadership.

[1] H. A. Steiner, *The International Position of Communist China: Political and Ideological Directions of Foreign Policy* (New York: Institute of Pacific Relations, 1958).

Despite the multiclass, multiparty structure of the "people's democratic dictatorship"—rendered equivalent to "the dictatorship of the proletariat" by official pronouncements in 1956[2]—the Chinese Communist Party has been in substantial control of the Chinese mainland since 1949. It has been extremely self-conscious of its leadership position and in its acceptance of responsibility for the course of policy and events. Any meaningful analysis of "ideology" and "politics" must therefore begin with an appreciation of the broad configurations of Chinese Communist policy since 1949, and especially since 1953.

Mao Tse-tung defined the "master plan" of the party in *On People's Democratic Dictatorship*, written to commemorate the 28th anniversary of the founding of the Chinese Communist Party (July 1, 1949):

> *Our present task* [1949] is to strengthen the apparatus of the people's state, which refers mainly to the people's army, the people's police and the people's courts, for the defense of the nation and the protection of the people's interests. *When this condition is met,* China will be enabled to advance steadily, under the leadership of the working class and the Communist Party, from an agricultural to an industrial country, from a new democratic society to a socialist society and communist society, to abolish classes and to achieve world communism. (Emphasis supplied.)

The initial tasks of 1949, corresponding to the "minimum program" of the party, were reflected in the Common Program of September 29, 1949. They were considered to have been accomplished by 1953 when the First Five-Year Plan was announced and elections were called for the First National People's Congress to adopt a constitution for the Chinese People's Republic. At that time, the "establishment-consolidation" period of 1949–53 was formally designated as the first phase of a "period of transition to socialism" which was fitted to a concept of a "general line." Mao Tse-tung assertedly defined the "general line" in these terms: "The general line and the general mission of the state are the gradual realization, over a considerably long period of time, of the socialist industrialization of the state, and the gradual realization of the socialist reform by the state of agriculture, handicrafts, and private industry and commerce."[3] Such restatement in 1953 of the master plan of 1949 signified an acceleration of the "gradual" processes of socialist transformation;[4] and, almost immediately, increased pressures were exerted to socialize the "means of production." (We use the term "socialization" to describe the objective process of establishing complete state control, if not "ownership," of the "means of production," in displacement of private or capitalist control—without moral judgments, and with no implication that "socialization," as such, has necessarily succeeded in attaining stated production objectives.)

After 1953, the Communist leadership moved progressively and steadily toward the announced socialist objective—initially against such relatively small and selected targets as the "rich

[2] Developed by Liu Shao-ch'i in *The Political Report of the Central Committee . . .* (Sept. 15, 1956) (Peking: Foreign Languages Press, 1956), pp. 56–59.

[3] As quoted by Li Wei-han in an address of October 27, 1953, in American Consulate General, Hong Kong, *Current Background,* No. 267.

peasantry," but subsequently on a broad, total front. Mao Tse-tung could accurately sum up the result in his "contradictions" speech of February 27, 1957: "Socialist relations of production have been established." [5]

## THE "PARTY LINE"

In moving toward the socialist objective, the party high command signaled the various steps and phases in the spirit of a military operation by regular pronouncements of the "party line." The party line—any party line—is extremely significant for our purposes since it is the specific device by which "ideology" and "politics" are brought into harmony to meet a particular programmatic need. From this point of view, the "general line of the transition period" was a broad strategic directive calling upon party and state cadres and other activists to place themselves in a "state of readiness." Other party "lines" prescribed the time and manner of the attack on more specific, intermediate, or reinforcing targets.

Taking, now, a broad overview of the action of the party between 1953 and 1958, we are able to identify a succession of principal "party lines" bearing upon the socialist objective:

1. The "First Five-Year Plan of National Economic Construction," announced in general terms by Premier Chou En-lai in February 1953, given more specific definition in Li Fu-chün's report to the Central People's Government Council on September 15, 1953, and finally "adopted" by the National People's Congress on July 30, 1955.[6]

2. The forewarning by Li Wei-han to private industrialists and merchants of the impending application of the "general line" to their situations, October 27, 1953.[7]

3. Articles 4–10 of the Constitution of the Chinese People's Republic, adopted September 20, 1954, on the basis of Liu Shao-ch'i's report of September 15, recording the party's decisions on the "socialist" character of agricultural producers' co-operatives, announcing the doom of "rich peasant economy," and institutionalizing other related policies.[8]

4. Mao Tse-tung's call for a "high tide of socialization in the Chinese countryside" in his report of July 31, 1955, endorsed by the party Central Committee on October 11 and implemented with speed and thoroughness during the early months of 1956 by the establishment of "low" and "high" level co-operatives (collectives).[9]

5. The "voluntary transformation of private industry and commerce" by the device of "joint" state-private operation, January–February 1956.

6. The "ideological struggle against bourgeois idealism" directed to the reform of artistic, literary, and scientific workers under the ambiguous slogan: "Let Flowers of Many Kinds Blossom, Diverse Schools of Thought Contend!" —announced (unpublished) by Mao Tse-tung, May 2, 1956; elaborated in Lu Ting-yi's address of May 26, 1956, on the same subject; and further "clarified" in Mao Tse-tung's address on "The Correct Handling of Contradictions Among the People," February 27, 1957.

7. The nationwide "rectification movement" of 1957–58 against "bureaucracy, sectarianism, and subjectivism" called by the Central Committee directive of April 27, 1957, in support of Mao's address on "contradictions" and directed against "bourgeois rightists" and other "antisocialist" elements.

8. A movement to "strengthen international socialist solidarity" in the name of "antirevisionism"—nominally pointed against Tito, but capable of being applied against Khrushchev, as developed in the Politburo critique of December 29, 1956,[10] and amplified in the resolution adopted by the Eighth National Party Congress on May 23, 1958.[11]

9. The call to a new "general line of socialist construction" by Liu Shao-ch'i's report to the Eighth Party Congress on May 5, 1958,[12] developing the "big leap" toward socialism previously anticipated by the Central Committee's directive of March 3, 1958, against "waste and conservatism."

10. The Central Committee's directive of August 29, 1958, called for merging the rural collectives into "communes" as "the fundamental policy to guide the peasants in accelerating socialist construction," and predicted a new "upsurge" that would produce the complete "communization" of the countryside in another few years. The directive anticipated that the new communes would be "the best form of organization" for the transition to eventual communism, and that they would survive as the "basic social units in communist society"—supplanting the collectives of the transitional socialist period.[12a]

The foregoing list of "principal" party lines of the 1953–58 period may be supplemented by more specialized party lines relating to "rational adjustment of wages," "antilocal nationalism," "redness and expertness," "local industrialization," "language reform," "socialist education," and a dozen others. In addition, the harrassed party cadres—deliberately kept in a state of tension and excitation—could regularly find infinitely detailed interpretations of the party line in the leading editorials of *People's Daily*.

## CHARACTERISTICS AND SERVICES OF THE "PARTY LINE"

Even though we cannot explain each of these party lines in detail, their mere enumeration suffices to show that we are concerned with ideological and political operations of vast scope and significance. We may note, however, that such party lines as those just listed have several common characteristics: they deal with specific problems and issues which may be national, regional, or local in incidence; they give conscious expression of the purpose or intention of the leadership; they incorporate specific action directives to cadres, activists, and other personal elements of administration; they seek to maintain ideological compatibility between the several party lines in effect at a given time and to distinguish lines applicable at a particular "stage of the revolution" from lines enforced under other circumstances; [13]

[13] In his "contradictions" address, February 27, 1957, Mao said: "Some people do not understand that our present policy fits the present situation and our past policy fitted the past situation." (Note 5, *Supra*.)

and, they usually enlarge rather than contract the scope of political and administrative action.

The technique of the party line assists the regime in the movement toward its general political goals in several ways: (1) a party line pronouncement may resolve differences that have arisen within the hierarchy, offers a yardstick to measure the "correctness" of administrative action, provides any needed standard of "orthodoxy," and tends to promote uniformity of administrative action; (2) the party line is a basis for formal indoctrination and discipline within the party, state, or other administrative apparatus; (3) it is an authoritative basis for indoctrination of the general population and provides direction and guidance for press, radio, and other communication media; for specialized propaganda agencies and operations; and for educational and training activities of different types; (4) the method assists the leadership to move toward objectives by step-by-step methods, revising targets in the light of experience or difficulties and maintaining effective surveillance over administration; and (5) the standardized party line technique, relating action to theory and insisting that all change occurs within a known framework of ideological objectives, assists to create the desired image of the all-seeing, all-wise, omnipotent, and infallible Leader, or Leadership, which seems so necessary for the maintenance of a totalitarian regime.

## THE RELATIONSHIP OF "IDEOLOGY" TO "POLITICS"

The characteristics and services of the party line show that we are not dealing with vague theoretical abstractions or rootless propaganda effusions, but with hard-core methods, techniques, and policies of daily government and administration. The party line is therefore a key to the problem of the rela tionship of "ideology" to "politics" i Communist China. The "party" i question, however, is a self-conscious self-perpetuating, and highly discipline elite with a special *mystique* derive from "the universal truths of Marxism Leninism." It sees itself, for example as a force organized to wage class war fare, as the "vanguard" of a proletaria which may not actually exist, and i declares that it has the suicidal purpos of "eliminating classes, state authority and party." [14] Necessarily, then, th party has a different relationship t government than the political parties o Western bourgeois societies and a differ ent concept of the relationship of "ideol ogy" (theory) to "politics" (practice) Aristotelian logic does not inform us o this relationship, which is actually one of the central substantive problems o Marxist-Leninist thought and one o the principal means for distinguishing Marxist-Leninists from other types o Marxists. For understanding, we must turn to the murky mists of dialectica materialism.

Mao Tse-tung once declared that an outstanding characteristic of Marxist philosophy—that is, dialectical materialism—was "its practicality: its emphasis on the dependence of theory on practice, emphasis on practice as the foundation of theory which in turn serves practice." [15] A theory standing in this relationship to practice is not a theory for academic pedants seeking knowledge of truth for its own sake but is an instrument for working revolutionaries. As Mao put it in 1937, the Marxist must be concerned "with actively changing the world by applying

[14] Mao Tse-tung, *On People's Democratic Dictatorship* (Peking: English Language Service, New China News Agency, 1949).

[15] "On Practice" (July 1937), in Mao Tse-tung, *Selected Works* (London: Lawrence & Wishart, 1954–1956), hereafter cited as "Mao," I, p. 284.

the knowledge of its objective laws." [16] In May 1941, he told his cadres in Yenan that they should "study the theory of Marxism-Leninism with . . . the [definite] aim of integrating it with the practical movement of the Chinese revolution and seeking from it a stand, a viewpoint and a method for solving the theoretical and tactical problems of the Chinese revolution." [17] Marxism-Leninism was the "arrow"; the revolution in China, the "target."

Mao decried "big talk" and "idle chatter" and insisted that all cadres engage in serious investigations and studies of practical situations; he ridiculed the "subjective" comrades who "can only quote words and phrases from Marx, Engels, Lenin and Stalin" and "give all their heart to the dogmas, said to be eternally immutable, which their teachers have taught them." What the cadres needed to understand was "that the fundamental task of the leading bodies of the Communist Party lies in two important things, namely, to know the conditions and to grasp the policy; the former is what we call knowing the world, and the latter, changing the world." [18] Here Mao in effect defines "party line" as the term is used in contemporary China, including the analysis of a particular situation confronting the party leadership at a given time and the statement of the course of action prescribed to meet the theoretical requirements of the situation.

At the beginning of the first "rectification movement" (*cheng-feng*) in February 1942, Mao expressed the need for "theoreticians who, basing themselves on the stand, viewpoint and method of Marxism-Leninism, can correctly interpret . . . and give a scientific explanation and theoretical elucidation of China's various problems. . . ." [19] Only then could there be full "unity of theory and practice." He emphasized that "an aimless theory is useless, incorrect and should be thrown away. . . . We study Marxism-Leninism . . . because it is a science which will lead the proletarian revolution to victory." [20] Mao has reiterated this position endlessly; the theme was as dominant in the "rectification movement" of 1957–58 as it had been during its predecessors.

## IDEOLOGICAL ADAPTATIONS TO NEW SITUATIONS

The notion that all social tasks and activities are subject to political-ideological considerations was incorporated in Liu Shao-ch'i's remark to the Eighth Party Congress on May 5, 1958, where he said: "Ideological and political work is always the soul and guide of every kind of work." To the daily work of revolutionizing society there must be brought the particular "stand, viewpoint and method" derived from "the universal truth of Marxism-Leninism."

But Marxism-Leninism is not a closed system of finite rules directly applicable to daily work. As Mao said in 1937: "Marxism-Leninism has in no way summed up all knowledge of truth, but is ceaselessly opening up, through practice, the road to the knowledge of truth." [21] The "true revolutionary leader" must therefore correct his "ideas, theories, plans or programs when they are found to be erroneous"; and, "when a certain objective process has already advanced and changed from one stage to another, [he must] be adept at making himself and all his fellow revolutionaries advance and revise their subjective ideas accordingly, that is to say, he must propose new revolutionary tasks and

new working programs corresponding to changes in the new situation." [22] The crew cannot rest on its oars; and the coxswain, once the race is won, must sustain the mood of tension and announce the next adversary.

In this spirit, Mao Tse-tung spoke of "the correct handling of contradictions" (February 27, 1957)[23] on the eve of the antirightist rectification movement of 1957. "Our socialist system," he said, "has just been set up; it is not yet fully established, nor yet fully consolidated." Evidently, before the "big leap" in socialist production could be ordered (in the form of 1958's new "general line of socialist construction"), the rightist elements must be identified as "enemies of the people" and brought to book. Mao therefore spoke of certain "contradictions" within the ranks of the people already socialized—such as contradictions between workers and peasants and between the working class and the national bourgeoisie—but explained that such "non-antagonistic contradictions" differed from "antagonistic" contradictions "between ourselves and our enemies." The antagonistic contradictions are to be resolved principally by "drawing a line between us and our enemies." On the other hand, the contradictions "among the people" (giving "people" the special meaning that the term has had in Communist China since 1949) could be resolved, basically, by discussion and education, and, as Mao saw it: "Socialist society grows more united and consolidated precisely through the ceaseless process of correctly dealing with and resolving contradictions." A similar position had been developed in *On Contradiction,* as early as August 1937,[24] when the revolutionary situation was entirely different; but it is remarkable how far certain basic ideological-political attitudes of the 1930's and 1940's have persisted down to the present day in Chinese Communist operations.

Mao argued in 1957 "the necessity of waging the struggle in the ideological field," while candidly declaring that "it will take a considerable time to decide the issue in the ideological struggle between socialism and capitalism." Ideological struggle entailed debate and discussion, and Marxists were not to fear "right" (correct) criticism. The "poisonous weeds" sown by "revisionists, or right opportunists," should be fought "wherever they crop up." But discussions among the people under the slogans "let a hundred flowers blossom and a hundred schools of thought contend" could be turned to good account provided a distinction be made between "fragrant flowers and poisonous weeds." Therefore, in a revised edition of his February 27, 1957, address, Mao held that

words and actions can be judged right if they:

1. Help to unite the people of our various nationalities, and do not divide them;
2. Are beneficial, not harmful, to socialist transformation and socialist construction;
3. Help to consolidate, not undermine or weaken, the people's democratic dictatorship;
4. Help to consolidate, not undermine or weaken, democratic centralism;
5. Tend to strengthen, not to cast off or weaken, the leadership of the Communist Party;
6. Are beneficial, not harmful, to international socialist solidarity and the solidarity of the peace-loving peoples of the world.

Of these, Nos. 2 and 5 were called "the most important."

## IDEOLOGY AND POLITICS AS "SUPERSTRUCTURE"

From such statements as these, one sees clearly that ideological standards of judgment are really political standards.

[22] *Ibid.,* p. 295.
[23] Note 5, *Supra.*
[24] Mao, II, pp. 13–53.

The "ideology" in question is actually an operational device in precommunist society, employed by Marxist-Leninists to adapt the superstructure of the state to changes in the economic base and productive forces of society. From this point of view, the ideology and politics of a particular stage of economic development take on a transitory if not ephemeral character and occur during the process of realizing more fundamental "truths of Marxism-Leninism," which are not degraded to the level of mere "ideology." Mao Tse-tung must have had such a concept in mind when, in his "contradictions" speech, he declared that "our state institutions of people's democratic dictatorship and its laws, and socialist ideology under the guidance of Marxism-Leninism" formed a "superstructure" (*shang-tseng-chien-chu*) which "has played a positive role in facilitating the victory of socialist transformation and establishment of a socialist organization of labor" and which "is suited to the socialist economic base." He reasserted the Marxist position that "democracy is part of the superstructure and belongs to the category of politics." "Democracy" and "freedom" were both seen to be means serving the economic base of society rather than ends in themselves.

Recent reassertions by Chinese Communists of traditional Marxist doctrinal positions identifying ideology and politics as "superstructure" may be significant from several points of view. By reaffirming the doctrinal orthodoxy of the Chinese Communists, they lay a basis for condemning asserted Titoist departures from orthodox Marxist-Leninist views of the relationship of the state to society and the economic forces of production. Thus, Tito's "anti-Marxist-Leninist, out-and-out revisionist program" was condemned on the ground, among others, that "politically, it substitutes the reactionary theory of the state standing above classes for the Marxist-Leninist theory of the state. . . ." [25] The asserted Titoist deviation would have the effect of denying the eventual "withering away of the state," in contrast with Mao's views of the nonpermanent character of "our state institutions" and "socialist ideology." Mao's views received support from Lu Ting-yi, the Politburo member who is also Director of the Central Committee's Propaganda Department, who in March 1958 defined "ideology" to include "philosophy, social science [politics?], literature and the arts," held that it "is part of the superstructure," and asserted that "the superstructure must serve the economic foundations and the growth of productive forces." [26]

Mao's position is also related to the growing emphasis on solidarity and unity within "the socialist camp." It also suggests the possibility that as a large number of contiguous countries of Europe and Asia complete their several domestic processes of socialization, the need will be felt for a doctrinal clarification of the problem of transforming "socialism" to "communism" and for explanation of how the state is to "wither away." In any case, the distinction between "socialism" and "communism" is constantly made, and the "classes, state authority and party" which persist as the superstructure of socialist societies may play a different role in Communist society—if they are not entirely transformed. The question of "national roads" to communism there-

[25] *People's Daily* (Peking), editorial, May 5, 1958; *Peking Review,* May 13, 1958, pp. 6–8; American Consulate General, Hong Kong, *Survey of China Mainland Press,* No. 1767.

[26] Lu Ting-yi, "Let Us Be the Force That Promotes Progress," reprinted in *Hsin-hua pan-yüeh-k'an* [New China Fortnightly], No. 7 (1958), pp. 133–134, from *Kiang-hai Hsüeh-k'an,* No. 1 (1958), and translated in slightly different form than quoted above in *Survey of China Mainland Press,* No. 1740.

fore receives special attention. Each country may be permitted to achieve its own form of socialism in accordance with its special national conditions, with no requirement of uniformity. But in pursuing socialism as a "national road" to communism, the different Communist and workers' parties must not adopt methods or attitudes that would infringe upon or frustrate the Communist objective they share as the common goal. There may be "national roads" to communism; but there can be no "national communism"! Ideology and politics of the socialist phase of development may vary from country to country, China included; how far they may differ or vary in the Communist phase is an unanswered doctrinal question.

## National Roads to Communism

The problem of the relative autonomy of different national Communist parties was made a critical issue during the Eastern European crises of late 1956 and has remained alive during the ensuing struggles of Peking and Moscow with Marshal Tito. Ideological guidelines for resolving the issue were first laid down by the Chinese Communist Politburo in its analysis published December 29, 1956.[27] The basic positions were subsequently developed and clarified in the Moscow Declaration of the Communist and Workers' Parties (November 1957), in the resolution of the Eighth Chinese Communist Party Congress of May 23, 1958, in the *People's Daily* editorials and other documents of the Chinese Communist campaign against Tito's revisionism after May 5, 1958,[28] and were confirmed by the Mao-Khrushchev communiqué issued in Peking on August 3, 1958.

The Politburo statement started with the premise that "each state and nation has features different from those of others," from which it follows that "all nations pass through the class struggle, and will eventually arrive at communism, by roads that are the same in essence but different in their specific forms." Since the "universal truth of Marxism-Leninism" becomes concrete and operative "in real life only through the medium of specific national characteristics," each Communist party "must respect the national interests and sentiments of other [socialist] countries." Stalin erred by "being unmindful of the independent and equal status of the communist parties of various lands," exhibiting "great-nation chauvinistic tendencies" that must be overcome. (This portion of the analysis may have been calculated to impress on the Soviet Union the necessity of respecting the position of the Chinese People's Republic.) But even small countries (Hungary? Yugoslavia?) might display nationalist tendencies harmful to the "unity" Communist countries should seek with each other while maintaining their "respective independence." Therefore, "no matter whether their country is big or small, if communists counterpose the interests of their own country and nation to the general interests of the international proletarian movement, make this a pretext for opposing the general interests and not seriously to maintain international proletarian solidarity in actual practice but on the contrary to damage it, they will be committing a serious mistake of violating the principles of internationalism and Marxism-Leninism."

Following this principle, the autonomy of Gomulka's Polish Workers' Party was found compatible with "international proletarian solidarity," but the decision of Imre Nagy to withdraw Hungary from the Warsaw Pact on the pretext of Hungarian national interest was considered an act of "treachery" justifying armed suppression. Tito's employment of the Hungarian crisis to launch a further campaign against Stalinism was held not to be an internal affair for Yugoslavia but a matter of interference in the affairs of others, "creating conditions which the enemy can use to cause confusion and division in our own ranks." The "brotherly advice" offered to the "Yugoslav comrades" took the form of an extended essay on the dangers of a "revisionism" that contemplated the possibility of building socialism "without going through a proletarian revolution led by the party of the proletariat."

The Politburo returned to its analysis of the "fundamental experience" of the October Revolution, holding that while "each country has its own path of development," so far as "basic theory is concerned, the path of the October Revolution reflects the general laws of revolution" and is "the road which the proletariat of all countries must travel to gain victory." The "national roads" to communism must all adhere to the "universal truths of Marxism-Leninism which are generally applicable" and which the Politburo summarized as follows:

1. The advanced members of the proletariat organize themselves into a communist party which takes Marxism-Leninism as its guide to action, builds itself up along lines of democratic centralism, establishes close links with the masses, strives to become the core of the laboring masses and educates its party members and the masses of people in Marxism-Leninism.

2. The proletariat, under the leadership of the communist party, rallying all the laboring people, takes state power from the bourgeoisie by means of revolutionary struggle.

3. After the victory of the revolution, the proletariat, under the leadership of the communist party, rallying the broad mass of the people on the basis of a worker-peasant alliance, establishes a dictatorship of the proletariat over the landlord and capitalist classes, crushes the resistance of the counterrevolutionaries, and carries out the nationalization of industry and the step-by-step collectivization of agriculture, thereby eliminating the system of exploitation, private ownership of the means of production and classes.

4. The state, led by the proletariat and the communist party, leads the people in the planned development of socialist economy and culture, and on this basis gradually raises the people's living standards and actively prepares and works for the transition to communist society.

5. The state, led by the proletariat and the communist party, resolutely opposes imperialist aggression, recognizes the equality of all nations and defends world peace; firmly adheres to the principles of proletarian internationalism, strives to win the help of the laboring people of all countries, and at the same time strives to help them and all oppressed nations.

Such are the objectives animating the play of ideology and politics in contemporary Communist China and underlying its view of the external world.

[27] Note 10, *Supra.*

[28] Translations of the principal documents of this campaign, including *People's Daily* editorials and important articles by Ch'en Po-ta and Wang Chia-hsiang, are in several successive issues of *Peking Review*, Nos. 14–18 (June 3–July 1, 1958).

# Leadership in the Chinese Communist Party

By Chao Kuo-chün

Abstract: The central locus of political power in Communist China is the Chinese Communist Party (CCP), now the largest single Communist organization in the world. Organizationally, the CCP is a pyramidal structure based on the National Party Congress which elects the Central Committee, which in turn elects the Political Bureau. The present Eighth Central Committee, elected in 1956 and expanded in May 1958, manifests both the stability of the party leadership and its adaptation to new circumstances. The core of decision-making power in the party structure is the Political Bureau and its seven-man Standing Committee. Analysis of the membership of the present Central Committee indicates that this elite group is relatively young, drawn largely from the interior provinces of China, well-educated by Chinese standards, and predominantly indigenous in background and training. Almost all have relatively long party membership. Several aspects of the Chinese Communist Party leadership are striking. First, it has demonstrated a higher level of political stability than that of any other major Communist party in the world. Second, it has developed notable organizational skills which greatly assist mobilization of the population and implementation of its major domestic programs. Third, it has demonstrated significant flexibility and realism in the handling of complex problems. Despite recurrent outside speculation about factionalism and schisms, the Chinese Communist Party leadership under Mao Tse-tung still appears to be both durable and determined.

---

*Chao Kuo-chün is Visiting Lecturer at the Indian School of International Studies, University of Delhi. Between 1949 and 1958, he was at Harvard, M.I.T., and Cornell, doing research and instruction in the fields of Chinese and Indian studies. He is the author of Mass Organization in Mainland China (1953), Agrarian Policies of Mainland China, 1949–1956 (1957), and Economic Planning and Organization in China, 1949–1958, and has contributed articles to THE ANNALS, The American Political Science Review, Foreign Affairs, Current History, and journals in Hong Kong, India, and Japan.*

With the rapid economic development currently being achieved in mainland China and with Peking playing an increasingly prominent role in world politics, there is a growing need for more accurate understanding of the nature of the political structure of Communist China and for more critical evaluation of its political leadership. The year 1958 is an opportune time to assess the patterns of power in the Chinese Communist Party. Within the party, significant developments in the hierarchy were formalized at the Second Plenary Session of the Eighth National Party Congress held in May 1958. And, at the national level, several basic programs have been announced by the party during the past twelve months: the "general line of socialist construction," the "big leap forward" in industry and agriculture, the decentralization of commerce and industry, and the "rectification" campaign against political and ideological unorthodoxy.

Many complex factors—political, economic, and social—are involved in the above developments. In this paper, however, attention is concentrated on the following points: first, the primary loci of power in the party; second, the composition and background of the present top-echelon leadership, as exemplified by the 97 regular members of the Central Committee (CC); and third, the major trends in the party leadership.

## The Power Structure of the Chinese Communist Party

The central locus of political power in Communist China is the Chinese Communist Party (CCP), now the largest single Communist organization in the world. As the CCP is the prime mover behind both the domestic and international policies of Communist China, an appraisal of its power structure is of basic importance.

The Communist Party of China is the vanguard of the Chinese working class, the highest form of its class organization. The aim of the Party is the achievement of socialism and communism in China.

Thus the opening paragraph of the present party constitution adopted in 1956 sets forth, simply and starkly, the official view which the CCP has of itself. Organizationally, the CCP is built in accordance with the fundamental Leninist precepts of elitism, organization, and control. Rigid hierarchy, disciplined subordination of inferior to superior, obedience to authority, sustained control—such are the essential elements in the structure. At the top, the real leadership of the CCP consists of the smallest practicable group of veteran Communists of proven ability and reliability. Control is conveyed downward through a pyramidal organization to the party groups and individual party members at the lower levels. At the bottom, the party makes a continuing attempt to preserve its integrity through strict control of the gates of membership and through stern and unceasing discipline of its members. The entire organization is built on the principle of "democratic centralism," officially defined as "centralism on the basis of democracy and democracy under centralized leadership."

The organization of the party structure is based on the National Party Congress, which elects the Central Committee of the party, which in turn elects the Political Bureau.

According to the revised (1956) party constitution, the Central Committee is the supreme organ of the party during the intervals between meetings of the National Party Congress. Thus, through its group decisions, through the positions held by its individual members, and through the activities of its key central departments—Organization, Propaganda, Rural Work, and United

Front Work, for example—the Central Committee has a dominant influence upon the political, military, economic, and social life of the country. The present, Eighth, CC elected in the autumn of 1956 now includes 97 regular members and 96 alternates (the alternate membership was increased from 73 to 96 in May 1958), and is headed by Mao Tse-tung as Chairman and by five Vice Chairmen: Liu Shao-ch'i, Chou En-lai, Chu Teh, Ch'en Yün, and Lin Piao. It includes virtually all members of the previous, Seventh, CC elected in 1945 (with the prominent exceptions of Kao Kang and Jao Shu-shih, who were purged in 1954–55, and a few other individuals who had either died or slipped in importance) together with a greatly expanded group of second-level party leaders who have become important since 1949.

The enlargement of the CC membership in 1956 indicated both the relative stability of the party leadership and its adjustment to new circumstances. Yet membership in the CC is not ipso facto equivalent to a position of real authority. The present large size of the CC combined with the relative infrequency of its meetings has made it more and more difficult for that body to play a major role in the day-to-day decisions of the party.

*Power loci*

In practice, therefore, the Political Bureau is the central directing and decision-making organ of the party. The Political Bureau was enlarged at the Eighth Congress from 13 to 17 members and again to 20 members in May 1958. The apex of political power in Communist China today is the Standing Committee of the Political Bureau created at the Eighth Party Congress to take over the former functions of the Central Secretariat. The Secretariat is now in charge of top-level administrative work of the party under the direction of the Politburo and its Standing Committee, and the post of general secretary —held by Teng Hsiao-p'ing—remains a very strategic position in the party high command.

From this central core, Communist political power revolves outward through a series of concentric rings which link the party and the nation. Since the abolition of the regional administrative areas and the transfer of top regional party leaders to Peking in 1954, the important local centers of authority have come to be found in the secretariats responsible for provincial party affairs. At the Eighth Party Congress, Chou En-lai spoke of assigning "more powers to the local administrative organs and a better division of labor between the central and local authorities." (Report on the Second Five-Year Plan, September 16, 1956.)[1] The increased importance of local leadership could be noted in May 1958, when two of the three newly elected Politburo members were provincial party secretaries; at the same time, five provincial party secretaries were elected as alternate members of the Central Committee.

Other major loci of power in Communist China include the top military command and political commissar positions, major departments in the headquarters of the People's Liberation Army, and chairmanships of leading mass organizations such as the Young Communist League, the All-China Federation of Trade Unions, and the All-China Women's Federation. Strictly speaking, these positions are not part of the party mechanism. Functionally, however, they are occupied by top party leaders and form an integral part of the

[1] Text of Chou's speech, together with other major documents, may be found in *Eighth National Congress of the Communist Party of China* (Peking: Foreign Languages Press, 1956), p. 328.

total power mosaic of the party. Changes in the leadership of these nonparty organs often suggest changes within the party itself. For example, the removal of Li Li-san from the chairmanship of the Federation of Trade Unions in 1953 indicated his political decline even though no formal party disciplinary action was taken against him.

THE TOP LEADERSHIP

The Standing Committee of the Politburo now consists of seven members: Mao Tse-tung, Liu Shao-ch'i, Chou En-lai, Chu Teh, Ch'en Yün, Teng Hsiao-p'ing, and Lin Piao (Lin was elected in May 1958). The most significant change at this top level of leadership is that registered by Teng Hsiao-p'ing, who has emerged during the past few years as a key figure.

The seven members of the Standing Committee are also the top-ranking members of the Politburo itself which is now constituted as follows: [2]

Members: Mao Tse-tung
Liu Shao-ch'i
Chou En-lai
Chu Teh
Ch'en Yün
Teng Hsiao-p'ing
Lin Piao
Lin Po-ch'ü
Tung Pi-wu
P'eng Chen
Lo Jung-huan
Ch'en Yi
Li Fu-ch'un
P'eng Te-huai
Liu Po-ch'eng
Ho Lung
Li Hsien-nien
K'o Ch'ing-shih
Li Ching-ch'üan
T'an Chen-lin

Alternate members: Ulanfu
Chang Wen-t'ien
Lu Ting-yi
Ch'en Po-ta
K'ang Sheng
Po I-po

The composition of the Politburo of the Chinese Communist Party indicates both continuity and expansion in leadership. Nine new names have been added to the regular membership of the Politburo during the past two years: Lo Jung-huan, Ch'en Yi, Liu Po-ch'eng, Ho Lung, Li Fu-ch'un, and Li Hsien-nien (all elected in September 1956), K'o Ch'ing-shih, Li Chiang-ch'üan, and T'an Chen-lin (elected in May 1958).

The increased weight of military leaders at the top levels of the party structure is suggested by the fact that four of the six members of the Politburo newly elected at the Eighth Congress and seven of the total of 20 members are Marshals of the People's Liberation Army. Yet the available evidence does not indicate that the military is now the dominant power group in Communist China. Five of the seven members of the all-powerful Politburo Standing Committee are civilians, and Marshal Chu Teh, the fourth-ranking member, is now 72. The military still constitutes a minority in the Politburo, and none of the six alternate members of the Politburo is a military man. There are only two generals in the nine-man Central Secretariat. And, finally, the definition of a military leader in the Chinese Communist context is unique, for the Chinese Communist forces have for many years been developed on Mao Tse-tung's concepts which accord major weight to political as well as purely military elements in warfare. Almost all the key army personnel belong to the Kiangsi-Yenan group, and they appear to form a disciplined and cohesive group long associated with the Mao Tse-tung leadership. To date there has

[2] See American Consulate General, Hong Kong, *Current Background* No. 513 (revised), July 16, 1958, for complete listing of the central apparatus of the Chinese Communist Party.

been no reliable confirmation either of schisms between the party and the military or among the military leaders themselves.

While the current greatly expanded Central Committee of 97 regular and 96 alternate members is far less significant than the Politburo as a decision-making organ, a member's ranking within the Central Committee is still generally indicative of his political importance. In order to contribute to an understanding of the top leadership of the Chinese Communist Party, the backgrounds of the 97 regular members of the Eighth Central Committee are analyzed below (see Table 1). Not every one of the current CC members may be considered a top leader, although all key party figures are on the CC. Due to incomplete or inexact information regarding a number of CCP leaders, observations drawn from this background analysis serve largely to indicate the general pattern in the leadership structure.

TABLE 2—BREAKDOWN OF THE AGE GROUP OF THE 97 MEMBERS OF THE EIGHTH CC, CCP

| AGE | NUMBER |
|---|---|
| Under 46 | 1 |
| 46–50 | 20 |
| 51–55 | 34 |
| 56–60 | 26 |
| 61–65 | 7 |
| Above 65 | 5 |
| Unknown | 4 |
| Total | 97 |

*Background*

As an elite group, the leaders of the CCP are relatively young. Of the 97 regular members of the present CC, about 80 per cent belong to the age group from 46 to 60, with the age group 51–55 constituting approximately 35 per cent; 56–60, about 26 per cent; and under 50, about 21 per cent (see Table 2 for groupings as of 1958).

Regarding their geographical origin, 30 (31 per cent) are from Hunan province; 12 (12.3 per cent) from Szechwan; 6 each from Hupeh and Shansi; 5 each from Fukien, Hopei, Kiangsu, Shantung, and Shensi; and 4 each from Anhwei, Kiangsi, and Kwangtung. The remaining 6 are distributed among five other provinces (including Inner Mongolia), while eight provinces or areas (including Sinkiang and Tibet) are unrepresented (see Table 3). A substantial portion of the CC membership thus comes from the interior provinces in the hinterland, from areas relatively removed from the Western influences of the port cities and coastal districts. This contrasts sharply with the membership of the Central Executive Committee of the Kuomintang in the prewar period, when about 40 per cent of its membership came from six coastal provinces.[3]

In comparison with the great majority of the Chinese population, the members of the Chinese Communist hierarchy have had much better than average education (see Table 4). Of the 97 CC members, 51 probably received education in a college, normal school, or professional institution, while 22 were trained in military academies (here defined to include Communist military training schools in Juichin and Yenan). The high proportion of leaders with military training is a reflection of the military environment of modern Chinese politics and of the long years of "armed struggle" against both National Government armies and Japanese forces during the period between 1928 and 1949.

The indigenous roots of the present leadership are suggested by the fact that 56 out of 97 CC members are not known to have had any training outside China. Of the remainder, 25 received training in the USSR, 9 in France, 5 in Japan, and 1 in Germany (see Table 5).

TABLE 6—PERIOD OF JOINING THE CCP OF THE 97 REGULAR MEMBERS OF THE EIGHTH CC, CCP

| YEAR | NUMBER |
|---|---|
| 1921–1924 | 24 |
| 1925–1927 | 45 |
| 1928–1937 | 20 |
| Unknown | 8 (probably all before 1938, with the possible exception of Yang Hsiu-feng) |
| Total | 97 |

Some, of course, visited more than one foreign country (two received brief training in the United States, for example), but in this computation only the country where the individual received his major training is counted.

Available data also indicate that almost all members of the present CC have relatively long party membership. About 70 per cent joined the party between 1921 and 1927; virtually all the rest appear to have joined before 1938 (see Table 6). It is almost certain that none of the 8 unknown, with one possible exception, acquired party membership later than 1937.

Other background factors, while significant, are not considered in this analysis because of lack of adequate information. For example, the social background of the majority of the CC members is not definitely known. Of the 40 per cent about whom there are some reports, the largest number comes from peasant families, followed by gentry-official, and working class families.

### *Characteristics*

Many characteristics of the Central Committee membership reflect those of the Chinese Communist Party as a whole. The party as a political organism is relatively young, and its origins are still predominantly rural. Data released at the time of the Eighth Party Congress in September 1956 stated that, of the (then) 10.7 million party members, 67.5 per cent were between 26 and 45 years old, while only 7.6 per cent were over the age of 46. As of 1956, peasants reportedly constituted 69.1 per cent of total party membership; workers, 14 per cent; intellectuals, 11.7 per cent; and others, 5.2 per cent. During the Sino-Japanese war period, 1937–45, over 90 per cent of the party membership consisted of peasants. Women appear to be underrepresented on the present Central Committee. While some 10 per cent of the party members are females, only four women—Ts'ai Ch'ang, Teng Ying-ch'ao, Ch'ien Ying, and Ch'en Shao-min—are among the 97 regular members of the CC and none appear on the Politburo.

The more prominent new names among the current CC members include the following: K'o Ch'ing-shih, Secretary of the Shanghai and Kiangsu Party Bureau and Mayor of Shanghai since November 1958; Li Ching-ch'üan, Party Secretary of Szechwan province and a new Politburo member; Lin T'ieh, Party Secretary and Chairman of Hopei province; and Hu Yao-pang, Chairman of the Young Communist League.

In general, however, despite the expansion of the top apparatus, the leadership of the CCP is still dominated by veterans of the pre-1949 struggle for power in the countryside of China. Despite recurrent outside speculation about factionalism within the CCP, virtually no concrete evidence exists with respect to the existence or the precise motivation of such factions. Mao Tse-tung still appears to be the undisputed leader of the party as he has been for over twenty years since the Tsunyi conference of January 1935. A Reuters dispatch from Peking of August 16, 1957, concludes that

his [Mao's] value in preserving the "unity of all patriotic Chinese," which the Communists have been stressing for the last year, is still immense, and it is unlikely that his colleagues would let him go, even if he wanted to go, or that they would want to see him go.[4]

Regionalism and provincialism do not appear to play a major role in the politics of Communist China as they did in the later decades of the Ch'ing dynasty and in the Republican period. Differences within the leadership appear to relate more to tactical issues—the proportion of investment allocated to capital goods and consumer goods, or the speed of collectivization, for example—than to the long-term strategy of the Chinese Communist regime.

## EVALUATION OF THE CCP POWER PATTERN AND LEADERSHIP

Although detailed analysis of the structure and manipulation of power within the Chinese Communist Party is extremely difficult, several salient features emerge from analysis of the data presented above and from examination of recent developments on the mainland.

The first striking aspect is the high degree of solidarity in the CCP leadership. Internally, the Chinese Communist Party leadership has demonstrated for the past twenty years a far higher level of political durability than that of the Communist Party of the Soviet Union or any other major Communist party in the world. This stability is partly manifested by the high measure of continuity in membership between the Seventh (1945) and Eighth (1956) Central Committees. It is also manifested by the fact that the party leadership, after carrying through major programs of political, social, and economic reorganization during the years since 1949, has remained both cohesive and confident. (The purge of Kao Kang and Jao Shu-shih was, in a sense, the exception which proved the rule.)

A second important feature is the high organizational skill developed by the party. These organizational techniques enable the party to mobilize all sectors of the Chinese population to work actively on the programs of national construction planned by the party. At the grass-roots level, the leadership organizes and indoctrinates the masses both through the party apparatus and the Young Communist League and also through mass organizations such as the trade unions, the Women's Federation, and myriad others. Through these bodies, the party is able to absorb the most active and able elements into its own structure. With the assistance of modern mass media such as the broadcasting network, the party is able to explain its programs and to implement them throughout the mainland within a very short period of time. The organization process is assisted by a host of socio-psychological techniques: public criticism of government officials in "rectification" campaigns, study and self-criticism sessions, and the stimulation of nationalist sentiment in political and production drives—for example, the slogan "catch up with England in fifteen years." For the first time in Chinese history, the central political authority of the country has penetrated directly to the village, the family, and the individual without reliance on intermediate local elements—such as the landed gentry in the countryside during the pre-1949 period, for example. Popular sentiment and local problems are reflected through the frequent reports of cadres who work closely with the people and by periodic visits of national leaders to inspect basic-level organizations.

A third feature of the Peking leadership lies in the flexibility with which it has been able to co-ordinate political,

[4] *New York Times*, August 18, 1957, p. 34.

economic, and social programs. In the agricultural sector, for example, the party initiated the Chinese peasant into organized farming through a four-stage process: first, mutual-aid teams, then agricultural producer co-operatives, then collectives, and finally "people's communes." At the same time, the collectivization of Chinese agriculture has been closely co-ordinated with agro-technical improvements, rural marketing development, mass education, and political indoctrination. Thus the Communists have been able to accelerate the process of socialization in the countryside during the relatively brief period of nine years without serious disruption of the essential process of agricultural production. Another illustration of Peking's approach to national development problems is seen in the extensive decentralization of industrial and commercial activity in recent months. These moves have apparently been a major contributing factor to the increased production by local industries during 1958.

With comprehensive planning under a highly centralized regime, and with nationwide activities being undertaken at a very rapid tempo, problems and shortcomings are inevitable. One of the major problems confronting the CCP today stems from the simple fact of greatly accelerated growth in party membership during the past decade. To meet the pressing demand for trained and politically reliable personnel to deploy in the face of tremendously expanded problems, the party has had to admit millions of newcomers. From a membership of about 4.5 million in 1950, the party has continued to swell: to 10.7 million (September 1956) and to 12.7 million (September 1957). The conflict between quantity and quality of party membership remains a persisting problem. Recognizing that indecision, inefficiency, and erosion of morale are constant problems, the leadership is making regular efforts to maintain the present enormous party bureaucracy as an efficient and responsive political structure.

### POLITICAL TRENDS

Study of the prevailing power structure and leadership in China indicates that the Chinese Communist Party leadership under Mao Tse-tung continues to enjoy a high degree of cohesion. The growing stature of Mao as a major spokesman in the Communist camp has further enhanced his prestige in the eyes of the Chinese. The top leaders of the Politburo and the younger individuals—like K'o Ch'ing-shih, T'an Cheng, Ch'en Po-ta, and Hu Yao-pang —rising in the party hierarchy are all close associates of Mao. The unusually high continuity of leadership in the CCP suggests that the Peking regime will probably maintain its present basic policies in the foreseeable future.

Under the determined leadership of the CCP, Communist China has embarked upon an ambitious program of industrialization and technical-cultural revolution. The implications of this program are international as well as domestic, for the decisions of the Communist Party at Peking now affect a quarter of the world directly and almost all the earth's population indirectly. Thus an understanding of the power structure in mainland China is of critical importance in accurate assessment of many current world problems.

# Organization and Response in Communist China

By H. F. SCHURMANN

ABSTRACT: Communist China today is marked by two great processes: industrialization and organization. Organization is total, reaching from the top of society down to its lowest levels. Everyone is recruited into some group organized and controlled by the regime. At its lowest level, organization consists of numerous small groups, usually numbering no more than twenty people. These are the "study" and work groups. It is through these small groups that the masses are controlled and manipulated according to definite organizational principles uniformly applied throughout the society. These principles call for the development of strong internal solidarity in the small groups as well as disciplined obedience to orders from above (manipulability), both of which are to some extent mutually exclusive. Hence the Communists consistently and universally use certain mechanisms, mainly "study," to maintain a dynamic balance between the two. "Study" is the intensive application of group and self-criticism to individual group members. The considerable success of the Communists in eliciting "response" in the small groups is due not only to coercion but also, possibly, to a tradition in China of participation in small, tightly knit associations.

---

*H. F. Schurmann, Ph.D., Harvard University, is Acting Assistant Professor in the Departments of Sociology and History, University of California, Berkeley. He is the author of The Economic Structure of the Yüan Dynasty (1956) and of articles on Chinese history and society in professional journals. The results of his ethnological work in Afghanistan will appear in a forthcoming volume, The Mongols of Afghanistan. During the summer of 1958 he visited Hong Kong to collect material on organizational problems of Communist China.*

THE LAST decade has seen the emergence in China of a new totalitarian state. Within the short space of ten years, the Communists have succeeded in unifying and organizing the vast expanses of the Chinese mainland in a manner unknown in all previous Chinese history.

In this process of political consolidation, the Communists have proceeded systematically and relentlessly, operating according to definite organizational principles. These principles are those which underlie the organization of the Communist party and which have now been extended to the entire society. Two of the most fundamental principles are what may be called: (1) co-ordinated leadership, and (2) the operational unit, or to use Communist terminology: the cadres (*kan-pu*), and the small group (*hsiao-tsu*). The cadres may be Communist or non-Communist; the small groups may be Communist or non-Communist. Yet, wherever there is organization today in China, there are cadres and small groups. Every individual in China is a member of some organized association brought into existence by the Communists themselves.[1] Such membership always involves participation in some "small group" (henceforth to be called SG and used in this specific Chinese Communist sense).[2] The nuclear group of every organization is the SG. Thus the party SG is the lowest unit of party organization; there may be several SG in a cell (*chih-pu*) or the SG may be identical with the cell itself. All SG's are led by a cadre. Party cadres are a special variety of the cadres in general. Every leader, whether he is in the party or not, is regarded as a cadre. The SG's and the cadres are the building blocks of Chinese Communist total organization. Without an understanding of these organizational nuclei, no understanding of contemporary China is possible.

No organization can become operative by coercion alone. To function, an organization must be able to elicit "response" from its members, that is to say, acceptance or commitment on the part of the members to the goals of the system as defined by its leaders and a willingness to participate in the activities necessary for the attainment of these goals. Though coercion is undoubtedly an important weapon in the Chinese Communist organizational arsenal, there are other, more important means of eliciting response. There is no question that ideology—the values and goals of Chinese Communism—is one of the chief means. But there also may be other factors involved, factors deriving from what may be called the traditional social structure of Chinese society. In this paper, I shall deal with some problems of nuclear organization in Communist China, and suggest some reasons for the apparently intensive response to organization by large segments of China's population.

## NATURE OF THE SMALL GROUP

The SG is not simply an abstract group used for purposes of registration or classification. Nor is it a "natural" group which existed before the coming of the Communists and was simply taken over by them for their own purposes. SG's were purposively organized by the Communists and universally centered around a principal activity, namely

[1] Marginal persons in the cities are at least involved in street group organization, and in the rural areas they are usually caught up in the "co-operatives" as "nonregular members."

[2] The information for this article was obtained largely from the collection of Chinese Communist materials in the Hoover Library, Stanford University. On membership in the SG, see *Kung-fei chung-yao tzu-liao hui-pien*, Vol. 3, p. 186. The material cited, though published in Formosa, is a convenient collection of Communist source material quoted verbatim.

"study" (*hsüeh-hsi*), the activity commonly referred to as "brainwashing."[3] Every person is a member of some study group (*hsüeh-hsi hsiao-tsu*) which meets regularly to "study." In some instances the members of the SG may also live and work together, in which case they are known as a "living small-group" (*sheng-huo hsiao-tsu*). These groups ideally consist of from seven to thirteen people, although an absolute size is not fixed. The criterion of size is ability to function effectively; but, in general, organizational handbooks advise against groups which are either smaller or larger than the limits given. As one source says, if the groups are too large there is enthusiasm but lack of control; if they are too small, there is control but lack of enthusiasm.[4] Attendance is compulsory. SG meetings usually take place from once in a week, during ordinary times, to long daily sessions, when a "movement" is in progress. The SG members almost always sit in a circle facing each other. The SG leader will usually launch the meeting, but during its course every one must rise and "express his opinions" (*fa-yen i-chien*). Discussion (*t'ao-lun*) ranges from broad political subjects to extremely personal matters affecting individual members. If some meetings are trite and routine, others are marked by intensive "struggle" (*tou-cheng*) in which some members may be severely attacked. SG's exist in the party, in factories, in schools, in village co-operatives, in the army—in short, within every formal organization in the country. Where people are not covered within formal organizations, neighborhood SG's, under the control of the street committees (*chü-min wei-yüan-hui*), are organized to make certain that the entire population is reached.

The main purposes of the SG are to function as a collective work or activities group, to induce collectivist attitudes in its members. The political aspects of the mechanism are basic, for the SG operates as an instrument for control and supervision and acts as a channel for communication from leadership to masses and from masses to leadership.

The specific nature of activities within an SG will vary according to the organization, but the general characteristics of all SG's are similar. The following account by a refugee author of SG life in a university gives an indication of the activities within an SG. In the university, SG's were formed according to school classes. Collective living and collective study were carried out within the framework of the SG. The SG leaders were in charge of class attendance; in military fashion, they called out names and marched the students to class. After class, the SG collectively went to the library for study and research; sometimes collective discussion followed class lectures. Collective pre-exam study was the rule. After exams, democratic criticism of exam results was carried out in which the SG performance rather than individual performance was the major criterion of judgment. Members of the SG also lived together, for which reason these SG's were also known as "living groups." In the morning, they had to wash collectively, to eat breakfast collectively. And, as this was in the early period after Communist victory, they had to dance the *yang-ko* collectively after a collective supper. Then there was collective viewing of films, collective singing. All this, needless to say, was compulsory. If anyone refused to participate, he was regarded as deviant, criticized as an individualist, and subject to severe "thought reform." Col-

[3] *Ibid.* On "brainwashing," see Robert J. Lifton, "Thought Reform of Chinese Intellectuals," *The Journal of Asian Studies*, Vol. 16 (1956), pp. 75–88.

[4] *Kung-fei chung-yao tzu-liao hui-pien hsü-pien*, III, p. 27 ff.

lectivism (*chi-t'i chu-i*), as the author woefully remarks, truly means destruction of the individual.[5] Collective living may have been particularly intense in the university SG's, but similar activities go on in all SG's. The *Yangtze Daily* (September 11, 1951) reported that in some factories in Tientsin there were more than twenty-seven SG meetings within a single week. On road building projects and in labor camps, workers are also organized into small "living groups" and subjected to the same form of collective activity.[6] While it is impossible to get a complete picture of the actual workings of SG's in the different organizations, one fact is clear: one of the main purposes of the Small Group is to induce a high degree of collective living and collective attitudes in its members.

## THE CADRE

Every SG has a leader, the SG leader (*hsiao-tsu-chang*). The SG leader is a cadre, although in some cases of a very low level. Nevertheless, as the designated leader of the SG, he is in direct contact with the higher levels of the organization, whether party, union, collective, army, or other. Through the cadre, orders are transmitted to all levels of the organization, ultimately reaching the lowest level or SG. The SG leader is responsible for the eliciting of response from the group to orders from above.

It is also the responsibility of the SG leader to maintain the solidarity of the group. SG members are urged to form close ties with each other, to develop strong feelings of comradeship. They are urged to "get the feeling that the SG has the warmth of one big family."[7] They should "all be good sisters and brothers, good classmates, good comrades."[8] The leader too must remain closely identified with the SG, so that "on the surface one cannot see the difference between leaders and led, and only when he must function as leader does he then act as one."[9] As a leader, he must be aware of the personal problems of the members of the SG. If quarrels arise between members, he must act as arbiter.[10] All handbooks for cadres warn against excessive authoritarianism and indicate that the SG leaders must relate to the members as equals. All organizational literature of the Chinese Communists stresses the importance of maintaining true solidarity, true group spirit among the members of the SG. The members are urged to form strong informal ties of solidarity with each other, aside from their work or study relationships.

## MANIPULABILITY AND SOLIDARITY

Although Communist sources strongly emphasize the importance of solidarity in the SG, a more serious problem is what might be termed the manipulability of the SG. The basic purpose of the SG is not the fulfillment of the needs of the members of the group, but rather the regulation of their functions in terms of the goals set by the regime. To this end, the SG must remain responsive to commands from above and must be manipulable by its cadre leaders. Given natural human tendencies, the uncontrolled SG would either disperse or turn into a true primary group, bound together by close ties of solidarity but no longer amenable to outside direction or control.

[7] *Kung-fei chung-yao tzu-liao hui-pien,* III, p. 186.

[8] *Ibid.*

[9] *Ibid.*

[10] *Ibid.*

The problem of manipulability, whether in party, union, army, collective, school, or other organization, is expressed in the party literature as "maintaining discipline." For the most part, party literature shows more concern with the problem of discipline than with the problem of group solidarity. The recent (1957) statements of Mao Tse-tung on "internal contradictions among the people" reflect a growing awareness of the alienation of cadres from those whom they lead and a decline in small group solidarity at the lower levels of society. However, in both the earlier and present-day literature, discipline seems to be the main problem. During guerrilla days, centrifugal and particularistic tendencies were repeatedly denounced. The campaign against "mountainism" (*shan-t'ou chu-i*), for example, was aimed at the serious problem posed by decreasing coordination among the Communist party guerrilla armies, each on its own mountain top.[11] Related denunciations of "nativism" and "cliquism" can be found in all party literature since the Shensi border days, if not earlier.[12] In other words, the "natural" tendency toward small group formation, toward ingroupedness, with the implication of decreasing manipulability from the center, remained one of the main organizational problems of the party.

One means utilized within some SG's to maintain discipline is internal structuring, or formal organization within the SG itself. The more the SG is structured along formal lines, the more the formation of primary ties—hence ingroup ties—is inhibited. Thus, for example, in some of the labor union SG's (which seem to be larger than those of the party), people were appointed to take charge of specific tasks (*kan-shih*) such as production, study, writing of reports, culture and recreation, recruitment and organization, welfare, mutual aid, problems relating to women and youth.[13] The functions of labor unions in Communist China are similar to those in Russia, that is, the maintenance of labor discipline and the assurance of labor's response to the industrial tasks of the nation.[14] Similar structuring can be found in the SG's of the party, of street committees, of the youth league, and so forth.

### *Avoiding stagnation*

If internal structuring or formal organization within the SG's of the unions and other organizations be a means of holding the group together, there is also the danger of stagnation. The Chinese Communists are well aware of this danger, and their organizational literature constantly stresses ways of keeping the organization alive and responsive. A *People's Daily* editorial (August 19, 1953) warned against stagnation by calling for constant internal reorganization, minimal interference in the free time of workers, and the encouragement of SG activities so that "the opinions of the masses can be 'concentrated,' the power of the masses be manifested, and the union [not] become separated from the masses." Concern with what I have called the problems of solidarity and manipulability in the organizational structure is also expressed in a speech made by the Chinese Communist Party leader Teng Fa in 1944, at a time when the Communists did not yet face major problems of industrial organization. He outlined six ways to combat stagnation

[14] Cf. *Labor Problems in Communist China (To February 1953)* (= HRRI Project, Research Memorandum No. 42) (Lackland Air Force Base, Texas, 1955), p. 82.

in the factories: constant internal reorganization; teaching workers "to regard the factory as their home"; aiding management in maintaining labor discipline; having party, union, and management pay attention to worker grievances; strict "study" to reform "bad tendencies"; and participation of cell secretaries in factory committee meetings, management operations, and production.[15] Liu Shao-ch'i, as quoted in a handbook for Communist party members, lists four ways of maintaining discipline in a cell: regular meetings; a report system where members report to the group on their work and the SG leader reports to the group; referring all major questions to higher party authorities; and strict criticism and self-criticism.[16] Needless to say the same system is employed in the SG's of unions and other organizations.

Another writer, Lung Ch'ien, first emphasizes the importance of solidarity in the SG, but then turns around and warns against weakening discipline:[17]

> [Too much talk is bad for solidarity], but another matter is when everyone lives together harmoniously, with no trouble. This sort of condition appears as the result of feudal type solidarity. All that is necessary is that you be loyal to somebody, that you can help him along. Why should one get mad at one another? Just get along with each other! In public you should not attack me, and I shall not attack you. In this way, we set up a wall over which we do not attack each other, and try to remain at peace. But in reality we talk behind his back, and at will spread around wild talk. In this type of familial atmosphere there is no way of criticizing performance. There is also no way for the leader to carry self-criticism. . . . Unless there is Bolshevik criticism and self-criticism, party discipline cannot really be firm!

In the Communist press, especially in the columns devoted to "party life," there is constant discussion on ways of maintaining SG activity. Cadres are criticized for bureaucratic tendencies, for alienating themselves from "the masses"—that is the ordinary members of the SG. SG's are criticized for not rotating leadership often enough, thus allowing "contradictions between the leaders and the led" to arise. There are criticisms of too many meetings which exhaust the members of the SG, and there are criticisms of too few meetings which produce indifference. There are criticisms of cadres who do not "penetrate into the masses," as well as criticisms of cadres who might be said to penetrate too deeply, as in the case of the recent denunciations of certain labor union leaders who allegedly fostered "revisionism" and trade union tendencies in their unions.[18] The maintenance of dynamic, responsive, and collective SG activity is one of the major organizational problems of the Communists in China, a problem which is constantly discussed in their mass publications.

## Organizational Problems

The Communists have created a vast structure of organization in China. It is clear that they are confronted with all the problems that large scale organization brings with it. Insights into the nature of some of these problems may be gained by looking at the workings of the organizational nuclei, the SG's. Every member of an organization is at the same time recruited into a study group whose members are supposed to develop close work and friendship relationships among themselves. One might go so far as to say that a certain degree of informal and primary solidarity among members is a requisite of the SG system. However, "excessive solidarity"—the tendency toward in-group formation—makes the group less responsive to orders from above and less oriented toward the general goals of the system. Communist writers, from Mao Tse-tung down, have repeatedly warned that the SG must not degenerate into a "feudal" club—that is, a traditional type friendship group. Nevertheless, the same writers also warn against excessive formalization of the SG, the lack of true ties of solidarity, the development of authoritarian tendencies on the part of the cadres. Though both solidarity and manipulability are functional requisites of the SG, "excessive" development of one has a deleterious effect on the other. The Communists have discovered from experience that the SG without some mechanism cannot remain both solidary and manipulable at the same time.

## Criticism and Self-Criticism

The most important mechanism developed by the Communists for maintaining the functions of the SG is "criticism and self-criticism." Though an old Leninist mechanism of control, "criticism and self-criticism" has become the universal mechanism for maintaining small group control in Communist China. "Criticism and self-criticism" is applied far more often and more thoroughly in Communist China than in the USSR. "Criticism and self-criticism" is the means through which "study" is implemented. The popularity of the term "brain washing"—never used by the Chinese Communists themselves—has given the impression that "indoctrination" is the main function of "study." While inculcation of specific doctrinal ideas is important in "study," its main purpose is the development of proper group attitudes. The mechanism for doing this is the application of "criticism and self-criticism," a painful psychological process which alternately evokes feelings of anxiety and security in the individual.[19]

These techniques are applied at all meetings, though not always with the same vehemence. Essentially, the technique consists in the usually temporary alienation of a single member from the group through the application of collective criticism. One member is singled out for criticism, either because of faulty ideological understanding, poor work performance, or some other deviance. He is not only subjected to a barrage of criticism from the members, but also joins in and begins to criticize himself. The avowed purpose of the procedure is to "correct" (*kai-tsao*) the individual. Under normal circumstances, the individual is "reintegrated" into the group after the "temporary alienation." The experience of temporary alienation by the one criticized and collective criticism by the group members is, in theory, supposed to have the general effect of maintaining the group's cohesion and effectiveness. Great fear exists on the part of those potentially criticizable that they may become victims of a more permanent alienation. Fear of such a permanent alienation serves to strengthen the bonds within the group. While the effectiveness of this technique cannot be judged accurately, the continuing and intensive practice of "study" in Communist China indicates that the Communists regard

[18] A few random references on this type of discussion: *Canton Daily*, September 18, 1956; *Tsingtao Daily*, February 6, 1957, *Amoy Daily*, March 28, 1958. The *People's Daily* of August 12, 1958 denounces such labor leaders who "pretend to be concerned with the workers' welfare."

[19] Cf. Robert J. Lifton, "'Thought Reform' of Western Civilians in Communist Chinese Prisons," *Psychiatry*, Vol. 19 (1956), 173–95.

"study" as an important mechanism in organization. Impressionistic reports of observers would seem to indicate further that these tactics have had far greater success and elicited far greater response in China than in the USSR.[20]

The technique of alienation or isolation is also widely used in the labor camps. One refugee, P'ei Yu-ming, reports that in the Shensi camps the prisoners were divided into three groups: progressives, backward, and isolates. They were physically separated from each other and formed separate groups. The progressives were those who showed positive evidence of successful indoctrination. The backward were the over-all mass of unregenerates who still had to undergo indoctrination and become amenable to the new system. The isolates, however, were those who had regressed seriously from a former progressive position. They were subject to a form of punishment known as isolation. A board with the word "isolate" (*ku-li*) was hung around their necks. They were forced to eat in separate places, given poor food. No one was allowed to speak to them, and they were forbidden to speak to others. Isolates were not hopeless cases, but could only regenerate themselves through special effort.[21]

## Study, Incentive, and Piece-Work Techniques

Though the avowed purpose of "study" is indoctrination, its main function relates to the implementation of organization. The dynamic tensions released during "study" sessions, on the one hand, prevent the members of the group from sinking into lethargy and a quietistic sort of solidarity, and on the other serve to implement informal ties among members. "Study" sessions also avoid excessive formalization of the group. The tensions and conflicts which these sessions produce, far from endangering the workings of the system, are the very mechanisms by which it remains dynamic. If new work techniques are to be introduced, a "study" session is held. If social innovation is to be practiced, a "study" session is held. SG meetings take place in the evenings, after work hours, and though discussions almost always involve talk about everyday problems, a general atmosphere of doctrinal approach is maintained. Such and such is a Leninist way of thinking; such and such is not. Similarities to certain types of religious sect meetings are apparent.

The Chinese Communists also make use of other mechanisms for implementing organization and eliciting response. The use of incentive and piece-work systems to obtain greater work response is widespread. Encouragement of mobility through new recruitment or replacement of cadres is also an important social mechanism. Neither of these techniques, however, is primarily group oriented. In fact, they encourage alienation from the group and, in the long run, it might be inferred, could have disruptive effects on group solidarity. But it is the SG system with all of its ramifications which forms the basic building blocks of the Chinese Communist totalitarian system. Through the dynamic interplay of the conflicting tendencies toward solidarity and manipulability, controlled and guided by the mechanism of "study," the Chinese Communists have developed an organizational tool of tremendous power.

The organizational principles of the Chinese Communists—the cadres, small groups, study techniques, and so forth

[20] Robert Guillain, *600 Million Chinese* (New York: Criterion Books, 1957), p. 133.

[21] *Wo lai tzu tung-pei nu-kung-ying* [*I Came from a Manchurian Slave Labor Camp*] (Hong Kong, 1954), p. 66 ff.

—are basically those of Communist parties in all countries.[22] One may infer from the considerable organizational success of the Chinese Communists that these principles, though borrowed from a non-Chinese ideology, have served them well within Chinese society. Not only Communism's ideology but also its organization had an "appeal" which made large scale recruitment possible. The earliest period of Communism in China (early 1920's) is marked by the existence of study groups and cells.[23] The earliest nuclei of Communist organization were found, not among workers or the peasantry, but among the dissatisfied intellectuals. For these deviants—the "advanced" element of the population—the Marxist small group offered opportunities for human solidarity rarely found elsewhere. The uniqueness of the Marxist group lay precisely in the fact that social deviance—rejection of traditional values and a readiness to fight against traditional society —was a requisite for membership in the group. The group offered comradeship, the chance to establish primary relationships with other human beings who were in similar opposition to society. These were the forces which appealed to recruits and which made for solidarity in the conspiratorial group.

## Traditional Chinese Culture and Response to Communism

If response to the SG in Communist China may be partly explained by the "appeal" inherent in Chinese Communist organizational tactics, certain indigenous factors in Chinese culture have also been instrumental in eliciting response to Communism. The culture and social structure of traditional China had deep roots; during the millennium proceding the present century, both remained essentially unchanged. Despite great changes in Chinese society during the last half century, the old patterns of action have not entirely disappeared. Some traditional institutions remain, and many old habits of action continue to affect behavior. Though the Communists wage a ceaseless struggle against "the old"—as for example in their unrelenting attack on the family system—on "superstition," on regionalism, they have not failed to make use of certain basic behavior patterns well known to them as Chinese for implementing their plans. In some instances, the Communists have used traditional type groups for their own purposes. For example, in the villages, the Communists took over traditional amusement and storytelling groups and transformed them into vehicles for Communist indoctrination.[24] However, more significant is the fact that the Chinese Communists have also taken advantage of certain traditional behavior patterns, most important of which are the strong associative tendencies of the Chinese.

Studies of traditional Chinese social structure have emphasized the strong family and group orientation of the Chinese.[25] The internal solidarity of the Chinese family is well known. But group solidarity also manifested itself outside the family. China has for centuries been a society of clubs, guilds, and associations of various sorts. Generally speaking, these associations tended to take the shape of semiformal, semiinformal organizations: small, relatively compact, marked by a high degree of

[22] Cf. Philip Selznick, *The Organizational Weapon* (New York: McGraw-Hill Book Co., 1952), p. 17 ff.

[23] Benjamin Schwartz, *Chinese Communism and the Rise of Mao* (Cambridge: Harvard University Press, 1951), pp. 33 ff.

[24] *Kung-ch'ü nung-min chiao-yü* [*Peasant Education in Communist Areas*] (Hong Kong, 1952), p. 87.

[25] Cf., for example, Marion Levy, *The Family Revolution in Modern China* (Cambridge: Harvard University Press, 1949), p. 164 ff.

interaction among members. This penchant for association may be observed in any overseas Chinese community today. Aside from the web of informal and primary relationships among members, these associations were characterized by fraternal and equalitarian solidarity. Though age-generation differences ranked "older" and "younger," a clearly defined leadership at the top was not particularly common. The elders "consulted" and made decisions through "consensus." Even in the family, "consensus" played its part in the making of decisions. In a household where the official head of the family was an older brother, important decisions affecting the family as a whole could only be made after consultation with the other members of the family.[26] The making of decisions in the villages was carried out through consensus, and not through command. In associations too, no individual necessarily played an indispensable role. Leadership positions were rotated, and new recruits for top positions were always found.[27] Witness the secret societies, which endured for hundreds of years without a clearly defined leadership and based themselves almost entirely on enduring fraternal solidarity. To state these observations somewhat more abstractly, in traditional Chinese society there were strong tendencies to respond to equalitarian group situations characterized by informal and primary type relationships.

Superficially, the Communist SG presents certain similarities to traditional Chinese associations. The SG is small, in theory highly solidary, and in theory highly equalitarian. Chinese Communist mass propaganda has consistently stressed themes of comradeliness and equality in the small groups. The same two themes are stressed today. Even if the SG's have an "appeal" which flows directly from their internal structure, the very fact that they bear certain strong resemblances to traditional Chinese group types is an important factor in eliciting response among the masses. That the SG is something quite different from a traditional club is probably clear to most Chinese by now. Yet, as indicated above, other nontraditional methods of control are now used to hold the SG together and keep it functioning.

[26] Cf. Niida Noboru, *Chûgoku no nôson kazoku* [*Peasant Family in China*] (Tokyo, 1952), p. 220 ff.

[27] Niida Noboru, *Chûgoku no shakai to girudo* [*Chinese Society and Guilds*] (Tokyo, 1951), p. 115.

## MORAL FORCE OF IDEOLOGY

The Communists confront the problem of group control and manipulation in a situation where group values are weakly, if at all, socialized. The group is new, its work new, and the goals proclaimed are expressed in strange language and require some novel action. It is through the SG that such control is exercised. An atmosphere of abstractness, of moral importance permeates the meeting. A work problem may be discussed, but it is often given the same abstract treatment as a problem of Marxist theory. Though utopian images are raised as in meetings of chiliastic sects, more important is the sense of participation in the bringing about of the new society. In China, participation of the masses in the "building of the New China" has always been stressed by Communist *agitprop*. Because a sense of active participation in a "great task" is stressed, exclusion or alienation from the group is one of the worst punishments which can befall a member.

Here ideology has a crucial function. Without the moral force of the ideology, neither "study" nor "criticism" would be effective. Only if the individual becomes deeply aware of his innermost signs of revolt against authority and purges himself through a violent emotional outburst has "study" become effective. Only if, in his temporary revolt, he feels his alienation from the group, does his rapid reintegration become meaningful. The Chinese situation reveals again the tremendous importance of ideologies with a strong moral force for organizing new type groups. Leaving aside the Communist examples, one need only mention the Puritan settlements of New England or the Zionist agricultural settlements in Palestine. But in these two cases, the organizations were self-contained and existed for the satisfaction of their members. The Chinese Communists, on the other hand, must construct and maintain a durable hierarchy of organization. Thus they require manipulability as well as solidarity, and mechanisms for maintaining both.

# Agriculture and Population in Relation to Economic Planning

By J. E. Spencer

Abstract: The initial agrarian reform program of distributing land to the landless won over the poorer rural masses that form the main Chinese population. By staged evolution of co-operative organization, land has now become state property, making almost all Chinese landless in the strict sense. The consolidation of farm land into co-operatively managed units permits policy control, taxation, agricultural public works programs, agricultural management, and crop collection to be more effectively handled than was formerly the case. Long-range major improvement programs actually are expanding the farm landscape, developing irrigation, reducing floods, and improving yields. An integral feature of economic planning is a new major birth control program which is just beginning to take effect. The population total now stands close to 640,000,000, with an annual increase of about 11,000,000 and death rates comparable to those in advanced countries. The essentially intensive agriculture is being further intensified. Some headway is being made and the Chinese population is a little better off in basic, essential needs than it formerly was. Mechanization and other features typical of agricultural improvement elsewhere are being pushed as long-term improvements which are just beginning to show results.

CAN Chinese agriculture under Communist control improve with sufficient speed to feed a growing population adequately and to continue to supply exports to pay for some of the imported equipment needed to turn China into an industrial state before that population grows too large to feed at all? If it can, then the industrial machine may help mechanize and further improve Chinese agriculture. If it cannot, mainland China faces further turmoil when the population reaches a critical hungry state.

Much of the literature dealing with Chinese agriculture and population in the last half century has stressed the intensive nature and the high productivity of agriculture and the proficiency of the Chinese farmer. Similarly it has stressed the omnipresence of people in the landscape, the high densities in the agricultural lowlands, the number and size of villages, and the relative smallness of the urban population. There has been uncertainty about the true productivity of agriculture, and no one has been able to say how many Chinese there really were. In recent years two general reactions have matured: that Chinese agriculture has been less productive than was earlier thought to be the case, and that the Chinese population was greater than the figure commonly listed.

Chinese agriculture has been traditionally maintained in a framework of private land ownership and tenancy patterns with minimal regional transfer of products, but with a number of Chinese monopoly crops which have entered foreign trade for nearly three hundred years. The primary use of human energy has been basic, animals have been subordinated to crops, tools and techniques have remained simple, and the intensity of cultivation has grown. The farm population has long comprised about 80 per cent of the total, and despite their having engaged in many auxiliary occupations, the rural level of living has been declining for over a century.

## How Many Chinese Are There?

Chinese have lived in every kind of local environment in large numbers. For many centuries China has been one of the more populous parts of the world. Historically, Chinese governments have made population counts in some detail for different purposes, but no true census was ever taken until 1953. Since the last Manchu imperial count of 1911 returned a figure of 374,000,000, many estimates have been made, ranging between 425,000,000 and 600,000,000, with most authorities choosing a figure close to 500,000,000. The Communist census of 1953 startled everyone interested in China, including the Communists themselves—it showed a total of 582,000,000. More startling items were the annual increase of almost 12,000,000 persons per year and the death rate of only 17 per thousand. The accuracy of the census was hotly debated abroad, but the Chinese use the data themselves, and its accuracy now is accepted as greater than that of previous tabulations and estimates. Some 505,000,000 of the 1953 total were rural residents, the percentage being just over 86 per cent. Recently the total of urban dwellers has been growing rapidly. It exceeds the opportunities for urban employment, and the government has repeatedly pushed urban residents back into the rural countrysides.

Table 1 shows possible populations from 1931 to 1958. It has two base points: a 1931 population that "seems about right" and the 1953 census total. Annual rates of natural increase have been picked with regard to many factors, only the most important of which are noted in the table. Chinese population growth responds to many factors, the constant, imperative drive for large

TABLE 1—POSSIBLE TOTAL CHINESE POPULATION AND ANNUAL INCREASES

| MID-YEAR DATE | TOTAL POPULATION IN 000's | PER/1000 INCREASE | ANNUAL INCREASE IN 000's | FACTORS AFFECTING INCREASE |

| 1932 | 486,940 | 4.0 | 1,947 | |
| 1931 | 485,000 | 4.0 | 1,940 | Post-flood poor health conditions<br>Major flood = poor public health |

families being somewhat fictional. This table is presented only as a possibility since there is some need for basic data from which to make even simple comparisons.

## BASIC AGRARIAN POLICY

The abolition of landlordism and the distribution of land to the tenants provided a majority pressure group which could be relied upon for steady support for further steps which would profit them more than other groups. "Poor peasants and hired laborers have always been the motive force of revolt in China. Today, they provide the main drive in the agrarian movement transforming the whole country." [1] Second, third, and fourth stage phases of the agrarian revolution all have moved toward further collectivization; toward land controlled more and more completely by the state; toward larger and larger group organization of primary production in which the individual progressively loses land, equipment, wealth, and freedom to act alternatively. Chinese Communist policy has remained Chinese, utilizing every possible historical analogy to keep the early stages of the revolution within a context familiar to the masses. Departure from classical Marxist theory, and from its Russian practice, has been frequent when an expedient was necessary to win the support of the poorer

[1] Chen Han-seng, "Land Reform Uproots Feudalism," originally published in *China Reconstructs* (May–June, 1952), reprinted and quoted from *China in Transition* (Peking, 1957), pp. 76–84, item from p. 78.

Chinese rural masses. Through the skilful manipulation of the lowest economic groups—first against the highest and then against the middle—the poorer segment of the population has been led to demand more and more changes in their favor, creating the illusion that the whole restructuring of agrarian economy has been by popular demand.

In the early and middle stages, the Communists relied upon the "middle peasants" to provide farming skills, local leadership, group management, and farm production until the lower levels could be trained in the new patterns. The old and strong tradition of local agrarian co-operation within the village community has been fully utilized in developing the whole co-operative structure of agriculture. The rural population has been kept busy at the familiar but useful chores of raising dike levels, planting trees on deforested hills, digging irrigation canals, and developing erosion-preventive works. The government has partly broken with the Chinese tradition of forced labor on public works by paying for all such labor when the laborers are members of co-operatives. However, it continues the old tradition of forced labor by putting dissenting elements through "reform through labor" brainwashing reorientation. An old device of remitting taxes to areas hit by flood or drought has been successfully revived. Efficient use has been made of the technique of dangling a carrot over the donkey's nose. Chinese implementation of this policy has used all the tricks employed in Russia, and new ones are devised regularly. Significantly, the tax burden has been shifted from a direct load upon the rural population to secondary forms of taxation so well arranged that statistics can demonstrate steady decline in taxation of the agricultural sector.

Later and recent moves in agrarian management have amalgamated the smaller co-operatives, infused young and thoroughly indoctrinated city people into rural co-operative groups, consolidated organizational gains, and catered further to non-Chinese populations in the marginal areas of China proper. There seems to be no basic policy change now in progress. However, breathing spells are being provided when the pace seems too great. Then a new set of moves are arranged to appear to spring "spontaneously" out of the countryside, or if pulse-feeling indicates it will be acceptable, the leadership takes a large step in further consolidation.

## CHANGING THE MECHANICS OF AGRICULTURE?

The distribution in 1950 of about 120,000,000 acres of land to about 60,000,000 families—some 40 per cent of the farm area to some 60 per cent of the agrarian population—fractured an already fragmented agrarian economy. This was what the landless had wanted; but when they found that it solved none of their basic problems, they were amenable to further changes previously planned by Communist policy.

The process towards collective work went stage by stage. First there were the mutual-aid teams for seasonal tasks. Then some of these became permanent. Then came the preliminary, semi-socialist form of agricultural co-op, in which members received interest on their landholdings as well as a share of the crop for work done. Finally, in the socialist co-op, or collective farm, the land and bigger farm implements became common property and work done was the sole source of income.[2]

Parallel with this process in densely settled areas, the mechanized farm, the state farm, and the tractor station appeared in increasing numbers in less

[2] Editorial commentary, "Two Revolutions for the Farm," *China in Transition* (Peking, 1957), p. 75.

heavily settled and more suitable areas.

Some new tools, chemical fertilizers, government agricultural loans at relatively low interest, and other pecuniary gains were granted families joining co-operatives, or were increasingly granted the full co-operatives. The growth of the full co-operative wiped out the newly secured leading position of the "middle peasants" and elevated further the relative status of the former lower economic groups. With the gains which could be received from joining the co-operatives, the pragmatic rural population recognized the possible advantages, or accepted the inevitability of the process of collectivization, according to their status; and, during 1956, the full co-operative movement spread much more rapidly than the Communist leadership had expected.

Until industrialization can drain off its proper share of the growing rural population and provide the mechanization of agriculture, the traditional intensive agriculture must continue. The dangling carrot of higher yields in one county is held up for all to emulate. The higher quotas, the mass campaigns on varied themes, and the pushing of urban population surpluses into the countryside all point toward further intensification of existing patterns of agriculture. In 1957 some 30,000,000 people with few modern tools worked at improving and extending the facilities for irrigation. For the second Five-Year Plan, 1958–62,

> Maximum effort will be concentrated on the increase of per-acre yields—for which China's manpower, climatic and other conditions are very favorable. The main direction for the development of Chinese agriculture is toward greater intensiveness, as in Japan or Western Germany. Extensive methods, like those used in the Soviet Union or the United States, do not in general suit China. . . . The actual nationwide steps being adopted to raise per-acre yields fall into three main categories: water conservancy, increased use of fertilizer, and improvement of farm tools.[3]

The term "water conservancy" as here used is threefold, involving irrigation, flood control, and field drainage.

## THE POPULATION POLICY SHIFTS

Early Chinese Communist theorizing decried all forms of population control as unnecessary for China and a device of decadent capitalism. It is evident that the publication of the 1953 census, in November, 1954—with its data on totals, annual increases, birth rates, and death rates—startled the theoreticians, for since that date the policy has been completely reversed. The upper ranks of the Communist leadership had been quietly using birth-control techniques for several years. More recently the practice has spread increasingly to the urban technical, professional, and skilled labor classes. Gradually it was realized that birth control could be a further weapon against the traditional Chinese family system, could promote social mobility of working groups, and could increase the economic productivity of the female population.

Policy implementation began slowly and carefully in 1955 with public statements on the need for family planning and related subjects. These increased during 1956, and in 1957 the popular educational program began. Public health posters advocating birth control now fully illustrate techniques, leave nothing to the imagination, and prepare the public for the future all-out campaign.[4] In May 1957, the Ministry of Public Health revised its regulations on abortion and sterilization as a final step to legitimize all forms of birth control.

The new policy derives part of its stimulus from the increasingly effective public health program which now is lowering death rates. It will be some years before the full run of modern medical facilities are available to the whole population; but epidemic control is within reach at the present time, and death rates are falling. Both the public health factor and the birth control policy make prediction of future population growth extremely difficult.

While population control now appears to be an integral part of Chinese Communist economic policy, it is also evident that no simple solution to the problem of too many people is immediately in sight. Attempted regulation of the abstraction labeled the "birth rate" necessarily requires practical interference with a network of human relations and responses, both personal and social. While the Communists recognize that overpopulation is a major problem, they still confront the fact that the pressure of population growth cannot realistically be solved by official fiat alone. To date, success in this sphere has been modest.

## THE BALANCE AND THE FUTURE

Almost all Chinese Communist data for the years since 1949 show improvement in agricultural production because during 1949 the Chinese economy was almost at a standstill. To demonstrate progress, total yields after 1949 are compared with those of some pre-Communist "peak year," often 1934, 1935, or 1936. Total yields in 1956 should have been much greater than total yields in any of the "peak years" because there were more acres in farms and more farmers to work them. This simple comparison only makes it clear that such a capable agricultural people as the Chinese can still carry on their careful, intensive, and productive agriculture under the Communists, and it does not support the wishful hope that the Chinese agrarian economy will soon collapse because of any changes that have been made by the Communists in its organizational structure. The assessment of nonstatistical descriptive reporting is more difficult.

No government of China has yet been able to control the Gods of Weather. Communist planning cannot really claim all the credit for two years of good agricultural weather and bountiful harvests that caused yields to exceed quotas (1952 and 1955), though it can properly claim credit during two years of quite poor weather (1954 and 1956) during which the resulting floods and droughts probably brought less human misery than that which accompanied such visitations during the last century.

By 1956 the best pre-Communist per acre yields had not been equaled for the major crops, though these yields were better than those of 1949 and 1950.[5] Constant turnover in labor on farms has the same output reducing effect as does heavy turnover in industry. The fact that the lower per acre yields continue may indicate, also, that the total averages still are reduced by the low returns derived from current expansion of cropping onto lands of marginal quality and onto frontier lands not yet fully developed. Hence, it may be expected that improvement in per acre yields will continue.

There is little direct evidence on per capita output on Chinese agriculture.

[3] S. Hua, "Agriculture Will Have a New Look," *China Reconstructs*, Vol. 7 (February 1958), pp. 2–5, items from page 3.

[4] Editorial comment in *Eastern Economist*, Vol. 30 (January 3, 1958), p. 38, and E. S. Kirby, "China's Population Problem," *Far Eastern Economic Review*, Vol. 24 (April 24, 1958), pp. 513–17.

[5] "Peak year" yields and the 1955 "good year" yields were as follows, in pounds per acre: Rice 2,971 vs 2,387, wheat 1,022 vs 766, soy beans 848 vs 711, peanuts 1,606 vs 1,151, tubers 5,211 vs 1,677 (grain equivalent), rapeseed 848 vs 370, cotton 205 vs 234. The latter, along with sugar cane, both important minor crops, are the only ones to show per acre increases.

From indirect evidence, such as the continued Communist complaint over poor farming techniques, it is very unlikely that the per capita output of strictly farm labor has improved so far, despite the issue of tools. Current reports emphasize marked increases in total yields, and it seems probable that the greater total returns are almost entirely derived from the added crop acreage and from the added volume of rural labor now present. Providing rural stability, decreased labor turnover, and the attainment of a real degree of mechanization, the per capita output should rise. This development, however, is something for a future decade, and truly higher per capita incomes must also wait.

The agricultural landscape is being enlarged, both in the long and densely settled areas and on the margins, though many mistakes still occur.[6] On the dry margins of the northwest, there at last seems operative an effective program of river control which can permanently extend the agricultural frontier through water conservation and irrigation for a good many years before it reaches maximum development. Enlargement of the cultivated area in some densely settled areas was a one-time expansion which cannot be repeated until true mechanized cultivation can occur. True long-term water conservation through integrated flood control dam systems can expand flood plain farmland and reduce the almost annual flood losses on a considerable acreage. Further elevation of flood plain dikes in some areas can keep ahead of river-bed sedimentation and rising river levels for some decades. Expansion in some areas of marginal quality can still go on as an expedient to be afforded so long as there is an oversupply of farm labor. With proper experiment and long-term planning, both expansion and improvement of agriculture can go on in many upland areas. These measures of farmland expansion all require some degree of government assistance which the present government is thoroughly prepared to finance and supervise. Such expansion is actually taking place at present through the addition of acreages running close to 2,000,000 acres per year.

Enlargement of crop yields through such measures as extension of irrigation facilities on existing farmlands, substitution of higher yielding crops for existing crops on such lands as are irrigated, large field operation, better planting techniques, co-ordinated labor supply at peak periods, and the supply of even the simplest of tools and animal draft power in adequate amounts can be a continuing factor for some years before a saturation point is reached in any element.

Modern plant breeding and the regional perfection of agricultural ecology have not made much progress in China. Nor has the control over insect, bird or animal pests, or over epidemic diseases among crops and livestock developed real efficiency. Though the Chinese farmer has been the world's most skilled user of fertilizers in the past, the supplies have not equaled the need for at least a century. Communist programs in plant breeding and in pest and disease control are just beginning to show results which are not yet well reflected in the available data on crop yields. The northward movement of rice double-cropping; the appearance of longer staple, higher quality cotton; the decline of rinderpest and anthrax among cattle and water buffalo; and the growing distribution of cheap chemical fertilizers are but samples of a growing trend. No Chinese government in recent centuries has had either the power or the program to carry through improvements in the above aspects of agriculture whereas the present regime has both the power and the program.

[6] The total cultivated farm land "perhaps" was not far from 250,000,000 acres in 1936, was reported at 241,900,000 acres in 1949, and at 275,390,000 acres in 1955. The total crop acreage in 1936 was not far from 325,000,000, whereas in 1955 it was reported at 377,705,000. The food crop return in 1936 is thought to have been in the vicinity of 150,000,000 metric tons, and that of 1956 was reported at 194,400,000 metric tons.

### *Long-term investments in agriculture*

Government is now putting an increasing capital investment into long-term agricultural development projects. Major programs for flood control, irrigation, mechanization, fertilizer production, farmland expansion, crop improvement, and agricultural management exceed any investment in agriculture since the expansion under the Manchus in the last half of the seventeenth century. Since much of this is long-term planning, its effects do not yet show up clearly. Many parts of agricultural investment to date such as cheap loans to farmers and co-operatives, payment for large volumes of labor in low per capita output public works projects, price rigging on state purchases of farm produce for urban consumption and export, and lower agricultural taxation are really subsidies to the rural population to maintain their minimum levels of living pending the real improvement hoped for through the true capital investment in long-term projects. It is from the subsidy measures that most improvements in levels of living have resulted so far.

Now that virtually the whole of the farming population belongs to full co-operatives, farmers find themselves landless wage earners on government farms.[7] The concession to traditional feelings bestows the privilege of the private holding of a farm home, a few hand tools, a garden patch, a few pigs and chickens, and other minor appurtenances of economic value. An individual or a family now can derive its basic income only by working for the co-operative—either on the farm or at auxiliary employment arranged by the co-operative—each full day's labor counting so many "work points" toward the annual settlement total. The co-operative's taxes, investment capital, reserves, nonlabor operating costs, and other items are withdrawn from the yield prior to the annual settlement with members. A "work point" at settlement time is paid at an annually fixed rate, partly in produce and partly in cash. If a family works but little, few "work points" pile up in the ledger, and its annual income is small. Continuous work by all family members is the only way to a larger income. The greater the efficiency of the co-operative, the greater its member annual incomes may be; the greater the compliance and conformity of members to the guiding policy of the state, the more favored treatment results. Rural families have now become "wage point slaves" whose acceptance of Communist leadership is more surely guaranteed.

Comparison of numerical figure income achieves little, for the arbitrary work point, price, and monetary structure of Communist China do not convert in meaningful terms. A leveling process has spread the agricultural return to all rural groups in a way which increases the level of living of the majority, the former lower economic segment. Agricultural returns now are increasing faster than population, and per capita availability of basic foods seems slightly greater than during pre-Communist times. All the indices of agrarian economy point upward, even though the annual rises are slight.[8]

[7] Approximately 118,000,000 of the 122,000,000 farm households operative in 1957 were co-affiliated with one of the several forms of co-operative, by far the great majority of whom belonged to the 752,000 full co-operatives.

[8] On a 1936 index of agricultural production, 1936 being 100, 1949 was 76, 1950 was 86,

Communist planning, policy, and administration look well ahead, are flexible, and are sensitive to rural feeling. Protest and dissatisfaction are not ignored, but expedient mechanisms are devised to allay restive feelings and alter practices sufficiently to maintain the support of the rural masses.

The Communist party has won complete control of rural China. In the welter of claim and counterclaim about the changing countryside, two basic trends emerge. First, Chinese agriculture—despite mistakes, considerable rural distress, and continuing inefficiency—is able to feed the population better than it has been fed in the past. Second, agricultural production appears to be gaining headway over population increase. While little real improvement in rural living standards has appeared, the huge mass of poor peasants, which form the majority of rural Chinese, are, relatively speaking, better off than formerly.

Agriculture still forms the basis of the entire economy of mainland China. The Communist leaders at Peking require control of the maximum portion of agricultural output for general national development programs, while at the same time the Chinese peasant requires sufficient incentives to spur him to maintain and possibly to increase production. To the extent that Peking is able to sustain a realistic balance between the goals of the party and those of the peasant, it can view the future with confidence.

1951 was 93, 1952 was 113, and 1957 had climbed to 142. Taking the 1936 population at 100 as par (from the possible table given earlier), the population index for 1957 stood at 127. There are inefficiencies in this sort of crude comparison, but they are no greater than attend any other statistical comparison of China at various dates.

# China's Industrial Growth, 1953—1957*

By RONALD HSIA

ABSTRACT: Official data indicate a pattern of rapid industrial growth in Communist China during the First Five-Year Plan (1953–57). This growth varied considerably from year to year, largely because of industry's substantial dependence upon agriculture and because of uneven performance in the agricultural sector of the economy. The composition of mainland China's industrial output also changed significantly during this period. The nation's resources were primarily concentrated on development of heavy industry, and the annual rate of growth of production of capital goods was thus consistently above that of consumer goods. The tempo of industrial expansion should increase further during the Second Five-Year Plan (1958–62) as the regime continues maximum mobilization of material, financial, and human resources. New policy changes—including more attention to industries serving the agricultural sector, emphasis on smaller industrial units, and decentralization of industrial planning and administration—will affect future development. By 1962 the economy of mainland China should have completed the period of rapid industrial expansion known as the take-off and entered a new stage of sustained, self-generating growth.

*Ronald Hsia, Ph.D., Hong Kong, is Lecturer in Economics, University of Hong Kong, and Consultant, the RAND Corporation, Santa Monica, California. * The author wishes to acknowledge the assistance of the Asia Foundation for enabling him to undertake a portion of the research for this paper.

AVAILABLE evidence indicates that the economy of mainland China has entered the relatively brief period of drastic and decisive transformation known as the take-off. After the take-off period, during which the single most striking phenomenon is the high rate of industrial expansion, economic growth tends to become a self-generating process.[1] This article is intended to describe and analyze this process in Communist China. Our concern is not only with the rate of industrial growth but also with changes in the composition of output. Throughout the paper the term "industry," unless otherwise specified, refers only to modern industry including, however, handicraft workshops.

## COMMENTS ON DATA

Quantitative data used here are either obtained or derived from official Chinese Communist statistics, the accuracy of which cannot be ascertained with precision. Data obtained from official or semiofficial publications are frequently incomplete, ambiguous, or inconsistent. Employment statistics may be cited as an example of incompleteness and ambiguity because of the lack of clearly defined identity for data presented. Inconsistency is also prevalent and may be found even in statistics released by the State Statistical Bureau and the National Economic Commission.[2]

Particularly pertinent to this study are official value output data given in "constant 1952 prices." The rate of industrial growth derived from such data tends to carry some upward bias, attributable mainly to the changing industrial structure and the concomitant policy and practice of pricing new products.[3] Unless on an annual basis the proportion of the value of new products to the total industrial value output assumes a constant ratio, statistical bias is unavoidable. Since the usual practice in a planned economy is to set the prices of new products unduly high and since the tendency in a developing economy is for the ratio of new products to total industrial output to increase through time, an upward bias would normally be the case. The lack of data on this ratio, unfortunately, rules out the feasibility of adjustment. Thus, in using official annual value output figures to derive the rate of growth, we are forced to assume a constant ratio of the value of new products to the total industrial value output for each of the years covered.

The official value statistics for industrial output are given in gross value rather than value-added. While the latter represents solely the value created by manufacturing processes, the former includes also the value of raw materials and intermediate products consumed in the production process. Thus changes in gross value may be brought about by variations in the combination of input factors. In addition, the use of gross value tends to exaggerate the rate of industrial growth if there is a splitting of producing units. If, on the other hand, an amalgamation process is going on, the rate of growth tends to be lower in terms of gross value than in terms of net value. This, as we shall see, was the case in mainland China during 1953–56 when the amalgamation of private firms into joint public-private enterprises was in progress.[4] This is understandably a short-run phenomenon. With the virtual disappearance of the private sector of the economy at the completion of the First Five-Year Plan and with the increase in the roundabout nature of the production process as a natural outcome of industrial development, the continued use of the gross value concept in Communist statistics will probably tend to reverse the trend noted in the relative behavior of the gross and net value output during 1953–56.

## GROSS INDUSTRIAL OUTPUT

In the period covered by the First Five-Year Plan, mainland China's gross industrial value output expressed in "constant 1952 prices" increased 132.4 per cent.[4a] The average annual rate of increase is calculated to be 18.4 per cent.[5] Although this rate of growth is considerably lower than that achieved by the Soviet economy during its First Five-Year Plan period,[6] it nevertheless marks a period of very rapid industrial growth in the economic history of China.

The rate of increase in industrial output during the quinquennium showed considerable variation from year to year. In 1953 and 1956, the increase was over 31 per cent; in 1955 and 1957, it was below 8 per cent. Data on the annual rate of growth are presented in Table 1 along with industrial value output figures. This wide variation in the

TABLE 1—GROSS INDUSTRIAL OUTPUT IN MAINLAND CHINA, 1953–57

(In million yüan new JMP at 1952 prices)

| YEAR | GROSS VALUE OUTPUT[a] | INCREASE OVER PRECEDING YEAR (per cent) |
|---|---|---|
| | (1) | (2) |
| 1953 | 35,577 | 31.7[b] |
| 1954 | 41,513 | 16.7 |
| 1955 | 44,748 | 7.8 |
| 1956 | 58,660 | 31.1 |

| 1953–57 | 243,308 | 132.4[d] |

[a] Including the output of handicraft workshops, but excluding that of cooperative and individual handicrafts. [b] The 1952 output amounted to 27,014 million yüan new JMP. [c] Preliminary. [d] Increase over 1952.

Sources: *1955 Kung-pao*, p. 20; *Ta Kung Pao*, Peking, August 2, 1957; *Hsin-hua pan-yüeh-k'an* (New China Semi-monthly), Peking, March 10, 1958, p. 13.

[1] Cf. W. W. Rostow, "The Take-off into Sustained Growth," *The Economic Journal*, Vol. 66 (March 1956), pp. 25–48. Present indications are that the take-off period of the Chinese economy will probably be of shorter duration than that which Professor Rostow specifies for the advanced economies. This point will be discussed in the author's forthcoming monograph on "China's Industrial Development under Communist Planning."

[2] To illustrate the inconsistency in Communist statistics, we need cite only one instance. The increase in industrial labor productivity during 1956 was reported on July 1, 1957, by the National Economic Commission to be 26 per cent. Exactly one month later, it was reported by the State Statistical Bureau to be 18 per cent. *Ta Kung Pao*, Peking, July 2 and August 2, 1957.

[3] Strictly speaking, it is impossible to express any new products appearing in subsequent years in terms of constant 1952 prices as there were no such products in that year. New products can only be "priced in" to the value aggregates for the years in which they appear.

[4] The number of industrial enterprises decreased from 167,403 in 1952 to 125,474 in 1955. Cf. State Statistical Bureau, *Kuan-yü i-chiu-wu-wu nien-tu kuo-min ching-chi chi-hua chih-hsing chieh-kuo ti kung-pao* (Communiqué on the results of implementing the plan for the development of the national economy in 1955), Peking, 1956, p. 23. Hereafter referred to as *1955 Kung-pao*.

[4a] The increase in gross industrial value output during the first plan quinquennium when adjusted to population changes becomes much more modest. On a per capita basis it came to 108.2 per cent. The computation of this percentage is based on the official 1952 mid-year population figure given in *T'ung-chi kung-tso* (Statistical Work), Peking, semi-monthly, June 14, 1957, p. 25 and our estimated 1957 mid-year population extrapolated from official figures for 1952–56 given in the same source.

[5] Computed by the formula $y = xr^5$, where $y$ represents the 1957 value output, $x$ the 1952 output, and $r$ the average annual rate of growth. For the output figures used, see Table 1.

[6] According to Soviet official statistics which are also based on gross value output expressed in constant 1927/28 prices, the annual average rate of industrial growth during 1927/28–1932 amounted to nearly 24 per cent. Cf. I. A. Ioffe, *SSSR i kapitalisticheskie strany*. Moscow, 1939, p. 127.

annual rate of industrial growth may be attributed basically to agricultural production.[7] The causal relationship is based on the preponderant dependence of the industrial sector on the agricultural sector for the supply of raw materials. During 1953–56, 51.7 per cent of the gross industrial value output came from industries using raw materials from the agricultural sector. If 1956 alone is considered, the dependence was reduced only slightly.[8] This substantial direct dependence of industry on agriculture was increased by two indirect factors. First, China's need to import heavy equipment and certain basic materials for her industrial expansion had to be met chiefly by the export of agricultural commodities.[9] Second, the scale of industrial investment was, to a fairly large extent, determined by the performance of the agricultural sector in the preceding year inasmuch as agricultural surplus has constituted a major source of investment resources in the Chinese economy. Consequently, industries not depending on agriculture for raw materials would also feel these indirect effects. Thus the good harvests of 1952 and 1955 were followed by high rates of industrial growth in 1953 and 1956, while the poor harvests of 1954 and 1956, among other factors, resulted in much lower rates of industrial growth in 1955 and 1957.[10]

## NET INDUSTRIAL OUTPUT

Net value output may be estimated on the basis of official statistics on (1) the net national product (NNP),[11] (2) the share of "industrial output"[12] in the NNP, (3) the gross industrial output, and (4) the gross value output of individual and co-operative handicrafts. The fact that official statistics on the share of "industrial output" in the NNP are obtainable only for 1952 and 1956 limits our estimates of net industrial output also to these two years.

Mainland China's NNP has been reported to be 61,130 million yüan new IMP for 1952 and 88,750 million yüan for 1956. The aggregate output of the industrial sector and the individual and co-operative handicraft sector constituted 18.0 per cent of the NNP in 1952 and 26.4 per cent in 1956.[13] The net value output of these two sectors thus amounted to 11,003.4 million yüan in 1952 and 23,430 million yüan in 1956.

To obtain an adjusted figure for net industrial output, it is necessary to determine the ratio of the output of the individual and co-operative handicraft sector to the combined industrial and handicraft output. The lack of specific data forces us to assume the same degree of grossness in the value output of both sectors and to calculate this ratio on the basis of gross output. Data on gross industrial output have already been given in Table 1; the gross output of handicraft co-operatives and individual handicraftsmen has been reported officially to be 7,312 million yüan in 1952 and 11,700 million yüan in 1956.[14] From these data, we derive an output ratio of 213 : 1000 for 1952 and 166 : 1000 for 1956. With these ratios, we can exclude the output of the individual and co-operative handicraft sector from the above-given combined total. Thus adjusted, the net industrial output becomes 8,659.7 million yüan for 1952 and 19,540.6 million yüan for 1956.

The latter figure may be compared with the 1956 net industrial output of 19,567.1 million yüan estimated by Ma Yin-ch'u, the noted economist.[15] As his method of calculation is unknown, we assume that the discrepancy between the two estimates may be attributable either to his use of preliminary data released earlier by the State Statistical Bureau or to different rounding practices. At any rate, the difference is negligible in view of the present state of Chinese Communist statistics. The high correspondence between the estimated 1956 net industrial output made here and that of Ma Yin-ch'u may serve as an indication that the estimate for 1952 is reasonably accurate. The estimates of 1952 and 1956 net industrial output, together with Ma Yin-ch'u's estimate for 1953, are shown in Table 2.

TABLE 2—NET INDUSTRIAL OUTPUT IN MAINLAND CHINA, 1952, 1953 AND 1956

(In million yüan new JMP at 1952 prices)

| YEAR | NET VALUE OUTPUT[a] | RATIO OF NET TO GROSS OUTPUT[b] (per cent) |
|---|---|---|
| | (1) | (2) |
| 1952..... | 8,659.7[c] | 29.8 |
| 1953..... | 11,572.3[d] | 32.5 |
| 1956..... | 19,540.6[c] | 33.2 |

[a] Including the output of handicraft workshops, but excluding that of other handicrafts. [b] Calculated from data given in Column 1 of this table and Column 1 of Table 1. [c] Estimated by the author on the basis of official statistics. [d] Estimated by Ma Yin-ch'u in his article "Hsin jen-k'ou lun" (A new theory of population), *Jen-min jih-pao*, July 5, 1957.

On the basis of our estimates for 1952 and 1956, mainland China's net industrial output increased 124.8 per cent during the four years. This aggregate increase yields a cumulative rate of growth of 22.5 per cent per year. The exclusion of 1957 because of the lack of data on which to base any estimate for the net output of that year tends to exaggerate the average annual rate of increase, for in 1957 Chinese industry experienced the slowest growth during the first plan quinquennium (see Table 1). For comparative purposes, it is also necessary to shorten the period covering the gross industrial output to exclude 1957. During this four-year period, then, gross industrial output increased 102.2 per cent, or 19.3 per

[7] The annual maturation of capital construction projects in the industrial sector undoubtedly played an important role in determining the annual increases in output. Its importance, however, was minimized by the low rate of capacity utilization in those years in which industrial growth was relatively small. Cf. Ronald Hsia, "Growth Capability of the Chinese Economy as Envisaged in the Proposed Second Five-Year Plan," *Contemporary China*, Vol. 2, Hong Kong (1958), pp. 62–63.

[8] It became 48 per cent. Cf. Niu Chung-huang, *Wo-kuo kuo-min shou-ju ti chi-lei ho hsiao-fei* (Accumulation and consumption in China's national income), Peking, 1957, p. 86; Chi Ch'ung-wei, "Tsen-yang shih wo-kuo kung-yeh keng chün-yün-ti hsiang-ch'ien fa-chan" (How to improve the balance in China's industrial development), *Chi-hua ching-chi* (Planned Economy), monthly, Peking, July 1957, p. 5.

[9] Agricultural produce plus processed agricultural commodities constituted three-fourths of mainland China's exports. *Jen-min jih-pao* (People's Daily), Peking, July 13, 1956.

[10] The heavy dependence on the performance of the agricultural sector was the chief bottleneck in China's industrial development during the 1953–57 period. The Communist planning authorities tried to remedy this situation by increasing agricultural investment and by assigning high priorities to industries serving agriculture. Such measures have been incorporated in the Second Five-Year Plan, at least partly, to enhance the rate of industrial growth.

[11] Unlike the Western practice, the NNP is defined in Communist China to the exclusion of both personal and government services, that is, services not considered as part of production in the Marxist sense. This narrower definition, however, should not have any noticeable effect on the net industrial value output derived from the NNP thus defined.

[12] Including the output of handicraft co-operatives and individual handicraftsmen.

[13] Both NNP figures are given in constant 1952 prices. Niu Chung-huang, *op cit.* (note 8 *supra*), pp. 21, 23.

[14] *1955 Kung-pao*, p. 20; *Jen-min jih-pao*, January 6, 1958.

[15] *Jen-min jih-pao*, July 5, 1957.

cent per annum.[16] The latter figure is to be compared with the average annual increase of 22.5 per cent in net output.

This substantially higher rate of growth in net industrial output may be attributed largely to the low ratio of net to gross output in 1952 (See Column 2 of Table 1) which, in turn, was attributable to (1) the low labor-raw material input ratio and (2) excessive double counting in gross value output. Thus, if we further shorten the period to three years, using 1953 instead of 1952 as the base, the difference in the rate of growth is narrowed considerably. During 1954–56, the average annual rate of increase amounted to 18.1 per cent in terms of gross output and 19.0 per cent in terms of net output.

The higher rate of increase in net value output, as pointed out above, was due chiefly to the reduction of accounting units in connection with the amalgamation of private firms into joint public-private enterprises. It was also due, to some extent, to the gradual rise in the labor-raw material input ratio, attributable to (1) changes in product involving relatively more labor input, (2) economy or waste-reduction in raw material consumption, and (3) uneconomic increases in industrial labor. In addition, it is possible that wage increases affected the value output theoretically expressed in constant prices. Obviously such increases, if permitted to leak through, would boost net value output more than gross value output.

## Relative Growth of Heavy and Light Industry [17]

The principle of concentrating the nation's economic resources on the building of heavy industry was rigidly adhered to in the drafting and execution of the First Five-Year Plan.[18] This adherence was reflected in a substantially higher rate of projected increase, and a still higher rate of actual growth, in capital goods over consumer goods. The Plan envisaged a 126.5 per cent increase for the former and a 79.7 per cent increase for the latter during the quinquennium, both expressed in gross value at 1952 prices.[19] According to preliminary reports from mainland China, however, actual increases amounted to 204.2 per cent for capital goods and 85.1 per cent for consumer goods. The average annual rate of growth thus came to 24.9 per cent for capital goods and 13.2 per cent for consumer goods.

Annual output data from which the above rates of increase have been derived are shown in Table 3, from which some observations may be made. First, as in the case of gross industrial output, the rate of growth in both capital goods and consumer goods showed considerable year-to-year variation. Second, the fluctuations were much more violent with consumer goods production. This phenomenon illustrates the greater effect which the performance of the agricultural sector had on the output of consumer goods. While some 84 per cent of the value output of consumer goods came from industries using raw materials from agriculture,[20] the indirect effects of agricultural output on the scale of industrial investment and on the economy's export capacity were also felt by the consumer goods industries. The exceedingly low rates of increase in the output of consumer goods in 1955 and 1957 (see Column 4 of Table 3) can thus be correlated to the poor harvests of 1954 and 1956 respectively.

Finally, the annual rate of growth of capital goods was consistently above that of consumer goods throughout the period. The divergent rates of growth resulted in a notable change in the composition of China's industry. On the eve of the launching of the First Five-Year Plan, consumer goods were relatively more important than capital goods in terms of their gross value output. At the completion of the Plan, however, the relative importance was reversed. More concretely, the share of capital goods in gross industrial output stood at 39.7 in 1952 but at 51.9 per cent in 1957.

## Changes Affecting Future Industrial Growth

Changes in the policy of the Communist regime concerning China's industrial development were discernible as early as 1956, but wholesale reorientation appeared only with the launching of the Second Five-Year Plan. Policy changes affecting industrial growth in-

[16] Computed on the basis of data given in Table 1.

[17] Heavy and light industries are used in this article synonymously with capital goods and consumer goods industries.

[18] The adherence of the Chinese Communist regime to this pattern of industrial development has stemed from two sets of considerations. Subjectively, the regime is determined to build, within the shortest possible time, an integral industrial system with a high degree of self-sufficiency in basic materials and manufacturing industries, a modern defense industry, and a material and technical basis for large-scale mechanized farming. A few objective considerations may also be given. First, the concentration of the nation's economic resources on the building of heavy industry tends to shorten the duration of the take-off period. In other words, it tends to hasten the attainment of the point where industrial growth becomes a self-sustained process. Second, the development of heavy industry is less hampered by the more or less "unplannable" production of the agricultural sector on which light industry relies heavily. Third, greater advantage can be taken of the availability of Soviet technical aid and the general knowledge of Western industrial know-how by concentration on the development of heavy industry. Fourth, the marketing of heavy industry products poses no serious problem in a planned economy. Cf. Solomon Adler, *The Chinese Economy* (London: Routledge, 1957), pp. 61–63; Ronald Hsia, *Economic Planning in Communist China* (New York: Institute of Pacific Relations, 1955), pp. 27, 72.

[20] Niu Chung-huang, *op. cit.* (note 8 *supra*), p. 86.

TABLE 3—GROSS VALUE OUTPUT OF CAPITAL GOODS AND CONSUMER GOODS IN MAINLAND CHINA, 1953–57

(In million yüan new JMP at 1952 prices)

| YEAR | CAPITAL GOODS[a] | | CONSUMER GOODS | |
|---|---|---|---|---|
| | OUTPUT[b] | INCREASE OVER PRECEDING YEAR (per cent) | OUTPUT[b] | INCREASE OVER PRECEDING YEAR (per cent) |
| | (1) | (2) | (3) | (4) |
| 1953 | 14,670 | 36.7[c] | 20,907 | 28.4[d] |
| 1954 | 17,570 | 19.8 | 23,935 | 14.5 |
| 1955 | 20,578 | 17.0 | 24,170 | 1.0 |
| 1956 | 29,170 | 41.8 | 29,490 | 22.0 |
| 1957 | 32,661[e] | 11.9 | 30,149[e] | 2.2 |
| 1953–57 | 114,649 | 204.2[f] | 128,651 | 85.1[f] |

[a] Same as "means of production" in Communist official statistics. [b] Including the output of handicraft workshops, but excluding that of other handicrafts. [c] The 1952 output amounted to 10,730 million yüan new JMP. [d] The 1952 output amounted to 16,284 million yüan new JMP. [e] Preliminary. [f] Increase over 1952.

Sources: *1955 Kung-pao*, p. 24; *Ta Kung Pao*, Peking, August 2, 1957; *Hsin-hua pan-yüeh-k'an*, Peking, March 10, 1958, p. 13; *1958 Jen-min shou-ts'e* (People's Handbook), Peking, 1958, p. 460.

clude (1) increased attention to industries serving the agricultural sector, (2) emphasis on small and medium-sized industrial units, (3) decentralization of industrial planning and administration, (4) greater emphasis on existing plant facilities in the coastal areas, (5) modernization of handicrafts, (6) promotion of native methods in mining and metallurgy, and (7) a new theory of "balanced" growth.

Although all these changes were aimed at heightening the tempo of industrial development, the relationship is more apparent in some cases than in others. For instance, the greater emphasis on industries serving agriculture is intended, through raising the level of agricultural output, to eliminate the bottleneck of raw materials supply and to widen the agricultural surplus for making possible a higher rate of industrial growth.

Also, the new concept of "balanced" growth needs some explanation. According to this theoretical formula, any balance is temporary and conditional, relative rather than absolute. To achieve this temporary balance between the various sectors of the economy, the advanced sectors should not be pulled back; instead the sectors lagging behind should be pushed ahead to catch up with them. Thus a new balance is achieved on a higher physical level. Reference may be made to the holding back of the machine-building industry in 1956–57 owing to the relatively slow development in certain types of steel; 20 per cent of the capacity of the plants under the First Ministry of Machine-building was not utilized during 1957.[21] According to the new theory the steel industry should catch up with the machine-building industry rather than the other way round. Thus attention is now to be focused on the lagging sectors of the economy.

[21] *Chi-hua ching-chi*, September 1957, p. 14.

The decentralization of industrial planning and administration should be viewed in conjunction with the emphasis on small and medium-sized plants, the modernization of handicrafts, and the promotion of native mining and processing methods. Without decentralization, the latter changes are almost certain to result in administrative inefficiency, waste, and confusion. The basic aim of these changes is to attain full mobilization of local financial, material, and human resources throughout the country for industrial development and to enable the central government to concentrate its investment resources on large-scale projects of key importance to the entire economy. This program tends to enhance industrial expansion; while at the same time it also has the economic advantage of meeting rural needs for consumer goods and simple farming implements and fertilizers locally.

In addition, the building of small or medium-sized plants in numerous localities can yield quick results with a relatively small amount of investment per industrial unit.[22] The First Five-Year Plan was focused on large-scale industrial units run by the central government ministries to the neglect of local industry. This overemphasis is to be corrected in the Second Five-Year Plan. At the same time, the industrial capacity and transport facilities [23] developed during the first plan quinquennium facilitate the building of local industry. For example, the fact that Chinese industry can now produce complete sets of thermo- and hydro-electric power-generating equipment makes possible the

[22] Economy in investment is expected to result from the use of locally available material and labor, and of standard designs drawn by central industrial ministries.

[23] 8,500 kilometers of railways and over 70,000 kilometers of highways were built during 1953-57. *Hsin-hua pan-yüeh-k'an*, January 10, 1958, p. 14.

construction of numerous local power stations. Also, the 260 per cent increase in technical personnel in industry [24] during the first plan period makes it possible for the central industrial ministries to provide technical assistance needed for the development of local industries.

All these changes will probably enhance industrial growth in the period of the Second Five-Year Plan. Recent reports from Communist China on the new industrial upsurge should, however, be examined in the light of the fact that 1957 had the lowest rate of growth in industrial output during the first plan quinquennium, and the fact that the target for 1958 industrial output was set at a relatively moderate figure of 14.6 per cent over 1957. Thus the reported overfulfillment of the production plan for the first quarter of 1958 and the reported industrial output during the first half of 1958 at 34 per cent higher and that for April, May and June respectively at 42, 46 and 55 per cent higher than the level achieved in the corresponding periods of 1957 [25] are not spectacular. The steadily increasing excess is, however, noteworthy.

A significant part of the program to increase local industrial production began in May 1958, with the launching of a new campaign known as the "technical revolution." While the long-range objective of this drive is to provide the economy of mainland China with the technological basis for modern, large-scale production, its immediate aim is the speedy modernization of handicrafts and the promotion of improved native methods in mining and manufacture. The progress of this movement, together with the expansion of local industries,[26] should definitely increase China's industrial growth capability within the second plan quinquennium.[27]

In addition, most of the remaining 109 out of the 156 major capital construction projects to be built with Soviet aid will be finished during the 1958–62 period.[28] The completion of these proj-

[24] *Peking Review*, weekly, Peking, March 25, 1958, p. 7.

[25] *Jen-min jih-pao*, August 3, 1958.

[26] It is reported that some 520,000 small and medium industrial units were built in China during January–May 1958. *Hung-ch'i* (Red Flag), semimonthly, Peking, July 1, 1958, p. 19.

[27] During its enlarged session held in the latter part of August 1958, the Political Bureau of the Central Committee of the Chinese Communist Party reset the 1958 target for steel output at 10.7 million tons. According to the annual economic plan for 1958 adopted by the fifth session of the First National People's Congress in February 1958, the steel target was 6,248,000 tons. At the end of the first quarter it was revised upward to 7 million tons by the Ministry of Metallurgical Industry. Since this amount included only the output of the plants under the jurisdiction of the Ministry, we may deduce that the additional 3.7 million tons of steel are to be contributed by local industry. Although the output of the latter is quantitatively impressive, its quality is subject to serious question. The low-quality steel produced by local industry is valuable only in so far as it can release the higher quality steel for more important production purposes. From a long-range point of view, the local small and medium-sized steel plants are of more value in preparing a skilled labor force for future expansion of China's steel industry "proper." *Hsin-hua pan-yüeh-k'an*, March 10, 1958, p. 18; *Peking Review*, April 29, 1958, p. 11; *Jen-min jih-pao*, September 1 and October 1, 1958.

A similar trend boosting output is detectable in most other industries, as revealed in the revised 1958 targets given in the Appendix to this article.

[28] According to Li Fu-ch'un, 57 of the 156 projects were to be completed by the end of 1957. However, the report on the implementation of the 1958 plan during the first quarter reveals that "during 1958 work will begin, or continue, on 109 out of China's 156 major, backbone capital construction projects." Evidently, 10 of the 57 projects mentioned by Li Fu-ch'un were not completed as scheduled. No reports are obtainable on the progress of the additional 55 Soviet aid proj-

ects, especially if accompanied by improved performance in the agricultural sector, will further strengthen mainland China's industrial structure. By then the Chinese economy will have concluded its take-off and entered a new period of sustained growth.

ects arranged in April 1956. *Hsin-hua pan-yüeh-k'an*, January 10, 1958; *Peking Review*, April 29, 1958, p. 10.

## APPENDIX

GROWTH OF SELECTED INDUSTRIES IN MAINLAND CHINA, 1953–57

| INDUSTRY | UNIT | 1953 | | 1954 | | 1955 | |
|---|---|---|---|---|---|---|---|
| | | OUTPUT QUANTITY | INCREASE OVER PRECEDING YEAR (per cent) | OUTPUT QUANTITY | INCREASE OVER PRECEDING YEAR (per cent) | OUTPUT QUANTITY | INCREASE OVER PRECEDING YEAR (per cent) |
| Electric power | million KWH | 9,195 | 26.6 | 11,001 | 19.6 | 12,278 | 11.6 |
| Coal | thousand metric tons | 66,572 | 4.8 | 79,928 | 20.1 | 93,604 | 17.1 |
| Crude petroleum | thousand metric tons | 622 | 42.9 | 789 | 26.8 | 966 | 22.5 |
| Pig iron | thousand metric tons | 2,175 | 14.5 | 2,962 | 36.2 | 3,630 | 22.6 |
| Steel | thousand metric tons | 1,774 | 31.5 | 2,225 | 25.4 | 2,853 | 28.3 |

# The Thought Reform of Intellectuals

By Theodore Hsi-en Chen

Abstract: The Chinese Communists need the services of the Chinese intellectuals and yet distrust them as products of bourgeois society. Since 1949, the regime has adopted various measures to reform the intellectuals to make them acceptable and useful to the new Communist society. At first, comparatively mild forms of "study" and political indoctrination were used. Later, the intellectuals were asked to take part in various "revolutionary movements" and in "class struggle" in both countryside and city. By 1951 the pressure was intensified, and the intellectuals were organized to practice criticism and self-criticism and to make public confessions of past errors. Then, in an attempt to curb deviant ideas not compatible with Marxist-Leninist-Maoist ideology, the Communists launched successive campaigns against bourgeois and other "unproletarian" thinking. A new trend in the treatment of the intellectuals seemed to be appearing in 1956, when the intellectuals were offered new privileges, even a measure of freedom of thought. However, when the intellectuals took advantage of the liberalization and frankly expressed their criticism of the Communist program, they were branded as "rightists" and attacked again. Since 1957 there has been a further tightening of ideological controls on the mainland.

---

*Theodore Hsi-en Chen, Ph.D., Los Angeles, California, is Professor of Asiatic Studi and Head of the Department of Asiatic Studies at the University of Southern Californ He served for a number of years as the Dean of the Faculty of Fukien Christian U versity in China and in 1946 returned to that university to serve as its Acting Preside for one year. In 1954, he went to Formosa to help establish Tunghai University und the auspices of the United Board for Christian Higher Education in Asia. Among h publications are Developing Patterns of the College Curriculum in the U. S. (1940 Chinese Communism and the Proletarian-Socialist Revolution (1955), and many articl in journals such as Current History, Far Eastern Survey, Soviet Survey, American Journ of Sociology, Educational Record, and others.*

THE "problem of the intellectuals" has been one of the major issues confronting the Chinese Communists since their accession to power on the mainland. During the past decade, the attitude of the Peking regime toward the Chinese intellectuals has embraced two related dimensions: the urgent need to utilize their services and the continuing distrust of their ultimate loyalties.

The Communists, on the one hand, require the support of the intellectuals both because of their traditional importance as teachers and moulders of public opinion and because of their present importance in relation to the ambitious plans for industrialization and national development. On the other hand, they are basically distrustful of the "old-time intellectuals" whom they view as the misguided products of bourgeois society. The Chinese Communists have repeatedly declared that their long-term goal is to develop a new generation of "proletarian intelligentsia" firmly grounded in the ideas of Marx, Lenin, and Mao Tse-tung. For the present, however, the older intellectuals must be used, while at the same time they must be vigilantly watched and firmly constrained to reorient their thinking in officially approved channels.

This double-barreled policy of "absorbing" and "reforming" the intellectuals has been clearly defined in official Communist party statements for many years.[1] Even when confined to their Yenan base during the Japanese war, the Communists established a special university for the express purpose of re-educating intellectuals who had come to join them in the hinterland. After they came to power in 1949, the "thought reform" effort became a task of national scope and significance.

[1] See, for example, the "Decision of the Central Committee of the Chinese Communist Party on the Absorption of Intellectual Elements," December 1, 1939, translated in C. Brandt and others, *A Documentary History of Chinese Communism* (Cambridge: Harvard University Press, 1952), pp. 349–51.

## The "Study" Campaign

The Communists at once initiated a "study" (*hsüeh-hsi*) campaign to enlist the entire population in a program of political indoctrination. In the universities, they organized both students and faculties to study Marxist-Leninist theory and "the thought of Mao Tse-tung." One of the most important subjects for study was the class struggle. At home, this meant a call to the intellectuals to join a "bitter class war" against the landlords, the feudal elements, and other "class enemies" of the proletariat. Abroad, it meant a recognition of "imperialist America" as a mortal enemy and an appreciation of the Soviet Union as Communist China's best friend and teacher.

The Communist program for the "ideological remoulding" of the intellectuals was not only confined to theoretical "study"; it also demanded active participation in the campaigns through which Peking extended its controls through all levels of Chinese society. During the land reform movement beginning in 1950, the intellectuals were sent to the villages not only to acquire first-hand experience in the countryside but also to take an active role in the struggle against the landlords. Class consciousness was to be further developed by their participation in other political programs and campaigns—such as anti-American drives and the activities of the Sino-Soviet Friendship Association—designed to convert the intellectuals to the new ideology.

## Tightening the Vise

In 1951 the Communists turned from milder forms of "study" to more coercive methods of thought reform. The outbreak of the Korean War and the campaign for the suppression of "counter-

revolutionaries" gave the government new opportunities to identify and eradicate centers of active opposition and to demand more complete compliance on the part of the entire population. Thus the pressure for thought reform of the intellectuals became more demanding.

In September 1951, more than 3,000 faculty members from twenty institutions of higher education in Peking and Tientsin were brought together for four months of intensive "reformative study" (*kai-tsao hsüeh-hsi*). This was followed by similar programs in other parts of China, and the drive was later expanded to embrace elementary and secondary school teachers as well as intellectuals in the fields of literature and art.

University presidents, deans, and senior professors, as well as young instructors and staff members, were assembled to "study" the required Communist texts. For hours, they listened to reports and exhortations from party and government officials. Under the watchful eyes of the cadres, they practiced "criticism and self-criticism" designed to destroy their established thought patterns and to replace them with the essential elements of the Communist ideology. They were led to examine their past careers to uncover specific "errors" and to submit the concrete results of their self-examination in autobiographies and confessions. The Communists intended that the process be humiliating, for thought reform required that the intellectuals should rid themselves of their traditional pride, recognize their inadequacies, and humble themselves at the feet of their new self-styled ideological superiors.

## Eradicating Deviant Ideologies

During the years since 1951 the Communists have steadily pressed their programs designed to eradicate deviant ideologies on the mainland. The rapid extension of socialist controls throughout the political and economic structure of China has been accompanied by repeated efforts to enforce more rigid ideological and cultural controls.

As the Peking regime had utilized its early agrarian reform program in large measure as a political struggle against the landlord class in the countryside, so it launched the "3-anti" and "5-anti" campaigns in 1952 to emasculate the urban bourgeoisie.[2] These drives set out to eliminate not only the "five evils" of the bourgeoisie but also "bourgeois ideology" itself, which was considered the root of all evils. Declaring that the schools and universities had been the repositories and the intellectuals the bearers of bourgeois ideology, the Communists called upon both educational institutions and individuals to purge themselves of all such unorthodox tendencies. "Bourgeois ideology," in the Chinese Communist usage, covers a wide variety of intellectual attitudes and assumptions which the Communists regard as antithetical to Marxism-Leninism. These range from "reformism" (the "vain hope" that society may be improved by gradual reform rather than violent revolution) through "individualism" (aversion to collective activity) to indifference to political study.

In 1954 the Communists took another step in their attack on "bourgeois" thought when they precipitated a sharp controversy over the great eighteenth-century novel, the *Hung Lou Meng* (Dream of the Red Chamber). The central issue involved an interpretation of the novel by a prominent Chinese scholar, Yü P'ing-po, who was a recognized authority on the work. The Communists alleged that his interpretation

[2] The "3-anti" drive was directed against corruption, waste, and bureaucratism; the "5-anti" campaign, against the five most common "crimes" of urban businessmen and industrialists (bribery, tax evasion, fraud, theft of state assets, and leakage of state economic secrets).

fell far short of the appropriate Marxist canons of criticism and that it neglected the social and historical background of the novel. They stated that this erroneous interpretation was the result of "bourgeois idealism," a misguided expression of the "art for art's sake" viewpoint which ignored the socio-political significance of literature and art. Intellectuals throughout the mainland were required to organize forums to discuss the *Hung Lou Meng* case, and the mounting pressure compelled Yü P'ing-po to engage in extended self-criticism and finally to confess his "erroneous ideology."

The pressure on the Chinese intellectuals continued when the Communists renewed earlier attacks on the "reactionary ideology" of Hu Shih.[3] Numerous articles in the mainland press and in official periodicals denounced Hu Shih's malevolent influence stemming from his "bourgeois ideology."

Even more striking was the Peking's denunciation of Hu Feng, a writer and editor who—though himself close to the Communists for many years—did not agree with the official policy in regard to literature and art. The campaign against Hu Feng, also nationwide in scope, was another stern warning that the Communists would brook no interference with their ideological program.

## A Fresh Look at the Problem

Despite these successive campaigns, the Communists were still concerned about the "problem of the intellectuals." They had good reason for their uneasiness, for the intellectuals—while they had attended "study" sessions and participated in the mass campaigns, shouted the approved slogans and signed the necessary confessions, denounced their contemporaries and their own bourgeois background—still were not giving the new regime the wholehearted support it required. While they met the official requirements, their attitude was distinctly unenthusiastic.

The Communists were thus confronted with a serious problem, for their ambitious national plans for socialization and industrialization required the active assistance of all available trained personnel. Faced with the need for the support of the intellectuals, Peking began to look for better methods to overcome the negative attitude of the intellectuals and to enlist and sustain their support.

In January 1956, the Communist party called a special conference to discuss the problem. At this meeting, Chou En-lai declared the intention of the party "to find a correct solution for the question of the intellectuals, to mobilize them more effectively, and to make fuller use of their abilities." The party, Chou said, had correctly pursued a policy of "uniting, educating, and remoulding the intellectuals," but he admitted that the program had been less than completely successful. Among China's higher intellectuals, he estimated, only 40 per cent could be considered as active supporters of the new order; of the rest, "40 per cent or so" were doing no more than what was required of them, 10 per cent were "backward intellectuals who oppose socialism," while the remaining 10 per cent were "counterrevolutionaries" who could not be reformed. Even among the active supporters, "a great many progressive intellectuals still display a greater or lesser degree of bourgeois idealism and individualism in their outlook and behavior." Admitting "shortcomings" in the treatment accorded to intellectuals, Chou promised remedial measures to improve their working and living conditions: better housing facilities,

[3] The prominent Chinese scholar often honored as the "Father of the Chinese Renaissance" in the years after World War I.

higher salaries, more rewards and incentives, increased appropriations for reference books and needed equipment. In the ensuing months, a number of such improvements were carried out.

## "LET A HUNDRED FLOWERS BLOSSOM"

Such measures were welcome, but they still failed to overcome the prevalent passivity of the intellectuals. While the intellectuals were appreciative of improved material conditions, they were also concerned with intangible matters. Many scholars—discouraged, disillusioned, frustrated, humiliated, or impatient—complained that true scholarly work was impossible under the rigid regimentation imposed by Marxist orthodoxy.

Realizing this, the Communist leaders moved to relax to some extent the severe limitations they had imposed on intellectual activity on the mainland. The result was the incongruous emergence of a well-known classical Chinese expression, "Let a hundred flowers blossom, let a hundred schools (of thought) contend."[4] Mao Tse-tung himself first proposed this slogan in an unpublished address to the Supreme State Conference on May 2, 1956. Shortly thereafter, Lu Ting-yi, Director of the Propaganda Department of the Central Committee of the party, made the first complete public airing of the new policy.[5] While Lu used hyperbolic language to hail the new policy as ushering a new day of "freedom of independent thinking, freedom of debate, freedom of creative work, freedom to criticize, to express one's own views," he left no doubt that the fundamental policy of the thought reform of intellectuals would remain unchanged. He warned that there was no place in Communist China for the freedom of the capitalist countries or for the chaos of ancient China. He declared that there would be no let-up in the class struggle and that the freedom of "blossoming" or "contending" would be offered only to "the people," that is, to those who supported the Communist party and its program. The "ideological struggle," so much emphasized in the successive thought reform campaigns, would continue, but it would now be carried on by a new method.

Despite the invitation to free expression, the initial reaction of the intellectuals was wary. Some did take advantage of the opportunity to voice complaints, but their statements were moderate in tone and were largely concerned with practical questions of livelihood and work conditions rather than with larger issues of state or party policy.

## MAO SPEAKS AGAIN

On February 27, 1957, Mao Tse-tung made a speech which attracted international attention. The address, entitled "On the Correct Handling of Contradictions among the People," contained a reaffirmation of the "hundred-flowers, hundred-schools" policy which he had enunciated the previous year.[6] It came at a time when the position of the intellectuals was still uncertain. Mao's earlier call for liberalization had met with little response, and some elements in the party had already voiced opposition to the new "freedom."[7] This opposition in turn accentuated the skepticism and uncertainties of the intellectuals who became even less inclined to respond to the new appeal.

At the same time, conditions both within China and abroad had alerted the Communist leaders to the danger of mounting popular discontent. Domestically, the restlessness of the intellectuals had spread to other segments of the population. Student recalcitrance, manifested in strikes and riots, had challenged the strict controls of the regime, and there were increasing signs of unrest among workers and peasants. Throughout the country, shortages of food and consumers' goods were causing increased dissatisfaction.

Internationally, the Chinese Communists were unquestionably alarmed by the Hungarian revolt of late 1956. More than once in his speech, Mao referred to the Hungarian outburst which, he said, "had caused some of our intellectuals to lose their balance." "Certain people in our country," he said, "were delighted when the Hungarian events took place. They hoped that something similar would happen in China." Realizing that pent-up discontent might lead to a sudden explosion, Mao apparently concluded that it would be wise to release some steam. "The lesson of the Hungarian events," he said, "deserves our attention."

With respect to the intellectuals, Mao underscored the need to enlist them in the "colossal task of socialist construction." At the same time, he reiterated the necessity for the intellectuals to "continue to remould themselves," while stating that this was now to be achieved by "painstaking reason" rather than by "coercive methods." Mao left no doubt, however, that the liberalization was only a tactical maneuver, a new means of gaining the same ultimate objective, namely, the thoroughgoing reform of the intellectuals to make them acceptable and useful to the new Communist society. In using the new freedom, he warned, people must realize that "they have to keep themselves within the bounds of socialist discipline." The intellectuals must still study Marxism-Leninism and learn to appreciate its superiority over all other ideologies.

It took more than two months for the cautious intellectuals to muster sufficient courage to speak out freely. The initial response was moderate and restrained, but by the beginning of May 1957, inhibitions were discarded. For one month, one bold critic after another voiced his dissatisfaction—even disgust—with the Communist regime.

In their attempt to win over the intellectuals, Mao Tse-tung, Chou En-lai, and other Communist leaders had admitted that the Communist party and its cadres had not exercised their leadership wisely and that they were now willing to listen to suggestions for improvement. Instead of criticizing Communist methods, however, the intellectuals attacked basic Communist objectives and goals. They challenged the entire system of Communist control. They severely criticized the identification of the party with the state. They detailed the evil consequences of party control of education. They pointed out that the Communists had monopolized power and position and that non-Communists were given merely nominal positions to create the deceptive appearance of a "coalition government." They expressed resentment over the humiliation which they had suffered under the domination of immature cadres and in the course of successive thought reform campaigns. They quoted the old classical saying that scholars would prefer death to humiliation, implying that they could neither be forced nor intimidated to serve the Communist regime.

The critics even challenged the Communist claim of ideological superiority.

[4] Used in ancient China to describe the environment which permitted opposing schools of thought to express themselves freely.

[5] Published in Peking *Jen-min jih-pao,* June 13, 1956.

[6] Published in *Jen-min jih-pao,* June 19, 1957. The English translation appeared in *New York Times,* June 19, 1957; also in *People's China* (Peking), July 1, 1957, supplement, pp. 3–27.

[7] For statements attacking the new policy as dangerous to the cause of socialism, see articles in *Jen-min jih-pao,* January 7, 1957, and in *Hsüeh-hsi,* February 18, 1957.

They questioned the benefits of socialism. They boldly asserted that Marxism-Leninism could not be accepted as the infallible guide for China's development. A professor of history declared that the Marxist school had failed to develop any new understanding of human history and society since the death of Engels, thus virtually sweeping aside what the Chinese Communists have hailed to be the unique ideological contributions of Lenin and Stalin.[8]

During the month of genuine "blossoming" and "contending," the critics became bolder. One college professor declared that the Chinese people were prepared to overthrow the Communists or even rise to kill them.[9] An engineer stated that Communist rule was worse than Kuomintang rule.[10] Stunned and alarmed, the Communists finally took action to halt this dangerous trend: they launched a nationwide campaign against "rightists" extending through all strata of Chinese society. The short period of liberalization was abruptly ended, and all "blossoms" which did not suit the Communist taste were condemned as "poisonous weeds" to be uprooted.

## THOUGHT REFORM, NEW STYLE

A new phase in the continuing program of thought reform followed. In this most recent stage, a new wave of confessions and pledges swept the country. Intellectuals who had spoken out during the period of liberalization were forced to recant and to confess their need for further reform; those who had remained silent were made to repledge their support of socialism and their loyalty to the Communist party. Intellectuals, along with many other elements in the population, were marshalled to join in a new movement of political dedication requiring complete "surrender of heart" (*chiao-hsin*) to the Communist party. At the same time, the intellectuals were told that it was not enough that they be educated "experts"; they must be "both Red and expert," that is, both politically orthodox and technically competent.[11] No intellectual is allowed to be indifferent to politics.

The non-Communist political parties —for example, the Democratic League, the Kuomintang Revolutionary Committee, and others—were made another major target of "rectification" since some of the most scathing attacks on Communist rule had been made by members of these parties in forums sponsored by them. Each party was instructed to launch its own "rectification campaign," to denounce its erring members, and to ferret out "rightists" in its own ranks. As a result of the renewed internal dissension, the "democratic parties" became even more impotent than before.

Thus the brief period of relaxation of ideological controls in Communist China in the spring of 1957 ended abruptly. In some respects, the demands for political conformity are more pressing in 1958 than ever before, for the Communists have been able to identify and expose centers of resentment and resistance. Yet some gains at least have been registered by the intellectuals. In general, they are now accorded more favorable material treatment in terms of higher salaries and better housing.

[8] Statement of Lei Hai-tsung in *Jen-min jih-pao,* April 22, 1957.

[9] Statement by Ko P'ei-ch'i in *Jen-min jih-pao,* May 31, 1957.

[10] Cf. summary of the views of "rightists" in *Jen-min jih-pao,* June 12, 1958.

[11] The slogan, "Strive to be both Red and expert," is directed against intellectuals who attempt to remain aloof from politics. Another slogan, "Stress the present and slight the ancient" (*hou-chin po-ku*), is directed against those who seek refuge in the study of China's old culture and who thus "stress the ancient and slight the present" (*hou-ku po-chin*).

In particular, scientific and technical personnel enjoy a wider scope of activity than in the years prior to 1956. They now have access to foreign books and journals previously denied them, and have more and better equipment.

The long-range effects of the brief intellectual outburst in the spring of 1957 are unclear. Certainly it is significant that there were still individuals who had the courage to express sharp disagreement and dissatisfaction with many of the basic premises underlying Communist rule on the mainland of China. Both the extent of the opposition and the variety of the criticisms leveled by the Chinese scholars and intellectuals against Communist rule indicate the internal tensions which still exist beneath the surface of political and intellectual conformity which Peking consistently attempts to present to the outside world.

# Continuity and Change in Modern Chinese Literatur

By Tien-yi Li

Abstract: The Chinese Literary Revolution of 1917, originally concerned with the problem of replacing the classical language with the living language of the people as a medium for written communication, introduced a period of rapid change and experimentation in Chinese literature. During the 1920's and 1930's, political as well as literary issues were involved in the debates over literary theory and practice. Nationalism and realism were dominant themes, and left-wing influence grew steadily. The Chinese Communist approach to literature, specifically defined by Mao Tse-tung in 1942, was translated into a nationwide program for the writers with the Communist victory in 1949. Since then, "socialist realism" has been the guiding principle for all writing although Communist policy has selectively accepted certain segments of the Chinese literary heritage which meet their political criteria. While the widespread use of new forms, techniques, and emphases resulting from the Western impact on China has been a notable feature of modern literature, nevertheless the element of "realism" has definite historical antecedents in Chinese literary history. Thus both continuity and radical change have been present in the stream of modern Chinese literature.

---

*Tien-yi Li, Ph.D., New Haven, Connecticut, is Assistant Professor of Chinese at Yal University. He formerly taught at National Southwest Associated University and Na tional Central University in China, and at Smith College. Since 1955 he has served o the editorial board of the Tsing Hua Journal of Chinese Studies. He is the author o Woodrow Wilson's China Policy, 1913–1917 (1952) and various articles in professiona journals.*

In Chinese literature as in Chinese politics, the twentieth century has been a period of turmoil and dissension, an era in which the stabilizing forces of tradition have been repeatedly rocked by the new and aggressive forces of iconoclasm. What are the major problems which have confronted the Chinese literary world in recent decades? What are the key indicators of continuity; what are the significant signs of change? To answer these questions, it is necessary to survey some of the important trends in modern Chinese literature during the years since the Literary Revolution of 1917.

Many people tend to identify the Literary Revolution of 1917 with the Chinese Renaissance which is also called the New Culture Movement, the New Thought Movement, or the New Tide. Actually the two developments are interrelated but not identical. To be more explicit, the Literary Revolution represents only one phase of the larger movement usually termed the Chinese Renaissance.[1]

[1] In defining the Chinese Renaissance, Hu Shih, who played a leading role in the new movement, mentions three prominent features: "First, it was a conscious movement to promote a new literature in the living language of the people to take the place of the classical literature of old. Second, it was a movement of conscious protest against many of the ideas and institutions in the traditional culture, and of conscious emancipation of the individual man and woman from the bondage of the forces of tradition. It was a movement of reason versus tradition, freedom versus authority, and glorification of life and human values versus their suppression. And lastly, strange enough, this new movement was led by men who knew their cultural heritage and tried to study it with the new methodology of modern historical criticism and research. In that sense it was also a humanist movement." The first feature mentioned by Hu Shih is identical with the Literary Revolution as originally started. See Hu Shih, *The Chinese Renaissance* (Chicago: University of Chicago Press, 1934), p. 44.

## Nationalism

The Literary Revolution was originally concerned with the problem of replacing the classical language with the living language of the people as a medium for written communication. As early as 1915, Hu Shih and his friend, Chao Yuen-ren, had discussed this question seriously. The latter was then thinking in the direction of alphabetizing the Chinese language and actually proposed certain details of procedure for alphabetization. While not opposed to Chao's idea, Hu Shih thought that some intermediate steps should be taken "to make the ideographic characters more teachable in the elementary schools"; and he also proposed certain details of reform. After more consideration, he concluded that "the future literature of China must be written in the living language of the people," and that "no dead language can produce a living literature."[2] In 1917 he formally launched a vigorous debate in the Chinese intellectual world by publishing an article entitled "Some Tentative Suggestions for the Reform of Literature"[3] in the liberal monthly, *The New Youth*. In this article, still written in the classical language which he was determined to overthrow, Hu Shih advised writers against artificial imitations, unhealthy pessimistic thinking, stereotyped clichés, irrelevant and abstruse allusions, and the conventional antithetic style as shown in parallel prose and regulated verse. He advocated a literature which should be characterized by an embodiment of true feelings and concrete thoughts, an emphasis on grammar, and a readiness to use colloquial words and expressions. He laid special emphasis on the last characteristic because he be-

[2] *Ibid.*, pp. 50–51.

[3] "Wen-hsüeh kai-liang ch'u-i." See *The New Youth* (*Hsin ch'ing-nien*), Vol. 2, No. 5 (Jan. 1, 1917).

lieved that from an historical point of view vernacular literature, which was bound to flourish, should be the main literary product of the times.

In support of Hu Shih's proposals, Ch'en Tu-hsiu, editor of *The New Youth,* wrote a more startling essay entitled "On a Revolution in Literature." [4] A radical himself, Ch'en attached political and social significance to the new movement. In this essay, also written in the old literary style, he brought up the following three slogans:

1. To destroy the painted, powdered, and obsequious literature of the aristocratic few, and to create a plain, simple, and expressive literature of the people;
2. To destroy the stereotyped and monotonous literature of classicism, and to create a fresh and sincere literature of realism;
3. To destroy the pedantic, unintelligible, and obscurantist literature of the hermit and the recluse, and to create a plain-speaking and popular literature of a living society.[5]

The arguments of Hu Shih and Ch'en Tu-hsiu were well received by a group of professors and students in Peking. Ch'ien Hsüan-t'ung, Chou Tso-jen, Fu Ssu-nien, and Liu Fu, for example, were all in favor of adopting *pai-hua,* or the vernacular language, as a medium for literary expression; and the arguments they presented in support seem to have been equally effective. Soon the reformers themselves went one step further by abandoning the classical style in their own writings. Writing in the vernacular style became a vogue, and by 1919 hundreds of *pai-hua* newspapers and magazines were published. In the following year, the Chinese Ministry of Education ordered that, beginning in the fall of 1921, textbooks for the first two grades in the primary schools should be in the national language, that is, the vernacular tongue. In 1922 it was ordered that all elementary and secondary textbooks should be rewritten in the national language.

[5] See Hu Shih, *op. cit.* (note 1 *supra*), p. 54.

### REALISM

The problem of ideology, as well as that of language, also engaged the attention of the early reformers. Both Hu Shih and Ch'en Tu-hsiu, as well as many other leaders, expressed important views on this subject. Special mention should be made of the view presented by Chou Tso-jen in his essay entitled "Human Literature." [6] He saw the Chinese Renaissance largely as a movement for the emancipation of the individual from the feudal bondage of the past. In this new context, any action against human nature, individual interests, humanitarian principles, and fraternal love was to be condemned. The literature of the modern age should describe man's ideal life based on high morals. Negatively, it should reflect man's real life or expose its inhuman aspect with a view to improvement. In short, he favored the idea of art for life's sake.

The writers of the Literary Research Society—Mao Tun (Shen Yen-ping), Cheng Chen-to, and others—closely followed Chou Tso-jen's theory. Their central thought was realism. They were contemptuous of men of letters who buried themselves in the ivory tower, blind to the social evils and injustices around them. They made it their duty to foster a literature that would reflect the times, record actual happenings in society, pierce through the dark side of life, and—more important—point the way to progress and happiness. In one article, Cheng Chen-to even went so far as to maintain that all works of literature should be imbued with social color and revolutionary spirit. His interpretation of realism, then, was very close to that of the advocates of the so-called "revolutionary literature."

[6] "Jen te wen-hsüeh." See *The New Youth,* Vol. 5, No. 6 (Dec. 15, 1918).

Contemporary with the realists were the romanticists of the Creation Society. They opposed utilitarianism in literature. One of their leading theorists, Ch'eng Fang-wu, in his article, "The Mission of the New Literature," [7] defined their aim as the search for literary perfection and the realization of literary beauty. While they favored the principle of art for art's sake, they did not aim at an escape from the realities of life. Disgusted with existing conditions in China, they desired a better way of living. Soon they began to attach social value to literature. Even Yü Ta-fu, a decadent novelist with individualistic inclinations, began to advocate socialism in an essay entitled "Class Struggle in Literature." [8] Under the influence of the Chinese Revolution of 1925–27, these romanticists brought forth the slogan of "revolutionary literature." Kuo Mo-jo's article, "Revolution and Literature," [9] may be regarded as a manifesto formally announcing this change of attitude. As their representative, he made known their decision to abandon individualism and romanticism and to identify their interests with those of the proletariat.

### LEFT-WING MOVEMENT

Sensitive to the prevailing trend, disappointed with the political and social situation, and stimulated by his own indomitable spirit of revolt, Lu Hsün (Chou Shu-jen), the most outstanding author of that time, also converted himself to socialism. From 1928 until his death in 1936, he played a leading role in the leftist movement and had many promising young writers among his followers. With the founding of the League of Left-Wing Writers in 1930, the leadership of the literary movement gradually passed into the hands of the leftists. The chief aim of the leftist writers was to promote a popular literature which would deal with all problems from the viewpoint of the proletariat and would be written in a language comprehensible to the masses. The twin movements for the popularization of literature and for the Latinization of the Chinese language were both launched before the death of Lu Hsün.

The predominance of the leftist writers did not go unchallenged. The writers of the Crescent Moon Society, for example, strongly resented leftist literary theory, and their leading critic, Liang Shih-ch'iu, repeatedly challenged the validity of the term "revolutionary literature." Influenced by neohumanism and rationalism, he argued that literature should be based on human nature rather than on any specific political belief. A number of writers closely connected with the Kuomintang also opposed the leftists, and shortly after the appearance of the League of Left-Wing Writers, they launched a Chinese nationalist literary movement. They held that the highest principle of literature should be nationalism and denounced the leftists' theory of class struggle. Nationalism as a guiding principle was never totally discounted by the leftists themselves. However, they often interpreted it in terms of patriotism or anti-imperialism and always linked it with internationalism, proletarianism, or socialism. Besides the "crescenters" and the nationalists, there were also the neutralist writers, who bemoaned the fact that literature was being made a

"political loudspeaker" by both the leftists and the nationalists. Their slogan was simply freedom of expression.

In passing, mention should also be made of the Analects school, led by Lin Yutang. Humor was the prevailing tone of practically all the publications of this group. In the eyes of the leftists, however, the humorous literature of this school was entirely out of tune with the spirit of the times. Lu Hsün bitterly accused the humorists of attempting merely to turn "the cruelty of the butcher" into a laughing matter. After Lin Yutang left China for the United States, the Analects school, deprived of leadership, weakened and lost its importance on the Chinese literary scene.

During the Sino-Japanese War (1937–45), every patriotic writer, whether leftist, rightist, or nonpartisan, was conscious of his duty as a fighter for national existence. Literary critics all emphasized the role of men of letters in the war. They believed that all writing should directly or indirectly express the irresistible desire of the Chinese people for freedom and independence. The political, social, and didactic function of literature was stressed. Both the Nationalists and the Communists endeavored to use literature as an effective weapon for fighting the war, for winning popular support, and for strengthening their positions against internal and external enemies. During the war years, the leftists continued to play a predominant role in the field of literary theory and production, and the most active and productive writers of the period were found in the ranks of the leftists and their sympathizers.

## COMMUNIST APPROACH TO LITERATURE

In May 1942, Mao Tse-tung made a comprehensive redefinition of the function of literature in his "Talks at the Yenan Forum on Art and Literature."[10] The purpose of the Yenan forum, according to Mao, was

> to fit art and literature properly into the whole revolutionary machine as one of its component parts, to make them a powerful weapon for uniting and educating the people and for attacking and annihilating the enemy, and to help the people to fight the enemy with one heart and one mind.[11]

This program was closely connected with the Communists' current (1942) campaign for correcting various unorthodox political tendencies: subjectivism, sectarianism, and party formalism. Literature, as Mao understood it, should be intended for, and serve the needs of, the workers, the peasants, the soldiers, and the urban petty bourgeoisie with its intelligentsia. He laid great stress on the importance of popularization and elevation. By popularization he meant spreading literature among the masses; by elevation, raising the people's level of literary appreciation. Furthermore, there should be "unity of politics and art, of content and form, and of the revolutionary political content and the highest possible degree of perfection in artistic form."[12] The language to be used for literary creation should be rich, lively, and perfectly intelligible to the masses. With respect to the problem of China's past literary heritage, he favored accepting and assimilating the fine qualities of the literature of the past. While not opposed to using literature as a means for the exposure of the dark side of things, he thought that it was more important for writers to depict the positive side and

[10] "Tsai Yenan wen-i tso-t'an-hui shang te chiang-hua." For an authorized English translation of these talks, see *Selected Works of Mao Tse-tung* (London: Lawrence and Wishart, 1954–56), Vol. IV (1956), pp. 63–93.

[11] *Ibid.*, p. 64.

[12] *Ibid.*, p. 86.

to eulogize "the proletariat, the Communist Party, New Democracy, and socialism."[13] The objects to be exposed, he argued, should always be the enemies of the people, never the people themselves. Mao admitted that his approach was utilitarian. But he explicitly stated that his utilitarianism was that of the proletariat, not that of the feudal, bourgeois, and petty-bourgeois classes. The leftist writers later identified this kind of proletarian utilitarianism with socialist realism, a term originally borrowed from the Soviet Union. Since 1942 the literary theories expounded by Mao in his Yenan talks have been the basic guiding principles for the leftist writers of China.

Mao's Yenan talks gave a fresh impetus to the creation of literature in the Communist areas. From 1942 to the establishment of the Central People's Government in 1949, a large volume of literary works appeared: novels, operas, plays, poems, folk songs, and reportage essays.[14] The favorite themes of the authors were the war of resistance against Japan, the civil war, land reform, industrial and agricultural production, the history of the Chinese Communist revolution, and other related topics. Three of the most popular works won Stalin prizes for literature in 1951. They were: *The Sun Shines over the Sangkan River,* a novel by Ting Ling; *The White-haired Girl,* a new type of opera by Ho Ching-chih and Ting Yi; and *The Hurricane,* a novel by Chou Li-po.[15] The period from 1942 to 1949 also witnessed the emergence of numerous young writers, among whom Chao Shu-li was considered outstanding. Chao's three works, *Hsiao Erh-hei's Marriage, Rhymes of Li Yu-ts'ai,* and *Changes in Li Village,* won him great fame as a novelist.[16] The Communist literary critics particularly acclaimed his skillful use of the everyday language of the common people.

[13] *Ibid.*, p. 89.

[14] For information on the literary developments of this period, see Wang Yao, *A Draft History of China's New Literature (Chung-kuo hsin wen-hsüeh shih kao,* two volumes, 1951–53, Peking and Shanghai), II, pp. 205–445; Liu Shou-sung, *The First Draft for a History of China's New Literature (Chung-kuo hsin wen-hsüeh shih ch'u-kao,* two volumes, Peking, 1956), II, pp. 28–305; and Chou Yang, "The People's New Literature and Art" in his *China's New Literature and Art* (Peking, 1954), pp. 51–86.

## SOCIALIST REALISM

In July 1949, a conference of Chinese writers and artists met in Peking and established the All-China Federation of Literary and Art Circles. Under this federation, there were also formed several subordinate organizations including the All-China Association of Literary Workers. Four years later (September–October 1953), another national literary conference was held in Peking. It reviewed the past work of the federation, criticized some misunderstandings about the literary theory of Mao, and concretely defined the goal of socialist and realist literature. It also voted for the reorganization of the federation and its various subsidiaries, and as a result, the All-China Association of Literary Workers was reorganized as the Association of Chinese Writers.

During the years since 1949, socialist realism as a literary principle has been repeatedly stressed and expounded in

[15] All of these three works have been translated into English. See Yang Hsien-yi and Gladys Yang, Translators, *The Sun Shines over the Sangkan River* (Peking, 1954); Yang Hsien-yi and Gladys Yang, Translators, *The White-haired Girl* (Peking, 1954); and Hsü Meng-hsiung, Translator, *The Hurricane* (Peking, 1955).

[16] For English translations of these works, see Chao Shu-li, *Rhymes of Li Yu-ts'ai and Other Stories* (Peking, 1950), and Gladys Yang, Translator, *Changes in Li Village* (Peking, 1953). For an evaluation, see Chou Yang, "On the Works of Chao Shu-li" in his *China's New Literature and Art,* pp. 134–54.

the literary world of mainland China.[17] From the Communist point of view, a good piece of literature has to be both true to life and ideologically correct. Lack of socialist content will lead to "naturalism," while separation from reality will result in "conceptualization" and "generalization." Both extremes must be avoided. In the past two years, there has been a heated debate over the validity of the expression *"hsieh chen-shih"* or "depicting reality." According to the Chinese critics and writers with orthodox Marxist-Leninist views, this expression alone does not convey the total meaning of socialist realism. There must be a perfect unity of socialist thinking and realistic depiction in literature. The principle of depicting reality, applied in isolation, is invalid; it becomes valid only when it is unified with socialist ideology. In fact, the whole theory of socialist realism has been stressed repeatedly to warn those writers who, under the pretext of realistic depiction, have described only the negative aspects of things and have failed to eulogize communism.

A number of ideological remolding campaigns have been launched in China since 1949. The most extensive ones affecting literary and art circles have been the criticism of *The Story of Wu Hsün,*[18] the purge of Hu Feng, the attack upon Yü P'ing-po, and the denunciation of the antiparty clique of Feng Hsüeh-feng, Ting Ling, and Ch'en Ch'i-hsia. When the movement for "letting a hundred flowers blossom and letting a hundred schools of thought contend" was at its height in 1957, some observers felt that the Chinese Communists' policy of thought control had actually come to an end. Before long, however, the movement turned into another nationwide campaign against rightists and revisionists. The poisonous weeds, the Communists insisted, had to be uprooted from the people's flower garden.

## National Objectives as Literary Themes

During the past decade, the mainland of China has been the scene of a series of campaigns designed to mobilize the country for the achievement of major national objectives: the land reform, the Korean War, the suppression of counterrevolutionaries, the 3-anti and 5-anti drives against illegal practices in public and private enterprises, the movement for industrialization and agricultural collectivization, and the struggle against revisionism and rightist thought. Throughout this period, the Chinese writers have utilized the themes of these political campaigns as literary themes and have, in quantitative terms, published an impressive body of work.

[17] See, for example, Chou Yang, "Socialist Realism—The Road of Advance for Chinese Literature" in his *China's New Literature and Art,* pp. 87–102; Mao Tun, "New Realities and New Tasks," *Chinese Literature,* No. 1 (1954), pp. 1–23; Chou Yang, "Building a Socialist Literature," *Chinese Literature,* No. 4 (1956), pp. 198–222; and Chou Yang, "The Important Role of Art and Literature in the Building of Socialism," *Chinese Literature,* No. 1 (1957), pp. 179–88. For more information on post-1949 literary developments in China, see, among many others, Wang Yao, *A Draft History of China's New Literature,* Vol. II, pp. 446–543; Albert Borowitz, *Fiction in Communist China* (a monograph prepared for the Center for International Studies, M. I. T., Cambridge, 1954); Chao Chung, *The Communist Program for Literature and Art* (Hong Kong, 1955); Chou Yang, "For More and Better Literary and Artistic Creations!", in his *China's New Literature and Art,* pp. 1–50; Mao Tun, "The Key Problems in Art and Literature," *Chinese Literature,* No. 4 (1956), pp. 223–28; Mao Tun, "The Chinese Literature of Today," *Chinese Literature,* No. 2 (1957), pp. 205–14; and Mao Tun, "A Discussion of Recent Short Stories" ("T'an tsui-chin te tuan-p'ien hsiao-shuo"), *People's Literature (Jen-min wen-hsüeh),* No. 6 (June, 1958), pp. 4–8.

[18] This is a film dealing with the life of Wu Hsün, a beggar-educator of the nineteenth century.

Some of their best-known productions may be mentioned: in fiction, *Wall of Bronze* by Liu Ch'ing, *The Plains Are Ablaze* by Hsü Kuang-yao, *Flames Ahead* by Liu Pai-yü, and *A Thousand Miles of Lovely Land* by Yang Shuo; in drama, *Steeled in Battles* by Hu K'o, *Dragon Beard Ditch* by Lao She, and *The Long March* by Ch'en Ch'i-t'ung; in reportage, *Those Most To Be Loved* by Wei Wei; in children's literature, *Going to the Movies* by Chang T'ien-yi; in autobiographical literature, *Kao Yü-pao* by Kao Yü-pao.[19]

So far as technique is concerned, many of the literary works produced on the mainland in recent years are still far from satisfactory. The Chinese literary critics have complained that many works are unnecessarily long and verbose. In his speech, "Down with Foreign Formalism," [20] the veteran author Lao She scathingly attacked the kind of current writing which is wordy, clumsy, illogical, unintelligible. Brevity and conciseness in language are now emphatically advocated.

Practically all types of Chinese opera have undergone revision both in language and content in recent years. Some of the revised operas like *Liang Shan-po and Chu Ying-t'ai* and *The Story of the White Snake* [21] have won popular acclaim. Besides, many of the classical novels, dramas, and poems have been reedited and revaluated. *The Dream of the Red Chamber, The Romance of the Three Kingdoms, The Water Margin,* and *The Unofficial History of Officialdom,* for example, have appeared in new editions and have all been declared to be works of the finest quality. For the benefit of the younger generation, some classical works have been translated into modern vernacular. The extensive translation of Ch'ü Yüan's poems is particularly worthy of mention. Since 1949, a large number of Chinese classics have been republished. According to a recent report from Peking, a group of scholars have been officially appointed to work out detailed plans for republishing "all the great extant classics from the earliest times down to the eve of the May Fourth Movement of 1919." [22]

[19] Most of these works have been translated into English. See Sidney Shapiro, Translator, *Wall of Bronze* (Peking, 1954); Sidney Shapiro, Translator, *The Plains Are Ablaze* (Peking, 1955); Liu Pai-yü, *Flames Ahead* (Peking, 1954); Yüan Ko-chia, Translator, *A Thousand Miles of Lovely Land* (Peking, 1957); Tang Sheng, Translator, *Steeled in Battles* (Peking, 1955); Liao Hung-ying, Translator, *Dragon Beard Ditch* (Peking, 1956); Ch'en Ch'i-t'ung, *The Long March* (Peking, 1956).

[20] "Ta-tao yang-pa-ku." See *People's Literature,* No. 3 (March 1958), pp. 1–2.

[21] For English versions of these two revised operas, see Yang Hsien-yi and Gladys Yang, Translators, *Love under the Willows* (another name for *Liang Shan-po and Chu Ying-t'ai,* Peking, 1956) and *The White Snake* (Peking, 1957).

## Chinese Literary Heritage

The Chinese Communists have up to the present time adhered to the policy of preserving what they believe to be the best literary heritage of China. In the revaluation of China's literary traditions, they have rejected much but, at the same time, have also found some elements which they deem worthy of preservation. For example, all forms of traditional popular literature such as the Peking opera, the old type of novel, the story-teller's tale, the *yangko,* and the drum song have been identified as "national forms" for preservation. The recent antirightist campaign has brought forth a new theory: *"po-ku hou-chin,"* or "to slight the past and stress the present." Some observers feel that this theory may mark the beginning of an end to the policy of preserving China's literary legacy. But, as the Chinese Communists view it, increased emphasis

[22] See *Peking Review,* Vol. 1, No. 12 (May 20, 1958), p. 17.

upon the present does not mean a total negation of the past and therefore is not incompatible with their established policy regarding literary heritage. The key to an understanding of their attitude towards traditions is their favorite expression "critical acceptance." They will accept tradition only if it is found to be acceptable by their own criteria of evaluation. As long as the principle of critical acceptance can be applied, they will probably continue to advocate the preservation of China's literary heritage. In a lengthy article published in *The People's Daily* on February 28, 1958, Chou Yang, senior Chinese Communist literary arbiter, stated, "As socialist literature can only grow and flower on its own native soil, it must re-evaluate and carry forward the national tradition and evolve a national style." [28] This statement, which is in keeping with the thought of Mao Tse-tung, may be regarded as a summation of basic Communist policy with respect to China's literary heritage.

## WESTERN LITERARY THEORIES

During the past forty years, a host of literary theories from the West have invaded the Chinese literary world. While each of these theories has had some part in fostering a new literature in China, the major role was played by realism. The term "realism," as first understood by Chinese writers, merely meant an objective representation of life and society. Living in a period of turbulence and instability, most Chinese writers could not shut their eyes to the realities. It was only natural for them to attempt realistically to reflect the conditions of the times, to express their resentment against social evils, and to register their hopes and aspirations for improvement and reform. In the course of time, many Chinese writers began to associate realism with socialism and to produce works which tended to be predominantly didactic in tone. In mainland China, all minor currents of literature were easily detectable before 1949, but since that date they have gradually lost their identity in the major trend of socialist realism.

The adoption of new forms and techniques—again a product of the Western impact—is certainly one important feature of modern Chinese literature. In some cases, Western forms have been adopted with modification; in others, they have been borrowed wholesale. Dissatisfied with the stereotyped methods of traditional Chinese poetry, the new poets have tried practically all Western forms, including free verse and the sonnet. But as yet they have not achieved any remarkable success in their experimentation. So far as the drama is concerned, the new form is quite different from the old. Whereas the old drama is an operatic type filled with poetry, singing, dancing, and gesticulation, the new drama is purely a ***hua-chü*** or a spoken drama. It is either a one-act play or a play divided into a number of acts and scenes and, like Western plays, has full stage directions. As a popular theatrical entertainment, it has not yet surpassed the traditional Chinese opera. The essay has completely broken with traditional types and is now free of formal rules or restrictions with regard to length or subject matter. With this freedom, modern Chinese essayists have produced a substantial quantity of genuinely good writings. In the last two decades the so-called "reportage essay" has enjoyed great popularity in China. This type of essay, however, is more a journalistic report than a literary production. Under the influence of Western literature, many Chinese writers of fiction have rejected the traditional forms as represented by the "romantic" literary tale of the T'ang dynasty, the story-teller's tale of the Sung and Ming periods, and the popular language novel of Ming and Ch'ing times. In writing novels and short stories, they have in one way or another imitated Western types of fiction. On the whole their experimentation with Western forms and techniques has been relatively successful, and their works have proved to be the major literary accomplishment of modern China.

[28] See Chou Yang, "The Great Debate on the Literary Front," *Peking Review*, Vol. 1, No. 4 (March 25, 1958), p. 12.

## CONTINUITY

The element of change has been briefly discussed in the light of the Western impact. What of the element of continuity? Is traditionalism entirely gone? Certainly not. If not, can we detect any continuous trend in the light of Chinese historical development? In fact, according to Hu Shih, the whole New Culture Movement of the modern period was carried out in the spirit of the many renaissance periods from the T'ang down to the Ch'ing dynasty. In one sense, the *pai-hua* literature of the modern period is a departure from the literature written in the classical language; but in another sense it is largely a continuation of the popular language literature of earlier times.

The Chinese written language, as seen in the literature of modern China, has certainly been invaded by foreign words and grammar. But it has not undergone any complete change in its essential structure and will doubtless preserve its basic structure for the foreseeable future. The assimilation of foreign words and syntax will in the long run make the Chinese language richer and more flexible.

The term "realism" has loomed large in the minds of modern Chinese authors. Yet the type of realism which they have practiced is not entirely foreign to traditional Chinese literature. In re-evaluating the Chinese literary heritage, many Chinese scholars have described as excellent realistic productions a number of old masterpieces such as *The Dream of the Red Chamber, The Water Margin,* and *The Unofficial History of Officialdom.* Realism as interpreted in modern China thus represents an old Chinese literary tradition and is not merely an importation from the West.

While Western literature has certainly had a great influence in modern China, China's traditional literary forms have never vanished. In fact, they are still active and are still manifesting vigor and resilience. Since the 1930's, the leftists have constantly talked about the restoration of "national forms." Now it has become official Communist policy to encourage the use of "national forms" for literary work. In a sense, the Chinese Communists have discovered that it is not only possible but also advisable to put new wine in old bottles.

During the past few decades, China has experienced deep and widespread changes. Some observers have tended to interpret all forms of change in modern China in terms of "revolution." Yet the word "revolution," if it implies a total change, does not apply well in the field of literature where very few elements have been overthrown completely. The stream of modern Chinese literature has been broad enough to encompass not only the current of change, both gradual and rapid, but also the current of continuity, always latent and often active.

# Dynamics of the Moscow-Peking Axis

By Allen S. Whiting

Abstract: Alliance with Soviet Russia has served the military, economic, and political interests of Communist China. The dependency of Peking upon Moscow during the Stalin period compelled suppression of ideological differences on the part of Mao Tse-tung. Growing Chinese strength, however, afforded increased leverage upon the post-Stalin leadership. In 1956, the East European crisis prompted Peking to intervene in bloc affairs, promoting a formula which varied from the approach of Moscow. This formula called for relegation of bloc differences to secret bilateral discussions as well as for toleration of greater divergence in the domestic practices of bloc regimes. Chinese mediation between the Polish and Russian positions during 1956–57 appeared to smooth bloc relations throughout East Europe.

Abandonment of this formula at the November 1957 conference in Moscow coincided with a major shift by Mao Tse-tung on other aspects of Chinese foreign policy. This shift paralleled preconference signs from Khrushchev of a harsher line both on bloc affairs and toward the non-Communist world. Overtly the Sino-Soviet attack against "revisionism" applied to the Yugoslavs. Gomulka's position at the conference, however, as well as during the 1958 attack on Tito, suggested that Poland also felt pressure from the new line. The change in Peking's policy from 1956 to 1957 may have come from a reappraisal of Soviet strength resulting from intercontinental ballistic missiles (ICBM) and artificial satellite developments in the latter half of 1957. Such a reappraisal may explain the new harshness of Chinese foreign policy statements directed not only within the bloc but to other areas as well.

His publications include Soviet Policies in China 1917–1924 (1954); Dynamics of International Relations (1956), co-authored with Dr Ernst B. Haas; and Sinkiang: Pawn or Pivot? (1958), co-authored with General Sheng Shih-ts'ai.*

69630

TEN years ago, Mao Tse-tung declared, "Internationally we belong to the anti-imperialist front, headed by the Soviet Union." [1] Formal founding of the Sino-Soviet alliance in 1950 initiated military, economic, and political implementation of his words. Neither changes in the Kremlin nor turbulent events in East Europe have shaken Mao from his 1949 conviction that "the Chinese people must either incline toward the side of imperialism or toward that of socialism. There can be no exception to this rule. It is impossible to sit on the fence. There is no third road."

In the intervening years, the People's Republic of China has grown from a dependent Soviet satellite to a major partner in the Moscow-Peking axis. Particularly since the death of Stalin in 1953, this transformation in Peking's status, both inside the bloc and in the world at large, has seemed to justify Mao's abandonment of the traditional Chinese policy of "using barbarians against barbarians" in favor of "leaning to one side."

To be sure, Peking has paid for its gains. Approximately 2.4 billion dollars in Soviet credits consumed between 1950 and 1957 require payment with interest over the next decade.[2] Virtually all of the 211 industrial projects based on Soviet deliveries are covered by Chinese exports. Politically, by aligning with Moscow, Peking lessened its chances for recognition from the United States and thereby for admission to the United Nations. But without attempting to strike a comprehensive balance, certain observations strengthen the conviction that Peking's gains in the alliance far outweigh its losses.

## Gains from the Alliance

The strategic payoff in the military realm is impressive. No other policy could have provided Mao with the largest and most modern air force in Asia only ten years after seizing power. For a nation which produced its first automobile in 1958, the 1,800 jet fighters and bombers provide important proof of Soviet support. Nor could China's scant and scattered petroleum resources sustain this force without large fuel deliveries from the Soviet bloc.

On the ground, the process of re-equipping and modernizing with Russian tanks, artillery, and transport has drastically transformed the poorly trained and inadequately armed masses of Chinese infantry who fought in Korea. Even greater changes may lie in store as a consequence of the Soviet alliance. In 1958, Foreign Minister Ch'en Yi predicted, "We will have atomic weapons in the future." [3] Should Moscow open its nuclear stockpile to Peking, a new impetus might be afforded the drive toward Chinese Communist ascendancy in Asia.

The bedrock of Sino-Soviet military unity is the pledge of mutual assistance in case of outside attack. First enunciated in the Treaty of Friendship, Alliance, and Mutual Assistance Between the USSR and the People's Republic of China, signed on February 14, 1950, this guarantees that "in the event of one of the High Contracting Parties being attacked by Japan or States allied with it, and thus being involved in a state of war, the other High Contracting Party

[3] Interview of May 10, 1958, with correspondents of *Die Welt* and *Die Stuttgarter Zeitung*. *New York Times*, August 18, 1958 quoted Warsaw "sources" as reporting a Soviet agreement to provide China with atomic weapons, concluded during the Khrushchev-Mao talks of early August 1958.

will immediately render military and other assistance with all the means at its disposal." While not explicitly operative against the United States and United Nations forces in Korea, this guarantee undoubtedly deterred American strategists from striking at Peking's sanctuary in Manchuria when Chinese Communist "volunteers" hurled General MacArthur's troops back from the Yalu River to the thirty-eighth parallel.

On September 7, 1958, Nikita Khrushchev dropped the qualifications covering mutual assistance in the 1950 treaty and declared flatly, "An attack upon the People's Republic of China . . . is an attack upon the Soviet Union."[4] This unprecedented Soviet support for Peking came in a letter to President Dwight D. Eisenhower during the crisis over the Taiwan Strait. On September 19, 1958, Khrushchev amplified this pledge by threatening nuclear retaliation against any country which employed nuclear weapons against Communist China.[5] Thus the Sino-Soviet Alliance provides Peking both with minimal military security in case of war and with vital political leverage for atomic blackmail.

In the realm of economics, the alliance has also served Mao's interests. Credits, technical assistance, and imports from Moscow made possible the striking gains of the First Five-Year Plan indicated in Table 1.

With more than half of the original 211 industrial and construction projects "to be supplied from the Soviet Union" remaining in the Second Five-Year Plan, China's proclaimed goal of "overtaking Great Britain in fifteen years" clearly depends upon continuing Russian cooperation in trade, if not in aid. No Soviet credits have been announced since 1956. Moscow's share of Peking's foreign trade, however, exceeds 50 per

TABLE 1—INDUSTRIAL OUTPUT OF MAINLAND CHINA, 1952–1957[6]

| PRODUCT | 1952 | 1957 |
|---|---|---|
| Coal (million tons) | 63.5 | 128.0 |
| Electric power (billion kilowatt-hours) | 7.3 | 19.0 |
| Iron (million tons) | 1.9 | 5.9 |
| Steel (million tons) | 1.4 | 5.2 |
| Cement (million tons) | 2.9 | 6.7 |

cent. This provides a valuable source of imports, as well as an outlet for exports. Outside the bloc, China's shortage in foreign exchange is matched by its lack of large marketable export surpluses. Furthermore, Peking has given politics priority over economics in determining its relations with capitalist countries. This has kept trade with Japan and Great Britain below the level otherwise possible. These constraints upon China's trade outside the bloc make the Moscow-Peking axis a valuable asset for Mao's program of industrialization.

Training of China's managerial and scientific cadres has also depended largely upon Russian resources. From 1950 to 1957, more than 7,000 Soviet advisers worked in China at various times.[7] While they appear insignificant against the population of 600 million, their impact was far out of proportion to their number. These Soviet specialists directed principal construction projects, such as the massive Yangtze River bridge. In addition, they supervised indigenous personnel in on-the-job training programs, especially in the burgeoning industrial base of Northeast China (Manchuria). Mass translation of Soviet technical journals, and intensive training programs for thousands of Chinese engineers, scientists, and skilled workers in the Soviet Union provide further impetus for the "leap forward" from agrarian backwardness to modern industrialization.

[6] Richard H. Moorsteen, "Economic Prospects for Communist China." (Publication 1298 of the Rand Corporation.) Delivered at the meeting of the Association for Asian Studies, New York, April 1–3, 1958.
[7] *Peking Review*, Vol. 1, No. 9 (May 29, 1958), p. 20.

Symbolic of this leap, as well as of Moscow's assistance in making it possible, was the revelation by Kuo Mo-jo, President of the Chinese Academy of Sciences, that "Chinese scientists are determined to get China's artificial earth satellite into the sky at an early date. . . . The earlier that day comes, the better."[8] Kuo's statement, hailing Sputnik III, admonished Chinese scientists to "study" Soviet achievements closely. A Chinese satellite might answer nonparty criticism of "Marxist-Leninist science" prominent in the "rightist attack" of 1957. The political impact elsewhere in Asia might be even more significant, especially on Taiwan and among the overseas Chinese.

## THE ROLE OF IDEOLOGY

Few of these gains could have been foreseen by Mao Tse-tung in 1949. His commitment to the Russian alliance was primarily ideological, albeit reinforced by his perception of American commitment to Chiang Kai-shek in the civil war. Whatever may have been the strains of negotiating with Stalin in 1950, or in mediating between "great power chauvinism" (Russian) and "narrow nationalism" (Polish) in 1956–57, the mystique of "socialist unity against the imperialist camp" undoubtedly dominates Peking's view of world affairs.

But while the ideological component preceded in time the military and economic interaction in the Moscow-Peking axis, it alone is insufficient to explain the ties that bind. In fact, "universal application of the fundamental laws of Marxism-Leninism," championed by both partners, has not prevented important divergencies on both domestic and foreign policy. Certain consistent ideological differences between the Soviet and Chinese Communists can be discerned over the past three decades. Yet the degree to which these differences have influenced the political interaction of the two elites varies sharply from time to time.

These differences have been described by Peking as

> contradictions between socialist countries, between communist parties [which are] not basic . . . not the result of a fundamental clash of interests between classes but of conflict between right and wrong opinions or of a partial contradiction of interests.[9]

The first decade of the Moscow-Peking axis suggests that, in this respect, relations between Communist partners resemble those between capitalist states in the existence of conflicting national interests. The degree to which Peking may succeed in pressing its interests against those of Moscow depends upon four variable factors: the relative stability of the two elites in terms of domestic opposition; the relative influence of the two elites within the Communist bloc; the degree of Chinese dependence upon Russian assistance; and the prevailing power relationship between the Communist bloc and the "imperialist camp" as seen from Moscow and Peking. Thus it is not ideology alone which conditions relations between Moscow and Peking. In fact, ideology may be subordinated to mili-

[8] *Chung Kuo Ch'ing Nien Pao*, May 16, 1958. New China News Agency reports of Kuo's interview described his target date as "in the near future." *New York Times*, August 18, 1958, quoted Warsaw reports of Soviet agreement to assist in launching a Chinese satellite, concluded at the Khrushchev-Mao meeting in Peking.
[9] *Jen Min Jih Pao*, "More on the Historical Experience of Proletarian Dictatorship," December 29, 1956.

tary and economic factors so far as the resolution of differences is concerned.

Brief comparison of Peking's policy and position of 1949–50 with that of 1956–57 illustrates this point. During the first period, Mao supported the expulsion of Tito from the Cominform, muted his own claims to ideological innovation, and paid homage to Stalin's unfailing genius. Close reading of Chinese Communist writings of the period, however, revealed implicit differences with Moscow. If too obvious, such differences frequently were suppressed in later editions.

Mao's disagreements arose in part from his independence of Stalin in winning control of the Chinese Communist Party (CCP) in the 1930's and of all China in the 1940's. Suppression of disagreement was a necessary result of his utter dependence upon Stalin to maintain power after 1949. Rebuilding the shattered Chinese economy and restraining "imperialist aggression and its running-dog Chiang Kai-shek" necessitated reliance upon Russia. If Stalin's personal price for assistance was complete acceptance of Moscow's views, at least on the public record, Mao's inferior power compelled acquiesence.

The emergence of differences after Stalin's death, notably in the East European crisis of 1956–57, followed changes in these critical factors. First, stability of the Soviet elite was uncertain following the Twentieth Party Congress, while no comparable struggle for power appeared in the Chinese Communist Party. Second, Khrushchev dealt Soviet bloc leadership a heavy blow in his de-Stalinization speech at the Congress. Third, China's dependence on Russian support had declined, especially in the economic realm, from the earlier years. Finally, no crisis threatened the bloc from without, and in some respects the Soviet military position was becoming increasingly favorable in comparison with that of the United States.

These developments offered Mao more political leverage against Russian policies than had been available during the Stalin period. This transformation of China from satellite to partner is reflected in the changing image of the Moscow-Peking axis found in Western analyses. In 1950, many observers believed that Chinese intervention in the Korean crisis was forced upon Mao by Stalin. In 1958, an equally substantial core of opinion believed Khrushchev's attack on Tito to have been forced by Mao.

Setting aside such speculation for the moment, one final observation on the role of ideology might be made. It was more than ideological conviction which caused Peking to intervene in the bloc dispute of 1956, in contrast with its position in 1948. Intervention served Chinese military, economic, and political interests. Any breach of bloc unity affects Chinese military security both in the encouragement it offers "the imperialist camp" and in the burdens it places upon Soviet military forces. While Peking and Moscow agree on the need for bloc unity, however, they have differed on the means of attaining this end.

Furthermore, China's economic progress depends in part upon the reliability of planned deliveries from East Europe. Increased Soviet commitments to tide over unstable regimes may also reduce the availability of Russian economic assistance for China. Finally, Peking's prestige at home and abroad is involved with bloc developments. To cite specific instances, in 1956 Chinese university students voiced "shock" and "dismay" over Soviet military intervention in Hungary. The consequent turmoil in intellectual circles posed problems for the Chinese Communist Party throughout the summer of 1957. Meanwhile in

the United Nations, Burmese denunciation of the Russian military move coincided with Chou En-lai's tour of Southeast Asia. Chou, who was then both Premier and Foreign Minister, was publicly and privately pressed to explain his support for the use of foreign troops to intervene in domestic affairs.

This indicates that ideology alone did not prompt Chinese participation in the struggle between East Europe and the Soviet Union in 1956. It further suggests that changes in the Chinese position on this problem in 1957–58 came from equally serious military, economic, and political considerations, especially since these changes were incompatible with past ideological expressions. A brief review of the 1957–58 developments, therefore, may indicate the nature of these considerations and thereby throw light on subsequent Chinese policy in other areas.

## CHINESE VIEWS ON BLOC RELATIONS

Although the Twentieth Party Congress of February 1956 proclaimed the possibility of "different paths to socialism," the Poznań crisis in July and the Polish and Hungarian ferment of September and October made the question of Soviet controls over satellite developments a central issue. Vacillation and division in Moscow between "hard" and "soft" lines contrasted with Peking's position which fell midway between the confederative and the unitary approach to bloc relations. Chinese comment attacked extreme champions of independence as "bourgeois nationalists," at the same time rejecting complete Soviet domination as "great-power chauvinism."

Three points appeared at issue: the limits of Soviet prerogative vis-à-vis other bloc countries; the limits of deviation from Soviet practice by other bloc countries; and the means of achieving unanimity or of maintaining differences within the bloc. In brief, the Chinese formula called for keeping dissent confidential within the bloc while tolerating divergent views. This approach had characterized the CCP's approach to past differences with Moscow over theoretical and practical issues. It was succinctly stated by Chou En-lai in March 1957, two months after his successful repairing of relations between Warsaw and Moscow:

> . . . All the socialist countries take Marxism-Leninism as their guiding philosophy, which constitutes the basis of our unanimity on questions of principle. Yet this does not mean that all socialist countries, while being unanimous on principles, have also identical views on all questions at all times. Compared with the main aspect of our unanimity on principles, our differences on certain questions are after all of secondary importance. Moreover, these differences can be resolved and, on the common basis of Marxism-Leninism, a unanimity can be reached gradually through comradely discussions and consultation. Even if no unanimity can be reached for the time being, it would also be normal to reserve the differences while upholding our solidarity.[10]

The consistency with which Peking promoted this policy despite varying reactions in Moscow was manifest in the authoritative reports of Mao's encouragement to Gomulka throughout 1956–57, contrasted with Khrushchev's personal opposition to Gomulka both before and after the Hungarian uprising.[11] It was evidenced in the more moderate criticism of Yugoslav statements on Hungary in *Jen Min Jih Pao*, compared with *Pravda*. Similarly Politburo mem-

[10] Chou En-lai, "Report on Visit to Eleven Countries in Asia and Europe," to the third session of the Second National Committee of the Chinese People's Political and Consultative Conference, March 5, 1957, NCNA, Peking, same date.

[11] For detailed review of this and the following points see Whiting, *op. cit.* (note 4 *supra*), pp. 142–59. See also Richard F. Starr, "New Course In Poland," *ibid.*, pp. 64–88.

ber P'eng Chen's conciliatory visit to Belgrade came a few weeks before Soviet suspension of credits to Tito's government in February 1957. Only on the question of Hungary did Moscow and Peking present a unanimous front, established after differing domestic reports on the early stages of the revolt.

Formal enunciation of Sino-Soviet agreement on bloc relations, in the joint communiqué of January 19, 1957, asserted, "The socialist countries are independent and sovereign states and relations between them are based upon the Leninist principle of national equality." The statement reiterated the famous Panch Shila or "five principles" of the Sino-Indian agreement of 1954, "complete equality, respect for territorial integrity, independence, sovereignty, and non-interference in each other's internal affairs." The last point in particular symbolized the nub of Polish-Soviet problems in 1956–57. The context of the statement, which was issued upon Chou En-lai's departure from Moscow, suggested that Chinese mediation had assured Gomulka's survival against internal and external "Stalinist" pressures.

Thus the need for intervention in bloc affairs coincided with Peking's ability to intervene, reflected in the previously discussed increase in military, economic, and political power. The results were favorable; Peking's mediation appeared to cement ties between Warsaw and Moscow. Soviet acquiescence in Gomulka's leadership, despite his appeasement of the Polish peasantry and the Catholic Church, was reciprocated by Gomulka's insistence upon party leadership and his careful, consistent attack against "revisionism." The consequent reduction of tensions within Poland, paralleled throughout East Europe in the spring and summer of 1957, furthered both Soviet and Chinese strategic and economic interests. Finally, acceptance of the Chinese formula for bloc relations elevated Peking's prestige both inside and outside the bloc, without impairing the basic unity of the Moscow alliance.

## THE MOSCOW CONFERENCE, NOVEMBER 1957

Suddenly the Chinese formula was abandoned and pressure for conformity with Soviet policy reapplied throughout East Europe. In September, the Communist Party of the Soviet Union theses for the November celebration of the fortieth anniversary of the Bolshevik revolution warned that "those who stress the national peculiarities of each country marching to socialism" were "fundamentally opposed to Marxism-Leninism." Resisting this pressure, Gomulka, writing in *Pravda* on November 5, restated his past argument for "a specifically Polish road to socialism that accorded with our own concrete conditions." The next day, Khrushchev and Mao, in that order, delivered parallel injunctions to the Supreme Soviet against "revisionism." The Soviet leader warned:

> The dream of the enemies of socialism is that communists should start looking for some completely new, artificial road to socialism for each individual country. . . . This is one of the chief dangers and we must wage the most resolute fight against it.

Mao followed, declaring, "At present, the urgent task is to oppose revisionist deviations." Gomulka, as third speaker, did not echo these remarks.

Gomulka's position was a curious one. Repeatedly in Poland he had already attacked "revisionism." His expressions on the need for bloc unity carried no less conviction than did those of other bloc leaders. Yet within the context of the November conference, he appeared unwilling to subscribe to the positions

enunciated by Khrushchev and Mao. The precise nature of the stakes for which he was playing remains obscure. However, his differences with the Sino-Soviet position, particularly in choice of emphasis, are apparent.

Gomulka's article in *Pravda* reiterated the 1956 formula for bloc relations, stressing "the Leninist principles of complete equality, mutual respect, independence, and sovereignty." Mao, however, signaled a major shift from the earlier Chinese position, making no reference to "equality" or "independence" for bloc members in his Moscow remarks. Dropping the 1956–57 term "socialist commonwealth of nations" with its confederative connotations, Mao evoked the more traditional image of "the socialist camp" in a militant defense of Soviet leadership:

> The socialist force has surpassed the imperialist force. Our socialist camp should have a leader, and this is the Soviet Union. The enemy also has a leader, and this is America. If there is no leader, the strength will be weakened.[12]

Mao's argument for Soviet leadership paralleled Khrushchev's attack against revisionism in the reference to external threat. Here, too, the Sino-Soviet partners differed from the Polish leader in their emphasis upon the danger of war. Gomulka nowhere at the conference attacked "U. S. imperialism," but claimed hope in "the strengthening of the peace-loving forces and in there being greater chances for the preservation of peace." He justified reduced Polish industrial investments and other deviations from Soviet practice in part because of the absence of "imperialist and civil wars . . . and the threat of intervention" which had faced the early Soviet regime. By implication, no such threats now faced the bloc.

Mao, however, warned of "imperialist wolves" who "put their hope in war." Threats from "U. S. imperialists" in Hungary, Syria, Egypt, and Taiwan won special attention. His address to the Supreme Soviet made no reference to "the broad peace area" or to "the contradictions within the imperialist camp." He did not repeat the theme of 1956–57 that "war is no longer inevitable" and did not echo the foreign policy analyses of Ch'en Yi and Chou En-lai of the same period which saw "the relaxation of tension" prevailing in international relations. Just as Mao followed the lead of the Soviet Communist party and Khrushchev in redefining bloc relations, so too he supported the bellicose Soviet posture during the recent Syrian crisis by focusing on the threat of war.

The November 1957 conference produced two documents. The first was a "declaration" signed by twelve bloc delegations, the Yugoslavs abstaining. The second, a "peace manifesto," won support from sixty-four Communist parties, including the Yugoslavs. The "declaration" was more important, its compromise nature manifested in its inclusion of essential elements from both the Polish and the Sino-Soviet positions. Postconference comment diluted the appearance of unanimity with each side stressing those aspects which reflected its original stand. Increased Soviet attention to "revisionism" after November suggested Belgrade as the obvious target, in view of Tito's refusal to attend the conference and Yugoslav failure to support the declaration. Gomulka's position, in retrospect, appears to have made Warsaw also subject to pressure from the new Sino-Soviet line.

To the knowledge of the writer, no anticipation of Mao's shift on the problems of bloc relations and revisionism

[12] Mao Tse-tung, speaking to Chinese students at Moscow University, November 17, 1957, reported by NCNA, Peking, November 20, 1957.

had appeared in the Chinese press, not even in the articles written for the November anniversary. Polish and Yugoslav sources subsequently claimed surprise at the extent of Sino-Soviet unanimity in supporting firmness within the bloc and harshness towards nonbloc countries, and offered no credible explanation for the phenomenon.[18]

To be sure, political tensions in China seemed explosive during June and July 1957, with open criticism of the party's domestic and foreign policy from influential government and intellectual spokesmen. Yet the "antirightist struggle" of August and September appeared to have suppressed opposition. Serious as was the damage to Mao's experiment in resolving "nonantagonistic contractions" through "blooming and contending," it seemed insufficient to cause so sudden and far-reaching a reversal of policy. Nor did Tito's refusal to attend the conference compel renewed pressure upon Gomulka. The Polish leader had shown no basic change in policy from the spring of 1957. At that time, Cyrankiewicz's visit to Peking had prompted an announcement from Mao of a return trip to Warsaw. Mao's unannounced cancellation of the visit was never explained, but at the time was not interpreted in Warsaw as evidence of displeasure.

### 1958 Attack on Yugoslav "Revisionism"

The import of the new Moscow-Peking line became apparent in 1958. In March, publication of the draft program for the Seventh Congress of the League of Yugoslav Communists (LYC) reopened much of the controversy which had underlain the Moscow meeting.[14] The Soviet rebuttal in *Kommunist* in mid-April, though mild in tone, signaled a wide range of disagreement on important points of domestic and foreign policy. Bloc delegations boycotted the LYC Congress, despite some modification in the draft program. Following the adoption of the program, amidst pointed Yugoslav speeches bitterly referring to 1948, the bloc stepped up the attack. On May 5, *Jen Min Jih Pao* called the program "out and out revisionist" and went beyond previous Soviet comment in approving the 1948 Cominform resolution as "basically correct."

Space precludes a detailed review of the massive campaign which followed. The lines were consistent with those apparent in November, however. On the one hand, Sino-Soviet attacks pursued the themes of "unity of the socialist camp," "the danger of war," and "revisionism," in order to link Tito's acceptance of American aid with the idea that his position undermined the bloc. On the other hand, Polish comment belatedly and temperately criticized specific points of the LYC program but limited the area and means of the dispute. While Moscow suspended economic credits to Belgrade, Warsaw continued to negotiate economic exchange with the Yugoslavs. When Budapest linked Nagy's execution with alleged Yugoslav provocation of the Hungarian uprising, signs of Polish displeasure contrasted with official Chinese "joy" at the announcement. Khrushchev's personal attacks against Tito won belated response from Gomulka, with no Polish endorsement for "Soviet leadership" and with typical Polish emphasis upon "independence" and "equality" embodied in the "socialist commonwealth of nations."

Thus the 1956–57 political proximity between Warsaw and Peking against Moscow now changed into a Moscow-Peking union against Warsaw. This union was obscured by the staggered timing of the statements from the two capitals, as well as from apparent Chinese initiative in increasing the intensity of attack. It seems likely, however, that both these phenomena were prearranged, alternating the source of pressure upon Belgrade while gradually increasing it. The alternative image of Mao forcing Khrushchev's hand, even to the point of compelling suspension of Soviet credits to Tito, does not take account of the relative power of the two leaders, much less of the probable pattern of Chinese behavior in such circumstances.

### "East Wind Over West Wind"

This leaves unexplained the reason for Mao's major shift in November 1957. Conceivably he agreed to abandon the previous moderate policy in reaction against the combined pressures of domestic criticism from "bourgeois rightists" and of continued East European dissension from "revisionists." More than doctrine was at stake. At home the challenge to Chinese Communist leadership struck at the foundations of political power. In East Europe the challenge to Soviet leadership struck at the foundations of strategic power. Should Tito's wooing of Gomulka prompt the Poles to emulate the Yugoslavs and bargain between the United States and the Soviet Union without commitment to either side, China's strategic and economic interests in bloc unity would be jeopardized.

These interests appear, as in the past, to have played the more immediate role, making ideological concern a secondary, albeit contributing, factor. On November 17, 1957, Mao offered a new formulation proclaiming the strategic ascendancy of the socialist over the "imperialist" camp, "East Wind prevails over West Wind." His phrase, which keynoted Chinese propaganda throughout 1957–58, was linked with the Moscow conferences and Soviet earth satellite launchings as "proving" the superior strength of the Soviet bloc. *Jen Min Jih Pao,* on November 22, amplified Mao's words to include Soviet intercontinental ballistic missile accomplishments. Mao's proclamation of "a new turning point" in the relation of forces was reiterated in Chinese statements from this point forth.

To be sure, previous Chinese editorial comment had hailed both ICBM and Sputnik developments as marking the superiority of socialism over capitalism and the "smashing rebuff" to "hopes of imperialists who seek to start a new war." Yet it is possible to discern a difference between propagandistic reactions following closely on the heels of Soviet announcements, and authoritative analyses from high government spokesmen laying down major policy lines. In this regard, it is of interest that Mao's initial references in Moscow to the Sputnik hailed it in an exclusively scientific reference to "man's conquest of nature"; his strategic emphasis came only two weeks later. This shift brought Mao into line with the evaluation of Soviet weapons developments voiced by Soviet Air Marshall Vershinin and Premier Khrushchev during the Syrian crisis of September and October, 1957. In short, the evidence suggests a Chinese willingness to exploit Russian accomplishments for at least political propaganda, but that the final decision to do so at the highest level came only after consultation in Moscow.

One other development must be noted.

[18] *New York Times*, December 14, 1957 and January 4, 1958, reported that Gomulka's talks with Mao had aroused concern over the Chinese support for Soviet views. *Ibid.*, June 15, 1958 and July 15, 1958, gave conflicting accounts from Belgrade of Yugoslav explanations for events, but all reports agreed in the "unexpected" nature of Sino-Soviet unanimity.

[14] *Ibid.*, July 15, 1958, offers an interesting Yugoslav account of the connection between events in November 1957 and March–June 1958.

On November 5, a high level Chinese military mission suddenly departed from Peking for Moscow, too late to attend the Russian celebration. The group stayed in the Soviet Union for three weeks, reportedly attending reviews and inspecting military installations. Its composition, however, and the timing of its flight suggest that Mao required wider military assistance in problems under review than was afforded by the Minister of National Defense, Marshal P'eng Te-huai, who accompanied Mao initially.

Is it possible that Mao agreed to support Khrushchev politically on the question of bloc relations with the hope or expectation of sharing in the new Soviet acquisition of military strength? The image of such bargaining requires considerable refinement before serious consideration can be given this hypothesis. At the very least, however, it suggests that a new Soviet willingness to give political support for Chinese moves in Asia was agreed upon, perhaps including Soviet statements concerning the use of nuclear arms under certain contingencies as a deterrent to possible moves by the United States. From this minimal level of agreement which assumes only political moves by Moscow, Mao may have anticipated the sufficient possibility of a later expansion of Soviet support to have left the question of actual Sino-Soviet sharing of nuclear weapons to another time. Alternatively, increased Russian assistance in launching a Chinese satellite would have domestic as well as foreign benefits for Peking worthy of Mao's reciprocal political support against Khrushchev's "revisionist" opponents.

Such speculation answers no questions but may make more plausible the hypothesis of Chinese political leverage operating upon Russian policy within certain conditions and under certain limitations. The year following the November conference reinforced this possibility. In the change of policy towards East Europe, Mao Tse-tung appeared to gain nothing, while losing prestige not only within the bloc but among uncommitted non-Communist countries as well. Khrushchev, however, increased Russian bloc dominance in appearance, if not in reality.

The situation seemed reversed in the crisis in the Taiwan Strait. Here it was Khrushchev who steadily increased Russian commitment to a situation whose immediate benefits accrued only to China. The Soviet leader risked much of his "summit-conference" posture, and, in the last analysis, appeared to risk Soviet military involvement over a situation which had little direct bearing on Russian interests. Thus it is only in the general sense that Russian and Chinese interests converge in maximizing the pressures upon both bloc and non-bloc targets through exploitation of Soviet weapons. In specific instances, the divergence of interest is sufficiently great to compel the question: how has agreement been reached for co-ordinating policy?

The problem of plumbing Sino-Soviet secrecy was aptly demonstrated by the Khrushchev-Mao meeting in Peking of July 30 to August 3, 1958. First, the secrecy of the meeting was well kept, to judge by the surprised reaction of Western chancelleries, although its participants included not only the two chiefs of state but also Chou En-lai, Wang Chia-hsiang, Minister of Foreign Affairs Ch'en Yi, and Minister of National Defense P'eng Te-huai on the Chinese side, with Soviet participants including Minister of Defense Marshal Rodin Y. Malinovsky, acting Minister of Foreign Affairs V. V. Kuznetsov, and B. N. Ponomarev. Secondly, the lengthy statement issued upon conclusion of the four-day conference consisted mostly of

propaganda themes current in Communist media on such issues as summit conferences, the Middle East crisis, and Yugoslav "revisionism." No mention was made of Taiwan or the offshore islands, although this problem was immediately to raise international tensions to heights unequaled since the early days of the Korean crisis.

Yet the abundance of published materials which flow from Peking and Moscow may provide clues as to the differences of policy between the two partners. By testing various hypotheses concerning these differences and their resolution against the course of succeeding events, we improve our understanding of the dynamics of the Moscow-Peking axis. The task of uncovering Russian and Chinese intentions separately is difficult enough. But the greater problem of determining the interaction of Russian and Chinese policy poses the basic challenge for those concerned with the fate of the Arab-Asian world which borders this formidable alliance.

# Peking's International Position and the Cold War

By Shen-yu Dai

Abstract: Chinese Communist foreign policy is a blend of three major ingredients: the cultural confidence of the imperial Chinese tradition, the psychological energy of modern Chinese nationalism, and the political aggressiveness of contemporary Chinese Communism. These elements combine to produce a pluralist mentality which is frequently evident in Peking's vigorous cold war diplomacy. Mainland China's pattern of foreign relations is complex but cohesive. Its basic aim is the attainment of recognized international status as a major power. Its instrumentalities vary widely: political, economic, cultural, and propaganda devices are all used regularly. During the past decade, Peking's "people's diplomacy" has helped Communist China to overcome the limitations imposed by its *de jure* position and to gain increased influence in Asian affairs. Recently Communist policy has manifested growing interest in the so-called "national independence forces" not only in Asia but also in the Middle East, Africa, and even Latin America. Both Chinese national interest and Communist ideology compel Communist China to attempt to extend its ties in these areas.

Author of Peking, Moscow, and the Communist Parties of Colonial Asia (CENIS, 1954), he has contributed articles and reviews on China and Asia to Current History, Western Political Quarterly, and other journals.*

In the joint communiqué issued on August 3, 1958, at the conclusion of their meeting in Peking, Mao Tse-tung and Nikita S. Khrushchev declared that they were in full agreement on the importance of maintaining Sino-Soviet cooperation not only to "strengthen the solidarity of the socialist camp," but also to consolidate their ties with "all other peace-loving countries and peoples." [1] The statement outlines the dimensions of the present international ambitions of the People's Republic of China and suggests the desirability of renewed examination of some aspects of Peking's general program of foreign relations.

The eruption of reorganized national power on the mainland of China since 1949–50 has led to a drastic alteration in both Far Eastern and world politics. The international impact of Communist China is complex, for the Peking regime leads a double life in foreign affairs, acting simultaneously as a key source of influence in the Communist bloc and as a major power center in Asia. It is common but misleading to view Mao Tse-tung's China solely as the eastern terminus of the Moscow-Peking axis; such an approach tends to underestimate the international position of a country whose role is also in and of Asia. While Mao has bound his regime firmly to the USSR, he has avoided Russian control over the essential instruments of Chinese national power and has developed a vigorous foreign policy linking elements of continuity which are predominantly Chinese with new and radical elements which are uniquely Communist.

## The Pattern of Foreign Relations

While Peking's foreign policy blends many elements, it is primarily cold war diplomacy, geared to the realities of a divided world and driven by the deep impulse to extend Communist influence and authority. As a full member of the "socialist camp," Communist China is involved practically and politically with the Soviet Union in an unceasing conflict against the "imperialist" powers. In this conflict, diplomacy has the overriding purpose of winning allies or, at least, of neutralizing nations against alignment with the enemy. This type of cold war diplomacy has compelled Peking to conduct its foreign relations by many special means—by a program of "people's diplomacy" which, in essence, is political, economic, cultural, and psychological warfare in diplomatic dress. Designed to by-pass governments, it is aimed at the development of direct relations between official or state-controlled agencies in Communist China and unofficial groups and organizations abroad. In these relationships, Communist China has often been able to derive bargaining advantages which she would not have in formal diplomatic negotiations.

In an international environment characterized by tension and unrest, Peking's diplomacy attempts to make maximum use of the developed national power of Communist China in order to break down the barriers which now inhibit her international influence. The continued existence of a rival Chinese political authority in Taiwan and the continued lack of general international acceptance pose serious problems for Peking. Of the 60-odd Chinese diplomatic establishments outside the communist bloc, about 45 are in countries which maintain formal relations with the Republic of China and only 20 in countries which recognize the People's Republic of China. And in all United Nations forums, the representatives of Taipei rather than those of Peking speak for China.

Chinese Communist foreign policy has undergone many changes during the

[1] *New York Times*, August 4, 1958.

past decade. In the early period after the nationwide victory in 1949–50, policy was dominated by blunt aggressiveness and looked to the rapid spread of "people's revolutions" throughout the Far East. The Korean crisis (1950–53) brought Chinese Communist forces into direct action against non-Communist forces. During the period from the Korean truce of 1953, through the Geneva Conference and the proclamation of the "Five Principles of Peaceful Coexistence" in 1954, to the Asian-African Conference at Bandung and the Geneva Conference of 1955, various factors contributed to the development of a more moderate posture in diplomacy.[2] In 1958, Peking's policies again showed harshness, both toward deviant tendencies within the Communist bloc and especially toward the United States.

## INGREDIENTS OF POLICY

Peking's foreign policy is a powerful mixture, for it blends the cultural confidence of the imperial Chinese tradition, the psychological energy of modern Chinese nationalism, and the political aggressiveness of contemporary Chinese communism. These elements are not necessarily harmonious, and may even be incompatible at times. But each has its influence on Peking's policy makers and on the methods and symbols which they employ in their foreign relations.

In the direction of foreign affairs, the Chinese Communist regime thus has a pluralist mentality in which three different self-images—Chinese tradition, modern nationalism, and revolutionary communism—are present and available for use under varying circumstances.[3]

Peking has, for example, frequently stressed its cultural affinity with the neutralist nations of Asia. It has, on the other hand, vowed its dedication to the cause of unity and solidarity with its Communist allies both in Asia and in Europe. And, in dealings with Western governments, it has manifested continuing concern with the punctilious observance of its status as a modern national state. The fact that Communist China has these three faces which she may utilize in her international dealings makes her a formidable opponent, for she can easily concentrate or juggle the façades in accordance with the target and the occasion.

Because of the ancient position of China as a major cultural force in East Asia, the leaders in Peking today are still influenced, consciously or unconsciously, by the hoary tradition of the Middle Kingdom. Mao Tse-tung himself has never considered his regime as divorced from China's historical past. He has said,

> Our nation has a history of several thousand years, a history which has its own characteristics and is full of treasures. . . . The China of today has developed from the China in history; as we are believers in the Marxist approach to history, we must not cut off our whole historical past. We must make a summing-up from Confucius down to Sun Yat-sen and inherit this precious legacy. This will help us much in directing the great movement of today.[4]

[2] Cf. A. Doak Barnett, "The United States and Communist China," in *The United States and the Far East* (New York, The American Assembly, Columbia University), 1956, pp. 152ff.

[3] For a typical example of the Peking regime's pluralist mentality in present-day diplomacy, see "Chou En-lai's Report on World Situation and Tour of Europe and Southeast Asia," in American Consulate General, Hongkong, *Current Background* (CB), No. 439 (March 8, 1957). Here Chou talks about "kinship" and "ancient ties" with respect to Cambodia, and so forth; about "comradely friendship" with respect to North Vietnam as well as Poland, and so forth; but about "normal relations" and other international issues involving the West with respect to Ceylon.

[4] Mao Tse-tung, *Selected Works* (London: Lawrence & Wishart, 1954), Vol. 2, pp. 259–60.

This sense of continuity, which carries with it cultural pride and a feeling of "manifest destiny," affects Peking's view of regions such as Korea and Vietnam—areas of primary concern to the Chinese Empire for centuries. It also affects the Chinese Communist regime's relations with and attitudes toward other countries in Asia which formerly bore tribute to the imperial authorities in China. And, not least, it affects Peking's (and Taipei's) constant opposition to the existence of "two Chinas," for the Middle Kingdom, while often divided in fact, always maintained the concept of Sinic unity as an ultimate ideal.

### *Nationalism and Communism*

A second major ingredient in Peking's foreign policy stems from modern Chinese nationalism, which developed between 1850 and 1950, a century of Chinese history notably different from earlier periods. During these decades many of the central assumptions underlying traditional Chinese civilization were steadily undermined in a world permeated with developing technological power. Bred of the humiliations suffered by the Middle Kingdom at the hands of the Western powers and Japan, Chinese nationalism was intensified by China's persisting weakness in the face of superior outside strength.

Today the Communists claim to uphold the "true" principles of Sun Yat-sen, founder of the Chinese Republic in 1912, and pose themselves as the new defenders of freedom, equality, and Chinese national interests. In theoretical terms, they condemn the "bourgeois nationalism" of the Kuomintang as sterile and superficial and proclaim, in juxtaposition with "proletarian internationalism," a new "patriotism" embodied in a "fervent love of one's fatherland and its people, language, culture, literature, and best traditions."[5] In practical terms, they aim not only at the exclusion of foreign privileges (as the Nationalists did before them) but also, more important, at the development of an integrated national state capable of gaining and holding a secure position in the modern world. In a sense, Mao Tse-tung has harnessed the deep-seated Chinese distrust of the West and Western "imperialism" and mobilized a formidable drive around one fundamental theme: the Middle Kingdom resurgent as a strong national state.

The third major ingredient in Peking's foreign policy today is communism. Firmly allied with the "socialist camp headed by the Soviet Union," Peking views the world through the lenses of Marxism-Leninism-Maoism and consistently proclaims that its primary international obligation is to "enhance the strength and solidarity" of the bloc. The special position of the People's Republic of China as the newest major power in the Communist world creates a new factor in its foreign relations which never existed before in Chinese history. Peking's foreign policy today is directed by a compact professional Communist Party elite—the most stable in the bloc—who have had years of experience in China with the tools of political and psychological warfare which they are now utilizing at the international level in a constant effort to extend Chinese Communist influence and authority.

## TOOLS OF FOREIGN POLICY

In its drive to establish and maintain its international position, Peking has employed a wide variety of instrumentalities: diplomatic, political, economic, and cultural-propagandistic. In

[a] At the Chargé d'affaires level only.

[b] For political reasons, Israel's recognition of Peking (January 1950) has not been reciprocated.

this pattern, formal diplomatic exchange at the governmental level is only one—and often the least important—aspect of Peking's foreign relations. These tactical strands in Peking's foreign policy, in turn, are not isolated from one another but are interwoven, interacting, and mutually complementary. Taken together, they make the "people's diplomacy" of Communist China a far more intricate mechanism than most non-Communist observers realize.

In the diplomatic sphere the Peking regime has now been accorded *de jure* recognition by over thirty countries of the world. These include the entire bloc of twelve Communist governments in Asia and Eastern Europe, as well as thirteen non-Communist governments in Asia and Africa, and seven in Western Europe. For its part, Peking has also recognized several other governments in Asia and Africa (for example: Malaya, Ghana, Tunisia, Morocco, Guinea, and Algeria), even though the latter have not yet reciprocated. Table 1 shows the diplomatic position of the People's Republic of China as of November 1958.

By including nondiplomatic relations, Peking has concluded treaties and agreements linking it with more than forty other nations of the world.[6] While it has made consistent efforts to join international conferences and to gain membership in international organizations, Peking's policy of refusing to participate in any body which includes representatives of the Republic of China has excluded it from most non-Communist organizations and gatherings.

### *Liaison program and economic offensive*

In addition to its formal diplomatic relations, Peking has also developed a broad program of political liaison with both Communist and non-Communist organizations throughout the world. Its growing stature in the Communist bloc has provided increasing opportunities to influence Communist parties both inside and outside the bloc. And its quest for legitimacy and stature has also been supported by contacts with foreign political leaders and legislators. Countries having diplomatic relations with Peking have frequently sent parliamentary delegations to mainland China, and Peking in return has dispatched groups representing its National People's Congress abroad. The visit of the British Labor Party mission (August 1954) was noteworthy. Leading French politicians—Edgar Faure (May 1957) and Pierre Mendès-France (August 1958)—have been Peking's guests. Eager to increase her political support, Peking has also invited Latin American legislators to come to Communist China as government guests; more ominous have been the sojourns of Nepal's K. I. Singh and Thailand's Nai Pridi Phanomyong in Communist China, for this suggests the way in which Peking's diplomatic hospitality may be extended to include political asylum. The significance of this program, always well advertised, may be noted in the variety of foreign dignitaries who visited Communist China in late 1957 alone: Vice President Radhakrishnan of India; Prime Minister Daud of Afghanistan; former Vice President Hatta and Speaker of Parliament Sartono of Indonesia; Chief Justice U Myint Thein, Deputy Prime Ministers U Ba Swe and U Kyaw Nyein, and a Parliamentary delegation of Burma; and Deputy Prime Minister Crown Prince Mohammed El-Badr of Yemen—the first from an Arab state.[7]

Peking has also recognized the importance of economic tools in the implementation of its foreign policy, and its economic offensive has in many cases strengthened Chinese influence where Peking's political and diplomatic position has been poor. While nothing like the Russian program in magnitude, Peking's program has nevertheless been increasing. Despite the heavy demands of its domestic industrialization drive, Communist China has diverted part of its resources to foreign aid programs in both Communist and non-Communist areas in Asia, the Middle East, and Africa. Since 1953 she has granted economic and technical aid to North Korea (November 1953, January 1955), North Vietnam (July 1955, July 1957), and Outer Mongolia (August 1956), dispatching Chinese technicians and allocating Chinese goods and equipment to assist reconstruction and development activities. And the steady expansion of Chinese industrial and technological capacities has also had repercussions in non-Communist areas. Among those who now receive Peking's economic and technical aid are Cambodia (June 1956, US$22.4 million), Ceylon (September 1957, US$15.8 million), Nepal (October 1956, US$12.6 million), and Yemen (January 1958, US$16 million).[8] Some countries have received credit loans from Communist China, for example, Burma (December 1957, US$4.2 million); Indonesia (November 1956, US$16 million, also pending, US$20 million); Ceylon (March 1958, US$10.5 million); Hungary (May 1957, US$25 million); and so forth.[9]

### *Trading and cultural relations*

A broad trade offensive is another key element in Peking's foreign economic program. By 1958 Communist China claimed to have established trading relations with more than ninety countries and areas; with over half of these Peking had concluded formal trade treaties and/or contracts with unofficial trade organizations. These include countries in Asia: North Korea, North Vietnam, Outer Mongolia, Afghanistan, Malaya,

[6] For some details, consult *Die Verträge der Volksrepublik China mit Anderen Staaten* (Frankfurt/Main: Metzner, 1957). This volume is a useful calendar of bilateral and multilateral treaties and agreements, together with selected texts, over the years 1950–57.

[7] See Chou En-lai, "The Present International Situation and China's Foreign Policy," CB, No. 492 (February 14, 1958).

[8] For details on the Yemen agreements, see American Consulate General, Hongkong, *Survey of China Mainland Press* (SCMP), No. 1691 (January 16, 1958), pp. 21–31.

[9] Consult U. S. Department of State, *The Sino-Soviet Economic Offensive in the Less Developed Countries*, Washington, D. C., 1958; also *Handbook on People's China*, Peking, 1957, pp. 129–39.

Singapore, Burma, Ceylon, India, Indonesia, Cambodia, Nepal, Pekistan, and Japan; the Middle East: Lebanon, Sudan, Egypt, Syria, Yemen, Jordan, and Saudi Arabia; Europe: USSR, all East European Communist regimes, Great Britain, France, Finland, Sweden, Denmark, Switzerland, Belgium, Italy, West Germany, the Netherlands, and Austria; and Latin America: Argentina, Chile, and Uruguay.[10] Peking now regularly takes part in international trade fairs in both Europe and Asia and sends trade representatives and delegations abroad. At the same time, it sponsors export commodities fairs and invites foreign industrialists, businessmen, and bankers to visit mainland China. Through these channels Peking seeks to evade the handicaps of its diplomatic weakness. Cambodia, for example, had concluded trade agreements with, and received aid from, China well before July 1958, when she recognized Peking. And in the case of Japan, both major trade pacts (four up to 1958) and lesser contracts have been concluded, nominally through "private" organizations, in the absence of either recognition or diplomatic relations and in the face of concurrent trading with Taiwan.

An active program of "cultural exchange" has also added a new and significant dimension to Chinese Communist diplomacy. This effort is exerted not only by government agencies but also by nearly two dozen major "people's organizations" in mainland China, such as the Chinese People's Association for Cultural Relations with Foreign Countries, the Chinese People's Institute of Foreign Affairs, the China Committee for Commemoration of Great Figures in World Culture, and others.[11] A steady stream of individuals and group missions —ranging from scientists to football teams, from artists to philosophers, from journalists to religious leaders—flows to and from Peking.[12] Art exhibitions, scientific conferences, academic symposia, theatrical performances, athletic matches, and a host of other events garnish this "cultural diplomacy." Through these channels, Peking claims that it developed contacts with 63 countries in 1955 and 75 (including 63 non-Communist) nations in 1956.[13]

Blended with this cultural offensive is a constantly expanding program of propaganda designed to portray the People's Republic to the world in the best possible light. Here the Chinese Communists also make use of all available media. Radio Peking now broadcasts daily in Mandarin as well as several other Chinese dialects—including Cantonese, Chaochow, and Amoy—and also in more than a dozen foreign languages besides English—including Arabic, Burmese, Cambodian, French, Indonesian, Japanese, Korean, Laotian, Persian, Spanish, Thai, Turkish, and Vietnamese. Special programs are beamed toward critical areas of the world as events require; for example, toward the Middle East in Turkish, Arabic, and Persian in late 1957, in anticipation of the Cairo Conference on Asian and African People's Solidarity. The official New China News Agency (NCNA) now has 21 offices abroad as well as 30 in China, and its daily news file averages some 10,000 words in English alone.

[10] CB No. 438 lists most of these countries up to December 1956; others are added up to date by author.

[11] For a list with brief descriptions up to 1957, see *Handbook on People's China* (note 9 *supra*), pp. 163–78. The last mentioned was organized in April 1958 (see New China News Agency, or NCNA, Peking, April 23, 1958).

[12] Consult Richard L. Walker, "Guided Tourism in China," *Problems of Communism* (September–October, 1957), pp. 31–36.

[13] Shanghai, *Wen Hui Pao*, March 2, 1956, and Peking, *Jen Min Jih Pao* (People's Daily), January 21, 1957.

In the publications field, Communist China produces a mass of material in the Chinese language depicting the progress of "socialist construction" on the mainland for the overseas Chinese. The Foreign Language Press in Peking also prints books and periodicals for distribution abroad in English, Russian, French, German, Spanish, Japanese, Indonesian, Vietnamese, Burmese and other languages, and publishes several important journals for the Western reading public such as *People's China* (originally in English, now replaced by French and Indonesian editions), *China Pictorial* (published in 14 languages), *Chinese Literature* (English), *China Reconstructs* (English), and *Peking Review* (English, replacing the old edition of *People's China*). Movies prepared for showing abroad also make effective propaganda for the Peking regime in many parts of Asia and Africa, and now also at international film festivals.

## COMMUNIST CHINA'S POSITION IN ASIA

Through this comprehensive program of "people's diplomacy," Peking has been active and influential in an increasing number of areas of the world despite the restraints inherent in its *de jure* position. It has already gained and consolidated major status within the Communist bloc, and it has come to occupy a position of significant authority in Asia where China's traditional, modern, and current interests are naturally centered.

With respect to Outer Mongolia, North Korea, and North Vietnam—the three Communist areas which adjoin it on the north, northeast, and south—Communist China has made maximum utilization of geographical, historical, cultural, and racial as well as ideological factors in order to expand her political and economic influence.

Among the West's allies in Asia, Japan remains the prime target of Peking's diplomacy of "neutralization," which has as its aim the disruption of Japan's present ties with the United States and the development of increasing friendship and co-operation between Tokyo and Peking.[14] Tough or tactful as circumstances require, the Peking regime has already made considerable headway in this direction.[15]

With regard to Taiwan, Peking is adamant in its militant view that it cannot in the long run tolerate the continued existence of an operating Chinese government which stands as an alternative to its own political pretensions as the sole regime competent to represent China internationally. Peking is only slightly less hostile toward the anti-Communist governments of Korea and Vietnam, which are shielded by American power and prevent it from obtaining the full benefit of having Communist buffers on these critical borders.

And, with respect to Southeast Asia, which she views as her predestined sphere of long-range interest, Communist China has in recent years developed a relatively moderate posture based largely on the "Five Principles of Peaceful Coexistence" enunciated jointly, first with India and then with Burma, in mid-1954.[16] While continuing to extend

[14] Harold S. Quigley, in "The Chinese-Japanese Courtship," *Current History* (December 1957), has posed the question as to whether, in view of the apparent advantage vis-à-vis the West, Tokyo and Peking would not now "turn from separation to co-operation" in the Far East (p. 357).

[15] Consult C. Martin Wilbur, "Japan and the Rise of Communist China," in Hugh Borton and others, *Japan Between East and West* (New York: Harper & Bros., 1957). Cf. Shao-Chuan Leng, "Japanese Attitudes Toward Communist China," *Far Eastern Survey* (June 1958).

[16] These principles are: 1. mutual respect for each other's territorial integrity and sovereignty; 2. mutual nonaggression; 3. mutual noninterference in each other's internal affairs;

its "people's diplomacy," Peking has focused attention on the maintenance of normal political relations with Asian governments to the south, granting economic assistance to some areas: Burma, Cambodia, Ceylon, Indonesia, and Nepal.

## THE CHANGING INTERNATIONAL ENVIRONMENT

While Communist China's major security interests still rest in the Communist bloc and in East Asia, its present and potential involvement with other areas is now virtually on a global basis. During the 1956–58 period, Communist China manifested increasing interest in developing relations with areas in the Middle East and in Africa. With formal and informal ties firmly established with such countries as the United Arab Republic and Yemen, Southwest Asia and Africa now actually represent a new dimension in Chinese Communist diplomacy. In Western Europe, seven governments have recognized Peking, and most other countries have developed trading or other relations on an informal basis. Even Latin America is coming under Chinese Communist pressures as Peking has begun to direct specific anti-United States propaganda to that area and to seek the establishment of informal ties with political groups there whenever possible.[17]

In the projection of this global network of contacts, the Peking regime, while consistently according highest priority to its political objectives, has demonstrated a relatively high level of flexibility and realism. If the development of this pattern is noteworthy today, its implications for the future are also significant.

Late in 1957, Mao Tse-tung journeyed to the Soviet Union to participate in the meetings marking the fortieth anniversary of the Bolshevik revolution of 1917. In a speech to Chinese students and trainees at Moscow University on November 17, he stated:

> The whole world now has a population of 2.7 billion, of which the various socialist countries have nearly one billion; the independent, former colonial countries, more than 700 million; the countries now struggling for independence or for complete independence, 600 million; and the imperialist camp, only about 400 million. . . . At present . . . it is not the West wind which is prevailing over the East wind, but the East wind over the West wind.[18]

Mao's statement reiterated the Communist awareness of the changes which have taken place in the political distribution of the peoples of the world as a result of the dislocations produced by World War II and by the ensuing period of violent nationalism and international strife. He estimated the population of the world at some 2.7 billion. Of this total, the population of the Communist countries—including Communist China's 640 million people—now includes about 1 billion; that of the Western ("imperialist") states, some 400 million. Thus the "East wind" is said to be prevailing over the "West wind."

The position of the remaining sector of the world's population—a total of 1.3 billion (700 million in newly independent states which were formerly colonial area and 600 million in areas "now struggling for independence or for complete independence")—is significant.

4. equality and mutual benefit; and 5. peaceful coexistence. See *Documents Concerning Premier Chou En-lai's Visit to India and Burma*, Supplement to *People's China*, July 16, 1954.

[17] Latin American Communists, for example, have already been utilized by Peking to voice its opposition to an alleged United States attempt to form a "South Atlantic Treaty Organization"; see NCNA, Peking, July 11, 1957.

[18] *Ibid.*, November 18, 1957.

Mao Tse-tung was delineating the new vital zone in world political geography which a later Peking *Ta Kung Pao* editorial (April 27, 1958) labeled the "national independence forces" (*min-tsu tu-li li-liang*). In numerical strength, these forces exceed either the Communist bloc or the non-Communist areas clearly aligned with the United States. The zone presumably includes all the new national states of Asia and Africa which have attained independence, the remaining areas still under colonial administration, and (apparently) portions of Latin America allegedly dominated by "Yankee imperialism." In a later speech, Chou En-lai again stressed Peking's sense of indentification with Afrika and Latin America, as well as Asia:

> . . . the people of the Latin American countries have something in common with the peoples of Asian and African countries. They have common aims: to oppose colonialism, to oppose imperialist aggression and intervention, to demand peace and oppose war, to press for independent development of the national economy and emergence from backwardness. In other words . . . the people of the countries in Latin America, Asia and Africa have common aspirations and demands.[19]

The non-Communist and non-Chinese world does not recognize the specific validity of this political-ideological gerrymandering. But its general significance remains.[20] During the period since the Soviet Twentieth Party Congress (1956), the Sino-Soviet offensive toward the "national independence forces" has grown steadily. Chinese background, Chinese national interest, and China's present position as the major nonwhite power of the "socialist camp"—all compel Peking to make increasing efforts to extend her existing ties in this Asian-African area.[21]

[19] SCMP, No. 1836 (August 20, 1958), p. 40.

[20] John F. Melby, in "The Chinese-Russian Partnership," *Current History* (December 1957) has observed, for instance, that "the period of bi-polarization may be about over" (p. 326).

[21] In this connection, E. H. Rawlings, in "Elementaries of China's Foreign Policy," *Eastern World* (London), October 1957, has observed that "It is only natural that the Chinese want to head the revival of Asia and Africa as they are potentially the strongest coloured power in the world" (p. 15).

# Taiwan's Development as Free China

By Richard L. Walker

Abstract: In nine years the Chinese Nationalists have made substantial strides in rebuilding their government, morale, and symbolic appeal. Many of the civilian accomplishments on Taiwan have received little notice in the outside world. In the grim period, 1949–50, the Nationalist cause appeared hopeless, but United States protection and support since the Communist aggression in Korea in June 1950 have facilitated positive achievements. 1951 and 1952 were years of reform, followed by a four-year (1953–56) period of adjustment and planning. During these years increased emphasis was placed on building Taiwan's symbolism as a repository of Chinese culture. In 1957 and 1958 the cumulative effect of domestic reforms and United States aid brought a burst of flowering in economic and cultural fields. Six areas of major achievement in Taiwan deserve special mention: the land reform program, internationally acclaimed as a model; the work of the Joint Commission on Rural Reconstruction; improved living conditions which give Taiwan the highest standard of living in Southeast Asia; development of democratic and responsible local government; the expansion of public education and cultural activities; and the building of an efficient military force making a substantial contribution to Free-World defenses in Asia. But some problems persist: the inability of the Kuomintang to capture the imagination of the Chinese intellectuals and youth who remain outside Communist control, continued psychological tensions, and population pressure. A complete reorganization of the Kuomintang and the development in Taiwan of a new philosophy of democracy for China would be desirable; but these changes depend upon initiative from Chiang Kai-shek and seem difficult within the present crisis context. On balance, though, the Nationalists have succeeded to a point where their cause cannot be ignored.

---

*Richard Louis Walker, Ph.D., is head of the Department of International Studies the University of South Carolina, Columbia, South Carolina. He is the author of seve books and articles on China and the Far East including The Multi-State System of A cient China (1954) and China Under Communism: The First Five Years (1955). served with United States Army Intelligence in the Far East during World War II a has returned several times since. In 1954–55 Dr. Walker was a Visiting Professor National Taiwan University while carrying out research under a Rockefeller grant. 1957 he was a United States delegate and one of the principal speakers at the SEA seminar in the Philippines.*

When in August and September 1958, the Chinese Communists once again focused world attention on the island of Taiwan, ninety miles off the coast of Fukien, and warned that no force on earth could stop the "liberation" of the 13,936 square miles of territory and 10 million Chinese remaining under Nationalist rule, the situation was in marked contrast with that of nine years before when Mao Tse-tung's lieutenants organized their first attempt to "liberate" Taiwan.

In August 1949 the United States had published a "White Paper" which in effect attempted to extricate it from its China tangle. In September and October of that year, staff studies by all United States armed forces and the Department of State concluded that Taiwan could not be defended from Communist attack without large-scale active United States intervention and that neither the capability for nor the willingness to assume the risks involved in that intervention existed. Consequently on December 23, 1949, the Department of State sent to embassies abroad an information policy-guidance paper warning them to prepare for the fall of Taiwan to the Communists and to cushion the expected blow to United States prestige by stating that Taiwan bore no crucial relationship to United States security.[1] Subsequently on January 5, 1950, the day before the recognition of the Communist regime by Great Britain and following the extension of recognition by several other powers, President Harry S. Truman declared, "The United States will not pursue a course which will lead to involvement in the civil strife in China. Similarly the United States Government will not provide military aid and advice to the Chinese forces on Formosa."[2] Few people indeed held any hope that Taiwan would remain outside of Communist control for long.

Ironically, a key reason why in 1958 Taiwan was still in Nationalist hands and its security guaranteed by the firmest of United States commitments, could be attributed not to the United States initiative but to Stalin's military adventure in Korea. Following the Communist attack in Korea on June 25, 1950, President Truman moved rapidly to prevent the fall of Taiwan and on June 27 ordered the United States Seventh Fleet to neutralize the Taiwan area. The fleet was still there in 1958. But there were other reasons for the changed status and the far more formidable position of the Republic of China on Taiwan in 1958. These included the growing awareness of the threat posed by expansionist Communism under Peking direction in Eastern Asia, the increasing involvement of the United States in security matters in the Western Pacific area, and the growing realization that the Communist mainland regime did not merit or necessarily enjoy the support of many key groups under its control.

A most important reason for Taiwan's changed position in 1958, however, was the remarkable Nationalist record of achievement and regeneration in the intervening nine years. This record has received too little attention in the world, partly because of preponderant outside world interest in and concern over developments on the mainland under the Communist rule, but also because of the tendency to assume the permanent debility of the Nationalists on the basis of the sad performance in the immediate post-World War II years. There is a critical need for more adequate study and generally available information on

[1] For a discussion of background and outlook of United States policy toward China during this period see 82nd Congress, 1st Session, hearings on *The Military Situation in the Far East* (The MacArthur Hearings), esp. pp. 1667–72.

[2] *Department of State Bulletin*, January 16, 1950.

the achievements as well as the problems on Taiwan for the benefit of informed judgment in the outside world.[3]

## GRIM YEARS

Few governments have faced graver problems with dimmer prospects than the tattered remnants of the Chinese Nationalist administration who found their way to Taiwan as opposition to the Communists melted on the mainland during 1949. The years 1949 and 1950 were dismal indeed. The Kuomintang (KMT), the ruling party of the Republic of China, seemed hopelessly weak and its doctrine, organization, and methods had proved inadequate for meeting formidable problems on the mainland, let alone coping with efficient Communist organization and propaganda. There was, as many of its leaders admitted, ample reason why its cause had been written off by some of its staunchest friends.

A cool and even hostile reception greeted the more than 1,400,000 civilians and almost 600,000 military personnel who descended upon Taiwan. The behavior of Nationalist carpetbaggers who had taken over the island on October 25, 1945, under Governor Ch'en Yi (later executed in Taiwan under Chiang Kai-shek's orders) culminated in riots on February 28, 1947, which were put down with brutal repression. The result was a great chasm between the Chinese in Taiwan and the mainlanders, and the demands upon housing and other facilities occasioned by the move to Taiwan were not calculated to ease tensions which continued to run high.

In 1949 the economy of Taiwan was still in a state of dislocation. More than 300,000 Japanese had been sent back to Japan at the end of the war, and there were few Chinese qualified to fill the great gap in technical and administrative skill needed for posts the Japanese had reserved for themselves during their fifty-year rule. As on the mainland, the land tenure situation had created great peasant discontent. Further, the destruction caused by allied bombing during the war had resulted in economic dislocation more than halving production, and there seemed little likelihood that Taiwan could sustain its own population, let alone two million refugees.

The Nationalists did possess some assets when they moved the seat of their government to Taipei on December 7, 1949. One of these was determination bred of the realization that their whole future would depend upon their subsequent performance. Further, the move to the somewhat austere surroundings on Taiwan enabled them to shed many of the opportunists who bore much responsibility for the debacle on the mainland. The more than 1 million civilians —including many of the dedicated officials, the scholars, and the technicians whose talents were sorely needed—who moved to the island during 1949 and 1950 have been the key factor in subsequent achievement. They are all too frequently forgotten in the press accounts which have concentrated on the military or on the Chinese Nationalist leader, Chiang Kai-shek.

[3] Three books published in the West dealing with postwar developments on Taiwan appeared in 1952—Joseph W. Ballantine, *Formosa, A Problem for United States Foreign Policy* (Washington, D. C.: The Brookings Institution); H. MacLear Bate, *Report from Formosa* (New York: E. P. Dutton & Co.); and Fred W. Riggs, *Formosa under Chinese Nationalist Rule* (New York: The Macmillan Co.)—but since then no such surveys have appeared. These works were published before the completion of the land reform discussed below and while the memory of the 1947 revolt was still vivid. In 1956 Han Lih-wu published a second revision of his 1951 *Taiwan Today* (Taipei: Hua Kuo Publishing Company) from which the other three authors borrowed freely, but this work is an inadequate substitute for a needed volume by an outside scholar. W. G. Goddard, *Formosa (Taiwan)*, Taipei, 1958, is an uncritical collection of lectures by an Australian admirer of the Nationalists. Statistics in the Provincial Government Information Department's *Taiwan, Ten Years of Progress*, Taipei, January 1956, are generally accurate, but coverage of problems is less than inadequate. Michael C. S. Tung's *Free China on the March* (Taipei: China Cultural Service, 1957) is sufficiently panegyrical to cast doubt even on its accurate statistics. See also: Michael Lindsay, "The Future of Formosa," *New Republic*, October 6, 1958.

## THE CONTRAST

The contrast between Taiwan's international position and internal conditions in 1958 and the grim years 1949 and 1950 represents a remarkable change. There were few spokesmen, even in neutralist countries, who in 1958 advocated turning Taiwan over to the Communists; and although there was grave division within the Free World over support for Nationalist positions on Quemoy and Matsu near the coast of Fukien, there was widespread agreement that Taiwan and the Pescadores should be defended militarily against Communist attack. With a show of real imagination and vigor the Nationalists had under Foreign Minister George K. C. Yeh, who resigned his post after nine years in the summer of 1958 and was named Ambassador to the United States, expanded their diplomatic and cultural activities. By 1958 they maintained 43 embassies and legations, 14 consulates-general and 7 consulates abroad; and a vote at the United Nations in September guaranteed that they would continue to represent China in that body for another year. Taipei maintained close liaison with other countries in the Western Pacific threatened by Communist expansion: Korea, Vietnam, Thailand, and the Philippines. And its achievements had gained attention in areas outside Asia. After a visit in 1957, Brian Crozier, Chief Foreign Editor of the *Economist*, wrote in the *Listener*, "I am no longer convinced that the Nationalist cause is hopeless; and I now think I was wrong to write off Chiang Kai-shek and his Kuomintang Government as though they were discredited and of no account." [4]

The record of economic accomplishment in Taiwan during this period may be seen in Table 1. But while this table indicates the extent of World War II destruction and the contrast between 1949 and 1958 figures, it is still inadequate because it does not indicate production of many items formerly unknown in Taiwan: bicycles, plate glass, electric fans, plastics, aviation gasoline, and even jeeps.[5] By 1958 Taiwan, with climbing production and an increasingly

[4] Crozier's reports after returning from a visit to Taiwan had wide influence in Britain. His article in the *Listener* in February 1957 was reprinted in the British Commonwealth countries with equal impact. See also: "Aspects of a Myth," *The Economist*, London, February 9, 1957. The *Free China Review*, an English-language monthly published in Taipei, reprinted some reports by other visitors in booklet form, "Taiwan as Seen by Visitors," in 1958.

[5] Figures for the table have been gathered for the most part from the issues of *Industry of Free China*. This monthly publication (Chinese and English) of the Industrial Development Commission of the Economic Stabilization Board (hereafter ESB) is reliable, and its articles offer an eye-opening introduction to the manner in which economic development is being planned in the Republic of China. Agricultural statistics are to be found in the many publications of the Joint Commission on Rural Reconstruction (hereafter JCRR). The *Bulletin* of the UN Economic Commission for Asia and the Far East (hereafter ECAFE), published in Bangkok, contains regular statistics and frequent articles on economic development on Taiwan. The United States International Co-operation Administration also publishes reports on Taiwan's development. See, for example, its January 1956 report, *Economic Development on Taiwan, 1951–1955*.

TABLE 1—PRODUCTION IN TAIWAN

| PRODUCT | UNIT | PEAK UNDER JAPANESE | 1946 | 1949 | 1951 | 1953 | 1955 | 1957 |
|---|---|---|---|---|---|---|---|---|
| Rice | Metric tons (M/T) | 1,404,414 | 894,021 | 1,214,523 | 1,484,792 | 1,641,557 | 1,614,953 | 1,839,009 |
| Sugar | M/T | 1,419,000 | 626,297 | 626,297 | 356,165 | 901,000 | 747,992 | 866,000 |
| Pineapple | Canned case | 1,679,000 | 174,389 | 295,674 | 419,801 | 415,310 | 1,024,481 | 1,142,783 |
| Fish | M/T | 119,520 | 16,862 | 80,371 | 104,180 | 130,010 | 180,618 | 206,000 |
| Hogs | M/T | 1,873,000 | 577,861 | 1,362,159 | 2,262,000 | 2,820,000 | 2,799,369 | No available figure |
| Fertilizer | M/T | 34,000 | 4,843 | 45,840 | 111,810 | 165,707 | 169,887 | 215,000 |

| Electricity | Thousand Kwh | 1,195,327 | 357,033 | 854,300 | 1,285,104 | 1,564,341 | 1,966,358 | 2,555,187 |
| Paper | M/T | 18,404 | 2,952 | 6,393 | 20,554 | 27,897 | 38,560 | 59,634 |

diversified economy, was second only to Japan in standard of living in the Far East and Southeast Asia. Per capita consumption of food and other consumer goods had increased yearly since 1952, far outstripping the cost of living which, however, had continued to rise. In Taiwan there were less extremes in poverty and wealth than anywhere else in Asia as the regime displayed none of the ostentatiousness and corruption so closely associated with its last months on the mainland. The currency and economic situation were sufficiently stable to allow relaxation of foreign exchange regulations in 1958.[6]

In 1958, although tensions between the Chinese in Taiwan and those from the mainland still existed, they did not loom nearly as large in the over-all picture.[7] There was solid agreement that the Communist regime was not wanted by either group, an agreement regularly reinforced by the arrival of refugees from the mainland where the Communists were denouncing "freedom" as a "bourgeois fallacy." Taiwanese participated vigorously in local government and occupied key posts in the growing private industry which accounted for more than half of Taiwan's industrial output. Their participation and performance in institutions of higher learning and in teaching positions on the island helped to build one of the highest literacy rates in the world and to enhance Taiwan's symbolic value as a repository of the Chinese cultural tradition.

To appreciate the position of Taiwan in 1958, it is helpful to outline briefly the course of change following the movement of the Republic of China to the island. We will then examine some of the major achievements in more detail and point out persistent problems for Free China.

[6] See the statistics on per capita energy and calory consumption in numbers of the ECAFE *Bulletin* in 1958.

[7] Groups of Taiwanese in Japan and Hong Kong have kept their own hopes for Taiwan autonomy alive by calling attention to persisting problems between Chinese in Taiwan and those from the mainland. For views critical to the Nationalists see Khu Eng-han, "The Taiwan Problem and its Solution," *Far Eastern Economic Review*, January 16, 1958, pp. 67–70 and Li Thian-hok, "The China Impasse," *Foreign Affairs*, April 1958, both of which envisage eventual independence for Taiwan.

## THE COURSE OF CHANGE

### *The period of reform, mid-1950 through 1952*

Even before President Truman's decision in June 1950 to neutralize Taiwan, thus giving the Nationalists a breathing spell for reform and planning, they had begun to deal with major problems on the island. For example, the land reform had been started under Governor Ch'en Ch'eng in 1949, and a labor welfare and insurance program had been initiated in March 1950. More important perhaps was the reform program within the KMT. A party reform committee set up in 1950 functioned until the Seventh National Congress was held in October 1952, and it succeeded in breathing some new life into the organization and providing positions for some of the more liberal younger members. A manifesto and platform adopted at the October congress frankly admitted many past mistakes and warned, "What is gone is gone forever, but the future should not be allowed to slip through our fingers."[8] The KMT has continued to evidence some of the drawbacks of its Leninist-type organization, and many old party hacks still maintain positions of power. But the 1952 reforms were real, and they were carried into the government. By mid-1952 a qualified outside observer who had watched at first hand the last years on the mainland reported that "underpaid officials have made significant progress in reassembling the tattered ends of their government."[9]

With the entrance of the Chinese Communists into the war in Korea in October 1950, the United States moved to extend large-scale aid, both military and economic, to Taiwan.[10] A Military Assistance Advisory Group was set up in Taipei on May 1, 1951, and with its help the Nationalist armies were gradually re-equipped and reorganized into an effective fighting force. United States economic aid was reactivated in 1951, enabling more realistic planning for the island's future. In March 1951 the Economic Stabilization Board was established by the Legislative Yuan (one of the five branches of the Nationalist government) for planning, advising on, and co-ordinating all economic activities in Taiwan. This significant body has continued to work in close co-operation with American officials and advisors and has, from the outset, approached its task with vision and vigor.

These are just a few examples of many reforms carried out in the period following the outbreak of war in Korea. A solid basis was laid in all fields—education, health, land reform, political and economic responsibility—for building a viable government and economy.

[9] Albert Ravenholt, "Formosa Today," *Foreign Affairs*, July 1952. On other aspects of this early KMT reform see Gung-hsing Wang, "Nationalist Government Policies, 1949–1951," THE ANNALS, Vol. 277 (September 1951), pp. 213–23.

[10] For a summary statement of United States aid to Taiwan, see the *New York Times* of September 7, 1958, which puts the figure at more than 1 billion dollars.

### *The period of adjustment, 1953 through 1956*

By the beginning of 1953, as Mao Tse-tung consolidated his control, it was becoming apparent—though never overtly admitted—that a return to the Chinese mainland was not as imminent as Chiang Kai-shek's frequent statements to the army and the KMT might indicate. A number of mainlanders began to recognize the real task for the future was to make Taiwan into a testing ground for democracy in Asia. The heavy double bureaucracy of a skeleton regime for the whole of the mainland plus a provincial government was maintained, but an increasing amount of energy and attention was devoted to the Taiwan area. Chinese leaders on Taiwan gave real weight to publications and education dealing with Chinese culture.

The adjustment to possible long-term

isolation of Taiwan was apparent in the First Four-Year Plan, completed in 1956. The plan involved industrial diversification with the establishment of sixteen substantial and scores of minor new industries involving more than 5,700 new factories. Between 1950 and 1956 the gross national product increased by 66 per cent—agriculture 32 per cent; industry 132 per cent. Transport and communications facilities were substantially developed, many large electrification projects completed, and other large projects such as the US-$40,000,000 Shihmen Reservoir and the cross-island highway started. All of these demanded increased attention and energy channeled into the Taiwan scene.[11]

This period of adjustment was made possible by an increasing United States commitment to the Republic of China. In December 1954 the United States and the Republic of China signed a Mutual Defense Treaty guaranteeing the military security of Taiwan and the Pescadores. United States economic assistance appropriations between 1951 and the end of 1956 totaled US-$643,664,000 exclusive of military aid for which figures remained unavailable.[12]

During this period of adjustment, the Nationalist government moved out more actively in the field of foreign affairs. A program for the education of overseas Chinese students from Southeast Asia was developed, and their number in Taiwan surpassed 5,000 by the end of 1956 (more than 7,000 in 1958). A big boost to morale was the arrival on January 23, 1954, of more than 14,000 former Chinese prisoners of war from Korea whose vote in favor of the Nationalist regime represented no small blow to the Communists on the mainland. A program for the resettlement of refugees from Hong Kong, aided by private assistance from the United States, brought an additional 138,000 persons to the already overcrowded island. Taiwan carried on an active program of aid for the continuing stream of refugees who were still coming from the mainland at a rate in excess of 5,000 per month in 1958, most of them settling in Hong Kong.[13]

### *The period of realization, 1957 and 1958*

By the end of 1956 sufficient lag time had elapsed for United States aid and the measures taken by the Nationalists to make themselves felt. In 1957 the Taiwan economy began to evidence a remarkable surge of productivity as the accumulated impact of reforms and outside assistance took effect. Prices tended to level off, and there was a gradual relaxation of various types of government control.[14] The stability and flowering of the Taiwan economy were also reflected in other developments such as increasing investment by private sources, especially overseas Chinese, and the fact that in view of growing foreign trade and export industries the Chinese were beginning to stress regional economic co-operation.[15]

Let us turn in more detail to some of the major Nationalist achievements which made the period of realization in 1957–58 possible. Six general areas of Chinese accomplishment on Taiwan may serve to highlight the story. In every case it must be emphasized that although United States assistance has been a prerequisite, the effective use of this aid has depended primarily upon the Chinese civilians. They have shown dedication and faith which have all too often been forgotten by those in the outside world who have tended to view the Taiwan crisis in strictly military terms.

[11] For a good summary of the results of the First Four-Year Plan, see T. C. Pan, "Accomplishments of the First Four-Year Plan," ESB, Taipei, 1957. Preston Schoyer, "Present Conditions on the Island," *The Reporter*, March 10, 1955, p. 18, in the midst of this period points out that "Quite a number of them [the mainlanders] realize that the time for liberating the mainland has passed, and that the task of the future is to make Formosa into a testing ground of Asian democracy." For a good illustrated article covering Taiwan at the end of this period see Frederick Simpich, Jr., "Changing Formosa, Green Island of Refuge," *Natianal Geographic*, March 1957, pp. 327–64. On the type of planning which went into the Shihmen Reservoir see the ECAFE *Bulletin*, Vol. 8, No. 3 (November 1957), pp. 54–55.

[12] Allen S. Whiting, "The United States and Taiwan," in *The United States and the Far East*, The American Assembly, Columbia University, December 1956, p. 183. Whiting's survey, while pointing out the accomplishments during this period, brings out clearly some of the major economic and political problems. Written before the combination of forces and the accumulated impact of economic aid led to the flowering of the two subsequent years, it tends to be somewhat gloomy in economic forecasting.

[13] In addition to summaries of this problem presented to the United Nations, see *The Annual Report* of the Free China Relief Association (March 1956–February 1957), Taipei, April 1957.

[14] On relaxation of government controls and the texts of specific acts see the issues of *Industry of Free China* for the first six months of 1958. A discussion of further economic development can be found in two articles by K. T. Li, "Taiwan's Economic Position and Prospects," *Far Eastern Economic Review*, April 3, 1958, and "A Review of Industrial Development in Taiwan," ESB, Taipei, February 1958 and S. C. Hsieh and T. H. Lee, "An Analytical Review of Agricultural Development in Taiwan," *Industry of Free China*, Vol. 10, No. 1 (July 1958).

[15] 85th Congress, 1st Session, *Foreign Aid Program*, Senate Document No. 52, pp. 1380–82, discusses the important role of investment from private sources. The trend toward thinking about regional economic co-operation is revealed, for example, in the speech by K. T. Li, "Characteristics and Trend of Industrial Development in Taiwan," in a panel discussion with members of the World Bank in Taipei, May 17, 1957, subsequently published by the Economic Stabilization Board.

## MAJOR AREAS OF ACHIEVEMENT

### *The land reform*

The land reform program carried out in Taiwan has been a high spot in the Nationalist program and has been internationally acclaimed as a model. In contrast with the mass executions and violence of the Communist approach to the land issue on the mainland, Taiwan's land reform was peaceful and orderly.[16] Whereas on the mainland, the Communist measures were intended only as a prelude to enforced collectivization, the "Land-to-the-Tiller" program in Taiwan guaranteed and encouraged permanent private ownership.

It is difficult accurately to condense the full and thorough approach made to the land problem in Taiwan. Fortunately a number of good accounts have been written.[17] Roughly, the program was carried out in three phases. On April 14, 1949, as a first phase, the provincial government decreed a rent reduction to a top limit of 37.5 per cent of the crop for the tenant farmers. More than 300,000 farmers and 45 per cent of all farm families benefited from this. Another part of this phase provided security of tenure for tenants by setting the minimum lease period at six years, prohibiting advance payments of rent, and requiring all subsequent leases to be registered with the provincial government.

The second phase of the reform involved the sale of about 400,000 acres

[16] On the Chinese Communist approach to the land problem see chapter VI of my *China Under Communism* (New Haven: Yale University Press, 1955).

[17] By far the best and most comprehensive account is Hui-sun Tang, *Land Reform in Free China*, Taipei, JCRR, October 1954, 335 pp. Mr. Tang has also produced a summary, "Highlights of Land Reform in Taiwan," Taipei, JCRR, February 1957 on which this account is based.

of government-owned farmland to the farmers, with priority of purchase given to those actually tilling the land involved. The price for this public farm land was set at two and one-half times the value of the annual crop, the purchase price to be paid in semiannual installments, but no installment to exceed 37.5 per cent of the current crop yield. Four sales of these public lands were held from 1951 to 1953 and by the end of 1953, land had been purchased by 121,953 tenant families.

The third phase involved the required sale by landlords of lands in excess of fixed acreage depending upon the type of land involved. Before this phase, a thorough registration and classification of all lands (involving more than 6,000,000 index cards) was carried out in 1951 and 1952. The Land-to-the-Tiller Act which enabled the final phase of the land reform was passed by the legislature on January 20, 1953. Under the provisions which were carried out by January 1954, the government purchased lands in excess of about seven acres of paddy field or twice that much dry land at a price of two and one-half times the yearly yield. In payment for their land, the landlords received 70 per cent in "land bonds" bearing an annual interest of 4 per cent and redeemable in rice and sweet potatoes in 20 semiannual installments. The other 30 per cent was paid in stock certificates in four government industries which were thus turned into private capitalist ventures.

The execution and performance of the land reform program were successful beyond expectation. Three years after redistributing more than 26 per cent of Taiwan's cultivated land, authorities reported that less than 1 per cent of the farmers were delinquent in payment. One survey pointed out:

In the 6 years since land reform started, 39,000 farm families have built new homes and 87,000 have repaired their old ones. (There are approximately 650,000 farmers in Taiwan.) Eight per cent of the 317,000 farm families surveyed have purchased sewing machines, installed new lighting systems, or added lights. Eighty-eight thousand bought new bicycles. About half bought new farm implements or built new drying grounds or farm buildings. Eighteen hundred radio sets were purchased.[18]

### *The JCRR and raised living standards*

Closely connected with the land reform and an achievement in its own right has been the Joint Commission on Rural Reconstruction (JCRR), a model of successful co-operation in administering foreign rural assistance. JCRR was organized under the terms of the China Aid Act of 1948. In 1956 it had a technical and administrative staff of 230 Chinese and 11 Americans. In its first seven years in Taiwan it carried out 1,852 projects resulting in direct improvement in the lives of more than 90 per cent of the people.[19] For example, in co-operation with the World Health Organization (WHO), it established a rural health network of 368 health stations and 22 health centers which became self-supporting in three years. With its aid and encouragement the World Health Organization reported that by 1956 Taiwan was the healthiest place in Southeast Asia. Malaria had become a rarity and other dread diseases were nonexistent on the island. JCRR has established 4-H clubs, carried out pest control, aided the organization of farmers' associations, trained personnel, established experiment stations, and so forth. Most important, the JCRR has been a significant example of effective international co-operation in which most of the achievements relied on Chinese effort. As a Special United States Congressional Study Mission observed:

The JCRR's contributions should not be measured alone in cold statistics of increased production. More significant, although less frequently recognized, is the training in leadership and democratic processes it has produced among the farmers and also among officials. Such values are bound to be reflected in the political evolution of the country.[20]

As pointed out above, the industrialization and agricultural improvement have resulted in remarkably improved life for the people on Taiwan. ICA reported that per capita production in 1957 was 40 per cent greater than in 1950. Indicative of how people in general were benefiting from increased production was the report of the Taiwan Power Company that in 1957 it had more than 700,000 customers. Rural electrification has spread to practically every area of the island. By 1958 more than 450,000 were covered by the labor insurance program, and on August 1, 1958 another 175,000 government employees were brought within the framework of this program which carried medical, disability, and other insurance benefits. Although Taiwan has concentrated on planned economy, the Second Four-Year Plan, started in 1957 and involving almost three quarters of a billion United States dollars, has laid great stress on private investment. Further economic planning in Taiwan has been focused on the consumer.[21]

### *Local government, education, and culture*

Although the Nationalists have maintained the heavy burden of a government presumably for all of China, this skeleton administration has been subject to constant trimming as more attention has been devoted to local government. By 1958 the national bureaucracy was outnumbered four to one by civilian employees of the provincial and local authorities. The provincial budget increased from NT$366,319,487 in 1950 to NT$3,110,989,811 for 1959. This latter figure was more than twice the whole national budget of 1950. Although the KMT practically monopolizes party political life on the island, issues on the provincial and local level are openly debated and independent candidates are frequently elected. In 1957, for example, the mayor of Tainan was elected in opposition to the KMT candidate. Contests for the provincial assembly and for the magistracy of the sixteen counties and for mayors of the five special municipalities have been hotly contested. For an election of minor officials on January 19, 1958, more than 78 per cent of the eligible voters—all those over 20 years of age—turned out despite inclement weather. In terms of democratic participation, local responsibility, maintenance of stability and security, the program of local government on Taiwan has made steady progress.

Taiwan's system of public education is also a major achievement. In 1957, 93.82 per cent of children of primary

[18] JCRR, *General Report, VII, 1956*, p. 2. This report offers a balanced and clear exposition of achievements as well as problems on the rural scene.

[19] In addition to its valuable annual *General Reports*, JCRR has published many useful volumes of surveys and statistics for the researcher. Outstanding among these is Arthur F. Raper, *Rural Taiwan—Problem and Promise*, Taipei, July 1956. For a good summary of JCRR work, see Senyang Chou, "JCRR Program: An Effective Antidote Against Communism," *Free China Review*, Taipei, December 1957, pp. 11–14.

[20] House of Representatives, Committee on Foreign Affairs, *Report* by Special Study Mission to the Middle East, South and Southeast Asia, and Pacific, 1956, p. 163. This report contains a brief outline of JCRR work.

[21] ESB, *Highlights of the Second Four-Year Plan for the Economic Development of Taiwan*, Taipei, August 1957. For statistics on the contrast in focus of planning in Taiwan with that on the mainland and elsewhere in Asia see ECAFE *Bulletin*, Vol. 7, No. 3 (November 1956), pp. 32–33.

school age were in school. The government started a systematic expansion of compulsory education from 6 to 9 years in the 1957–58 academic year. That year there were 1,471,706 students in elementary schools, 270,523 in secondary schools, and 21,259 in seventeen colleges and universities.[22] Admission to upper middle schools and colleges is on the basis of rigorous examination. Of great importance in terms of building the symbol of the Republic of China as a repository of Chinese culture has been the work of the thousands of top flight scholars and teachers who came from the mainland. Scholarly journals and books published in Taiwan set high standards. Over 19,000 new books were published between 1949 and 1957 in addition to the printing of old titles. Under the leadership of eminent scholars the Academia Sinica, the highest academic research organization, has continued the work for which it was famous on the mainland. On November 4, 1957, Dr. Hu Shih, Chinese Ambassador to the United States during World War II, was named its new president. The work of the many mainland refugee scholars finally flowered, like the economy, with substantial impact beginning in 1957. By 1958 it was possible for scholars in the outside world for the first time in two decades to build full library collections of Chinese classics, histories, and other basic works of the Chinese cultural tradition printed in Taiwan, many of them works burned or destroyed by the Communists on the mainland.[23] In 1958 Taiwan produced 28 newspapers and 498 journals and magazines. A highly literate population enjoyed opportunities for study of traditional Chinese culture at the newly built National Central Library in Taipei and among the mainland art treasures at the Joint National Palace Museum and National Central Museum in Taichung. And some of the most competent and promising young scholars in the Chinese tradition come from among the Chinese from Taiwan, many of whom have in recent years gained top honors in the college entrance examinations.

### *Military and other achievements*

The reorganization and regeneration of the Chinese Nationalist armed forces into one of the major military establishments in Eastern Asia represents another significant achievement.[24] These forces include 300,000 combat army troops, a navy of about 70 vessels, and an effective and well-trained air force. Much credit goes to the work of the United States Military Assistance Advisory Group and to military hardware from the United States. But the growing effectiveness of the Chinese Nationalist armed forces is also due to the Nationalist contribution to their own defense. The Chinese have provided salaries, food, and housing for the more than half million members of the armed forces, while United States military aid has been devoted almost exclusively to providing training and modern equipment.

As a part of keeping the armed forces fit, the Nationalists began drafting Chinese from Taiwan in 1954, and by 1958 more than 35 per cent of the armed forces were Taiwanese. It is worth noting that for the most part the Taiwanese have been relegated to the lower ranks. Under a jointly sponsored Sino-American plan more than 80,000 overage military personnel had been retired by 1958. Nine years after a disorganized and defeated military establishment found refuge in Taiwan, it had been converted into one of the strongest forces confronting further Communist expansion in Asia and was making a substantial contribution to United States and Free World defensive capability there.

The major areas of accomplishment listed above should not be taken as exclusive. Since arriving in Taiwan, the Chinese Nationalists have also made notable progress in other spheres as well: participation in international bodies, expansion of foreign relations, work among the overseas Chinese, building regional cultural exchanges in Eastern Asia, and developing concepts and programs of economic development for a free society.[25]

## MAJOR PROBLEMS AND FAILURES

All has not been success for the Republic of China. The Nationalists have been unable to eliminate some of the very factors which contributed heavily to their failure on the mainland.

A key problem lies in the nature of the Kuomintang (KMT) itself. After much soul-searching and admission of more than a decade of failure, Sun Yat-sen turned to the Russians in 1923 and adopted their Leninist party structure when the KMT was reorganized in 1924. The KMT still retains much of this structure, grossly unsuited to democratic development. Sun rejected Marxism, but the political doctrine he attempted to substitute has proved inadequate. Chiang Kai-shek and the top KMT have not moved to break with the past and create a new party and doctrine to make democracy meaningful for China today. The result has frequently been blind incantation of phrases of Sun Yat-sen by a group whose lives are given to making orthodoxy of thin intellectual fare. The combination of the party structure and *San Min Chu I* (Sun's Three Principles of the People) has brought all the drawbacks of authoritarianism—ideological weakness, attempts to impose uniformity, leader worship, political officers in the armed forces, insecurity, and defensive attitudes—without many of the compensations of the democracy Sun desired.[26] Despite remarkable economic achievements and social progress in Taiwan, the KMT has been generally unsuccessful in capturing the imagination and zeal of the youth either at home or among the overseas Chinese.[27]

Three decades of constant struggle with the Communists have encouraged an either-or, black-white approach to problems on the part of top KMT leaders who have been antagonistic and sensitive about criticism on most major issues and many minor ones.[28] This has resulted in undermining the sorely needed support among intellectuals in Taiwan, among refugees in Hong Kong,

[22] These statistics are later modifications of those published in the illustrated volume of the Ministry of Education, *Education in the Republic of China*, Taipei, 1958, 114 pp.

[23] Publication activities in Taiwan have come as good news for sinologists in the outside world. See Frederick W. Mote, "Recent Publications in Taiwan," *Journal of Asian Studies*, Vol. 17, No. 4 (August 1958), pp. 595–606.

[24] With the reopening of military activity in the Taiwan area in August 1958, a number of press accounts covering the Nationalist military establishment appeared. For earlier appraisals see Fred Sparks, "The Facts about Formosa," *Reader's Digest*, July 1955, pp. 83–88 and Allen S. Whiting, *op. cit.* (note 12 *supra*), pp. 177–79.

[25] On this last item see "Development Planning in Taiwan," *International Labour Review*, Vol. 76, No. 5 (November 1957), pp. 479–95.

[26] For a discussion of Nationalist political drawbacks see Whiting, *op cit.* (note 12 *supra*), pp. 184–89.

[27] Examples of criticism on this score are abundant. See, for example, Chao Kuo-chun, "China's Tunnel to Formosa," *Nation*, August 3, 1957, which tends to be critical and negative, and editorials in *Tsu-kuo Chou-k'an* (*China Weekly*) published by a group of young anti-Communist refugees in Hong Kong.

[28] For a strong critique of the KMT attitude that whoever is not 100 per cent for them must be against them and aids the Communists, see *China Weekly*, No. 271 (March 24, 1958), pp. 3–4.

and among the overseas Chinese. In turn, some KMT officials are distrustful, defensive, and security conscious and have blind spots on the ramifications of some of their actions. A case in point was the unnecessary restrictive revision of the Press Law pushed through a closed session of the legislature in June 1958, a move roundly denounced in Hong Kong and overseas Chinese circles and an occasion for great lament in Taiwan.[29] The jelling of attitudes has tended to prevent emergence of imaginative younger leaders at the top despite growth of intraparty democracy at the local level where Taiwanese now constitute more than half of the KMT membership. Although these local developments have been exerting pressure upward, the process has been slow.[30] In view of the challenge posed by Communist achievements in building military and industrial power on the mainland, it is doubtful whether anything short of drastic revision of the whole KMT structure and doctrine will erase blind spots and mutual distrust between the top KMT and the very people it needs and who, in turn, need a positive force around which to rally.

Such a radical departure would depend upon one man, President Chiang Kai-shek. But Chiang is inflexible and views the struggle with the Communists in overwhelmingly military perspective.[31] His magnificent courage, faith, and strength of will have proved valuable assets in dark days, but he has frequently placed personal loyalties ahead of issues; and many Chinese in Taiwan fear that so much emphasis has been placed on his personal role as "Savior of China" (as KMT billboards proclaim), that the normal constitutional process will be endangered on his death.[32] Fears are expressed that his eldest son, Chiang Ching-kuo, who heads the security police and is in charge of political training of the troops, is being groomed to succeed him. In 1958, Chiang moved to allay these fears by appointing his Vice-President, Ch'en Ch'eng, as Premier. Ch'en is respected by Taiwanese and mainlanders alike, and the cabinet he named on July 15 augured well for some future liberalization.

Many major problems on Taiwan stem from the continued civil war and the Nationalist determination to "fight back to the mainland." The faith in the return keeps hopes alive in Taiwan, but it also results in keeping up a costly double bureaucracy and the burden of large armed forces.[33] The state of civil

[29] *China Weekly*, No. 285 (June 23, 1958), pp. 3–4; and *Tzu-yu Chung-kuo* (*Free China*), Taipei, Vol. 18, No. 10 (May 16, 1958), pp. 305–306 and Vol. 18, No. 12 (June 16, 1958), pp. 369–70. It is worth noting that the latter two articles, criticizing the Press Law, were published in Taiwan. *Free China* remains the major item to be cited against those who maintain that even constructive criticism is not allowed in the Taiwan press, and there is a need for more such items.

[30] The Eighth Congress of the KMT which closed on October 23, 1957, for example, enlarged the central committee from 32 to 50, making way for some younger members, and made other moves of a minor nature toward liberalization, an indication that local tendencies are being felt at the top.

[31] This is clearly displayed in his book published in 1957, *Soviet Russia in China* (New York: Farrar, Straus and Cudahy). See the review by C. Martin Wilbur in the *New York Times Book Review*, June 23, 1957.

[32] For an appreciation of Chiang Kai-shek see the column of Joseph Alsop in the Washington *Post*, October 3, 1953; Richard Hughes, "Portrait of Chiang on His Mountaintop," *New York Times Magazine*, September 28, 1958; and J. L. Stuart, *Fifty Years in China* (New York: Random House), 1954. For typical examples of adulation of Chiang see Michael Tung, *Free China on the March* or the review of Chiang's book in the *Free China Review*, July 1957, entitled "Book of the Century"!

[33] "The Republic of China, with a present population of less than 11 million, maintains a military establishment of more than 600,000

ar is used to justify wartime surveilnce and the very control measures hich alienate potential supporters nong the overseas Chinese. It preents the emphasis on and dramatization civil rights necessary to make the epublic of China a more positive odel of a future free China on the olitical plane. But there is no easy scape from this dilemma for the leaders Taiwan, given the Communist pledge ad actions to destroy them and their wn pledge to create a non-Communist ainland. And given the crisis situaon, there has been far more political eedom than has been generally appreiated abroad.

The result is an attitude that all is emporary, and this has tended to preent mainlanders from settling into the aiwan scene in such a way as to overome persisting tensions between themelves and the Taiwanese who frequently eel they are denied adequate voice in heir own government. Chinese in Taian also react to the fact of their deendence on and subordination to the olicy decisions of the United States, nd the resultant frustration was appart in the riots against the American Embassy on May 24, 1957.[34]

A final major problem which deserves mention is the rate of increase in population on Taiwan, one of the highest in the world: 36 per 1,000. Taiwan is adding more people per year than inhabit the second largest city, Kaohsiung. The civilian population at the end of 1957 was 9,500,861; the population of Taipei, 777,467. Here too is a blind spot. The Nationalists have taken few measures to cope with burgeoning population, apparently feeling that to admit its existence would damage long-run faith in the return to the mainland.

## CONCLUSION

Despite such problems and failures, Nationalist achievements tilt the balance far in their favor. In nine years of exile they have done much to revive their own energy and will, and facing seemingly insuperable problems in the cold war, they have shown a truly indomitable faith in their cause and their culture. The balance is further tilted by the contrast between their approach to problems and the Communist actions on the mainland. Reform may be too slow to satisfy outside critics, but they refer mostly to attitude and outlook in the KMT, and many of them are ready to admit that but for Taiwan the hope for a free China and for Chinese civilization would have been extinguished long ago. This is, in turn, the reason for their deep concern that Taiwan continue in the direction of the past nine years. Certainly the record of those nine years indicates that Taiwan cannot be written off, but this only increases Communist determination to eliminate its symbolism. Thus it is difficult to foresee any easy solution to the resultant conflict and tension short of abject surrender. But the faith of those Chinese in Taiwan has already made this an impossible course.

nen. An equivalent figure for the United States would be nearly 10 million men under arms. The Chinese devote more than half of their total public revenues, national and provincial, to the support of their Armed Forces, thereby covering all but a minor part of recurring local currency requirements." # Overseas Chinese in Southeast Asia

By G. William Skinner

Abstract: Approximately 10 million overseas Chinese reside in Southeast Asia where they have economic power and political significance out of all proportion to their numbers. Southeast Asian governments are determined to loosen the Chinese grip on their national economies, to achieve an unequivocal clarification of the citizenship status of resident Chinese, to end foreign political activity among and to proceed with educational and political integration of their citizens of Chinese descent. Prior to 1954, Communist China strove with equal determination to protect the special interests of overseas Chinese; to win their loyalty; and to profit materially, politically, and strategically from their patriotism. The growing importance of Southeast Asian goodwill to China's foreign policy, however, prompted a new line whereby overseas Chinese are encouraged to acquiesce to Southeast Asian nationalist aims without appealing to Peking for protection. In accord with the new policy, China appears willing to relinquish claims to the allegiance of several million persons of Chinese descent and even to forgo much of the overseas Chinese contribution to China's economy. Meanwhile several Southeast Asian governments have taken advantage of Peking's policy and Taipei's weakness to proceed with stringent, nationalistic solutions to their overseas Chinese problems.

---

*G. William Skinner, Ph.D., New York City, is Assistant Professor of Sociology at C lumbia University where he serves on the staff of the East Asian Institute. He w Field Director of Cornell University's Southeast Asia Program from 1951 to 1956 a subsequently Research Fellow of the Cornell Modern Indonesia Project. His experien abroad includes research in China as well as Southeast Asia. Dr. Skinner is author of Chinese Society in Thailand (1957), Leadership and Power in the Chinese Community of Thailand (1958), and various articles on China and Southeast Asia in professional journals.*

Overseas Chinese pose a set of complex problems not only to scholars but also to men of affairs in and out of Asia. The very definition of a Chinese becomes intricate in the overseas context, for neither ancestry nor legal citizenship status is a realistic criterion of Chineseness in Southeast Asia. Millions of Chinese in this region neither claim nor exercise any prerogatives of Chinese citizenship and, because of widespread miscegenation and assimilation, untold thousands of persons descended from Chinese immigrants are identified completely as indigenous Southeast Asians. Nor can retention of Chinese cultural behavior serve as a reliable guide. Several million overseas Chinese can neither speak nor understand Chinese, and some groups among them are so un-Chinese as to prefer matrilocal marriage, to eat with spoon and fork rather than chopsticks, and to worship indigenous spirits or the Christian God in preference to Chinese deities.

In the last analysis, being a Chinese is, in Southeast Asia, essentially a matter of self-identification. Those who identify themselves as Chinese are almost without exception descended from Chinese immigrants through the male line and still use—at least in some form and in some circumstances—the surname inherited patrilineally from that ancestor. Overseas Chinese, then, comprise China-born Chinese residing abroad together with those patrilineal descendants of Chinese immigrants who still regard themselves personally and socially as Chinese. By this definition, their numbers in Southeast Asia today approach 10 millions. These are distributed among the major geographical units of the region as shown in Table 1.

Overseas Chinese are most strongly concentrated in the areas bordering the southernmost extension of the South China Sea: Their proportion of the total population reaches 44 per cent in Malaya and Singapore together, and lies between 27 per cent and 31 per cent in Sarawak, the northwest coastal districts of Indonesian Borneo, Bangka and Billiton and the Riouw Archipelago. They are most thinly distributed in the territories bordering China itself (North Vietnam, Laos, northern and northeastern Thailand, and northern Burma), where the Chinese constitute considerably less than 1 per cent of the total population. The countries with the largest numbers of overseas Chinese are Thailand, Malaya, and Indonesia—each with at least 2¼ million.

TABLE 1—Distribution of Overseas Chinese

| Country or Territory | Ethnic Chinese | Total Population | Per Cent Chinese |
|---|---|---|---|
| North Vietnam | 50,000 | 13,500,000 | 0.4 |
| South Vietnam | 780,000 | 12,000,000 | 6.2 |
| Cambodia | 230,000 | 4,200,000 | 5.5 |
| Laos | 10,000 | 1,750,000 | 0.6 |
| Thailand | 2,360,000 | 20,800,000 | 11.3 |
| Burma | 320,000 | 20,300,000 | 1.6 |
| Malaya | 2,365,000 | 6,250,000 | 37.8 |
| Singapore | 965,000 | 1,260,000 | 76.6 |
| British Borneo[a] | 270,000 | 1,000,000 | 27.0 |
| Indonesian Borneo | 320,000 | 3,500,000 | 9.1 |
| Java[a] | 1,100,000 | 55,000,000 | 2.1 |
| Sumatra[a] | 690,000 | 13,290,000 | 5.2 |
| East Indonesia[a] | 140,000 | 12,370,000 | 1.1 |
| Philippines | 270,000 | 22,280,000 | 1.2 |
| Total | 9,870,000 | 187,500,000 | 5.3 |

[a] British Borneo includes the colonies of North Borneo and Sarawak and the protectorate of Brunei; Java includes Madura; Sumatra includes Riouw, Bangka, Billiton and other offshore islands; East Indonesia includes the Celebes, Moluccas and Lesser Sundas. Portuguese Timor and New Guinea, with less than 4,000 Chinese each, are not included in the table.

## Historical Background

The large population movement implicit in these numbers had its origin in the early junk trade of Chinese merchants from the southeastern maritime provinces of Fukien and Kwangtung By the sixteenth century, Chinese trading communities were permanently established in several parts of Southeast Asia. The rising volume of Southeast Asian trade which followed Wester

stimulus and participation and the establishment of peace and order through consolidation of Western colonial rule encouraged migration on an increasing scale. Mass immigration, however, was a phenomeon of the century ending in 1950. In the early days, settled immigrants generally took indigenous wives, and with the exception of parts of Indonesia and Malaya complete assimilation with the indigenous peoples was the rule within a few generations.

During the past fifty years, however, the assimilation rate has slowed everywhere. This has followed the efflorescence of modern Chinese and Southeast Asian nationalisms, the steady increase during this century in the proportion of women among Chinese immigrants, and the development throughout Southeast Asia of systems of mass Chinese-language education. The quickening of Chinese patriotism among overseas Chinese, the growing preponderance of all-Chinese families, and the use of formal education to perpetuate Chinese culture and instill political loyalties have given the descendants of twentieth-century immigrants the cultural continuity and the persistence of national identity mistakenly thought to be universal attributes of overseas Chinese in earlier periods.

The immediate issues which give the overseas Chinese international importance took on urgency as nationalist movements brought political independence almost everywhere in Southeast Asia and as Communism was consolidated in China. They are rooted, however, in the peculiar position held by Chinese in colonial society and in the colonial economy. Partly by governmental design and partly through the play of divergent cultural systems, the Chinese in Southeast Asia achieved a social and economic position always distinctive and usually superior to that of the indigenes. Under these circumstances, Southeast Asian nationalism early developed an anti-Sinitic tradition which found more open expression as indigenous elites came to power. The overseas Chinese for their part brought to the postwar era feelings of superiority which at the very least are inappropriate to the new context.

Four of the overseas Chinese issues brought into sharpest relief by postwar developments will be dealt with on a country-to-country basis. These are (1) the economic role of overseas Chinese who dominate or control major segments of the nonagricultural economy throughout Southeast Asia; (2) the education of local-born Chinese children, over a million of whom by 1948 were enrolled in Chinese-language schools, alien in curriculum and influence; (3) determination of citizenship and problems of dual nationality arising from China's citizenship claims over all persons of Chinese descent; and (4) the political integration of overseas Chinese into the new national states of Southeast Asia. It is possible here to survey only the most significant of the recent developments relevant to these four issues and in only five of the major Southeast Asian countries.

It is no coincidence that the most drastic measures taken against overseas Chinese since the rise of Communist China were imposed by the three Southeast Asian protégés of the United States, each of which recognizes the Taipei regime as the only legitimate government of China. Thailand, the Philippines, and South Vietnam have resorted to stringent measures, however, not through encouragement from either Washington or Taipei—to the contrary, both governments opposed them—but because a protective American umbrella in effect shielded these countries from the impact of Peking's power and because the Chinese Nationalist regime was powerless after 1949 to provide any real protection to overseas Chinese.

## THAILAND

In independent Thailand, nationalism evolved rather than erupted, with the result that a gradual imposition of controls on overseas Chinese began over forty years ago. These reached a peak of severity during the first administration of Pibul Songram, and when Pibul returned to power in 1948, a new wave of restrictions was expected. The first moves concerned education. Within a month, all Chinese secondary schools were closed and a master plan was announced whereby the number of Chinese primary schools would be reduced from over 430 to an eventual figure of 152. From 1948 to 1955, the Ministry of Education waged an unremitting campaign to limit the financial base of Chinese schools, to Thai-ify their staffs and curricula, and to cleanse them of political influence. The campaign was largely successful. By 1955, the administrative and teaching staffs of Chinese schools were largely Thai, and with the exception of five and one-half hours per week of Chinese, all instruction was in the Thai language. The number of students attending these so-called Chinese schools fell in eight years from 175,000 to less than 50,000.[1]

The administration's efforts to Thai-ify the national economy were equally sweeping. Positive measures included a sharp increase in facilities for Thai vocational education and a massive expansion of governmental participation in industry, transport, commerce, and finance. Governmental agencies and semigovernmental Thai enterprises entered fields previously dominated by Chinese, and in the process of monopolizing others excluded Chinese citizens. New legislative restrictions were also imposed. Acts passed in 1949, 1951, and 1952 together reserved eighteen industrial and service occupations for Thai citizens. A law passed in 1956 provided that any class of businesses employing ten or more persons may be required by royal decree to employ up to 50 per cent Thai nationals. In consequence of this governmental effort, increasing numbers of Thai have acquired business interests, more often than not in co-operation with Chinese business skill and capital.[2]

With regard to the citizenship issue, the Thai government passed new legislation in 1953 which denied Thai citizenship by birth to children both of whose parents were Chinese citizens. At the peak of the government's anti-Sinitic campaign, it abandoned all attempts at integrating its citizens of Chinese extraction. The electoral law of 1951 required candidates for political office to have been born of a Thai father and placed stringent restrictions on the franchise of citizens born of an alien father. In 1952, the Ministry of Interior began discriminating against citizens of alien extraction in its land policy. In 1953 a new Military Service Act added "persons born of an alien father" to those who shall not be called into active service.[3]

In 1955, following the establishment of the Southeast Asia Treaty Organization (SEATO), the Asian-African Conference in Bandung, and Pibul's tour abroad, the Thai government relaxed its anti-Chinese campaign. Excesses have since been avoided with regard to the economic and education issues, although no basic change in policy can be expected. With regard to citizenship and political integration, however, a com-

[2] *Ibid.*, pp. 353–62.

[3] *Ibid.*, pp. 320, 374.

plete reversal of policy has occurred since 1956, with new nationality, electoral and military-service legislation reaffirming the traditional Thai efforts to assimilate socially and integrate politically the descendants of Chinese immigrants.

## THE PHILIPPINES

In the Philippines, manifestations of economic nationalism came almost as early as in Thailand. The Constitutional Convention in 1935 approved a resolution declaring that "public interest requires the nationalization of the retail trade." Not until May 1954, however, did a bill to this end become law. By its provisions, aliens (Americans excepted) and partnerships and corporations the capital of which is not wholly owned by Philippine citizens are prohibited from engaging directly or indirectly in the retail trade. No new retail shops may be established by aliens, but existing enterprises are not required to liquidate prior to the death or retirement of the proprietor or prior to 1964 in the case of partnerships and corporations. This legislation affects between 15,000 and 20,000 Chinese retail establishments with gross sales in the neighborhood of 500 million pesos. Chinese business interests immediately challenged the constitutionality of the law, but in 1957 the Philippine Supreme Court rejected the appeal, taking the occasion to charge the alien retailer with "utter disregard for . . . the people on whom he makes his profit." A recent decree, as yet little enforced, requires retail enterprises owned by Philippine citizens to employ only Philippine citizens, thus promising the eventual nationalization of labor as well as of ownership.

The Philippines was the last Southeast Asian country to tolerate outright foreign control of Chinese education. Until recently, Chinese-language schools, which have a current enrollment of over 45,000, followed regulations of the Ministry of Education in Taipei and were supervised directly by the Chinese Embassy in Manila. In 1957, however, the Philippine Ministry of Education took over formal control; to date it has taken only moderate steps to Philippinize the Chinese schools.

## SOUTH VIETNAM

In the fall of 1956, South Vietnam launched an attack on the overseas Chinese problem fully comparable in its harshness to the Thai campaign of 1952–53 but with a long-range assimilationist purpose. Ordinance No. 48, promulgated by the President in August, granted Vietnamese citizenship automatically to all persons of Chinese extraction born in Vietnam. A few days earlier the authorities had ordered a registration of all Chinese born abroad, and in subsequent months the police began confiscating alien registration papers from local-born Chinese and compelling them to accept citizenship papers. This approach to the citizenship issue elicited strong reaction in Peking as well as Taipei and moved the theretofore local-born Chinese citizens—whose number may have exceeded half a million—to mass civil disobedience. The deadline for registration was extended to August 1957, at which time less than 100,000 had complied. The only alternative allowed by the government was repatriation to Taiwan, and even this was denied Chinese citizens born of a Vietnamese mother. Red tape and the abrupt closure of repatriation lists in June 1957 kept the number of those evacuated—by airlift—to a nominal 3,000. Conspicuously absent from this measure was any element of free choice. The effort to force assimilation is also seen in concurrent Vietnamese regulations requiring Vietnamese language instruction in Chinese schools and abolishing Chinese signs from shops, and in pressures on local-born Chinese to Vietnamize their names.

The Vietnamese citizenship ordinance was followed almost imediately (September 1956) by a decree barring Chinese nationals from eleven important categories of occupations. Aliens were required to liquidate or turn over to Vietnamese within one year their interests in rice milling, the cereals trade, all transport enterprises, and commission agencies. They were given only six months to vacate business operations in the remaining seven categories, including such traditionally Chinese occupations as butchering and retailing of articles of daily use. This decree, more sweeping than the Thai restrictions and more immediate in its effect than the Phillipine law of 1954, had by 1957 rather thoroughly disrupted the entire Vietnamese economy, forcing the government to retreat in almost every aspect of its interpretation and enforcement of the original decree.[4]

## INDONESIA

Indonesia's approach to overseas Chinese problems is of special importance not only because it is the largest country in Southeast Asia and the home of a quarter of the region's Chinese, but also because it maintains diplomatic relations with Peking. A major aim of all Indonesian administrations since the achievement of political sovereignty in 1949 has been the installation of indigenous Indonesians in the business life of the country. Ministerial regulations and decrees have effectively excluded alien Chinese and wholly alien corporations from importing large categories of goods; from establishing new banks, insurance companies, and most types of factories; and from owning rice mills and certain types of transport agencies. A 1957 regulation calling for the registration and relicensing of all foreign enterprises envisages the eventual extension of restrictions on aliens to every sector of the economy.

The Provisional Constitution, which enjoins authorities from discriminating against particular groups of the citizenry, would seem to preclude an extension of official economic discrimination to citizens of Chinese descent. Increasingly since 1950, however, the relevant governmental agencies have used their control over credit facilities, licenses, and foreign exchange to favor indigenous Indonesians as against other Indonesian citizens. While this policy has aroused protest from liberal Indonesian political groups, it has proved altogether too mild for the growing body of indigenous entrepreneurs traditionally rooted in a strong Islamic ethic. Early in 1956 these interests acquired a prestigeous and vigorous spokesman in the person of Assaat, former acting president of the Republic of Indonesia. The movement founded in his name rallied widespread nationalist support for a racist economic program favoring "pure" Indonesians as against "new" citizens of foreign descent. Despite opposition from the Communist Party and Assaat's defection to the rebel cause in 1958, his movement has strongly colored the continuing program of economic nationalism in Indonesia.

The Indonesian government's handling of the citizenship issue has attracted widespread interest throughout Southeast Asia. Under the terms of the agreements granting sovereignty to Indonesia, Dutch subjects of Chinese origin who did not specifically reject

[4] Bernard B. Fall, "Viet-Nam's Chinese Problem," *Far Eastern Survey*, Vol. 27 (May 1958).

Indonesian citizenship by December 1951 automatically became citizens of the new country. Large bodies of Indonesian opinion, however, felt that this passive system provided little assurance that citizens of Chinese descent would give sole allegiance to Indonesia. Accordingly the Indonesian government negotiated an unprecedented nationality treaty with Communist China, signed in April 1955. The treaty, as supplemented by an exchange of notes, was ratified by the Indonesian Parliament only in December 1957, and has not yet been implemented. By its provisions, persons of Chinese descent who acquired Indonesian nationality under the earlier passive system (with the exception of "a certain group," not yet officially defined, considered by the Indonesian government to hold only Indonesian citizenship) must opt for Chinese or Indonesian citizenship within a two-year period. Persons of dual Chinese-Indonesian nationality who neglect to choose will automatically acquire only Chinese citizenship. In the future, children born in Indonesia of fathers holding Chinese citizenship will acquire only Chinese citizenship. The great significance of the treaty lies in the renunciation by China of all claims to the citizenship of Indonesian Chinese who choose to adopt Indonesian nationality. It will be noted that in the absence of additional legislation providing for easy voluntary naturalization, the descendants of foreign Chinese will remain Chinese citizens in perpetuity.[5]

### *Education and political integration*

In the field of education, recent Indonesian policy toward overseas Chinese is of great significance. In 1957, forced by the decisive action of military commanders, the Ministry of Education evolved a radical policy designed to ensure a national education for all citizens in the student population. Within a year, hundreds of Chinese-language schools were converted to Indonesian-language schools following the standard "national" curriculum, and some new schools for citizens of Chinese descent were established on the same "national" pattern. Students were redistributed so that virtually no Indonesian citizens remained in Chinese schools. According to new regulations, only the major cities and a handful of towns in each province are permitted to have foreign schools. As a result the number of Chinese schools has fallen from over a thousand to a few hundred.

With regard to political integration of its citizens of foreign descent, the Indonesian government has made notable strides. Registration for elections has involved remarkably little discrimination against those of Chinese descent. A wide range of parties included Chinese in their lists of candidates. The Provisional Constitution guarantees citizens of Chinese descent at least nine representatives in Parliament and eighteen in the Constituent Assembly; since only a few Chinese won election to these bodies in 1955, the government has subsequently appointed Chinese members to fill out the quota. Many Indonesian Chinese favor working solely through Indonesian parties to avoid the dangers of communalism, but most of the Chinese electorate has supported BAPERKI, which in many respects functions as a Chinese communal party. Concerned in the first instance with the elimination of discrimination among Indonesian citizens, BAPERKI appeals implicitly to pride in Communist China, gives all-out support to President Sukarno, and generally finds itself on the side of the Indonesian Communist Party in political debates.[6]

[5] Donald E. Willmott, *The National Status of the Chinese in Indonesia* (Ithaca, N. Y.: Cornell Modern Indonesia Project, 1956), pp. 32–47.

### MALAYA

In the case of Malaya, where the Chinese population approaches in size that of the Malays themselves, the issues concerning overseas Chinese assume wholly different proportions. The future of the country depends on a solution to the communal problem, and the issue of citizenship was hotly debated and soberly considered throughout the years of preparation for the independence achieved in August 1957. According to the compromise embodied in the 1957 Constitution, Chinese residing in the Federation on Independence Day may, on satisfying an eight-years' residence requirement, register as Malayan citizens, while all persons born in the Federation subsequent to independence are automatically citizens.[7] These surprisingly liberal provisions are not unopposed by militant and religious nationalists among the Malays, but if they remain in force, an increasingly large majority of all Chinese in the country will be eligible for Malayan citizenship.

The ten-year insurrection led by Chinese terrorists under the banner of the Malayan Communist Party has been a failure.[8] In its wake Malays are extremely wary of Chinese leftist tendencies, but a general consensus opposing Communism extends to all ethnic communities. Politics at this stage in Malaya's development inevitably has a communal base, but an auspicious beginning has been made toward political integration of the Chinese. The Malayan Chinese Association, the major Chinese political vehicle, represents primarily the more moderate, Malaya-oriented elements in the community; it elicits from Malay politicians remarkably full consideration of Chinese opinion, in part because of fears that Chinese leadership may pass to more radical hands. The Malayan Chinese Association has united with the chief Malay and Indian communal organizations to form the Alliance Party, which in 1955 won 51 of the 52 elective seats in the Legislative Council. The full council of 98, which serves as parliament of the Federation until the 1959 elections, includes fifteen elected and eleven appointed Chinese members. Only 11.2 per cent of the electorate for the 1955 elections were Chinese, but the Chinese proportion will have increased markedly by 1959.[9]

In its attempt to create a common Malayan nationalism, the government eschews both the Thai and the Indonesian approaches to the problem of Chinese education. It intends neither to reduce the number nor change the instruction medium of Chinese schools, whose 1957 enrollment exceeded 320,000. Rather, it aims to bring all vernacular schools into a national system of education with a Malayan orientation, unified primarily through common teacher training and common-content syllabuses. Instruction in Malay, the national language, is already well under way in almost all Chinese

[6] G. William Skinner, "The Chinese of Java," *Colloquium on Overseas Chinese*, edited by Morton H. Fried (New York: Institute of Pacific Relations, 1958).

[7] Frank H. K. King, *The New Malayan Nation* (New York: Institute of Pacific Relations, 1957), pp. 16–17, 36. The acquisition of citizenship through registration is subject to review by the responsible Minister, who in practice is expected to exclude only those notoriously engaged in proforeign activities, that is, activists on behalf of Peking or Taipei.

[8] As of September 1958, only an estimated 600 terrorists remained at large, most of them deep in the jungles near the Thai border.

[9] *Ibid.*, p. 15; Francis G. Carnell, "The Malayan Elections," *Pacific Affairs*, Vol. 28 (December 1955), pp. 320–21.

schools, and the retraining of Chinese teachers has begun.

To date, Malay politicians in the Alliance Party have kept economic nationalism within bounds. The Constitution forbids the enactment of legislation which discriminates against any citizen or class of citizens by reason only of religion, race, or place of birth. However, it also upholds the "special position" of the Malays by continuing for at least fifteen years the pre-independence, pro-Malay quotas, land reservations, and business and professional restrictions. In a sense, this provision postpones the issue of economic nationalism in the hope that preferential policies can in the meantime raise the business skills and opportunities of Malays to a level more nearly comparable to those of the Chinese. If only to forestall militant anti-Sinitic economic nationalism, many Chinese political leaders and the Malayan Chinese Association itself are committed to strengthening the Malay role in the national economy.

## CONCERN WITH PEKING'S ROLE

The issue of Communism pervades almost every facet of the overseas Chinese problem in Southeast Asia. Every nation of the region has pursued its overseas Chinese policy with an acute awareness of Peking's growing power. Each government has severely restricted the immigration of Chinese from mainland China; each opposes Communist infiltration of Chinese schools; each realizes that some of its resident Chinese are avowed Communists willing to conduct intelligence or subversive activities for Peking; and none of these governments is sanguine about the political integration of citizens of Chinese descent when these include many whose support will go to indigenous pro-Communist political groups. Many Southeast Asian politicians have felt that the mid-1950's may be their last opportunity to bring local Chinese Communists under control and to achieve nationalistic ends affecting the overseas Chinese before the growing weight of Peking's international influence can block these steps. This view, widespread in Thailand in 1952–54 and more recently in South Vietnam, is also encountered in the Philippines, Malaya, and even in Cambodia, which in 1955 moved to naturalize local-born Chinese and to ban a wide range of professions to Chinese aliens, but which in 1958 recognized the Peking regime.

Up to 1954, Peking's overseas Chinese policy did nothing to dispel mistrust in Southeast Asia or to suggest that the vigor of Peking's protection of overseas Chinese would not increase in proportion to its international power. All pronouncements of policy during the early years stressed the task of winning over the Chinese residing abroad and concentrated on campaigns to the immediate advantage of the Communist state. In its attempt to gain maximum loyalty and support from overseas Chinese, Communist China has utilized three major appeals: (1) its protection of the interests and welfare of Chinese overseas through diplomatic means and the deterrent effect of Communist power; (2) its right as the legitimate government of China to patriotic loyalty and its appeal to pride in China's new international stature and internal accomplishments; and (3) the special privileges, services, and amenities extended to overseas Chinese and their dependents in China.[10] The loyal goodwill won by these appeals has been the basis for subsequent indoctrination in the virtues and principles of Communism.

This propaganda effort has been carried on through a variety of channels

[10] The appeals used by the Chinese Nationalist regime anticipated and closely parallel those adopted by Peking.

including Chinese schools, the Chinese-owned press, extensive radio broadcasts beamed to Southeast Asia, expense-free visits to China, and cultural missions to Southeast Asia. This vigorous program serves the national interests of Communist China in many direct and significant ways. The effort maintains the flow of remittances to the dependents in China of overseas Chinese, a valuable source of foreign exchange and indirectly of revenue.[11] It facilitates successful appeals for the investment of overseas Chinese capital in reconstruction and development corporations. It has enabled Peking to attract to the mainland tens of thousands of young intellectuals educated abroad at no expense to China, willing to devote their lives to national reconstruction. It provides China with a corps of effective trade promoters and allies in its economic offensive abroad.

This effort is by no means over, but since 1954 it has run increasingly on momentum supplied by Communist partisans overseas, while Peking has shifted its emphasis to accord with changing foreign and domestic policies. Official pronouncements from Peking had by 1958 seriously jeopardized each of its major appeals to the overseas Chinese and circumscribed the immediately advantageous results of the earlier policy.

The appeal based on special privileges and concern for overseas Chinese inevitably ran afoul of Communist China's socialization program. In the China of 1957, characterized by mass austerity and engaged in a speedy transformation to full socialism, discipline and morale were sorely tried by continuing extravagance on the part of the overseas Chinese' dependents in China, by "capitalistic" abuses of the entry privileges accorded overseas Chinese, and by the elaborate provisions protecting overseas investments and guaranteeing profits. In the policy change effected that year, the economic integration of overseas Chinese' dependents was speeded up, duty-free entry of goods brought in by overseas Chinese was stopped, and attempts to increase incentives for overseas Chinese investors were condemned as capitalistic and unpatriotic.[12]

[11] Peking's ill-advised campaign in 1951 to extort remittances from overseas Chinese was, of course, a serious departure from a policy of attracting remittances by positive appeals. It was disavowed in 1952, however, and cadres in Kwangtung and Fukien were subsequently subjected to continual scoldings for failure to "protect" overseas remittances.

## FOREIGN POLICY CONSIDERATIONS

The major determinant of China's shift in overseas Chinese policy, however, is Peking's growing reliance on the goodwill and active support of Asian governments in international relations. In 1949–50, Peking roundly denounced every Southeast Asian government, neutralist as well as pro-Western, and registered violent protests over all actions unfavorable to overseas Chinese. Gradually, however, as Communist China settled down to a sustained program for attaining general international recognition, its need for friends and benevolent supporters among the nations of Asia became of paramount importance.

In late 1953 there were already signs that this factor was conditioning Peking's policy, and on several occasions in 1954, Chou En-lai enunciated the regime's willingness to settle the ques-

[12] In June 1957, Ho Hsiang-ning, chairman of the Overseas Chinese Affairs Commission, indicated that special consideration of overseas Chinese' dependents would be limited to a "fixed period" and warned that it is "not right to make special accommodations for a few at the expense of the overall scheme that is nation-wide in scope." American Consulate General, Hong Kong, *Current Background*, No. 467 (July 15, 1957), p. 17.

tion of dual nationality and to urge overseas Chinese to be law-abiding residents of their countries of domicile.[13] Peking's current approach, gradually evolved since 1954, is embodied in the following statement by a major spokesman:

> We hold that overseas Chinese should be free to choose the nationality of the country in which they reside and should be loyal to that country and its people. As for those who wish to remain Chinese subjects, we ask them to continue to observe the policies, laws and regulations of their countries of residence and to respect the customs and habits of the local people. Overseas Chinese should be encouraged to invest commercial capital in local industries, and to cooperate with native capitalists to help develop the independent national economies of the countries in which they live. Children of overseas Chinese should study local languages, geography and history, and acquire certain skills so that they may enter higher schools or earn a living there.[14]

In short, Chinese overseas are advised to come to terms with Southeast Asian nationalists. They are to acquiesce in the efforts of the Southeast Asian countries to nationalize economic and educational systems, and they are to abandon Chinese citizenship when necessary. Peking's appeal to the patriotic loyalty of all persons of Chinese descent and its posture as grand protector of Chinese interests overseas are both seriously impaired. The earlier stress on remittances, investment in China, and promotion of China's foreign trade have been replaced by recommendations to invest locally and cooperate with indigenous businessmen. There is no mention of the vast program which attracted over 45,000 overseas Chinese students to the mainland between 1949 and 1957 but only of obtaining higher education overseas.

Is Peking sincere in its new overseas Chinese line? The record suggests that the mainland regime is in a better position today than during its first few years to forgo financial and other material help from Chinese overseas and that Peking is bending over backwards to avoid offending friendly Southeast Asian governments. It has pointedly refrained from holding elections among Chinese abroad.[15] Since 1955 the Chinese Embassy in Jakarta has been more scrupulous than the Indonesian government itself in distinguishing Chinese citizens from Indonesian citizens of Chinese descent. Indonesia provides still another indication of Peking's policy priorities. Recent decrees backed by the Indonesian Army have imposed an exorbitant tax on Chinese aliens (July 1957) and banned all Chinese-language publications (April 1958). These measures were risked on the assumption that China so valued Indonesia's international support that she would sacrifice her own sons. In fact, China's protest was so muted as to be inaudible outside the foreign ministries in Peking and Jakarta.[16]

[13] Peking's changing line forced the Nationalist regime in Taiwan to revise its attitude regarding citizenship in late 1954. Cf. Willmott, *op. cit.* (note 5 *supra*), p. 33. In 1957, Taipei reaffirmed its respect for the principle of free choice in the matter of citizenship, this time in reference to Vietnam. *Free China Review*, Vol. 7 (May 1957), p. 48.

[14] From the speech delivered by Ho Hsiang-ning in February 1958 to the National People's Congress. *Jen-min Jih-pao*, February 7, 1958.

[15] The Constitution of 1954 reserves thirty seats in the National People's Congress for representatives of overseas Chinese. This provision would be innocuous in Southeast Asian eyes only if Peking defined overseas Chinese as residents abroad holding only Chinese citizenship.

[16] The Indonesian Army has issued another decree much to Peking's advantage, namely the ban on Kuomintang organizations imposed in September 1958, in retaliation for the support given Indonesian rebels by some KMT elements. It should also be noted that Peking's policy toward overseas Chinese in Indonesia is conditioned by a desire not to embarrass the Indonesian Communist Party, which has a mass indigenous following and is vulnerable to charges of excessive concern for the rights of resident Chinese.

On the face of it, Peking has sacrificed the immediate advantages of its earlier overseas Chinese policy to the abiding need for friends among the nations of Southeast Asia. Confident that she has already won majority support among the overseas Chinese of the region and strong enough to sustain a decline in material help from them, Communist China is now unwilling to permit their special interests to hinder her domestic program of political and economic transformation or, above all, her struggle for full international recognition. Most of Peking's Chinese partisans overseas are by now sufficiently disciplined to accept the new nonprotectionist line without demur.

## *INTERNATIONAL AFFAIRS*

THOMAS K. FINLETTER. *Foreign Policy: The Next Phase.* Pp. ix, 208. New York: Harper and Brothers for the Council on Foreign Relations, 1958. $3.50.

The launching of the two Russian satellites in the autumn of 1957 revealed that the Communists are now prepared militarily to challenge the United States and its allies in the struggle for world supremacy. On the political front their strategy is to weaken the western allies by promoting discord among them, and to win over to the Communist side the uncommitted peoples of Asia and Africa.

In the light of these circumstances, the author believes that the continuation of the defensive policy of containment, never very satisfactory, "promises a future of all loss and no gain" (p. 50). Therefore, although confining our military power to defense—to deter and resist aggression—we should take the offensive "in the areas of politics, economics and world opinion." Specifically, we should repair the damage to the Western Alliance resulting from the Suez crisis of 1956, and henceforth treat our allies in the North Atlantic Treaty Organization as partners whom we should consult, rather than as members of a hierarchy subject to our orders as the "leader."

With the uncommitted peoples of Asia we should seek to build a bridge of understanding on the foundation of the United Nations Charter and its principles of peace and human freedom, in which we both believe. China is for the present lost to communism, and "non-communist Asia needs our help as . . . it faces the massive military power of Russia and China" (p. 16). We likewise need Asia, "the next battleground in the cold war" (p. 17). But we must not proceed, as we have too often done, unilaterally in the manner of an imperialist power. Proposals which we may offer for common action in the fields of economics or politics, designed to prevent these peoples from being pulled into the Communist orbit, and to enable them to choose freedom, should be adequately discussed and freely accepted.

The foregoing considerations also apply to the solution of the problem of armaments. In the pre-atomic age statesmen had to formulate their policies on the assumption that war was not only possible but probable. Today, in an age of hydrogen weapons, they must strive with a sense of the greatest urgency completely to eliminate it. Therefore, the United States should "make the attack on war the central theme of all its foreign policy . . ." (p. 199). And, especially in view of the imminent danger that fission and hydrogen weapons may be scattered all over the globe unless an effort is made to get an agreement for the control of armaments, the emphasis on disarmament "as the most immediate line of attack on war" (p. 198) is indicated. But "no successful foreign policy directed toward peace can be successful unless it strikes on many fronts at once, all with the single purpose of eliminating war from the world scene" (p. 198).

FRANK M. RUSSELL

University of California

D. W. BOWETT. *Self-Defense in International Law.* Pp. xv, 294. New York: Frederick A. Praeger; Great Britain: Manchester University Press, 1958. $7.50.

G. I. A. D. DRAPER. *The Red Cross Conventions.* Pp. ix, 228. New York: Frederick A. Praeger, 1958. $6.00.

These two volumes, dealing with two of the most controversial aspects of international law, namely self-defense and the rules of warfare, represent genuine and needed contributions to legal literature. In his volume on *Self-Defense in International Law*, Dr. Bowett of the University of Manchester wades manfully through the quagmire of terminology involving distinctions between self-defense and self-preservation, self-help, reprisals, intervention, and sanctions, traces the historical background of these terms, and emerges with a definition of self-defense based on the premise that the right can only be exercised against conduct which is delictual and on the stipulations laid down in the famous "Caroline" case more than a century ago.

Many may differ with Dr. Bowett's definitions but there can be no doubt that his analysis of self-defense in practice, brought up to a date as recent as the Suez crisis of 1956, is extremely clear and helpful. After discussing the substantive rights for which self-defense is permissible, such as independence, territorial integrity, and protection of nationals, he proceeds to a detailed account of the relationship of self-defense to war and neutrality, and concludes with a careful dissection of Article 51 of the United Nations Charter and with a study of the theory and practice of collective self-defense.

The author maintains that as a result of "the trend towards a prohibition of the state's unlimited right to resort to war" self-defense has become "legally meaningful" (p. 272), but he is quite correct in his conclusion that "the right of self-defense can only achieve full recognition" when the legal system "embodies the compulsory settlement of the question of legal responsibility on which the whole concept of self-defense depends" (p. 275).

In *The Red Cross Conventions*, Mr. Draper of King's College reviews briefly the various treaties dealing with the treatment of prisoners, civilians, and those wounded in warfare, beginning with the famous Geneva Convention of 1864, and extending through the Hague Conventions and the 1929 Geneva Conventions to the four newest Geneva Conventions of 1949. These four, which revise both the two 1929 treaties and the 1907 Hague Convention relating to the sick and wounded in naval warfare, and add an entirely new convention for the protection of civilians, are thoughtfully analyzed in the text and printed in full in the Appendix.

The author points out the changes in the former treaties and the additions to previous conventions which the newest Geneva agreements contain, showing how the experiences of World War II indicated the inadequacies of the earlier documents. He dwells at length upon the so-called "common articles" in all four conventions, namely Articles 1, 2, and 3 which he believes contain perhaps the most significant contributions to the rules applicable to armed strife (p. 95).

These three articles stipulate that the conventions are to be respected "in all circumstances," including situations in which a formal state of war may not be recognized or in which one of the states in conflict may not be a party to the treaty or in which the conflict may not be "of an international character." The "common Article 3" lays down a minimum code of humanitarian behavior in cases of "armed conflict not of an international character," thus extending to civil strife, for example, prohibitions against torture, the taking of hostages, and "outrages upon personal dignity," even if there is no formal belligerency.

In his conclusion, Mr. Draper states that as of the time of writing the four Geneva

Conventions, consisting of 427 articles, bind sixty-six states and "constitute more than one half of the total content of the law of war" (p. 114). He views them as a "unique contribution to the modern law of war" (p. 115) and hopefully suggests that these "humanitarian principles of justice and compassion must govern . . . the treatment of man by man if our civilization is to be worthy of the name" (p. 115). However, there is always the gnawing doubt as to the value of any rules of war in a nuclear age, or is the attempt to have some rules better than having none at all? Perhaps so!

PAYSON SIBLEY WILD
Vice President and Dean of Faculties
Northwestern University

JOHN GANGE. *University Research on International Affairs.* (Studies in Universities and World Affairs.) Pp. xvii, 147. Washington, D. C.: American Council on Education for the Carnegie Endowment for International Peace, 1958. $3.00.

This is the sixth of a series of reports, sponsored by the Carnegie Endowment for International Peace, on Universities and World Affairs. Previous reports dealt with education about international affairs, foreign students, training of specialists, and so forth. The present report surveys the conditions in colleges and universities which restrict the amount and quality of research on international affairs.

This book is not addressed to the professional research scholar for he already knows the problems he faces. As the author says, "what is in the report came from the author's conversations with these scholars." However educational administrators, foundation officials, officers of voluntary organizations in the international field, and government policy makers may find this report some aid to understanding the conditions under which useful research concerning international affairs will derive from their academic colleagues.

Among the obstacles to research which Mr. Gange enumerates are the unsympathetic attitude of some college administrations, the competition of rival demands upon faculty members' time, shortages of funds, lack of contacts with professional confreres by researchers in smaller institutions, and restrictions on travel and on access to government documents.

Among the more suggestive discussions is that concerning barriers to communication in the world of scholarship. The author discusses the proclivity to secrecy on the part of the scholar himself as well as such external impediments as overclassification of documents, classification of contract research, and suspicion of American scholars by many foreign governments.

Gange notes the great concentration of research activity in a relatively few centers. He estimates that the major portion of campus-based research in international affairs is conducted in less than six per cent of the 763 member institutions in the Association of American Colleges. Quite properly Mr. Gange accounts for this concentration in terms of the institutional environment, not by the myth that all talent has gravitated to those few institutions. Yet even if there is much potential research talent in other institutions which has been turned in other directions by the demands of the environment, still it is not clear that the situation can be changed. Mr. Gange does not explore the question of how far it is in the nature of modern research in all fields to be a highly concentrated activity. The problem of whether this is a good thing, whether it is inevitable, and what to do about it if it is neither good nor inevitable is one which goes beyond the present study, although Gange touches on a number of the relevant considerations.

ITHIEL DE SOLA POOL
Professor of Political Science
Center for International Studies
Massachusetts Institute of Technology

ROBERT E. ASHER and others. *The United Nations and Promotion of the General Welfare.* Pp. xvi, 1216. Washington, D. C.: Brookings Institution, 1957. $8.75.

Having now passed the first decade of United Nations history, our hopes of a more mature perspective on this complex organization are being realized by the publication of numerous studies. Few of these are as useful or impressive as those being undertaken by the Brookings Institution, of which this volume is one. The rewards to be gathered from this work are many, even if they are not easily won. Few books deserve the handicap of over a thousand pages of reading matter; perhaps this one would have benefited from more stern editing, but dogged pursuit—by both authors and readers—results in impact.

The work is essentially a survey and an accounting of the activities of the United Nations and related agencies in dealing with problems of international co-operation in economic and social affairs, in the promotion of human rights, in the advancement of dependent peoples, and in the efforts to harmonize conflicting national views in solving these problems. As is readily visible, there have been remarkable and even revolutionary changes in the last decade in most of these matters, but the issue here is one of discerning the role of the United Nations in all of this. The struggle of the authors in this pursuit can be described as valiant, responsible, informed, and, frankly, dogged. It is also imperiled by acute complexity, particularly in Part Two, which has to do with economic and social matters. But these things are complex, and they should be treated accordingly. Moreover, the authors are all well-equipped authorities, intimately knowledgeable in their fields.

As for the role of the United Nations, the reader may well be left with the lingering impression that in all of this maze of activity a rather inordinate amount of United Nations energy has been expended either in flogging dead horses or in trying to harness unharnessable ones. Further, there is the impression that the authors would all be far happier if somehow politics could be abolished. There is, moreover, a certain awe and perhaps hints of defeatism at the developing United Nations preoccupation with the problems of the underdeveloped countries.

There is little room for particular comment, and the reviewer will pass over the chapter on economic co-operation in Part Two with only the comment that it was by all odds the most difficult to follow—a comment offered more in sympathy with the author than with the reader. The chapter on UNESCO was developed with a sure touch of realistic understanding, and merits a high rating on the list of "recommended readings" regarding that badly-debated if properly-contentious agency. The chapter on "Problems of the Underdeveloped Countries" is also rewarding, sensitively written, and realistically treated. Part Three on Human Rights is an account of the United Nations in one of its less reassuring aspects, and deserves high marks for mature handling. Part Four on Dependent Peoples is excellent, not only for the breadth and depth of its coverage, but for bringing into adequate focus the little-known Committee on Information and the struggle with Article 73(e). Finally, the terminal evaluation is not only adequate and helpful, but commendably realistic.

To conclude, this reviewer survived the cautious realism of the survey and ended up with a far deeper appreciation of the necessity and worth of the United Nations. To bring order to a disordered world—when nearly half the world appears to have a vested interest in the continuation of disorder—is not a task we can afford to abandon. And we are learning as much from the failures as we are from the successes—rare as they may be—of the United Nations. This weighty work teaches one respect and humility, and it definitely offers guidance and better understanding.

ROSS N. BERKES
Director, School of International Relations
University of Southern California

EDWARD B. GLICK. *Latin America and the Palestine Problem.* Pp. viii, 199. New York: Theodor Herzl Foundation, 1958. $4.50 clothbound; $2.75 paperbound.

This study deals with the positions taken by Latin-American delegations to the United Nations on the questions laid before that body affecting Palestine and Israel. With the exception of a few minor excursions into more recent territory, 1952 is the terminal date of the study. The author finds that, during the period reviewed, the Latin Americans generally supported the

Israeli cause in the United Nations. He attributes this to the effectiveness of Jewish diplomacy, the existence of some philosophical principles held in common by Latin Americans and Israelis, and a distance between the Middle East and the Western Hemisphere great enough to permit the Latin Americans the luxury of voting their consciences, uncontaminated by considerations of national interest. Furthermore, the author believes that Latin-American endorsement in the United Nations has been of crucial importance to Israel. His reasons for this include the voting strength of the twenty states of Latin America, the personal influence of some of its delegates in obtaining the support of others in the United Nations, the fact that Latin Americans presided over five of the sessions of the General Assembly covered in the study, and the circumstance that three of the eleven members of the United Nations Special Committee on Palestine (UNSCOP) were Latin Americans.

The book suffers from one serious defect. Largely due to his insufficient attention to problems of research design, the author is unclear—and, at some points, downright inconsistent—in his formulation of the research task he set for himself. Is this study an attempt to employ the Palestine question as a test of the overall success or failure of the United Nations? Is the book an analysis of the importance of the international organization, with emphasis on the Latin-American delegations within it, to Israel? Or is this a case study of the role of small states, as illustrated by Latin America, in an international organization? Passages can be found, in various chapters throughout the book, in which it is separately said that each one of these is the purpose of the study; at one curious point, the methodologically remarkable claim is made for all three in combination. In his reluctance to determine what is assumed and what is to be tested, which are constants and which are variables, the author seriously limited the type and significance of the findings awaiting him.

On other counts, it should be pointed out that Glick's style is quite readable, and that his sources are well documented. Many students will find the data assembled for the Appendices—particularly the voting tables on the Palestine question—extremely useful. But this reviewer cannot escape the conviction that the volume could have been far more significant had its central research problem been more sharply and clearly defined.

GEORGE I. BLANKSTEN
Professor of Political Science
Northwestern University

HENRY W. EHRMANN (Ed.) for the International Political Science Association. *Interest Groups on Four Continents*. Pp. xiv, 316. Pittsburgh: University of Pittsburgh Press, 1958. $6.00.

This volume is the outgrowth of a round-table conference held by the International Political Science Association in Pittsburgh in 1957. About thirty professors from fourteen nations attended, listened to working papers, and discussed the implications and generalizations of these papers. About two-thirds of the book is devoted to the role, organization, and operation of interest groups in Australia, Finland, France, Germany, Great Britain, Japan, Sweden, United States, and Yugoslavia. These individual papers are filled with information never before brought together in a single volume. The Yugoslavian paper is of great interest, for it presents the political system of that nation in a far less critical light than do most works on Tito's state. Author Djordjevic writes, for example, "Yugoslavia never belonged to those countries where the Party constitutes the core and the sole motive force and directing power of the State mechanism and political process."

Following the analyses of the various countries, the book summarizes the proceedings of the round table. These include discussions of the identification, internal organization, and public relations of pressure groups, the consideration of interest groups' influence on political parties and the governmental process, and the over-all effects of groups on consensus and decision-making. This section brings to light many additional facts and concepts regarding groups in political societies throughout the world.

**The Gandhian Philosophy of Conflict**

By JOAN V. BONDURANT

An exciting study of Gandhi's technique of nonviolence, which he called *satyagraha*, and described as a "movement intended to replace methods of violence, based entirely upon truth." In terms familiar to the West, the author explores the distinguishing characteristics of the Gandhian technique, the relevance of continuing experiments in its refinement, and the far-reaching implications *satyagraha* has for social and political philosophy and the problem of conflict on all levels. *269 pages. $5.00*

**Ethics in a World of Power**

**The Political Ideas of Friedrich Meinecke**

By RICHARD W. STERLING

Writing from a country shattered by two World Wars and by Nazi barbarism, Friedrich Meinecke, Germany's foremost historian of this century, was deeply troubled by the problem of reconciling power and justice in international affairs. This study of his political philosophy traces his thinking about nationalism and power politics, the dilemmas that beset the man of action in political life, and the possibility of "ethics in a world of power." The author studied under Meinecke and used primary sources in Germany.
*336 pages. $6.00*

**Population Growth and Economic Development in Low-Income Countries**

By ANSLEY J. COALE and EDGAR M. HOOVER

A study of the alternatives confronting low-income countries with respect to population growth that shows the nature and extent of economic gains resulting from fertility reduction. India is used as a case study in this book that has direct implications for all low-income, agrarian areas entering into a program of economic development. *402 pages. Tables & charts. $8.50*

*The Journal of Asian Studies*

*The Journal of Asian Studies,* formerly known as the *Far Eastern Quarterly,* is the publication of The Association for Asian Studies. It is the leading scholarly journal dealing with research in the various disciplines of the social sciences and humanities on East, Southeast, and South Asia, from Japan to Pakistan. Articles, book reviews, and review articles are published in the four regular numbers annually. In addition, a fifth number, the "Bibliography of Asian Studies," lists significant books and articles in Western languages published on this area during the preceding year.

Membership in the Association, which includes a subscription to the five numbers of the *Journal* and the Association's *Newsletter,* is $10.00 a year, domestic or foreign (with a special $7.00 rate for students). For subscription or membership, apply to the Secretary of the Association, Box 2067, Ann Arbor, Michigan.

*Kindly mention* THE ANNALS *when writing to advertisers*

The major appeal of this book will be to the student of government, but the lay reader can learn much from it if he has some background in government. For the political scientist, the volume demonstrates the value of a comparative study of pressure politics and the potential of round tables composed of political scientists from all parts of the world. American political writers have often asserted that pressure groups are more important in the United States than in those nations operating under a strong national party system. Readers of the volume are certain to feel that this assumption needs a drastic revaluation. Although the participants were cognizant of variations in different systems and countries, they were able to find certain uniformities. One of these is that the "pluralist interest group system" is found in one degree or another in both Western and non-Western countries.

Professor Henry W. Ehrmann deserves credit for a superb job as *rapporteur* and editor. A most useful Index has been included. All in all this book is a substantial contribution to the growing literature on pressure groups.

HAROLD ZINK and others. *Rural Government in Sweden, Italy and India: A Comparative Study.* Pp. xiii, 142. New York: Frederick A. Praeger under the auspices of The International Political Science Association, 1958. $4.25.

The International Political Science Association, under a UNESCO contract, assumed the responsibility for conducting this comparative study of rural local government in Sweden, Italy, and India. The responsibility was great, for accurate information on rural local government is scarce and a comparison of the three countries selected certainly has never been attempted before. Despite the uniqueness of the venture, one must conclude that the book is stronger in its separate parts than it is as a considered whole. The general reporter, Harold Zink, and the reporters for Sweden (Arne Wåhlstrand), Italy (Feliciano Benvenuti), and India (R. Bhaskaran) labored diligently, and their contributions are worth examining with care. But three more varied societies, with more differing aims and institutions of rural local government, could scarcely have been found had one especially looked for a group to contrast. Even the definition of "rural local government" called for comment all around, and each reporter necessarily wrote his contribution bearing in mind the nuances of the definition which suited his own case.

This is a case of a research basket of apples, oranges, and pears; the fact that summary statements at the end of each substantive chapter, plus some concluding comments, are added by the general editor only helps to identify the differences and contributes little towards the goal of constructing general propositions in political science which would be applicable to the field of local government. The case might have been different had three or more countries of more similar historical and cultural backgrounds been selected. It appears to have been premature to attempt the universal scale implied by the research design of this project.

The scattered sections by the reporters are scissored-and-pasted into functional chapters—scope, history, legal status, machinery, activities, intergovernmental relations, finance, citizen participation, and parties and interest groups. It was left to the ingenuity of the various reporters to expand here and there in the text enough to sketch in regional social histories which have been so intimately related to the form and function of local government everywhere. It would have been far more satisfactory had the country parts been presented as units, leaving the general editor free to formulate his own comparative statement at the end.

As one especially concerned with studies of India, I may add that the parts on India are excellent as far as they go. Regional—and even localized—variations are so complex and unexplored in India's federal system of government, however, that one sympathizes with several anguished reminders from the Indian reporter emphasizing the highly generalized nature of his

comments. A series of detailed reports on each of India's fourteen states will be needed before anything approaching adequate material will be available for generalizations embracing all of India. India, at this stage in the development of political science, is its own best arena for comparative studies.

The Index is helpful, but the selected Bibliography is sketchy.

Berkeley

## *ASIA AND AFRICA*

CHANG KIA-NGAU. *The Inflationary Spiral: The Experience in China, 1939–1950.* (Technology Press Books in the Social Sciences.) Pp. xvii, 394. New York: The Technology Press of Massachusetts Institute of Technology and John Wiley & Sons; London: Chapman & Hall, 1958. $10.00.

There are few individuals better qualified to write on the economic and financial problems of China and the Chinese government in recent decades than Chang Kia-Ngau. He has been a Deputy Governor and Governor of the Bank of China, Cabinet Minister in the Ministry of Railways and the Ministry of Communications, Economic Adviser to the Nationalist Government, Director of the Central Bank of China, the Bank of China, and the Board of Joint Administration of Government Banks, and, in the post-war period, Chairman of the Manchurian Economic Mission. Bringing his knowledge and experience to bear on this subject is roughly equivalent to having Arthur F. Burns, Ewan Clague, and William McC. Martin, Jr. collaborate on a book dealing with the American economy, 1953–57.

The text reflects this special competence. It is comprehensive and filled with both facts and insight. Numerous statistical data give depth and professional flavor to the writing which is precise, analytical, and arresting. Chang's employment of the general equilibrium non-*ceteris paribus* type of analysis is refreshing as well as illuminating, coming as it does in the wake of the rise of econometrics. It is reassuring to learn that statistical data pertaining to such things as consumption, investment, and taxes are to be found and can be used in the real world as well as in the economic models.

The chief defect of the study is a pardonable one. The author is so totally immersed in his own subject that he sees it as the predominant issue of the period under consideration, as the central problem of the times around which all the others revolve. Most notably: "Many historical forces contributed to the collapse of the Nationalist government after World War II, but the direct and immediate cause which overshadowed all other factors was undoubtedly the inflation" (p. 363). With all due respect to Chang, it may be argued that the power of the Chinese Communist Army and the effectiveness of the Chinese Communist propaganda concerning the distribution of wealth and income in China had as much—if not more—to do with the Nationalist government's downfall as did the inflation. He observes that the Nationalist government did not possess "the wisdom and courage to undertake unpopular measures" (p. 365). Neither did it possess the common sense to undertake certain popular measures which would have at least retarded if not prevented its collapse—for example a land tenure reform program.

Despite the question of emphasis, the book is an outstanding one. It is strongly recommended if not required reading for all students of economic development.

SIDNEY KLEIN
Assistant Professor of Economics
Rutgers University

PAUL A. VARG. *Missionaries, Chinese, and Diplomats: The American Protestant Missionary Movement in China, 1890–1952.* Pp. xii, 335. Princeton: Princeton University Press, 1958. $6.00.

Within the field of his special interest and professional competence, Professor Varg has produced what, on the whole, is an excellent book. With an engaging frankness he states that his primary interest is in Sino-American diplomatic relations. Through diligent research in pertinent sources, both printed and manuscript, he has covered the close inter-connection between Protestant missions in China and the policies and actions of the United States Government, especially, but not exclusively, in the years 1890–1952. Less successful but informing as an account by one who is confessedly "an outsider to the enterprise" (p. ix), is the account of the entire scope of American Protestant missions in China, with changing emphases in the Chinese program and shifting attitudes among the supporting constituencies in the United States. Here the author's lack of background is apparent, both in numerous but relatively minor mistakes of fact, and in a failure to see the story to which he has addressed himself in its setting in the history of Christian missions, from many nations and branches of the faith, not only in China but also elsewhere in the world. He rightly discerns a basic issue in the contrast between the triumph of Communism in China and the apparent debacle of Christian missions, with its seeming defeat of Christianity. But in ascribing the reason to the fashion in which Soviet ideology "was presented in terms of meeting the needs that the Chinese themselves felt" and suggesting that if "Christianity had been first and foremost an economic and political doctrine rather than a religion emphasizing the spiritual, it might have overcome the handicap of being foreign" (pp. 321–322) he oversimplifies the problem and neglects important factors—as do those who ascribe the failure of the Roman Catholic missions to win China in the eighteenth century to the refusal to follow the methods of accommodation to the culture of the empire which were formulated by Ricci and other Jesuits. In the area in which the author is a specialist there is the strange omission of the part which missionaries played in the return of a portion of the American Boxer indemnity. Also in the realm of politics, it is astonishing to read that the Taiping Rebellion was "a "Christian movement" (p. 7). That certain of its features were of Christian provenance and that its leader had been influenced by contact with Protestantism has long been recognized, but the accuracy of labelling as "Christian" the syncretistic amalgam of those elements with others of quite different origin is at least open to debate.

KENNETH SCOTT LATOURETTE
Sterling Professor of Missions and
Oriental History, Emeritus
Yale University

RYUSAKU TSUNODA, WM. THEODORE DE BARY, and DONALD KEENE (Eds.). *Sources of the Japanese Tradition.* (Records of Civilization, Sources and Studies, No. LIV, Introduction to Oriental Civilizations.) Pp. xxvi, 928. New York: Columbia University Press, 1958. $7.50.

Teachers, students, and the wider public will welcome this first of three volumes which will provide edited selections from the traditions of Japan, India, and Pakistan, as well as China. Institutions with a limited budget for library accessions concerning Asia will find that such volumes of translated readings offer much for the investment. It is also evidence of the maturing of Japanese studies in America that this collection, an enriching companion to general histories of Japan, could be prepared.

This book stresses the intellectual traditions of Japan as expressed by writers. Of course many of the original authors were leaders of experience and action—monarchs, officials, courtiers, priests, philosophers, moralists, warriors, artists, and social reformers. The volume has been produced in connection with the Columbia College General Education Program in Oriental Studies.

The readings are organized into five parts according to historic periods: the Ancient (106 pp.), Heian (79 pp.), Medieval (117 pp.), Tokugawa (284 pp.), and Modern—or "Japan and the West"—(315 pp.) eras. Within sections there are, in all, twenty-nine topical chapters with documents grouped under sub-topics. Some inclusions are complete documents; others are compact portions, while from still others (as, for example, the Constitution of 1889) scattered passages or articles are quoted. Of course, more perspective was available for choosing materials from the

earlier periods. Specialists will be able to think of important writings, movements, and schools of thought which are not represented, but selection was imperative; on the whole it has been well done, although in a few cases the editors seem to have accepted the favorite pieces recommended by contributors, and in a few cases these were what the latter happened to have worked on in the recent past.

Selection must have been especially difficult for the modern period with all of its change and complexities. Certain of these readings rank with the most interesting, however. They include important arguments about national policy before and during Japan's expanding intercourse with maritime powers, political documents of the reformative Meiji era, examples of Japanese liberalism, revolutionary nationalism, militarism, socialism, religious pietism, and thinking since World War II about the role and special contributions of which Japan is capable.

Prior to this last section, it is mainly the Japanese cultural tradition which has been illustrated but in the division on Japan since about 1850 there is increased attention paid to political writings.

IRENE B. TAEUBER. *The Population of Japan.* Pp. xv, 461. Princeton: Princeton University Press, 1958. $15.00.

This major work, many years in preparation, is a survey of Japanese population history from the early legendary period onward, a guide to and critique of the official population data, and a detailed analysis of the demographic development from 1920 to 1955. It is largely based on the Japanese sources that are available to few western demographers; and for this reason, and also as a result of its extensive classified Bibliography, this volume promises to serve as the principal introduction to Japanese population materials for foreign scholars.

Japan has long been of particular interest to western demographers, to many of whom it has been the classic example of the population problem, but it has much more to offer to the student of population. The nation has a long political and demographic history that can be traced in outline and growing detail over a number of centuries, and it is unique among Oriental nations in the extent and quality of its modern population data. It also constitutes the outstanding example of the introduction of western industrialization and urbanization into an eastern society. Besides all this the demographic record spans the rise and fall of an empire, from the expansion in the Western Pacific and on the Asiatic mainland to final military disaster and return to the narrow limits of the home islands.

*The Population of Japan* traces the demographic correlates and consequences of this wide gamut of cultural, economic, and political change. Here two principal contributions of the study, apart from its substantive content, should be noted. One is the critique of the various source materials, with explanation of their limitations and how they are to be interpreted. The other is the provision of extensive notes on the environment of ancient and new values, of economic stability or change, of legal and political influences within which marriage, reproduction, migration, and mortality occurred. For all except the occasional specialist who wants highly detailed information on specific topics, such as age reporting phenomena or the accuracy of the reporting of causes of death, the work can serve as a guide to the interpretation of the official Japanese population data.

The wealth of material and topics covered can be only partly noted here. The introductory chapters summarize the political and demographic history of Japan through the Tokugawa Period, then describe the registration data and population movements to 1918. More detailed analyses then proceed on the basis of census and registration data from 1920 to 1955. Among the topics given particular attention are change in total population and its distribution, the labor force and its changing composition by industry, the internal redistribution of population, the expansion of the Japanese into the outlying possessions and dependencies, the patterns of marriage and fertility, the control of family size, and mortality. A final group of chapters deals with the demographic impact of war and with the outlook for the future.

In a broader sense this work is especially significant as the most detailed study we have of the demographic consequences of the introduction of western material culture into an eastern society. Several points emphasized by the author are especially worth noting in this connection. One is that the Japanese experience cannot safely be generalized because precedent for family limitation was already well established in Japan before the Meiji Restoration. Another is that Malthusian fears to the contrary, the great population increase since the Restoration has been accompanied by a rise in the level of living.

E. P. HUTCHINSON
Professor of Sociology

RUSSELL H. FIFIELD. *The Diplomacy of Southeast Asia: 1945–1958.* Pp. xv, 584. New York: Harper & Brothers, 1958. $7.50.

Seven of the eight states in Southeast Asia have assumed responsibility for their own foreign affairs in the past thirteen years. Professor Fifield has undertaken to survey the diplomatic conduct of these eight members of the international community, taking their changing status as his main theme. Unfortunately the details swell up to obscure the story at times.

But the author has sifted an extremely large amount of material to bring out the basic relevant facts and has done a remarkable job of compressing information into 500 pages. He begins with a brief review of the geographic, social, and economic setting; the course of events leading up to independence; and the administrative machinery for diplomacy in each state. A chapter is devoted then to the major elements of foreign policy and associated acts of diplomacy in The Philippines, Indonesia, Burma, Thailand, the former Associated States of Indochina, and Malaya. Finally he discusses what little tangible evidence there is for any regionalism in the area and what the relations of the respective states have been to the United Nations. The comprehensive Bibliography of forty-four pages and Index of fifteen pages are noteworthy. The book is based on personal observation and inquiry as well as a careful examination of published sources.

Professor Fifield, perhaps to a fault, adheres to a country-by-country approach both in his general organization and within each chapter. Since he has considered the questions of regionalism and the United Nations sufficiently universal for separate treatment, one might complain at not finding unified discussions of such equally broad matters as neutralism, or relations with the United States and the People's Republic of China. This lack may be a part of the author's tendency to eschew judgments upon the validity, morality, or effectiveness of the manner in which these new states have conducted their foreign affairs. Moreover such restraint is consistent with his generally open-minded and sympathetic outlook, which permits considerable light to shine on the viewpoints of the Southeast Asian leaders themselves. *The Diplomacy of Southeast Asia* will be useful for information and reference to anyone interested in the area.

Southeast Asia Program
Cornell University

WENDELL BLANCHARD in collaboration with HENRY C. AHALT and others. *Thailand: Its People, Its Society, Its Culture.* (Country Survey Series.) Pp. x, 528. New Haven: Human Relations Area Files Press, 1958. Distributed by Taplinger Publishing Company. $6.50.

This survey of Thailand is the eighth volume in a series written by one of the interdisciplinary teams at the Washington, D. C., branch of the Human Relations Area Files. The disciplines represented are anthropology, international affairs, political science, economics, and history.

Such staff production is commonplace in government and I have been flooded with it

for seventeen years. It is usually of irregular merit and must be used cautiously. So I was not prepared to be impressed unduly by the volume under review. But I was impressed unduly—or duly, whichever you prefer. It is first class, and provides an enormous amount of specific and "knowing" information. It has a good feel from the beginning. I tried asking it questions, the hard test for a survey volume: Does it say what one needs to know? In general it does.

One of the great merits of this volume is that one is led to believe, early in the book, that real people live in Thailand. Considerable attention is given to the kind of human beings who made Thailand. This is especially valuable as people draw closer to each other. I wish I had had a book like this when I first went out in 1927.

Of course I might take exception to some things in the book: the official version of Taksin on page thirty-four, which was a partial fiction to make the Chakri beginnings more respectable, for instance. Or the dodging of the fact, on page 122, that Pibul had gently and decently elevated Prime Minister Phahon to the shelf of Senior Statesman and was not merely "the obvious choice for Premier." He chose himself. Or the implication on pages 123–124 that graft and corruption were products of the Pridi faction and decreased to tolerable limits under Pibul. Or the inadequate paragraphs on pages 239–240 on the settlement of Thailand's official state of war with the United Kingdom and France and the role of the United States in that settlement. Or the repeated theme in various contexts that the Thai are unoriginal and just absorb what they can from other cultures without expanding the frontiers of their knowledge, failing to recognize just what the Thai genius has done and can do with outside inspiration.

But these are incidental and perhaps I am prejudiced. The book is excellent, the Index is thorough, and the Bibliography is presented in such a way that further reading is encouraged.

KENNETH LANDON
Staff Assistant
Operations Coordinating Board
Washington, D. C.

MARTIN F. HERZ. *The Short History of Cambodia: From the Days of Angkor to the Present.* Pp. 141. New York: Frederick A. Praeger, 1958. $3.00.

Prompted by the availability of historical materials, Martin F. Herz, Foreign Service Officer by vocation and historian by avocation, gives in his *Short History of Cambodia* a charming picture of the high civilization of ancient Khmer Angkor Vat, and a frank, analytical, and yet appealing picture of Cambodia today. He binds the two pictures together rather tenuously, telling in a short chapter what little he feels we should know of the interlude between the eclipse of the great Cambodian Empire during the period of Marco Polo's visits to the East and the eclipse of the no less imposing French Empire only a few years ago. In both the episodes which he chooses to stress, his Cambodians occupy the stage of history brilliantly.

No one can live in South East Asia without falling under the spell of Angkor Vat and of the great neighboring city of ruins, Angkor Thom. The excavation and resurrection of these mighty testimonials to an imperial past must remain as the finest accomplishments of the French in their ill-starred venture into Indo-China. Foreign Officer Herz brings a stolid realism to his evaluation of the picturesque quotations about Angkor Vat with which he enriches the text. He is also a realistic judge of the various theories put forward by his predecessors to explain the sudden pause in temple building, the abrupt termination of carving and bas-relief, and the setting up of monumental steles to record a history which was becoming increasingly discouraging and tragic. It was not necessarily the shift from Mahayana to Hinayana Buddhism with its more austere disapproval of ornate art and temples, and it was not necessarily the revulsion against the old Brahminic religion and an exodus away from its temples and their priesthood so exigent in sacrifices, gifts and forced labor, but instead it was probably just the same weight of foreign influences which undermine modern states which finally toppled Angkor. In this interpretation Herz accepts only partially the explanations given by Leclère, by Louis Finot, and by Lawrence P. Briggs for the fall of the ancient Cambodian Empire, and realistically suggests that the overpopulation of Annam, which was alternately invaded and re-ruled by Chinese or relinquished and repelled by them, worked inevitably to push against and destroy the buffer state of Champa and then eventually to flow over and occupy underpopulated Eastern Cambodia. The process of history still continues, because as late as 1700 Saigon was still a Cambodian village, while the Chinese influence is now strong. Cambodia was caught between the rising tide of Annam and the "decapitating" influence of the powerful Thai state around Ayuthia, which gradually replaced the Cambodian elite with a Thai one. Caught between Annamite and Thai, Cambodia was less successful in playing off the one against the other than, in a later century, Thailand was in playing off the encroaching French in Cambodia and Laos against the encroaching British in Malaya and Burma.

Mr. Herz is authoritative, writing from personal observation and breaking new paths, as he takes up the fate of Cambodia under the French, and traces the tortuous route to independence. His recital of Narodom's maneuvers and success against the French, against the enticements of both East and West in the ideological war, and against offers of aid with suspected conditions attached, is as documented as if taken from official reports to the State Department. If anyone can make us grasp Cambodian neutralism, Mr. Herz can. His illuminating book performs in this a very useful service.

WILLIAM L. SMYSER
Professor of History
State Teachers College
East Stroudsburg, Pennsylvania

OSCAR LEWIS with the assistance of VICTOR BARNOUW. *Village Life in Northern India: Studies in a Delhi Village.* Pp. xiii, 384. Urbana: University of Illinois Press, 1958. $7.50.

Professor Lewis and his staff of nine present here, mostly for the second time, some results of surveys conducted in a village near New Delhi. The surveys show the village of "Rampur" to be poor and short of land. The landed castes are said to exploit the landless through the inter-caste service system, while that system itself is beginning to crumble. Twelve "factions" are described as major particles in the molecular structure of local politics. Elaborate weddings continue today, and the twenty local festivals are said to go on with little change, without much pattern, and with slight reference to the higher traditions of Hinduism. Rampur village farmers express a this-worldly outlook, while Brahmins and others maintain more "traditional" other-worldly views. All are shown to hold unscientific ideas about disease and medicine. Finally, the great role of kinship in the social life of Rampur—by contrast with the Tepoztlan in Mexico—prompts Professor Lewis to warn against substituting a generalized notion of "peasant society" for particular facts about particular societies.

Although these survey papers were produced by inexperienced investigators during a brief term of field contact under strenuous administrative pressure, they are offered as models of anthropological work for India. The uneven quality of the results testifies rather to the severity of the handicaps. At many points, deficiencies of observation are filled in with quotations from previous studies made elsewhere by others; the effects are often confusing. At other points, as in the descriptions of weddings and ideas of disease, local data are presented with slight or mainly external analysis. Land tenure relationships are not disentangled from the inter-caste service system, while the statements about individual and caste status appear hypothetical. The claim to have discovered a distinctive, factional dimension of social structure seems based on the application of a novel terminology to aspects of patrilineal kinship which have been known from many previous studies. The possibly empirical derivation of the intricate factional sociograms is not demonstrated. Great historic waves of religious change— Vaishnavism, Shaivism, Islam, and so forth—appear to be left aside in the assertion of festival stability. Close inspection of Rampur religious behavior in its contexts may reveal more intimate connections, both with

local social patterns and with greater literate traditions. The equation of "otherworldly" with "traditional" seems not to take account of the worldly orientation of much ancient Hindu literature. And a positive general conception of peasant society still seems an invaluable guide to particular facts about peasant communities, whether in India or in Mexico.

It is to be hoped that these studies may some day be supplemented and completed under more favorable conditions so that they can be interpreted in relation to each other and to a larger view of cultural history.

McKIM MARRIOTT
Assistant Professor of Anthropology
and Social Sciences
University of Chicago

S. M. KEENY. *Half the World's Children: A Diary of UNICEF at Work in Asia.* Pp. xxvi, 254. New York: Association Press, 1957. $3.50.

The United Nations Children's Fund and its mission of mercy are known all over the world, including the more remote regions of Asia in which millions of children have been born and brought up in the past under conditions of squalor, disease, and misery which killed them off in huge numbers and left a large proportion of the remaining ones crippled for the rest of their lives. Such waste of human life and such untold suffering for those who are left behind need hardly continue if the resources of modern science and of organized community effort can be brought home to these suffering people. In his book *Half the World's Children*, Mr. Spurgeon M. Keeny unfolds the story of seven years of devoted service in extending UNICEF aid to the 200 million children of Asia, about eight per cent of the world's total population.

The story is told, in a simple and extremely readable form, of the remarkable achievements accomplished by this great organization, which is sedulously exploring ways and means to fight disease, to feed the undernourished, and to promote in many ways the entry of a ray of light and hope into countless homes of children, irrespective of their country, race, or creed. To give permanence to this campaign for child welfare, UNICEF rightly stresses the channeling of its activities through governments and utilizes the available social service agencies to make its ministration as broadly based as possible. The success of all forms of welfare work depends a great deal on the sympathy, understanding, and patience which the workers bring to bear on their respective tasks from day to day; it is heartening to read in Mr. Keeny's account of the UNICEF program a revealing story of devoted service, which local and foreign workers developed and sustained in spite of discouragement, personal discomfort, and various obstacles in the path of progress.

In this book of a continuing saga of high achievement the author reveals himself as a person endowed with the understanding and sympathy which enable him to penetrate beneath the squalor and misery he sees around him to the personality of the child and to the primary human reactions which make him as lovable as the child of a more happily endowed home. The reader secures for himself from the book something of the glow of satisfaction which Mr. Keeny must have felt as a sustaining force during his several years of participation in the successful organization of purposeful effort to promote health and happiness. He describes such programs as a campaign against ten million cases of yaws in Indonesia, the vaccination of fifty million persons against smallpox, flood relief, and various other tasks of an equally important and beneficent nature carried out in different countries and among various peoples of Asia and the Far East.

Children are the most precious assets of all nations; may we not hope that the great program of improving the life of children, to which UNICEF has dedicated itself and in the carrying out of which it seeks and secures the help of all nations, will make a growing contribution to the elimination of those stresses and strains that are at the bottom of all the troubles the world faces today.

J. RUSSELL ANDRUS and AZIZALI F. MOHAMMED. *The Economy of Pakistan.* Pp. xvii, 517. Stanford: Stanford University Press, 1958. $8.50.

Pakistan, the smaller and less well endowed of the two states emerging in 1957 from British India, has always been overshadowed in Western eyes by neighboring India. It is characteristic that *The Economy of Pakistan* is the first book available in the West on the economy of that country, the world's sixth largest in population. Andrus and Mohammed have filled the need for a book providing a compilation of the available factual material on Pakistan's economy. In its 500 pages one can find figures on the national income as well as the number of cubic feet of standing timber in state forests, on the balance of payments, as well as the receipts and expenditures of the Post Office. The coverage of other known facts or informed guesses is as comprehensive as that for statistical data.

The emphasis on complete coverage and detail is at the same time a serious weakness. Data are included which are of significance and interest only to the specialist in a particular field. The picture of the economy is blurred, since the reader has to decide at each step whether the discussion deals with a significant aspect or interesting trivia. Some statistics are presented without adequate indication of their reliability and occasionally there is no clear distinction between vague proposals, definite plans, projects under execution, and goals actually achieved. Current economic data in a book are inevitably somewhat dated by the time it appears, but this is particularly serious where statistics are heavily emphasized yet most series can go back only to 1948. A number of examples of all of these weaknesses could be cited. *The Economy of Pakistan* includes, for instance, a figure of annual "requirements" for meat production with no warning that it is a meaningless estimate. There is a relatively detailed discussion of the Six Year Plan and of measures to assist small scale industry, without indication that neither has had much practical significance.

Most disappointing is the scarcity of critical analysis. The economy of Pakistan is faced with a number of challenging problems and their analysis would be of considerable interest. But there is little discussion here of the economic relations between the two quite separate parts of the economy; no analysis of the strategy of development adopted by Pakistan; no consideration of the means adopted to divert resources to investment; little concern with the effect of government regulation on private investment—beyond an uncritical acceptance of claims that the government is doing all it can to encourage such investment. The few instances of analysis or policy recommendations are not without questionable conclusions. It is contended for instance that "a favorable balance of trade will remain a necessity for Pakistan" (p. 262). Yet an unfavorable trade balance is both likely and necessary in the foreseeable future if the economy is not to stagnate. Pakistan will not be able to earn the foreign exchange to pay for the imports required by both current consumption and any sizeable development program. She will have to continue to rely heavily on foreign loans, grants, and investments which implies an unfavorable, not a favorable balance of trade.

In view of the shortcomings of *The Economy of Pakistan* the First Five Year Plan of the Government of Pakistan will continue to be a satisfactory and cheaper introduction to the Pakistan economy for most readers. The Plan does lack some of the factual material incorporated in the book and for anyone interested in well-organized, easily accessible compilation of most of the available data on the Pakistan economy, this volume will be a good source. In this respect it fills an urgent need reasonably well, but as an attempt to provide a clear picture or analysis of an important economy it is disappointing.

Harvard University

DANIEL LERNER with the collaboration of LUCILLE W. PEVSNER. *The Passing of Traditional Society: Modernizing the Middle East.* Pp. xiii, 466. Glencoe, Ill.: Free Press, 1958. $7.50.

For centuries much of the Middle East was a stagnating backwater, and even after the rest of the East had begun to undertake historic reforms, the region maintained its placid rhythm. It was only a few years ago that it shed its complacency and today nobody can know what may happen to it tomorrow. Books about it, published a short time ago, are already dated.

Professor Daniel Lerner's book is unlikely to share their fate. He deals with basic human problems within the Middle Eastern context, grounded in the separate histories and traditions of six nations. The project originated at Columbia University's Bureau of Applied Social Research in 1949 as a sample survey of six Middle Eastern countries. The interviewers performed their tasks, oriented mainly toward the effect of mass media. Dr. Lerner was then asked to analyze their findings. Five years later he followed up the original project with a set of re-interviews. He was greatly impressed by the rapid passing of traditional society in the region. He found, of course, that the rate of progress varied. Why was Lebanon changing while Iran faltered at modernization? Why did Turkey follow a straight line and Egypt a zigzag one? The difficulties of obtaining the material in an area unused to the interview technique were great. The interviewer was taken for a spy in Syria while in Iraq no sample survey could be taken at all. Then, too, how were secluded women to be interviewed and how was one to catch up with Jordan's nomads?

When finally taken, the interviews revealed many significant facts about the six countries and about the impact of the irradiation of western concepts. It was particularly instructive to learn how the different population strata reacted to the questions, as, for instance, the modern people, the transitionals and traditionals in Turkey.

Professor Lerner weaves the results of the interviews into the description of the six nations' social ways, against the background of the contemporary transformation of their modes of thought, their individual and group behavior patterns. He concludes that the general aim of modernization was to narrow the gap between the top and bottom social group by creating a substantial middle sector—increasing the number of "transitionals" who compose the living reality of transition. Since the manuscript of his book was completed, the Middle East has been convulsed by further changes, especially in Jordan and Lebanon. Yet the information conveyed in Professor Lerner's book has been neither contradicted nor weakened by events. In the light of quite recent events, his interviews, analysis, and background information are even more revealing.

In writing his book the author has eschewed the temptation to mix obscurity with profundity or substitute the former for the latter. In this book both the thoughts and style of writing are clear. Indeed, *The Passing of Traditional Society* is very good reading. In the ever-increasing literature about the Middle East, this large volume by Daniel Lerner, assisted by Lucille W. Pevsner, is bound to retain an honored place.

New York University

JAMES MORRIS. *Islam Inflamed: A Middle East Picture*. Pp. 326. New York: Pantheon Books, 1957. $5.00.

James Morris is a British correspondent who knows the Middle East well, having served in Palestine during World War II and visited there in a somewhat different capacity during the years which followed. During the Suez conflict of 1956, Mr. Morris was a special correspondent of the *Manchester Guardian* in Israel. This is not, however, a book about that conflict, nor essentially about politics in the narrow sense of the term.

Published originally under the much more attractive and accurate title of *The Market of Seleukia, Islam Inflamed* is a picture of the Middle East as it appeared to the author at the time of the Suez crisis. It is an impression of the Muslim Middle East as it was "at a decisive moment of its history," when, in November 1956, the author stood beside a road in the Sinai desert with an Israeli colonel,

among Israeli troops, with the debris of a defeated enemy strewn about the landscape. This is his "picture of the region as it was that day, frozen for a moment in all its varied attitudes, before the hot breath of history melted the tableau." With a touch that is quick and easy—perhaps too much so—the author portrays the Egypt of Nasser, independent Sudan, Lebanon bickering over oil transit rights, Syria in effervescence, Iraq threatened by possible subversion, Jordan riddled with intrigue, Iran restless, Saudi Arabia in transition, and an emergent nationalism throughout the Arabian Peninsula.

The book is not a scholarly, well-documented study, and is not to be judged as such. It simply records the author's impressions, written with a facile and sometimes brilliant pen, of the peoples, the cities, the oases, the ports, the suks, the customs, the habits, and the outlook of a vast and varied region. While this is not a work of politics, the author includes reflections on British, American, and Soviet policy and interest in the Middle East, and characterizations of current Middle Eastern leaders. But he is much more interested in the people, the mosques, the bazars, the fellahin, and the Bedouin.

HARRY N. HOWARD
Beirut, Lebanon

ILENE BEATTY. *Arab and Jew in the Land of Canaan*. Pp. 108. Chicago: Henry Regnery Company, 1957. $2.50.

This work, packed with the leitmotifs of Jewish guilt for the crucifixion and the noble Arab versus the materialistic Jew, is proof that the Jewish plot theory, developed to perfection by Hitler and used by the Communists and Nasser, still has some propaganda value in the West. The author finds the Zionists and Israeli guilty and the Arabs innocent on all counts. The common argument that the Jews terrorized a "million" Arab refugees into fleeing is not made more acceptable by the author's question: "Has any Arab army ever attempted to invade Israel?" Miss Beatty concludes that the "true" owners of Palestine are the ancient Canaanites, or their descendants, the Arabs, and that the Jews' sin against Jesus deprives them of any rights to the Holy Land. However, the ancestors of many of Palestine's Arabs have settled there during the past two centuries; some undoubtedly are of Jewish descent, and thus are partners in the rejection of Jesus, while many Jews are very likely descendants of assimilated Canaanites. The book abounds with reasoning which seems to be based not only on prejudice, but also on ignorance.

Miss Beatty proposes that the Holy Land should be set up as the "Palestine International Monument" of 10,429 square miles, a United Nations Agency on which no large nation should be represented and which should administer the land like an American national park. "The present residents should continue to reside wherever they are, Arab refugees should all be returned to their former habitations, with the Israelis to be resettled in new places, except in cases where the Arab houses have been destroyed and Jewish collective farms built instead. Those who cannot or do not wish to regain their former places, should be resettled or given jobs in the Park department as tree planters or tourist guides. The International Monument would be a mecca for tourists and thus would become a fabulously lucrative business."

She is sure of Arab approval of this solution by tourism. The author advises the Israelis to follow suit as the Jewish state cannot support itself anyway; "American-Jews," as good businessmen anxious to save their investments, are told to pressure Israel into accepting this solution.

The book, based on "independent" research, fails to take up the essentials of Zionism and Israel. These cannot be understood without comprehending the factors of an almost 2,000-year-old hope for restoration; doors closed to the persecuted; the Nazi murder of six million; the desire to survive as a people in one place where Hebraic culture is the primary one; not to speak of the desperate fear of the genocide threatened by Arab leaders. These factors form the background of modern Zionism and its realization in Israel. Internationalization of Palestine will not provide open doors for persecuted Jews, nor will it pre-

vent the Arabs from wanting to carry out their long proclaimed intentions of driving all the Jews in Israel into the sea. The book therefore cannot be taken as a serious solution to the problem.

DON PERETZ. *Israel and the Palestine Arabs*. Pp. xi, 264. Washington: Middle East Institute, 1958. $5.00.

This is the type of doctoral thesis which well deserves publication in book form for its usefulness to contemporary readers as well as future ones. It deals with the vitally important matter of the relationships between Arabs and Jews, between Israel and the Palestinian Arabs, both those within the Jewish Republic and along its frontiers in concentration camps.

There are few writers on these matters who are capable of achieving the objective point of view, devoid of propaganda and emotional bias, which is attained and maintained throughout the volume by Don Peretz.

After sketching briefly the background of the subject, the author in considerable detail discusses repatriation of the Arab refugees and its failure; compensation to the Palestinian Arabs for their heavy property losses resulting from the Arab-Jewish war; and the illegal seizure, destruction, and looting of Arab property which took place after the Arab hegira. These he neither condones nor condemns. Rather he tells what happened and presents with clarity the complex problems which were thrust upon the Israeli Government. He goes on to deal with the whole question of the expropriation of Arab property and the blocked bank accounts of the Palestinian Arabs in Israeli-controlled banks.

The book reveals the attitudes of the various Israeli political parties and groups toward the varied aspects of Israel's relationships with the Palestinian Arabs—the refugees and the Arab minority in Israel. In some ways the book arouses a sense of deep discouragement arising from a realization that among the Israeli few seem to have shown any deep compassion toward the Arab refugees or protested against the suffering imposed upon them in the name of security, military necessity, and expediency. Perhaps it is an illusion to think that people who have greatly suffered would have compassion for the suffering of others.

Don Peretz's book is essential reading for anyone who wishes to understand those phases of the Arab-Jewish conflict which are related to the Arab refugees and the Arab minority in Palestine. The book is a valuable contribution, but because it is most desirable that knowledge of this problem should become more widely known, it is to be regretted that *Israel and the Palestine Arabs* is heavy and tiresome reading. The mass of detailed information, though useful to the historian, is of little interest to the general reader.

WILLIAM YALE
Professor of History
Boston University

ERNEST W. LUTHER. *Ethiopia Today*. Pp. 158. Stanford: Stanford University Press; London: Oxford University Press, 1958. $4.00.

Potentially one of the richest countries in Africa, Ethiopia still remains largely untouched by the economic and social upheavals that afflict the rest of Africa. From the bewildering array of Western techniques, Ethiopia's rulers assimilate only as much as the rickety medieval framework can stand. The Italian invasion brought with it the full impact of Western influence and when Ethiopia took her place alongside the other members of the United Nations she was committed to the policy of continuing that inflence through the medium of foreign aid and advice. But foreign advisers must operate through a system of monarchial centralism and it is the Emperor who sets the pace and determines the objectives to be pursued.

Mr. Ernest W. Luther's book, *Ethiopia Today*, provides an extremely useful and up-to-date commentary on the manner in which outside influences are working out within an archaic setting. As economist for the State Bank of Ethiopia, Mr. Luther was in an exceptionally good position to assess what has been happening, and as his many examples show, he has been a keen observer and is not, as so many are who write about Africa, prepared to base his generalizations on experiences gained solely in the capital city.

The main emphasis of the book is upon economic matters and here Mr. Luther writes with confidence and authority. Anomalies abound on all sides. "Estimates of revenue and expenditure usually made a year or more after the event by the Ministry of Finance are termed the 'budget'" (p. 62). Contrary to western practice, the Emperor's addresses to Parliament consist entirely of a review of past events; there are no exhortations to future legislative action. Mr. Luther puts his finger on a key difficulty in implementing measures of economic development. The peasant's "wants are so limited and the standards of living all around him so low, that the desire to accumulate manufactured products for use or for ostentatious display, both of which motives are important driving forces in economically advanced countries, seldom arises" (pp. 79–80). It is Mr. Luther's contention that the key to Ethiopia's future rests on an improved agricultural output.

Politically, the Emperor remains the mainspring of the whole system. The revised 1955 Constitution pays homage to many democratic ideals, but with no independent civil service or judiciary, the Ethiopian system is one of men and not of laws. The Emperor's greatest service to his people has been the setting up of an institutional framework which will facilitate the future political and economic advance of his country. At the moment however, behind the brave new facade of the 1955 Constitution, men are largely motivated by the old system of values and it is the great merit of Mr. Luther's book that he affords us so many glimpses of the conflict between the old and the new.

ERNEST BEAGLEHOLE. *Social Change in the South Pacific: Rarotonga and Aitutaki*. Pp. 268. New York: The Macmillan Company, 1957. $6.50.

Professor Beaglehole is chairman of the Department of Psychology at Victoria University College, Wellington, New Zealand. He is also one of the foremost authorities on Polynesia today. His anthropological and psychological studies on several islands constitute a valuable series of papers, distinguished for their significance to the two disciplines he serves and for their relevance to the practical affairs and administration of these island peoples. The present book is a highly commendable study in the same pattern, and should be of interest to administrators of dependent peoples, to missionaries, and to social and political scientists.

To the study of social change on Rarotonga and Aitutaki, two islands in the southern Cook group, Dr. Beaglehole has brought an approach heretofore little exploited by anthropologists—the use of historical documents. Demonstrating the validity of this method is itself an important accomplishment. The purpose of this study is "to take a self-sufficient non-literate community in which change has been initiated by stimulus from without and then trace the effects of this stimulus in the resulting changed cultural life of the people" (p. 4). Unlike many nonliterate peoples in the world, the Cook Islanders have an extensive record of the changes wrought on them during the first eighty years of European contact in the London Missionary Society archives. Since missionaries were the first and for a long time the most important agents of cultural change such records are without parallel. Supplementing the missionary archives—which commence in the early 1820's—are government reports and so forth for the latter part of the nineteenth century. Then, skipping fifty years, which is rather too bad, Beaglehole brings the study up to date by two months' field work in 1948–49. Most of the historical data pertain to Rarotonga, while the field work was done on Aitutaki.

After a brief introduction the book is

divided into four parts. Included in the first part is a summary—much too brief for the nonanthropological reader—of the aboriginal culture, followed by a description of the coming of the missionaries and the changes they effected up to 1857. The second part analyzes the events up to 1901. While Beaglehole summarizes the missionary material well, and has some extremely perceptive remarks to make about missionary acculturation, it would seem that he did not use these rich documents to their fullest potential. Perhaps a more functionally oriented conceptual scheme would have enabled him to utilize the material better. There seems little reason to fear, as he suggests in the Preface, that another conceptual framework would have intruded itself on his purposes any more than the one he uses.

Beaglehole attempts to explain almost all his cultural data with psychological concepts—for instance he states that the major function of warfare was the release of aggression—often ignoring social and other functions. His favorite psychological concept is learning theory, and while I would not quarrel with the utility of this theory for analyzing culture change, it does seem inadequate for this material.

The second half of the book is devoted to the contemporary scene. Part three considers everything from population to religion in modern life in a tantalizingly incomplete way. Part four deals with welfare, psychology, and social change. Two months' field work is, of course, a very short period of time in which to gain much more than a cursory knowledge of a society. More detailed field work and analyses would have given added authority to Beaglehole's statements on character structure, which rivals social change as the theme of the book.

Various professionals will find other faults: the use of "character structure," "basic personality type," and "social personality" as synonyms, for example. Without more evidence, few anthropologists will be willing to equate Rarotonga and Aitutaki culturally. Two serious faults are the lack of a map and a bibliography. Even a small-scale map of the Pacific would help orient the reader, and a bibliography should have been obligatory for the usefulness of fellow scholars.

Despite the above criticisms, the book remains a significant study in social change.

## *WESTERN EUROPE*

DONALD READ. *Peterloo: the "Massacre" and Its Background.* Pp. ix, 234. New York: Barnes & Noble, 1958. $6.00.

On August 16, 1819, a crowd of 60,000 persons gathered on St. Peter's Field in Manchester to demonstrate for the reform of Parliament. Under the leadership of Henry Hunt, a demagogue of rare oratorical ability, the working people from the Lancashire textile mills were demanding political reforms, annual Parliaments, and universal suffrage as a means of improving their economic conditions. Although they marched to Manchester from neighboring towns in an orderly manner, unarmed, cheerful, and "dressed for the most part in their Sunday best," the Tory magistrates of the city, resentful of the demonstration and doubtful of its legality, made ample military preparation to maintain order and "to suppress all seditious meetings immediately as they assembled." As soon as Orator Hunt had begun to speak to the huge assembly, they ordered the Manchester Yeomanry to ride into the crowd toward the hustings to arrest him. This troop of cavalry, composed of local men stoutly Tory in politics and deeply suspicious of the reformers, were ill-suited for a job requiring discipline and moderation. Soon finding themselves in trouble with a hostile crowd, they forced their way forward striking wildly at any resistance. As panic seized the crowd, and sticks and stones began to fiy, the better trained troop of hussars rode into the confusion using the flats of their swords—and occasionally the edge—to disperse the terrified mob. In ten minutes the field had been cleared of people, leaving behind eleven dead and four hundred injured.

Thus St. Peter's Field became "Peterloo," an ironical inversion of Waterloo and a symbol of the folly and futility of repressing peaceful political demonstrations. Peterloo was henceforth a dead-end street for those Tories who had held power during the wars against France by smearing their opponents with the word Jacobin and by identifying domestic reforms with the hatred and fear of republican France. For Manchester and other industrial cities of the North, Peterloo was a political catalyst crystalizing opinion in favor of parliamentary reform.

This dramatic turning-point is so well known in political history that it hardly needs retelling. The justification for Donald Reed's new book is his penetrating analysis of the social and economic conditions which produced Peterloo. He describes the riots and disturbances in Manchester from the outbreak of the French Revolution to stress the perennial conflict between Church and Dissent and the increasing distress of the textile workers as their wages lagged behind rising prices. He also proves clearly the inability of the old Tory oligarchy, in sympathy with the landed gentry and aristocracy, to rule a rapidly growing industrial city. As a case study of political change in a major city during the early Industrial Revolution, this book has valuable instruction for the American student of political and social science.

R. G. COWHERD
Professor of History and Government
Lehigh University

PHILIP P. POIRIER. *The Advent of the British Labour Party.* Pp. 287. New York: Columbia University Press, 1958. $4.50.

The British Labour party continues to attract the attention of American historians, and this doctoral dissertation is a good addition to the accounts of its origin. It is solidly based on official documents, private correspondence, diaries, newspapers, and party pamphlets. It deals with the revival of socialism in the 1880's, the Marxist-Fabian conflict, Keir Hardie and the Independent Labour party, relations with the Liberals and the "Lib-Labs," the winning of the trade unionists, the foundation in 1900 of the Labour Representation Committee, and the victories of 1906 that resulted in the formation of the Parliamentary Labour Party. The emphasis, however, is not always what one might expect. The author pays slight attention to the pioneer work of H. M. Hyndman's Social Democratic Federation and practically ignores H. H. Champion who for years persistently urged the workers to form their own political party in order to effect social change. The Fabians come off less well than in most accounts; the author corrects the impression sometimes given that they played the decisive role in the creation of the Labour party, but to the reviewer it seems that he writes off too easily their contribution to its gradualist and practical character. The leaders of the Independent Labour Party are given the deservedly prominent role in the forging of the socialist and trade unionist alliance that is still basic in the Labour party.

James Ramsay MacDonald is treated here without the "betrayal" of 1931 always in mind and his great services during the early years receive due credit. He emerges as one of the most astute politicians of the day. The political opportunism—sometimes close to deception—with which he sometimes furthered the interests of the new party throws light upon the man whose actions in 1931 nearly wrecked it. MacDonald's own papers for these years were not available, but the evidence for his political maneuvers and bargains is fully revealed in the correspondence of Herbert Gladstone, the Liberal Chief Whip, with whom in 1903 he made the electoral pact that paved the way for the great Liberal victory of 1906 and for the entry of twenty-nine Labour members into the House of Commons. The Liberals in charge of their party organization were jubilant over the agreement they thought justified by the immediate results; they ignored warnings of the danger of nursing an infant party that might supplant their own.

CARL F. BRAND

Stanford University

GERDA RICHARDS CROSBY. *Disarmament and Peace in British Politics, 1914–1919.* (Harvard Historical Monographs, No. 32.) Pp. viii, 192. Cambridge: Harvard University Press, 1957. $4.00.

This small volume is a fine memorial to the competent scholarship of Mrs. Crosby, who unfortunately did not live to see her excellent study emerge as a book, or to extend her investigations into disarmament proposals and efforts in the decades after 1919. Here she has concerned herself with the greatest of problems, that of men thinking about and working for peace while caught in a war whose sufferings and sacrifices possessed their minds and filled their hearts with fear and hate. To the thoughts of men and women concerned with the 1958 debate on disarmament a third dimension of understanding will be added by this able analysis of the last generation's preoccupation with peace-making.

As the title makes clear, the author deals with British thinking on disarmament and peace. A sketchy account of British liberal thought on the matter in the nineteenth century precedes a thorough, detailed, and well documented analysis of the ideas and programs proposed and discussed in Britain during World War I. Obviously, the study could not be confined to British ideas alone when it came to the peace conference of 1919. Here Mrs. Crosby gives the essential thinking of Frenchmen and Americans about disarmament, ideas naturally affected by national interests and points of view. In that conference British views had to be reconciled with those of other nations to be transformed into the compromises of the treaty finally presented to Germany.

This reviewer believes that more consideration should have been given to American naval policy after 1916, particularly to the determination of the United States to have a navy second to none because of British views about "freedom of the seas" and because of a conviction in some naval circles that Great Britain and Japan were seeking a share of surrendered German warships in order to make themselves strong against the United States.

One wishes that a thorough examination could be made some time of the assumption that disarmament leads to peace. Certainly, as Mrs. Crosby rightly intimates, the century of relative peace and tranquillity which Europe enjoyed after 1815 is not to be explained by adherence to that principle. While the author does not state it explicitly, her book shows how peacemaking has suffered greatly from the belief of statesmen and politicians that it is possible to start with naive ideas as to the causes of war and from that point to work indirectly, backwards, and through a principle of opposites towards the thinking on which peace is to be established.

HARRY R. RUDIN
Colgate Professor of History
Yale University

T. G. W. POWELL. *The Celts.* (Ancient Peoples and Places Series, No. 6.) Pp. 282. New York: Frederick A. Praeger, 1958. $5.00.

This book, written by the head of the Department of Prehistoric Archaeology at the University of Liverpool, is a greatly needed and highly successful attempt at an up-to-date synthesis of what may be accepted as the results of specialized research regarding the ancient Celts and their culture. It is designed for the educated public, not for the specialist, although the interests of the latter are not altogether neglected. With a masterful touch which reveals a full command of the sources—both literary and archaeological—as well as of the pertinent recent literature, the author, while avoiding excessive details, fruitless controversy, and dogmatic conclusions, has given us a lucid and highly informative treatment of his subject.

The initial chapter traces the gradual formation of Celtic civilization and a Celtic nation in Central Europe from the close of the last Ice Age to the Hallstatt period (7th–5th centuries B.C.), and the subsequent diffusion of Celtic peoples and their civilization in the Hallstatt and following La Tene periods into the first century A.D. It also serves as an introduction to the sources of our knowledge regarding the Celts. Chapter two deals with Celtic physical types and temperament, Celtic social institutions, agricultural and pastoral life, arts and crafts, arms and warfare, settlements and fortresses. Chapter three introduces us to Celtic views of the supernatural world, their priestly class, their religious rites, their sacred places, and their burial practices. The fourth and last chapter traces the transformation, disappearance, or survival of certain western Celtic peoples, with their cultural legacy to Medieval Europe. Here we also find interesting discussions of some well known Celtic place and tribal names, such as Cimbri and Teutones, Germania and Germani, Welsh, Caledonians, Picts, Scots, and Gaels.

The volume is generously provided with figures throughout the text and a fine set of plates is appended, accompanied by useful explanatory notes. The marginal references to both figures and plates are very helpful to the reader. At the end of each chapter there are notes, chiefly bibliographic, directed to the more serious reader, and the author has also provided a list of the chief museums having notable collections of Celtic materials, a general Bibliography, and an Index.

In general, the presswork is excellent, but a few slips must be noted. The place name Aquae Sextiae appears as Aquae Sextia (p. 82) and again as Aqua Sextiae (p. 163). *Interpretatio Romano* on pages 128 and 136 should be *interpretatio Romana.* On page 183, "evidences" would be preferable to "evidence." And it is hard to see the pertinence of the references to Plate 26 on page 101, and to Plates 39–41 on page 128.

Professor Emeritus of Ancient History
University of Michigan

WARREN C. BAUM. *The French Economy and the State.* (A Rand Corporation Research Study.) Pp. xvi, 391. Princeton: Princeton University Press, 1958. $7.50.

The Fourth Republic sickened in Indochina and died in Algeria. Its malaise was inseparable from political *incivisme* and complex economic and social dilemmas at home. Students of French affairs will therefore turn eagerly to this Rand Corporation Study, with its ambitious title, hoping to find therein an analysis of the domestic diseases of political economy during the declining years of a regime now dead.

They will be disappointed. Mr. Baum, now with the Federal Communications Commission, set himself a far more limited, albeit difficult and useful task: that of setting forth, in full statistical detail, the policies of the late power-holders in Paris in their strivings to reconstruct, modernize, stabilize, finance, tax, and regulate French industry, commerce, and agriculture. His questions are: Why did government act? How did government act? What were the results of state intervention in the economy? His answers are richly factual, well-reasoned, and ably written. They provide a storehouse of data not readily available elsewhere. They will please those economists who see no relationship between "economics" and human behavior and those political scientists who see no relationship between politics and social structure. "The 'State' has (here) been treated as an entity separate from the people who compose it. The popular pressures giving rise to state action have not been systematically explored, nor has it been asked where the responsibility for the state's performance might lie . . ." (p. 343).

Mr. Baum is modest. Despite the utility and merit of his labors, he has, as Churchill once said of Attlee, very much to be modest about. He has skillfully sketched the skeleton of the relationships between government and business in the Fourth Republic. Someone else must put flesh on the bones and relate these relationships to parliamentary politics, interest groups, class warfare, and widespread civic irresponsibility in contemporary France. Let us hope that Mr. Baum, who has here made a beginning, will himself undertake the task.

FREDERICK L. SCHUMAN
Professor of Government
Williams College

GEORGE CLARK. *War and Society in the Seventeenth Century.* (The Wiles Lectures Given at the Queen's University, Belfast, 1956.) Pp. vii, 156. Cambridge: Cambridge University Press, 1958. $3.50.

ROBERT S. QUIMBY. *The Background of Napoleonic Warfare: The Theory of Military Tactics in Eighteenth-Century*

*France*. (Columbia Studies in the Social Sciences, No. 596.) Pp. viii, 385. New York: Columbia University Press, 1957. $6.75.

To conscientious historians and sociologists the close relationship throughout history between warfare and society, both as cause and consequence, has long been evident. In recent years, however, and particularly since August 1945, this field of study has been further investigated by ever-increasing numbers of responsible and intelligent citizens including statesmen, scientists, and military leaders. In our current nuclear and ballistic age with its steady stream of scientific discoveries and technological developments in industry, we might initially be inclined to attribute changes in the concept and technique of warfare to the introduction of new and deadlier weapons. On further reflection, it becomes quite apparent that in the final analysis weapons of warfare are no more potent than the men who design and operate them. Moreover, if we are to accept the tenet that a military organization cannot help but reflect the character of its commander, it is reasonable to conclude that an army is equally a reflection to a pronounced degree of the pattern of thought of the society and the age in which it exists.

This close kinship of war and society in Europe from the outbreak of the Thirty Years' War to the Napoleonic Campaigns has been meticulously analyzed and traced in a most scholarly and erudite manner by the authors of the two books under consideration. To this reviewer, their opinions in large part appear compatible with the contention of the eminent British psychologist, Havelock Ellis, that war is one of the youngest of human institutions, being an outgrowth of civilization rather than savagery.

Sir George Clark's lectures show us how war assisted materially in the formation and eventual emergence of modern European nations from hitherto geographically divided and ideologically opposed segments of population. He states that, in the seventeenth century, war was readily accepted as a part of the social order; moreover, it was regarded as a perfectly legitimate instrument of state protocol. The regent rather than the individual noble or the military adventurer finally won out as the supreme arbiter of state policy; for example, Louis XIV's rise to a position of prominence in international affairs could not have been achieved until domestic discord had been overcome through force of arms. Once the institution of war and its very technique became the sole prerogative of the state rather than of the individual, Europe took on the aspect of several competing international dynasties, each with military governing classes in control, and each equipped with relatively small professional armies to be used as the means to attain national objectives.

As Professor Quimby has so clearly portrayed, the intellectuals of the eighteenth century, far from restricting their theories exclusively to political and social problems, extended their interests to military affairs with particular emphasis on strategy and tactics. Herein we are given an extensive survey of the contrasting opinions of such military theorists as Saxe, Guibert, Bourcet, and Du Teil, all of whom were instrumental in formulating the size, composition, armament, and technique of maneuver of the French armies, and were to exert great influence on the mind of Napoleon. Their views were eventually incorporated into the basic drill book, the celebrated Ordinance of 1791, which although open to criticism nevertheless governed the soldiers who fought the battles of the Revolution as well as those of Napoleon.

Prior to the French Revolution, the common man throughout Europe in the eyes of his ruler was considered irresponsible not only as a citizen but also as a soldier. In neither role could he be trusted or treated as a human being. On the battlefield this was bluntly reflected by the tactical formations which utilized his services as a meticulously drilled, closely guarded, and barbarously disciplined element of expensive machinery in which the role of the individual was completely suppressed. Once the old social and political system, which afforded the foundation upon which rested the military hierarchy, was cast to the winds, commensurate changes and innovations in the technique of combat had to be introduced to meet the changed social status of the new citizen-soldier.

COLONEL ROGER WILLOCK

Princeton, New Jersey

*La Belgique et les Nations Unies*. (National Studies on International Organization.) Pp. xi, 372. New York: Manhattan Publishing Company, 1958. Prepared by a Commission of l'Institut Royal des Relations Internationales for the Carnegie Endowment for International Peace. $3.00.

This is the tenth in the series of summary volumes on individual states and the United Nations sponsored by the Carnegie Endowment for International Peace. Prepared by a commission of Belgium's Royal Institute of International Affairs under the direction of Paul de Visscher, the present volume shows a care, conciseness, and structure lacking in some of its predecessors and often missing in other joint enterprises.

The book divides into three sections and is prefaced by a short account of Belgium's international position before 1945. Section I is relatively short and reviews the formation of the United Nations in the light of Belgian viewpoints, both official and unofficial, from Dumbarton Oaks through the San Francisco meeting to the ratification of the Charter. Most of the material is old stuff to students of the United Nations.

Part II deals with the evolution of Belgium's attitude toward the United Nations to about 1952. There are chapters on Parliament, the fitting of the United Nations process into the foreign ministry, the delegations to the United Nations, and public opinion as sampled in the Belgian press, radio, and cinema. The charts dealing with votes and press opinions are of the type to gladden the hearts of all statistical political scientists and will also be of use to the layman. Although it is anything but comprehensive, the material in this section is not easily obtainable in this country and thus is perhaps of the most interest and use.

Part III, about half the book, treats Belgium and various United Nations problems and operations: there is a long section on problems of principle built around r gional ententes and new members; a surve of structural problems reviewing dissati faction with the veto and Charter revisio and three chapters on problems of comp tence. One of these, discussing trust terr tories and colonies, is of particular valu in view of Belgium's activities in the Cong and her attempt to reconcile colonialis with a world-wide "social solidarity." O this latter matter, a long chapter deals wit Belgian interests in United Nations socia cultural, and economic matters, and an other takes up the question of the Worl Court.

Like most of the volumes in this series the one on Belgium is a useful referenc work. It lacks a bibliography but has goo footnotes, a so-so Index, and excellen typography. Belgium's views are naturall sympathetically treated, but the entir work can stand out as a fine contributio to summary, but not essentially basic, re search literature on the United Nations.

SALVADOR DE MADARIAGA. *Spain: A Modern History*. Pp. xiv, 736. New York: Frederick A. Praeger, 1958. $7.50.

This is a revealing and significant study of contemporary Spain, one of the few published since that country's civil war, but the title belies its true content. The book is more a collection of analytical and interpretive essays grouped about the common theme of Spain than it is a traditional history, for Madariaga's real contribution falls not so much in the area of chronological reporting of events or presenting exhaustive compilations of related facts, as in that of offering penetrating insights into the make-up of the value system that motivates the Spanish mind.

The publisher calls this book a biography of a country, but to my mind it is more nearly a biography of the author, in that the two major portions of the work reflect the two most important divisions in his intellectual life. Book One—some 370 pages—is a reworking of materials first

published in 1930, when Madariaga was Professor of Spanish Literature at Oxford; it presents an empirically oriented introduction to twentieth century Spain, stressing not only political but geographic, economic, social, and intellectual factors which obtained before the country embarked upon its tragic civil war in 1936. Of necessity so broad a survey makes no pretense at depth in every field, but it has a kind of Anglo-Saxon flavor of objectivity and impersonality which, given the writer's frankly-stated liberal centrist views, is anything but typically Spanish, especially in view of Madariaga's own often-repeated description of his countrymen's personalist and extremest proclivities. The only weakness in this part of the present volume lies in a tendency to carry over statistical and descriptive data from the 1930 version rather than to bring the material up to date, though this does little to weaken the validity of the general statements presented here.

Book Two—some 275 pages—on the other hand, covers The Republic, the Civil War and After, a period during part of which the author participated directly in Spanish politics. Despite his prefatory statement that this book "had to be written" because "an objective examination of the events of 1931–41 should be available, written with the inside knowledge that only consanguinity can provide," this section of the work is much less objective and a great deal more personal than the first part, underlining the Spanish side to Madariaga's personality. But for the very reason that Book Two grows out of personal observations and activities, loss in objectivity is more than balanced by providing hitherto unavailable information concerning the birth, life struggle, and death of the ill-fated Republican experiment in which the writer had so vital a role. Moreover, from his center position Madariaga lashes out with equal vehemence at the extremist forces of both right and left whose intransigence broke the back of the Republic, thereby providing at least a degree of balance in the allocation of onus for the civil war that is not found in most discussions of the conflict.

Unfortunately, Book Two also contains the least satisfactory portion of this study, the section dealing with the internal organization and activities of the Franco regime. Here it is that Madariaga's long separation from Spanish daily life is most apparent and most unfortunate, for the lack of detail and appreciation of the forces at work upon the "Command," as he terms it, is in sharp contrast to his earlier chapters. This is true also in the bibliographical resources he cites for this part of the book.

In addition to the two books, this work contains a twenty-five page Appendix containing the text of Stalin's letter to Largo Caballero and a personal memoir of Madariaga's concerning his activities for the Spanish Republic.

LAWRENCE FERNSWORTH. *Spain's Struggle for Freedom.* Pp. viii, 376. Boston: Beacon Press, 1957. $6.00.

Drawing upon his experience as a correspondent in Spain for *The Times* of London and the *New York Times*, Mr. Fernsworth has added to the growing collection of analytical studies of modern Spain under the Franco regime.

The author is primarily concerned with giving the reader an appreciation of Spanish traditions and the historical events which still have a direct bearing upon the country. His bibliographical sources include the writings of many Spaniards in exile in England, the United States, and Mexico. It would have added somewhat to Mr. Fernsworth's arguments had he quoted and listed diplomatic sources, giving more cogency to the reasoning about the current status of Spain in modern diplomacy. This reviewer's opinion is not intended to detract from the validity of the presentation of material. In fact, the interviews with Spanish leaders in Spain prior to the Civil War in 1936 are very forceful, as well as revealing, in the delineation of Spanish thought on popular government.

Of particular interest is Mr. Fernsworth's interview with Don Manuel Azana, who had taken part in early Republican operations back in the summer of 1934 (p. 155). Mr. Azana was specifically asked by Mr. Fernsworth to give the reasons for the November 1933 defeat of the Republican coalition and the return to power of the hostile Right groups. "The factions of the Right," explained the Spanish leader, "spent money like water. They wished to undo the agrarian legislation and, above all, to recuperate their vast holdings and keep the people in servitude. They have again imposed starvation wages in Andalucia and Estremadura, undoing the work of the Republic. And the peasants are hungering. They have adopted extreme views, and speak of inciting revolution. This is a great mistake. The Republican cause can only be advanced by the united political action of all favorable parties." The events which followed now constitute history—internal conflicts, outside intervention, gross misinterpretation by certain sections of the press, and later, Spain's "neutrality" during World War II. In retrospect, it is not pleasant to read Mr. Fernsworth's careful detailing of events during the Spanish Civil War, but such a study is mandatory for the formation of any valid opinion.

Particular criticism is directed by the author towards the military pact of September 26, 1953, the "bases agreement" pact, between the United States and Spain. In general, the pact covered the installation of American air and naval bases, mutual military assistance, and economic assistance. Though Mr. Fernsworth does not point it out, subsequent economic assistance from the United States has taken the form of thermal power units, steel mill equipment, atomic research reactors, diesel locomotives, and power-generating units through almost fifty million dollars in grants from the Export-Import Bank of Washington. Lately, under Public Law No. 480 covering American "surplus" commodities, large volumes of agricultural commodities have been exported to Spain.

Quite logical is the author's argument against the use of expediency by some American diplomats who have favored Spain's "buffer state" position. He rightly warns against the formulation of policy which can be easily upset by treachery.

Mr. Fernsworth draws the conclusion that, paradoxically, a reconciliation of Spain's most irreconcilable elements—the Monarchists and the Republicans—"seems to be the answer to a renewed and stabilized Spain" (p. 344). Nevertheless, facts indicate that two elements are still diametrically opposed to each other's fundamental philosophy of government. Should there be a resolution of factional difficulties, there may be an end of the Spanish dictatorship and the ruthless suppression of all voluble opposition within Spain.

SAMUEL P. PERRY, JR.
Columnist
*Boston Chronicle*

LOUIS L. SNYDER (Ed.). *Documents of German History.* Pp. xxiii, 619. New Brunswick: Rutgers University Press, 1958. $10.00.

This is a book of the basic documents of two thousand years of German history, edited by Dr. Louis L. Snyder, Professor of History at The City College of New York. The editor has assembled one hundred and sixty documents of German statesmen, politicians, military leaders, men of letters, artists, and philosophers. Some more or less important illustrative materials are included with the key documentation. This volume includes contemporary accounts of battles, texts of treaties, imperial laws, constitutions, decrees, proclamations, decisions of courts, letters of the makers of German history, speeches, narratives, war songs, poems, propaganda, contemporary newspaper articles, programs of political parties, excerpts from the works of scholars and men of letters, and other materials selected by Dr. Snyder to develop chronologically the history of Germany. The editor has thus included "items of political, economic, social, military, cultural, religious, intellectual, and psychological significance." All translations of these materials are, unless indicated in footnotes, by the editor. He has also prepared extensive introductory notes giving the historical setting as well as the import of the documents.

*Documents of German History* is divided into eight parts of which the first covers the history of Germany from the early Germans to the Reformation or from the battle of the Teutoberg Forest, A.D. 9, to the founding of the University of Heidelberg, 1386. Part Two extends from the Reformation through the rise of Prussia. Part Three is entitled the War of Liberation and the Revolution of 1848. Parts Four and Five analyze the history of Germany during the eras of Bismarck (1862–1890) and William II. Part Six, The Weimar Republic, contains six key documents and a "draft for a student composition on the Advantages of War, 1927." The National Socialist dictatorship from 1933 to 1945 is documented with twenty-five historical selections from the Nazi period. The last part brings together seven very important documents on Germany after World War II (1946–1957). An Appendix contains useful information on Germany, including a chronology and a reading list. A number of good political maps illustrate the text.

Two of the principal criticisms of documentary compilations by specialists are first the omission of historic documents which the reviewers regard as essential and second the inclusion of documents which, while important, are not basic to the development of an objective pattern. The most glaring omissions in this volume are, with a few exceptions, in the medieval part. There are also included in the volume minor documents and materials which are not only controversial but weaken the excellent pattern.

The scholarly introductory notes by Professor Snyder are worthy of the highest commendation. He has again and again made profound observations concerning the historical setting of many of his selections and advanced concise introductions to serious German problems. Moreover this documentary history of Germany is an achievement of American scholarship, and an invaluable study for the understanding of the German people as an integral part of the European community.

RALPH HASWELL LUTZ
Professor of History, Emeritus
Stanford University

HANS ROSENBERG. *Bureaucracy, Aristocracy and Autocracy: The Prussian Experience 1660–1815.* (Harvard Historical Monograph, No. 34.) Pp. xi, 247. Cambridge: Harvard University Press, 1958. $5.00.

Hans Rosenberg, well known for his excellent studies on Prussia, has written an empirical monograph on the bureaucratization of Prussia, "the Sparta of the North," under the Old Regime from 1660 to 1815. Emphasizing an interdisciplinary point of view with special stress on sociological implications—surely the way of coming historiography—the author gives an intensive rather than extensive treatment of this important subject.

Dr. Rosenberg pieces together three coalescing lines of development, a triangular historical process: First, the formation of the new elite of Prussian bureaucratic governmental executives who made possible politico-administrative centralization and the building of absolute monarchy; second, the sociological aspects by which this bureaucratic professional class evolved into an aristocratic status group; and third, the status, outlook, and primary function of this bureaucracy as an authoritarian political group, the unfortunate result of which was a system of government cast in the image of the Prussian aristocracy.

Within this framework the author has produced an invaluable study which throws much light on the development of Prussia-Germany. The long range political outcome was vital for both Germany and the world. The results of Germany's tradition of obedience to authority and the placing of power in the hands of self-interested groups unwilling to play by the rules of democratic co-operation were tragic. "The conservative heirs of the absolute monarchy share the responsibility for the rise and victory of mass dictatorships and twentieth-century totalitarianism" (p. viii).

The Prussian conservatives managed to carry forward, into the age of industrialism, illiberal attitudes and aristocratic patterns of class, status, and political hierarchy, meanwhile skillfully using nationalism as a tactical weapon, perpetuating their peculiar combination of militaristic, bureaucratic, and authoritarian traditions, and hypnotizing the German people in the process. Later on, German philosophers and historians from Hegel and Ranke to Treitschke idolized *das alte Preussentum*, gave metaphysical sanction to the German state, and played a notable part in the corrosion of liberalism as a way of public life.

On only two counts, one general and one specific, would the present reviewer be inclined to differ with this first-rate study. It is difficult to accept the author's contention that the Prussian experience in bureaucratic, aristocratic, and autocratic rulership was "on the whole representative of general European trends." Notwithstanding the claims of area research, there is precious little parallel between the Prussian experience and that of the West. This is precisely the key to the tragedy—the yawning chasm between "the German Mind" and the Western European Enlightenment. Neither British nor French bureaucracy promoted the kind of autocracy that brought Germany to the brink of destruction. Germany became the stepchild of Europe precisely because Prussianism and Prussian bureaucracy were suffused with Eastern authoritarianism.

To Dr. Rosenberg's list of historians as "corroders of liberalism" this reviewer would venture to add the name of Friedrich Meinecke, whose reputation for "liberalism" is undeserved and who was an unconscious proponent, despite tortured rationalization, of that pernicious Prussianism which brought terrible consequences not only to Germany but to the world.

This is a superb study in research, organization, and writing; certainly one of the most penetrating books in English ever written on Prussia. It is to be hoped that Professor Rosenberg will extend the scope of his study through the nineteenth and twentieth centuries, with special attention to Hitler's berserk Third Reich.

LOUIS L. SNYDER
Professor of History
The City College of New York

JOHN FORD GOLAY. *The Founding of the Federal Republic of Germany.* Pp. xii, 299. Chicago: University of Chicago Press, 1958. $5.00.

The Germans are greatly impressed by their Basic Law for the Federal Republic of Germany, which was drafted by a council composed of delegations of twenty-seven members each from the Christian Democratic Party and the Socialist Party, five from the Free Democratic Party, and two each from the German, Center, and Communist parties. It was ratified in May, 1949, by the legislatures of more than two thirds of the participating German states (*Laender*) and proclaimed by the Parliamentary Council, meeting in public session at Bonn on May 23, 1949. This democratic constitution of 146 articles with later amendments is to remain in force until a constitution is adopted in freedom by all Germans. Several promising young Germans have already written dissertations based upon various studies of the Basic Law.

Dr. Golay's essay is the first systematic analysis in English of the "present day problems as the Germans themselves see them." It is based upon the principal speeches of the party leaders, the published documents concerning the formation of Western Germany's Basic Law, and the materials in the archives of the Bundestag at Bonn. The author has also had access to the Allied documents. His exhaustive and scholarly Bibliography, footnotes, and explanatory notes are to be commended.

The first chapter covers the decisions of the western powers to establish a western German government. The second compares federalism in Germany and the United States. The third chapter is a brilliant study of both the tremendous impact of the tragic events which destroyed the Weimar Republic and the decision of 1948–49 to leave the fate of constitutional parliamentary government to the present political parties and to the electorate. The fourth reviews the attitudes of the parties toward the multiparty system. The author concludes that the decision to retain proportional representation was a sound one. The fifth is a profound discussion of basic rights which the author modestly calls a summary. The final chapter is a frank recognition by Dr. Golay of the political maturity of the German people in the present crisis.

Dr. Golay has written a timely and scholarly study of the founding of the Federal Republic. He has made objective selections from the constitutional speeches of party leaders, thus allowing the Germans to speak for themselves. The biographical notes concerning Adenauer, Brentano, Lehr, Schmid, Heuss, Seebohm, and others are of great value for the general reader. The Basic Law is included in the Appendix together with the first amendments.

The manuscript of this book was read and checked by the following scholars: Dr. G. Bernard Noble of the Department of State; Mr. James E. King, formerly executive secretary to the United States High Commissioner, Germany; and Professors Otto Wirth and Helmut Hirsch of Roosevelt University.

Since the text of this essay has been "cleared" for publication by the Historical Division of the Department of State, appropriate steps might be taken by Dr. Golay or a governmental agency to have a German translation of this study in the improvement of international understanding published in Germany. It would present the American viewpoint to general readers in Germany and other European countries.

RALPH HASWELL LUTZ
Professor of History, Emeritus
Stanford University

CLIFFORD R. BARNETT in collaboration with ROBERT J. FELDMAN and others. *Poland: Its People, Its Society, Its Culture.* (Survey of World Cultures.) Pp. 470. New Haven: Human Relations Area Files Press, 1958. Distributed by Taplinger Publishing Company. $7.50.

Poland, with its growing industrial production, and its twenty-eight million inhabitants, is the largest and the most important country of East Central Europe, now under Soviet control. The October revolution of 1956, Gomulka's bid for a limited political and economic independence, has dramatized the key role of Warsaw. The success of the Polish experiment may have a profound influence on the fate of the Soviet Empire and affect the position of Russia in the world. For this reason, more attention should be paid to the affairs of this crucial country. A Western scholar studying the "Socialist bloc" is constantly faced with a shortage of basic reference books on Poland. It is praiseworthy, therefore, that "The Survey of World Cultures" published the present volume as one of the first of its series.

The focus of the book is Polish society as a whole; it deals with the interrelationship of problems usually studied in separate volumes. The approach is mostly sociological, with emphasis on the dynamics of the processes under consideration.

The book is divided into twenty-two chapters, the enumeration of which gives a good idea of the structure: "The Culture and Society," "Historical Setting," "Geography and Population," "Ethnic Groups and Languages," "Religions," "Dynamics of Political Behavior," "Legal and Theoretical Base of Government," "Structure of the Government," "Diffusion and Control of Information," "Foreign Relations," "Basic Features of Economy," "Organization and Use of Manpower," "Financial System," "Agricultural Development," "Industrial Development," "Domestic and Foreign Trade," "Public Health," "Formal Education," "Family," "Social Organization," "Art and Intellectual Expression," "Values and Attitudes." The concluding chapter represents a sort of synthesis; it is well balanced, penetrating, and illustrated with convincing examples. The book is provided with a Bibliography of additional reading, with thirty clear statistical tables, and with a good Index.

The book is on the whole fair and accurate; it is a pity that, although published in 1958, its statistical data on the whole do not go beyond 1955. The seventh and eighth chapters would benefit from a more detailed analysis of the role of the Communist party. In many ways the book supplements Professor Oscar Halecki's work, *Poland*, published last year by Praeger under the auspices of the Mid-European Studies Center. Together they serve as useful references for the expert, as well as for the non-specialist.

M. K. DZIEWANOWSKI
Associate Professor of History

## *RUSSIA*

HOLLAND HUNTER. *Soviet Transportation Policy.* (The Russian Research Center Studies, No. 28.) Pp. xxiii, 416. Cambridge: Harvard University Press, 1957. $8.50.

This is an exceedingly competent description of the physical achievement of the Soviet railways from 1917 to 1955, and of the railway policy that lay behind it. As such it can hardly be bettered; Professor Hunter has fluent Russian, wide reading in obscure sources, deep technical knowledge of railways in general, and a great statistical flair.

Many things, however, are implied by the title yet not to be found in the book. First, the other carriers get only the treatment their statistical unimportance merits; a most unfortunate decision in that they are of extreme interest and their study throws a flood of light on the workings of the Soviet economy. Why was the Baltic-White Sea canal built? Why the subsequent canals? Why, oh why, the Northern Sea Route? Why do Communists dislike automobiles? Such questions are most inadequately discussed. Yet the canal story is an enthralling one: the predominant use of forced labor—not mentioned at all—the manifest unprofitability of the completed object, the belated attempt to tie in with irrigation, and the Grand Turkman canal interrupted in mid-construction on Stalin's death. By 1955 there was practically no motor traffic or main roads; does not this astonishing fact rate more than one page? Above all others the Sovietologist forgets at his peril the great principle of Sherlock Holmes—the importance of the Dog that Did Not Bark in the Night.

If the physical achievement of the non-railway carriers is neglected, so is the all-important topic of the resource allocation mechanism and the rationality of prices both as it affects inter-carrier relations and in regard to alternative railway policies. The short passage on this is the merest apology for what needs to be said, and indeed precisely by Professor Hunter, who has in fact studied the question deeply and spoken to many Soviet transport experts about it. Happily this gap will shortly be remedied by his contribution to the Berkeley symposium on the Soviet price mechanism. Both that contribution and scattered remarks in the present work reveal, however, far too much respect for the rationality of Soviet resource allocation, as if choices consistently made at vast expense simply could not be as silly as they look. Your reviewer is convinced that superficial appearances are correct.

Nevertheless this will remain for a long time the standard work on Soviet railways, which carry 80 per cent of all Soviet freight. It is doubly welcome for the excellent chapters on location policy and the geographical pattern of economic activity, which are so intimately connected with transport and so often neglected. Until something more extended appears these chapters too are easily the best on the subject with which they deal.

P. J. D. WILES
Fellow of New College
Oxford University

C. JAY SMITH, JR. *Finland and the Russian Revolution, 1917–1922.* Pp. x, 251. Athens: University of Georgia Press, 1958. $4.50.

We are given in this book an all but day-by-day account of the progress of the revolution in Finland following the collapse of Tsarist Russia in 1917, and the long and intricate war that followed—partly civil war and partly a three, four, or five cornered fight that grew out of and fused with the war between the Entente and the Central Powers. An examination of the sources for this confused period has led to a careful tracing of the intricate threads that make up its history. No fault is to be found with the author in his narration of events, other than the slips that any author is liable to make. But any writer who goes beyond this and attempts to make sense or meaning out of these chaotic events ventures on a task that exposes him to disagreement and criticism.

The first thing that is to be noted is that it is questionable whether any sound view can be taken of Russo-Finnish relations apart from a general consideration of the whole question of Russia's attitude towards the national minorities in the period pre-

ceding the revolution. Here the author contents himself with a rapid summary of the events that brought Finland into the empire and the course of her relations towards it. This inevitably involves the policy of the Tsarist government towards minority groups through the centuries, and the growth, among Russians of all classes, of an attitude that was well expressed by the Emperor Nicholas I: "Wherever the Russian flag has once been raised, it must never be lowered." This could be translated to mean that no Russian, even the revolutionary, could view with enthusiasm the grant of autonomy to the subject nationalities, let alone the right of secession.

The second thing that this reviewer thinks has been ignored is the attitude of the Bolsheviks, especially Lenin, towards these national minorities. The latter's views were disclosed in 1913 in "Aesopian" language that was entirely equivocal; in a letter written to a friend to supplement and explain this pronouncement, it appears that Lenin had no intention of honoring a promise of independence unless these minorities supported Bolshevist aims. It is questionable, then, whether it is quite correct to say only that Lenin was guilty of an error in evaluating the situation in Finland in 1917. Any recognition of Finland's rights by the Bolsheviks was conditional on their lending themselves as Bolshevik tools in the class struggle; in case of failure to do so, the latter reserved the right to nullify recognition of independence in ways that have become familiar to us during the "cold war."

Some of the conclusions reached by the author in his summary are among the "might have beens" of history. The Russification policy of Nicholas II may have been the cause of Finland's hostility to the Russian regime, just as the refusal of Denikin, Kolchak, or any of the responsible White generals to recognize her independence doomed the chances of Finnish collaboration in the attack on Petrograd and sealed the fate of the White armies. But in the light of Russian history, it does not seem that any other outcome was possible.

STUART R. TOMPKINS
Research Professor of History, Emeritus
University of Oklahoma

GEORGE FISCHER. *Russian Liberalism: From Gentry to Intelligentsia.* (The Russian Research Center Studies, No. 30.) Pp. ix, 240. Cambridge: Harvard University Press, 1958. $4.50.

This analysis of Russian liberal thought from 1861 to 1905, the work of Professor George Fischer of Brandeis University, is a stimulating and absorbing study of a trend in Russian political thought and life in the second half of the nineteenth century, a subject which has been generally ignored. Professor Fischer carefully defines Russian liberalism as Western individualism: the seeking of a society in which the individual is self-governing and central and in which institutionalized liberties such as private property and the supremacy of law prevail. This began in the 1860's with the gentry, who were interested in taking advantage of the Great Reforms, particularly in the field of local government, and then became more radical and doctrinaire as the urban intelligentsia became prominent in the movement. This transformation from the conservative, moderate, and empirical to the radical and even revolutionary liberalism of Miliukov and the Kadets is clearly demonstrated. However, the transformation within the gentry, which Professor Fischer has to some degree neglected, may have been as important as the development of the progressive classes and their version of liberalism. Among Professor Fischer's most important achievements is his demonstration that many of the urban intelligentsia who became liberals around the turn of the century arrived at that position after having been Marxist or *narodnik* Socialists. This simple but vital point throws much light upon the failure of Russia's liberals.

This excellent study lacks the depth and insight of Professor Victor Leontovitsch's *Geschichte des Liberalismus in Russland,* which places more emphasis than does Professor Fischer upon institutional developments and upon the ideas and the institutions fundamental to the rule of law, a basic liberal goal. The focus of Professor Leontovitsch's book is therefore more sound, particularly since Professor Fischer by beginning in 1861, ignores the earlier stirrings of Russian liberalism; and, by

*Two New Books to Challenge Your Students*

**THE SOVIET CRUCIBLE:**
**SOVIET GOVERNMENT IN THEORY AND PRACTICE**

*by Samuel Hendel, Professor and Chairman, Department of Government, The City College of New York.*

Soviet government—in theory and in practice—comes to life in this fascinating collection of writings. Here are the most significant speeches of the men who have shaped Soviet history—Marx, Lenin, Trotsky, Stalin, Khrushchev—, along with candid commentaries by such distinguished scholars and authors as Merle Fainsod, Harold Laski, Sidney Hook, Milovan Djilas, Harrison Salisbury, Maurice Dobb and Allen Dulles.

More directly than any other book, The Soviet Crucible explores Marxist-Leninist theory as it has influenced Soviet policies. Leading authorities offer their view of just how important theory actually is in guiding Soviet policy today.

To set the stage, the editor presents material on the Czarist heritage, particularly on the history of Russia from the end of serfdom until the outbreak of the Bolshevik revolution. He follows the Soviet Union through its formative years, until Stalin's triumph by the end of 1928, when the totalitarian character of Soviet institutions was largely decided. The concluding sections examine the Soviet political, economic and social systems today and present the most reliable forecasts of future Soviet activities.

About 600 pages. Ready in February.

**THE IMPACT OF AIR POWER:**
**NATIONAL SECURITY AND WORLD POLITICS**

*by Eugene M. Emme, Operations Research Office, Office of Civilian and Defense Mobilization, former Professor of International Politics, Air University.*

Focused upon the problems of national security and military policies of today and tomorrow, this comprehensive collection gathers together, for the first time, the authoritative writings on all aspects of air power. The full meaning and implication of air power are explored through the speeches and writings of distinguished statesmen, airmen, scientists, historians, critics and other scholars. This book is, in many ways, a pioneering work comparable to Admiral Mahan's classic work on sea power.

About 900 pages. Ready in February.

*Kindly mention* THE ANNALS *when writing to advertisers*

stopping short *in 1905, leaves* us at the brink of the period which provided Russian liberalism its greatest challenges and its greatest failures.

However, the book does make clear that the soil of Russia was not suited to liberalism at the turn of the century, *when* Russian economic development was by-passing the stage which produced economic and political liberalism in the West and *when* most thinking was more revolutionary and socialist than liberal.

Professor Fischer develops briefly some tantalizing comparisons between Russia of the second half of the nineteenth century and several currently under-developed countries. His recognition of the fact that what we call under-development today involves cultural, political, and psychological factors as well as economic ones reveals deeper insight into this subject than one generally finds today, and this reviewer, for one, hopes that he will in the future develop this theme in more detail.

ROBERT F. BYRNES
Indiana University

ALAN MOOREHEAD. *The Russian Revolution.* Pp. xiv, 301. New York: Harper & Brothers, 1958. $5.00.

The work gives an account of the Russian revolution in 1917 and the events that led up to it. It is based on books about the period, almost all published in the United States and England, but the main foundation was provided by Dr. Stephan T. Possony's *unpublished* study of the Russian revolution and in particular his recent research into the German Foreign Office files.

These files allow us to answer several questions of particular interest. Firstly, did the Germans in their contacts with the Bolshevists attach special importance to Lenin? Mr. Moorehad makes it clear that Lenin had from the summer of 1916 on no further dealings with Keskuela, one of the German agents (p. 126), but he suggests that Lenin "no doubt still wanted to keep contact" with the other German agent, Parvus. Mr. Moorehead thinks that for this reason Lenin pounced on an article published in 1915 by Parvus in his magazine *Die Glocke* "with surprising leniency" (p. 126). The fact is that Lenin publicly called Parvus a jester, boot licker, petty coward, and adventurer, describing Parvus's magazine as the organ of apostacy and filthy lackeyism, and a dunghill of German chauvinism (cf. Lenin's article in *Sozialdemokrat* of 20th November 1915). The break between the two was in reality complete—this is also borne out by Lenin's letter to Ganetsky of 30th March 1917 (cf. Lenin, *Collected Works*, Vol. XX, Bk. 1, p. 69). After relations between Germany and Lenin had been severed he does not seem to have figured more prominently in the German calculations than any other Russian revolutionary in Switzerland. Indeed, when the Germans, on March 25th, 1917, gave permission for the journey through Germany nobody on the German side knew or inquired whether Lenin would be among the travellers.

The book does not shed any new light on the second point of special interest, namely who in Germany made the final decision to ship the Bolshevists to Russia and whether General Ludendorff was the main culprit. Mr. Moorehead's assertion that one Sklarz who went to Switzerland for talks with Lenin was acting as agent for the German General Staff (p. 178) is to my mind wrong. He went there on March 27th, 1917, on a private mission for his employer, Parvus, who wanted to muscle in after the German Foreign Office had already instructed the Berne Legation to make the necessary arrangements for the journey. That no record for the Sklarz meeting with Lenin exists (p. 178) is not correct. Sklarz talked not to Lenin but to an intermediary and Lenin's version is given in Fritz Platten's *Die Reise Lenins durch Deutschland*, p. 40. Nor is it true to say that Parvus's proposals, submitted to the German Foreign Office in 1915, "became the blueprint for the German strategy for the Russian revolution" (p. 115); Jagow, the Secretary of State at the time, "rejected his (Parvus's) ideas out of hand" (Count Brockdorff's letter to Jagow's successor, dated 2nd April, 1917, *Hauptarchiv des Ausw. Amts, Der Weltkrieg*, 2, *Vermittlungsaktionen*, Vol. 31).

There are other statements and conclu-

sions which are contrary to my reading of the German files and more could have been said about German financial support to the Bolshevists. That Mr. Moorehead fails to give any specific references, by series of these files, subject matter, and volume number, is rather regrettable in a work of this kind.

All the same, the book is superbly written and a pleasure to read.

Z. A. B. ZEMAN (Ed.). *Germany and the Revolution in Russia, 1915–1918.* Documents from the Archives of the German Foreign Ministry. Pp. xxiii, 157. London: Oxford University Press, 1958. $4.00.

The fateful events between 1915 and 1918 in Russia witnessed a paradoxical cordiality in the relations between certain leaders of Imperial Germany and the Russian Left Socialists. It led to the German aid which enabled eminent Bolshevik leaders to reach their homeland amidst war conditions. For this reason the Bolsheviks came to be labelled as "German agents" and "Berlin's hirelings." The severe verdict is quite comprehensible in view of the agitated sentiments and antagonism fanned by war and revolution. More than forty years have passed and the time has come when the historian is able to take a more objective view of this strange wedlock and cite reasons for this seemingly inexplicable solicitude on the part of Germany for the socialist cause.

Gathered before us are documents extracted from the Archives of the German Foreign Ministry, ably edited by Mr. Zeman; these shed considerable light on the question. They show convincingly that Lenin had no direct contact with German officials, nor is there any indication to prove that he was fully aware of the extent to which his comrades had associated themselves with the Germans. The bare facts clearly demonstrate the peculiar quirk of fate: the interests of Berlin and of those who schemed "to transform the bourgeois revolution into a truly social revolution" in Russia coincided temporarily. For totally opposite reasons both sought the termination of war on the eastern front and the utilization of cessation of hostilities for their own ends.

The collection of evidence covers the period from the beginning of 1915 until the end of 1917. Throughout this time the German Foreign Office displayed a willingness to support both politically and financially not only the Bolsheviks but any other elements that might disrupt conditions in Russia. This was part of a gigantic gamble as alluring to some German leaders as it was distasteful to others. If some could envision only the demoralization and collapse of Russian efforts, resulting in termination of war in the east, others feared that the virus of Bolshevism might carry with it most dangerous political potentialities for Germany. The entire subject matter of this volume has been previously discussed in historical literature; now we have substantial evidence from the German side. It can only be hoped that similar historical evidence may be forthcoming from the Soviet side. Meanwhile the documents gathered by Zeman show sufficiently the German motivations in their political gamble. The editor has rendered considerable aid to the student of modern history in clarifying a heatedly discussed subject.

OLIVER H. RADKEY. *The Agrarian Foes of Bolshevism: Promise and Default of the Russian Socialist Revolutionaries, February to October 1917.* (Studies of the Russian Institute.) Pp. xiv, 521. New York: Columbia University Press, 1958. $8.50.

Professor Radkey's doctoral dissertation, entitled "The Party of the Socialist Revolutionaries and the Russian Revolution of 1917," was submitted and accepted at Harvard University in 1939. The present work is the first volume of a projected two-volume publication of that dissertation. It carries the story of the PSR, or Party of Socialist Revolutionaries, down to the October Revolution which brought the Bolsheviks to power. The second volume will follow the career of the party through the early days of the Communist regime to the party's demise through the exile of its leaders or their submersion in the Bolshevik flood.

This carefully, almost meticulously, done study is, however, much more than a doctoral dissertation. It is apparent that Professor Redkey has spent these last nineteen years not only in running down every last clue to his thesis and interviewing again and again the dwindling number of party leaders, but in rethinking earlier attitudes and arriving finally at a maturity of judgment that hasty publication a generation ago might have denied him. While his own understanding of his problem has deepened, the author has seen changes over the years in the attitudes of men like Chernov, Kerenski, Vishniak, and Zenzinov, all of whom he interviewed in the thirties and again a decade or two later. How extremely unfortunate it is that other scholars as sound and thorough as Dr. Radkey should not have made similar studies of the Mensheviks, the Kadets, and the Octobrists, whose leaders nearly all have gone. No such study of the Bolsheviks was ever possible, although the present work casts much light upon their actions in the period of the Provisional Government.

The subtitle of *The Agrarian Foes of Bolshevism* is *Promise and Default of the Russian Socialist Revolutionaries, February to October, 1917.* The story is one primarily of default rather than promise. Almost from the moment of the party's rebirth in 1918—the failure of the 1905 revolution had in effect destroyed the party—the PSR suffered from schism and rivalry and ineffective leadership to the point where there was not one party but several. Mr. Radkey distinguishes between rightist, right right centrist, right centrist, left centrist, left left centrist, and leftist splinters. Apart from the tragic refusal of the leaders to set aside differences in the interest of party unity, the party lost its popular support to the Bolsheviks because of its unwillingness to meet the soldiers' demand for peace by taking Russia out of the war and its hesitation to satisfy the peasants' appetite for land by breaking up the great estates. Lenin promised both, and the leftist SR's helped carry the masses into the Bolshevik camp by going along with him.

Many readers will not find it easy to follow the twistings and turnings of most of the PSR leaders, few of whom were as forthright and consistent as Natanson and Breshko-Breshkovskaia. Without the clear and pleasing style of Mr. Radkey's presentation, some might not think it worth the effort to try.

WILLIAM BENTON. *This is the Challenge: The Benton Reports of 1956–1958 on the Nature of the Soviet Threat.* Edited by Edward W. Barrett. Pp. xv, 254. New York: Associated College Presses, 1958. $3.95.

The first 167 pages of this book consist of articles or addresses growing out of the author's observations during his prolonged visit to the USSR in 1955; the balance is an Appendix with very valuable documentation. The challenge, as Mr. Benton sees it, lies in Soviet education. In successive chapters he analyzes education in the schools, the organization of cultural life, the aims of education, and the role of the press. Every page is replete with facts and official explanations in regard to Soviet principles and practice in this field, together with the author's keen observations. He speaks of "the concentrated zeal of hundreds upon hundreds of earnest-looking students" in the Lenin Library, and of his astonishment at learning that these were not university students but "workers from the night shifts" in the factories.

It would have been well for the author, and for the American public, to have greater awareness of this tremendous urge for knowledge on the part of the Russian people. This is not a product of the Communist regime. It was characteristic of Russian youth before the Revolution. It is this which provides the fertile soil in which Soviet education and propaganda raises up scientists who are also propa-

gandists. Besides, Soviet youth is hard-working. In analyzing the difference between the schools in the USSR and those in the United States, Mr. Benton notes not only the heavier curriculum in the former, but the tendency toward an easier approach to education in the latter. This will have to be overcome if America is to retain its lead.

The clear-cut purpose of Communist education is made clear in a quotation from the Soviet Encyclopedia: "To develop in children's minds the Communist morality, ideology and Soviet patriotism; to inspire unshakable love toward the Soviet fatherland, the Communist party and its leaders; to propagate Bolshevik vigilance; to put an emphasis on atheist and internationalist education; to strengthen Bolshevik will power and character, as well as courage, capacity for resisting adversity and conquering obstacles; to develop self-discipline; and to encourage physical and esthetic culture."

One of the factors in the situation that struck Mr. Benton with great force was the high quality of top Soviet newspaper editors and educators, and the tremendous power in their hands. "They are experienced and sophisticated men, attractive men, manifestly able men, and because of these qualities they are potentially dangerous men to the US." The notes which Mr. Benton took on conversations with the Foreign Editor of *Pravda*, the Editors of *Izvestia*, the Managing Director of Tass, and the Minister of Higher Education constitute an important contribution to our knowledge of the interplay between Marxist-Leninist doctrine and the authentic elements of science and society.

Being an experienced and able man in public service, Mr. Benton finds it natural to take up the challenge. He recommends federal support for education at all levels, special measures for ensuring that gifted students may develop their full talents, and various methods for piercing the curtain. He is fully in accord with the plan for exchange of persons. He feels this to be of extreme importance, calling Soviet insulation the "sinister enemy." If we could make a dent in "communist saturation strategy," the people of the Soviet Union would respond with friendliness and join in the search for freedom and justice.

This is not a handbook on education in the Soviet Union, but puts the challenge of that education in a way that should be examined widely in the United States.

Committee YMCA

ALEXANDER G. KOROL. *Soviet Education for Science and Technology.* (Technology Press Books in the Social Sciences Series.) Pp. xxv, 513. New York: Technology Press of Massachusetts Institute of Technology and John Wiley & Sons; London: Chapman & Hall, 1957. $8.50.

At long last the American people have become interested in Soviet education—one of the great and inescapable realities of the present epoch of world history. Indeed, during the past year they have exhibited a measure of panic, and even hysteria in some quarters. The occasion of the concern, as we all know, was not the publication of the first scholarly accounts of Soviet education. Such accounts had appeared at intervals from the first decade of Soviet power. The occasion rather was the sudden rise of sputnik number one before the astonished gaze of mankind.

Although sputnik was not a product of the teaching of physics from the sixth grade, as many seem to think, the swift advance of Soviet science and technology cannot be understood apart from the tremendous development of a comprehensive system of education under the all-powerful leadership and direction of the party of Lenin and its Central Committee. The story of this development is told with clarity and force by Alexander Korol of the Massachusetts Institute of Technology in a book more comprehensive than its title would suggest.

The first three chapters are devoted to the "Soviet system of mass education" and the program of the now famous "ten-year school," the institution that until recently was regarded as primarily responsible for the general education of the younger generation—intellectual, moral and political. The remainder of the book, except for the last chapter, gives a detailed and scholarly account of the entire program for the training of specialists of semi-professional and professional grade in all branches of economy and culture. Interesting and relevant comparisons are made throughout these chapters with American practices, standards, and achievements. No one who is interested in Soviet education or in the source of Soviet power and dynamism can afford to ignore this important book.

The final chapter, entitled "Comments and Reflections," is especially valuable for the American educator in the present crisis. Here the author raises the fundamental questions regarding the meaning of Soviet education for us. It is unfortunate that many of our citizens who seem to have been suggesting that we should adopt some of the basic patterns of Soviet education have not first read this chapter. Dr. Korol knows, as every competent student of comparative education knows, that education must always be relative to a given system of government and society. What is good for a dictatorship may be poison for a democracy.

The reader should know that, since this book was written, Soviet education seems to have entered a new period. At any rate, proposals for fairly radical reform of the entire system have been coming from time to time from Khrushchev and the Central Committee. Yet to anyone familiar with the history of the subject certain of these proposals and the very words employed are reminiscent of the past and even of the nineteen-twenties. The basic features of Soviet education are not likely to change until and unless the social system itself changes.

GEORGE S. COUNTS

Teachers College
Columbia University

CHARLES JELAVICH. *Tsarist Russia and Balkan Nationalism: Russian Influence in the Internal Affairs of Bulgaria and Serbia, 1879–1886.* (Russian and East European Studies.) Pp. x, 304. Berkeley and Los Angeles: University of California Press, 1958. $4.50.

During the period of 1879–86, the Russian government, in spite of hopes to the contrary, was forced by the needs of her foreign policy—and especially the demands of military strategy—to question the policies of Bulgaria's government under Prince Alexander of Battenburg. In contrast, Russia's influence in Serbia was strengthened, for there King Milan's Austrophile tendencies and his generally unpopular actions served to draw the Serbian people closer to Serbia. Within this framework, Jelavich describes in considerable detail the specific issues in Russo-Bulgarian and Russo-Serbian relations: the controversy over the Russian-sponsored Bulgarian Constitution, the Bulgarian railroads, the control of the army, and the personal animosities between the Czar and the Prince; and, in Serbia, the ouster of Metropolitan Mihailo. Jelavich is especially interested in the dramatic culmination of the national struggle in Serbia and Bulgaria: the union of the two Bulgarias, the Serbo-Bulgarian war, and the kidnapping of Prince Alexander.

Based on material in the Public Record Office in London, in the *Haus- Hof-* and *Staatsarchiv* in Vienna, and on the unpublished private papers of Nikolai Karlovich Giers, Russian Foreign Minister during the period under discussion, the work is the most penetrating and systematic discussion of this historical period available. The author has gathered his sources from far and wide and in different languages. His erudition, as shown in the numberless footnotes and the Bibliography, is overwhelming.

There is only one minor point for which Jelavich can be criticized. With so many hardly known documents and sources noted throughout the work, the specialist would be thankful for having him include also the publishers, since most of this material appears to be inaccessible today.

## *AMERICAN HISTORY AND GOVERNMENT*

FORREST MCDONALD. *We the People: The Economic Origins of the Constitution.* Pp. x, 436. Chicago: University of Chicago Press, 1958. A Publication of the American History Research Center, Madison, Wisconsin. $7.00.

The rise and decline of Charles A. Beard's thesis about the Constitution provides an interesting study in intellectual history. When first formulated in 1913, so profane an approach to so sacred a document aroused resentment. Then in the debunking twenties and the crusading thirties Beard's economic interpretation won increasing support. By the forties it seemed to command general acceptance. But in the fifties it has been subjected to severe criticism, not now by outraged defenders of the household gods, but by scholars soberly bent on checking the facts. In 1956 Robert E. Brown raised searching questions concerning both Beard's method and substance. In 1958 Forrest McDonald in an independent work—he states in his preface that he has refrained from reading Brown's book—administers the *coup de grâce* to the Beard thesis.

Beard argued, of course, that the Constitution was sought by the capitalistic minority, that those who drafted it had an immediate financial stake in its adoption, and that ratification was put over on the small farmer and debtor majority by undemocratic methods. While Brown and McDonald have disagreements of their own—Brown can find only six delegates in the convention who had personal property in excess of their realty, while McDonald pronounces personalty interests "in a clear majority" by 31–24—both agree in rejecting the thesis that the personalty-realty cleavage explains the divisions either in the convention itself or in the debate over ratification. Both show convincingly that the question of personal financial advantage—always the weakest feature of Beard's argument—played little part in the broad picture; indeed, as McDonald points out, both the largest private creditor and the largest public creditor in the convention were opposed to the Constitution. As for the ratification process, Brown argues plausibly that Beard greatly overestimated the number of people excluded from the suffrage; and McDonald, in an impressive state-by-state analysis, presents the variety of forces and factors which entered into the final decision. It can now be accepted, I believe, that the Constitution was both desired and supported by a much wider representation of interests than the Beard thesis permitted.

All this does not mean a rejection of the idea of an economic interpretation. Both Brown and McDonald are wholly prepared to read the Constitution as a secular document, closely bound up with the concrete needs and interests of the day. But their researches argue the importance of what McDonald calls a "pluralistic study of the Constitution." Now that he has cleared away the Beard thesis, historians will look forward to two further volumes, promised by Mr. McDonald, setting forth his positive views about the making of the Constitution.

ARTHUR SCHLESINGER, JR.
Professor of History
Harvard University

NORMAN COUSINS (Ed.). *'In God We Trust': The Religious Beliefs and Ideas of the American Founding Fathers.* Pp. viii, 464. New York: Harper & Brothers, 1958. $5.95.

From the list of founding fathers, Mr. Cousins has selected nine for comment. He devotes much more than one-half of the volume to Jefferson, Thomas Paine, and John Adams, and includes a special chapter given to the correspondence between Jefferson and Adams in the area of religion. James Madison, John Jay, George Washington, Benjamin Franklin, Alexander Hamilton, and Samuel Adams are covered in 146 pages all told.

Franklin's "thorough deism" did not exclude the existence of the deity. His trouble was with Calvinism's "ordination" which made prayer "useless and an absurdity." Franklin contributed a revision of the Lord's Prayer which substituted Heavenly Father for the traditional form, and asked that we be provided for this day, as thou hast hitherto daily done, and kept out of temptation, and delivered from evil. The doxology does not appear.

"Washington, like Jefferson and Franklin, was non-denominational in his spiritual views." His natural deism was increased by his high regard for the "morals and teachings of Jesus."

John Adams settled the matter himself, "I have been a church-going animal for seventy-six years. . . . And this has been alleged as one proof of my hypocrisy . . . ask me not whether I am a Catholic, Protestant, Calvinist or Arminian. *As far as they are Christians, I wish to be a fellow-disciple with them all.*" He was called a Puritan, Deist, Orthodox Christian, and Humanist. He described his religion as: "Allegiance to the Creator and Governor of the Milky-Way and the Nebulae, and benevolence to all his creatures."

When President, Jefferson refused to proclaim days of fasting and prayer. He defended the Quakers and Unitarians and criticized severely the "Athanasian paradox that one is three and three one. . . ." It was preposterous to say that "God from the beginning, elected certain individuals to be saved, and certain others to be damned; and that no crimes of the former can damn them; no virtues of the latter save." ". . . the genuine doctrine of one only God is reviving and I trust there is not a young man now living in the United States who will not die an Unitarian." "That this will, ere long, be the religion of the majority from north to south, I have no doubt" (pp. 161, 163, 237).

Jefferson reduced the inherited 773,000 words ascribed to Jesus to 25,000 in writing the *Life and Morals of Jesus of Nazareth* which the Fifty-seventh Congress published and distributed among its members.

On page 247 Adams asks Jefferson whether he has read J. W. Goethe's *Schriften*, and on page 257 Jefferson answers that he has not and until Adams raised the point the question had never occurred to him. There are at least five sets of Commandments. Protestantism except Lutheranism uses chapter 20 of Exodus while Roman Catholicism and Lutheranism employ Deuteronomy chapter 5, which lets the Sabbath originate at the time of the exodus rather than at the time of creation on the first seventh day. Adams gives Goethe's Tenth Commandment the form: "Thou shalt not boil the kid, *while it is yet sucking*!"

Cousins begins his fine discussion of Thomas Paine thus: "A man who was willing to travel anywhere in the world to combat atheism and to establish the proof of the existence of God can hardly be denounced as an atheist himself, but this is what happened to Thomas Paine. His crusade was based on the love of God and man, yet he was flayed as an infidel and enemy of religion."

And so the author gives fifty-five pages to Paine and twelve pages to Samuel Adams whose father helped establish the new South Church and also owned a brewery. The son "maintained connections with both."

CONRAD HENRY MOEHLMAN
Professor of the History of Christianity, Emeritus
Colgate Rochester Divinity School

*The Papers of Thomas Jefferson*, Vol. 14, 8 October 1788 to 26 March 1789. Edited by Julian P. Boyd. Pp. xliv, 708. Princeton: Princeton University Press, 1958. $10.00.

The newest volume in this monumental series manifests the same painstaking scholarship and sustains the same high level of interest as its predecesors. The events that occurred in the six-month period under consideration are worthy of the men who were observing and commenting upon them. From the United States come letters to Jefferson with insight and information concerning the transition from the Articles to the Constitution. Jefferson makes his own position perfectly clear. He welcomes the new Union and, for the most part, approves and supports its fundamental law. But he objects to the indefinite re-eligibility of the President and is fearful of the absence of a bill of rights, although the addition of the latter appears assured by the time the Constitution is inaugurated.

A revealing exchange of views takes place between Madison and Jefferson on the subject of such a bill of rights. To

Jefferson, its insertion into a series of amendments is not only a political necessity to satisfy the opponents of federal power, but also an essential guarantee of individual freedoms. He sees the dangers of legislative, and eventually executive, power. The courts, therefore, can use a bill of rights to protect the individual. Madison, however, is not convinced by this argument. He places no reliance in "parchment barriers" and has little hope that they will suffice against the real threat —which is a government powerfully backed by a popular majority. One may well ponder this interchange in reflecting on the current crisis over desegregated schools and on the dilemma of a Supreme Court which faces a weak executive, a Congress that abdicates responsibility, and a rebellious state administration.

From his side of the ocean, Jefferson writes to his friends about developments in Europe. At the moment when the Constitution of the United States is going into effect, France is electing its Estates General and is preparing for reorganization of its government. What is rather odd is that Jefferson seems not to realize how close the country is to revolution. He reports the various procedural moves and the jockeying of groups for position. True, he is afraid that an assembly of twelve hundred men can become a mob. But in general he is optimistic and hopeful that France will right itself and reform its principal abuses. How drastic these "reforms" were going to be, how convulsive the next twenty-five years—of this he does not detect the signs, if signs there were to detect.

At the close of the volume, the European chapter almost ended, Jefferson was making ready for a "visit" home. His philosophy was soon to confront the tests of practice, as he wrestled with Hamilton and Adams—and later with Napoleon.

University of California
Berkeley

AMOS R. E. PINCHOT. *History of the Progressive Party, 1912–1916.* Pp. xii, 305. New York: New York University Press, 1958. $7.50.

"For all its legal status," wrote Amos Pinchot, "the Progressive party cannot really be said to have been a political party at all. Rather, it was a faction, a split-off fragment of its mother star, the Republican party, which, like a meteor, flamed momentarily across the sky, only to fall and cool on the earth of solid fact." This generation has seen two other parties called progressive thus rise and burn out; a history of the first of the three by a participant-observer is most welcome. It is welcome even though it was never completed, even though it is in places bitter. It is carefully edited by Helene Maxwell Hooker, who has written an eighty-five page biographical introduction, which gives a good account of the place of Amos Pinchot in the politics of the first two decades of the twentieth century.

Never as well known as his brother Gifford, Amos Pinchot (1873–1944) had a vast acquaintance among the influential people of New York and Washington. He wrote speeches, pamphlets, magazine articles—and many long letters. He was attracted to Senator Marion La Follette, Sr., as the leader for the opponents of big business, but like the others in the Progressive party, he was also attracted to Theodore Roosevelt as a leader who had a chance to win. But T. R., according to Pinchot, was not as much interested in program as in winning, and to win he had to have the financial support of wealthy men like George Perkins and Frank Munsey. He could not obtain this support without fatal compromises.

The *History* contains several vivid descriptions of Roosevelt, whom Pinchot knew well. For example: "He loved to be cronies with the great, the near-great, and the about-to-be great. He liked prize fighters, wrestlers, boxers, actors, emperors, anybody and everybody that was preeminent. . . . He liked the feeling of having a Gary or a Frick or a railroad president shake him by the hand and put his arm around him. . . . He had a boyish human quality of loving to be fooled, of yielding to the obsession of romantic illusions."

The Progressive party was too much Roosevelt and too little program, according to Pinchot, and when T. R. refused

to run in 1916, it died. Pinchot offers some interesting generalizations about how a new party should be started: "A party cannot be founded without a definite cause, or solely upon the personality of an individual. To survive the hardships of the early years, a new party must be a party of ideas, not of men. If the Progressive party had framed an issue that was at the same time clear and of large actual consequence, it would not have died upon the defection of its leader. . . . The party, however, had an aspiration instead of an issue. . . ." By contrast, an old party is not so dependent upon an issue: "It can go along by its own momentum, through the force of tradition, habit, and party loyalty. It can be dull and noncommittal."

We have too few men who like Pinchot can both take part in and write astutely about our politics.

University of Colorado

GEORGE E. MOWRY. *The Era of Theodore Roosevelt, 1900–1912.* (The New American Nation Series.) Pp. xvi, 330. New York: Harper & Brothers, 1958. $5.00.

Of many recent works related to the Progressive movement, Professor Mowry's addition, the latest of the New American Nation Series, has been especially awaited —for two particularly good reasons. One is that the author, Professor of History at the University of California, is one of the foremost scholars in the field (*Theodore Roosevelt and the Progressive Movement* and *California Progressives*, published respectively in 1946 and 1951), and secondly that the book is unparalleled in its analysis of the period. In addition, it manifests a sensible scheme of organization, discriminatory use of primary sources, a discerning synthesis of recent interpretations of the movement, and a pleasant readability.

The first several chapters set the stage for understanding Progressive America. Interpretations of economic, intellectual, political, and urban life at the turn of the century precede a fifth chapter, "The Progressive Profile." The Progressive mentality was a "compound of many curious elements. . . . One part of it looked backward to an intensely democratic small America; another looked forward to a highly centralized nationalistic state. And both elements contained a rather ugly strain of racism" (pp. 104–5).

The middle chapters on the Roosevelt presidency contain the heart of the work. Theodore Roosevelt's entry into the high office was a mark of ambivalence in which he emerged as a "skillful broker of the possible." Necessarily, the President inhibited many reforms in order to secure "any" legislation and, more importantly, his election in 1904. His agreement with Congress, "a compromise with power," did not, however, imply executive inaction. To this the Northern Securities affair and the famous coal strike of 1902 testified. In concise form the author continues his description and analysis of Roosevelt's tenure, moving into diplomacy and the full presidential term.

When applied to hemisphere diplomacy, the Progressive mission lost something of the ethics which premised its domestic policy. The non-hemispheric foreign policies also left much to be desired although they did contribute to the concept of arbitration.

The portion on the presidency concludes with "Roosevelt: The Final Years"—a chapter demonstrating positive political leadership. Illustrative were his successful maneuvers in handling the Hepburn Act, pure food and drug legislation, the meat inspection measure, the Employer's Liability Act, the Brownsville problem, and conservation of natural resources. Professor Mowry feels that the domestic program marked such liberal tendencies that "by the time Roosevelt left office a distinct cleavage had appeared in the Republican party" (p. 225).

In the latter chapters Taft is President but the ear is still Roosevelt's. In sound perspective the author poses the difficulty Taft had reconciling "his philosophical conservatism and his friendship with Roosevelt, his deep sense of loyalty of both a personal and party nature . . . his inclination to swim with the tide" (p. 236). Political ineptness made reconciliation impossible, resulting in a Progressive rebellion

of considerable magnitude—illustrated particularly by the Pinchot-Ballinger affair.

The author closes his work rather abruptly with a description of the Republican decline and Roosevelt's active re-entry on to the national political scene in 1912—firmly placing him in the liberal camp of the New Nationalism.

Professor Mowry has made an inestimable contribution to the Progressive literature. Although not definitive in its coverage of the whole movement, this book, combined with the author's *Theodore Roosevelt and the Progressive Movement*, is thus far the closest thing to it.

THOMAS H. GREER. *What Roosevelt Thought: The Social and Political Ideas of Franklin D. Roosevelt.* Pp. xv, 244. East Lansing: Michigan State University Press, 1958. $5.00.

The title of this book would seem to indicate an extraordinarily ambitious project, one that would seem to be beyond the capacity of one person writing one monograph. Mr. Greer has not held himself to investigating one period of President Roosevelt's life or one phase of his activity, but rather has undertaken to penetrate the President's mind in a comprehensive way and to display his thinking processes at work. A reader could be forgiven for picking up such a work with some scepticism.

But as he reads, the scepticism vanishes and he realizes that the writer has been amazingly successful. As he ponders this success he realizes how much material the author had to go on; ample resources are available for one who will use them with industry. He realizes, also, that the undertaking was not after all quite so formidable as might at first be thought.

What Mr. Greer had to do—and what he did—was to study mostly what the President did, although due attention was also paid to what he said. The doing was most important. Here was a man who had a long experience of power. He was able to do many of the things most people say to themselves they would do if they had the chance. He was often frustrated; he often dissimulated; he often deferred to his political colleagues or to his own appraisal of public tolerance for what he wanted to do. But a two-term Governor and a more than three-term President could hardly conceal his views or his intentions. Voluminous papers are readily available, more so than those of almost any other public figure, and these have only to be studied. There emerges, if due precautions are taken, a view of the preconceptions that any such man must have, acquired through family life, education, associations, and the impact of events. This equipment can be seen in the process of modification. The occurrences of life cause such modifications; the personal adjustments necessary to the career he has chosen modify them. The mosaic is finally a very complex one, but not one which is impossible to understand.

The truth is that Roosevelt's background and his approach to life were not very mysterious if they are carefully studied. They lead on to his public work without hiatus. His political career, the process of achieving a position where he could express his ambitions for others—in the state, in the nation, and in the world—was an extremely skillful one. It must have been to have been so successful. No one could have had the good fortune to prevail so many times with the electorate if he had relied on good fortune alone.

Mr. Greer has been both industrious and penetrating, and the result is a study worthy of a place on the growing shelf of Rooseveltiana. I personally liked particularly his appraisal of the President as executive, so often spoken of disparagingly. The office of President is not the office of a tycoon. Its most important feature is a leadership not all of its occupants have furnished. Its manifold relationships with the electorate, with Congress, with the party, and the leaders of other nations give it a significance far beyond that usually encompassed in the word executive. Mr. Greer has understood this. But it is hardly fair to single out one phase of a rounded treatment such as this is. There are chapters dealing with such topics as the President's constitutional ideas, his relation to the political system, his view of the function of government, on good neighborliness in foreign affairs, and on the management of public relations.

This volume is to be recommended to students of Roosevelt, of the presidency in general, and of political ethics.

R. G. TUGWELL
Professor Emeritus of Political Science
University of Chicago

PAUL KECSKEMETI. *Strategic Surrender: The Politics of Victory and Defeat.* Pp. ix, 287. Stanford: Stanford University Press, 1958. $5.00.

Over eighty members of the United States Senate recently recorded their opposition to any federal expenditures for research suggesting that this country might consider the possibility of surrender in some future nuclear war. The stimulus for this demonstration of senatorial ostrich-mindedness was this challenging study of *Strategic Surrender* by Paul Kecskemeti. Prepared as part of a research program of the Rand Corporation under contract with the United States Air Force, it presents a searching scientific inquiry of what the author calls "the Politics of Victory and Defeat." In considerable detail he examines surrender both as a strategic and a political concept, noting the varying strategies of rout and attrition, tactical and strategic surrender, in total and non-total war.

Every nation involved in warfare, against whom the tide of battle has turned, must at some stage consider the cost of continuing the struggle or seeking to end it on the best possible terms. Nor is the cost to be measured solely in terms of material losses but also, and perhaps primarily, in terms of political and moral consequences. "The point to be emphasized," says author Kecskemeti, "is that the terms 'victory,' 'defeat,' and 'stalemate' when used to characterize the final outcome of wars rather than the outcome of military engagements, are not absolute, but relative concepts." To those who think of wars as religious crusades in which the forces of righteousness are arrayed against the minions of evil, such ideas will appear to be both cynical and sinful. And one can well imagine the sense of outrage with which such political Manichaeans will read the following: "It is possible to pay too much for victory and even for stalemate. One may safely say that the maxim 'in war there is no substitute for victory' is totally erroneous."

The only logical outcome for those to whom war is a holy crusade of good against evil is either total victory or unconditional surrender. Unfortunately, a policy of unconditional surrender not only prolongs the conflict but makes an orderly termination of hostilities almost impossible. It invites disaster and anarchy in the defeated state and increases the cost of victory to the victor. The account in this volume of the "unconditional" surrender of Italy and Germany in World War II outlines in painful detail the disastrous, indeed almost calamitous, consequences of this policy.

Even in the case of Japan, our stubborn insistence upon unconditional surrender not only prolonged the war but led to the tragic decision to drop atomic bombs on Hiroshima and Nagasaki—a decision which seems in retrospect unnecessary if not wholly indefensible. Our stubborn refusal to negotiate a surrender by making the one concession which the Japanese asked us to make—the preservation of the imperial establishment—had disastrous consequences both for Japan and for us. For Japan it prolonged an admittedly hopeless struggle, strengthened the hand of the suicidal fanatics of the military caste, and led to Hiroshima and Nagasaki. For us it was costly, not only in military and material, but in political terms. It made Russian participation in the Pacific inevitable, with political consequences adverse to us, the Chinese, and the Japanese. Moreover, the final surrender was not "unconditional" but almost exactly on the terms suggested by the earlier Japanese peace "feelers": that is, the preservation of the imperial establishment.

Instead of voting in blind and ignorant indignation against research on *Strategic Surrender*, our senators might do well to read and soberly reflect upon the lessons

which this book teaches. They might especially note and remember the words with which the author concludes:

"The major political implications of the new strategic situation brought about by the emergence of nuclear weapons may be formulated as follows: powers may seek to survive in the nuclear age, either by going to extremes of inhumanity and malevolence never imagined before, or by drastically limiting their expectations of gain from the application of armed power. . . . If the inhuman alternative . . . is excluded for us because of our nature, so much the better. . . . If we rule out the inhuman solution, then we must . . . revise some of our deeply rooted traditional attitudes, such as our rejection of compromise and our faith in extreme, ideal solutions when the chips are down. . . . In the past, these propensities served us well in some respects and played us nasty tricks in others. In the future, they can only render us impotent to deal with political reality and thus jeopardize our very survival."

PETER H. ODEGARD
Professor of Political Science
University of California
Berkeley

HANSON W. BALDWIN. *The Great Arms Race: A Comparison of U. S. and Soviet Power Today*. Pp. ix, 116. New York: Frederick A. Praeger, 1958. $2.95.

In this thought-provoking book, the well known military commentator of the *New York Times* has measured the strategic power of the United States and the Soviet Union. Mr. Baldwin's balance sheet has appraised the broad sources of military strength—economy, technology, education, and morale. The triad of big battalions, big factories, and big bangs has set the quantitative framework for this impressive comparison.

The author's intent was to produce an objective estimate of forces. He also attempted to avoid the trap of current hyper-self-criticism "initiated by the sputniks," which "has verged from hysterical excitement to self-satisfied complacency." In setting himself this goal, he could have foreclosed his objectivity if indeed post-sputnik concern about the American defense posture was hysterical and hence exaggerated. This reviewer, for one, is satisfied that Mr. Baldwin's objectivity has remained untarnished and that *grosso modo* his measurements are right.

Mr. Baldwin's conclusion is that the United States is "still the first military power of the world. If we do certain things, we can probably remain so, though we shall never again hold the unmatched power position that we formerly enjoyed at the end of World War II." Upon reflection, this well-documented and eminently sound finding is, perhaps, not too surprising. There is really not too much doubt that the United States will continue to rise to the occasion, probably with stage-fright and confusion, but performing well in the end. The belittling of American power—and will-power—is just that much foolishness.

Mr. Baldwin's sober optimism is free of complacency. There are many weaknesses in United States arms. It is unfortunate that "essentially, the military's faults and weaknesses are the faults and weaknesses of the government they serve, of the legislature that supports them, and of the body politic." These weaknesses include the following: inadequate appropriations, strategy by budget-making, a cumbersome command and decision-making structure, remoteness of the Joint Chiefs of Staff from the President and the National Security Council, poor implementation of decisions, faulty procurement policies, confused relationships between government and industry, weaknesses in the educational system as well as "lack of any real motivation, the absence of self-discipline, and the physical and moral 'softness' of many of the men who don the uniform. The bond of common service to the country, the sense of adventure, the desire for opportunity, and the quest for danger have been replaced in many of our youths by the urge for security—an urge that, paradoxically, could defeat itself."

There may or may not be deficiencies of similar magnitude in the Soviet system. We may speculate about the organizational, ideological, economic, moral, and strategic weaknesses of communism but we must not count on the persistence of shortcomings and mistakes which are subject to speedy correction.

Though formidable, Mr. Baldwin's list of American problems is incomplete: the author has underplayed United States shortcomings in strategic thinking and in non-military warfare. He does not criticize adequately American failure to understand and go all out in the technological race, which is perhaps more important than the "great arms race."

I fear, too, that Mr. Baldwin has not given due weight to the great military handicaps which in an age of nuclear surprise attack are placed upon the United States by its political ideals. The ideal that we never should attack first is, of course, excellent, but we should not forget its compelling and costly corollary: our strength must be kept at such a level of force and readiness that we can survive a surprise "first blow" and strike back effectively. We have not always been willing to pay the price of our idealism.

The author deserves much credit for an outstanding acomplishment. His research is meticulous, his judgment is realistic and balanced, his skill in compressing an enormously complicated material into a highly readable book of 116 short pages is truly enviable, and his message salutary. Hanson Baldwin has merited the praise of many grateful readers.

STEFAN T. POSSONY

Graduate School
Georgetown University

DUNCAN MACRAE, JR. in collaboration with FRED H. GOLDNER. *Dimensions of Congressional Voting: A Statistical Study of the House of Representatives in the Eighty-First Congress*. (University of California Publications in Sociology and Social Institutions, Vol. I, No. 3.) Pp. v, 203–390. Berkeley and Los Angeles: University of California Press, 1958. $3.50.

This study bears the subtitle *A Statistical Study of the House of Representatives in the Eighty-First Congress* and the author, with collaborator Fred Goldner, has analyzed in great detail a number of key votes in the Congress elected in 1948. Though the material thus treated is ten years old, the method used and the findings developed are of real substance in the politics of 1958 and 1960.

While the use of roll-call votes admittedly has built-in handicaps in terms of legislators fighting hard against a popular measure during debate, then shifting over to be recorded as "right" on the last—and not necessarily decisive—vote, it is the only reliable method available for measuring opinion. Using these roll-calls, scales have been set up to measure "Fair Deal," "Race Relations," "Labor Relations," "Foreign Aid," and "Welfare State" attitude and votes. In addition a series of scales to evaluate votes on agricultural issues are included. These measures, for both parties, are outlined in detail in the first third of this study, then related to one another and to individual constituencies.

In the analysis of the voting in the 1948 Congress the study reveals no startling new information about patterns of Congressional behavior, but the detailed comparisons offered are most helpful in pinning down statistically things only generally described before. Thus, the data on race relation attitudes in North and South, the strong pro-cotton and pro-peanuts positions of Southern members, the naturally anti-oleomargarine views of dairy district Congressmen—all these are well enough known. Here we can find specifics on the expression of these views in Congressional voting and useful correlations of these patterns with others.

The author concludes his research with a commentary on the scale positions in terms of roles played by Congressmen in their political work and careers and a general enquiry into the uses of scale analysis for legislative processes. Included as an Appendix are procedure data, material on the Congressmen and their districts, and some general considerations on the uses of this special form of analysis in the treatment of legislative behavior.

Politics is an uncertain world at best and this work is modest in pointing out many of the limitations imposed on any concept of true measurement in dealing with politics; none the less this is a useful contri-

bution to a growing literature and should be helpful in stimulating new efforts to find the best possible yardstick for political action.

RICHARD M. SCAMMON
Director of Elections Research
Government Affairs Institute

BERNARD RUBIN. *Public Relations and the Empire State: A Case Study of New York State Administration, 1943–1954.* Pp. xiii, 357. New Brunswick: Rutgers University Press, 1958. $7.50.

*Public Relations and the Empire State*, a pioneering work, examines the place of public relations in state government. It carefully evaluates public relations activities in New York State over a period of eleven years during the Dewey Administration, and on the basis of this examination appraises future trends in this new field.

Mr. Rubin displays a thorough knowledge of the literature of public relations and its practices. He has also studied the ephemera: speeches in mimeographed form and pamphlets, and has corresponded and talked with many of the knowledgeable men and momen in state government public relations. The book is well balanced, authoritative, and complete.

Mr. Rubin rightly deplores the ignorance among state officials of the function of public relations, and equally so the lack of agreement between public relations practitioners as to what public relations is and what it should do. Mr. Rubin urges an integrated approach to the public relations problem of state governments by top officials. He suggests that outside consultants might perform an important service in planning the field. He foresees that public opinion research and television will be much more effectively used by state governments in enlightening the people.

This book is recommended to state officials and, particularly, to public relations men in state work. For them it will provide a philosophic approach to their work as well as a working manual to aid them in their day-to-day duties. The book outlines programs and policies, discusses public relations and public responsibility, defines job qualifications for public relations personnel, and outlines methods to make public relations a more effective tool in the furtherance of democratic government.

If there is to be any criticism of the book at all, it is only the minor one that the author, to this reviewer at least, does not seem to give quite enough attention to the dangers inherent in public relations work by the government. Obviously it can carry with it the abuse of power, but that is true of other fields as well. The proliferation of the techniques and strategies for tyranny over men's minds can lead to grave abuses. Society must be aware of and protect itself against such abuses if public relations is to serve constructive goals.

EDWARD BERNAYS
New York City

RALPH A. STRAETZ. *PR Politics in Cincinnati: Thirty-Two Years of City Government Through Proportional Representation.* Pp. xvii, 312. New York: New York University Press, 1958. $5.00.

From 1926 to 1957 Cincinnati was governed by a city council of nine members elected from the city at large by the Hare system of proportional representation. During these three decades its city government enjoyed an outstanding reputation for integrity and efficiency—especially by contrast with its government from 1884 to 1926 when it was dominated by a powerful Republican party "machine." Despite this wide endorsement, the PR system was always controversial with Cincinnati's electorate and political leaders. In its thirty-two year life, it was five times challenged in referenda—winning in 1936 by 831 votes, in 1939 by 742, in 1947 by 7,602, in 1954 by 695, and ultimately losing in 1957 by 11,589. Professor Straetz examines the claims and counterclaims, the charges and countercharges, of PR opponents and proponents throughout these embattled years, providing the first systematic study of the PR system in a large American city.

His analysis begins with attention to "a typical PR repealer election" (1954) and continues through chapters devoted to Council composition and legislative activity, the mayoralty, political parties, the role of groups—the Negro, labor, religious, and civic groups—and four major election issues: the Communists, local government, "personalities and out-of-towners," and the city manager. He concludes with a discussion of "the mechanics of PR." On all these matters, the author finds both the charges of the opposition to PR and the claims of its proponents to be exaggerated. Maintaining on the whole an admirable objectivity, his conclusion in each instance is on net favorable to the PR system. Thus, for example, he holds that while PR gave the Negro a new and proper status in Cincinnati's government the system itself does not produce racial bloc voting; nor does it, in his view, have any special tendency toward religious or ethnic bloc voting. Instead, the strongest voting ties have been to party—to the Charter party and to the Republican party. Similarly, the author concludes that PR elections have produced hard-fought contests with specific alternatives presented forcefully to the electorate, "and this characteristic has existed in Cincinnati in this century only during the life of PR."

The conclusion which is least persuasive is that PR brought a two-party system to Cincinnati. The Charter group did bring an organized opposition to the Republican party—and may continue to do so without PR—but many of the elements of a two-party system were still missing. The Charter group is even more a coalition of disparate groups than is the usual political party, but its truncated character is even more significant: as a purely local organization, it cannot reach into the county government or into the state legislature, in each of which many decisions of crucial importance to Cincinnati are made. Of equal relevance to the claim of a two-party system is the fate of the Democratic party in Cincinnati under PR; no assertion can be made that it has been helped. A purely local opposition party is not an impressive substitute for the second party usually sought in the two-party system.

The council manager plan remains in Cincinnati after the abolition of PR. The future of that plan and its champion, the Charter party, will provide a test for some of Professor Straetz's conclusions about the PR system. Will the city manager's role be significantly modified by the changed electoral system? Will the character of the city council be altered? Will the Charter party hold its own in electoral strength under the new system? And what will be the effects upon the Democratic party, the Negro's political status, the role of labor and business groups? These are questions which the reviewer hopes the author will return to in the near future. His wealth of information about Cincinnati and his demonstrated competence in analyzing its politics make him the obvious choice for such an assignment.

WALLACE S. SAYRE
Professor of Public Administration
Columbia University

ROLAND N. MCKEAN. *Efficiency in Government Through Systems Analysis: With Emphasis on Water Resources Development.* (Operations Research Society of America, Publications in Operations Research No. 3.) Pp. x, 336. New York: John Wiley & Sons, Inc.; London: Chapman & Hall, 1958. $8.00.

This important book is an exciting venture in a relatively new field which has, for the most part, become barnacled with quasi-theories and both vague and ambiguous nomenclature. Systems analysis is virtually, though not completely, synonymous with "operations research" or "operational analysis." It is an empirical approach to solving any kind of problem that can be considered as part of the functioning of a system; it treats systems qua systems, seeking empirical generalizations that can be mathematically generalized and widely applied. Thus, for example, queueing "theory" deals with bottlenecks or waiting-time: the stacking of aircraft over a crowded field; checkout lines in supermarkets; traffic delays at toll gates; the "servicing" of random arrivals by a hospital's finite emergency facilities; or the relations between a nation's college facilities and the lengthening queue of freshman applicants. Likewise, various "programming" techniques are used to improve manufacturing schedules, to plan the blending of peroleum products at a refinery to meet consumer demands, or to control production of an entire industry, such as the

American oil industry. Research of this type is not a science, but an art using science as are medicine and engineering. The aim is to establish functional relations between a system's components, and then to measure the sizes of the components and their magnitudes and directions of change. The ultimate goal is to assign values—dollar values or others—within parameters to alternative courses of action. This is not automatically "the science of decision-making," but a generalization of the methods of handling the data upon which decisions are based. Military operations were the first to be operationally analyzed, and this is still a major activity. Today the art is also applied to a host of business problems; unfortunately, with rare exception, it has become the property, by right of conquest and by default of scholars in other fields, of the denizens of the schools of business administration. Dr. McKean is one of these rare exceptions.

Public programs consume an increasingly large percentage of the gross national product, and individual programs are increasing in size. All involve multi-level problems of choice, and it is essential that methods of quantitative analysis be available as aids in decision-making. Although Dr. McKean is concerned with the economics of these programs, he emphasizes the differences between the public and private sectors of the economy. He is fully sensitive to the elements of these choices that involve human values, our assumptions about the nature of a free society and about the status of the individual, and the ideas of group responsibility and public welfare. Though he rarely deals with these in detail, they underlie all aspects of his technical discussion and are frequently explicit.

Although his book is devoid of the mathematics of system analysis, it is by no means devoid of intellectual discipline and linguistic clarity. The first six chapters are a treatise on the general problems of systems analysis: formulating and testing criteria; dealing with non-quantifiable intangibles; risk and uncertainty; and the role of time in system performance. He offers a thorough examination of both the logical and empirical limitations of the art, and examines in detail the types of logical errors frequently made because of psychologisms which can insinuate themselves. Upon this foundation rests a discussion of the special problems connected with national water resource projects, illustrated by explicit analyses of the Green River Watershed project (Kentucky-Tennessee) and the Santa Maria Project (California). He concludes the book with more than fifty pages devoted to other potential uses of systems analysis in the government.

Dr. McKean is a writer of high literary merit, and his sense of humor includes a mastery of whimsical examples which leave the reader astounded at their aptness and validity—after he has stopped chuckling. In sum, Dr. McKean has performed a public service.

SAMUEL E. GLUCK
Rutgers University
Director of Research
Bonded Scale and Machine Company

O. J. FIRESTONE. *Canada's Economic Development, 1867–1953.* (International Association for Research in Income and Wealth, Series VII.) Pp. 384. London: Bowes & Bowes, 1958. 45*s*.

Any review of Canadian growth from 1867 to 1953 would attract the attention of American readers interested in economic development; this is especially true in a year when anti-United States sentiment appears to be expressed in some sections of the Canadian press. Dr. Firestone is the Economic Adviser to the Canadian Department of Trade and Commerce. He has written the last published installment of the co-operative enterprise in the study of economic growth of nations initiated by the International Association for Research in Income and Wealth in connection with its 1953 Conference. His volume fills a vital statistical gap in Canadian economic history by providing, for the first time, comparable long-term series for a number of key economic indicators, such as net family formation, national product and expenditure, and related price indexes.

The analysis and description of methods and sources are sufficiently scholarly to satisfy the technical expert on comparative economic growth. In addition, the study has been designed to meet the needs of a wider body of business men, investors, and potential immigrants who have a special interest in learning details of the expansion of the Canadian economy and its future prospects.

Over eight decades of growth are covered by this volume, starting from Canada's existence as a unified political entity, and covering the change from a rural and small scale economy to one in which the proportion of manufacturing and other large scale activity places it in the category of the most advanced countries. Canadian trends in population, national product, industrial structure, distribution between consumption and investment, the share of foreign trade, and the contribution of the state are discussed with a reasonably consistent statistical framework and with sufficient continuity over time to reveal the time pattern of the broad lines of development.

The primary aim of the author has been to relate the story of Canada's economic development in terms of national product and national wealth. He also wished to provide Canadian and overseas scholars with an opportunity to learn more about the rate of expansion and the changing structure of a young country—Canada—which has now attained the rank of one of the world's industrial leaders. Actually, Canada ranks sixth in the world in terms of national income originating in manufacturing.

A major problem confronting Dr. Firestone was the inadequacy of data for the early period of his study, as official estimates of national income and gross national product on modern lines are available only from 1926 to date. Another problem has been the absence of recent wealth estimates; the last official estimate was made for the year 1933, when the series was discontinued because of the inadequacy of basic data. Private estimates of national wealth are available for a few selected years back to 1930. These vary so much in quality and coverage, however, that they proved of little value to Dr. Firestone in analyzing economic growth.

Largely through the author's efforts, Canada now has a continuous series of aggregates and breakdowns for a period of more than eighty years, and an appraisal of Canada's long-term growth within the framework of the national accounts. Some of his estimates, admittedly, are tentative, and possibly may be revised at a later date. It is believed, however, that his basic findings will be changed only by addition and refinement rather than by alteration of his major conclusions. What he has done for his country will serve as the basis for future research there and as a pattern for studies of economic development abroad.

MARY E. MURPHY
Professor of Business Administration
Los Angeles State College of Applied Arts and Sciences

A. R. M. LOWER, F. R. SCOTT, J. A. CORRY, F. H. SOWARD, and ALEXANDER BRADY. *Evolving Canadian Federalism.* (Duke University Commonwealth-Studies Center Publication No. 9.) Pp. xvi, 187. Durham, N. C.: Duke University Press for the Duke University Commonwealth-Studies Center, 1958. $3.50.

This is the ninth of the Duke University Commonwealth-Studies Center publications. The contributors—a professor of law, two historians, and two political scientists—are all Canadian scholars of recognized ability and attainments. Each writes from knowledge and experience gained from years of study and research.

The book, however, is open to adverse criticism on two counts. In the first place, it gives inadequate attention to several significant aspects of Canadian federalism. For example, although Dominion-provincial financial relations are generally admitted to be the most important as well as the most vexing problem of Canadian federalism, only six to eight pages are devoted to this topic. In the second place, there is considerable duplication between the different papers. Thus each of the contributors comments on Quebec's long-continued fight to maintain its cultural and political autonomy and three of them recall that Sir John A. Macdonald was a strong advocate of centralized power.

As for the merits of the book, the essays provide penetrating insights into many aspects of Canadian federalism: how it has evolved; wherein it resembles, and wherein

it differs from that of the United States, Australia, and the British West Indies; and how and why certain problems have arisen as well as the attempts which have been made to deal with those problems. To be more specific, we are told that the Canadian federation had its origin in empirical considerations and fear of the United States; that the operation of Canadian federalism has been greatly complicated by Canada's biracial composition; and that the intentions of the Fathers of Confederation to establish a strong, centralized federation were long frustrated by provincial rights sentiment in Quebec and Ontario and by Privy Council interpretations of the Canadian Constitution which tended to enlarge the authority of the provinces at the expense of the Dominion. We are further advised that, although the powers of the central government have significantly increased since 1930, the government at Ottawa still does not have adequate authority to guarantee the preservation of civil liberties or to implement treaties relating to matters assigned by the British North America Act to the provinces. But, judging from the Canadian record, one may confidently predict that these and other problems will be tackled—and eventually resolved—in the traditional Canadian manner, with due regard for democratic procedures and traditions.

WILLIAM R. WILLOUGHBY
Professor of History and Political Science
St. Lawrence University

## *PHILOSOPHY AND SOCIOLOGY*

LEV E. DOBRIANSKY. *Veblenism: A New Critique*. Pp. xii, 409. Washington, D. C.: Public Affairs Press, 1957. $6.00.

The subtitle of this volume claims "novelty" for a critique—or this particular one—of Veblen as a philosopher of society and history. Dobriansky's tone is destructive: not a particularly hard task. Moreover, it is one which could have been performed in a quarter of the space—400-odd pages, packed with pretentious wordage, often straining at the limits of the rhetorically allowable. Much erudition is displayed, and some significant insights are stated more or less clearly and agreeably. Unhappily, however, the standpoint and touchstone of comparison is a position as vulnerable in this writer's opinion as Veblenism itself. The crux of it is that Veblen was a Darwinian, and Darwinism, "as a naturalistic theory, offers no explanation of the origin of the universe" (p. 93). The reviewer cannot imagine more self-contradiction and sheer nonsense expressed in three words than is achieved in speaking of explaining the origin of the universe. Anyway, since such an aim was contrary to Veblen's intention, pretension, or performance, the objection is merely irrelevant.

Dobriansky's book is at once a critique of Veblenism and propaganda for the *philosophia perennis*—medieval theology, here called "Christian reflection" (p. 28). Practices obliquely referred to as "blemishes" on medieval civilization (p. 32), are in fact strictly implied by the "perennial philosophy"; compulsion to believe logically goes with absolutism, with any special claim to "the truth," notably from a source above open critical inquiry and discussion. But most especially it goes with "wishful thinking"—in this connection called "faith"—which will readily explain the origin of the universe, and answer any other question, whether it makes sense or not.

Space limits allow only a few observations on the author's demolition, or Veblenism, or the alternative put forward. All three, of course, have some truth along with their shortcomings, and the book is useful in clarifying opposed positions. The crux of Veblenism is perhaps the pretense to "colorless objectivity" when describing cultural history in terms of "cumulative change"; ridiculing "orthodox" economists for holding a "static" view of human nature; and denouncing or satirizing nearly everything. "Cumulative change" would mean laws of history, which would have to be found first of all, and then explained, rather than treating the formula as itself an explanation. Mr. Dobriansky pillories Veblen for admitting "activity" as an aspect of reality, but rejecting finalism.

What Veblen said—as here quoted (p. 108)—is that activity is imputed by our minds, not an observed fact. This raises the ancient puzzle, doubtless insoluble—except by "faith"—of what we find in phenomena as contrasted to what we read into them. The book seems to take no account of the paradoxes and antinomies of thinking that have been familiar in philosophy for centuries. Physical process clearly does not imply finalism while human conduct does—in the contrasting forms of purpose, subject desire (or opinion) and objective value-judgments which are presupposed in any discussion of a problem. Dobriansky constantly upbraids Veblen for his "dualism" of inert process and purposive action. The contrast is an elementary fact of experience; the defect is that, for interpreting human phenomena, dualism must be amplified into a complex pluralism of basic concepts.

This review has run beyond the assigned length, while directly—scantily—covering the second and third chapters of the book (pp. 25–122). Continuation would be chiefly "more of the same," except as regards the first chapter, which is biographical and seems quite good. The chapters treating Veblen's views on economics are less disapproving—not surprisingly, in view of the shared antipathy to "money-making."

FRANK H. KNIGHT
Professor Emeritus of Social Science and Philosophy
University of Chicago

MARK BLAUG. *Ricardian Economics: A Historical Study*. (Yale Studies in Economics: 8.) Pp. x, 269. New Haven, Conn.: Yale University Press, 1958. $5.00.

When Ricardo published his *Principles of Political Economy and Taxation* in 1817, he provided food for thought of two generations of economists. Until the 1860's, no English-speaking student of economics could afford to neglect a work whose analytical power stood above all previous systematizations. Just as is true with Keynes today, no economist then needed to be pro-Ricardian but few would have wanted to be labelled pre-Ricardians. Some writers turned out expositions and interpretations of the work of the great man; others attempted to develop and refine it. Again others used it as a basis for policy proposals or as a foundation for their own systems of thought. Still others prepared influential popularizations of Ricardo's terse and elliptic writings. And, last but not least, there were the opponents of Ricardo, whose work was inspired by that of the master just as much as was that of his most faithful disciples.

All these groups were integrated by their dependence on Ricardian thought. They include a number of writers of great originality as well as of diverse views, a diversity that was facilitated by Ricardo's abstractiveness. The work of the Ricardians is carefully reviewed in the present volume, the first to deal extensively and exclusively with the Ricardian school. After an introductory chapter devoted to an exposition of Ricardo's system, the author turns to the work of the two most faithful Ricardians, McCulloch and James Mill, to the vacillations of Colonel Torrens, and to Samuel Bailey's early critique. This is followed by chapters on employment, business cycles, population, and wages, in which Ricardo's position is compared with that of Marx, Keynes, Say, Malthus, John Stuart Mill, and other writers. The author then turns to Harriet Martineau and other popularizers, to the Ricardian socialists, to Richard Jones, the early exponent of historical economics, to Longfield, and to Senior. The three concluding chapters treat of John Stuart Mill, of matters of economic policy, and of Fawcett and Cairnes, the last of the "classics."

The work is remarkably erudite and well written. It brings to the fore a new scholar, who was barely twenty-eight years old when his doctoral dissertation, from which the present volume springs, was submitted to Columbia University in 1955. A promising beginning indeed, and one that attests to the fact that the history of economics contains grist for the mill worthy of the best minds. The work appears at the right time, when there is need for balanced judgment to offset the influence of

Schumpeter's posthumous work with its brilliant but often one-sided interpretations.

HENRY WILLIAM SPIEGEL
Professor of Economics
The Catholic University of America
Washington, D. C.

DENNIS H. ROBERTSON. *Lectures on Economic Principles*, Vol. II. Pp. 162. London: Staples Press, 1958. (Distributed by John de Graff.) $3.50.

This book is the second of three volumes which reprint the author's lectures at the University of Cambridge. It deals with the distribution of incomes between production factors. The approach is characteristic of the Cambridge school and the level of discussion is appropriate to upper-division undergraduate students in the United States. The treatment is very concise but the reader is likely to be surprised at how much is included in a small volume. At times the exposition becomes algebraic but a literary exposition in common-sense terms usually follows so that the nonmathematical reader can understand what is involved. Principles are stated, but illustrations of the various theoretical points are also given, comments are made on the views of others, and pertinent data are cited.

Robertson is no great admirer of the Keynesians and takes the opportunity to point out that Marshall, before Keynes, had recognized the interdependence of saving and income. He raises doubts as to whether, over time, increased income expands the volume of saving as much as the Keynesians have believed. He looks on individual saving with greater favor than did Keynes, pointing out that a fuller distribution of corporate profits in dividends would enable investors to exercise greater control over the direction of new investment. On the desire for security through bond investment, Robertson comments that "Society seems to protect itself—some would say over-protect itself—against this nuisance by organizing a secular robbery, through the depreciation of money, of those who have sought to keep their savings safe." Yet he says that " 'the euthanasia of the rentier' is not really a very sensible objective of policy."

Among other things, the book criticizes the Cambridge theory of labor exploitation and contains enlightening discussions of such aspects of British policy as the attempt in the post-war years to nationalize increments in land values, and the action on the part of the British government in the same period to keep interest rates low despite a continuing shortage of investment capital. Nevertheless, Robertson recognizes that, with capital as well as with labor, there can exist conditions in which a lower factor price enhances the factor supply.

Although closely reasoned throughout, the book is both clear and interesting; sometimes witty. It can be recommended warmly both to teachers and students in this country.

EDMUND WHITTAKER
Professor of Economics
Colorado State University

ABRAM L. HARRIS. *Economics and Social Reform*. Pp. xvi, 357. New York: Harper & Brothers, 1958. $5.00.

For a "practicing" social scientist the title of Dr. Harris' book raises false hopes and expectations. Perhaps such a person is not a suitable one to review the book when its substance rather than its title is considered. For the volume deals not with economics as a substantive science, but rather with the economic theories held by certain selected writers; nor does it deal with social reform as actions or events, but with the theories on social reform held by these same writers. The selected list under examination is varied enough: John Stuart Mill, Karl Marx, Thorstein Veblen, John R. Commons, Werner Sombart, and for Catholic opinion, Heinrich Pesch. The unifying organizational framework for the analysis is supplied by the author, but in a loose and suggestive form, rather than as a consistent inclusive structure. It is stimulating, but there is very little of it—in the Introduction and in a few summaries.

The treatment in the main is encyclopedic and reflects tremendous erudition—too much, in fact, for this reviewer, and I fear too much for any but the initiated. The volume of references is overwhelming, to the point where a sense of direction is lost. It presupposes a vast detailed knowledge on the reader's part of the minutest components of the writings not only of those under review, but of the field as a whole. Of economic substance or of the facts of social reform there is little, even though the life span of the writers analyzed covers a century and a half of the most phenomenal changes in economic structure and activity in Western society. There is hardly a hint of the quantitative revolution in this period of production, consumption, transportation, or invention. And one misses the significance for social reform of these facts and of the related developments in the exploitation of natural resources, and in the fields of demography and public health.

With respect to social reform one would expect some reference to events in the complementary development through the nineteenth and twentieth centuries of individual political freedom on the one hand and governmental responsibility for welfare on the other. The author's manner of analyzing the writings on his selected list without relation to such events does not provide for such a discussion. It even avoids the comparison of qualitative characteristics between, for example, the genius of Karl Marx in analyzing the social process while fomenting revolution at a safe distance, the incisive and lucid exposures of Veblen, and the yeoman's work of Commons in first-hand labors in the political economy. Of necessity, also, the author's treatment avoids the meaning for social reform of international economic competition and its social reflections in Mussolini's, Hitler's, and Stalin's impacts on social organization. It would seem that, on the whole, Dr. Harris has produced a reference book within self-imposed limits, rather than a discussion of economics and social reform.

PHILIP KLEIN
Resident Representative
United Nations Technical Assistance Administration
Jerusalem, Israel

FERDINAND A. HERMENS. *The Representative Republic*. (International Studies of the Committee on International Relations, University of Notre Dame.) Pp. xiv, 578. Notre Dame, Ind.: University of Notre Dame, 1958. $7.50.

Professor Hermens has crowded—perhaps overcrowded—such a mass of material into the pages of his new book that a summary account becomes inevitably a distortion. However, we will not be too far off the main line if we accept it as an apology for constitutional, democratic, representative, republican government.

Professor Hermens doubly rejects political relativism. He will not agree that there is no normative choice among the various forms of government, that whatever the type "that which is best administered is best." Nor will he accept any reductionist doctrine which interprets political structure as a derivative by-product of economic or other non-political forces. The political realm is autonomous; the choices made among alternative political structures and procedures are morally as well as historically significant; the representative republic is not merely one form of government among numerous peers, but the best government and—if properly conceived—even the strongest.

These controlling ideas Professor Hermens develops by describing the representative republic in contrast to the other governmental forms—monarchy, aristocracy, authoritarian and totalitarian dictatorship—by a theoretical analysis of its anatomy, physiology, and pathology; and by examining its empirical manifestation in most major and many minor contemporary nations.

In the light of Professor Hermens' central theses it is somewhat puzzling to discover that satisfactory examples of the representative republic exist only in Great Britain and the older dominions (Canada, Australia, New Zealand), plus—though as a case "*sui generis* . . . which it would be impossible to transfer to other countries"—the United States. In spite of the theoretical autonomy of the political, it turns out that the countries of Asia, Africa, and Latin America—that is, most of the world—do not provide the developed "social matter" that is requisite to the republic. In eastern Europe outright tyranny has shoved the potential republic aside, as it

did between the wars in Germany and Italy. One or another lesion prevents the republic's healthy functioning in the other nations of the West, including present-day Germany and Italy.

Now if the political realm were indeed autonomous, and if among possible political types the representative republic were indeed both strongest and best, one might expect the republic to be doing a rather more impressive job in practice than Professor Hermens' own review of the record indicates. Professor Hermens' republic tends to drift off into the timeless world of the Platonic forms. Although this retreat leaves his general theory rather empty, the cogency of many of his specific discussions both theoretical and practical is not thereby diminished.

JAMES BURNHAM
Kent, Connecticut

WILLIAM MONTGOMERY MCGOVERN and DAVID S. COLLIER. *Radicals and Conservatives.* Pp. 174. Chicago: Henry Regnery Co., 1957. $4.00.

William M. McGovern and David S. Collier write, in their small book, of radical and conservative "liberalism." They define liberalism as adherence to the two principles of democracy and liberalism, thus including the term to be defined in the definition. At any rate, it is the antithesis of totalitarianism, which is authoritarian and establishes statism. They also contrast liberalism with left-wing radicalism, as it has stood in sharp contrast with socialism, "at most times and places."

The radical liberals are the ones who emphasize an extreme form of democracy, objecting to hereditary monarchy and aristocracy in any form and property qualifications for voting; they favor universal manhood suffrage, women's suffrage, and lowering the voting age. Modern radicals, shifting from early radicals (Bentham, Jefferson, and Jackson), who were believers in laissez-faire, demand a very great measure of state regulation of all economic activity.

The conservative liberals are skeptical of legislative schemes to solve all of man's political, social, and economic difficulties. They believe ardently in checks and balances and the separation of powers, and are devout believers in the general principle of individualism. They accept Sydney Hook's distinction between heresy and conspiracy in interpreting civil liberties, and would deny protection to "conspirators." They oppose collectivism, but will admit the necessity of moderate change. They do not believe that democracy is an ideal for all times and all places.

The book ends with the injunction that "that government governs best which *balances* best." The authors fall, without doubt, into the classification of "conservative liberals." One gets the impression of dressed-up conservatism. They talk about duties before one has the privilege of rights. They misquote the well-known aphorism of Lord Acton on power. They say that most observers would attribute the difficulties of Weimar Germany and France under the Fourth Republic to Proportional Representation. They see the spread of Communism as usually having nothing to do with economic status or standard of living, and its success in China as related to the too rapid overthrow of the Confucian heritage. Presumably, also, the late Senator McCarthy was a "liberal."

DALE PONTIUS
Associate Professor of Political Science
Roosevelt University

DAVID W. NOBLE. *The Paradox of Progressive Thought.* Pp. viii, 272. Minneapolis: University of Minnesota Press, 1958. $6.00.

There are two major aspects to this book, one of which is easy to comment on because its contribution is clear and illuminating. In the chapters which discuss the ideas of men like J. M. Baldwin, C. H. Cooley, Simon Patten, and T. Veblen, Dr. Noble has succeeded in presenting the contributions of these men in a full and integrated fashion and has also shown the philosophic background in which they are anchored.

The second aspect deals with the central thought which holds these chapters together. All these men are viewed as creators of the climate of opinion which was characteristic of the United States between

1880 and 1920. They are called liberal and progressive. They are all presumed to have been involved in a paradox, but its essence is not clearly stated or defined. Noble's approach is based upon that which Carl Becker presented in his volume, *The Heavenly City of the Eighteenth-Century Philosophers.* In so far as Becker attempted to show that the *philosophes* "demolished the Heavenly City of St. Augustine only to rebuild it with more up to date materials" it can be said that Noble attempts to show that the liberals demolished the heavenly city of the *philosophes* only to rebuild it with even more up to date materials.

There is a paradox in this only if one assumes that the acceptance of the logic and method of science excludes beliefs in ideals and values, or that the acceptance of determinism precludes human creativity. In fact, men like Cooley and Baldwin, who stressed scientific rigor, were at the same time firmly convinced that it is in man's power to promote social progress; they themselves worked for social reforms.

Apart from the questionable use of the term "paradox," the book admirably succeeds in showing the profound philosophical basis of the leading social theorists. It might be said that they made significant contributions because of the philosophical implications of their theories. Indeed, in view of Noble's analysis, it is difficult to see how anything in the social sciences can be significant which does not throw light upon the controversial issues of social philosophy.

THEODORE ABEL
Chairman, Department of Sociology and Anthropology
Hunter College

*The Doctrine of Saint-Simon: An Exposition: First Year, 1828–1829.* Translated with notes and an introduction by Georg G. Iggers. (Beacon Series in the Sociology of Politics and Religion.) Pp. xlvii, 286. Boston: Beacon Press, 1958. $4.95.

The title of this book may prove misleading to readers until they have perused the Preface by G. D. H. Cole and the Introduction by Professor George G. Iggers. The volume is not, except very incidentally and indirectly, an exposition of the doctrines of Henri, Comte de Saint-Simon. Rather, it is a translation by Professor Iggers of the first part of the *Exposition of the Doctrine of Saint-Simon,* delivered as lectures by leading followers of Saint-Simon in 1828 and 1829. It is based on the third, revised and enlarged edition, published in Paris in 1831. The *Exposition* was mainly the work of such disciples of Saint-Simon as Enfantin, Bazard, Buchez, and certain engineering students from the Ecole Polytechnique in Paris. In his Introduction, however, Professor Iggers does provide a good summary of the doctrines of Saint-Simon himself.

The Saint-Simonians, with whom this book is mainly concerned, differed from their "master" mainly in their ultimate rejection of his scientific positivism and of his faith in liberty and democracy. They did, however, retain his emphasis on the importance of religion as a main factor in social reorganization, although their Saint-Simonian "Church" was a much more rigorous and authoritarian institution than anything Saint-Simon had envisaged. They, like Saint-Simon, developed their doctrines through several well-defined stages of major emphasis.

In the first stage, about 1825–1826, they stressed the importance of a proper state of mind with which to approach social reform. This was to be based on an intelligent study of history which was supposed to reveal and encourage the reality of progress, the basic importance of positive science, and the reorganization of society through the teachings of social physics. The second stage, which gradually developed from 1826 through 1829, emphasized the possibility of social reorganization under a hierarchy of able leaders, whose fitness would be self-revealed through their superior intelligence and achievements. They would not be elected but would be publicly accepted on the basis of their recognized merits. In this period, the Saint-Simonians also stressed Saint-Simon's views about the importance of industry, especially banking, and introduced a novel interest in feminism, in some cases approaching free love. It is this phase or

stage of Saint-Simonian doctrine with which the volume under review is chiefly concerned.

Beginning late in 1829, the Saint-Simonians moved into a third stage in which "science and industry were clearly subordinated to politics and religion in the hierarchy." The main traits of their thinking and policy in this stage were the sanctification of the state, conservative humanitarianism, and a sort of secular Catholicism. They were deeply affected by the Catholic reactionaries of the time: Bonald, De Maistre, and their followers. They accepted much of the structure and authority of the Catholic Church but rejected its supernaturalism. The direction of society would be handed over to a secular priestly hierarchy, headed by a "general priest" who would preside over the lesser priests who looked after specialized duties and functions. The net result, so they hoped, would be the creation of a benign and efficient authoritarianism, which would not be "of the people" but would rule humanely for them.

Space does not permit detailed comment on this highly interesting complex of social, economic, and political theory. One can only close with the observation that the translation is excellent and that Professor Iggers' Introduction alone is easily worth the price of the book. It is a superb vignette in the field of the history of social, economic, and political theory.

Some will be repelled by a body of social theory which subscribes to authoritarianism. Yet, unless timely reforms are instituted in our present social, economic, and political order, we may be lucky a generation hence in the Western world to be enjoying authoritarianism of a "benign" type. We have all but wasted the time—more than a century—which has elapsed since the days of the Saint-Simonians.

HARRY ELMER BARNES

Malibu, California

A. H. M. JONES. *Athenian Democracy.* Pp. v, 198. New York: Frederick A. Praeger, 1958. $5.00.

Our concepts of the workings of Athenian democracy are primarily derived from the strictures of philosophers, publicists, and dramatists whose sympathies were oligarchic. These writers, according to Professor Jones, were not representative of Athenian citizenry, the great majority of whom were proud of their democratic institutions.

The contention that Athens remunerated citizens for the discharge of their civic responsibilities from income derived from the Empire is refuted, as is the oft-repeated charge that the Athenian democracy rested on a foundation of slavery. From two-thirds to three-fourths of the citizens had no slaves but were persons who "earned their own livings and whose political pay served only to compensate them in some measure for the loss of working time" (p. 18). Likewise, only a negligible portion of the government's income came from the exploitation of state-owned slaves. While Athenian citizens were not radical egalitarians, they insisted on equality before the law and in the formulation of public policy. Although there were a few ill-considered actions by the Assembly, particularly during the Peloponnesian War and its aftermath, democracy did not mean the ascendancy of the rabble. On the contrary, "the Athenian people were rather snobbish in their choice of leaders" (p. 49). The juries and even the assemblies were made up primarily of the wealthy and the middle class. It should also be remembered that the laws could not be altered by a simple decree of the Assembly, but by a prescribed review procedure which included safeguards against fickle proposals or ill-considered action.

The policy of Athens in dealing with the Empire is open to reproach, but it certainly was more enlightened than that of Sparta, and it was in accord with general Greek practice. It is dangerous to interpret the history of the Empire in terms of modern economic imperialism. There was no state effort to acquire markets or to support private ventures directed toward this end. The government's concern, rather, was to assure an uninterrupted flow of vital imports, such as grain, balanced primarily from the income from the silver mines.

This little volume comprising five previously published papers will interest all students of Greek antiquity. The material on economic conditions is particularly valuable, as is the description of the social structure. There is adequate documentation, and an Appendix dealing with the estimate of citizen population during the Peloponnesian War has virtually the stature of a sixth paper.

CHARLES EDWARD SMITH

Dean of the University
Louisiana State University

ERNEST H. KANTOROWICZ. *The King's Two Bodies: A Study in Medieval Political Theology.* Pp. xiv, 567. Princeton: Princeton University Press, 1957. $10.00.

Inspired by a conversation with the late Max Radin and provoked by Maitland's caustic study of the fiction of the king as corporation sole, Professor Kantorowicz was led to a painstaking and richly rewarding research into the originative elements of the theory of the King's Two Bodies which underlay the convenient legal device which seventeenth century English jurists contrived for the interests of the Crown.

The first clear elaboration of the King's Two Bodies appeared in Edmund Plowden's *Reports:*

"For the King has in him two Bodies, *viz.*, a Body natural, and a Body politic. His Body natural is . . . subject to all Infirmities that come by Nature or Accident. . . . But his Body politic is a Body that cannot be seen or handled, consisting of Policy and Government . . . and this Body is utterly void of . . . natural defects and Imbecilities, which the Body natural is subject to, and for this Cause, what the King does in his Body politic, cannot be invalidated or frustrated by any Disability in his natural Body."

The historical antecedents of this juridical distinction of the two bodies reach back into the political theologism of the early medieval theories of kingship. From Christology come the duality of natures and one divine person; from ecclesiology, the doctrine of the *corpus mysticum*; from sacramental theology, the objective validity of sacerdotal ordination and episcopal consecration, derived from the medieval practice of annointing kings and emperors. First the political theorists and then the jurists appropriated the elements which, *mutatis mutandis*, provided the basis for the perpetuity and transcending dignity of royal office and institution however mortal and defectible its human agency. Well might Maitland remark that the English jurists were compounding "a creed of royalty which shall take no shame if set beside the Athanasian symbol." In the twelfth century both canon law and civil law made possible a shift of emphasis from christological exemplarism to a new and more secular duality of king and law and, with the emerging distinction between private and public law, the contrast between the private and public personality of the royal ruler. The dualities of Bracton's king, above and below the law, the constitutional development of the thirteenth and fourteenth centuries, and the gradual evolution of the English parliamentary institution conspired to the construction of a corporative theory of the state whereby the king became incorporated with his subjects and they with him. The sempiternity of the King's body politic in England was untouched by the decapitation of the natural body of Charles I whereas in France the dissolution was complete.

The titles of the five middle chapters outline this development: "Christ-Centered Kingship," "Law-Centered Kingship," "Polity-Centered Kingship: Corpus Mysticum," "On Continuity and Corporations," "The King Never Dies." Even the poets gave expression to this humanly created dualism. Shakespeare's Richard II reproaches himself for turning traitor to his own immortal body politic, and we are treated, in Dante, to a fascinating study of his expansive conception of *Humanitas* in his man-centered kingship as the perpetual actualization of all human—and royal—potencies.

Words cannot do justice to the vast erudition, scholarly precision, and masterful control of the author in the use of original sources—much of it not so easily accessible to medievalists—and of secondary literature. This carefully and richly documented study is graced by an excellent Bibliography and thirty-two plates which are pointedly illustrative of the arguments within the volume. There is just one

desideratum, reluctantly made. One had almost wished that the author's concentration on symbolism had allowed for a more evident appreciation of the practical utility of the fictions which the English jurists contrived for the daily and urgent business of securing private and public rights, privileges, and prerogatives in public law.

JOSEPH F. COSTANZO, S.J.
Professor of Political Philosophy and Historical Jurisprudence
Fordham University

NORMAN F. CANTOR. *Church, Kingship, and Lay Investiture in England 1089–1135.* (Princeton Studies in History, Vol. 10.) Pp. xiv, 349. Princeton: Princeton University Press, 1958. $6.00.

Mr. Cantor has written an extremely important and valuable book based on both extensive research and careful analysis of documents and the ideas they contain. While its central theme is the history of the Investiture Controversy in England, Mr. Cantor has broadened his subject to include other aspects of the relations between church and state which were affected by the ideas of the church reformers who followed the leadership of Pope Gregory VII.

The most striking feature of Mr. Cantor's work is his skill in analyzing ideas and distinguishing between different ones. Thus he shows clearly that while the Cluniac movement was the chief force behind church reform in a general sense, the particular objectives of Gregory VII and his followers were not Cluniac. In his book the various shades of opinion stand out clearly. His account of the different suggestions advanced for settling the Investiture Controversy is particularly valuable. Thus he demonstrates conclusively that the ideas of Bishop Ivo of Chartres which many scholars have considered the basis for the final settlement in England and Germany were quite unlike those embodied in the agreements between the kings of these two states and the papacy.

Mr. Cantor's subject bristles with controversial questions many of which can never be completely solved because of lack of evidence. He argues persuasively that the series of tracts which are known to scholars under the title of "The Anonymous of York" were written by Gerard, archbishop of York. Although he has built up a strong case, it seems doubtful that it will end the controversy over these fascinating documents.

From the point of view of a scholarly monograph there is little to criticize in Mr. Cantor's work. While he makes some statements based on very feeble evidence, he shows clearly what the evidence is and the reader is free to accept or reject the conclusion. Once or twice he allows himself to forget his caution in handling ideas, as when he states that canon law forbade an archbishop to perform his functions before he received the *pallium*. The reformers were trying to make this a rule, but it was still vigorously opposed by such great canonists as Ivo of Chartres.

This is not a book for the general reader; it is a scholarly monograph written for other scholars. It should be read by every medievalist because the subjects it treats are of prime importance in the history of the Middle Ages as a whole and many of Mr. Cantor's ideas are both new and stimulating.

SIDNEY PAINTER
Professor of History
Johns Hopkins University

CARL JOACHIM FRIEDRICH. *The Philosophy of Law in Historical Perspective.* Pp. x, 252. Chicago: University of Chicago Press, 1958. $4.75.

One of the most sustained and often justified criticisms of the law is that its handmaidens, lawyers and judges alike, are singularly unconcerned with general philosophical considerations and are content to apply it without looking beyond the legal norms which mark its boundaries. According to Dr. Carl J. Friedrich, this attitude divorces the profession from reality and has prevented the development of a comprehensive philosophy of law in favor of artificial and contradictory rules which, in large measure, ignore the general experiences of mankind. This is the basic premise of his latest book, a German edition of which was first published some time ago.

This rather esoteric volume attempts first, in nineteen relatively short but pithy

essays, to trace the historical development of the law from its Old Testament origin to this century's so-called natural law revival. In this first segment, which is the major portion of his book, Dr. Friedrich's distillation of his source material is so effective that he has far outstripped this reader's absorption rate. His methodical straining coupled with his fiendish obsession for overlong sentences had me panting to stay at his heels. This is probably more a criticism of the reviewer than the writer but, at this point, I'm much too tired from running to care.

The second and, to me, the more interesting portion of the good professor's book is a self-styled "systematic analysis" of this historical development. It ends with what can best be characterized as a scholarly plea for world constitutional law. He sees in the development of national law and the treaty creating the European Coal and Steel Community ample precedent for such a logical possibility. If only reality would catch up to logic, Dr. Friedrich would, I am sure, gladly acknowledge that the law has, at long last, come of age. Until it does, he—and the rest of us—cannot afford to be uncritical.

WILLIAM M. KUNSTLER
Associate Professor of Law
New York Law School

DAVID L. SILLS. *The Volunteers.* Pp. xx, 320. Glencoe, Ill.: Free Press, 1957. $6.00.

While it is stated on the jacket that this is "The story of the men and women who have banded together to conquer polio—and the remarkable organization they have created," the scope of the study is somewhat more limited. It is a report on the role of the local organizations and the volunteer workers who made such organizations possible, rather than a history of the National Foundation for Infantile Paralysis, or even a report on its well-known leaders who sparked the national movement.

With the focus of the study on local leaders in the "polio fund" drives, the study concentrates on a description of the volunteers, their recruitment, their functions, and, specifically, motivations which induced them to work for the organization. It is in this sense that Sills gives us one of the first clear pictures of the functioning of a volunteer organization as a case study in "institutional analysis." To achieve its purpose, the study is "oriented toward the problem of the influence of an organization's membership upon its fundamental character"; thus, the method throughout is a concentration on the working volunteers who made the well-known March of Dimes so successful throughout the years, culminating in the financing of the research which led to the discovery and application of the Salk vaccine.

The data for *The Volunteers* Sills obtained from various sources. First, a nationwide survey of public attitudes toward various diseases and public contributions to fund-raising campaigns was conducted by the American Institute of Public Opinion in February 1954, and a similar survey was undertaken in four cities in the same month by the Bureau of Applied Social Research of Columbia University. The attitudes and opinions of volunteer workers in the March of Dimes campaigns on the local community level and of the officers of county and state chapters of the Foundation for Infantile Paralysis were obtained from two surveys, one conducted in eighty-five counties by the American Institute of Public Opinion, and the other conducted in thirty-seven different counties by the Bureau of Applied Social Research. The detailed analysis comes primarily from the latter survey, in which interviews were conducted with 129 chapter volunteers and 105 March of Dimes volunteers. Data from the larger surveys were used to obtain a basic understanding of the American public who support the program.

Three chapters in the monograph should be of special interest to specialists interested in the creation and functioning of volunteer organizations; these are chapters three, "Recruiting Volunteers," four, "Raising Funds," and eight, "The Rewards of Volunteering." The Appendices contain two useful presentations concerning the samples studied and the construction of indices in the various surveys.

*The Volunteers* is of special interest to the reviewer who lives in a culture where

volunteer associations are not known, where all such programs as those encompassed by this Foundation are the concern of the government, and where there is only now beginning an effort to enlist public volunteer support in such national programs as the YMCA, Red Cross, and cancer. Social work is a new profession in large areas of the world and there, precisely, is where studies of this nature need to be publicized.

GEORGE W. HILL
Professor of Sociology

H. R. HAYS. *From Ape to Angel: An Informal History of Social Anthropology.* Pp. xxii, 440, xv. New York: Alfred A. Knopf, 1958. $7.50.

Although not a member of the fraternity of those who study the human organism and its culture, H. R. Hays has written a unique and inviting history of anthropology. *From Ape to Angel* follows in the tradition of popularized research. The author did not glean his facts from other histories; his job demanded intensive research in primary materials. The personal touch was sought for and appears in interesting details like Bastian leaving Germany for South America on a cool April day without his overcoat. Occasionally suspense is added by a little fictionalizing. For example, Tylor, trying to improve on existing theories of the origin of religion, is pictured purposefully studying the nature of magic and the significance of dolls and other toys. The reviewer is not aware of any autobiographical records demonstrating that it happened so, but writing of the sort does no harm. No doubt it is much better suited for teaching—or selling books—than are footnotes.

Naturally the advanced student will find ground to quarrel with particular interpretations or emphases. Here and there Hays is a bit too free. It doesn't help Lévy-Bruhl's already sorely misunderstood contribution to define a collective representation this way: "When a savage looked at an object he saw it in terms of all the associations, superstitions, and prejudices of his group." Lévy-Bruhl said that collective representations are shared ideas possessing a strong element of feeling, acquired and renewed under vivid circumstances—during ceremonies, for instance—which serve to guide perception. But on the whole the section dealing with this scholar is quite good if a bit vague.

Arrangement of material is not wholly chronological. Names sometimes recur, indicating that the structural basis of the book is not so much the individual scholar as the themes he pursued. The first quarter of the volume covers the "classical evolutionists," including Darwin. Main attention, however, goes to men who sought to explain the evolution of culture. Appropriately enough, the next period is titled Critical Reaction. Then comes Diffusion and Sociology and, finally, what seems to be the contemporary era: Psychological Insight and Social Responsibility.

The significance of what modern anthropologists are doing and saying concerns the author. The book ends with these words: "Anthropology is shaping weapons to reduce the inhumanity, to lessen the ignorance of this world. It remains to be seen whether we are willing to use them."

JOHN J. HONIGMANN
University of North Carolina

ROBERT GLASER and others. *Current Trends in the Description and Analysis of Behavior.* (Nine lectures under the auspices of the Department of Psychology, University of Pittsburgh, delivered during March 11 and 12, 1955 and March 8 and 9, 1956.) Pp. 242. Pittsburgh: University of Pittsburgh Press, 1958. $4.00.

This is the ninth annual volume of the University of Pittsburgh's Current Trends in Psychology series. It consists of nine lectures, eight by psychologists and one by a psychoanalyst, delivered under the auspices of the Department of Psychology at the University. Three of them were delivered during the 1955 Current Trends conference on March 11 and 12, 1955, and six of them on March 8 and 9, 1956.

The six later lectures had a specific purpose—the examination and assessment of recent advances and probable future developments in the description, analysis, and measurement of group and individual behavior—but the other three lecturers did not address themselves to these topics. Each participant was free to select his own title and to approach the topic in his own way. The result is a highly disparate set of chapters, a potpourri of theoretical critiques, attempts at conceptualization, interpretations of research trends, and some research findings. The reader who hopes to find a unified or coherent evaluation of present-day psychological methodology will be disappointed indeed.

Three of the lecturers—Zubin, Guetzkow, and Hamlin—attempt to deal with general methodological issues in the broad areas of psychopathology, and clinical and social psychology. Among these, Guetzkow's discussion of "The Interaction Between Methods and Models in Social Psychology" is the most thoughtful, stimulating, and informative. Although it is an interesting commentary on the basic problems in research in psychopathology, Zubin's paper, "A Biometric Model for Psychopathology," does not present a theoretical model for the field.

The other six papers focus on narrow areas of research and/or theory. While some of them are excellent—Lindsley's "Psychophysiology and Perception" for example—they tend to be highly technical, addressed primarily to specialists. Only a few of these will be of interest to the general reader or to the nonpsychological behavioral scientist.

Certainly a series of nine lectures cannot be expected to present a comprehensive or representative coverage of the field of psychological methodology. Nevertheless, it seems particularly unfortunate that research techniques in learning, motivation, and problem-solving were almost completely neglected. Analytic methods recently developed in these fields are making possible new discoveries and insights into behavior which may have vast and important implications for all the behavioral sciences.

Psychological techniques of measurement, description, and analysis often influence, and are influenced by, methodological and substantive progress in related disciplines. Few of the lecturers, however, have examined the relationships between their own techniques and/or findings and those of other behavioral scientists. More detailed consideration of such relationships would have made several of the papers more meaningful and useful to researchers in other fields.

In spite of the extreme heterogeneity and restricted scope of these papers, a number of important, vigorous, general trends in psychology emerge very clearly. Among these, the outstanding seem to be the continuous search for new and more refined techniques of observation, measurement, and analysis; and an ever-increasing emphasis on the use of theoretical models to order diverse data and to define areas in need of further investigation.

PAUL HENRY MUSSEN

University of California
Berkeley

ARTHUR S. MILLER. *Racial Discrimination and Private Education: A Legal Analysis.* Pp. ix, 136. Chapel Hill: University of North Carolina Press, 1957. $3.50.

What about the private schools and colleges of the South and racial desegregation? Does the momentous Supreme Court decision of 1954 on desegregation in public schools, coupled with other recent judicial decisions, have any significance for schools which are owned and operated by private agencies, denominational and otherwise? What would happen to a private school in one of the southern states which by statute prohibits or penalizes racial integration in non-public education if it voluntarily attempted to enroll Negroes and whites together? What would be the result of an attempt by interested parties to have the 1954 ban on segregation in the public schools extended by judicial decision to private education? What is the legal status of racially restrictive bequests and grants made to private schools? These are the basic questions discussed largely, though not exclusively, from a legal viewpoint by Arthur S. Miller, Professor of

Law at Emory University, in this tightly reasoned little volume.

On the basis of existing trends of judicial decision and inherent logic, the author is reasonably confident that state sanctions —whether withholding of tax exemption privileges otherwise granted, or imposition of criminal penalties—in the South against voluntary integration by private schools, if and when tested, will be declared unconstitutional by virtue of the "equal protection of the laws" and "due process" provisions of the Fourteenth Amendment to the Constitution. This does not mean, he is quick to add, that considerable harassment of such schools could not still ensue through over-meticulous enforcement of "housekeeping" rules and the operation of private pressure groups such as the White Citizens' Councils.

In contrast, the author feels that any attempt to have the desegregation principle extended mandatorily by judicial decision to the private schools of the South will legally fail, given the existing climate of public opinion by which he is convinced judicial ratiocination is considerably affected.

The recently litigated Girard College case is discussed in some detail in consideration of the status of racially restrictive bequests to private education. The key point thus far is seen to be the question of whether "state action" is involved in the operation of the school in question. No successful attack has yet been mounted on the power of the "dead hand" to restrict racially a legacy's beneficial use in purely private education.

On the whole this reviewer finds Professor Miller's analysis, both legal and sociological, persuasive. One would have wished, however, for another chapter which would discuss in detail the legality and operation thus far of state statutes of the type existing in several northern states, notably New York, proscribing racial discrimination in the admission policies of private schools. The author's discussion of these laws, which he considers constitutional, is perfunctory. Moreover, he is in error on the following legal point: The key argument in the Girard College case, with regard to the Fourteenth Amendment, was whether the Board of Directors of City Trusts' administration of the estate escaped the "state action" ban because it constituted "fiduciary" action by the city, not "proprietary," as he has it. These are minor points, however. This is a valuable book, which educators, lawyers, government officials, and social scientists with an interest in race relations and the sociology of law will find both useful and accessible.

JOHN S. BRUBACHER and WILLIS RUDY. *Higher Education in Transition: An American History: 1636–1956.* Pp. viii, 494. New York: Harper & Brothers, 1958. $6.50.

In these times when citizens in all walks of life make heated comments on higher education, it is refreshing to read a dispassionate and scholarly history of our colleges and universities from the Colonial era to the present. Certainly the authors assemble evidence adequate to prove to all critics that faculties and administrators have always been diligent in defining and re-defining the objectives and methods of the higher education of American youth. If our institutions of higher learning are not replicas of European—or Russian—models, this book shows that during scores of years of free debate in a free society, the concept of the university for the gifted few and trade schools for the rest has always been defeated.

With painstaking documentation and liberal reference to the writings of outstanding educational leaders, the authors portray higher education from the colonial college based on English antecedents through the church-founded or affiliated institutions of the early nineteenth century to the German-inspired university pattern of the late nineteenth century. The twentieth century expansion of the land grant colleges into great state universities and the still spreading community junior college movement are related to the special needs for diversity in a democracy committed to education beyond high school for an ever increasing proportion of its younger citizens.

For laymen or educators who believe they have hit upon panaceas for present deficiencies in higher education, this book should be a restraining influence. The search for the talented, admission with advanced standing, honors programs, release from classroom routines for independent study—all such devices had been discussed and tried in various institutions in pre-Dewey, pre-Hutchins, and even pre-Charles Eliot days.

In short, the authors have produced a well written, carefully annotated, interesting history of educational theory as it has developed at the college and university level. When it comes to their interpretation of the findings, however, one might question the seemingly wholehearted endorsement of Jacksonian egalitarianism in higher education. The reader, nevertheless, is given unbiased evidence from which to draw his own conclusions—even the conclusion that the Jeffersonian concept of true higher education only for the highly qualified and motivated may be a desirable trend for the future.

This timely book gives the perspective that should be grasped by all who would generalize about education beyond the high school.

SAMUEL S. STRATTON

President
Middlebury College

LOUIS SCHNEIDER and SANFORD M. DORNBUSCH. *Popular Religion: Inspirational Books in America.* Pp. xi, 173. Chicago: University of Chicago Press, 1958. $4.50.

The subtitle of this volume is more accurately descriptive than is the title. The authors analyze the contents of "forty-six best sellers of the literature . . . published over the years 1875–1955." Most of these were written by Americans, the others sold largely in this country. One has a Jewish author, a few are by Roman Catholics, the remainder were written by Protestants. The books were analyzed paragraph by paragraph, and code letters and numbers were assigned to indicate the item or point of view expressed. Ratios of frequencies of respective items were computed, and these were taken as indicative of the relative stress given them. Three Appendices contain the code and explain the methods of analysis and the statistical treatment. The text describes and comments on the results without cluttering the pages with percentages.

Catholics stress the afterlife more than do Protestants, and are less critical of dogma or ritual, but in most respects the messages are comparable. Trends are observable over the decades studied; the authors identify thirty-five items in which these are evident. In recent years there has been increasing emphasis on "attending and participating in church, reading the scriptures, and consulting a spiritual counselor." There has also been a trend toward secularization. Changes in emphasis or in subject matter occurred during, and immediately after, the depression of the 'thirties, and after each World War. Following the depression there was much less stress on the note that religion brings wealth. The increase in psychiatric treatment has been accompanied by increased emphasis, in this religious literature, on applying some of these principles to the religious life. Radio has suggested slogans such as "tune in with God," and the automobile age brings "high octane thinking means Power and Performance." Particularly in Bruce Barton, Jesus becomes the great advertiser and the successful business man; with the aid of only a few poor fishermen He built up the greatest organization the world has seen. It would be interesting to have, as a follow-up of this study, an account of the reactions of readers, with specified status and backgrounds. The authors deplore the fact that they were not able to undertake such an onerous task.

WILSON D. WALLIS

Professor of Sociology

ELI GINZBERG. *Human Resources: The Wealth of a Nation.* Pp. 183. New York: Simon and Schuster, 1958. $3.95.

Certain American economists are notable for their prodigious output of publications and among them Dr. Ginzberg must rank near the top. This is at least the thirteenth book bearing his name as author or co-author that has appeared in the last ten years. In addition to his professorship at Columbia University, he holds the

positions of Director of the Conservation of Human Resources Project at Columbia University and Director of Staff Studies of the National Manpower Council. In these latter positions he has been guiding research in the manpower field and the development of policy statements based on that research. The present little book, written for the general reader, is intended as a brief summary of the findings up to date. Three of the seven chapters are based on lectures delivered at the Berkeley Campus of the University of California.

The objective of the Columbia University project, in the author's words, has been to seek "to develop new and deeper understanding about the individual and social factors, and their interplay, which influence the way in which the human-resource potential of the American population is developed; and the extent to which people are in a position to make use of their potential to their own advantage and to the advantage of the society of which they are a part."

In the present popular summary, the results of this research have been distilled to a limited number of major points, presented in an informal style, and embellished with personal observations and anecdotes. A primary concern is that the waste of human resources in the United States is threatening our national security. Causes of waste include unemployment, underemployment, inadequate training, arbitrary barriers to employment of certain groups (Negroes, women), and under-utilization of skills. Further, a serious problem of malutilization arises because of the lack of balance of rewards in the business sector and in the government and voluntary or nonprofit sector. Talent is drawn away from teaching and public service because of this imbalance. After a review of factors affecting development of talent and superior performance, the author concludes that to acquire excellence a man must continuously seek opportunities for training and development, must refuse to be deflected by obstacles or temptations, and must enjoy a certain amount of luck. As life becomes generally easier, fewer people, it is feared, will cultivate excellence, and society may be the loser.

Work in the United States is no longer grinding and arduous, but has been so transformed over the past half century that most men are not unhappy toilers. Perhaps too few now find their work challenging or are willing to make an unlimited commitment to their job. But how to stimulate young people in a democracy and guide them into the right educational and vocational paths? Reforms are needed in our educational program—not an unexpected conclusion. Better advice—but not too much—should be provided by schools, by the government, and by professional agencies, to help in occupational choice.

Dr. Ginzberg's book will interest the citizen who has given little or no thought to our manpower resources, to vocational and professional guidance, or to the kinds of educational programs needed today. But for others, this reviewer recommends reference to the original studies of the Conservation of Human Resources Project and the reports of the National Manpower Council.

GERTRUDE BANCROFT
Special Assistant for Manpower Statistics
United States Bureau of the Census

MORRIS ROSENBERG, with the assistance of EDWARD A. SUCHMAN and ROSE K. GOLDSEN. *Occupations and Values*. Pp. ii, 158. Glencoe, Ill.: Free Press, 1957. $4.00.

This is a report based upon two studies, one made in 1950, using a sample of 2,758 students, and a second in 1952, utilizing a sample of 4,585 "college students selected on a representative basis from eleven universities throughout the country. In the second study it proved possible to reinterview 944 Cornellians who had participated in the first investigation" (p. i).

How do various values relate to occupational choice? Rosenberg distinguishes, statistically, three value configurations: the "people-oriented" value complex, the "extrinsic-reward-oriented" complex, and the "self-expression-oriented" complex. These three types are utilized throughout the study. The top occupation choices of the "people-oriented" are *social work*, medicine, and teaching; of the "extrinsic-reward-oriented" are real estate, finance, hotel, food, and sales and promotion; of the "self-expression-oriented," architecture, journalism, drama, art.

The book then takes up careful, subtle relationships between such factors as "faith in people," "personality" factors—confidence, self-other conceptions, and aggression—social background, and occupational choices and success orientation.

The data on occupational values and changes in occupational choice (1950 to 1952) are especially significant for the validity of the author's typology presented above. For example, fifty-seven per cent of the "people-oriented" choosing teaching in 1950 continued in 1952, but only nineteen per cent of those choosing teaching but otherwise oriented adhered to their original choice. Numerous other relationships of this type are presented. The chapters on "ends and means" and "reluctance and resolution" are stimulating and suggestive. Finally the implications are assessed, and factors in the value complex which seem to facilitate and those which seem to impede "social contribution and individual satisfaction" are considered.

A few of the many findings and interpretations may help to gain a "feel" for this book: "the conflict of the college student does not seem to be a question of money versus security; rather . . . many people want money in order to have security"; in our emerging bureaucratic society "the occupational value of creativity and self-expression may lead to maladjustment in work," a wide range of occupational choice may impede personal satisfaction with occupation quite as much as facilitate it; almost three times as many would prefer to own their businesses or farms as expect to; and somewhat more expect to work in educational institutions and government bureaus than prefer to!

All in all this is a sophisticated study of the interactions among various values, occupational choices, and success expectations of the college population.

# FOREWORD

Several years ago the United States Children's Bureau, as part of its program on juvenile delinquency, published a report about the effectiveness of measures in delinquency prevention.[1] The analysis was based on the research literature and covered evaluative studies conducted over the past twenty-five years or so.

The review led to the conclusion that, so far as formal research could document, programs for the prevention of juvenile delinquency had not been notably effective. This conclusion was tempered, however, by two facts. First, few programs, relatively speaking, had been evaluated, and most of those not adequately. Second, many of the evaluative studies were out of date since they dealt with programs and methods that today might not be considered the best. Moreover, there were hints—and in some cases more than hints—that good results had been achieved with certain types of delinquent children under certain circumstances. This was notably the case in child guidance work and was perhaps also true of the kind of neighborhood work that Clifford Shaw originated.

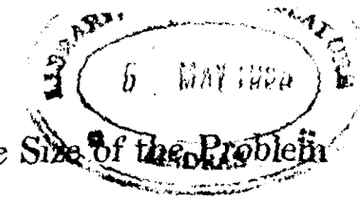
Some of the programs and methods newly entered upon seemed, however, to give promise of more favorable findings. Among those mentioned in the report were various devices for "reaching out" to youngsters and their parents with services they were unlikely to seek for themselves; for instance, group work with delinquent and predelinquent gangs, case work or group work with "resistant" families. These and other newly devised programs seemed to be taking up where older ones had failed and to be benefiting both from the experience of their predecessors and from recent advances in knowledge about human behavior and motivation.

In the present number of THE ANNALS the story of the measures of delinquency prevention and their effectiveness is continued. Here we have reports from practitioners and research workers who have been closely associated with these efforts. The range of programs is considerably expanded over that shown in the Children's Bureau monograph, and the caliber of the scientific evaluation, where undertaken, seems to have improved.

The most striking change, however, lies, it seems to me, in the level of sophistication exhibited in the reports. This is shown in the way the work with delinquent youngsters and their parents is carried on, in the psychological and sociological knowledge underlying the work, and in the methods employed in its evaluation. Much has been learned in all these areas in recent years. These articles show programs of delinquency prevention both benefiting from that advance and contributing to it.

To me perhaps the most important contribution of this series of articles lies in the picture it provides of the kinds of youngsters that are likely to become chronically delinquent and of the kinds of homes and neighborhoods they live in. The picture is not a new one but it is drawn in a way that reveals, more vividly than usual, the fears and the discouragement and, withal, the wish to be like other people that characterize these youngsters and their parents. The treatment measures described—both those that would improve the environment and those that

[1] Helen L. Witmer and Edith Tufts, *The Effectiveness of Delinquency Prevention Programs,* Children's Bureau Publication Number 350, 1954. (On sale by Government Printing Office.)



are directed toward the individuals—take their direction from this knowledge. The knowledge itself is rooted both in the social sciences and in psychology and demonstrates their interrelatedness.

The articles deal with small programs and, in part, short-lived efforts. Few of them report scientifically established results. Nevertheless, in their conception of what needs to be done and in their suggestions for some ways of doing it, they hold the hope that the problem of delinquency can be reduced if communities are willing to put the effort required into the work.

HELEN LELAND WITMER

---

*Helen L. Witmer, Ph.D., Alexandria, Virginia, is Director, Division of Research, Children's Bureau, United States Department of Health, Education, and Welfare. Until 1949, Dr. Witmer was Director of Research, School of Social Work, Smith College, and from 1949 to 1951, she was Professor of Social Welfare, University of California, Los Angeles. She was Director of Fact-finding for Midcentury White House Conference on Children and Youth, 1950. Among other books, she is the author of Social Work (1942) and Personality in the Making (1952) and co-author of An Experiment in the Prevention of Delinquency (1951).*

# Delinquency Prevention: The Size of the Problem

By I. RICHARD PERLMAN

ABSTRACT: The extent and nature of that ill-defined complex, juvenile delinquency, defy precise definition. Nevertheless, existing evidence indicates that delinquent behavior known to official agencies has increased in recent years, both absolutely and proportionally. Moreover, there is evidence that a great amount of law-violation among juveniles goes undetected. Because of the size and importance of the juvenile delinquency problem, its tremendous cost in dollars and in human wastage, and the prospect that it will increase still further, much more must be learned about its prevention, treatment, and basic causes. More and better research is needed to test hypotheses concerning causal factors, to evaluate current programs of prevention and treatment, and to try out and evaluate new methods. Research priorities must be carefully assessed and the finding of basic facts must be improved. We will then have an adequate base line for evaluating the problem and an adequate picture of the extent to which our treatment facilities are now applying what we do know.

---

*I. Richard Perlman, Washington, D. C., is Chief of Juvenile Delinquency Statistics of the Children's Bureau, United States Department of Health, Education and Welfare. For many years he has been particularly responsible for the collection of national statistics on juvenile delinquency and active in efforts towards improving the reliability of the data in this difficult area. He is the author of various articles on the statistical reporting of juvenile delinquency and other social welfare programs.*

IN ANY effort directed towards preventing or reducing delinquency, some idea of what is being prevented or reduced is essential. Just what is juvenile delinquency and what do we know about it?

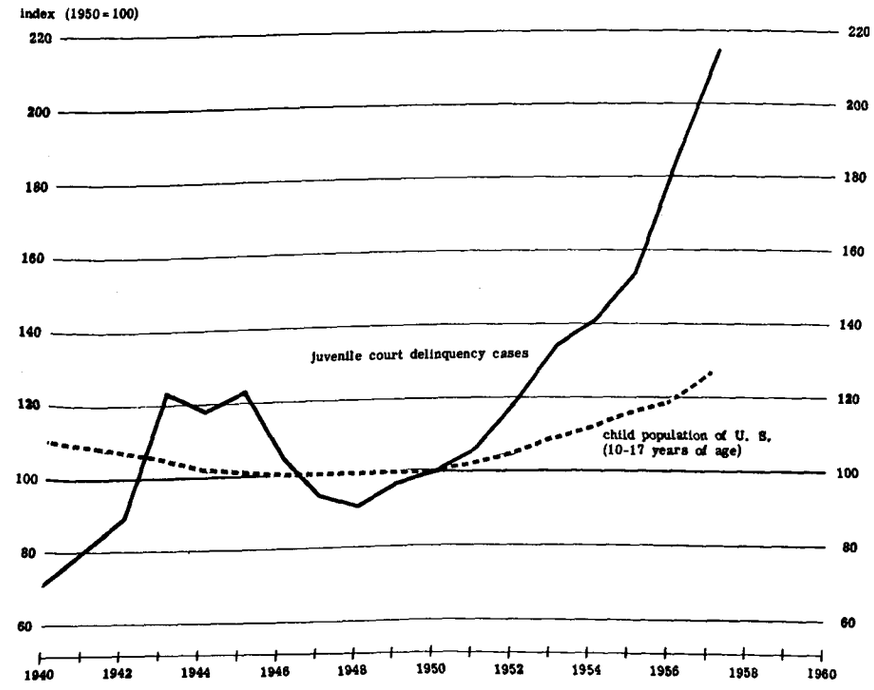
Juvenile delinquency is a catch-all word; it means different things to different people. To some, the manner of attire—the mere wearing of bluejeans or a ducktail haircut—is sufficient to label a child a delinquent. To a home owner who strives hard to keep his lawn looking neat, a delinquent may be a youth who rides his bicycle across the lawn. To one who reads the lurid newspaper headlines about teen-agers, a delinquent conjures up a picture of a young hoodlum who robs, steals, and murders. These are popular conceptions of juvenile delinquents and they obviously vary widely.

Legally speaking, a juvenile delinquent is one who commits a delinquent act as defined by law and who is adjudicated as such by an appropriate court. But even laws which many think of as being absolute or definitive are not so regarding juvenile delinquency. Most juvenile court laws define as delinquent a juvenile who violates any state or local law or commits any act that would be considered a crime if committed by an adult. In addition, however, most statutes define as delinquency acts which are violations of laws only when committed by children: truancy, running away, incorrigibility, ungovernable behavior. In the latter categories, the law ceases to be definitive and becomes vague and subjective. For what actions of a child could not at some time or other be considered by someone to be malicious mischief, incorrigible, or beyond the control of his parents? This vagueness can also make one ask when is a child normally rebellious and when is he an incorrigible delinquent? When is he just socializing with the neighborhood children and when is he loitering? And why is smoking delinquent today and perfectly acceptable a week from today when a youth reaches his eighteenth birthday? Also why should the child who impulsively runs away because of a minor dispute with his parents share the appellation, delinquent, with the youngster who robs a filling station?

And even laws vary among different states. Just who is considered to be a child is different in different states. So are the types of misbehavior included under the broad term of delinquency. Thus, it is quite possible for a child to be considered a delinquent in one state and not one in another state.

With so diffuse a definition of delinquency, with much delinquent behavior going undetected or when detected, being handled by other than law-enforcement agencies, a clear-cut determination of the exact extent and nature of juvenile delinquency seems impossible. Much has been written on the difficulties of measuring and reporting on juvenile delinquency.[1] No attempt will be made to repeat those discussions here except to re-emphasize that good statistics are an indispensable base line for gauging preventive efforts. They require the active efforts of all in a position to provide the data. But we cannot afford to await perfect statistics before taking some action. With the limited information that is currently available we can learn something about juvenile delinquency and perhaps obtain some clues as to what more we need to know.

The best available evidence presents the following picture.



## TRENDS

Juvenile delinquency which comes to the attention of official law-enforcement agencies has risen in recent years. The

[1] See *NPPA Journal*, Vol. 3, No. 3 (July 1957).

CHART 1—JUVENILE COURT DELINQUENCY CASES, 1940–1957

number of juvenile delinquency court cases reported to the Children's Bureau began to increase after 1948 and have continued to rise for nine consecutive years. They more then doubled between 1948 and 1957, as indicated in chart 1.

In 1957, more than 600,000 cases of delinquency were referred to juvenile courts. These involved an estimated ½ million different children or about 2.3 per cent of all children in the vulnerable age group—10 through 17—in the United States. This percentage represents the proportion of children involved in court delinquency cases in one year—1957, and it is frequently cited to show the size of the delinquency problem. A much better idea of the size of the problem can be gained by estimating the percentage of all children who will become involved in at least one court delinquency case during their adolescence. Generally this covers an eight-year period, from 10 through 17 years of age. Allowing for repeaters who are involved in about one-third of all delinquency cases, this percentage is roughly estimated to be as high as 12 per cent if the 1957 rate continues. Considering boys alone, it would be much higher, roughly 20 per cent. The percentage of delinquency cases for boys is high because they contribute about 5 times more to delinquency than do girls whereas the boy and girl distribution in the child population is about equal.[2]

Various other studies substantiate the belief that the size of the delinquency problem is greater than would appear from just looking at one year's figures.

[2] The data cited in this paragraph include traffic violations wherever the juvenile court has jurisdiction in such cases. Incomplete national data on traffic cases collected in 1957 for the first time since 1945 indicate that the number of such cases is sizable—somewhere around 30 per cent of all delinquency cases.

For example, S. E. Hathaway and E. D. Monachesi, in reporting on their work with the Minnesota Multiphasic Personality Inventory, show that 22 per cent of all boys and 8 per cent of all girls in the ninth grade of the Minneapolis schools had appeared before the court, the police, or both within a period of two years.[3] Bernard Lander, in his study of juvenile delinquency in Baltimore, presents the following data: Approximately 40 per cent of the Negro boys aged 14 to 15 and 26 per cent of the Negro boys aged 10 to 13 were registered in the Baltimore Juvenile Court on delinquency petitions in the four-year period covered by the study. Of the white male population group, approximately 12 per cent of the 14 to 15 age category and 7 per cent of the 10 to 13 age group were in court as alleged delinquents.[4]

### THE POLICE AND JUVENILE OFFENDERS

A much greater number than come to the attention of juvenile courts—perhaps as much as 1.7 million children—are dealt with by the police for misbehavior. About three-quarters of these are not referred to juvenile courts but rather are handled directly by the police. In such cases the police officers take whatever steps they think might alter the delinquent behavior of the children. This means referring some of these boys and girls to social agencies for help.

Police arrests of children as reported by the Federal Bureau of Investigation also show increases in recent years, following closely the pattern evidenced by the juvenile court delinquency cases. Table 1 shows the percentage of change from one year to the next in both series.

The increases are not limited to the large congested urban areas as is so often supposed. On the contrary, the increases seem to be greater in the smaller and rural areas. For example, the FBI reports that between 1956 and 1957 the increase in arrests of persons under 18 years of age was 16 per cent in cities with a population of under 25,000 while it was only 8 per cent in cities of 25,000 or more. Juvenile court statistics also show greater increases in rural and semiurban areas than in large urban areas. Even though increases have been somewhat greater in the smaller areas, juvenile delinquency is still primarily an urban problem. For it is in the large cities that most delinquency is concentrated.

### DESCRIPTION AND BEHAVIOR OF JUVENILE OFFENDERS

Most studies indicate that the juvenile delinquent who comes to the attention of juvenile courts is more likely to be a boy than a girl (chances are 5 to 1); he is generally about 14 or 15 years old when referred although he had exhibited behavior problems considerably earlier. His attitude is hostile, defiant, and suspicious. He is usually retarded in school work and in reading ability and shows a chronic history of truancy.

Delinquents, more frequently than nondelinquents, come from homes broken by death, divorce, or desertion or homes lacking in understanding, self-respect, stability, affection, and moral standards. Frequently their homes are economically as well as emotionally deprived. This is not to say that many nondelinquents do not emerge from these same social and emotional environments, but only that such factors tend to produce disproportionate numbers of delinquents.

Since the definition of delinquency is so broad, the reasons for which children are referred to juvenile courts are equally broad. They vary from the trivial to the most serious. Table 2 reveals that the majority of boys are referred to juvenile court for some type of stealing or some form of malicious mischief; most girls are referred for being ungovernable, for running away, or for having committed a sexual offense. These are the overt offenses for which children were referred to court. On the surface, they appear to be relatively minor. Behind the specific overt act, however, often lies a long history of recurring misbehavior or a basic behavior problem that requires court attention and treatment.

Table 2 is based on rather old data (1945) collected by the Children's Bureau. No recent national data on reasons for referral to court are available. It is likely that this distribution has not changed much since 1945. This belief is borne out by an examination of recent state juvenile court reports which show no substantial variation from the distribution shown in Table 2.

A review of the 1957 police arrest data from the FBI's Uniform Crime Reports also confirms the fact that most arrests of juveniles under 18 years of age are for relatively minor offenses and that very few are for the really serious ones. For example, of all arrested persons who are under 18 years of age, 21 per cent were arrested for larcency—mostly with a value of under $50. An additional 27 per cent were arrested for violations of state or local laws—generally running away, truancy, curfew violations, and other delinquent behavior—not enumerated in the very complete listing of the Uniform Crime Reports Part I and Part II offenses. On the other hand, only 1 per cent were arrested for robbery; 1 per cent for aggravated assault; less than 1/10 of 1 per cent for criminal homicide.

A statistic frequently cited about juvenile offenses is one showing the preponderance of juveniles among arrests for burglary and auto theft. These offenses, however, are not a major cause of juvenile arrests. Eleven per cent of the juveniles arrested were charged with

TABLE 1—JUVENILE ARRESTS AND COURT CASES

| YEAR | PER CENT INCREASE OVER PRECEEDING YEAR | |
|---|---|---|
| | POLICE ARRESTS OF CHILDREN[a] | JUVENILE DELINQUENCY COURT CASES |
| 1949 | 4 | 7 |
| 1950 | 5 | 3 |
| 1951 | 8 | 6 |
| 1952 | [a] | 11 |
| 1953 | 8 | 13 |
| 1954 | 2 | 6 |
| 1955 | 11 | 9 |
| 1956 | 17 | 21 |
| 1957 | 10 | 16 |

[a] Police arrests of children up through 1951 are based on fingerprint arrest records; for 1952 and thereafter they were based on reports of all persons arrested whether fingerprinted or not and therefore are not comparable to the earlier data. Percentage changes are based on a varying number of cities participating each year, not on a comparable group throughout as in delinquency court cases.

TABLE 2—REASONS FOR REFERRAL TO JUVENILE COURT

| REASONS | PERCENTAGE DISTRIBUTION | | |

burglary and 8 per cent with theft of an automobile. It is often said that this latter offense has a different meaning for juveniles than for adults since it is largely concerned with joy-riding rather than with larceny for profit. Nevertheless, auto theft cannot be dismissed lightly since it does represent a complete disregard for other people's property, and it often involves the commitment of other serious offenses.

### TREATMENT OF JUVENILE OFFENDERS

Of the roughly 1.7 million boys and girls who came to the attention of the police for misbehavior in 1957, the cases of about 3 out of 4 were dealt with directly by the police and were not taken to the juvenile court. The remaining ¼ or about 428,000 cases were referred to court for care and treatment. This number plus an additional 175,000 delinquency cases referred to juvenile court by parents, teachers, social agencies, and others made up the slightly more than 600,000 delinquency cases handled by courts in 1957.

While awaiting the action of the court on their cases, the majority of the children, about 67 per cent of them, were not detained away from home. However, about 33 per cent were held overnight or placed in detention homes, police station houses, jails, or elsewhere. It is estimated that about 100,000 children are confined in jails each year by authority of the courts or other law-enforcement agencies to await official action on their cases. Many of these jails are unfit for even adult use, but what is even worse they expose children to close association with adult criminals.

In 1957, of the boys and girls referred to juvenile courts for delinquency, the cases of about half were dismissed, adjusted, or held open without further action. Of the remaining children, over 150,000 were placed on probation and about 52,000 were committed to training schools for delinquent children. The rest were either referred to other agencies or were handled in other ways. The average length of supervision on probation is estimated at about 10 months, and the average length of stay in a training school is estimted at about 9.5 months. Where aftercare supervision (parole) is provided, children released from the institutions are supervised for an additional average period of about 16 months.

### UNDETECTED DELINQUENCY

The facts presented thus far are for the most part based on detected delinquencies which come to the attention of the law-enforcement agencies. Another group of known delinquents is the group of children who are handled by community agencies without referral to the police or the juvenile courts. Several experiments in the use of central registration have indicated that the numbers of children handled in such a manner are quite sizeable. These two groups then make up the known delinquency problem—similar somewhat to that portion of an iceberg which shows above the water line.

The invisible part of the iceberg represents conceptually—and perhaps even in relative size—the delinquency problem which goes undetected. For if we think of as delinquent any misbehavior which might be dealt with under the law, whether detected or not, then undoubtedly a great many children escape the attention of the law-enforcement or other child-caring agencies. While the exact number of undetected delinquents probably will never be known, several studies reveal that it is substantial. For example, a study, published in 1947 by James S. Wallerstein and Clement J. Wyle,[5] summarized the admissions of some 1700 law-abiding men and women, overweighted with professional and businessmen of substantial standing, regarding their "delinquent" and "criminal" acts. Almost all these individuals confessed to having committed offenses under existing laws. Two-thirds of them engaged in behavior which under the laws of their state were felonies. A. L. Porterfield's work[6] followed the same pattern of study and found that a sample group of college students all acknowledged committing a considerable number of offenses similar to those found among youth brought into court. However, the offenses of these college students rarely appeared in any official statistics. Still another early survey by F. J. Murphy, M. H. Shirley, and H. L. Witmer[7] revealed that a large number of boys admitted to committing serious acts of delinquency which had never become a matter of court record. Not only do such studies show that the number of hidden delinquents is great, but they also reveal that the number of undetected delinquents is large among the middle- and higher-income groups—the groups which appear in strikingly small numbers in official statistics.

### RISE IN JUVENILE DELINQUENCY

From all this evidence one is inclined to conclude that the problem of juvenile delinquency is tremendous and that it has been rising in recent years. But has the rise been real? Much stormy discussion has centered around this question. Statements are often issued on the face of statistics that there has really been no real increase in delinquency. Rather, the statements imply, the statistics merely reflect better reporting procedures, more public awareness through publicity, and increased law enforcement. Some of these statements are hard to prove or disprove, but let us examine some of the evidence. Practically all agencies dealing with delinquents are reporting increases in offenders. Police are handling more children; courts are getting more cases involving children; detention homes are running to capacity; training school populations have been increasing and they, too, are operating at or above capacity. New facilities are being built. These are real children being dealt with, not paper increases. Similarly, some states and individual courts which have had stable reporting systems for many years are also reporting offense increases. With such strong evidences, it is unlikely that the increases are due wholly to better reporting. Perhaps some of it is but not all.

True, juvenile delinquency has been receiving much public attention and perhaps some of this public awareness has resulted in drives against juvenile delinquents. But adult crime, which has not received such disproportionate public attention, has also been increasing. Is it not more plausible to assume that some pervading social breakdown is causing real increases in both juvenile and adult crime than it is is to assume that the apparent increase in juvenile delinquency is really only a greater public awareness of the problem?

That more efficient law-enforcement accounts for the increase in arrests of juvenile delinquents is a cliché that one cannot seem to escape. It does not detract from the good work of law-enforcement agencies to say that the efficiency of law enforcement as a system is not limitless. The increases in delinquency have been occurring each year for the past nine years and here, as in other processes, the law of diminishing returns

[6] Austin L. Porterfield, *Youth in Trouble* (Forth Worth: Leo Potishman Foundation, 1946), pp. 37–51.

[7] Fred J. Murphy, Mary M. Shirley, and Helen L. Witmer, "The Incidence of Hidden Delinquency," *American Journal of Orthopsychiatry*, Vol. 16, No. 4 (1946), pp. 686–96.

must certainly set in. And should delinquency happen to drop in the near future, this same argument might place us in the unfortunate position of attributing the decrease to laxity or inefficiency in law-enforcement.

The preponderance of statistical evidence, as well as discussions with persons actually dealing with delinquents, has convinced the writer that there has been a real rise in delinquency. It cannot be accounted for by better reporting or better law enforcement. It cannot be attributed solely to the recent increase in the child population, since the increases in both police arrests and court delinquency cases have far outstripped the increases in the child population. And the prospect for the future looks even worse. The Bureau of the Census predicts we shall have 35 per cent more boys and girls in the 10 through 17 age groups in 1965 and 48 per cent more in 1970 than we had in 1957. This is due to the large sustained birth rates that occurred during and after World War II. Should the number of delinquents increase only at the same pace as the child population increases, the problem will be much bigger than it is now. Should the number of delinquents increase at a faster pace—as it has been doing in recent years—then the problem may become staggering.

## THE PRICE OF DELINQUENCY

The costs of juvenile delinquency are staggering. The greatest damages—personal unhappiness, wasted and unproductive years, family distress, and many other related tribulations—cannot be estimated. However, the FBI estimates the current average cost of all crime in America to be somewhere around 20 billion dollars. Many studies indicate that the majority of adult criminals have graduated from the ranks of juvenile delinquents. Much of this cost, therefore, can be indirectly attributable to juvenile delinquency.

Even the direct costs of juvenile delinquency are large. Very conservatively, public services for delinquents—police, courts, detention facilities, and institutional care—are estimated at over 200 million dollars. The cost to the American public in property value stolen by juveniles has been estimated in a report of the United States Senate Subcommittee to Investigate Juvenile Delinquency [8] to be about 115 million dollars. In addition to this is the unknown damage done through acts of vandalism.

## NEED FOR FURTHER RESEARCH

The limited statistics which are available are sufficient to paint a gloomy picture about the size of the delinquency problem and about its seriousness for the future. It is no wonder then that our attention should turn to means of preventing or reducing the problem.

Unfortunately the statistics do not tell us enough about the whys and wherefores of delinquency, the motives, the reasons—all very necessary for any good approach to prevention. For example, most statistics on delinquency indicate that a disproportionate number of delinquent children come from slum, economically deprived areas. Yet we know very little as to why some children brought up in the same type of environment go on to become well-respected successful citizens. Examination of statistics reveals that some children commit an offense for the first time and never commit another, while others repeat their offenses over and over again. We know very little as to why this occurs. Is it that the manner of dealing with children is successful for some but not with others? And

[8] Juvenile Delinquency, Report of the Committee on the Judiciary, U. S. Senate Made by Its Subcommittee on Juvenile Delinquency, Report No. 130 (Washington, 1957), p. 5.

why should this be? Or is it that some children, accidentally or impulsively involved in delinquency on one occasion, would probably never repeat their offenses again regardless of the services available? From the statistics we know that most children are likely to be about 14 or 15 years old when first referred to court for delinquency. If symptoms predisposing these youngsters to delinquency could have been discovered at an earlier age, as some researchers have recently been trying to do, could we have prevented these children from getting into difficulty?

Such questions, and many more, need answering in order to make any great impact in the prevention of delinquency. Some answers to them are being experimentally sought. Some new preventive methods of working with possibly delinquent children are being tried and tested. Several of these will be described in other papers in this volume. Such attempts are laudable, but they are too little and come very late. Research on a much grander scale is necessary. There also needs to be a more discriminate determination of what needs to be done and what will be productive in this illusory field. Even on a grand scale, the cost of research would be small in comparison with the cost of delinquency.

# Some Meanings of Aggressive Behavior in Children

By Eveoleen N. Rexford

Abstract: Overactivity and aggressive, destructive behavior in children are often regarded as precursors of juvenile delinquency. This symptomatology is nonspecific for diagnosis or causation. Review of typical cases shows the wide range of meanings such behavior may have and the varied backgrounds, in a causal sense, from which such children may come. If delinquency is to be reduced or prevented, more will have to be learned scientifically about this whole subject. Both clinical workers and the general public will have to revise their attitudes toward and their ways of dealing with aggressive children.

---

*Eveoleen N. Rexford, M.D., Cambridge, Massachusetts, is Director of the Douglas A. Thom Clinic, Boston. From 1938 until 1942, Dr. Rexford served as a staff member at the Central Islip State Hospital, Central Islip, New York. In 1942–43, she was a Commonwealth Fellow in Child Psychiatry at the Judge Baker Guidance Center, Boston, and continued there as a staff member until 1948. From 1943 to 1949 she was on the staff of the James Jackson Putnam Children's Center and during the academic year 1944–45, she was College Psychiatrist at Wellesley College. Dr. Rexford also carries on private practice in psychoanalysis and holds appointments as Instructor at the Harvard Medical School and the Boston Psychoanalytic Institute. Dr. Rexford is a member of the American Psychoanalytic Association, the Boston Psychoanalytic Society and Institute, American Psychiatric Association, the Massachusetts Medical Society, American Academy of Child Psychiatry, and the Group for the Advancement of Psychiatry; she is also a Fellow of the American Orthopsychiatric Association.*

During the past eleven years the Douglas A. Thom Clinic for Children, a child psychiatric facility in Boston, has carried out a series of studies of young, antisocial children. These children, mostly boys ranging from 6 to 12 years of age, have engaged our particular attention because of their potential for later serious adolescent or adult criminal careers. In each instance, their behavior has extended far beyond the minor outbreaks to which all young children may be subject in their struggles to attain controls and acceptable social patterns. Their misconduct has presented a serious problem in management for home, school, and neighborhood. We are aware that many juvenile offenders and adult criminals have histories of severe behavior disorders in their early years, but we know also that many individuals with such a history do not pursue a criminal career. In our investigations, we have moved from studies of the personality and treatment of the children to studies of the family milieu in which they are raised.

This research interest has led us to pay particular attention to the various types of children who are referred to a community child guidance clinic for "overaggressive behavior" and to sort out the different meanings to be attached to this complaint.

Young children and adolescents are frequently brought to a child guidance clinic with a complaint of overactivity and of aggressive, destructive behavior. This symptomatology, centering around the core idea of "aggressiveness," is about as nonspecific a complaint in the social sense as is headache in the physical realm. Upon investigation, we may find that one "overaggressive" child has developed a habit of talking back to a restrictive mother who could tolerate no deviation from her expectation of prompt obedience. Another child for the first time may be engaging in physical combat with his peers in a manner to be expected occasionally from a lively and energetic boy of 8 or 9. On the other hand, it may develop that the boy seems to live a life of persistent provocation and retaliation, constantly fighting and opposing any limits which may be set up for him. His mother, for example, may report that he sets fires, that he even set fire to baby's crib with his baby brother in it. In each instance, before we can make appropriate plans to help the child and his family, we must make a diagnostic study of the child and his family in order to understand the nature of the child's "aggressiveness" and to set his behavior in its proper perspective.

Clinical work with aggressive children is undoubtedly influenced in many ways by our cultural attitude towards aggression and aggressive activity. Despite the fact that competitiveness is a highly valued characteristic of our system of free enterprise, and the push to achieve and to succeed is considered a natural attribute of the American way of living, the current pressures toward conformity on both children and adults suggest society-wide conflicts about the acceptability of the aggressiveness implied in these activities. From our psychiatric work with children and adults, we become aware of how commonly hostile feelings and acts lead to anxiety and guilt in our patients, reactions which often interfere with their legitimate search for self-realization. Many of us seem inwardly convinced that whatever we regard as aggressiveness is bad, dangerous, and immoral. We may react to this inner conviction by developing a moralistic and punitive attitude toward the hostile wishes and behavior of others or by housing our inward rebellion beneath an outward conformity to authority and law. We may maintain a secret, childish delight in the mani-

festations of aggression in those about us or, more happily, we may attain a mature attitude toward our aggressive impulses which we are able to put to work for us in socially acceptable activities. Professional people whose task is to help those with emotional problems share the conflicts of others and must recognize and allow for their own personal attitudes toward aggressiveness if they are to be of assistance to their patients and clients.

In our scientific study of human behavior over the past fifty or sixty years, we have come to recognize that man is born into the world with a complement of strong primitive impulses which is the source of psychic energy making all adaptation and life itself possible. These primitive instinctual drives include self-preservative, reproductive, and aggressive urges. If we are brought up with a reasonable amount of affection and understanding, all of these psychic energies become more or less domesticated, transformed, and sublimated.

There are probably no human activities which do not require the investment of a core of aggressive, forward-propelling drives. As is true of all our primitive instincts and wishes, our aggressive impulses not only carry potentials for growth but can also propel us toward socially unacceptable and destructive goals. Each culture makes its own demands upon the members of a society in regard to acceptable expressions of the aggressive drives as with the other instinctual impulses. A child's mastery of his angry feelings and destructive urges arises from a complicated interplay among his earlier experiences in his own home, the attitude of his parents, the demands of his social group as he goes out into the community, and his own fantasies and modes of dealing with his aggressive wishes. It is not surprising, therefore, that many children today are referred to our clinics and casework agencies because of problems with aggression.

### CASE HISTORY: JOHN

These considerations are immediately relevant whenever we set out to study a child who has been referred to the clinic with this complaint. Eight-year-old John, for instance, was brought to the clinic by his 49-year-old mother, who was sorely troubled by her only son's temper tantrums which had developed during the past year. Her husband, a man in his early 60s, and she were both quiet people who preferred a regime of order, good manners, careful selection of companions, and a high standard of performance in school for their son. John had conformed to these demands surprisingly well until he was about seven years old; but as he became more mature, his boyish energies sought outlets in activity, noise, and an interest in sports which his parents could not understand nor accept. His temper tantrums consisted of verbal objections to his parents' restrictions, of tears, stamping of feet, and threats that when he grew up he would leave so that he could do what he wanted. John himself loved and respected his parents and was very much caught up in the conflict between his natural wishes and the demands which his parents put upon him. He had come to express his feelings of pent-up frustration and of anger in the temper tantrums of which the parents complained.

### CASE HISTORY: JIMMY

Jimmy was 5 years old when he was brought to the clinic because of repeated physical assaults on his younger brother and sister and upon his classmates in kindergarten. He was otherwise a charming, lovable, and bright little boy; and his busy, overworked parents found what they regarded as the

viciousness of his behavior very hard to understand. It was quite true that the abruptness and severity of his attacks on other children made them serious affairs. It was obvious also, as we came to know Jimmy, that he suffered a great deal from guilty feelings and was convinced that he was a very bad boy, to whom dreadful things would happen as punishment for his behavior.

When we first saw Jimmy's parents and discussed with them his past history, we learned that he had been born with bone malformation of one leg and had had to spend the first eighteen months of his life in a plaster cast from his waist down. Following the removal of the cast, he went regularly to the hospital for exercises, which were supplemented by a training routine carried out at home according to the doctor's instructions. Shortly after the cast was removed, a baby sister was born and, when Jimmy was 4, a baby brother arrived on the scene.

Although Jimmy was occasionally solicitous of the young brother and sister and made some attempts at helping his mother care for them, both parents were aware that, from the beginning, Jimmy regarded the babies as intruders and was very jealous of the care and attention which his mother and father gave to them. They realized that Jimmy had been very much hampered as a baby by his physical illness and that he was probably not yet ready to give up the infant's role.

When we saw Jimmy by himself, we noted that he ran around a great deal and that he found it extremely difficult to settle for any length of time on one toy or activity. He was imperious in his wishes and found it very hard to tolerate any delay in having them satisfied. He could not understand why he could not go into other rooms and take from the other children in the clinic any toys that caught his fancy. When he was frustrated in any way, he would launch an attack upon the toys and furniture in the playroom. When picked up and held by his doctor, he would suddenly settle down and cry like a much younger child.

It took many months of patient work to help Jimmy build a tolerance for frustration and to find more mature ways of mastering his impatience and the imperiousness of his wishes. However, by the time he reached second grade, his attention span had improved so that he could make good headway in learning to read and write, and he received great satisfaction from these new achievements. Although the parents were quite overburdened with supporting and raising their family, they were able to find a little more time to give Jimmy their exclusive attention and also to set limits for him when his controls were obviously tenuous. Nevertheless, it remained somewhat more difficult for Jimmy than for many children of his age and intelligence to withstand disappointment and to find alternate ways of getting what he wanted.

In our clinical work, we have noted repeatedly that children who have been greatly restricted physically in early infancy find it very difficult to develop as much patience and control of their wishes as most children of their age. Jimmy, however, was fortunate in having affectionate parents who cared a great deal about him and who were able, with assistance from the clinic, to find ways of helping him control himself. This in turn contributed to his own inner discipline.

### CASE HISTORIES: BOBBY AND BILL

Bobby was referred to the clinic when he was 9 years old because of spells of destructive behavior coupled with vicious attacks, apparently unprovoked upon both adults and children. Hi

teacher, who first called the clinic, reported that Bobby seemed to have "a persecution complex," but that he was very bright, read extremely well, and talked learnedly about many topics far advanced for a boy his age. He was greatly preoccupied with atom bombs and told long stories about bombings of cities, describing at great length the destruction and bloodshed.

Bobby was a curious-looking boy. He seemed to ignore any personal approaches but talked readily about his thoughts which were dominated by the conviction that he was surrounded by enemies and that, therefore, in self-defense he had to plan the most horrible retaliatory schemes to punish all the bad people who were angry with him and wished his death. The parents, both of whom were quiet, suspicious, and anxious, gave a guarded story of Bobby's development which minimized the seriousness of his mental symptoms. They attributed his aggressive outbursts to the fact that children did not like him because they envied his great brain power. After some time, we were able to gain the parents' confidence sufficiently so that they could admit their concern about Bobby. Eventually he was placed in a psychiatric treatment residence where he could have a therapeutic milieu twenty-four hours a day.

It is not uncommon for an adolescent boy to be unwillingly referred to a clinic because of aggressive outbursts of several months' duration. Bill, for instance, had matured physically very rapidly and was soon able to tell his doctor about many of the anxieties that his physical growth and sexual feelings engendered. He was very much aware that he had a flimsy control over himself and was frightened of his temper outbursts. It was his private conviction that he was going crazy, an idea which had been reinforced by some angry comments his father would make when Bill "blew up" so quickly over what seemed to his parents "the slightest thing."

Neither of the parents was very tolerant of the boy's adolescent turmoil but, with help from the clinic staff, they were able after a time to give more understanding and support to the boy while setting necessary limits to help reinforce his own tenuous controls. Bill's talks with the doctor about himself, the reassurance he gained in learning that many adolescents have similar feelings and fears, and his rapid identification with his doctor helped stabilize him, so that after a few months the aggressive outbursts diminished in both intensity and frequency.

These vignettes illustrate the fact that "a problem with aggression," which usually indicates some interference in the child's adaptation, may have very different meanings. In this connection, it should also be noted that children's difficulties in controlling their aggression may also lead to marked inhibition of activity, with fears of striving, passivity, learning blocks, or "overgoodness." The severity of a child's personality disorder in which "overaggressiveness" plays a part will determine the clinic's approach to the child and his family and influence both the techniques and the goals of management.

## HOME BACKGROUND OF DELINQUENT CHILDREN

There is one group of children of grade school and adolescent age who are often referred to clinics because of such behavior as assaults upon the person or possessions of others, firesetting, truancy, all the usual pattern of juvenile delinquent behavior. The life history of such boys, and indeed the history of their dissocial behavior, vary from instance to instance. In some cases, the history given by the parents indicates that the child was able to get along fairly well until some specific traumatic

event or series of events led him to react with anger, frustration, and loss of controls.

Careful recording of their history and collection of collateral information will often reveal that these children had long been unmanageable at home, in school, and in the neighborhood. They may even be well known to the police who have preferred no formal charges because of their youth. They may be bright but rarely have they performed well in school and often have marked learning blocks. They tend to be hostile, resentful, overactive individuals, often extremely skilled in their performance of antisocial acts, confident that all people lie, steal, and cheat whenever it is to their advantage. They may never have learned how to delay or otherwise manage their instinctual wishes except by doing, taking, or saying what they wished. They have a short attention span and find it hard to tolerate frustration of any kind. The parents usually report that they were difficult babies in relation to feeding, sleeping, and toilet training. They were never successfully disciplined; the parents usually tell of many punitive attempts to curb the child's behavior.

Over the past decades, many studies of such children have demonstrated the frequency of a history of broken homes, of criminal or psychotic parents, frequent separations of the child from the parents, particularly the mother, of illegitimate birth, and of considerable social and economic stress of all types. When such severe disruption has occurred in the early critical years of a child's life, the child's capacities for forming affectionate relationships, for controlling his instinctual wishes and for "reality testing" are apt to be slight and the therapeutic task presented is concomitantly a very difficult one. These children's life experiences have been so unrewarding and their primitive feelings and fantasies so little transformed and sublimated that they view the outside world as a hostile place, other people as their enemies, and themselves in the position of having to strike out before they are struck down. Although these children may come regularly to a clinic, they subject their therapists to a long and ingenious period of testing, seeking to prove by endless maneuvering that the therapist too lies, steals, or cheats when it is to his advantage to do so. They are extremely restless children and find it difficult to remain within the confines of the clinic walls.

Not all children who exhibit persistent antisocial behavior during the grade-school years come from these typical predelinquent homes. A certain number of antisocial young children are brought up in relatively intact homes where the parents are self-supporting, raise their children themselves, do not live with other relatives, and have not been separated from the children for any significant period of time. In such situations, more subtle factors must be sought to explain the limited instinctual controls and the persistent impulsive "acting-out" to which such children are prone.

Recently, in our clinic, we have begun to look more carefully at the intricacies of familial attitudes in such cases and to investigate how these children have been brought up, particularly in relation to gratification and controls. The earlier scientific contributors to the problems of delinquency pointed out the many defects in the family life of most delinquent children, so much so that it has become commonplace to assume that we have come to an understanding of the origins and perpetuation of the antisocial problem when we have elicited the familiar picture of the broken home, the frequent placements, and so forth. It is often forgotten that not all children

from such homes necessarily become delinquent, and that therefore there must be some specific influences or special circumstances which encourage that kind of adaptation in a particular child. The concentration on the child who does not come from the familiar pathological background permits us to focus on more subtle factors that may be involved in the perpetuation of the antisocial pattern. Investigation of the less disorganized families may throw some light on the means whereby the deficiencies in family life in the highly pathological setting promote and encourage the persistent impulsive "acting-out" of the young delinquent child.

*Parents' role*

There are probably many reasons for our knowing relatively little about the more minute, interpersonal transactions in the family with an antisocial child. Such parents are very reluctant to visit a clinic or casework agency. They will refer their child only if forced to do so by considerable community pressure. Once in the clinic, the parents are apt to make clear rather quickly their disinclination to use the kind of help psychotherapy or casework offers. Very few will consent to come for regular weekly interviews and, if they do, there is discouragingly little change in the parents' attitudes or ways of handling the child. Many of these families are in a state of chronic crisis, so that a great deal of the interview time is taken up with the immediate stress which the therapist is expected to help relieve.

It has been our experience that if a skillful and knowledgeable therapist works patiently over a period of many months with a young delinquent child, he will usually be able to establish a relationship with that child and make some headway in working with him on his many problems. However, if the parents are unable to support the change in the child, we are limited in what we can do to help him. We have the impression that the emotional climate of such homes does little to facilitate a child's growth or to provide an educational milieu in which he can gradually learn to control his wishes, delay his demands for gratification, and find more socially acceptable ways of satisfying his needs.

In some instances, there are rather clear indications that both parents get a strong, vicarious gratification from their children's rebellious and antisocial behavior. Many of these fathers make clear that they regard any kind of aggressive activity as desirable masculine self-assertion, not to be curbed in any way. They are apt to see the boy's difficulties as due to the mother's pressure and to assert that they can manage the boy with no trouble. In some instances, investigation may reveal that the father took very little regular responsibility for the child, or is quite passive and indulgent with him when he does associate with the boy, or is inconsistently punitive with the youngster. In others, it appears that the two males have a hostile alliance against the woman and that home life is a constant series of running battles. Although the mothers may have many emotional problems, they are apt to be the more adequate and responsible of the two parents. At the time they come to a clinic, however, they appear to be functioning less maturely than they did earlier in their lives and to have available fewer personal resources with which to meet their family problems.

## PREVENTING JUVENILE DELINQUENCY

Since World War II, the increasing national concern about juvenile delinquency has brought a flood of opinions and recommendations in the press and forums. Many lay and professional statements blame the parents for the

delinquency of children and include a prescription which insists that the parents be made to take corrective action. It is, however, one thing to recognize that the origins and perpetuation of antisocial behavior probably lie within the child's early life with his family and another to assert that the solution for the problem is to demand that the parents change their ways and correct the child's behavior immediately. In the first place, since it is rare that the parents will do so, this demand does not provide a pragmatic solution to our problem. More important is the fact that the more we learn about these parents and their family life, the more we become aware that they are handicapped by basic attitudes that grew out of their own adaptation to life experiences and that they cannot change overnight at the behest of society. In most instances, a strengthening of family life and the creation of a more healthy emotional milieu for the young antisocial child cannot be attained without help from outside agencies and institutions.

The problem for casework and psychiatric agencies, which are often expected to give precisely this assistance, is that their traditional ways of helping people toward change are not acceptable or congenial to these families. A basic assumption of psychotherapy and casework is that an individual is willing and able to take responsibility to try to find out what the trouble is, to think about it, to try to change not only his actions but his attitudes. This approach, we find as we know these families better, is a devalued and intolerable mode of solving the problem to most of these people. As a group, therefore, they are to be found in such agency categories as "the hard to reach" or "the resistant" family.

It becomes increasingly clear that we clinical workers need to acquire far more scientific information about these families so that we can modify our clinical approaches to them. Then we may be able to offer help which they can use. The New York City Youth Board has encouraged an approach to families who will not come into agencies for help which they describe as "reaching the unreached." Psychiatric clinics and casework agencies in other communities are examining their clinical methods to see how their staff members can find ways of reaching such persons. We must remember that the professions of psychiatry and social casework are relatively young. Accordingly, when our traditional methods are not effective, we need not assume that a certain group of people cannot be helped by us. Rather, the logical conclusion is that clinical investigation is in order so that we can devise effective methods to deal with them. This is the challenge which the antisocial children and their families present to the clinical professions, a challenge which is being met today by both formal and informal research. Hopefully, these studies will put at our disposal data which will allow us to develop new or modified helping techniques.

We cannot emphasize too strongly the crucial importance of clinical research in the area of juvenile delinquency. There is a dismaying contrast between the resources made available for programs of delinquency prevention and those devoted to projects seeking a more basic understanding of the origins and perpetuation of antisocial behavior. The Witmer and Tufts pamphlet on the effectiveness of delinquency prevention measures, published by the United States Children's Bureau in 1954, illustrates how little we know about the effectiveness of the many preventive programs carried on for years by reputable organizations. The authors point out the difficulties in evaluating programs for prevention when there are

gross gaps in our scientific understanding of the whole area of delinquency and crime.

### THE COMMUNITY'S RESPONSIBILITY

The community at large, for its part, has an important responsibility to examine its collective attitudes and actions and to see how it can offer consistent support to all of our programs for curbing antisocial behavior. As long as our society does not present a united front concerning delinquency, our efforts to meet this great social and psychological problem will be severely handicapped. When a school teacher, probation officer, or neighbor alternates between condoning the dissocial acts of a young child as mischievous boyish pranks and demanding a punitive, authoritarian approach to him, our preventive and treatment programs suffer. Repeatedly we have found that the parents of antisocial children will seek help for the child only when community pressure persistently demands that they take this step.

The earlier comments in this paper about the nature of aggression and the many inconsistencies in our attitudes toward it have great pertinence to this question. We as adults and as members of community groups that carry the demands of our culture must make up our minds what we consider acceptable for children of varying ages, what we can tolerate, and what we cannot. We must adopt a kind but firm attitude toward the unacceptable and give consistent support to the community institutions that are charged with maintaining society's demands. We must recognize that crushing suppression of antisocial behavior under the law of the talion is not effective in combating delinquency and crime.

On the other hand, the failure to recognize the consequences of antisocial behavior for the youthful individual and for society and indulgence with and condoning of his dissocial acts will not be effective either. We have learned from our psychiatric experience that children need to find in their home environment both warm affection and control. There is evidence that the individual adapting to his society also requires a combination of kindly understanding and firmness from his fellow citizens. The clinical professions have a large and challenging task ahead of them in helping antisocial children and their families more effectively. Our society has an even more crucial task in providing a consistent background for the efforts of those who are dealing with individual delinquents. We must face the unpleasant reality that a society that condones income-tax evasion and political graft and admires the one who "gets away with it" is far from creating the atmosphere of respect for individual needs and for authority that is vital for the prevention and control of delinquency in the young.

# The Chicago Area Project—A 25-Year Assessment

By SOLOMON KOBRIN

ABSTRACT: The Area Project program is based on studies of the epidemiology of delinquency and of the social experience of children growing up in city neighborhoods with high rates of delinquents. Preventive effort is concentrated in such delinquency areas. The structure of the local society is regarded as deficient in its ability to reduce the normal alienation of the male adolescent and to restore and maintain adult controls. In most instances delinquency in this situation is viewed as a product of social learning. Procedures of the Area Project are based on the assumption that young people are responsive principally to the expectations of their intimate groups: family, peers, and neighbors. The major activity of the Area Project program is the development of youth welfare organizations among residents of delinquency areas and, within the structure of these groupings, direct work with predelinquent and delinquent individuals and groups. Neighborhood groups are encouraged to employ qualified local residents to carry on the work. Variation in the procedures in the organization of local groups and in the content of their programs reflects variety in patterns of integration of local social institutions. Area Project experience indicates that residents of delinquency areas are capable of action in relation to youth welfare problems. Such action has probably reduced delinquency in the program areas.

*Solomon Kobrin, Chicago, Illinois, has been a supervising sociologist on the staff of the Illinois Institute for Juvenile Research and the Chicago Area Project for the past eighteen years. In this capacity his assignments have included neighborhood organization, community surveys, and studies of juvenile delinquency and adult crime. In the period 1951–53 he was Project Director of an exhaustive examination of the problem of drug addiction among young persons in Chicago sponsored by the National Institute for Mental Health. He has taught sociology at Roosevelt University and the Illinois Masonic Hospital of Nursing Education and has contributed articles to professional journals.*

THE Chicago Area Project shares with other delinquency prevention programs the difficulty of measuring its success in a simple and direct manner. At bottom this difficulty rests on the fact that such programs, as efforts to intervene in the life of a person, a group, or a community, cannot by their very nature constitute more than a subsidiary element in changing the fundamental and sweeping forces which create the problems of groups and of persons or which shape human personality. Declines in rates of delinquents—the only conclusive way to evaluate a delinquency prevention—may reflect influences unconnected with those of organized programs and are difficult to define and measure.[1]

For two reasons the simple and satisfying laboratory model of the controlled experiment is difficult to achieve in measuring the effects of a program. First, it is virtually impossible to find groups which are identical in all major respects save that of participation in a given program. Second, there exists a widespread and understandable reluctance to deny to systematically selected segments of homogeneous groups the putative benefits of programs, a procedure which does produce an approximation to a control group.[2]

The present assessment of the Chicago Area Project will have to rest, therefore, on an appraisal of its experience in carrying out procedures assumed by its founders and supporters to be relevant to the reduction of delinquency. To this end, the theory of delinquency causation underlying the Area Project program will be presented. This will be followed by a description of the procedures regarded as essential to the modification of conditions which produce delinquency. Finally, the adaptations and modifications of these procedures will be described and evaluated.

## Conception of the Delinquency Problem

A distinctive feature of the Area Project program is that at its inception it attempted explicitly to relate its procedures in a logical manner to sociological postulates and to the findings of sociological research in delinquency. Under the leadership of the late Clifford R. Shaw, founder of the Area Project and its director during virtually all of its existence, a series of studies completed between 1929 and 1933 brought to the investigation of this problem two heretofore neglected viewpoints: the ecological and the socio-psychological. The first was concerned with the epidemiology of delinquency in the large city; the second with the social experience of the delinquent boy in the setting of his family, his play group, and his neighborhood.[3]

[1] For example, rates of delinquents among nationality groups whose children at one time figured prominently in juvenile court statistics declined as these groups improved their economic and social position and moved out of neighborhoods of high rates of delinquents. See Clifford R. Shaw and Henry D. McKay, *Juvenile Delinquency and Urban Areas* (Chicago: University of Chicago Press, 1942), pp. 151–57.

[2] See Edwin Powers and Helen Witmer, *An Experiment in the Prevention of Delinquency* (New York: Columbia University Press, 1951), as a distinguished and solitary example of one program which, in the interest of advancing knowledge, denied hypothesized benefits of a program to a control group.

[3] Studies in the first category include Clifford R. Shaw and others, *Delinquency Areas* (Chicago: University of Chicago Press, 1929); certain sections of Clifford R. Shaw and Henry D. McKay, *Social Factors in Juvenile Delinquency* (Washington: U. S. Government Printing Office, 1931); and a final volume in which the geographic distribution of rates of delinquents in a number of American cities was analyzed in great detail, Clifford R. Shaw and Henry D. McKay, *Juvenile Delinquency and Urban Areas*. While the last volume was published a decade after the earlier ones much of its data were available to the authors at the time of the founding of the Area Project. Studies of the social experience of delinquent boys include Clifford R. Shaw, *The Jack-roller* (Chicago: University of Chicago Press, 1930); Clifford R. Shaw, *The Natural History of a Delinquent Career* (Chicago: University of Chicago Press, 1931); and Clifford R. Shaw, Henry D. McKay, and James F. McDonald, *Brothers in Crime* (Chicago: University of Chicago Press, 1938).

With respect to the first problem, it was found that certain areas of the large city produced a disproportionately large number of the delinquents. The high rate areas were characterized as "delinquency areas" and subsequently an effort was made to define their major social features. In the American city of the period, the populations of these communities were made up of predominantly recent migrants from the rural areas of the Old World. As a group they occupied the least desirable status in the economic, political, and social hierarchies of the metropolitan society and in many ways showed an acute awareness of their position. Their efforts to adapt their social institutions to the urban industrial order were at the most only partly successful. The generation of immigrants, in their colonies in the decaying heart of the city, adapted with moderate success only those institutions which preserved customary forms of religious practice, mutual aid, and sociability.

However, the immigrant generation was notably unable to preserve the authority of the old institutions, including the family, in the eyes of the rising generation and was quickly confronted with a problem of conflict with their children. Disruption of cross-generational control produced the conditions for the emergence of a variant species of youth subculture in these communities marked by a tradition of sophisticated delinquency. At the same time this tradition was sustained and fostered by the anonymity of much of the population of slum areas, by the presence of a young adult element which engaged in crime both as an occupation and a way of life, and by the extraordinary harshness of the competitive struggle which arises when the controls of social usage decay. The distribution of official delinquents pointed firmly to the conclusion that the high-rate areas constituted the locus of the city's delinquency problem, both as to number of delinquents and seriousness of offenses.

## The Delinquent as a Person

With respect to the second problem, these investigations suggested that, given the conditions of social life in the delinquency areas, delinquency in most cases was the product of the simple and direct processes of social learning. Where growing boys are alienated from the institutions of their parents and are confronted with a vital tradition of delinquency among their peers, they engage in delinquent activity as part of their groping for a place in the only social groups available to them. From investigations of the type reported in *The Jack-roller, Natural History of a Delinquent Career,* and *Brothers in Crime,* the conclusion was drawn that with significant frequency, delinquency in the slum areas of our cities reflects the strivings of boys in a social rather than an antisocial direction. These studies focused attention on the paradoxical fact that no matter how destructive or morally shocking, delinquency may often represent the efforts of the person to find and vindicate his status as a human being, rather than an abdication of his humanity or an intrinsic incapacity to experience human sentiment.

This view formed something of a contrast to notions of human nature and delinquency which were, and still are, somewhat more widely accepted. These beliefs, which generally represent delin-

quent conduct as a manifestation of pathology or malfunction of personality, rest implicitly on an image of man as quick to lose his distinctively human capacities under adverse conditions. The image implied in the Area Project conception of the delinquency problem is that man tends always to organize his behavior in the service of his human identity. To what extent this view is supported by the research of Shaw and his associates, and to what extent the research proceeded from this view is, of course, a difficult question to answer. The fact remains, however, that from the beginning the Area Project program rested on a conception of human nature which was optimistic concerning the prevention of delinquency and the rehabilitation of the delinquent. Delinquency was regarded as, for the most part, a reversible accident of the person's social experience.

Thus, the theory on which the Area Project program is based is that, taken in its most general aspect, delinquency as a problem in the modern metropolis is principally a product of the breakdown of the machinery of spontaneous social control. The breakdown is precipitated by the cataclysmic pace of social change to which migrants from a peasant or rural background are subjected when they enter the city. In its more specific aspects, delinquency was seen as adaptive behavior on the part of the male children of rural migrants acting as members of adolescent peer groups in their efforts to find their way to meaningful and respected adult roles essentially unaided by the older generation and under the influence of criminal models for whom the inner city areas furnish a haven.

## Socialization and Community Action

Research in the problem of delinquency formed one of two major sources of suggestion for the Area Project program. The second was furnished by what may best be regarded as a set of sociological postulates concerning, first, the processes by which persons come under the influence and control of social groups and take over their values; and, second, those affecting communal or collective action in the solution of social problems.

It is a commonplace of sociological observation that the source of control of conduct for the person lies in his natural social world. The rules and values having validity for the person are those which affect his daily nurturance, his place in primary groups, and his self-development. He is responsive as a person within the web of relationships in which his daily existence as a human being is embedded.

The inference seemed unavoidable, therefore, that to succeed delinquency prevention activities must somehow first become activities of the adults constituting the natural social world of the youngster. Or, put another way, a delinquency prevention program could hardly hope to be effective unless and until the aims of such a program became the aims of the local populations. Thus, an indispensable preliminary task of delinquency prevention is to discover effective methods of inducing residents of the disadvantaged city areas to take up the cause of prevention in a serious manner. The disposition of the founders of the Area Project was to regard this element of the program as so indispensable that if these populations proved unable to act in relation to the problem, the prevention of delinquency was a lost cause.

A second postulation concerned the problem of developing collective action toward delinquency. Here another commonplace of sociological observation suggested that people support and participate only in those enterprises in which they have a meaningful role. The organized activity of people everywhere flows in the channels of institutions and organizations indigenous to their cultural traditions and to the system of social relationships which defines their social groups. Consequently one could not expect people to devote their energies to enterprises which form part of the social systems of groups in which they have no membership. The relevance of this observation is that there had always existed an expectation that people residing in the high delinquency rate areas could somehow be induced to support the welfare agencies established there. A basic assumption of the Area Project program was that under prevailing conditions it was illusory to expect this to happen.

Thus, in view of the primacy of the local social life in the socialization and control of the young person, all effort, it was felt, should be devoted to helping residents of high delinquency rate areas to take constructive action toward the problem. The interest of the wider society in winning the rising generation of these communities to orderliness and conformity had first to become a vital interest of the local society.

## Organization of the Delinquency Area

A final assumption necessary to the rationale of the Area Project program had to do with the social and institutional organization of the high delinquency rate neighborhood and with the related issue of the capacity of residents of these areas to organize and administer local welfare programs. It was observed that despite the real disorder and confusion of the delinquency area, there existed a core of organized communal life centering mainly in religious, economic, and political activity. Because the function of the slum area is to house the flow of impoverished newcomers and to furnish a haven of residence for the multitudes who, for various reasons, live at the edge of respectability, the nucleus of institutional order actually present is sometimes difficult to discern. There seemed further to be strong evidence that the residents most active in these local institutions were, in terms of interest, motivation, and capacity, on their way up the social class ladder. With respect to these elements of the population it was assumed, therefore, that they represented forces of considerable strength for initiating delinquency prevention activities.[4] There being no evidence of a deficiency of intelligence among them, it was taken for granted that with proper guidance and encouragement they could learn how to organize and administer local welfare programs.

In summary it may be said, then, that the Area Project program regards as indispensable to the success of welfare activity in general and delinquency prevention in particular the participation of those who form a significant part of the social world of the recipients of help. This is seen not as a prescription or a panacea, but as a condition for progress in finding a solution. The program has remained experimental in the sense that it has continued to explore the question: What kind of participation is necessary on the part of which kinds of persons in terms of social role in the local society? But it has rested firmly and consistently on the conviction that no solution of a basic and lasting character is possible in the absence of such participation.

[4] It should be observed in passing that some of the economic and political leadership of these communities did not always fit phillistine specifications of respectability, and that on this score the Area Project program came under criticism during its early days.

### PROCEDURES IN NEIGHBORHOOD ORGANIZATION

It follows that the basic procedure in the program is the development of local welfare organization among residents of high delinquency rate neighborhoods. This undertaking called for skill in the organizer in identifying the residents holding key positions of influence and the ability to arouse their interest in youth welfare activities. The first phase requires a knowledge of the local society; the second a capacity for sympathetic identification with the local resident. Knowledge of the local society implies familiarity with its culture and history, in the case of ethnic groups; with the local institutions; with the structure of power through which decisions are made and executed; and with the conflicts and cleavages which orient and align the population.

Initial organization in several of Chicago's delinquency areas was undertaken by sociologists employed jointly by the Behavior Research Fund, now dissolved, the Chicago Area Project, and the Illinois Institute for Juvenile Research. The Institute, an agency of state government, until recently has furnished a major share of the salaries of the staff engaged in this program.[5]

It became quickly evident, however, that, for cogent reasons, the employment of qualified local residents offered advantages in the establishment of such programs. In the first place the indigenous worker usually possessed a *natural* knowledge of the local society. Second, he was hampered by none of the barriers to communications with residents for whom the nonresident, especially those identified with "welfare" enterprise, tended to be an object of suspicion and hostility. Third, his employment was a demonstration of sincere confidence in the capacity of the area resident for work of this sort. Fourth, he was more likely than the nonresident to have access to the neighborhood's delinquent boys and therefore to be more effective in redirecting their conduct. Fifth, his employment represented a prime means of initiating the education of the local population in the mysteries of conducting the welfare enterprise. Hence, virtually from the first, one of the most distinctive features of Area Project procedure was the employment, in appropriate categories and under the tutelage of staff sociologists of the Institute, of local residents to aid in the organization of the approximately dozen community or civic "committees" which were established in Chicago over the course of two decades.[6]

A second major procedural feature of the Area Project program is represented by efforts to preserve the independence of the neighborhood groups after they become established as functioning units. This turned out to be mainly an exercise in self restraint, for the easier and in many ways more natural course would have been to maintain a close supervision and control of their activities. However, since it was the aim of the program to foster the development of knowledge and competence in the conduct of youth welfare activities and to encourage among residents of delinquency areas confidence in their own capacities to act with respect to their problems, the policy was followed of insisting upon a formal, structural autonomy of the organization. The problem in this connection was to maintain full support and help without rendering the independence of the group an empty formality.

[5] A recent reorganization of these services shifted much of this staff to the administrative jurisdiction of the Illinois Youth Commission.

[6] Sharp question has been raised by leaders of the social work profession regarding the competence of such persons, whose qualifications rested on assets of character and personal trait rather than on formal training and education. Leaders of the Area Project have always encouraged talented workers in this field to obtain as much training in the group work and social work fields as they could. However, they have regarded the talent for this work as the primary value.

### MAINTAINING AUTONOMY

Three devices were found to be useful in dealing with this problem. First, neighborhood groups either exercised the power of veto in the assignment of Area Project staff to function as their executives; or, more frequently, nominated a qualified local resident as their executive who was then employed as an Area Project staff member. Second, staff members were required to function as representatives and spokesmen of the local groups rather than as representatives of the Area Project central office or of the Sociology Department of the Institute for Juvenile Research. This served to foster an identification of the worker with the point of view and the needs of the local group. Third, policy decisions of neighborhood groups which appeared to Area Project staff to be unsound were nonetheless accepted and acted upon by them. Since staff members exercised much informal influence with the groups to which they were assigned, this problem arose infrequently. However, when it did arise, the autonomy of the neighborhood group was scrupulously respected.

These, then, are the procedural principles of the Area Project program: development of youth welfare organizations among residents of delinquency areas; employment of so-called indigenous workers wherever possible; and the fostering and preservation of the independence of these groups.

### TYPES OF NEIGHBORHOOD GROUPS

Before moving to an evaluation of the Area Project as a delinquency prevention program, some indication ought to be made of the specific activities and forms of organization found among these neighborhood groups. The founders of the Area Project were always mindful of variety in the forms of social life and of the necessity, therefore, of adapting the approach to problems of organization as well as the content of program to conditions existing in each work location. In consequence each neighborhood organization within the Area Project differs somewhat from the others in both these respects.

Generally these differences are related to the patterns of social organization existing in their areas of operation and to the degree of unity and co-ordination among local institutions. On this axis, delinquency areas may be classified as structured and stable, structured but unstable, and unstructured and unstable.[7]

In the structured and stable communities, Area Project neighborhood organizations reflect a direct expansion in interests and functions of established neighborhood institutions. In some cases in this category, the dominant local church sponsors the organization, encouraging influential lay leaders to assume responsibility in the development of its program. However, there are few urban neighborhoods in which a single institution exercises complete dominance of the life of the residents. The more usual case in this class is represented by the local organization in which a number of important neighborhood institutions participate. These may include one or more churches, local political bodies, businessmen's groups, and lodges and fraternal groups. However, the representation is always in-

[7] These terms are relative. From the vantage point of an orderly and integrated middle-class residential community the structured and stable delinquency area might appear to be both excessively disorderly in terms of delinquency, crime, and other social problems and excessively controlled and dominated by religious or political organizations.

formal, and membership belongs to participating persons as individuals. This informal mode of representation has come to be preferred, probably because it permits the inclusion of important groups which are not formally constituted. Such, for example, are extended kinship groups, friendship cliques, and aggregations of persons temporarily unified around specific problems or issues. In unstructured or unstable communities the member usually represents only himself.

### REASONS FOR JOINING GROUPS

Differences of this order among Area Project groups seem also to be accompanied by differences in motivation for participation. Members of all Area Project groups share a responsiveness to slogans of youth welfare. However, members of groups operating in the relatively well-organized neighborhoods tend to find in this activity a means for realizing their aspiration for upward mobility. A related need is served in those communities where the framework of institutional life fails to furnish a satisfactory place for certain age or sex groups. In these situations young adults and women, for example, may find in the Area Project neighborhood organization a means of gaining recognition.

The second major motivation is found most frequently in communities with few or no organizations (unstructured), and in those that have no fixed pattern of integration of the activities of organizations which may exist (unstable). Here the dominant motives for participation in the Area Project group are, first, a simple concern with the tragedies attending youthful law violation; and second, a desire to break down social isolation through organized contact with neighbors. These constitute the motivations most frequently sanctioned in official representations of Area Project doctrine because they are most apt to evoke a positive response to promotional appeals.

### VARIETY IN PROGRAM CONTENT

Area Project neighborhood organizations all include, with varying emphasis and elaboration, three elements in their programs. The first is the sponsorship of a standard kind of recreation program for the children of the neighborhood, including in some instances programs of summer camping of considerable scope. Such recreation programs are likely to have two distinctive features: the use of residents, usually active members of the Area Project group, as volunteers assisting in carrying on the recreation program; and the improvisation of store-front locations or unused space in churches, police stations, and even basements of homes for recreational use.

The second element of the program is represented by campaigns for community improvement. These are usually concerned with such issues as school improvement, sanitation, traffic safety, physical conservation, and law enforcement.

The third element of the program is reflected in the activity directed to the delinquent child, gangs of boys involved in delinquency, and, in some cases, adult offenders returning to the neighborhood from penal institutions. The activity includes helping police and juvenile court personnel develop plans for the supervision of delinquent youngsters; visiting boys committed to training schools and reformatories; working with boys' gangs in the informal settings of the neighborhood; and assisting adult parolees in their problems of returning to the community.

Specific program content in each of the local groups varies in relation to a number of factors. Among these are the facilities available for recreation or camping; the character and intensity of problems of safety, physical maintenance, or law enforcement in the area; and the staff's ability to arouse enthusiasm and effort from the leaders of the local organization in carrying on direct work with delinquents. Some groups are committed to an extensive program of recreation, including the development and operation of summer camps. Others, located in neighborhoods well equipped with such facilities, carry on no recreation work at all.[8] Some have labored strenuously in programs of neighborhood conservation; others have not concerned themselves with such issues. All have been continuously encouraged and helped by state employed Area Project staff to maintain direct work with delinquent children and with street gangs, and with virtually no exception all local groups have done so.

### ACHIEVEMENTS OF THE AREA PROJECT

The achievements of the Area Project may best be assessed in relation to its theory of delinquency causation in the social setting of the high-rate neighborhoods. In this theory, delinquency is regarded as a product of a local milieu (a) in which adult residents do little or nothing in an organized public way to mobilize their resources in behalf of the welfare of the youth of the area; (b) in which the relative isolation of the adolescent male group, common throughout urban society, becomes at its extreme an absolute isolation with a consequent absolute loss of adult control; and (c) in which the formal agencies of correction and reformation fail to enlist the collaboration of persons and groups influential in the local society. Leaders of the Area Project assume that progress in the prevention of delinquency cannot be expected until these three problems are well on their way to solution. Since progress in the solution of these problems comes only slowly, permanent declines in delinquency are not expected even after years of effort.

First among the accomplishments claimed by the Area Project is its demonstration of the feasibility of creating youth welfare organizations among residents of delinquency areas. Even in the most unlikely localities capable persons of good will have responded to the challenge of responsibility and have, with help and guidance, operated neighborhood programs. On the whole these organizations have exhibited vitality and stability and have come to represent centers of local opinion regarding issues which concern the welfare of the young. Above all, they have justified the assumption made by Clifford Shaw and his associates that persons residing in these localities have the capacity to take hold of such problems and contribute to their solution.

The Area Project has made an equally distinctive contribution respecting the problem of the isolation of the male adolescent in the delinquency area. From the beginning it called attention to the fact that the recreational and character-building agencies in these areas were unable, through their established programs, to modify the conduct of boys caught up in gang delinquency. In all probability the Area Project was the first organized program in the United States to use workers to establish direct and personal contact with the "unreached" boys to help them find their way back to acceptable norms of conduct. The adoption of this pattern in many cities during recent years may be regarded as in part, at least, a contribution of the Area Project to the development of working methods in the de-

[8] Contrary to popular impression those of our big city neighborhoods which have been centers of social problems, including delinquency, for many decades sometimes acquire more than a just share of recreational facilities. This has resulted, quite simply, from their long-time status as objects of society's solicitude and philanthropy.

linquency prevention field. At the same time, it should be indicated that from the viewpoint of Area Project assumptions and procedures such work, to be effective, must be carried on as an integral part of a more general program sponsored by residents of the locality.

Finally, the Area Project has pioneered in exploring the problem of tempering the impersonality of the machinery which an urban society erects to control and correct the wayward child. Leaders of the Area Project have tended to regard the procedures of juvenile courts, school systems, police departments, probation and parole systems, training schools, and reformatories as inescapably bureaucratic. That is, the procedures of these organizations tend to become set ways of dealing with persons as members of categories. While it is both rational and efficient as a way of processing human problems, of doing something about and hence disposing of cases, this mode of operating results in serious loss of control of the conduct of the young person. The young person in particular is regarded as responsive mainly to the expectations of his primary groups. Thus, to enhance the effectiveness of the corrective agencies of society, it is necessary to enlist the disciplining power of such groups. This is a difficult and complex undertaking, since the customary primary groups for the child, namely family and peers, are often, in the disorder of the delinquency area, unable or undisposed to exercise the needed discipline.

However, it has been found that in no area is the disorder so unmitigated as to be devoid of persons, whether residents or staff employees of the local organization or both, who staunchly represent the values of conformity, many of whom have or can gain the trust of the wayward. Such relationships capture the essential element of the primary group. The Area Project effort has been to discover an effective pattern through which the good offices of these persons may be used by teachers, police, social workers, and court officials to formulate and execute for the supervision of delinquent children jointly conceived plans designed to meet the specific problems and needs of the person. In this exploration the Area Project has found that there are natural primary relationships with delinquents which may be used effectively for delinquency prevention and that they are best utilized in collaboration with the agencies having formal responsibility for the welfare of the children and the protection of the community.

## CONCLUDING OBSERVATIONS

In all probability these achievements have reduced delinquency in the program areas, as any substantial improvement in the social climate of a community must. However, the extent of the reduction is not subject to precise measurement. The effects of improvement in the environment of children are diffuse, cumulative, and intertwined with trends and forces which have their origin outside of programs of this character. In the final analysis, therefore, the Area Project program must rest its case on logical and analytic grounds.

No assessment of this program can be complete without defining its historically unique character. The genius of its founder, Clifford Shaw, lay in his sharp perception of delinquency as human behavior and in his sense of the naturalness or inevitability of violative activity in the youngster who, whether singly or in groups, is neglected, despised, or ignored as a person. This is the spirit which has animated the Area Project program and which has made it distinctive among delinquency prevention programs. This image of the delinquent and this notion of the delinquency-making process have led to the program's insistence on centering the operation within the milieu directly productive of delinquency, upon drawing into the operation as many as possible of the persons involved in the basic socializing experiences of youngsters, and upon dealing with delinquents or incipient delinquents as persons worthy of consideration and respect.

Not uncommonly, programs of prevention, whatever their initial intention or resolve, understandably tend to move away from direct contact with the delinquent and his milieu. Distance is achieved by interposing institutional forms between workers and delinquents, as in programs of formal and official treatment, or by dealing with the delinquent as a person arbitrarily abstracted from his social environment, as in programs based on individual therapy. This kind of evolution is comprehensible in the former type of retreat because the delinquent arouses anger and resentment in the law-abiding person, who consequently is hard put to form a sympathetic identification with him. Retreat from the milieu of the delinquent is even more understandable, for nothing would seem more unrewarding than to attempt to put aright the social disorder of the delinquency area.

It may well be that in perspective the Area Project's distinctive contribution to delinquency prevention as a field of practice and technique will be seen in its development of a method designed to keep preventional work focused upon its proper object, the delinquent as a person in his milieu. Central to this method is not only a view of the problem which stubbornly refuses to uncouple the delinquent from the social world which has created him, but a set of procedures which have demonstrated a capacity to draw into the preventional process itself the inhabitants of this world.

# Co-ordination of Services as a Means of Delinquency Prevention

By Gisela Konopka

Abstract: The South Central Youth Project was based on the assumption that juvenile delinquency is part of the child-rearing problem of the whole community. Prevention therefore demands co-operation and co-ordination among all the organizations of the community related to youth and aimed at the creation of a healthy community climate. Accordingly, this Project did not consist in the establishment of a new agency but was rather a co-ordinated effort on the part of law-enforcement, health, and welfare agencies and of public schools in an area of high delinquency. The Project focused on detection of the beginning signs of delinquency and on finding concrete means to improve interagency communication and co-operative efforts. On the basis of its experience, the following suggestions for carrying on such work in the future were made: (1) Establish Practitioner Committees from sufficiently small geographic areas to meet regularly to make plans for cases needing concerted community effort. (2) Increase the flexibility of established agency structures and functions. (3) Realize the importance and difficulty of the "aggressive case work" and "street-corner group work" approaches and train selected practitioners for this task. (4) Increase the use of community education; co-ordinate the work of all agencies to change community culture. (5) Strengthen community efforts capable of early detection and attention to juvenile problems as for instance the services of school social workers and youth agencies using qualified professional personnel.

*Gisela Konopka, D.S.W., Minneapolis, Minnesota, is Professor of Social Work at the University of Minnesota. She is a member of the Governor's Advisory Committee on Youth and has served on several national committees concerned with juvenile delinquency. In the summers of 1950, 1951, and 1956, she served as Child Welfare Consultant in Germany under the auspices of the United States State Department. Dr. Konopka is author of Therapeutic Group Work with Children (1949), Group Work in the Institution (1954), Eduard C. Lindeman and Social Work Philosophy (1958) and author and co-author of other books and various articles in professional journals.*

Those of us who live in Chicago are obliged to confess that last year there were arrested and brought into court fifteen thousand young people, under the age of twenty, who had failed even the common law of the land. Most of these young people had broken the law in their blundering efforts to find adventure. . . . It is said indeed that practically the whole machinery of the grand jury and of the criminal courts is maintained and operated for the benefit of youths between the ages of thirteen and twenty-five.[1]

THESE words were written almost fifty years ago. They show that the problem of juvenile delinquency is not a new one. Why then, will one ask, have we not found a way to combat it and perhaps wipe it out as we have succeeded with physical diseases? Why did we not find a vaccine to prevent it? With the physical and biological sciences as a pattern, much research has been done and "remedies" have been based on the assumption that juvenile delinquency is an entity like a physical disease and therefore *one* solution can be found. According to differing theories—or the tenor of the times—such a solution has been found in environmental manipulation ("good housing is the solution") or in psychological help ("we need more child guidance clinics") or in physical-educational approaches ("better sports, recreation!").

It is coming to be accepted today, however, that delinquency is part of the total problem and effort of child rearing, the hardest and most complicated effort of every society and culture. To prevent or reduce delinquency therefore involves not only individual human organisms or psyches. It also involves adult-child relationships, relationships among adults and of young people with each other, the whole community climate: economic circumstances and human reactions to them; race relations; ethical, religious, and political convictions and practices. A thorough and truly scientific attempt at prevention of juvenile delinquency would require a complete evaluation of all community practices relating to child rearing and youth culture and the establishment of new services based on these findings. Existing communities, however, cannot completely change their institutions. It might be worth while to try to make such a change in the newly created communities that are springing up in this country at a growing rate. Long-established communities are probably limited to a second-best approach.

The Welfare Council of Minneapolis, in establishing the South Central Youth Project, tried this second-best approach. It could not initiate a completely new community culture. It recognized, however, the complexity of the problem of delinquency and refrained from attacking it at just one point. It realized that community institutions, such as school, church, law-enforcing and social agencies, had grown in a certain way. Changes necessary because of increased knowledge or change in the form of delinquency could not be brought about by constantly creating new agencies; instead, the established structures had to be used to and had to be helped to learn new methods and ways of working together. This kind of approach was far less sensational than those that start with new agencies. Because of the ingrained separatism of existing agencies, it needed time and patience. The following account of the Project and its acomplishments is therefore not striking. Yet in retrospect, the Project seems one of the soundest approaches to the community problem of juvenile delinquency.

### ORGANIZATION OF THE PROJECT

Minneapolis is a fortunate city with a high percentage of home owners; with lakes and parks within the city limits; and with highly developed schools, churches and all-round health, welfare, and youth services. It is also enhanced by the general alertness of conscientious citizens. Nevertheless, as all larger cities, it has its blighted areas and its social problems. One such geographical area was chosen for the South Central Youth Project. The area was chosen on the basis of a survey made by a faculty committee of one of the junior high schools. The survey showed that in the south-central area in 1950–51, 490 cases were referred to school social workers, this being by far the highest number in the city. Out of 1,120 pupils in this area, 10 per cent were placed on probation or committed to institutions during that school year.

The problems of the area were those usually found in such sections of a city: low-income families; broken homes; chronic health problems; much absence from school; a racially mixed population with thwarted movement of the minorities into other areas of the city, partially because of low economic status, but partially because of prejudice; high mobility; and no stable community leadership. Besides the school social workers, a large number of community agencies were active in this area. As in other surveys, it was found that the families of many of the youngsters presenting delinquency problems had received intermittent services from a large number of these health and welfare services over many years.

In 1954, a committee of the Community Welfare Council explored intensely the problems of this area and developed the plan for the Project. It was set up as a two-year experiment that would combine demonstration and research. The Project emphasized co-operation between existing agencies and the use of each agency's staff and the skill inherent in it. It also hoped to experiment with new techniques, if such could be found.

The financing of the Project was in itself an unusual example of joint community effort. The money came from local foundations: the Community Chest, Women's Clubs, the Junior Chamber of Commerce, and a group of women employees in one of the large industries of the city.

The Project was directed by a planning committee. This included executives of a large cross section of public and private social agencies, the chief of the Crime Prevention Bureau, representatives of the public school system, of the health services, several interested laymen active in civic organization, and one state legislator. This Committee met about bimonthly. It appointed a small steering committee, which met frequently and for many hours to attempt to solve the many interagency problems which arose and to evaluate the work being done.

The day-to-day work was done by individual staff members of agencies delegated to work with the Project. The agencies directly involved were: Big Brothers, Big Sisters, a church, three settlement houses, the Crime Prevention Bureau, Family and Children's Service, Department of Court Services, the Welfare Board, the city's public relief agency, and the Visiting Nurse Service. Those were the agencies active in the chosen area.

The staff members met regularly as the Practitioner Committee to discuss co-ordinated planning, work with particular cases and pertinent ways of referral from one to another, and to explore new techniques that might be of help to families in the Project. The Director of the Project, the only additional paid staff member, worked most closely with this Committee. He and the Chairman of the Project participated in all meetings of the Planning, Steering, and Research Committees.

### PROJECT PRACTICE

The kinds of cases the Project handled were those well known to everyone who works with juvenile delinquents: a gang of boys staging a drunken party and assaulting other youths; girls parading in new dresses acquired through shoplifting; a child found constantly truanting and his helpless mother who, fearful of her new environment after a horrible experience in a concentration camp, had made no contact with neighbors and distrusted every "official"; fathers abusing daughters; and so on. The 205 cases handled during the experimental period of the Project covered the range of such problems. It seems unnecessary to present case histories, for they are similar to many reported in other papers.

The techniques used were those of good case work and group work, with increased emphasis on work with the whole family and more "going out" to such families than is usual in conventional social work. There was also thoughtful and sensitive handling of difficult situations on the part of police handling juveniles, a longer than usual period of following up on acute situations, and an especially interesting and comparatively new way of working with parents of juvenile delinquents.

In this latter experiment parents, selected by the Juvenile Court, were invited by settlement house workers to informal group discussions. This approach combined authority and voluntary participation. Parents felt less singled out entering a settlement house than a court house. The experiment was not always successful, but it did succeed in reaching about half of these troubled and suspicious parents. The group-work approach not only proved helpful, it seemed the only one possible with such people.

The most promising aspect of the Project lay in the co-operation it developed among the various agencies and organizations involved. I shall therefore elaborate more on this aspect of the Project.

### PROBLEMS OF WORKING TOGETHER

The deepest insight gained from the Project was the fact that our helping institutions—schools, law-enforcement and social agencies—have at times become so separate and specialized that they stand in the way of a concerted effort to help the child. In a complex society, the major force that helps a child to feel stable and secure and helps him develop a capacity to cope with many demands and decisions is the family. When this natural force does not function adequately, the community must replace or, more frequently, supplement it by other institutions. Many of our social agencies are effective and manage, in spite of usually great staff shortages, to help children and young people with a complicated growing-up process. Yet their efforts are separated, at times duplicated, at times contradictory and, at least for the individual caught in the web, exceedingly confusing and frustrating. For instance, a desperate mother who tries to cope alone with the raising of a large family does not understand the intricacies of our social agencies, which force her to get economic help from one source, discuss problems of her oldest boy in a delinquency institution with another person, be called to the office of a third because of delinquent behavior of her daughter at home, be visited by a neighborhood worker who is concerned with the younger children, and each time be expected to talk, to be friendly, to "relate."

The separation of agencies often prevents true knowledge of a situation. For instance, one case worker in a family agency worked intensely with a marital problem in which the father presented the picture of a weak, fearful man who did not dare present any authority to his children. Only in discussions in the Practitioner Committee meetings was it found that this same father, when he attended a discussion group in a neighborhood house, took aggressive leadership and violently dominated his wife. Both the case worker and the group worker, in trying to help this family, had seen only one part of this man's personality. To help this family effectively, both of the roles the father played had to be understood.

We found that agencies usually worked together only when formal referrals were made, and that those often took far too long to become effective. Agency procedures—case acceptance and assignments—were slow. When the Project speeded up the process of referral, cases could be handled more to the satisfaction of the client and were more frequently productive of trust.

Workers from the various agencies often seemed strange to each other when the Project started and knew little of each other's work. At times there was actual distrust which interfered with working together for the best of the client. The Practitioner Committee meetings, which brought such feelings into the open, began to provide a new climate of feeling among those who served the area. The relationship between the Crime Prevention Bureau and the social agencies was an especially complicated one. It took over a year before this relationship could be discussed openly among the practitioners. They were too "polite" to approach the subject. Meanwhile, delinquencies were not reported to the police because social workers feared indiscreet handling and the loss of trust of their clients. The police on the other hand felt thwarted in doing a good preventive job by not knowing about these minor problems and therefore saw children drift into more serious situations. The face-to-face group created by the Project made it finally possible to speak frankly about these problems. Two full meetings were used to discuss frankly, not only grievances, but the ethics of each professional group and resulted in a better understanding of each other's practices.

## RECOMMENDATIONS OF THE PROJECT

By bringing specific cases before the group, the diverse agencies not only pooled their knowledge but also decided on a concerted way of action. This meant more than the usual case conference between different agencies. By placing cases before the whole committee, agencies that usually would not have been involved were found to have frequent and valuable contacts with the youngsters or the family. By common decision, major responsibility was placed on one person, so that the clients were not confronted with too many different people working with them.

Based on this experience, one of the recommendations of the Project was the establishment of Practitioners Committees in sufficiently small geographic areas throughout the city. Such committees should meet regularly and discuss cases needing concerted community effort. Constant working together, it was found, increases mutual confidence and knowledge of each other's resources; it also helps to develop integrated plans of action, sometimes even beyond individual cases.

It was found that this kind of cooperative work presupposes flexibility in the administrative structure of agencies. For instance, on grounds of observations made during the Project period, the public welfare agency decided to assign to each family a case worker who would stay with them even if they moved to another district. This was done because it was found that most problem-ridden families constantly changed social workers and thus lost the trust and help they had gained.

The family agency, to give another example, considered having group meetings for clients on its waiting list and the setting of definite appointment dates because the indefinite "we will call you when we can take you" was found to be too frustrating and was preventing the best use of agency service. A school and a settlement house decided to let a group worker—who at times had the only "in" with angry youngsters—do some informal tutoring outside of the school office and in the settlement house where it was more acceptable to the youngsters. The excited and jubilant cry of a 15-year-old girl who had been truanting for years, "Boy, I got my first B in my life! This is fun!", was reward for this flexible use of agency staff.

This dimension of flexibility is considered one of the most important recommendations growing out of the Project. Surely agencies must keep largely to their own functions and use the specialized skills of their workers. Yet those policies must be "stretchable," if agencies are to work with the complicated phenomenon of delinquency. Sometimes agency workers said, during the period the Project was in operation, "Ordinarily we would not accept this case, but since it is a Project case we will." That means the client got a service he would not get otherwise. This must not be so. Flexibility must be a rule of agency practice.

The Project helped agencies rethink the question of private-public responsibility. Former distinctions (such as that the public agency should provide financial assistance while the private agency gives additional services, or that private agencies should pioneer in new efforts) not only did not hold true in actual practice, they also did not seem helpful in juvenile delinquency cases. For the sake of keeping citizen responsibility alive, a healthy community needs both public and private agencies, but their functions need not be sharply separated and the necessary flexibility can be applied by both.

The Project brought to the fore the importance of the individual as well as the group approach to youngsters, adults, and families. Every agency involved and every professional person needed some knowledge and skill in both techniques. It was obvious that particular agencies justifiably use predominantly one approach: schools and neighborhood houses the group approach; family agencies and public assistance agencies the individual one. Yet each was found to need the other technique at times. This finding pointed again toward the need for flexibility, this time in the use of techniques—especially toward the need for practitioners who have genuine appreciation, skill, and capacity to know which techniques to use.

As in several other attempts to prevent delinquency, the Project found the "reaching-out" technique in case and group work necessary and rewarding. By repeatedly going out and offering service to families who were hostile and distrustful of any helping effort, the practitioners learned that "hard to reach" did not always mean impossible to reach. They acquired much empathy for people who felt caught in a never-ending circle of hopelessness. They also learned much about the realistic limits of social work's knowledge and skill and became less discouraged or defensive when they did not succeed.

It was found that the "reaching-out"

approach calls for specially selected and trained people because it has the danger of leading to an attitude of "I always know better what is good for you." It involves extraordinary knowledge and diagnostic skill to introduce a social service that is not sought. It also asks of the practitioner much insight into his own motives and a true absence of conceit and power drive. This service is surgery in human relations. No one must be allowed to use a knife who too much enjoys the use of it, nor one who, with good will but little knowledge, might cut into the wrong place.

"Reaching out" also asks of the practitioner independent judgment and resourcefulness. A young caseworker, for instance, showed such imagination when she reached one of the distrustful, difficult mothers, not by using the usual interview method, but by letting this woman teach her a foreign language. This kind of case work, as well as its counterpart in group work, calls for retraining, even of the gifted people who want to do and are capable of doing this kind of work.

"Reaching out" should also mean early treatment and attention to incipient delinquency. The Project workers did not hold that social work should be limited to severely disturbed cases. The school social workers and the social group workers, in their contacts with "normal" youth, were recognized as key persons to detect and treat early signs of social disturbance.

The Project, we have said, included many kinds of social agencies and related them to specific cases of juvenile delinquency. It was realized that, beyond this, more community education should be carried on. To achieve a more healthy community climate—indispensable for genuine prevention of juvenile delinquency—more community forces should be involved. Neighborhood churches, for instance, played only a small part in the work done. They, as well as city-wide youth-serving agencies, should become part of the cooperative effort. Intensive work to achieve genuine acceptance of minority racial groups is needed. No indigenous leadership in the area was utilized, but all participants were convinced that it must exist and should have been found and encouraged. The skills of community organization and education were the ones least used and sorely missed by the Project.

## THE IMPACT OF THE PROJECT

Two years are too short to show great success with individual families. The impact of the South Central Youth Project lies in three areas:

A genuine rethinking of social agency practices; an increase in flexibility in each of them and a more active cooperation among them.

A clearer realization of what kinds of staff are needed to work with our most neglected, hurt, least verbal citizens who are prone to delinquency.

A deepening of the understanding that juvenile delinquency is a total community problem of child rearing and therefore calls for an attack on the whole community culture and cannot be solved by segmented institutions or individuals.

How can those lessons be put into practice?

It should be made clear to the public that delinquency is a child-rearing problem. That means it is not the problem of the police or the church or the home alone, but of the whole community and its institutions. A concerted effort at stressing this idea can do much to prevent the eternally repeated attempt at individual delinquency-prevention efforts, made with glamorous promises and then followed by cynical defeat. It can rally moral and financial support to existing agencies and institutions and work toward their improvement. It can raise the feeling of responsibility of the individual citizen.

Social agencies in new communities should not follow the traditional pattern but should be established according to increased knowledge of community problems. In older communities, agencies should be encouraged to work closely in small geographical areas and to increase their flexibility and their cooperation with other organizations.

The relevant professions should recognize that better understanding of delinquency requires the removal of some of the sharp boundaries between them. They should introduce into their training a wider range of skills and understanding in the area of human relations and an ability to use the skills of others. This applies particularly to teachers, social workers, nurses, and the police.

Communities should recognize that, in areas with high rates of delinquency, social services must be highly skilled and that social work can be done only slowly and over a long period of time. This is as costly as work with chronic diseases. If communities could seriously plan for such expenses—and plan sufficiently—the cost, over a period of about fifty years, may decrease. This is a realistic time span which is needed to work on such complex problems. New communities should plan ahead so that problems will not arise to so great an extent.

The public should realize that not all delinquency can be prevented or corrected, just as not all physical diseases can be cured.

Adults should move away from hostility toward the younger generation and accept the eternal responsibility of each older one for the coming one. In Jane Addams' words:

> We may either smother the divine fire of youth or we may feed it. We may either stand stupidly staring as it sinks into a murky fire of crime and flares into the intermittent blaze of folly or we may tend it into a lambent flame with power to make clean and bright our dingy city streets.[2]

# A Work Camp Program for Potential Delinquents

By Antoinette Fried

Abstract: Fuld Neighborhood House in Newark, New Jersey, has for the past two summers sponsored a Work Camp Project in an attempt to combat delinquent trends by offering teen-agers both paid work in accordance with their abilities and the guidance and leadership of trained social workers. The experiment has not been an unqualified success, but many good results have been obtained and many valuable lessons learned for future projects. Boys of the particular subculture involved equate success with the art of obtaining the greatest material reward for the least effort possible, an equation clearly indicated by their work habits. Their deep fear of being taken advantage of by society causes them to react violently to anything which they feel to be unfair, but at the same time they are extremely responsive to just treatment and anxious to maintain a close and friendly relationship with the social workers who serve as their leaders. The extension of the Work Camp Project into a year-round program could provide the continued leadership sorely needed by these young people and offer them an incentive to obtain the education and training necessary to enable them to become productive members of society.

---

*Antoinette Fried, Ph.D., is Director of Group Work and Recreation at James Weldon Johnson Community Center in New York City. She was Executive Director of Fuld Neighborhood House in Newark, N. J., until the fall of 1958. At Fuld House, Dr. Fried initiated all-summer Country Day Camps for children, the first Street Club Worker Program offered in Newark, and the Work Camp Project for Teenage Boys. She was instrumental in setting up the Tenants' Organization in the Rev. William P. Hayes Homes Housing Project and in organizing services for mentally retarded children.*

It is necessary to state at the outset of this report that it deals with a subculture of American society, namely that of the teen-age youth of large cities where minority groups live in slums, severely blighted areas, or low-rent housing developments. All statements and suggestions in it are based on direct experiences with such youths, made in particular during the periods of the experimental Work Camp Project conducted during the summer months of 1957 and 1958 by the Fuld Neighborhood House, Newark, New Jersey, and carried out in co-operation with the Essex County Park Commission.

The participants in the Work Camp Project were Negro boys, 14 to 17 years old, some lean and long, six feet or more in height, some short and hard-muscled, members of the neighborhood Boxing Gym, competitors for the Golden Gloves. They dressed strictly according to the fashion of the moment—fiery red sweaters, rust-colored suede jackets, striped ivy league shirts. All of them wore hats and all of them smoked and drank. Clothes might be in bad need of repair, hatbands darkened by sweat, and one cigarette might have to be shared with several friends, but the style of living was unanimously maintained.

These external evidences are the surface of a code of behavior shared by those who live in the particular neighborhood and seldom revealed to outsiders. The boys who live by this code are governed by a tremendous desire to prove to a world which they experience as basically hostile that they are ready to accept the challenge. In order to do so, they need the financial means which will enable them to compete with a more fortunate part of society, and to demonstrate through external symbols—clothes, cars, alcohol—that they, too, are on the winning side. Simultaneous with their determination to prove their manliness is evidence of an equally great need for the guidance of adults who can be trusted.

The Work Camp Project was designed to offer the boys the experience of a nonhostile world by providing both leaders who would combine fairness with interest in every individual and an opportunity for the boys to meet their external needs by earning an income through constructive and socially approved work. After two Work Camp summers, the blueprint still seems to hold. The many unforeseen experiences which grew out of it are, however, in need of study and evaluation, a first attempt at which is made in this report.

## Work Camp, 1957

In the spring of 1957, the first Work Camp Project for Teenagers was set up by the Fuld Neighborhood House and the Essex County Park Commission in Newark, New Jersey. The Board of the Park Commission fully understood the experimental value of the Project and its potential meaning. It agreed to provide a location in the Eagle Rock Reservation in West Orange—work which could be performed by boys age 14½ to 17—a foreman to give necessary instruction, hand tools, and a salary of one dollar per hour during six weeks of work, Monday through Friday, seven hours a day. Fuld House was, in turn, responsible for providing a group of fifteen boys, well known to the agency, a professionally trained group worker as leader, and transportation by chartered bus. The boys' obligation was to obtain their working papers and to pay Fuld House fifty cents a day for transportation.

The boys were recruited from a club which had been active in the agency for over a year. It was known that they were unstable, emotionally highly volatile youngsters, most of them with police records for minor delinquencies such as

truancy or loitering, with an occasional assault charge. All were prone to delinquency and most of those over 16 years of age had quit school. Throughout the year, they had responded well to the leadership of a staff member, B.B., who had identified himself patiently and sincerely with their individual and group problems and had, in turn, received confidence and co-operation. Under his leadership they had developed from a rowdy delinquent group to a club which, within the confines of the agency, was able to function in a socially acceptable, satisfactory manner. It was felt that the Work Camp Project would offer a possibility for further development. B.B. left the agency at the end of the spring season with the promise to return in the fall and resume leadership of the group.

It was clear to the staff of the Camp Project that the change in leadership plus the adjustments demanded by work camp life would pose many problems. Even such simple obligations as the provision of working papers and regular payments of bus fare were new experiences for the boys. A large number of "drop-outs," iregular attendance, little accomplishment, and a considerable loss of money were expected by both sponsoring agencies.

These expectations proved largely incorrect. Only three boys dropped out and had to be replaced. Average daily attendance was twelve out of the group of fifteen. No one was ever late for work. After some attempts at cheating, which represented one way in which the boys "tested" the staff, bus fare was paid in full. While none of the boys were able to work a full seven hours, the group delivered a satisfactory job, achieving much more than had been foreseen. Several miles of trail were cleared and widened, underbrush and heavy growth of trees removed, and rain ditches dug. Staff and Park Commission were gratified and the boys were proud of their accomplishments. There was unanimous desire to work under a similar set-up throughout the year.

No one was prepared, however, for the after-effects of the project. When the boys returned after the four weeks of vacation, during which the House was closed, they had exploited to every possible degree the high status gained through the Work Project. They had become neighborhood models as well as neighborhood bullies. Every youngster within a radius of several blocks wanted to join the club and many claimed to have done so. Cocky behavior and minor delinquencies committed by real and by self-appointed members of the club had irritated adults, police, and school officials, and had caused much friction. When Fuld House opened for the fall season, the boys appeared in a body and expected to "take over" the agency. Under the renewed leadership of B.B., the House was going to be exclusively their and their friends' center. So convinced were they of their right to this status that they paid their membership fees without the customary struggle and bickering.

Then, suddenly, the fantasy of owning the agency broke down. B.B. was ill and unable to return. New staff members laid down rules to be respected by all alike, disregarding all claims to special privilege.

The club went wild. In a meeting with the staff, chairs were thrown, obscenities voiced, and the threat made that all new members trying to enter the House would be beaten. Under great protest, the whole club was then expelled from the agency and membership fees returned. The boys were told that they could return as individuals after their parents had been visited by staff members and informed of the breaking-up of the club.

This plan was carried out and eventually all members of the former club returned to the House. The situation was, however, not a happy one. The resentment at having been betrayed and deprived of status never died down. The new staff was unable to compensate for the loss of B.B. and to offer a program which would match the happy excitement of the summer weeks. However, each of the boys maintained a certain measure of loyalty to the House and confidence in individual staff members. A rule not to fight in or near the agency was made by the boys themselves and was obeyed. Help from staff members was still sought when any member of the group found himself in trouble. A process of disintegration had, nevertheless, set in and could not be stopped. The present status of the eighteen boys who participated in the 1957 Project is as follows:

| | |
|---|---|
| Not in trouble: working or in school (2 of these boys participated in the 1958 Project) | 8 |
| On probation,* employed | 1 |
| On probation,* unemployed, not in school (all of these boys tried to participate in the 1958 Project but failed to meet the requirements) | 6 |
| In jail** | 3 |

After this experience, it was clear to the staff that, in repeating the program, care would have to be taken to look more realistically at the relation between work done and remuneration received; to keep a closer check on the boys' emotional reactions; and to prepare for a follow-up program in the fall which would meet as much as possible the boys' personal needs and expectations.

## WORK CAMP, 1958

Despite its shortcomings, the Work Camp Project had aroused a great deal of positive interest. Throughout the winter, inquiries concerning participation were received from many teenagers, and in the early spring high school guidance personnel started to refer applicants. Since no more than twenty boys could be accommodated, only fifty applications were accepted. The applicants were informed that less than half of them could be enrolled and that the final selection would depend upon the fulfillment of certain requirements, such as attending weekly meetings, several weeks prior to the start of the Camp, to discuss the details of the Project, handing in completed working papers two weeks before Camp, and agreeing to pay bus fare regularly every morning.

Budgetary limitations made it impossible to carry out the recommendation made in 1957 to have one leader for each group of five to seven boys. It was, however, possible to increase leadership as well as the number of participants by having two leaders work with ten boys each. They were M.B., who had conducted the 1957 Project, and Fuld House's Detached Worker, W.R. It was felt that the latter's close contact with the boys would not only benefit the summer program but would also be of help in setting up a program for the fall. R's decision to carry out his usual evening activities in the streets, after the end of the camp day, was, furthermore, considered a stabilizing factor and one which would forestall the development of unrealistic ideas in the youngsters. These assumptions proved to be correct.

Less successful, however, was a major change in program, even though all the boys had agreed to it during the weekly discussions. Since a seven-hour work day had proved too strenuous, it was decided to divide the day into four hours of work and three hours of recreation. The leaders felt that paying a

* Loitering, suspicion of theft, assault.
** Auto theft, assault and battery, morals charge.

full salary for incomplete performance had contributed to the boys' lack of responsibility and dishonest tendencies. It was furthermore hoped that regular periods of recreation and friendly talk would contribute to the youngsters' inner development.

From the first day on, the leaders were told by the boys that the four-hour work day had been accepted only because, in a summer of business recession, jobs for teen-agers were practically unavailable. The recreation part of the program was never liked; it died down in the course of the six weeks. Swimming, the only type of recreation which the boys would have liked, could not be offered. Ball games in the heat of the early afternoon were of little appeal, and a quiet enjoyment of nature did not belong in the boys' sphere of inner life. They liked to rest and talk for an hour or so after lunch and did not mind a game of cards, chess, or checkers on the lawn, but basically they were anxious to do such things in the familiar streets of their lively neighborhood rather than in the isolation of the woods. This experience can be considered as one more piece of evidence that recreation for recreation's sake does not appeal to teenagers. It is enjoyed only as the self-chosen expression of an independent group's interest or temperamental need; it is better liked during the evening hours than in the day, when grown men of stature—whatever this stature may be—are at work.

*Reasons for lack of success*

The not-too-satisfactory work performance of this second summer is less easy to explain. Each one of the boys was physically well able to put in four hours of work in the morning. Nevertheless, they seldom delivered more than two hours of real effort and often had to be coaxed to do that. Part of this slackness can be attributed to the resentment over the curtailed income. A deeper-reaching reason, however, came to the fore when the leaders decided to report on the individual time sheets the exact amount of time put in by each boy. The weekly pay would reflect these reports.

A small revolt broke loose. Three boys threw down their tools and walked off. If one and a-half or two dollars was going to be their pay for "a whole day's work," they would rather not work at all. In discussing the situation with the remaining boys, it was found that almost every one of them knew of some adult who earned as much as $2.50 to $5.00 per hour for construction work and, according to the boys, spent most of his time "just standing around, smoking and talking"—the very behavior these boys exhibited on the job. These statements were made with great emphasis and conviction. They revealed one of the pictures of the successful man that the boys carried within them as a model: the man who is "smart" because he knows how to cheat and because he is able to earn much with little effort. The gambler, the "numbers-man," and the racketeer appeared as hero figures.

A deep-seated fear of being taken advantage of by a society in which one is a "second-class" member accounts for much of this attitude. This fear was shown clearly when, on the first pay day of the season, some technical difficulties arose and the Park Commission had to delay payment for more than a week. It took all the leaders' skill to prevent violent reactions to this announcement. When it then turned out that the Director of Fuld House would be able to meet the emergency by advancing funds sufficient to cover the pay checks, tremendous relief took over. All laughed heartily and only a few wanted to accept the offer. Some preferred to wait for the regular check; others asked merely for enough money to pay their daily bus fare.

Still another episode revealed the fear of unfairness and rejection together with quick awareness and acceptance of just settlement. On several successive days, lunch bags had been rifled. A sandwich, a few cookies, a piece of fruit were missing here and there. No one made an issue of the small disappearances until, one morning, two complete bags containing lunches, towels, and cigarettes were gone. A meeting was called, and the leaders informed the group that since the situation had outgrown the proportion of a joke, one dollar would be deducted from everybody's pay on this particular day. Should the incident recur, each member of the group would be fined a whole day's pay. The announcement elicited the expected uproar:

"An hour's pay?! Why man, that's es-tortion! Es-tortion, man! I'm going to call my lawyer!"

"A whole dollar out of that raggedy pay?"

"Yes, raggedy it is—and with my brother having T.B. and I'll have to buy him a casket. . . ."

"Out of my first pay check, too! I worked for that money, man, you can't take it from me!"

"Twenty dollars—say—that buys a whole week's food!"

"Where does the money go to? You keep it, Mr. B.?"

"Ah no, he don't—it goes to the Neighborhood House."

"Say, Mr. B., you goin' to keep our money?"

Quick side discussions revealed that the group would have little objection to paying the twenty dollars to the Neighborhood House, provided they would receive their checks and make the contributions voluntarily. Gradually the excitement subsided and the ring of true emotion went out of the words. Knives were flipped, somebody started to eat, and there were jokes and laughter although the manner was uneasy. At last, one voice came through:

"Mr. B.—you didn't give us any warning. You didn't do that when my plums were stolen—and his cake. It's only because it was their lunches. . . ."

Tense silence followed. "They" were the two white participants in the Project.

"All right," said B. after a pause. "We had not thought of that, but we'll straighten it out. Everyone who had anything taken from his lunch raise his hand!"

"Man," came a cry, "don't do it, man! He'll take a dollar for everyone who says he's lost something!"

This was exactly what B. had planned to do. After he made this clear and stressed the point that for lack of any clue even the two victims of the purloining were going to be fined, the deduction of pay was quietly accepted. No incident of this kind recurred during the remainder of the summer.

*Need for reassurance*

Invariably, episodes of this kind were followed by efforts on the part of the boys to make sure that they had not lost the leaders' affection. They would gather around B. and R. and tell stories, each one trying to receive attention, and if possible, praise. Space does not permit a full account of these tales, but the following provide a few examples.

Several boys related how they had devoted two years to raising pigeons. They gave a full account of the different species. Eyes sparkling with joy, they imitated voices, gait, and wing movements of the birds, described their coloring, shape of beaks and eyes, eating and mating habits. The perfectly

matched pairs were sold to trainers of homing pigeons. Only, they added, grinning, some of these birds had already been trained—they would return, and could be sold all over.

Another boy told how his severely injured father owed his life to a dog: the faithful animal had "sucked the gan-ge-rine right out of the infected leg." It died of the poison, but the father was saved.

When the dispatching of American troops to Lebanon was announced, talk of war and the army went on throughout the day. United States Marines overseas fired the imagination. Scenes of every war movie ever seen were reenacted in great detail. The movements of men attacking, falling, killing, or dying were realistically acted out, but no side was taken. Whoever was the winner in a good movie scene was the boys' hero, regardless of national or political allegiance. Leadership, prowess, and slyness were all that counted. The only derogatory remarks which, off and on, could be heard were anti-Communistic newspaper phrases. The prevailing sentiment was worship of leaders.

These experiences are related here because they offer insights into the lives of youths governed by emotion. The stories of the pigeons and the dog reveal their closeness to living things; the handling of the birds led to the absorption of data which, had it been presented to them in the classroom, would never have attracted their attention.

The story of the gangrene-sucking dog gives one pause over the failure of our educational system to break down old fears and superstitions. The emotions active in this particular incident are typical of a very low socio-economic class, related, probably, to an agrarian Southern background. They are, however, reminiscent of the widespread fear of insanity and psychiatrists found even in far more sophisticated groups. In the subculture discussed here, this latter fear is frequently encountered in parents who would rather see their delinquent children jailed than permit their referral to a mental health clinic. The old specter of the "crazy" man who is an outcast of society—the delinquent is no more than a misguided rebel—is as real to them as the dog who healed and died.

The discussion of war and the army laid bare the complete absence of historical and political information and the lack of any political conviction. The only positive feeling expressed was the desire to be either a leader or a strong leader's disciple.

## SUMMARY AND EVALUATION

The Work Camp Project was an attempt to meet the needs of young people at the crossroads where the decision between honest or delinquent, constructive or destructive life is to be made. It was found that the boys under study suffer from a lack of respect for most of their elders. Unstable, broken homes and overcrowded schools seldom provide the secure and responsive parent figures who can set limits and offer rewards. Deprived of respect and reliance, these children cannot develop any concept of right and wrong.

There is also a lack of respect for the ethics of society as they are preached. The boys absorb the facts of dishonesty and struggle for power on every level of national and international life and are equally sensitive to the discrepancies between ideals preached in churches and schools—the brotherhood of men, and racial and social equality—and the actual experiences of their families. As a result, they suffer from a distorted view of society. In their opinion, the man of status is the man who acquires a maximum of power and possession with a minimal output of energy.

The use of force and cheating are manifestations of strength and intelligence. Using influence to provide advantages for others—particularly employment and protection from the law—is friendship and, again, a proof of power. There is a deep-seated fear of being condemned to the role of underdog. Much delinquent activity is a self-protective reaction to this fear and to the desire for status.

All of these attitudes can be seen to be the result of the deficiencies of a system of education which fails to reach young people's true abilities, to help them find a constructive and satisfactory place in society, and to dispel their fears. The Work Camp Project was originally set up with the intent of meeting some of these needs—particularly by offering occupation instead of recreation, status through service and earning, and self-respect through status thus acquired.

The past two summers' experiences have shown that this basic idea does meet at least some of the needs of today's youth. Supported by many educators' findings,[1] we believe that the need for a purposeful place in society, for occcupation which affords appreciation and income, and for status based on respect and self-respect is shared by all young people. The specific recommendations made here have bearing on the subculture under study. We believe, however, that, despite experimental errors and shortcomings, the basic validity of the work camp idea is unquestioned and is in keeping with the needs and requests brought to us by young people from all levels of society. On the basis of these requests, as well as the experience of the two work camps, some general conclusions may be drawn about the opportunities which such programs should provide.

[1] See, for example: *New Ways to Reach Unreached Youth—a Challenge to New Jersey*, Third Annual Report and Recommendations of the State of New Jersey Youth Study Commission, June 1958, Alan S. Meyer, Research Director.

## RECOMMENDATIONS FOR FUTURE PROGRAMS

First of all, a successful youth project of this type must afford an environment in which agreements are carried out and limits set and respected. In a work camp situation, dual leadership seems to be necessary. Social workers are needed to offer help in all personal difficulties and guidance for individual and group development. These leaders must be men who can be trusted and can serve as an example to the group. Furthermore, groups should be small enough so that each leader will be able to give his attention to the often overwhelming personal problems of each member. Secondly, there must be foremen in charge of vocational instruction and the evaluation of the work performed. The young people's outspoken desire for firm direction and the objective justice of "give and take" is best met by a system in which personal growth and productivity on the job are handled separately.

The work experience should reflect actual employment conditions and the relation between work performed and remuneration received should be on a realistic level. The half-day work period as tried this year proved detrimental to incentive and morale; in its place a work day of normal length, remunerated by normal pay, would seem advisable. Alternating periods of work and relaxation in keeping with the physical potential of young boys would be useful, but no attempt should be made to combine this type of program with supervised recreation. The work project's basic value of giving status and independence suffers when linked to the outgrown practice of "organized fun."

Year-round activities in keeping with the needs of the specific community—agricultural work, conservation work, construction work, forestry or fishing—would help to maintain the gains made during the summer program and could also be used to awaken the desire to acquire vocational skill and to accept the schooling required. This could be furthered by the equivalent of the scholarship program presently available to gifted youth, in which funds would be provided making it possible for boys and girls not interested in a college education, but motivated to become useful members of society, to participate in a program combining vocational instruction with paid work.

Such a vocational merit system would counteract the fear of being unwanted and the resulting mistaken concepts of society and negative attitudes on the part of the young people involved, while establishing respect for leadership and learning. It would serve as an incentive to remain in school and acquire the kind of education necessary in today's civilization, providing in the long run a group of educated and purposeful citizens who feel secure in their world.

# The Effectiveness of a Boys' Club in Reducing Delinquency

By ROSCOE C. BROWN, JR. AND DAN W. DODSON

ABSTRACT: The delinquency rates for white boys in three areas of Louisville, Kentucky, were compared for the period 1944–1954. These areas were selected because they were similar in certain ecological characteristics. The delinquency rates decreased steadily over an eight-year period in the area where there was a Boys' Club. The delinquency rates in the two other areas with no youth-serving agencies increased over the same period of time. Some discussion is devoted to the limited nature of any conclusions that can be derived from a statistical study of this type in which several factors can not be controlled. The study indicates that the Boys' Club was probably one important factor in the decline in delinquency in an area of a city where delinquency was increasing in other sections.

---

*Roscoe C. Brown, Jr., Ph.D., New York City, is Associate Professor of Education, New York University. Dr. Brown has completed several research studies in community health, education, and human relations. One of his most recent studies was in collaboration with Dr. Dodson on school integration in a New York suburban community. He has also participated in several school surveys as a school population specialist.*

*Dan W. Dodson, Ph.D., New York City, is Professor of Education and Director of the Center for Human Relations Studies, New York University. In 1944–48 Dr. Dodson was Chairman of the New York City Mayor's Committee for Unity. While Executive Director of the Mayor's Committee, he advised Branch Rickey as he broke the color line in baseball. Dr. Dodson is Editor of the Journal of Educational Sociology and author of numerous papers in professional journals.*

THE RISE of juvenile delinquency has prompted many youth-serving agencies to re-assess their role in the prevention of this most challenging problem. This article deals with an attempt to assess the impact of one of the 450 Boys' Clubs on the delinquency rates of the neighborhood it serves. The particular club involved in this report is the Louisville Red Shield Boys' Club of Louisville, Kentucky.

The National Boys' Clubs of America national staff selected this Club for evaluation for several reasons. First, its establishment was fairly recent, 1946; its operation is in an area where incomes are generally low and housing comparatively poor; the delinquency rate was high when the club began operation; and lastly, the Boys' Club was the only major youth-serving agency operating in the area in the interim studied.

Although periodic reports which had been prepared by the Louisville Division of Police tended to show that the delinquency rate in the club area had decreased sharply between 1946 and 1954, the Boys' Club officials wanted an impartial study of the change in the club area of Louisville as contrasted to comparable areas within the city and with the city as a whole. They wished to determine whether the pattern of decline was real, and if so, whether it was explainable on alternate bases to that of the impact of the youth-serving institution. The authors participated in the study as members of the staff of the New York University Center for Community and Field Services, the agency engaged to do the evaluation.

## SOME METHODOLOGICAL CONSIDERATIONS

Social scientists will readily recognize the pitfalls of studies of this type. The public is anxious to find the simple "pat" solution to the handling of youth. All youth-serving agencies would like to maintain that they have a role in the prevention of delinquency. In fact, many base a major portion of their fund-raising campaigns upon this type of claim. Yet respected social agencies have a right to come to universities and ask that they assist in evaluating the impact of a program on those they claim to serve. The research technician is caught in the dilemma of the limitations of his methods, which preclude definitive answers, and his desire to be useful. He is caught between the risks of having his limited findings used adversely against the agency, if they are not complimentary to it, and having his limited findings used as "endorsement of science" if they do turn out to be complimentary to the program.

The first methodological consideration involved establishing the usefulness of a statistical study in determining the effectiveness of the Boys' Club program in preventing delinquency. The staff of the Center pointed out that a statistical study could not provide definitive evidence on the Club's actual role in the prevention of delinquency. Even if the delinquency rate has declined, there are several factors other than the Boys' Club that might have brought about the changes. Since there is usually some feedback between happenings in a community, changes in a large-scale social phenomenon such as delinquency would probably be the result of the interaction of several factors. Further, since the study was of necessity an ex post facto design, it would be impossible to provide for the controls necessary for a true test. Nevertheless, the Boys' Club and the authors felt that knowledge of changes in the delinquency rate in the Club area and in other comparable areas of Louisville would be helpful in establishing a point of departure for future studies.

The next consideration was the definition of delinquency, and the legal concept of juvenile delinquency in Louisville was used. Thus, in this study, delinquency was considered as "those offenses defined by the Crime Prevention Bureau of the Louisville Division of Police as being delinquent acts." Children between 5 and 16, from 1944 to 1952, and between 5 and 17, since 1953, committing delinquent acts in Louisville were processed by the Crime Prevention Bureau if apprehended. Some of the types of offenses classified as delinquent acts were: auto thefts, destruction of property, unlawful entry of property, offenses against persons, larceny, and truancy. In all, sixteen different categories of delinquent acts were identified by the authors.

### *Selection of comparable areas*

Data on delinquency rates for a two-year period previous to the opening of the Boys' Club were collected so that a base line might be established. The data covered the period 1944–1954 inclusive. Then permission had to be obtained to utilize the Crime Prevention Bureau's records and to develop a method of computing delinquency-rate statistics. The Assistant Chief of Police, who was a leader in the Boys' Club movement in Louisville, was quite helpful in obtaining permission for us to gain access to their records. The only limitation was that the boys' names were not to be used. Since there were some delinquents who were repeaters, it was decided that the delinquent rates should be based on the number of individuals. Thus, the rates were based on the comparison of the number of boys committing delinquent acts in a given year to the total number of boys residing in the area during that year. It was necessary to use the 1950 United States Census data as a base and extrapolate back to 1944 and forward to 1954 because there were no accurate data on the number of boys in each age bracket dating back to 1944. Although this method was approximate, the data followed a pattern of changes in the number of boys in each age group which was consistent with the over-all population trend in Louisville.

The most significant methodological problem was the selection of similar areas of Louisville for comparison with the Boys' Club area. This selection was the most crucial phase of the study because of the ex post facto nature of the design. When such a design is used for making comparative judgments, it is assumed that all factors other than those being compared are equal. Therefore, it was necessary to identify some basic ecologic factors that could be used to select areas comparable to the Club area. The criteria of median income, median rental, median education, type of housing, percentage of nonwhite population, and absence of a youth-serving agency building were used to select areas. These data were obtained from the 1950 census and from reports of the Louisville Planning and Zoning Commission and Health and Welfare Council of the Community Chest. Fortunately, neighborhood areas had been identified by the Planning Commission so that it was possible to compare neighborhoods of which the Club area was one and to select two other areas that were most comparable to the Club area. Unfortunately, they were not similar on all the selection criteria.

A summary of the basic comparative data follows:

| AREA | MEDIAN INCOME | MEDIAN RENTAL | MEDIAN EDUCATION YEARS | POPULATION | PER CENT NONWHITE |
|---|---|---|---|---|---|
| Area A (Club Area) | $2703 | $23.82 | 8.5 | 28,044 | 1.7 |
| Area B | 2423 | 24.83 | 8.6 | 10,088 | 11.05 |
| Area C | 2743 | 33.44 | 8.7 | 31,703 | 9.27 |
| City of Louisville | $2723 | $33.22 | 8.9 | 319,077 | 15.7 |

These data are indicative of the difficulty of matching neighborhoods even in a community the size of Louisville. It is necessary that the findings of the type of study reported here be carefully evaluated in terms of the similarities or differences of the areas being compared.

## THE BOYS' CLUB PROGRAM

Since this study was primarily concerned with the comparison of the delinquency rates in areas that were comparable to the Club area, we did not study the Club program extensively. However, a brief description of the Boys' Club program is given so that the reader can see the type of emphasis the Club placed on various activities and the age groups of boys being served by them.

The program philosophy of the Boys' Club emphasizes an all-around program for boys working in small groups. Through working with each group, program activities that are most acceptable to the boys are developed. The program attempts to provide training in citizenship and to promote the development of the boys through constructive activity. Some of the activities included in the Club program were: clubs, athletics, woodwork, crafts, dramatics, swimming, Boy Scouts, and a summer camp program.

The Club began its activities in 1944 in an older area in the western section of Louisville. The Club was originally located in a two-story frame building until 1952 when a new, modern building was opened. The Club's activities were restricted to the white population of the area. It is interesting to note that 55 per cent, 1,540 out of 2,822, of the white boys in the Club area were members of the Club in 1954–55. Seventy-one per cent of the 10 to 14 age group were members of the Boys' Club. This is a significant fact because there was a large decline in the delinquency rate for this age group. Also, the Boys' Club philosophy places a great deal of emphasis on programs for this age group.

## THE ACTUAL FINDINGS

The delinquency rate for the Club area decreased rather steadily from 1 in 19 boys in 1946, when the Boys' Club opened, to 1 in 39 in 1954. The decrease in the delinquency rate in the Club area was in contrast to an increase in the rate for the City of Louisville from 1 in 29 boys in 1946 to 1 in 18 in 1954. The delinquency rates for the two other areas in Louisville also increased. The increase in area B was from 1 in 44 boys in 1946 to 1 in 16 in 1954; the increase in area C was from 1 in 28 to 1 in 21 in the same period. The complete findings are summarized in Table 1.

### *Delinquency pattern*

Such a clear difference in delinquency rate statistics between the Club area, other comparable areas in Louisville, and the city as a whole could easily lead to the conclusion that the Boys' Club

[a] To be read as one of "x" boys as delinquent (e.g., 55 = 1:55).

was responsible for the decline of delinquency in one area of the city while delinquency was increasing in other similar areas. Since the study was not an experimental controlled study, it is necessary to look at other factors. The first step was to find what was different in the Club area when compared to other areas of the city. There are several factors, all of which were not studied, that might have influenced delinquency in the Club area: the leadership structure of each area, the influence of religious organizations, the type of family units, the relationship between the races, economic stability, and the effect of commercial expansion. For example, there was a difference in the number of industries in the areas studied. There were 30 in the Club Area, 50 in Area B and 65 in Area C.

A closer look at the actual delin-

quency pattern seems to indicate that while the Boys' Club probably had some influence on the delinquency problem, several other factors were also operating to produce social stability in the Club Area and social instability in the other areas. The delinquency pattern for both areas B and C fluctuated a great deal between 1944 and 1952 and then increased greatly in 1953 and 1954. This increase coincided with the inclusion of 17-year-olds in the delinquency statistics. In contrast to this pattern, the delinquency rate for the Club area declined sharply from 1946 to 1948 (1 in 19 to 1 in 33) and then remained rather stable until 1954. Thus, the rate in the Club area did not increase when the 17-year-olds were added to the delinquency statistics. The rather stable pattern of decline in delinquency statistics in the Club area despite the unstable pattern of increase in two other areas of Louisville might have been caused by the presence of the Boys' Club. Another interpretation, however, might be that the social forces in the community that led to the establishment and expansion of the Boys' Club were lacking in the other areas. The absence of such community-oriented social forces might then be associated with a general pattern of social disorganization which is conducive to delinquency. This analysis is similar to that of Bernard Lander in his discussions of the relationship of anomie to delinquency.

The results of this study should be comforting in one respect. Namely, the presence of an active, well-organized Boys' Club in an area where delinquency had been high and in a city where delinquency was increasing was associated with a decline in delinquency rate statistics while these rates were increasing in other areas of the city. Although specific cause and effect relationships cannot be determined, the results of this study indicate that in at least one major community in this country, the Boys' Club was a significant part of the community's arsenal in the battle against delinquency.

### CONSIDERATIONS FOR FUTURE RESEARCH

The authors feel that this type of ex post facto study has some merit in establishing a base line from which further studies can begin. Although it is not possible to generalize from this study of one community to other communities, the design of this study provides evidence of the limitations of the statistical approach to studying the effectiveness of any procedure in preventing delinquency. There is a fairly general feeling among social scientists, which is shared by the authors, that studies to obtain definitive answers to the prevention of delinquency should involve both the study of community process and case studies of large numbers of delinquent and nondelinquent boys. Whereas a study of the type that is reported here is comforting in its confirmation that the program of an agency such as the Boys' Club contributes to the alleviation of the delinquency problem, it adds little to basic knowledge on the prevention of delinquency.

# Effects of a Revised School Program on Potential Delinquents

By PAUL HOOVER BOWMAN

ABSTRACT: The Quincy experiment is in the seventh of its ten-year program. It is concerned with a cross section of all youth in a small, midwestern city in Illinois and is attempting to prevent maladjustment and develop special talents of children. While not being specifically centered on delinquency, it does offer a picture of what the delinquent is like in this setting. Typically, he is a child of lower ability and lower economic status who has a difficult home situation, who finds school equally frustrating, and who has little contact with other community agencies. He usually leaves school as soon as legally possible and is unsuccessful in the work world. The first procedures tried by the Project to meet the needs of delinquent children had only moderate success. Later, a special program was developed to determine whether the school years could be made a profitable rather than a defeating experience for them. This study is still in progress. Findings to date suggest that at the junior high school level the interests, attitudes, and aggressive behavior of these children are more likely to be favorably influenced than are their academic achievement or personality patterns. There is a hint that similar programs instituted in the earlier grades might be effective in the latter two areas also.

*Paul Hoover Bowman, Ph.D., Quincy, Illinois, is Research Associate, University of Chicago and Chief Consultant, Community Youth Development Project, Quincy, Illinois. Previously Dr. Bowman was Foreign Relief Administrator (Europe), American Friends Service Committee, 1938–40; International Representative (South America), Brethren Service Committee, 1940–46; staff member, Counseling Center, University of Chicago, 1947–48; and Assistant Professor of Psychology and staff member, Psychological Services Center, University of Louisville. Professor Bowman is co-author of Men and Hunger (1946), Studying Children and Training Counselors (1953), and Mobilizing Community Resources for Youth (1956).*

THERE are two limitations inherent in writing about the Quincy project for a symposium on the prevention of delinquency. First, this project was not designed specifically as a study of delinquency, but rather as a study of the range of maladjustment and talent in children. Consequently, discussion of delinquency cannot be as pointed as might be desired. Second, the experiment is still in progress with much information still to be collected. There are, however, some trends and observations that can be reported at this time.

### PURPOSE OF THE STUDY

After conducting several observational studies of children in communities, the University of Chicago's Committee on Human Development wanted to study questions relating to the utilization of existing knowledge about children. Could the findings of social science be interpreted to the professional and lay people of an average community and utilized by them? If so, would it make any significant difference in the lives of the children?

To secure some answers a study was designed and initiated by Dr. Robert J. Havighurst of the University of Chicago faculty and was underwritten for ten years by the C. A. Moorman Foundation. The hypothesis was that the average American community can significantly improve the mental health and talent development of its children by utilizing scientific knowledge of child development. An experimental and a control group were given a battery of tests to select the potentially maladjusted and potentially talented children. Comparable records are to be kept on these two groups for a period of ten years, after which evaluations will be made of the adult life pattern of each child. During the ten years, the task of the project staff is to motivate the community to develop talents and prevent maladjustment among the children of the experimental group, and to measure the results objectively.

Thus the efforts of the project staff are aimed not directly at the children, but rather at the adults who are responsible for children in the community. The goal is to upgrade the community's services to its youth. The criteria of evaluation are the prevention of maladjustment and the development of talents in a cross section of the children in public school as compared with a control group. More detailed discussion of the over-all project and its progress through the past seven years can be found in print elsewhere.[1]

Two parts of this project are of particular interest to the present discussion. The first is a description of the kind of "delinquent" behavior that has been found in a cross section of youth from this small American city, and the second a description of special classes in the public schools which are aimed to meet more adequately the needs of certain maladjusted students.

### THE SEMIDELINQUENTS

The official crime rate of the city of Quincy is quite similar to that of other cities of this size in this region. The rates of the midwest region average 10 to 15 per cent below the national averages, according to the Uniform Crime Reports of the Federal Bureau of Investigation. However, two differences are noted for this city. Since 1952 the

Bowman and others, *Studying Children and Training Counselors in a Community Program*, Supplementary Educational Monographs No. 78 (Chicago: University of Chicago Press, 1953), out of print; Paul H. Bowman and others, *Mobilizing Community Resources for Youth*, Supplementary Educational Monographs No. 85 (Chicago: University of Chicago Press, 1956).

rates for both the nation and the region have increased gradually each year with the exception of 1955. During the same years, the trend for Quincy has been in the opposite direction, where the average rate has decreased gradually each year with the exception of 1956. The Quincy crime rates are consistently lower in every category except that of murder, and here the rate is about double that of other similar cities in this region. The rates quoted are for all crimes, both adult and juvenile.

Even though the over-all crime rate is lower, a number of children still come in contact with the police. For instance, from our control group of 508 children, 94 (18.5 per cent) have had contact with the police during the last seven years. This is perhaps a minimum figure since some children have moved to other communities and our records may be incomplete.

It is much too loose a definition of delinquency, however, to include all of these as juvenile delinquents. Of the 94 offenders, one third have had only one contact with the police in seven years, and these were for such minor offenses as speeding, faulty brakes, breaking windows or street lights, or truancy. Another third have had more than a single contact with the police, but the reasons for the contact were definitely of minor seriousness.

These 77 semidelinquents come from all socio-economic classes and areas of the city. When the traffic violators are excluded, almost all those remaining are from the lower social class areas. Why? It may well be that these minor offenses are behaviors that are more closely supervised and prohibited by parents in the middle-income brackets without calling in police help. In the lower-income areas there is less strict surveillance by parents, more freedom for children for longer periods, more patrolling from the police, and, thus, more official delinquent records for these children. Semidelinquent behavior, as described here, is interpreted as common to all social classes, and probably resulting from the general enthusiasms and boredoms of youth.

### THE DELINQUENTS

This leaves a total of 17 children of the 94 who have engaged in activities of a more serious nature and are here defined as delinquents. This represents 3 per cent of our sample youth of this community. While these are rated as more serious cases, there still have been no murders, no shootings or knifings, and no gang warfare. Two-thirds of the offenses have had to do with creating a disturbance and stealing. One fourth of this group are girls; their offenses are largely drunkenness and sex offenses.

Several case descriptions may give a more graphic picture of delinquency as seen in Quincy. For instance, Rex was a boy of low mentality (IQ 77) who hated school and was frequently truant. He came from a home where the father was a steady worker but would frequently get angry with the boy and beat him. At the age of thirteen the boy was picked up by the police and admitted stealing $20 from the pocket book of a lady in a store. His mother repaid the money and no charges were pressed. At fourteen he was arrested for an attempted break-in at a filling station. He was later declared delinquent by the county court, placed in a detention home, and later transferred to a foster home for a short period. He was given a medical examination but no pathology was found. At eighteen he was picked up several times for drunkenness, fined several times, and finally jailed. He is fast becoming an habitual drunkard.

Sue was first picked up at the age of fifteen for hanging around down town with a group of girls. A month later she

was reported by her father for being truant, not coming home nights, and being unmanageable. She was married at sixteen but was reported to the police shortly afterward by her neighbors who complained of the filthiness of the apartment and the neglect of a small baby. The police found her at that time in a tavern. Two months later she was brought in for soliciting men in a tavern. She continues to practice prostitution in her parents' home.

A rather complete record is available for most of the 17 delinquent children, including school records, community records, and testing and interview reports of this project. These records give the following description of them. Three out of four are boys. At the average age of 19 they have had an average of five contacts with the law. They have all engaged in at least one act of a more serious nature as defined above. Half of them have been declared delinquent by the county court, and one-third have been in prison at one time or another. Every one of this group comes from the "lower-lower" socio-economic group as measured by Warner's Index of Status Characteristics. They change residence only slightly more often than the average family in the United States and these moves are very frequently among relatives; that is, a child might live here with one parent, move to California for a year with another parent or relative, and return here the next year to the same address. Only one-third of the group have grown up with both parents actually in the home; one boy has had four different parent substitutes, all of whom have been taken from him by death, desertion, or divorce. Only one-third have been in town during the entire seven years of the project; the other two-thirds have been out of town at least half of the time.

Intellectually most of these delinquents are in the borderline range between the mentally handicapped and the average—IQ 75 to 90—but about one-fourth are in the handicapped range. Their aptitude scores are generally low, of course, but their lowest scores are in verbal ability. The delinquents were given consistently higher scores on aggressive maladjustment by both teachers and peers; scores on withdrawn maladjustment were somewhat lower but still surprisingly high (62 percentile average). Their scores on leadership and friendship were in the lowest 25 per cent.

All but one of the delinquents on whom we have records dropped out of school between the eighth and the tenth grade. One-third have spent sometime in a class room for the mentally retarded. All but one have repeated at least one grade during their school career, and one child has repeated three grades.

What kind of help have these children received from community agencies? On the records available at this point, only one-fourth of the delinquents have had any contact with a casework agency in this city, and of these only one had been seen for treatment. This boy has conferred with the Family Service Agency seven times about his vocational choice. With this one possible exception, no child has had propessional therapeutic help. A survey was made of all churches in the vicinity to determine the amount and kind of contact youth have had with religious institutions. Of the 17 delinquents one was listed as a church member but did not attend or participate, and one other was actively related to a church. The rest have had no contact with churches as far as can be determined.

There is nothing particularly new in these findings; they are in accord with other studies in other areas and in larger cities. Delinquency in the smaller city seems similar to that in larger cities except that the behavior is not as extreme and is not characterized by gangs. The delinquent usually comes from the lower socio-economic groups and is likely to be below average in intelligence. It is also obvious that these children are not getting the remedial or supportive help that they need from the community and its agencies.

### FIRST EFFORTS AT PREVENTION

With this picture of maladjustment obtained from the older control group, it became the task of the staff to try to prevent the occurrence of similar behavior in the younger experimental group. Even when dealing with a small community and a limited number of children, the task of prevention of maladjustment is still extremely complex. The staff not only needed to find effective prevention methods, they also needed to get them used by the community.

The first methods tried were those that had been used elsewhere and found to be helpful. Placement in foster homes was used wherever practicable, but our experience with this approach was not very rewarding. Foster homes were scarce, and the parents (with one exception) did not want to give up their children. Even the few good placements did not work out well, and we came to feel that foster home placement, at least at the ages of 12 to 14 years, was not profitable.

With a few cases, an attempt was made to use the "aggressive" casework approach. These experiences led to several observations. First, this method was extremely time consuming; one worker could not adequately work with more than ten to twelve families if he expected to do a good job, and no community agency was ready to take on such an extensive program at the time. Second, our experimental children were at an age where it was difficult to work with families; these junior high school boys and girls were ready to grow further away from the parents rather than closer. We did find, however, some measure of success with certain families, particularly those in which the parents were interested and concerned about their children. These interested families were found among all social classes; however, the delinquents tended to come from nonco-operative lower-class families. Lastly, we found certain problems of a general community nature that kept defeating certain groups of children almost in spite of their individual efforts for improvement. Problems such as lack of adequate employment for Negroes, lack of recreational programs for youth, inadequate school curricula—these made it difficult to rely on the individual case approach alone, even though aggressive casework looks promising with selected cases.

Another approach tried was recreational clubs. We soon discovered that it was not difficult to establish rapport with the children or to get co-operation from their parents. The leader soon found himself in a strategic position to help these families use the resources of other agencies because he was trusted by both parents and children. A number of children were given individual help in better adjustment to the school, in using public health nurses for chronic ill health, and in getting in touch with various cultural and welfare activities.

The clubs, however, were ultimately abandoned, primarily because no agency in the community was ready to take on this program. The Boy Scouts were interested in trying to adapt their program for these children and conferences were held with national office personnel, but to date there have been no additional local programs. A worker in the state welfare department, who had been closely associated with Clifford Shaw, has been concurrently organizing several

of the lower-class neighborhoods; however, he has chosen to work independently of other community agencies. Our own experience here would indicate that recreational programs should not be relied upon to change people, but can be used as effective points of contact between children and the various resources of a community.

These first efforts at prevention reached a few of the children successfully, but obviously many were not being reached. In searching for a new approach the staff looked for one that would bring a more intensive contact with the child over a longer period of time, as well as one that could conceivably be used by the average community. Only the school seemed to offer this possibility.

## POTENTIALITIES OF THE SCHOOL

By the time a maladjusted child enters school, much damage has usually been done by unfavorable home and community conditions. It would be desirable to work with children much earlier than five or six years of age. On the other hand, the school does have children for six hours a day for approximately ten years after the age of five or six. The schools have physical facilities, a trained professional staff, and a legal responsibility for all children. Is education most effectively utilizing these years to prepare these children for adulthood? The answer is no.

In studying the older control group it was discovered that one-third of all students dropped out of school before graduation. This one-third was usually below average in intelligence and in social advantages. A detailed study of these drop-outs is now in progress.[2] It is clear that they hate school and have had only difficulty with it. This hatred usually begins in the early grades. Teachers say that, with few exceptions, children of this sort are their greatest problems, the ones that make it difficult, if not impossible, for them to teach. At the junior high level, these children take up a disproportionally large amount of teacher time in disciplinary actions of various kinds, all with little effect. School personnel are discouraged about dealing with this group, but by law they are charged with responsibility for them.

From this study it is clear that students who leave school have had nothing but defeat throughout their school career—defeat in classes, defeat in extracurricular activities, defeat with other students and teachers. It is also clear they are ashamed of not being able to read or write or "figure"; they desperately want to have these skills but are not likely to put the effort in the usual school setting. They claim they are frequently ridiculed by other students and teachers for their ignorance. They cannot understand or keep up; consequently, they either sleep or misbehave. If these children are to be legally held in school, we have an obligation to find how to meet their needs more adequately.

Can an educational program be devised that would catch and hold the interest of these students? If so, could they learn basic skills that they had not learned during past years? Would this change their personal adjustment and behavior problems? To study these problems two experimental class rooms were set up two years ago at the ninth grade level.[3] This grade level was chosen purely because the children of the experimental group were at this age. Even though this study is still in progress, it will be described more in detail as being a somewhat different approach to maladjustment and delinquency.

[2] "A Study of the Motivations of Youth for Leaving School" performed pursuant to a contract with the U. S. Office of Education, Dept. of Health, Education, and Welfare.

[3] This investigation was supported by a research grant, No. M-1319, from the National Institute of Mental Health, Public Health Service.

## CLASSES FOR SLOW LEARNERS

All children in the experimental group who were of below average ability and who were doing poorly in the eighth grade were selected for the study. Most of the sixty children thus selected were discipline problems at school; 41 per cent had police or court records. This group was then divided randomly into three equal groups. One of these continued in regular classes as a control group. The other two groups were placed in special classes. Two teachers for these special classes were selected from the regular teaching staff, not on the basis of any special training, but rather because of their interest in and sympathy with this kind of child.

The students in the special classes began their day as all other children in various home rooms. For the three morning hours, they met with their special teacher in one room. These periods were devoted to English, arithmetic, and a third hour of discussion and films on civics, general problems, and personal problems. During the fourth and fifth hour they returned to their special teachers for study hall, small discussion groups, hand work, and projects. Some of the children worked outside of school during the afternoon; others were out for such classes as chorus, band, art, and typing. During the sixth hour all of them were engaged in classes elsewhere in the school, such as home economics, gym, and industrial arts.

The school day for these pupils differed in three or four major ways. First of all, they spent from a half to three fourths of their day with one teacher who knew them well and was sympathetic with them. There was considerable variety in their learning experiences, such as films, field trips, work experiences, and projects. With a large block of time available, flexibility was possible in arranging schedules. Practical materials, such as newspapers, mail-order catalogues, and magazines, were used more than textbooks. Any reading materials that were used were carefully selected to appeal to their interests and to be at a reading level of the elementary grades. The children were not pushed to learn; the pace was slow. They did not have to compete with students of greater ability, since this has always increased their sense of defeat in the past. The efforts of the teachers were aimed at making school a pleasant experience; helping pupils learn the basic skills of reading, writing, and arithmetic; helping them learn the practical things they would use in their daily lives; and providing experiences in which they could find some success.

## EVALUATION

To what extent were these goals realized? The students were at first confused by these new experiences and spent considerable time during the first two months testing the teachers with extremes of misbehavior. This then subsided, but was present to some extent throughout the first year. This year was particularly trying for the teachers, who were working to gain the respect and confidence of the students.

Objections are frequently leveled at grouping slow students together because of the stigma that is involved. These students knew they were slow learners but felt that there was greater stigma in regular classrooms where they could not successfully compete. In the middle of the year they were given a chance to return to regular classes if they chose, but all decided to remain in the special class. One student was so emotionally disturbed that he was dropped from

school entirely and placed under psychiatric treatment. One other student was asked to leave the class because of misbehavior and was returned to the regular classrooms.

Written evaluations by the students seem to indicate clearly that the teachers were successful in providing a new kind of educational experience. One girl wrote, "I think myself that this is really a good idea, because with this kind of thing you can learn and say and tell if your not a brain. You can express yourself more freely. You can feel more at ease and not have to feel dumb and feel real bad and embarrassed in front of children who are real smart in almost all their studies and ideas. But most of all I think if you try your best and try to help the teacher get it in your head this isn't just a place to mess off and try to make it hard for her and everyone else, this would be a good place to start learning without just being passed on and on from one class to another getting dumber every year."

The few contacts that the teachers had with parents showed them also quite positive in their appraisal of the special classes. One father told the teacher that his boy had always hated school but now he and his wife were kept busy at supper time listening to the boy's stories of the many interesting things that were going on at school. He said that if there had been such things in school in his day, he might even have finished school.

The classes have proven of sufficient worth to the teachers and administrators of the schools that they have already been extended to each grade level of the junior and senior high school. In addition, an experimental classroom has been set up in one elementary school at the first grade level, because it is recognized that such a program to be most successful should begin early in the life of the child.

## RESEARCH DATA

Thus, the informal evidence would seem to place a positive evaluation on the results of these classes. The more careful evaluation by research evidence is not yet complete, but certain trends in the data can be reported.

Improvement in the basic academic skills has been only slight, with no differences between the experimental and control groups. Achievement tests show that the slow learners progressed at about one-third the normal rate during these two years. It is likely true that these children have reached their upper limit of academic achievement and cannot be expected to make further gains. Actually, however, the control group should have received greater academic impetus since they were theoretically engaged in academic type classes more of the time.

Personal adjustment shows the same kind of pattern, that is, some improvement during the two-year period for both control and experimental groups. It is rather surprising that this is true, since these years are usually very difficult ones for these children; on the other hand, it is probably true that children who are still in school at this age are somewhat a select group.

The data on the number of students dropping out of school are still incomplete, but at the present there are no significant differences between control students and those in the experimental classes. These classes have not succeeded in holding more students in school. However, it seems that the students from the experimental classes are having considerably greater success in their job experience, as measured by ratings of their employers and the length of time they hold their jobs. If this is substantiated by further data, it is evidence that practical learning has taken place.

The experimental pupils have shown greater interest in school than ever before, as measured by their attendance record. Absences for control group children increased from an average of 22 days in the eighth grade to 29½ days in the ninth grade. During the same period the absences for children in the experimental classes decreased from an average of 12 days to 11 days. This interpretation is supported by numerous oral and written expressions of the pupils.

A preliminary survey of delinquency statistics indicates a significant shift in delinquency rates for the control group during these two years. Previous to the beginning of these classes, the children in the experimental group happened to have had the greater number of contacts with the police and more serious offenses. During these two years, however, the trends in the two groups were exactly reversed. Using a rating scale developed in the Cambridge-Somerville study, it was found that the delinquency rate in the control group had more than tripled. This is not surprising since these years (16 to 18) are very crucial in the establishment of criminal patterns. However, during the same period the delinquency rate of the experimental group decreased more than one-third, and there were fewer serious offenses than in the other group of children. The numbers here are too small for generalization and the data are incomplete, but the trend is clear.

Data on the class of slow learners at the first grade level are even clearer. Eighteen children who had failed the first grade were selected for this special class. Many of them had relatives in the junior high classes. At the end of one year seven were able to enter third grade, thus regaining their lost grade status; six of these were able to read in the top group in a regular third-grade classroom. Scores of the total group on a personality test showed significant improvement. Again, interest was high and attitudes favorable.

The experiences of this project indicate the need for further experimentation in revising the school experience for children prone to delinquency and the promise of some positive results in the prevention of delinquency.

# The All-Day Neighborhood Schools

By Adele Franklin

Abstract: The All-Day Neighborhood Schools of the New York City Board of Education is a significant project. These are elementary schools in which additional staff are provided to help children during the schoolday and in an after school "club program" from three to five. The warm, personal relationship between teachers and children fuses home, school, and community into a sympathetic unit. Children of working parents who might otherwise be unsupervised in the empty after-school hours before the mother returns to the home, children needing help in learning processes, children with language and integration problems benefit from the program. Statistics show that there is a conspicuous lack of truancy and a minimum of vandalism in these schools and that the delinquency rate declines.

---

*Adele Franklin, Ed.D., New York City, is Director and founder of the program of the All-Day Neighborhood Schools of the Board of Education of the City of New York. Dr. Franklin is a former teacher, social worker, and recreation leader. She is the author, with Agnes E. Benedict, of Play Centers for School Children (1943); The Happy Home (1948); and Your Best Friends Are Your Children (1951). She has also written numerous articles in professional and lay magazines and has frequently spoken to professional and lay groups.*

WHEN the new school opened, the 1,200 children who were admitted were overawed by its spaciousness and by the colorful rooms with moveable furniture. They tiptoed through the halls and spoke in whispers —all except Pedro. Pedro came with a reputation built up in his former school, and Pedro was not impressed. As usual, he talked incessantly and loudly. He immediately started picking fights with the other children in his fourth grade class. In the midst of a lesson he started his usual clowning which varied from making "funny faces" to trying to stand on his head. He would leave the classroom without permission and create a disturbance in the halls. He spent most of his time out of the classroom, either because of his illegal departure or because he was sent to the office with a message stating that his behavior distracted the entire class. The teachers were convinced he was normally intelligent, but his inability to settle down resulted in school work that was far below the average for his age. His grandmother sympathized with the teachers and predicted that Pedro would either be crazy or dead by the time he was twelve.

That was eight years ago. Pedro is now completing the course in the Machine Trades High School. When he graduated from junior high school, he was an honor student and was chosen out of a class of 300 students to read the Bible at the graduation exercises. He called our office the other day to tell us that he and one other boy had been selected to try out for the American Theatre Wing. He said, "I may not get it but it's a wonderful chance. I really like acting better than mechanics, but I can be sure of earning my living with mechanics."

How was Pedro transformed? How did this supposedly "hopeless" boy become a mature and reliable citizen at the age of 18? We believe that the answer is the special attention given him in the elementary school.

The new school in East Harlem with a population that is 96 per cent Puerto Rican was opened as an All-Day Neighborhood School. This meant that seven additional teachers and a psychiatric social worker from the Bureau of Child Guidance were assigned to the school in addition to the regular staff. These extra teachers, under the guidance of the Director of the program and the Principal of the school, assisted classroom teachers in developing curriculum suited to these children. They also helped in getting to know the needs of individual children and in exploring ways of meeting these needs.

In an All-Day Neighborhood School each of the six grades has an extra teacher called a group teacher, whose duties from 11:00 a.m. to 3:00 p.m. include working with small groups of children from various classrooms. From 3:00 p.m. to 5:00 p.m. the group teacher provides an educationally sound recreation program for twenty-five selected children from the same grade. In charge of the six additional teachers is a seventh teacher called the Administrator. The continuity of guidance that is given to children through a program like this is of inestimable value. When the same person works with the child in the day school and in the after-school program, a fuller understanding of the child's personality results.

## Development of Pedro in School

The following year the group teacher assigned to Pedro's class helped the children get a better understanding of the social studies by having them dramatize the historical events they were studying. Having an opportunity to act out a part seemed to satisfy Pedro's need for acting the clown. His span of attention grew longer and his school

work improved. In addition, the classroom teacher, in conferences with the psychiatric social worker from the Bureau of Child Guidance, had learned to recognize an oncoming spell of restlessness in Pedro so that he could be sent to the office of the Administrator before the tension had reached the breaking point.

Participation in dramatics, dancing, and painting in the after school club enabled him to stay for longer periods, but on certain days he spent the afternoon helping the Administrator. On one such day the group teacher of the 6-year-olds was absent. Since no substitute was available, the Administrator took charge of the group. She assigned six of the children to Pedro. His gentleness and skill in handling these active little ones surprised her. Frequently after that he helped with the younger children. Their obvious fondness for him and their eagerness to have him with them gave a tremendous boost to Pedro's ego.

That summer, through the efforts of the Citizens' Committee and the Parents Association, funds were raised to supplement the summer program and the school was open for a summer play school run by the Community Education Division of the Board of Education. Pedro's group teacher was in charge of the summer program. Pedro spent a good deal of time in the school participating in some of the activities of his age group. He also helped in the office with supplies and assisted with the younger children at lunch and rest.

In spite of Pedro's gradual improvement both in studies and behavior, and in spite of his great love of dramatics, it was not until late in the sixth grade that he was able to give a performance in the assembly. The children themselves were puzzled over the fact that Pedro, who could act a part so ably with a small group, would go to pieces in the same part in a rehearsal in the assembly. The first indication of his gain in self-control was the success he achieved one day in actually taking a small part in an assembly program.

During his first two years in junior high school, Pedro came back to the school frequently. He spent some time with his former group teachers, but most often he came to talk with the Administrator and to help in the office. He was proud to report that he was doing well in his studies and was not getting into trouble. At his graduation from junior high school, to which he invited the Administrator, his Group Teacher and the Director, his grandmother and mother remarked tearfully, "We never thought it could happen."

Pedro continued his contact with us after graduation, but it became less frequent. At present he keeps in touch by a telephone call every few months.

If this were a single incident it would be interesting but not too significant. But Pedro is one of hundreds of elementary school children who, reached in the program of the All-Day Neighborhood Schools, have shown definite changes in behavior pattern. Principals, teachers, parents, and social workers point to overly aggressive or painfully withdrawn children who were helped by this program. These children have been able to make an adjustment and to maintain themselves in junior and senior high school.

## PHILOSOPHY OF THE ALL-DAY NEIGHBORHOOD SCHOOLS

It is an interesting fact the the All-Day Neighborhood Schools were not started to prevent juvenile delinquency. The basic idea was that children could not be educated from 9 to 3 and recreated from 3 to 5. It was also our belief that children in low socio-economic areas, who often have limited cultural backgrounds and frequently come from broken homes, have emotional problems which make learning difficult. Many times the school is the only institution trying to meet the needs of such children. Dr. Virginia Moore, psychiatrist of the Bureau of Child Guidance, stated: "The same energies and needs which express themselves in vandalism are, in the All-Day Neighborhood Schools, being channeled into constructive activities."

In their studies on juvenile delinquency, Sheldon and Eleanor Glueck [1] have indicated the importance of an adult figure either in the school, in the settlement house, or in the recreation center, with whom the child can identify himself. Dr. David Abramson,[2] in his book, *Who Are the Guilty?*, again emphasizes the importance of the school in preventing juvenile delinquency. The burden on the conscientious teacher with classes of thirty or more children is great.

## HISTORY OF THE ALL-DAY NEIGHBORHOOD SCHOOLS

The program now known as the All-Day Neighborhood Schools started as the Chelsea School Project under the auspices of the Public Education Association with the co-operation of the Board of Education. The Public Education Association, a voluntary organization of citizens interested in the improvement of public schools, took on this Project as a field demonstration. They wanted to discover what an extended school day and help to teachers during the school day could do for children. The WPA furnished the extra staff, who worked under the supervision of the Director, an experienced teacher with both recreational and social work training.

The Chelsea School, P.S. 33, located in Chelsea, had a mixed population of 33 nationalities. Housing was poor, infant mortality was high. Many families had been hit by the depression, and malnutrition was prevalent. We wondered if our program could reach children facing so many serious handicaps.

It was the Principal of the school, Miss Ruth Gillette Hardy, who first became aware of the changes in children's attitudes. Everyone was amazed to see that youngsters who were restless and unruly in the classroom stayed after school in the groups which they called their clubs. These same children were concentrating on painting or carpentry or even on dramatizing events in American History. Teachers who had been resistant to any innovation began to appreciate the work done by the group workers. They requested that it be extended to groups of children during the school day. Gradually there were changes in the approach to curriculum and also in teachers' attitudes towards children. Visitors were impressed by the general atmosphere of the school.

The Public Education Association asked the Board of Education to evaluate the program; as a result of this evaluation the Board of Education in 1942 decided to set up a three-year demonstration in the Chelsea School and in a school in West Harlem with an all Negro population. At this time the program was placed under the supervision of the Elementary Division of the Board of Education.

The Board of Education furnished six regularly licensed teachers for each school and one clerk for both schools. The Public Education Association continued to furnish the services of the Director and an Administrator for each school. It was our firm conviction that when teachers became better able to

[1] *Delinquents in the Making: Paths to Prevention* (New York: Harper & Brothers, 1952).

[2] *Who Are the Guilty?* (New York: Rinehart, 1952).

recognize children with problems they needed the help of a trained worker to confer with them about some children and to give special care to others who required it. Since the Board of Education would not supply a worker from the Bureau of Child Guidance, the Public Education Association engaged a qualified psychiatric social worker and a special arrangement was made for her to have supervision by the Bureau of Child Guidance. The Program was now designated as the All-Day Neighborhood Schools.

We soon realized that there was need for closer relationship with the community, and a community relations subcommittee was formed. It was necessary to have the community and the parents better acquainted with the school and its needs and to get the school to understand the community. It soon became evident that the problems in Chelsea and those in Harlem were so different that two separate committees would be more satisfactory. These local committees consisted of representatives of the Parents Association of the school and other individuals who were particularly interested in school-community relations. The committees served many functions. They brought volunteer helpers into the school; they publicized the program of the All-Day Neighborhood Schools in the local community; they raised money for additional supplies and for a summer program in the school. They worked with other community organizations to meet the needs of the neighborhood supporting such projects as rent clinics, public housing, extension of public library service, clean-up campaign, health examinations, and so on.

The work of the school in the community had its effect on the children. When they saw parents and other citizens coming into the school, helping them with their work or play, and showing an interest in their activities, it helped build up in them a feeling of pride and self-respect. Parents, children, and teachers worked together on common projects to improve the community.

### Evaluation of the Program

During the three-year demonstration period, an evaluation of the program was made by the staff of the Division of Reference and Research under Dr. J. Wayne Wrightstone. Members of the research team interviewed representatives of various social agencies with which these schools worked. They sent anonymous questionnaires to parents and to classroom teachers. They observed in the classrooms and in the group program. Because of the favorable findings, Dr. Wrightstone recommended the extension of the program.

Accordingly, in the fall of 1945, two schools in the Bronx were designated as All-Day Neighborhood Schools. The Board of Education now supplied seven teachers—one to serve as Administrator—and a clerk to each of the four schools. These clerks took care of the additional records and correspondence and ran off special mimeographed curriculum materials prepared by the teachers. They also kept records for the psychiatric social worker or psychologist. Three full-time social workers from the Bureau of Child Guidance were assigned to these schools. The Public Education Association continued to furnish the services of the Director until 1949, when, through the regular process of examination, the Director became a member of the staff of the Elementary Division and continued to develop the program.

In 1951 a new school in East Harlem was opened as an All-Day Neighborhood School. Within a short time it showed the effect that a community-centered school can have on a neighborhood. At

present there are nine All-Day Neighborhood Schools in four boroughs of New York City. They are operated under the Elementary Division under the supervision of Florence S. Beaumont, Associate Superintendent of the Board of Education.

Some years ago there was a general threat of a budget cut, particularly in the area of special services. Representatives of the Citizens Committees and the Parent Associations of the four All-Day Neighborhood Schools met together to plan a campaign to retain these schools in the education budget. The success the committee achieved in keeping the existing All-Day Neighborhood Schools pointed out the value of working together for a common goal. Out of this group was organized the City-Wide Citizens Committee for the All-Day Neighborhood Schools.

This Citizens Committee continues to co-operate actively with the Board of Education in promoting the growth and development of the All-Day Neighborhood Schools. They also raise funds to publicize the program. They have helped develop citizen, parent, and community interest in new schools as they were added.

The City-Wide Citizens, now known as the Citizens for All-Day Neighborhood Schools, have offices of their own at 450 Seventh Avenue, New York City. Through special grants they implement the program in the local schools. Since more children apply for the after school "clubs" than can be accommodated, they finance an additional teacher for an extra after school group in each school. Play equipment for roofs and playgrounds, as well as other needed materials, is furnished through funds raised by this committee. A special council has been organized at which representatives of the local Citizens' Committees and two members of the Board of the City-Wide organization meet with the President, Mrs. Milton K. Breslauer. Here they discuss mutual problems, exchange experiences, and make recommendations to the City-Wide group.

### Value of the All-Day Neighborhood Schools

In his article, "Therapy with Latchkey Children," [3] Dr. Joseph Rosner, former psychiatric social worker of the Bureau of Child Guidance, discusses the value of working with children in the school setting. He points out that the All-Day Neighborhood School makes the child accessible to treatment from 8:30 a.m. to 5:00 p.m. "Since children can be seen in the school, they are available for treatment during periods of resistance, when they might otherwise avoid agency contact." Often it is possible to work with parent and child and avoid the shattering break that occurs when a child is removed from the family and community to receive institutional care. Also, the lack of specialized facilities often means that children waiting for placement go without care, whereas in an All-Day Neighborhood School, with a psychiatric social worker and additional staff, treatment can be carried on while the child is at home and attending school.

The problem of "reaching the unreached" has been much discussed in recent years. There is also much talk about an interdisciplinary approach to our problems. In the All-Day Neighborhood Schools we are reaching the unreached, as illustrated in the case of Pedro and as indicated in Dr. Rosner's article. We are combining the techniques of education, recreation, group work, social work, and sociology within the framework of the school. We are involving parents and citizens in working together to improve the social struc-

[3] "Therapy with Latchkey Children," *The American Journal of Orthopsychiatry*, Vol. 27, No. 2 (April 1957), p. 412.

ture of the neighborhood in which they live. Not only does this bring about changes in the community; it also develops a feeling of self-respect in both parents and children.

The value of the close relationship made possible by the additional staff showed up plainly in its effect on Pedro. In general, the presence of the social worker in the school, giving guidance to the teacher when needed, helps lighten the teacher's burden and makes her better able to handle disturbed children.

It is certainly in the interest of economy and good planning to use school buildings fully. The facilities of these buildings have been used for community activities and for recreation and adult education. There is, of course, an additional cost when an All-Day Neighborhood School program is added to an elementary school. But the cost is far less than caring for a child in an institution or allowing a child to become a delinquent.

A statement by Dr. James E. Allen, Jr., New York State Commissioner of Education, sums up the value of such programs:

> The All-Day Neighborhood Schools have succeeded to a large extent in making up for the inadequate home. . . .
>
> They are unique in the educational structure of New York State. Located as they are in particularly overcrowded areas, they have done much to prevent truancy as the first step toward delinquency. . . .
>
> I should like very much to see your program extended and to have similar programs instituted in other large urban centers. You are carrying out a recommendation that has been made by almost every agency dealing with problems of truancy and delinquency for as long as I can remember. . . .
>
> Men live by admiration, hope and love, and children the more so. Without these things we would be lost, all of us.

# Delinquency Prevention Through Revitalizing Parent-Child Relations

By RUTH S. TEFFERTELLER

ABSTRACT: At the Henry Street Settlement, New York City, a project is under way to prevent the contagion of gang activity on younger children by detecting and working with the younger groups while there is still a good chance to influence them. Here we find that one of the most important steps in the corrective process lies in reaching the parents of these children and helping them reassert their own influence and authority. Even the flimsiest of parent-child relationship is a potential source of control, if help is given in time. Through this special project we are attempting to devise programs which place as much emphasis on encouraging parents to express their authority as on the intensive group work being done with the children. One of the most effective tools for achieving this has been through a constant effort to bring the parents of predelinquent gang members together at meetings so that their opinions and group influence can be felt by the children. Another has been through the close, informal relationships developed with individual parents around matters concerning their children and themselves. The partnership between home and Settlement is accepted and recognized by the children and, in most instances, is contributing towards revitalizing parent-child relationships. All combined, this approach seems to be having a positive effect on the behavior of the children in these young groups.

---

*Ruth S. Tefferteller, New York City, is Director of the Pre-Delinquent Gang Project at Henry Street Settlement in New York City. She has been on the staff of Henry Street Settlement since 1946 in various capacities as Children's Division Supervisor, Program Director, and Director of Echo Hill Farm, the Settlement's summer camp for girls.*

JUVENILE delinquency can in large measure be prevented and controlled if it is identified and treated in its incipient stages. Symptoms can be detected long before blatant delinquency erupts in a dramatic way. The breakdown of respect for law and authority by 8 to 13-year-olds in gangs is one of the most obvious indicators of trouble ahead. Cohesiveness and exclusiveness are characteristic of children's groups in the 8 to 13 age range. This is the active period for gravitation into friendship peer groups, where a system of vigorous socialization through childhood society begins to grind and chip away at personality formation. In predelinquent gangs, the group pattern they have chosen to follow is a negative one.

From our recent experience at the Henry Street Settlement, we are convinced one of the ways to check juvenile delinquency in pregang stages is through programs which help these groups achieve status in socially acceptable ways and which reinstate parental and adult control by re-awakening parents' interest in what their children are doing. For two and a half years now we have been engaged in a special juvenile delinquency prevention project with several predelinquent groups. Our greatest emphasis has been placed upon dealing with preadolescent children who, with their companions, are experimenting with predelinquent behavior. Often the parents have no knowledge of their children's actions until the police officer knocks at the door, a neighbor complains, or a Settlement worker visits them. The Pre-Delinquent Gang Project was designed to prevent the development of new gangs in our neighborhood by first detecting the early symptoms of gang behavior in younger groups and then working intensively with them and their parents as groups in order to wean them away from the older gangs' influence. With teen-age gangs steadily on the increase in our neighborhood, it is inevitable that we also have a greater number of younger groups admiring and emulating them.

A settlement house, of course, is in a unique position to detect predelinquent group behavior in its early stages, because its staff see at first hand what goes on in the neighborhood. At Henry Street we have learned much about the evolution of gangs and have seen how well they can perpetuate themselves. Always, as one group grew up, going on into jobs, marriage, or jail, there was a younger one ready to step into their shoes, their reputation, their pattern of behavior, and even assuming the same name.

If the teen gang professes to be defending the block from Puerto Ricans, you can be sure the younger followers will say the same; if the teen gang sees fit to fight "dirty" by having the whole group jump a single opponent, the system of ganging up becomes wholly acceptable to the young admirers. The dynamics of growing up and identifying with heroes, who fire the imagination as well as any television thriller can, are rapidly at work here. Our challenge is to find ways of winning these children back to friendlier ties with adults who can control and redirect them. Young as they are, the group encasement can be a tough thing to break through. Because they are young, we feel we should be able to do this before antisocial patterns become hard and fixed and before familiar adult figures, such as parents, teachers, group workers, in fact the adult community as a whole, lose contact and the chance for wholesome influence.

All of the five predelinquent groups with whom we are presently working came to our attention through their disorganized and defiant behavior in the Settlement House. After voluntarily joining our after school program, they

were disrupting the regular recreation groups, resisting all ordinary attempts to bring them into club activities on the same terms as the other children. They did not reject the Settlement; they attempted to participate in the program. But their group behavior was so disturbed they could not tolerate the mild discipline of having to share facilities with others; of meeting in accordance with a schedule; of listening to adults in charge; of respecting property, supplies, and equipment. They were tightly knit, inseparable, defiant, adventuresome, often destructive, yet always at loose ends, seeking and creating trouble, never able to concentrate on any interests.

In all five groups, despite their great variety, the parents, and the family problems, we are seeing a gradual lessening of predelinquent activity following the assertion and insinuation of parental authority. Calling the parents together at the earliest signs of trouble and as frequently as possible has brought about marked changes in the groups worked with so far. Ganging up on other children, stealing, breaking windows, defying adult authority outside the home, helping teen gangs in street warfare have been noticeably reduced through our efforts to team up with the parents.

## GROUP SOLIDARITY

What these groups continually ask and clamor for is the privilege of having a club of their own, a chance to be a club in an official way, under Settlement auspices. Traditionally, as we all know, we have looked favorably upon such requests and acted accordingly. With these children, however, the approach we use and find successful is to hold up their application until we have a chance to let the parents know more about the group and until we enlist parent action in determining whether or not to sustain them as a group. What we try to make very plain to the children is that their group behavior thus far has been unacceptable and that steps must be taken to be sure the official recognition of them as a club will not contribute towards strengthening them as a gang. Needless to say, they want the club very much, and this waiting period produces a greater desire and an incentive to talk and negotiate with us about what they hope to do when they get their club.

This approach provides us with endless opportunities for stimulating discussion with the children about their predelinquent behavior and how this could impair the success of a club. Children of this age have a capacity for insight into their own behavior and can be helped to recognize the seriousness of what they are doing if approached in a nonthreatening manner. They understand the seriousness of the deprecations of teen-age gangs and, in more confidential moments, will tell us how wrong they know it is, but that they are afraid to withstand the pressures of the older ones upon them. Our approach has been to speak openly and frankly against gang behavior, and, unorthodox as it may sound, we go so far as to even set limits on their choice of club names. If, during the planning, they choose one of the local gang names, we say this will not be acceptable if they intend to be a Settlement Club. If they ask what is wrong in calling themselves "Midget Cyclops" or "Junior Cyclops" (Cyclops being the name of one of our local gangs) we say firmly it is a gang name, it stands for trouble, aggression, fighting, vandalism, stealing, and so on throughout the neighborhood, and this immediately labels them, too, as being identified with delinquency. This, we explain, cannot be tolerated, and the children seem to understand what we mean.

Therefore, as a first step we try to work with the group informally to help

them aspire towards a more constructive type of club with an adult leader, even though we do not allow them the privilege of functioning as a recognized club under Settlement auspices until we get acquainted with their parents. Then, simultaneously, we work to bring the parents into group meetings to help them understand the phenomenon of a natural, self-formed, juvenile antisocial group, and to what kinds of activities this leads. We feel that bringing all the parents together on a group basis affords the beginning of a home and Settlement approach to correct a problem which is basically group centered. We use a great deal of initiative in our meetings with the parents to introduce this problem of predelinquent group behavior and to explain how this differs from the problem of normal mischievous play.

### PARENTAL INTEREST AND AUTHORITY

Parents need help in understanding the difference between a constructive boys' club of the useful variety and one which is fast developing into a young gang. They need sympathy and time to grasp the many subtle symptoms which we describe as indicative of gang development. So often they say their children are well behaved at home and the trouble outside is due to the company they keep. One of the clues for trying the group technique with the parents actually arose from the failure we were experiencing in seeing them one at a time.

From experience we know many of these parents do not join traditional mothers' and fathers' clubs or other social groups on their own, nor do they respond to poster appeals to enroll in parent education courses. But with persistence, friendship and an outgoing approach on our part, we find most will respond to special attention and will team up with other parents on matters concerning their children.

Even the least adequate of the parents whose children are heading for trouble are usually grateful for aid in putting them in touch with other parents who have the same problems. Many are not aware of all that is going on in the street. It is almost inevitable that the majority of the children in these groups come from homes where there is a high preponderance of inadequate parent guidance or broken homes combined with other social and economic pressures. The proportion of problems and weaknesses in family life may differ in each case, but the combination of their circumstances has made the parents unable to deal successfully with their children.

Bringing parents together in groups this way mobilizes adult opinion against juvenile misbehavior. It helps many who are individually timid or defensive to subscribe to a standard and take a more forceful stand in the eyes of their children. Often these are adults who heretofore have not had the strength or interest to be very vocal about juvenile aggression.

One boy's mother admitted she had been tacitly rooting for the local teen gang during a series of gang fights. But since her new and lively association with the Settlement and since the parents' meetings and discussions, she gained more courage to criticize publicly the behavior of several teen-age gang members whom she observed causing disruption in the Settlement building. Out in the street she went after those boys and gave them a sound tongue lashing.

Such expression against bad behavior has not been forthcoming from many of our neighbors. This mother said that when her own boy, aged 12, and several of his companions overheard her, it made a marked impression on them. She could plainly see, she has said on numerous occasions, that when parents take an open stand against gang tactics, it can do much to bring the younger ones into line.

### SETTING LIMITS AND STANDARDS

Our emphasis has not only been on helping the parents understand the phenomenon of negative group control over their individual children, but in encouraging them to work with us in planning the kinds of programs and activities best suited for their children's needs. Parents are first asked whether they want their children to have a club at all or whether they might prefer to break it up. Invariably they answer that it is impossible to do the latter, because the children "cannot be locked in the house. They find each other in the street and it's hard to separate them. Better let them have the club, and we all try to keep an eye on them."

Once a club program is launched with the help of parents, there is a commitment—deeper from some parents than from others, that is a source of strength. Subsequent difficulties or new plans for activity receive attention far more quickly and effectively because the parents, either as a group or individually, are consulted promptly. Control and discipline seem to work much better when the parents themselves, in cooperation with the Settlement, decide on the best plan to follow. Similarly, joint planning and approval of new programs lend importance and prestige to the event at hand. With this age group, parent participation seems wholly acceptable, even in cases where this may be the first time the child has seen his parent come out for a meeting. As one parent expressed it at a joint meeting attended by parents, children, and the Settlement staff:

> We are going to do our best to help you have your club so you won't have to act so tough and show yourselves to be such wise guys. But you kids have to co-operate to show us you can stay out of trouble. If this doesn't work, none of you will be allowed to play with each other any more, because as far as this rough stuff is concerned, that has to stop, no matter what. So here is your chance.

This parent is stronger and more effective than some of the others, but in the group situation the weaker ones interact with the stronger, and learning and reinforcement take place.

The parent group meetings, therefore, are crucial to launching the club program properly, for through these a number of goals are achieved.

Individual parents seem less defensive when discussing the children's behavior on a group basis in concert with other parents. They involve themselves more freely both in acknowledging the existence of a predelinquent group problem and in making concrete suggestions for dealing with it.

The parents' group demonstrates immediately to the children an expression of parental authority and awareness of their wish to have a club. Parents united in the presence of their children establish their authority vividly, and this makes an impression on the children.

It provides an opportunity for parents to meet other parents of the children with whom their youngsters play.

It stimulates parents to think about the necessity of close supervision for 8 to 13 year old children's groups (despite their apparent readiness to do many things on their own) and to plan supervised programs with us.

It places direct responsibility upon the parent for giving permission to the children to have a club with an acceptable club name and the conditions under which it must operate. In other words, it helps to set an expectation level for behavior prescribed by the parents themselves.

It involves the parents in setting time limits upon attendance in the club and the hour the children are expected home.

Interest develops in having us keep in touch with them on a regular basis to give them progress reports on the children and the group.

New opportunities open up for giving social services to the parents themselves, apart from the children. We are having more and more experience with this, as we gain their confidence and as they feel our support in helping them control their children.

It conveys to the parents our interest in working with them, both as parents and as adults, and leads to much more sociability between them and the Settlement.

Lastly, the meetings provide splendid opportunity for expressing not only concern for the children but an acceptance on our part of the parents themselves.

### THE SETTLEMENT WORKER: A GENERIC PRACTITIONER

News that they may have their club is passed along to the children by the parents and is usually received with much cheering and delight. A special worker who is available almost daily is assigned to the group, and the formal club program is launched. Club meetings, trips, athletics, dramatics, camping, fishing, pet collections, and all sorts of special projects become the modus operandi for gaining a foothold with the group. Wider opportunities open up for studying the individuals involved and for learning more about their predelinquent activities. As relationships with children and families deepen through the steady contacts, our influence becomes stronger and more acceptable. All sorts of opportunities develop where social, ethical, and moral values of the group can be affected. It would be too soon to evaluate what basic changes, if any, are taking place with the adults, but we know that at least by gaining parent co-operation the effects of our own investment of leadership work are far greater. Indeed, we have come to feel that without this added dimension of parental involvement, the total result of our professional work would be infinitely less effective.

The active programs with the children, individually and as a group, take up most of the leader's time; but, in addition, he is in and out of the homes constantly—to leave messages concerning the time and place for a trip, to visit a sick boy, to clear up a misunderstanding with a child, to explain a new program or schedule. Often these visits have to do with difficulties arising from poor adjustment to school, settlement, home, or neighborhood and may already involve probation officers and Children's Court. Nothing can go ignored and with children nothing can wait. Individual problems must be followed through with child and parent and anyone else involved, hopefully to the understanding of everybody. These services are in addition to the individual services given by psychiatric case workers in our Mental Hygiene Clinic. As with hardened gangs, a fairly small percentage of these younger children are emotionally disturbed and require psychiatric or other treatment. But the steady, "on-the-spot" guidance to children and parents is given continuously by the Settlement worker.

It is important to mention we are conducting this special group work program within the heart of the regular and normal Settlement House program, which is located within the very community in which these children live. This means trying to effect change within the context of the children's everyday milieu and among other groups where they are known and will continue to live. This, we know, is not easy and is a slow process, but in the long run whatever improvement occurs should be more lasting.

The following case illustration from our recent annual report gives a picture of some of the progress we feel we have made with one very difficult group thus far:

### PROGRESS REPORT: THE RANGERS

"The Rangers vary in age from 11 to early 13. They now have 15 members: 5 Irish, 3 Jewish, 2 Italians, 3 Negroes, 1 Puerto Rican and 1 Polish boy. They live in a low cost Housing Project opposite the Settlement and in tenements on Henry Street, Madison Street and Grand Street. All, except one, have both parents living in the home. The exception is Benny Jones whose father is dead. Two have working mothers: Benny's mother, Mrs. Jones, a widow, is an office worker; Jimmy's mother, Mrs. McCarthy, works as a waitress. The husband is alcoholic and not employable. The working fathers are primarily employed as truck drivers, longshoremen, and factory workers. One father is a salesman; one is a shipping clerk foreman, one is assistant gardner. The number of children in each family ranges from one to eight; total number of persons per family range from two to ten. The average per family is 5.5 people.

"We are still working with The Rangers and can report at this time these children have improved remarkably as a group and as individuals. They were approximately nine to eleven years of age when we first began our intensive approach in 1956 and when they had ten members. Today they number fifteen, and it is most important to point out that the five new ones are positive, well adjusted children. No single development reflects the change of this group from its earlier days as a fighting group to a more normal, constructive club, than the acquisition of new members who are well-controlled, happy youngsters whose parents feel the behavior level and group activities of The Rangers are good enough for their children. Further, the increased membership reflects a good deal of improvement in attitude toward racial minorities compared to the time when these youngsters openly declared they had to be a good fighting club to keep the 'Portos' or 'Spics' off the block. For this they had already been heavily indoctrinated by the local teen gang who were involved in gang warfare with Puerto Ricans.

"Among the five new members they have two Negroes and one Puerto Rican. Wilfredo, the Puerto Rican boy, is a lovely child and is well liked by the others. He comes from a home where supervision and family life are very good and this shows readily in his cooperative attitude and ability to accept authority. Benny, the newest member of the group, is a Negro boy, who enjoys unusual popularity wherever he goes. He is a bright, eager friendly boy, very adequate, and most properly raised by his mother, a widow and office worker. She is interested in everything Benny does and keeps in close touch with his outside interests. Mrs. Jones has warmly endorsed her son's membership in The Rangers.

"In the Settlement House The Rangers are finally on much better terms with the entire staff. They are more relaxed, more co-operative, more patient, and less threatening to other children. They still need daily contact with their leader and a very full play schedule to maintain a level of consistently improved behavior; but they are far more capable of using our facilities constructively and beginning to be increasingly resourceful in developing their own plans and ideas. Their program includes basketball, various other gymnastic activities, games-

room, parties, trips, and special projects. They are a full-fledged basketball team now and busily engaged in playing other teams. Their 'Jack and the Beanstalk' puppet show created a whole series of gratifying experiences for them, and recognition and applause for their performances have been a constant by-product. They have put on shows to raise money for UNICEF, later carrying the $23.76 straight to UN headquarters. They performed at one of our big Christmas parties; the show has been done twice for school assemblies at PS 147 where many of the members attend and are well known to teachers and principal.

"Actually, the group is so full of plans these days the preparation and execution of programs literally take up all of their time. To our knowledge there have been no group fights or ganging up on individual children in over a year. The last time we heard of any incident of this type was last May (1957) when they chased three boys all the way to the other side of Delancy Street to beat them up. The club leader could not find the Rangers that afternoon, but when we finally met a few of them on the street in the early evening, they were ashamed to tell us what had happened. We sensed a feeling of guilt as the boys reported their whereabouts, even though they felt they had a good excuse because 'their basketball had been swiped by those others.' But their obvious display of conscience over 'The chase' was one of the most revealing signs of progress we had noted up to that point. Since that time on many occasions, they have said, "we used to be a fighting club but we hardly do that any more." We think a new system of values and self-awareness has been forming with these youngsters, and they seem definitely to be aligning themselves more and more with socially approved behavior and showing more respect for people and property.

"Our relationship with the parents and families has built successfully over the months and with all of them, except one, we feel partnership in supervising and controlling the children. Contacts with Jimmy McCarthy's family are scarcer and more difficult because the mother works long hours and the father, though at home, is usually drunk. Jimmy has received an enormous amount of individual attention from us, not only because he needs and craves it, but because we discovered he was the negative leader of The Rangers. He has improved a great deal, though more slowly than the others, due largely to the successful relationship with his club leader —a warm, sympathetic, young man who has a good understanding of the boy's needs. Against great odds, the leader is also trying to establish a relationship with the father in the hope we might interest him in a program of rehabilitation.

"There are also more signs of independent thinking and action on the part of the individual members in contrast to the marked loss of individuality noted in the early stages. Ed Sarnoff was promoted to an advanced grade for scholastic achievements and came to tell us at the Settlement before he even reached home! Several boys are engrossed in developing a 'rock and roll' singing group and meet in each other's homes in the evening to practice; the majority became active in the Boy Scout troop at the Settlement House last season and are doing well in this. Joey has been granted the privilege of one evening a week in the teen program because he wanted to join the photography club. Jimmy only recently joined a pottery class with Fred Whaley.

"We are now beginning our third year of work with The Rangers and feel safe in saying that if improvement continues at the rate we have seen it so far, there is every chance the group will not become a teen gang." [1]

### RELATIONSHIPS WITH THE PARENTS

The success of our work to date has depended upon employing intensive leadership for the children, combined with the mobilization of the parents of each group concerning their children's behavior. However, another important result of our close association with the parents is that it puts us in the position of trying to help them with many other family and individual problems.

Parents as well as children become the beneficiaries of this group work approach. For out of the joint experiences created by working firsthand on common problems, they derive not only fresh guidance for better understanding their children, but gain new strength and courage to proceed more confidently on their own, or feel easier about asking for help.

Mrs. Lanos, mother of one of the "Sabres," sought advice freely when she was worried about her status in the Housing Development. She described vividly the anxiety and the tension this produces in family life and what it feels like to live under the constant threat of being uprooted if there is the slightest increase in income over the maximum allowed. She did not know the new housing manager and hesitated to take her particular problem to her.

We interceded to explain this tenant's special problem to the new and socially minded manager. The manager found there had been an error somewhere along the line in that Mrs. Lanos had not even been notified she was officially reinstated and had nothing to worry over at present. When Mrs. Lanos ran into the Settlement that evening, she said she was so happy, she was going to put up new kitchen curtains!

When Mr. Bellio lost his job recently, his boy, a member of the "Hawks," urged him to go to the Settlement to see his leader. The boy took his father's lay-off hard, and that same evening Mr. Bellio came to see us. He had been clerking in a grocery on Madison Street. After four years he was told they could not keep him on. Mr. Bellio considered returning to his old job as a cab driver, but had difficulty in obtaining a permit due to a foot injury. Several steps were taken to help Mr. Bellio get clearance on this so he could have his permit if he wanted it. In addition we phoned for an appointment with an employment placement agency. We also made personal contacts with individual sources where we thought there might be job possibilities. Letters of recommendation were written. Though no jobs were found immediately, this parent got a great deal of comfort in knowing he could count on the Settlement. His boy's behavior had been improving right along; but this recent series of contacts between the father and the Settlement has created new thrusts of progress for us all.

Opportunities such as these for getting closer to the families of these children have been numerous and most fruitful. Each time we work through another problem with the parents, it adds depth and dimension to our work with the children. Certainly it becomes the clearest evidence to the children that the whole family is identified with the Settlement and the specific work with the individual child and the group gets carried further along.

### NEED FOR LOVE AND DISCIPLINE

As close relationships develop between families and the Settlement, and often between families themselves, the erratic,

[1] Ruth S. Tefferteller, "Pre-Delinquent Gang Project"—Annual Report to Henry Street Settlement (March 1958), pp. 6, 7, 8.

confused behavior of their children becomes more stabilized and settled. The children seem to thrive on the attention given them as the immediate adult community attempts to prescribe regularity and order. It would seem that when adults, particularly the parents, close ranks and stand together, the very ground these children travel from home to various parts of the neighborhood becomes more solid. Over and over again as we deal with these particular predelinquent groups, we find them increasingly more relaxed, more co-operative, and more accepting of adult authority. There is evidence of more purpose in the groups, new values in their thinking, and boasts about putting things over on adults begin to be replaced with plans for activities which will give them a good reputation and recognition from their families.

Here, we say, the key to checking predelinquency in preadolescent groups lies in helping to reinstate parental influence where it rightfully belongs and in building stronger bridges between children and their parents and between families and community before it is too late.

> . . . It was a strange thing that up to the age of seven children were noticeable in Catford Street: the babies in their well-kept perambulators and the little boys and girls in coat-and-legging sets were prominent, but after the age of seven the children seemed to disappear into anonymity, to be camouflaged by the stones and bricks they played in; as if they were really the sparrows the Miss Chesneys called them, they led a different life and scarcely anyone noticed them. At fourteen or fifteen they appeared again, the boys as big boys that had become somehow dangerous—or was it that there was too much about them in the papers?—the dirty little girls as smart young women with waved hair, bright coats, the same red nails and lipstick as the dancer in the bus queue; they wore slopping sling-back shoes and had shrill, ostentatious voices. The street prickled with the doings of these boys and girls, as it admired and petted the babies, but the children were unnoticed. . . .[2]

# An Experiment in Police and Social Agency Co-operation

By G. LEWIS PENNER

ABSTRACT: The Englewood Project was an experiment which focused attention on children who as a consequence of apprehension by the police have been identified as vulnerable to a career of delinquency and whose antisocial behavior has not yet progressed to the point of requiring referral to court. Since the police are a vital case-finding source, the Project sought first of all to develop ways of improving police and social agency communication, an essential step in efforts to help these children. It offered casework service to families referred by the police, and it also searched for other community resources to help meet the needs of the children and their families. Among the objectives of the Project were: to learn more about the work and problems of the juvenile officers; to learn more about this group of children—their basic problems and needs, and their home and neighborhood life; to determine what contribution casework can make toward a total community approach to the prevention of delinquency; and to determine the adequacy and availability of existing social service facilities in relation to the problems of these children.

---

*G. Lewis Penner, Chicago, Illinois, has been the Executive Director of the Juvenile Protective Association of Chicago since 1952. From 1934 to 1948 he was associated with the Kansas State Social Welfare Department, both as a County Welfare Director and as a member of the state office staff, with responsibilities for staff development. From 1948 to 1952 he served with the American Red Cross in the Southwest as Home Service Field Consultant. In 1943–46 he was Secretary of the Kansas Council for Children. In 1946 he was President of the Kansas Society for Mental Hygiene. In 1950–51 he was Chairman of the organizing committee for the New Mexico Conference on Social Welfare. He is a Vice President of the Illinois Academy of Criminology, Secretary of the Illinois Child Labor Committee, and member of the Mayor's Advisory Committee on Youth Welfare, Chicago.*

THE interest of the Juvenile Protective Association of Chicago in the prevention of delinquency stems from decades of casework service in behalf of neglected or mistreated children. That the neglected, unwanted, uncared-for child often becomes the delinquent child is, of course, not surprising. Whoever observes at close range the children scarred by indifferent care and destructive parental handling sees additional jeopardy for them since, all too frequently, the community presents a different face to these children from the one it shows to the more fortunate ones. The city to them may consist of a collection of slums. School may be a place where they associate with an out group. Their parents, being themselves socially isolated, may never have used—nor taught their children how to use—the community centers, playgrounds, churches, and cultural facilities which the urban family needs as a pivot for its relationships with other families. They may live in an area of low social protection and prestige; and parental intervention, which normally serves as a foil for police intervention, is ineffective. There is, in whatever form it takes, a sad corollary between home neglect and community neglect.

It is generally accepted that the best time to identify behavior problems among this or any group of children and to offer help is when they are young—long before they have had a brush with the police. The schools do identify a remarkable number of them. But even if treatment resources were adequate, there would still remain some serious problems, since we have no reliable methods for predicting delinquency and there is no certainty that parents with problem children will avail themselves of help. Thus a community takes recourse to a second line of defense, a method of focusing on the teenager who actually has committed a delinquent act.

What is not sufficiently recognized is that police departments deal with thousands of children in what is often one of the most traumatic incidents in their young lives—the runaway girl, the boy caught in his first robbery, the hostile lad who has assaulted another boy in displaced rage against his father. Why not, then, take advantage of a crisis? The Englewood Project was premised in part on the desire to learn how the police incident could be used constructively as a starting point for treatment.

## STRUCTURE AND GOALS

By agreement between the Commissioner of Police and the Executive Director of the Juvenile Protective Association, an experiment was conducted over a three-year period—from August 1954 to August 1957—in the Englewood Police District of Chicago. The agreement stated in part:

> . . . It is considered sound procedure for the treatment agency to be separate from the Police Department, both administratively and in its location. The Juvenile Protective Association will maintain a small office near the police station and will accept referrals from the juvenile officers.[1] . . . The referrals will be from the group of children under seventeen who come to the attention of the juvenile officers for delinquent behavior, and whom the officers do not refer to court. The JPA representative will assist the Englewood district juvenile officers in developing methods of selecting cases for referral to the Juvenile Protective Association. Referrals will be made of children who indicate a need for social service beyond that which the juvenile officers or policewomen can appropriately give. All referrals by the police to the Juvenile Protective Association will be voluntary, and with the knowledge and consent of the family. Referrals will need to be limited to the number which the project staff can handle, either by acting as a channel for Social Service Exchange clearing and referral to other appropriate agencies, or for treatment themselves. The project staff will use casework service in treatment, with an emphasis on the characteristics of protective work—taking the initiative, reaching out to the family, attempting to overcome resistance, and operating more in the role of authority than is ordinarily done by social agencies. . . .

[1] Reference to juvenile officers also includes police women.

The Project followed fairly closely the description of method set forth in the above agreement except in one particular—referral to other treatment agencies. We soon discovered that it was almost impossible to effect such referrals, and the Project staff had to assume responsibility for treatment in nearly all cases.

A financial grant was secured from the Wieboldt Foundation, and a staff was employed consisting of two caseworkers, a half-time supervisor (who also carried some cases), a psychiatric consultant, and a research consultant. In the last year of operation three case readers were also engaged to help in a special study of selected cases.

In order to delineate what the Project should seek to accomplish, three goals were formally adopted:

- To determine the feasibility of police and social agency co-operation in the prevention of delinquency.
- To develop a modus operandi using casework skills in working with voluntary referrals from the police.
- To integrate and focus community resources for the treatment of children with developing patterns of delinquent behavior.

The police district selected for the Project is located about seven miles southwest of the Loop. It had, and still has, nearly the highest delinquency rate in the city. Since 1950 it has undergone a rapid population shift. At that time 10 per cent of its population was Negro. Today one-third of its 150,000 people are Negro. It is a crowded area containing some industry, a once very large but now declining shopping center, and residences which range from middle-class, one-family units to deteriorated slums. It is marked by a dearth of local social service resources. A number of its churches and synagogues, which once served a stable population, have been closed in the last decade because their congregations have moved away.

### *Feasibility of co-operation*

One of the Project's goals was to determine the feasibility of police and social agency co-operation in the prevention of delinquency. Since the Project was the first undertaking in Chicago in which a social agency, by formal plan, was to work on a professional level with a unit of the police department, it was important to examine factors which might act as barriers to communication between the two groups to which this was a new experience.

Both the juvenile officers and the Project workers were aware of the manner in which residuals of guilt and fear or hostility to authority are often stirred up in the public by contact with the police and how these feelings predispose people to expect venality and harsh treatment from the police. Both groups were also equally aware that social workers are often accused of being "ivory towerish" and depreciative of others who, without benefit of social work training, are active in the area of guiding human behavior. The frank recognition of these and other misunderstandings by both Project and police staff clarified the working relationship immeasurably and permitted both

groups to concentrate on their proper objective—the welfare of children in trouble.

One of the objectives of the caseworkers was to learn as much as possible about police work with children, a knowledge which brought with it an appreciation of police work as a specialty in much the same way as they regarded their own job, casework, to be a specialty. A metropolitan juvenile officer works under enormous pressure from sheer number of cases. In this welter of problems the officers attempt to individualize each child and to secure information regarding his home, background, and the circumstances surrounding the offense. Although their choices of disposition are generally limited to an adjustment at the station or referral to court, the responsibility both toward the welfare of the child and toward the community weighs heavily on them.

Referrals to the Project were to consist of the parents of those children whose offenses did not warrant referral to court but who, in the opinion of the police, were vulnerable and likely to get into further difficulty unless given help. To avoid burdening the police with paper work, a simple form supplemented their interviews with the family and their conversations with the Project staff. The following are typical examples:

Sophie Jones[2] (aged 15): "Runaway because she was afraid of punishment. Second time came into station at 1 a.m. and refused to live with mother. Child has been in numerous foster homes past three years. Mother separated from second husband."

Jean Kowalski (aged 12): "Left home 7 a.m. with her younger sister to see the Santa Claus parade. While down there, stole several articles from stores, took sister to friend's home in another neighborhood and stayed all night. Returned home next day and gave no good explanation of thefts or conduct. Seems to be a nervous child, has stolen from her mother on many occasions."

Jules Hilton (aged 16): "Chronic misbehavior outside of his home. Has been involved in numerous scrapes at school and in neighborhood. His uncle says boy is a chronic liar."

A review of all the cases showed that a high proportion of referrals, nine out of ten, had been appropriate.

[2] For obvious reasons all names of clients have been changed.

## THE FIRST SIX CASES

The second goal of the Project was the development of a method of working with families referred by the police. To give a picture of who the client was and what characterized the work, the first six cases referred by the police have been selected for brief review here. They are fairly representative of the types of problems encountered and of typical casework results:

A mother had taken her 15-year-old daughter Helen to the juvenile officer because "she would not obey" and was only interested in boys. This was a superficially conventional but emotionally disturbed family. Helen's impending birth had forced her parents' marriage. Helen's mother without conscious awareness was push-pulling Helen into sexual misbehavior and at the same time striving to force Helen farther up the social and education ladder than Helen could manage. The mother was seen about thirty times by a male worker, and later Helen was seen by a female worker. Some improvement in understanding between mother and daughter was noted. Ultimately Helen married. Although her mother had pushed her into marriage, the initial adjustment was fairly good despite some continued involvement in a hostile-dependent relationship with her mother. After the close of the Project, Helen, who had become pregnant, took the initiative to seek further casework help with a problem of marital discord.

Angeline, age 16, came from a grossly disturbed background. Violence among family members was known to have existed for three generations. For example, a grandmother was an invalid as a result of her husband's having hit her with an ax. Angeline's parents lived together off and on. There were times when the mother was highly restrictive and periods in which she provoked Angeline into stealing, drinking, and sexual misbehavior. The worker was unable to get the mother to focus on any problem. She finally retired voluntarily to a sanitarium. This necessitated a temporary foster home placement for Angeline. There she relaxed and did well. Angeline could not accept placement permanently, however, until after her mother had returned and proved her rejection unmistakably over and over again. By this time a foster home placement was no longer possible, and an eventual private institutional placement, backed up by order of the court, gave Angeline her chance for rehabilitation. Although there was no recurrence of delinquent behavior, Angeline obviously could have profited from a more therapeutically oriented institution than the one in which she finally found haven; the institution was, however, the best available.

Little was known of one boy because his mother refused all contact. The little that was known suggested few positive factors in the family.

Mark, aged 13, apprehended for suspected burglary, lived with his mother and stepfather. His own father had remarried also. Mark was painfully torn in his loyalties, especially when his mother kept using him to act out her anger at his father in court fights for support money, even though the stepfather would have liked to have treated Mark as his own. The casework goal, which was accomplished, was to resolve the mother's conflict in this area, to stop the futile court battles which kept terrifying Mark, and then to promote Mark's constructive identification with his stepfather.

George was a quiet, well-behaved 14 year old who, when caught exploring the glove compartment of a parked car, was carrying some ladies' underwear which he readily admitted stealing from a neighbor. Both parents wanted help for George, which may account for the remarkable progress he made in only fifteen interviews. The father occupied such a shadowy position in the family, compared to the mother, that the boy was having trouble finding out how to grow up to behave like a man himself. Although no one would presume that a neurosis involving fetishism can be resolved so quickly, it can be reported that George's symptoms disappeared, his self-confidence grew, and socially he showed real progress. A review of the material indicates George's future might well be easier had interviews continued over a longer period, especially since George would have liked to continue with them; nevertheless, he did well. The premature termination reflects the staff's early dilemma over the appropriate use of their time as between continued treatment and availability for new referrals.

Martin, a 13 year old boy, had come to the police's attention three times prior to the offense which occasioned referral to the Project. Martin was a compulsive neurotic of clinical proportions. He had a severe facial twitch. He had had no father since infancy. His mother and three older sisters were promiscuous. Martin had had a lifelong war with women, especially with the women in his family and with school

teachers. Our male worker tried vainly to establish a relationship with Martin, who came to the office five times, behaved politely and distantly, and ignored the "Y" membership he had said he wanted. Before we could do more, Martin was in trouble again for cursing a neighbor who had called his mother a prostitute. Released from the detention home, he quickly became involved in several thefts and burglaries. This unhappy boy was too far enmeshed in neurosis and delinquencies for outpatient help. In our recommendation to the court we stated our belief that Martin's only chance of rehabilitation lay in intensive psychotherapy in a controlled setting.

## REACHING THE CLIENT

An implicit assumption of the Project staff had been that the referred families would have little motivation to seek help and that simply to wait for them to appear at the Project office would not be satisfactory. Every effort was made to follow up promptly on the police referral and secure at least one interview. Although the referral focused on the behavior of a teen-age child, the cases repeatedly demonstrated that it was essential to work with the parents as well as the child. In fact, if a choice had to be made, it was in nearly all situations of infinitely more use to the child to engage the parent in treatment rather than to try to work with the child alone. A flexible appointment schedule was a necessity, especially for children, since they showed only a limited regard for time. They were likely to come early, or late, or miss appointments entirely.

The staff learned that "reaching out" to a client did not mean a tireless pursuit of the body, but rather the use of any method of reach him psychologically. It required directness and the ability to deal with resistance immediately—even by telephone if necessary. In the office setting we attempted to convey informality. Supplies of candy were always on hand, as were games and painting material. An object of special fascination was an old dictaphone through which some of the youngsters released a good deal of therapeutically meaningful material. Besides office interviews, the work included home visits, trips to court, baseball games, swimming, or whatever activity was indicated. In spite of explanations, clients feared that the Project was an extension of the police, and only experience convinced them that this was a voluntary and confidential process.

A total of 218 different children from 204 families were referred for service to the Project. Of these, 79 per cent were boys and 21 per cent girls; 59 per cent were Negro, 37 per cent white, and 4 per cent Mexican, Puerto Rican, and unknown. This distribution was similar to that of the total number of children seen by the police. About two-thirds of the children were between 12 and 15 years of age. The median for boys was 13½ years, and for girls it was 14 years, 2 months. More than half the children, 56 per cent, were retarded one or more years in school; nearly 41 per cent were in the appropriate grade for their age; and 1 per cent were in an advanced grade.

It certainly had not been expected that every family to whom the Project had been recommended by the police would use its services. Actually, 17 of the 204 families refused referral at the police station, and another 16 were found to be active with another agency—in most cases the Family Court. No effort was made to get in touch with them. Another 22 expressed acceptance of the referral but evaded all efforts by the Project to secure an interview. Contact was made with the remaining 149 families.

## STUDY OF SIXTY-SIX CASES

Sixty-six families out of these 149 were randomly selected for analysis of findings. The referral complaints for these sixty-six cases indicated that 52 per cent were classified as relating to property, 25 per cent to self, and 23 per cent to person. For the most part, complaints relating to "property" dealt with stealing—purse snatching, shoplifting, burglary, bicycle theft—or vandalism. Complaints which were classified as "self" dealt principally with runaways, truancy, curfew violation, incorrigibility, and a few incidents of exposure. The category of "person" was used for those complaints which indicated that there had been a physical abuse of another individual—fighting, assault, threatening a girl with a knife because she refused to be kissed.

The referral complaints ran the full gamut of behavior characteristic of children who get into difficulty. The fact that nothing more serious was reported was an artifact of the Project design. More serious offenses—as well as certain specific offenses like automobile theft or "rumbles"—were handled by the Family Court and thus were not referred to the Project.

The majority of children, almost two out of three, were not living with both their natural parents. This suggests the extent of psychological and social disruption which these children must have already experienced in their lives. The fact that a child lives with his natural parents does not insure him against psychological and social traumas. However, a child whose natural parents have been divorced, separated, committed to a state mental hospital, have deserted or died certainly has experienced a blow that probably affects his psychosocial development. All such children have problems, although they do not all manifest themselves in the form of antisocial or delinquent behavior. The recovery and further development of the child are related to his subsequent home life experiences. If a new stable home life is established in which the child's needs are met, there is every hope for normal growth and development. However, the vast majority of the families in this study never were able to establish a stable household after the initial breakdown. Furthermore, the low economic level of many of these families made it necessary for the mother to work on a full-time or part-time basis.

The basic problem for one-third of the families was economic and social. They simply had insufficient income to provide a decent minimal standard of living. These families were crowded into deteriorated tenements with inadequate sanitary and sleeping facilities and dangerous heating equipment.

In about half the families the problems were basically psychological in nature. In a third of these cases the parents themselves were psychologically inadequate; in another third the parents did not know how to rear children; and in the remainder the children were very much disturbed emotionally. The psychologically inadequate parents in this group were people who themselves were overwhelmed with problems, and whose energies were concentrated on maintaining themselves. These were parents who were infantile, extremely neurotic, psychotic, feeble-minded, or culturally maladjusted. They had nothing to give their children, and they themselves needed intensive clinical help. Treatment of their delinquent teen-agers often required placement away from home.

For the parents who were adequate psychologically, it was the developing adolescence of their children that had

created many problems with which they could not cope. They needed help in understanding and dealing with their growing children and in handling problems of discipline; they needed to know how to set limits, encourage healthy relationships with other children, and support their children emotionally when needed.

The eight children who were considered seriously disturbed displayed such behavior as running away repeatedly, violent fighting, retardation in school, stealing at home and in the community, fire setting, and incorrigibility. One child was epileptic, another used broken bottles to gash people, and all did poorly in school and played truant often.

Only about a tenth of the families showed no serious problems. For another tenth our contact was too brief to assess the existence of a specific problem.

The fact that nine families were without serious problems should not be surprising. Even children of adequate families get into trouble. Environmental factors in the community are recognized as strong motivating forces for good or bad. It is important to note, too, that five of the nine children whose families had no serious problems were not guilty of doing anything that warranted their being referred to the Project. The remaining four children in this group were accused of curfew violations, attempting to steal a wagon, damaging property by rolling stones, and—in the case of one boy—defending himself in a fight. These are acts in which every child is likely to be engaged. They have meaning only if coupled with other behavior or if measured against parental capacity to give guidance.

## FINDINGS

The Project was not a controlled research experiment but rather an exploration in a relatively new area with conventional casework skills. Since the staff was small and the undertaking was to cover a relatively brief period of time, it was decided at the outset not to attempt a scientific measurement of movement during treatment. Comparison with a control group was also ruled out for the same and other even more compelling reasons. It would have been impossible to isolate a control group with sufficient similarity of internal factors to give it validity. However, on the basis of internal evidence presented by the cases, the entire staff—caseworkers, case readers, and psychiatric consultant—concurred that a significant number of children and their families had been helped and that a voluntary agency can engage families referred by the police in a casework relationship. Out of 204 families referred, contact was made with 149 families; in about one-half of these (70 families) service went beyond the point of the intake study to varying degrees of successful treatment.

Police and social agency co-operation, a basic essential in a community's program for the prevention of delinquency, was found to be eminently feasible. Confidential interviews conducted with nine juvenile officers confirmed their appreciation of a treatment resource such as the Project. The people served could not, as a group, be described as "hard core" cases who have exhausted all the community's resources. They were, for the most part, a left out group of socially isolated, shy, discouraged and self-depreciating families whose response covered the spectrum of attitudes from complete resistance to grateful acceptance of help offered. Location of the office in the area where the client lives was amply justified. It accounted for the high proportion of office interviews.

Experience showed that the small size of the staff imposed severe limits on the

Project. It also revealed that a high degree of skill is imperative and that a treatment unit working with police referrals needs experienced as well as trained personnel. The Project also demonstrated that, for a variety of reasons, referral to other agencies is a wasteful process, often harmful to clients. In those cases where agencies accepted the referral, the client often could not sustain the impact of the transfer. A unit like the Englewood Project must be prepared to take responsibility for the treatment of its clients. The caseloads contained a number of families depending on public assistance and gave grim evidence of the extent to which the continuous grind of extreme poverty corrodes family morale when budgets are unrealistically restrictive.

Lastly, the Project revealed that a good many children prone to delinquency cannot be helped in their homes but can be helped if placed in residential treatment centers. These are the children whose parents, by devious methods, actually push them into delinquency, although they may be quite unaware that they are doing so.[3]

## RECOMMENDATIONS

Pursuant to the Project our agency made two specific recommendations.

One was the establishment of treatment centers. The family service and child guidance agencies of our city are presently taxed beyond their capacity by clients who are asking for their help. These agencies, without considerable expansion, are not in a position to seek out the youngster who is beginning to act antisocially. They are, of course, reaching a good many vulnerable children; but the combination of factors that motivates one family to seek out an agency and another to refrain from doing so bears little relationship to the delinquency potential of the child or to his treatability. The Englewood experiment clearly points up a need to establish treatment centers in the high delinquency areas of our city with the express purpose of accepting from the police and the schools referrals of families in which children are becoming behavior problems. Both the police and schools that find these cases must have a resource other than the court.

Since the centers would usually deal with more than surface problems, it is imperative that they be staffed by trained, experienced caseworkers. Provision for psychiatric consultation is of equal importance. Each center should have at least six workers, predominantly male, because they would be dealing mainly with male adolescents. The centers might well be staffed to provide both casework and street club work.

The location of these centers within the area to be served is vital. It is immeasurably simpler for both parents and children to visit a nearby office, and it is less threatening. For the staff, it enhances home visiting and co-operative work with other local institutions.

It is specifically recommended that six such centers be established by the city, to operate for a five-year period under close professional evaluation by a competent citizens committee. As they demonstrate their worth, the service should be expanded to other areas of Chicago.

The second recommendation was the expansion and strengthening of the Police Juvenile Bureau. The very presence of a juvenile officer in a neighborhood is a deterrent to juvenile misbehavior. The Juvenile Bureau of the Chicago Police Department should be greatly expanded and strengthened through in-service training. Further-

[3] See also Juvenile Protective Association of Chicago (816 South Halsted St., Chicago), *Report on the Englewood Project* (1958).

more, the organizational structure should be such as to permit the juvenile officer to make a career out of his job.

Intensive in-service training should be provided because the officers deal with children and parents in critical and emotionally charged situations. The manner in which this is handled may leave a lasting impression on the child. An officer who feels secure in his knowledge of procedure and law, who has some theoretical acquaintance with the psychological and social problems of youth, who knows something about the art of interviewing, and who is acquainted with the resources of the city, will, of course, find his work more gratifying and constructive. The police department has already taken some steps in this direction. These steps should be accelerated.

# A Follow-up Report on the Cambridge-Somerville Youth Study

By JOAN AND WILLIAM MCCORD

ABSTRACT: The Cambridge-Somerville Youth Study was founded in 1935 with the double purpose of preventing delinquency and providing research in the area of delinquency prevention. 325 boys were selected to receive preventive treatment, and a carefully matched group of 325 boys were provided as a control group. The treatment program utilized many of the practices prevalent in welfare work: family guidance, medical and academic assistance, co-ordination of community agencies, and supplementary entertainment for the boys. This article traces into adulthood the lives of 253 of the "treatment" boys and their 253 matched mates in the control group. Although the boys were counseled for an average of five years, whatever benefits they may have received were not reflected in their criminal rates: As many treated boys as control boys had been convicted of crimes; they had committed approximately equal numbers of crimes and did not differ significantly in the ages when such crimes were committed. Nevertheless, evidence gleaned from this program suggests that early treatment and intensive contact with the boy may be an effective means toward crime prevention.

*William McCord, Ph.D., is Assistant Professor of Sociology and Assistant Dean of Humanities and Sciences at Stanford University. Dr. McCord was formerly Instructor, Social Psychology and General Education at Harvard University.*

ONE of the most extensive attempts to prevent delinquency and crime was the famous Cambridge-Somerville Youth Study. Founded in 1935 by Richard Clark Cabot, a physician and social philosopher on the faculty of Harvard University, the project aimed at decreasing delinquency in two densely populated, factory dominated cities, Cambridge and Somerville, Massachusetts.

With the aid of a $500,000 grant, Dr. Cabot established a center for the project. After careful interviews, the staff selected subjects from among hundreds of boys referred by schools, welfare agencies, police, and churches as difficult children or as ones who were average in behavior and personality. Each boy was given medical and psychological examinations. Social workers consulted the families and reported on their homes. On the basis of this information, each boy was matched to another as closely similar in background and in personality as was possible. One in each pair was then selected, by toss of a coin, to receive the services of the Youth Study. Thus 325 boys were to be given friendly, regular attention from counselors, as well as whatever medical and educational service seemed needed. A matched set of 325 boys, a control group, was to be left to the usual services of the community.[1]

Beginning in 1939, for an average of five years, the "treatment boys" were given assistance ranging from academic tutoring to psychological counseling. The intensity and calibre of treatment varied from counselor to counselor and boy to boy. In some cases, as Dr. Cabot had hoped, treatment involved an intimate friendship between boy and counselor. In most cases, however, the treatment relationship was less close. Treatment had many aspects: talks between the boys and counselors, trips and other recreation for the children, and medical aid whenever it was required. In addition, many counselors, focusing on school problems, tutored their boys in reading and arithmetic. Others acted primarily as co-ordinators for welfare and family agencies, the YMCA, and summer camps. Large numbers of boys were encouraged to participate in shop classes or informal games at the project's center. Religion formed an important part of the treatment: Boys and their families were encouraged to attend church, and ministers and priests were alerted to their problems. Police departments, particularly the juvenile bureaus, kept in close touch with the project. Counselors often visited the boys' families to offer advice and general support.

The Cambridge-Somerville Youth Study differed from most social agencies in three ways: Its subjects were selected by the staff and were therefore, in a sense, "drafted" into the project. It tried to maintain contact with the boys and their families until the boys were about seventeen instead of "closing" cases after shorter treatment. Most importantly, it incorporated a control group of boys who could later be examined in an objective assessment of the effectiveness of the treatment program.

The first attempt to measure effectiveness was carried out while the program was in progress. Psychological tests, checks on school adjustment, and a review of court records failed to uncover significant differences between the treatment and the control groups.

In 1948, almost three years after the project had ended treatment, a second assessment was made by Edwin Powers, the project's Director, and Helen Witmer, a social scientist. At that time it was found that, according to juvenile court and criminal records, the treatment group had committed as many and approximately as serious offenses as had the control group. Dr. Witmer's ratings of the terminal adjustment of the boys also indicated few differences between the treatment and control groups. Since the conclusions of Powers and Witmer are fully presented in *An Experiment in the Prevention of Delinquency*,[2] we will not attempt to duplicate their report.

In 1956 the authors of this article received a grant from the Cabot Foundation to trace the lives of these boys now that they had reached manhood. We dropped from our study those who had died or who had received very little treatment; also, of course, we dropped their matched mates from the control group. We then secured criminal records for the remaining boys who had passed through Massachusetts or Federal courts. By 1948, 90 per cent of a random sample of 200 boys from the study were still living in the Boston area.

We had decided that the presence or absence of criminal behavior would be our criterion of success in treatment and that criminality would be determined through official court convictions. Objections can be made both to the criterion of success and to the method by which we measured it. We might, for example, have attempted to gauge the general mental health, adjustment, or character of the men. Yet since the major avowed aim of the project was the prevention of crime—and since other standards of success seemed relatively difficult to define or measure—we concluded that criminality should be the yardstick of success.

We recognize, of course, the many defects of official criminal records as a standard of criminality. An earlier study made by the Cambridge-Somerville staff revealed that many delinquent acts known to the counselors had gone undetected by the police. Admittedly, official records are incomplete and, in some cases, may reflect a variety of community biases. Nevertheless, no satisfactory substitute has yet been developed. Moreover, we believe that a confirmed criminal is unlikely to pass through the first thirty years of his life without being apprehended at least once. Furthermore, most of our subjects emerged from deteriorated neighborhoods; therefore the usual middle-class biases in court convictions would be equally applicable to all the boys. Thus, for a variety of reasons, court convictions appeared to be the most practical, objective standard of crime.[3]

The final group used for this assessment of treatment was made up of 506 men predominantly from lower-class and lower-middle-class backgrounds. Approximately half of these men, divided equally between the treatment and the control group, had been considered predelinquent. Their median I.Q. in child

[1] See Edwin Powers and Helen Witmer, *An Experiment in the Prevention of Delinquency* (New York: Columbia University Press, 1950) for a detailed discussion of the original selection and the treatment of the subjects.

[2] *Ibid.*

[3] Social scientists have attempted to measure criminality through self-reports. Sheldon and Eleanor Glueck, in *500 Criminal Careers* (New York: Alfred A. Knopf, 1930), reported interviews with criminals whom they had questioned on undetected crimes they had committed. A number of the subjects admitted additional crimes. Yet, using this method one is unable to dissociate bragging or dishonesty from the truth. Ivan Nye, more recently, in *Family Relationships and Delinquency* (New York: John Wiley, 1958), used a questionnaire administered to a group of high school students as a measure of crime. Yet Nye validated the "reported behavior" questionnaire by showing that it differentiated between incarcerated delinquents and non-institutionalized high school students—the standard which he attempted to eschew. (Incidentally, the questionnaire failed to tab as delinquent 14 per cent of the incarcerated subjects.)

hood was 98; their median age, when treatment began, was 11.

## COMPARISON OF TREATMENT GROUP AND CONTROL GROUP

When we compared the court records of the boys who had received treatment with those of the control group, we found that a slightly greater number of treatment boys had been convicted for at least one crime,[4] although their number of convictions was slightly lower. Neither of these differences, however, is statistically significant.

| | Number of Boys Convicted | Number of Convictions |
|---|---|---|
| Treatment group | 107 | 315 |
| Control group | 95 | 344 |

Both Professor Gordon Allport, in his foreword, and Edwin Powers had expressed the hope that the treatment boys would evidence better adjustment as they matured.[5] To check this possibility, we grouped the boys according to the age at which they committed crimes. We found that a slightly larger number of treatment boys had criminal records in each of three groups: those convicted only as juveniles, those convicted only after "maturation," and those convicted as both juvenile and as adult criminals. These differences, too, were not statistically significant.

| Age of Criminality | Number of Boys Convicted: Treatment Group | Control Group |
|---|---|---|
| Under 18 only | 34 | 29 |
| 18 or older only | 35 | 32 |
| Under and over 18 | 35 | 34 |

Nor was there a significant difference in the number of crimes committed during either the juvenile or the adult period.

[4] Twenty-seven treatment boys and 35 control boys had records only for traffic offenses. We did not consider these boys as criminal.

[5] Powers and Witmer, *op. cit.* (note 1 *supra*).

| Age of Boy | Number of Convictions: Treatment Group | Control Group |
|---|---|---|
| Under 18 | 152 | 157 |
| 18 and over | 163 | 186 |

Thus again we had failed to uncover evidence that the treatment had successfully deterred criminality.[6] We looked in another direction for such evidence. Although the treatment and control groups had been carefully matched before treatment began, we knew that much had been discovered since the 1930's about the causes of crime.[7] To control against erroneous matching, we held constant the affectional attitudes of the parents, their techniques of discipline, and the neighborhoods in which the subjects had been reared.[8] Nevertheless, we found no statistically significant differences in favor of the treatment group. Nor did we find differences in favor of the treatment group when we held constant the intelligence and the personalities of the boys.

[6] Another criterion of the effect of treatment could be commitment to reform schools, jails, and prisons. A number of biases affect whether a delinquent will go to an institution (judges sometimes consider the home situation or appearance in court). Consequently, we believe that incarceration is less satisfactory than conviction as a standard of criminality. However, the reader may be interested in this aspect of the analysis: Equal proportions of boys from the treatment and control groups were sent to reform schools and equally high proportions, upon release, were convicted for further crimes. Yet only half as many men from the treatment as from the control group were committed to jails and prisons ($X^2$ 5.7; $P < .02$). A number of possible interpretations of this finding are discussed in *Origins of Crime* (New York: Columbia University Press, 1959).

[7] See, for example, Sheldon and Eleanor T. Glueck, *Unraveling Juvenile Delinquency* (Cambridge, Mass.: Harvard University Press, 1950).

[8] See William and Joan McCord, in collaboration with Irving Kenneth Zola, *Origins of Crime* (New York: Columbia University Press, 1959) for a complete description of this analysis.

result of these various analyses, re forced to conclude that the ent program, considered in its , had been ineffectual as a preve of crime.

## OMPARISON OF VARIATIONS IN TREATMENT

mparison of treatment and conoups failed to indicate that the nt, in general, had been bene- One possibility suggested itself haps being responsible for the During World War II, many ors had joined the armed forces, turnover in counselors had been . We thought these changes ccount for the over-all failure of nt. Yet when we compared l rates—per cent convicted of —we found that they did not ntly reflect this factor.

| R OF LORS | | Per Cent Convicted of Crimes |
|---|---|---|
| | (N: 72) | 43 |
| | (N: 88) | 30 |
| | (N: 47) | 53 |
| n three | (N: 46) | 48 |

te changes in counselors, the nselor could be expected to have of influence unmatched by his rs. One of the results of the in counselors was that few boys ed their relationships with their nselors for an extended period

We anticipated that the duratreatment by the first counselor nfluence criminal rates. Again, d no confirmation for this view.

| H OF ENT BY UNSELOR | | Per Cent Convicted of Crimes |
|---|---|---|
| two years | (N: 38) | 47 |
| | (N: 134) | 39 |
| 3 years | (N: 81) | 42 |

neither the number of counor the length of treatment by counselor seemed to be respon- the apparent failure of treatment in preventing criminality, we next considered the total duration of treatment. One could argue that programs utilizing the tactics of the Cambridge-Somerville Youth Study must operate over extended periods of time. Length of treatment, to a considerable extent, reflected the staff's estimate of the seriousness of a case. Yet we found no support for the belief that lengthy treatment decreased criminality.

| Total Length of Treatment | | Per Cent Convicted of Crimes |
|---|---|---|
| Less than 4 years | (N: 82) | 35 |
| 4–6 years | (N: 65) | 29 |
| More than 6 years | (N: 106) | 53 |

In addition to variations in the duration of treatment, there was, of course, wide variation in the intensity of treatment. In almost every case, counselors devoted close attention to family problems. Nevertheless, there were considerable differences in the amount of interaction they had with the boys themselves. Using six months as the minimum time span, we divided the boys according to the greatest intensity of contact they had with any counselor.

| Greatest Intensity of Contact | | Per Cent Convicted of Crimes |
|---|---|---|
| Once a week | (N: 32) | 25 |
| Once in two weeks | (N: 84) | 51 |
| Once a month | (N: 47) | 43 |
| Less than once a month | (N: 82) | 33 |

If we assume that cases considered most serious were seen at least once in two weeks, then the comparison between the group seen every two weeks and those seen every week (for a minimum of six months) gives a measure of the efficacy of intensive treatment. When the criminal rates for these two groups are compared, we find that those seen every week had a significantly smaller incidence of criminality ($X^2$ 6.4; $P < .02$). This finding suggests that frequent contact between a boy and an adult counselor may deter criminality

and that sporadic contact has little effect.

Besides reflecting the intensity of treatment, the effectiveness of treatment was found to be related to the age of the boys when they first became participants in the program ($X^2$ 18.9; d.f. 4; $P < .001$).

| Age on Nearest Birthday | | Per Cent Convicted of Crimes |
|---|---|---|
| 5–8 | (N: 39) | 26 |
| 9 | (N: 35) | 29 |
| 10 | (N: 47) | 66 |
| 11 | (N: 56) | 45 |
| 12–13 | (N: 76) | 37 |

Clearly, early treatment appeared to have been most beneficial; possibly, the drop in crime rate for older boys—over 10 years old—was due to the fact that a higher proportion continued to have guidance through the difficult adolescent period.

We hypothesized that the sex of the counselors, too, might make a difference in the effectiveness of treatment. One might assume, on the one hand, that female counselors would best satisfy a rejected child's desire for maternal care —or, on the other hand, that male counselors would be most effective for they would furnish a masculine model for the boy. To check the relationship between the sex of the first counselor and treatment, we held the boy's age constant.

| | Sex of First Counselor | | | |
|---|---|---|---|---|
| | Female | | Male | |
| Age of Boy | | Per Cent Convicted | | Per Cent Convicted |
| 5–9 | (N: 42) | 29 | (N: 32) | 25 |
| 10 | (N: 6) | 67 | (N: 41) | 66 |
| 11–13 | (N: 48) | 29 | (N: 84) | 46 |

The group of boys in the 11- to 13-year age group who had female counselors had a significantly lower crime rate than did those guided by male first counselors ($X^2$ 3.9; $P < .05$). This may be a reflection of independent variables which we were unable to measure, but it appears that female guidance may be more valuable than male guidance for adolescent boys. On the other hand, the very young boy seems to respond equally to male and female counseling. These findings would seem to recommend a reversal in programs which leave adolescent guidance to men and frequently discourage the treatment of very young children by males.

In summary, these comparisons point again to the general ineffectiveness of those forms of counseling which consisted in family assistance plus infrequent interaction with the boy. The analyses suggest, however, that frequent contact with the child—particularly if begun when the child is under 10 or by a female after the boy has reached adolescence—may effectively prevent criminality.

## A Controlled Test of Intensive Treatment

One of the greatest difficulties in testing the effects of treatment is the large number of independent factors which may be responsible for variations in results. Having discovered that intensive contact seemed beneficial while the more common "general guidance" approach seemed useless in crime prevention, we sought a controlled test of "the best" treatment offered by the Cambridge-Somerville Youth Study.

Selecting cases which had received the most "intensive" therapy proved to be a rather tangled problem for standards of "good treatment" vary widely. Since the experiment had been initiated by Dr. Cabot, we decided to use his criteria as a basis for the assessment.

In almost every case, as we have noted, counselors worked with the families of their boys. Similarly, there was widespread attention paid to educational and medical handicaps of the boys. Naturally, "good treatment" involved the counselor's alertness to the needs of the family and acceptance by them.

In addition, we established four criteria for judging which boys had undergone the most intensive therapy—standards with which, we believe, Dr. Cabot would have agreed.

First, a counselor had to maintain a relationship with the child for an absolute minimum of two years.

Second, the counselor had to visit the child an average of once a week throughout the two year period.

Third, the counselor had to have a close relationship with the child. Only if the boy volunteered statements which seemed to indicate his regard and respect for the counselor did we judge their bond as an intimate one.

Fourth, the discussions between the boy and his counselor had, at some point, to touch on the child's basic personality problems: his relation with his parents; his sexual feelings; his attitudes toward authority and his peers; or his feelings of guilt, anxiety, aggression.

After combing the case records, we found, unfortunately, that only twelve cases satisfied these requirements. These boys were some of the most potentially delinquent cases in the project; they had been subjected to a variety of influences which research has shown to be productive of crime. In order to test the effects of treatment on this group, we needed to hold constant those factors which might have some influence on crime but were not directly related to treatment. Therefore each of the twelve boys who received intensive treatment was matched individually to another boy from the treatment group. We matched treated boy to treated boy because information on this group was so much more complete than on the control boys.

Each pair was equated on eight factors: the mother's attitude toward her son, the father's attitude toward his son, the child's personality, method of parental discipline, general home atmosphere, neighborhood, intelligence, and the delinquency prognosis score which had been assigned at the beginning of the experiment.

We were able to find boys who, on these factors, closely resembled the twelve boys who had received the Cambridge-Somerville project's most intensive care.[9] The mothers and the fathers of every pair resembled each other in their attitudes toward their sons. Each pair of boys was of the same general personality type. Except for one set, the pairs matched in terms of the parental discipline which they had received. Eleven of the twelve pairs had similar home atmosphere. Only one set differed by more than a single rating point in neighborhood. Using the Stanford-Binet intelligence scores, we were able to match the boys (within five points) in eight of the twelve pairs. Eight of the twelve pairs had been given a delinquency prognosis within one point on an eleven-point scale.

When we had finished this matching, two groups of remarkably similar boys could be compared with each other. One set of boys had received, for at least two years, the very best attention which the project offered; the other set received the less intensive, and, as we have seen, largely inadequate services of the program.

The results of the comparison are suggestive: While six of the boys who received the most intensive treatment committed at least one crime, eleven of their matched comrades became criminal ($X^2$ 3.9; $P < .05$).

Unfortunately, only a handful of boys underwent the intensive treatment. The small number of cases makes generalization difficult. Nevertheless, the results

[9] When difficulties occurred in the matching, we used a "preference" table which gave greater importance to those factors which research had shown to be the most important in delinquency causation. Naturally the matching was done without knowledge of the court records of any of the boys.

seem to indicate that intimate, long-term, "supportive" counseling may help to prevent criminality.

## SUMMARY

Three forms of analyses were used to check the efficacy of the Cambridge-Somerville Youth Study in preventing crime. In the first form, we compared 253 boys who had received treatment with 253 boys, carefully matched in personality and family background, who had received no special treatment. In this comparison, we found that the general program—consisting in guidance for the family, medical and academic assistance for the boys, co-ordination of community agencies, and supplementary entertainment of the boys—had been no more effective in crime prevention than other community services: Approximately equal numbers of treated boys and control boys had committed approximately equal numbers of crimes in childhood and adulthood.

In the second form of analysis, we concentrated upon variations within the treatment group. Negatively, we found that neither the change in counselors nor the length of treatment—which, for many boys, was shorter than had been planned—could be held responsible for the failure. On the other hand, we found evidence that the program might have been more successful had a greater number of boys been seen at least once a week by their counselors and had treatment been started during the first decade of the boys' lives. In addition, we found that male counselors were apparently as effective as female counselors with very young boys, although they were less effective with adolescents.

As a final method for assessing the project, we focused upon twelve boys who had received intensive treatment. We matched each of these twelve boys to another who had similar parents, personality, discipline, home atmosphere, and intelligence, yet had received no intensive treatment. We concluded from this closely controlled comparison that intimate, long-term, "supportive" counseling may prevent crime.

Thus, using the standard of "official" criminal behavior, we must conclude that the Cambridge-Somerville Youth Study was largely a failure. Some individuals undoubtedly benefited from the program; but the group, as a whole, did not. Yet even in its failure, the program must be regarded as a magnificent experiment, for its provision of a control group and its careful attention to research have produced a fund of information invaluable to future studies of the causation and prevention of crime.

# Preventive Work With Street-Corner Groups: Boston Delinquency Project

By WALTER B. MILLER

ABSTRACT: The corner-group method of attempting to prevent "gang" delinquency is in fairly wide use, but little substantial evidence as to its effectiveness is available. Research on the impact of the Boston Delinquency Project on law-violating behavior of adolescent corner groups utilized four major indexes to behavior change to "test" effectiveness. Preliminary findings indicate that worker activity resulted in a demonstrable impact on law-violating behavior of group members, involving an over-all reduction in incidence, with sharpest decreases during initial phases and increases during later phases; that correctional department commitment rates for residents of the Project area compared favorably with those of an immediately adjacent area and the state as a whole; that worker action resulted in different degrees of impact on different behavioral areas within the general pattern of group behavior; and that changes were effected in patterns of intergroup relationships both within the local community and among established youth-concerned organizations. Project termination produced locally supported plans for continuation which were not implemented on higher institutional levels. While the Project achieved limited but definite success in its major goal of inhibiting community delinquency, its "true" potential was not adequately tested because of factors hampering efficient execution of planned procedures.

---

*Walter B. Miller, Ph.D., Cambridge, Massachusetts, is Director of the Research Program of the Boston Delinquency Project. He worked with the Fox Indian Applied Anthropology Project between 1948 and 1952, making a study of Fox Political Organization. Between 1953 and 1955, he was affiliated with the Harvard School of Public Health, collaborating with Dr. Benjamin D. Paul in editing Health, Culture, and Community, a case book in public health practice. He has published articles in the areas of political organization, American culture, and juvenile delinquency. He is currently on the faculty of the Graduate School of Education at Harvard University and is also associated with Boston University and Simmons College.*

THIS paper will report, in highly condensed and preliminary form, selected findings of research designed to assess the effectiveness of the corner-group-worker program of the Boston Delinquency Project, a privately financed demonstration project that functioned from 1954 to 1957.[1] A brief description of the Project's service and research procedures will be followed by data on four indexes of induced behavior change and a summary of the over-all impact of the Project's corner-group operations on law-violating behavior.

## OPERATING PHILOSOPHY AND SERVICE PROCEDURES

The operating methods of any project which aims to bring about changes in human behavior must derive from some set of conceptions as to what motivates behavior, even though such basic assumptions frequently remain implicit and unsystematized. The theoretical concepts of the Boston Project's corner-group work may be summarized in highly condensed form as follows.[2] During the age period from 12 to 19, the dominant set of influences on the behavior of members of lower-class adolescent groups derive from the group's conception of prestige-conferring behavior and valued objectives. At this age, intrafamily relations and standards of behavior set by parents have relatively little direct influence on the adolescent's day-to-day behavior. These factors, however, may have played a role in his becoming a corner-group member.

On the basis of this concept, the Project took as its principal target of change the value system of the group itself. The primary device for altering collective values consisted of the introduction or facilitation of changes in the form of group organization. Such changes in form—generally involving the restructuring of the corner group into a formally organized club—are initially perceived by group members in terms of simple facilitation of immediately desired ends: getting club jackets with money raised by putting on a dance. In time, however, the development of greater organizational formalization becomes an increasingly effective instrument for altering the bases of intragroup status and group status vis-à-vis the community. Effective co-ordination of joint enterprises requires the imposition of internal sanctions on "disruptive" behavior, and organized groups must maintain a "rep" for law-abiding behavior to facilitate necessary interaction with law-abiding community groups.

The process of inducing changes in the value configuration of the group is predicated on the existence of substantial support for the maintenance of law-abiding behavior within the value system of the lower-class community itself. Hence, shifting the group's values from an emphasis on law-violating behavior as a basis of prestige to an emphasis on law-abiding behavior entails increasing the availability of law-abiding avenues to valued ends already present in the group's own cultural milieu. The method thus aims to affect individual behavior by altering the value configuration of the group that exerts most immediate influence on external behavior. It does not aim directly at bringing about lasting changes in intrapsychic dynamics, although a measure of personality change may be a by-product of changes in group functioning.

[1] The service program was instituted and financed by the Greater Boston Council for Youth, a committee composed of representatives of Boston's major youth agencies and affiliated with United Community Services of Metropolitan Boston.

[2] See also David Austin (Service Program Director, 1954–56), "Goals for Gang Workers," *Social Work*, Vol. 2, No. 4 (October, 1957), pp. 43–50, and Walter Miller, "A Treatment Approach to 'Conforming' Delinquency"; paper presented at American Psychological Association Meetings, August, 1957.

The Boston Delinquency Project carried out its corner-group work during a three-year period. During this time seven workers, two women and five men, worked intensively with seven group units and less intensively with seven others. All workers but one had a master's degree in social work; they ranged in age from 25 to 45. In most cases, a worker devoted major attention to a single group unit; in several instances, to two units. The social class status of workers ranged from upper-lower to lower-upper; median status was lower-middle.

The corner groups represented, for the most part, subdivisions of established "gangs." All "hung out" within the same section of Boston—three neighborhoods (30,000 population) of a larger district (112,000 population). Of the seven intensive-service units, four were composed of white boys, predominantly Irish; one of white girls, predominantly Irish; one of Negro boys and one of Negro girls. Ages of unit members ranged from 12 to 18 years at the inception of service. Male units averaged about thirty members, female about nine. Groups ranged from highly delinquent—all members with official delinquency records—to slightly delinquent—12 per cent with official records. The total number of individuals in intensive-service groups was 193, of whom about a fourth had appeared in court prior to the advent of the Project worker.

## RESEARCH FRAMEWORK AND METHODS

Seven months after the inception of the service program a concomitant research program was instituted.[3] Although research personnel maintained close contact with the service program, the research was organized as a semi-autonomous operation with a primary mandate to evaluate service effectiveness. The Research Director was a cultural anthropologist, and all research personnel were trained in social science rather than social work.

Development of a research method was contingent on recasting Project objectives as originally formulated so as to produce a "researchable" formulation, amenable to treatment within an appropriate theoretical frame of reference. To this end, the statement of service objectives was formulated as follows. The principal object of the corner-group program is to effect changes in the customary behavior patterns of the groups so that the occurrence of law-violating behavior is inhibited or reduced. The primary research question was then phrased: To what extent did changes occur in customary patterns of group behavior—actional, attitudinal, and perceptual—during the workers' term of service? This formulation made possible a direct but not exclusive focus on "law-violating" behavior as one subtype of "customary" behavior. It took as its principal form of base data "observed day-to-day behavior" rather than data derived from questionnaires, raters' impressions, psychological tests, or other methods of recording expressed attitudes or subjective states.

Four major indexes to behavior change were used.[4] It was assumed that the combined effect of the several measures would tend to correct for the particular limitations of each:

[3] The research program is financed through National Institutes of Health Grant M-1414, with funds administered through Boston University School of Social Work.

[4] A fifth planned index, "Court appearances of seven Project groups compared with seven matched 'control' groups," will probably not be employed due to difficulties involved in securing reliable "matching" data on key variables.

(1) Recorded court appearances of group members before, during, and after the Project.

(2) Official rates of juvenile crime for the Project area compared with rates for similar areas before, during and after the Project.

(3) Recorded incidence of group behavior patterns during worker's term of service: law-violating behavior; non-law-violating behavior.

(4) Developments in relationship patterns within Project groups, between adolescent community groups, and between groups and the larger adult community.

Analysis of the results secured on the basis of the different indexes is at varying stages of completion at present. The following sections will report on results obtained to date.

## TRENDS IN RECORDED LAW-VIOLATING ACTS

In evaluating the effectiveness of a program aiming to affect delinquency, three questions are of major significance:

Do changes or trends occur during the term of service which are reliably attributable to the presence and/or activities of the worker rather than other possible causative factors? This involves the question of adequately demonstrated cause-and-effect relationship.

Are demonstrated changes in patterns of law-violating behavior in a desired rather than an undesired direction? This involves the question of the relation of achieved results to stated objectives.

Are the magnitude and direction of desired change in patterns of law-violating behavior commensurate with the amount of effort and money necessary to produce them?

It is evident that unless prior questions can be answered "yes," answering subsequent questions is valueless. Before asking whether observed results are those desired and by whom, it is necessary to show first that changes did occur and, second, that these can, with reasonable certainty, be attributed to the workers' activity. A major function of the analysis of data on law-violating acts is to show that trends in such behavior occurred during the workers' term of service which could not be reasonably attributed to any set of causative variables except the presence and/or activities of the worker.

Because of space limitations, the method of processing the data and the tabular findings on these points must be omitted. The most striking finding was that the quarterly incidence trends of law-violating acts committed during a worker's term of service were remarkably similar in each group. Without exception, these rates dropped between the first and second quarter of the term and rose between the third and fourth. During the second quarter, there was a leveling off, with some downward tendency. For all but two groups, fourth-quarter rates were lower than first-quarter rates. This trend applied for younger and older, male and female, white and Negro, highly and moderately delinquent, and shorter and longer service groups.[5]

These findings establish a good probability of a cause-and-effect relation between worker activity and observed

[5] Breakdown tables comparing incidence trends for groups categorized by age, sex, ethnicity, and so on, and worker-related variables such as age, sex, contact frequency, and so on, as well as additional substantive and interpretive data, are contained in Walter Miller, "Trends in 'Delinquent Acts' Committed by Members of Seven Adolescent Corner Groups During Contact with Social Workers." Submitted to National Institute of Mental Health, March, 1958.

TABLE 1—CORRECTIONAL[a] INSTITUTION COMMITMENT RATES: PROJECT AREA COMPARED WITH REST OF DISTRICT[a]

| AREAS | ALL OFFENSES: BOTH SEXES | | ALL OFFENSES: BOYS | | "SERIOUS" OFFENSES: BOYS | |
|---|---|---|---|---|---|---|
| | BEFORE PROJECT | DURING PROJECT | BEFORE PROJECT | DURING PROJECT | BEFORE PROJECT | DURING PROJECT |
| Project Area | 6.8 | 7.5 | 10.4 | 10.7 | 7.8 | 6.7 |
| Rest of District | 6.8 | 9.8 | 10.7 | 17.5 | 8.4 | 12.3 |

[a] Figures represent number of commitments of individuals aged 13 to 17 divided by number of individuals 14 to 17 in each area. "Before Project" figures represent averaged rates for the years 1952 and 1953; "During Project," averaged rates for 1955 and 1956. 1954 is omitted because service operations were not started until June, and all workers were not in the field until late October. "Serious Offenses" comprise seven categories of offense; grand and petty larceny, theft, assault and battery, arson, murder and property destruction, eliminating categories such as "stubborn child," and so on.

Table 2 compares number of commitments in the Project District with statewide figures.

trends without the use of control groups. To attribute observed trends to any set of variables other than "worker presence"—for example, seasonal variations, police activity, school, agency or parental activity, natural "maturation"—one would have to assume the uniform operation of the postulated variables on each group during equivalent time periods. Two conditions make this assumption untenable. First, service terms for groups were not coterminous. Second, the durations of quarters differed, ranging from 2.5 months for one group to 8 months for another. Similarity of trends independent of time duration would imply that trends are a function of events relating to the initiation and the termination of a given condition. The advent and departure of the group's social worker are the one development which appears to meet these conditions. In addition, the possibility that group-related variables—sex, ethnicity, age level, delinquency level—could account for the trend is "controlled" by the form of the design.

Assuming that these data establish a reasonably high probability of a cause-and-effect relation between trends in law-violating behavior and worker activity, what do they show as to the effectiveness of this method in controlling delinquency? Very briefly, they indicate that a substantial reduction in the incidence of reported law-violating acts occurred subsequent to the arrival of the worker, presumably the result both of his presence and the nature of his activities. However, reported law violations increased during the period preceding the worker's announced departure. For four groups this increase did not reach the level of the first quarter; for two the fourth quarter rate was higher than the first; net change for all groups was a 25 per cent decline.

A basic limitation of these data is that they do not show either preworker or postworker trends. Postproject research would be necessary to determine whether the termination phase uptrends leveled off or declined.

## COMMITMENT RATES OF THE PROJECT AREA COMPARED TO OTHER AREAS

Indexes to incidence of law-violating acts based on records kept by official agencies must be interpreted with particular caution. Favorable results indicated by such statistics cannot be used as a reliable index of induced change;

TABLE 2—NUMBER OF COMMITMENTS TO CORRECTIONAL INSTITUTIONS: PROJECT DISTRICT COMPARED TO STATE

| AREAS | 1954 | 1955 | 1956 |
|---|---|---|---|
| Total for State..... | 642 | 817 (+27%) | 926 (+13%) |
| Project Area | 24 | 22 (−8%) | 19 (−14%) |
| Rest of District... | 34 | 43 (+26%) | 35 (−18%) |

State figures (raw numbers) are for ages 7 to 17; District figures, for ages 13 to 17. Percentage-change figures can be misleading when applied to small numbers.

however, grossly unfavorable statistics would greatly weaken any claims of impact.

At present the collection and processing of relevant official statistics are preliminary and incomplete. Only correctional institution commitments are available, and they apply only to the 13 to 17 age group to the end of 1956. Tables 1 and 2 show rates for the Project area compared to the rest of the district and to the state as a whole.[6]

The results shown here, while far from unambiguous, present no serious obstacle to a claim that trends in the occurrence of officially recorded law violation in the area of Project concentration compared favorably with other areas. Results presented in Table 1 appear to indicate the best showing for the type of delinquency taken as a top priority objective—serious crimes by male juveniles. Table 2 indicates that during a period when over-all rates in the state were rising steadily, rates in the Project area showed a slight decrease. A decrease is also indicated for the rest of the district between 1955 and 1956, but this can be seen as a possible normalizing of the very substantial increase between 1954 and 1955 when Project area figures were declining. In and of themselves, these trends do not provide a firm basis for claiming a favorable impact in the Project area but, taken in conjunction with other indexes, can contribute to a total impression of change in the direction of reduction or inhibition of law-violating behavior.

## DEVELOPMENTS IN GENERAL PATTERNS OF GROUP BEHAVIOR

On the assumption that law-violating behavior cannot be analyzed meaningfully in isolation from the general pattern of customary behavior, an analysis of some seventy types of group behavior is taken as the most important index to change and comprises the major research effort. The data-processing system utilized in this approach, which entails converting material from some 8,000 pages of written records into standardized data cards, is presently incomplete and few substantive results of the analysis are as yet available.[7]

[6] More detailed results of this analysis are contained in Walter Miller, "Juvenile Delinquency Trends in the Special Youth Program Area Compared to Other Areas: 1952 to 1956," February, 1957; on file with Special Youth Project. This paper includes additional breakdown tables, raw numbers, definitions of terms, census tract definitions of areas, discussion of methodological considerations, source of population statistics, and so on. Figures for the state are taken from Joseph Hozid, "Division of Youth Service Commitment Report I-MC-10," July, 1958.

[7] The principal limitation in the use of this index relates to the possibility that, in reporting behavior, workers will select or omit on the basis of interest or training, and that analyzed trends in reported behavior could be a partial function of trends in recording selectivity. This type of limitation remains inherent in the data but is compensated for to a considerable degree by several factors—including the tremendously detailed nature of the recorded material, differential selectivity by a range of observers, injunctions by the research director to record fully and objectively, and the fact that the processing system eliminates all evaluative or subjective statements. In addition, about 5% of the data represent either tape-recorded material or direct observation by the research director. These data appear essentially to confirm the reliability of the bulk of workers' recorded data.

[8] The mechanics of the coding system are complex and cannot be detailed here. The system is partially described in Walter Miller, "Research Procedures Used in Analyzing the Effectiveness of a Gang Delinquency Project"; prepared for N.I.M.H., March 1958.

### *Method*

In processing the data, graduate student research workers go through the detailed records and extract material from them relating to some seventy categories of observed behavior. These categories refer to a range of social and cultural "objects"—school, police, church, football, dancing, narcotics, theft, alcohol, sex, and so on. Each extracted behavior sequence involving these and other areas is recorded on a data card and categorized according to eight to twenty coding designations. Multiple copies of each card are made, so that all acts relating to each area of behavior can be filed chronologically for each group, thus producing a categorized "behavioral history" of that group.[8]

Filed and categorized data are then arranged for analysis so that data can be brought to bear separately on four questions for each behavioral area. (1) What was the general pattern of behavior of Group X in behavior area Y during a given time span? (2) What changes or trends occurred in this behavioral area? (3) What were the specific activities of the worker in reference to this behavioral area during this time? (4) To what extent are the observed trends attributable to the worker's actions?

Being able to isolate for separate consideration data bearing on questions 1 to 3 facilitates the difficult task of ascertaining cause-and-effect relationships. Four "logical" outcomes relating to "extent of change" and "density of worker action" are possible for each behavioral area—(1) Definite change noted: considerable worker action (assumption of "impact" tenable); (2) Little or no change noted: little or no worker activity (plausible to assume relationship between action and observed condition); (3) Definite change noted: little worker action (assume operation of an influence other than the worker); (4) Little or no change noted: considerable worker action (assume "resistant" area or inhibition of "expected" developments).

### *Results*

Very preliminary analysis of data, primarily from one group, shows a heterogeneous pattern of change. Definite changes were noted in reported behavior relating to the police and the business world; some change occurred in attitudes to and relations with white people; little or no change was noted in behavior relating to school, church, and drinking patterns. For the two areas in which definite change occurred, the direction was in line with the Project's stated aims.

For example, an analysis of thirteen types of "police-oriented" acts, both actional and attitudinal, shows (1) little change in manifestation of "positive" behavior towards police during the first three phases; (2) a concurrent but uneven diminution in overtly antagonistic behavior; and (3) a clear rise in "nonhostile" and a fall in "hostile" behavior for the last phase, reversing the situation of phase one. These trends may be attributed primarily to two factors: (1) The worker was particularly active in this area, manifesting strong motivation to alter attitudes to police, and working to weaken an initial perception of police as an institutionalized enemy. (2) The group became increasingly involved in collective enterprises (staging suppers, dances, etc.) which entailed direct interaction with police. As inter-

action increased, opportunity for "nonhostile orientation" increased, contributing, especially in the last phase, to the observed up-trend.[9]

Analysis of a limited number of behavioral areas for this one group seems to indicate that change was most likely to be great in those areas where worker activity was heaviest. For the "negligible change" areas ("church" and "alcohol") virtually no worker action was noted.

*Interpretation*

Findings referring to law-violating behavior appear to indicate that the broad trends in group behavior change were more a function of the continued presence of a worker than of differences among the workers in competence and procedural emphasis. Very preliminary analysis of data referring to all types of behavior indicates that different degrees of change in various behavioral areas within the over-all pattern can be related to interworker differences in approach and attributes. Determination of which behavioral areas appear to have greater and less change potential and delineation of factors which appear to induce or inhibit change in each area will be an objective in the further analysis of these voluminous data.

## DEVELOPMENTS IN COMMUNITY RELATIONAL SYSTEMS

Perhaps the most important criterion of the effectiveness of a program of the sort under consideration here is the extent to which it produces long-term impact on relationships among various community groups. Changes of this type, while difficult to measure quantitatively, nevertheless comprise a qualitative index of utmost importance. Since reports on changes of this type appear elsewhere, only a highly condensed summary of findings is presented.[10]

*Method*

A wide range of documents reporting relevant events—newspapers, committee minutes, worker reports, interviews with community adults, and so on—related to Project groups, neighborhood adults, community organizations, municipal departments, and so on were examined to ascertain intra- and inter-group relationships. Developments were recorded on chronological charts and trends delineated.

*Results*

Impact of varying types on established relations between the Project and a wide range of community groups was noted. Maximum impact was made on groups closest to the area of direct Project operations, with a widening circle of progressively lesser impact on groups farther removed. Within the primary target, the corner-group subunits, worker action tended to produce a series of factional splits as the center of gravity of the group shifted towards an increasing emphasis on law-abiding behavior as a major basis of intragroup status. Efforts by workers to keep law-abiding and law-violating factions within a single solidary unit were successful in some instances.

Relations between age-graded subunits within the larger corner group tended to weaken as the workers increasingly assumed a range of functions —instruction, advice, protection, and so on—formerly assumed by "brother" subunits for one another. Similarly, relational ties between groups and neighborhood adults, who customarily perform a range of functions for corner groups, were weakened as workers took over important parts of these functions.

A highly significant change occurred in the system of role definitions in the adolescent community. A new role, that of "corner-group social worker," became established and was added to the list of other recognized roles customarily filled by nonlocal adults: cop, pimp, pusher, queer, truant officer. The social worker was defined as someone who helps kids, can be trusted, and adds to the "rep" of groups which have one.

During initial stages, the Project's operations were regarded with considerable suspicion by community service and welfare agencies. As the program progressed, this suspicion diminished most rapidly among those groups closest to actual Project operations; during later stages, some agencies became strong supporters of the Project while others remained dubious or antagonistic. Local settlement houses in particular came to espouse Project methods, seeing in this approach a solution to their problems of coping with disruptive youngsters. Following the termination of the Project several local agencies instituted certain of the Project's methods —in particular, that of corner-group work. Although it is somewhat early to evaluate these measures, it appears very likely that their impact ranged from negligible to actual aggravation of conditions. The reason for this was that these programs were fragmentary, inadequately staffed, and lacked the degree of administrative sophistication and practice skill necessary to effective implementation.

On the municipal level, the Project's Central Administrative Committee, composed of representatives of the city's major youth agencies—police, courts, schools, churches, public recreation, state youth corrections, private welfare —became progressively dissatisfied with the Project. Conflicts between the Project's supporters and detractors resulted in angry resignations from the Committee, demands for censorship of all reports released by the Project, and friction with the Youth Corrections Department, which ordered several Department parolees not to participate in Project activities.

At the expiration of the Project's three-year demonstration period, strong pressure from the local community for service continuation resulted in a plan for instituting a city-wide delinquency prevention program under joint state and municipal auspices. This plan, lacking adequate support from the Central Committee, was not accepted by the Mayor and Governor and a subsequent scaled down proposal was defeated by legislative action. As of the present writing, no official action has been taken to implement the widely disseminated findings and recommendations of the Project.

## SUMMARY AND CONCLUSIONS

The findings reported in prior sections may now be brought to bear on the major questions previously cited. Phrased in somewhat broader terms these are: Did Project activities produce a significant impact on patterns of law-violating behavior of target groups? To what extent were the observed changes those desired—that is, in the direction of the Project's stated aims? How lasting were these changes, and to what extent did observed impact extend beyond those groups which were the immediate object of action? To what extent was the nature, magnitude, and "permanence" of observed changes

[9] Additional analysis of change in this area as related to worker action, as well as analysis of change in the seventy behavioral areas for the seven groups, will be included in the final report on the Boston Delinquency Project, scheduled to appear in late 1959.

[10] Walter Miller, "The Impact of a Community Group Work Program on Delinquent Corner Groups," *Social Service Review*, Vol. 31, No. 4 (December 1957), pp. 390–406, and "Inter-institutional Conflict as a Major Impediment to Delinquency Prevention," *Human Organization*, Vol. 17, No. 2.

commensurate with the amount of effort and money necessary to produce them? Only preliminary and highly condensed answers can be given here; more detailed treatment will appear in the Project's final report.

Data presented here appear to lend substantial support to the conclusion that there was a definite and measurable impact on patterns of group behavior during the period of the Project's operations—an impact which entailed a reduction in existing rates of law-violating behavior and/or the inhibition of expected incidence of such behavior. Decrease in frequency of law-violating behavior appeared most marked during earlier phases of worker contact; during later phases an "equilibrium-restoring" effect, related in some degree to the worker's departure and developments involving groups outside the area of intensive operations, appeared to result in an increase in incidence, whose net effect, however, did not raise the final all-group incidence rates to the initial levels.

Unsystematic analysis of post-Project developments appears to indicate that the resurgence of delinquency constituted a fairly brief phase for some groups. Groups manifesting more lasting effects appeared to be those which had experienced longer periods of consistent contact and for whom worker efforts had furnished the most consistent image both of the feasibility and desirability of a law-abiding way of life.

Events in the larger community reflecting Project activity indicate several conclusions documented only indirectly by the data presented here. I would speculate that the degree of impact produced by the Boston Delinquency Project does not represent the true potential of this method and its developed operating rationale. Efficient implementation of planned operating methods was substantially restricted by a set of factors by no means extrinsic to the nature of of the operations, resulting primarily in limiting Project operations to a time period considerably shorter than that required for a fair test and in blocking or hampering the efficient execution of important implemental measures.

This would suggest an implication of fundamental importance for communities which are presently applying or considering applying this method. The corner-group method for inducing behavior change in adolescent groups has an excellent potential for controlling delinquency during the years of adolescence. But programs must be planned with great care and executed with a high degree of excellence. The application of this method, which operates in a dangerous and highly charged area and taps emotional forces of great intensity, has an explosive potential. If executed inefficiently and with limited perspectives, it may result, at best, in negligible impact and, at worst, in severe damage and an aggravation of the situation. Planning, then, must be extensive both in time and space and operations must be administered and executed by a staff of the highest personal competence and sophistication. This requires, of course, financing considerably in excess of what is generally allotted to such operations to make possible programs administered on a permanent basis by knowledgeable and enlightened executive bodies. To the extent to which these conditions are achieved, the method will realize its potential.

# Preventive Work With Street-Corner Groups: Hyde Park Youth Project, Chicago

By JOHN M. GANDY

ABSTRACT: Group work with predelinquent youths outside of building-centered programs is an aspect of delinquency prevention to which settlement houses, neighborhood centers, and youth-servicing agencies are increasingly giving attention. Such group work follows the same general pattern as work with delinquent gangs, but there are significant differences in the nature and intensity of the workers' relationships with parents and other adults which have to be observed. The Hyde Park Youth Project, described in this paper, selected groups of teen-age youths who were believed to have a high potential for delinquent behavior and provided them with intensive staff service for periods from six to eighteen months. A comparison of the frequency of individual antisocial behavior at the outset of the staff service and termination indicated that the youths who were participating in little or no antisocial behavior when staff service was first provided continued to avoid delinquency. The staff was least successful with youths who, at time of first contact, already had a history of antisocial behavior.

*John M. Gandy, Toronto, Canada, is Director of Research and Planning of the Social Planning Council of Metropolitan Toronto. He was Assistant Director of Research, Welfare Council of Metropolitan Chicago from 1952 to 1954 and Director of Research, Hyde Park Youth Project, 1955 to 1958. Mr. Gandy has been a lecturer at the School of Social Work of the University of Chicago.*

THE Hyde Park Youth Project, financed through a grant from the Wieboldt Foundation, was established in 1955 by the Welfare Council of Metropolitan Chicago. Its aim was to experiment with ways of developing "a co-ordinated community-centered juvenile delinquency prevention and control program." The over-all project plan provided for the following four interrelated program emphases: casefinding-diagnosis-referral; treatment; community organization; and work with street clubs.[1] Although the focus of the whole Project was prevention and control of juvenile delinquency through a co-ordinated approach, only that aspect of the Project's work with street clubs will be described here. A full report on the total Project will be published early in 1959.

## THE SETTING

Communication of the experiences of the Project in working with street clubs will have little value unless the reader has a picture of the community in which the service was provided, in this case that part of Chicago known as Hyde Park. This community is an area of about three square miles surrounding the University of Chicago. It has been described as an "old, socially descending neighborhood of diverse classes and values, struck with a recent acceleration of in-migration of people whose values are in contrast with the traditions of the area." [2]

In 1955 the area had an estimated population of 45,000 of which approximately one-third was Negro. Although the size of the population has changed little in recent years, there has been a marked change in the racial composition. In the five years, 1950–1955, the number of nonwhites (primarily Negroes) living in the area increased from 2,700 to 14,500—over 400 per cent. In the same period the white population decreased 30 per cent. In the three years of the Project's operation there was further increase in the nonwhite population but at a much lower rate. Accompanying the change in the racial composition was an increase in the number and proportion of low-income families in what had, heretofore, been a residential area for students and middle- and upper-middle-income families. The increase in low-income families was accelerated by the announcement of plans for a large redevelopment project. Middle-income families quickly moved out of buildings scheduled for destruction, and this void was filled by low-income families willing to accept the uncertainty of almost a month-to-month living arrangement.

In 1955 the rate of arrests of juveniles in Hyde Park was about six out of every hundred boys and girls of juvenile court age. When compared with the other police districts in the City of Chicago, the rate for this community was about in the middle range. As with other communities in the city, the ratio of arrests of boys to girls was about three to one.

Hyde Park was selected as the setting for the Project because the community seemed to have many of the characteristics of other urban areas in transition but, at the same time, had sufficient stability and resources to offer promise for the development of a delinquency prevention program limited to a three-year period.

An important aspect of Hyde Park was the large number of community groups concerned about, and working for, the improvement of the community. Among these were: The Hyde Park Neighborhood Club, a nonsectarian community center; The Hyde Park-Kenwood Community Conference, organized to build and maintain a "stable interracial community of high standards"; the South East Chicago Commission, whose activities include support of an active program of urban renewal and law enforcement; and several strong parent-teacher associations. These community groups received much support from academic and professional groups in the community and their membership drew heavily on them.

The community is dominated by the University of Chicago. This, coupled with the existence of concerned community groups, made Hyde Park different from many of the communities in which intensive work has been done with street gangs. Hyde Park, however, is similar to many older residential areas, in cities from Maine to California, where changing standards and physical deterioration provide an environment in which the incidence of both individual and group delinquency is the pattern. In many such communities, gangs have become a major cultural institution, whose values are in many ways opposed to those of a larger society about them. They express and teach a sort of warfare with conventional values and become major sources of hostile, aggressive behavior that represents a threat to the community, its citizens, and their property.[3]

In contrast with many other similar programs, the Project's work with street clubs was an extension of the program of an established social agency. Professional services were provided on a contractual basis by the Hyde Park Neighborhood Club, a long-established group work agency. The Neighborhood Club worked with the Project staff to design the plan for work with the street clubs and provided the professional supervision of the workers employed. The street-club workers maintained offices both at the Project and at the Neighborhood Club. Throughout the life of the Project these workers were considered staff members of the Club, although most of their work was with groups outside the building and with individual youths who were not members of the Club.

The Project's approach to the work with street clubs was based on the assumption—stated in one of its publications—that "youths with problems of social maladjustment who are not presently adequately served by the community agencies can be brought into positive involvement with community agencies and institutions through the efforts of a street club worker who is identified with a neighborhood-centered agency. This process will result in better group and individual adjustment." [4] These assumptions formed the base for the following specific goals: Cultivation of positive relationships between the street club and community institutions; Cultivation of positive relationships between street clubs and other youth and youth groups in the community; Reduction of antisocial behavior on the part of street clubs; Furthering acceptance, by the street clubs and their members,

[1] The term "street club" is used throughout this paper to describe the groupings of youths worked with primarily outside of the building-centered programs of the community agencies. The term is synonymous with street-corner groups, however, some "street clubs" would be too loosely organized to be considered a "gang."

of the value system of the larger community; Assisting individual group members to understand and cope with personal problems affecting their adjustment to group and community life; and Assisting the street clubs to meet the needs of their members in a constructive manner.

As with most direct service programs, the Project was faced with the problem of setting some limits on the types of groups to be served. The following criteria for the provision of staff service to a street club were developed out of the Project's early experiences:

- The group selected for service must be either a group or a collection of individuals who share a meeting place or recreational or other interests in the Hyde Park area.
- The group must be one that has demonstrated antisocial tendencies or strong potential for antisocial tendencies.
- There must be community anxiety about the group.
- The over-all impact on the whole community which would probably result from working with the particular group must be considered.
- There must be a consideration of how effectively the group can be helped by the services of the street club worker.
- The group must be one not presently adequately served by community agencies and institutions.

### GROUPS SERVED

The 3 street club workers served a total of 11 street clubs in the three-year period. These clubs ranged in size from 9 to 36, with a combined membership in excess of 300. Three of the clubs were all Negro, 6 were all white, and in 2 clubs the membership was racially heterogeneous. One of the all-white clubs was co-ed.

In the main, the members of the clubs were from families that were among the least secure economically in the community and that had little formal education. The families of many of these boys were regarded by most people in the community as undesirable. The families themselves felt that the community was hoping to get rid of them through the redevelopment plan. In addition to the tensions created by such covert and overt hostility on the part of the larger community, tension was increased by the influx into the community of Negro teen-agers who competed with the resident boys and girls for recreational facilities.

Despite the tension and anxiety in the community, there had been only isolated instances of group conflict between the various street clubs at the time the Project began operation. Group antisocial activity consisted mainly of thefts, intraclub fights, and isolated assaults on individuals, many of whom were men students from the University. The behavior that was creating the most concern was loitering on corners, blocking of sidewalks, vandalism, profanity, and boisterousness. Such behavior on the part of youth was creating fear and hostility among adults, and this, in turn, tended to exacerbate the fears and anxieties of the teen-agers.

Local situations have often made it necessary to provide initial services to street clubs or gangs on the basis of meeting a series of emergency situations. In Hyde Park, however, the job was conceived as having a large component of prevention in it, due to the timing of the introduction of the service and the dynamics of the community. Nevertheless, this did not mean that the major goals and objectives were essentially different from what they would have been if the situation had been one of an emergent nature.

### NATURE OF STREET CLUB WORK

No attempt will be made here to report on the details of the staff's work with the eleven groups. Some emphases and approaches in that work will, however, be described. This seems indicated because, while there is an abundance of literature on work with delinquent gangs in very disorganized communities, little attention has been paid to work with marginal groups in urban areas in which there is some strength and vitality in the social fabric.

In establishing a working relationship with the street club members, the Project staff found that it was necessary to employ much the same techniques as those described by the New York City Youth Board and other agencies that work with gangs or street-corner groups —that is, "hanging around," gaining the group's confidence through concern for them, and so on. After the initial acceptance by the group the worker would try to establish himself as a representative of the community and its values, for it was held that the worker must play the role of an understanding and interested adult and one who is symbolic of the controls of the larger community. This did not mean that the worker would not try to help youths reach an adjustment with the police or the courts. He was consistent, however, in not giving them support in, or excuses for, antisocial behavior. Such a position puts many stresses on the relationship between club members and worker, but it was found that a consistent and "above-board" approach in this regard paid dividends.

Another dimension of the work that was found to be important but that has received little more than cursory attention in the literature is the role, "significant male." Many of the youths participating in the street clubs came from homes from which fathers were absent. In other homes the father was often dependent emotionally and/or financially on the mother, and this dependency was overlaid with considerable hostility. In many instances the father's hostility over his failure as head of the family and resulting dependence was directed toward the son when he reached adolescence. Youths from such families seek an adult man who will epitomize the strength and decisiveness that they do not find at home, and they frequently look to the social worker to fill such a role. It was recognized that a relationship of this sort is fraught with emotional dangers (for workers cannot really play the part of father), but these can be greatly reduced when the insight and training of the worker are such that he recognizes the difficulties or redefines the relationship when this is indicated.

In working with predelinquent youths, it was also found that successful relations and work with parents were possible. In all the groups, workers received many requests for help with the members' problems. Although many of these problems related to the group and its activities, there are other more personal problems, such as permits for jobs, school transfers, appearances in family court, and so on, in which it was necessary to contact the family. In some instances the worker was asked by the family for help with a problem; more frequently he was able to help the family understand the problems and needs of their teen-age child a little better. Here also, as in many of his other relationships, the worker had to have enough understanding of the dynamics of behavior, and particularly parent-child behavior, to use this relationship constructively. He also had to know community resources and their strengths and limitations.

Workers with predelinquent groups undoubtedly encounter less initial re-

sistance from their clients, but the demands on them for skill and understanding seem to be as great as, if not greater than, in work with groups that have a history of delinquency. Workers definitely need more than the ability to get acceptance, to show concern, and to manipulate situations. They must also understand both individual and group dynamics, the structure of the correctional and law-enforcement agencies, and the community's health and welfare services. Although the exact nature of the preparation for the job may lend itself to some differences of opinion, the demands are too great for the well-intentioned, dedicated, but untrained person to be successful at it.

### THE STREET CLUB AND THE ADULT COMMUNITY [5]

Little has been written about the nature and degree of the involvement of the adult community in work with street-corner groups. With well-organized groups, the antagonisms and conflict between them and adults and organized adult groups in the community may restrict the worker's role as a liaison person. In fact the worker is sometimes identified as a protector of the street-corner group in the face of demands for repressive and often punitive police action.

As was pointed out earlier, Hyde Park contained a number of groups concerned with the social problems of the neighborhood. The most promising of these with regard to the development of an understanding of the problems of the street clubs were the "block clubs" of the Hyde Park-Kenwood Community Conference. These clubs also represented a channel for transmitting some of the concerns of the adult community to the youths. These groups were usually composed of from 10 to 20 adults who dealt with the problems of areas one or two blocks in size. They often included in their membership individuals who were willing to devote some time and effort to the problem.

From the outset, the staff gave much thought to the question of how best to use the block clubs in their work. As it developed, the workers served as liaison between the block clubs, individual adults, and the youths, seeking to achieve understanding and respect between them. They would arrange conferences between street-club members and representatives of the block club, would get the block club to finance projects such as weekend camping trips for the boys, and occasionally would get a few adults to meet the needs of the youths for specific things, such as after-school jobs. In order to reduce the tension between the adults and teenagers, the worker had to be prepared to spend much time with adults, both individually and in groups, and to create lines of communication between them and the street-corner clubs. In order to do this, the worker had to be identified by the youths and the adults as a representative of the adult community. To the youths he had also to be a representative who would not compromise their interests; at the same time he had to avoid overidentification with the youths in the eyes of the adults. It was found that in this role the worker had to expect and accept numerous setbacks. He also had to be able to handle problems of relationships quickly and decisively, for relationships of this sort deteriorate very quickly.

### SUCCESS OF THE PROGRAM

The reduction of antisocial behavior was selected as the goal of the Street Club Project that lent itself to some degree for objective measurement of the Project's results. It is believed that tools might have been developed to measure the changes in the relationships between the street clubs and the organized adult community and the changes in attitudes and behavior between peer groups if additional staff had been available. Both of these areas offer considerable promise for further research.

In selecting this measure of the success or failure of the Project's work with the Street Clubs, we were not unmindful of problems and limitations. The most apparent was the inaccuracy of police statistics on arrests as a measure of reduction in delinquency, for the majority of antisocial acts do not result in arrests. Another limitation was the variation in law-enforcement policy, particularly in the number and activity of police and, to a lesser extent, the relationship of the worker with the police. However, despite these limitations it was recognized that police statistics would have to represent the basic data on which to build any assessment of change in the volume of antisocial behavior.

To supplement data from the police and law-enforcement agencies, we decided to use two other sources of data to evaluate the level of antisocial behavior: The workers' contacts with schools, civic groups, merchants, other groups and prevention agencies; and The workers' own knowledge of delinquent incidents. With regard to the latter, it was found that the worker who had been with a street club for a long time had knowledge of both individual and group delinquency and was able to evaluate the information that came to him from the boys.

The three major sources of information—police and court statistics, reports from community institutions and agencies, and individual worker's impressions—were combined as an index of the extent of antisocial behavior of the individuals comprising the street clubs served by the Project. In defining antisocial behavior, only those acts that were actionable under the laws affecting juveniles in Illinois were included. This too was recognized as a limitation, but it was found to be impracticable to try to differentiate the type and quality of antisocial acts. In addition, it was not considered feasible to attempt to measure the amount of group antisocial behavior since very little antisocial behavior involved all or the majority of any group.

In addition to the frequency of occurrence of antisocial behavior, it was necessary to relate these acts to two dates: the time of the worker's initial contact with a group and the time of termination of contact. In order to compensate for the problems that would have been encountered in attempting to set a specific day on which to rate the youths, workers were given the following instructions:

> Each member of a group served by the street club workers is to be rated twice. The worker will use the arrest records on file at the Project office, his own personal knowledge, diary material, and other records available to him to determine the level of participation of each individual in antisocial activities. The rating made as of the beginning of contact should cover a four-month period—the three months immediately preceding the time when he took responsibility for working with the group or when an individual youth joined the group and a one-month period following the worker's acceptance of responsibility for the group. The rating made at termination of his contact with the group should cover the three-month period prior to termination or prior to an individual youth's leaving the group.

The frequency of participation in antisocial behavior at the beginning of the contact and at termination was

[5] For a full discussion of the points summarized here see: W. E. Watson and John Gandy, "An Analysis of The Dynamics of the Inter-Relationship of Agency, Group and Community in Providing Staff Service to a 'Street Club'," Hyde Park Youth Project, Chicago (Mimeographed) March, 1958.

measured along the following scale, which allows for five levels of participation and also includes two categories reflecting the inaccessibility of certain youths, either because they were no longer in the community or because they were in one of the state institutions for juvenile offenders.

### RANKING AND FREQUENCY OF DELINQUENCY

1. No known or suspected participation in antisocial activity.
2. Not verified but considerable suspected participation in antisocial activity. The boy's name did not occur on lists of police arrests and the worker did not have positive knowledge of antisocial acts on the boy's part, but it was generally understood by the other boys in the group and by the worker that participation in such acts was frequent.
3. Seldom participates in antisocial activity. The worker had knowledge of antisocial acts on the boy's part occurring once every six months or less.
4. Occasionally participates in antisocial activity. The worker had knowledge of antisocial acts occurring not more than once every two months or less than once every five months.
5. Frequently participates in antisocial activity. The worker had knowledge of antisocial acts occurring once a month or more.
6. Institutionalized at the time of rating.
7. Unable to classify.

Table 1 presents the rankings of the youths at the time of first contact by the workers and at the time of termination of contact. These ratings show the following:

There was some reduction in the frequency of antisocial behavior on the part of 151 (46 per cent) youths.

For 130 youths the ratings were the same at termination as they had been at the beginning. Seventy-three of these (more than half of this group) had no known or suspected participation in antisocial behavior at the outset or at the end. The other 57, who were at the same level of suspected or verified participation in antisocial activity at the termination as at the beginning of contact, accounted for 17 per cent of all youths served.

Thirty-four youths (10 per cent of the total) showed more delinquent behavior at termination than at the beginning of contact. This latter category included youths who were sentenced to an institution.

Of the 156 youths found not to be participating in antisocial activities at termination, almost half (73) were so classified at the beginning of the contact. Of the remaining 83 youths, 22 were only suspected of antisocial behavior at the outset. Therefore, for 95 of the 156 youths who showed the least frequency of antisocial behavior at termination, the worker had not been able to verify any antisocial behavior at the beginning of the contact.

Sixty-one youths with no known or suspected antisocial behavior at termination were found to be participants in antisocial behavior at the time of initial contact. With this group there had been a reduction in frequency, with the largest group moving from "seldom participating" to "no participation." Only 9 youths, however, moved from "frequent participation" to "no participation."

The Project enjoyed less success with the youths who had been "frequent participators" at the outset. Of the 83 in this group, 32 (more than one-third) were either in the same group or insti-

TABLE 1—FREQUENCY OF PARTICIPATION IN ANTISOCIAL ACTIVITIES OF MEMBERS OF STREET CLUBS SERVED BY THE HYDE PARK YOUTH PROJECT

| BEGINNING | TOTAL | TERMINATION | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|

| Unable to Classify | | | | | | | | | |
| Unknown | 3 | | | | | | | | 3 |

*tutionalized* at the time of termination. This compares with 9 out of 54 ranked as "occasional participators" at the outset who stayed in the same category or retrogressed, and 18 out of 56 in the category "seldom participated."

The maximum amount of reduction in frequency of antisocial behavior was made by only 9 youth, 11 per cent of those for whom such a reduction was possible. At the other end of the scale, only 5 youths retrogressed the maximum distance on the scale.

The total picture, then, was one of little increase and some decrease in the frequency of antisocial behavior by the youths when the two points in time were compared. The Project, however, enjoyed its greatest success with youths who had had little or no recent history of antisocial behavior at time of first contact. For a number of the youths who had a recent history of antisocial behavior at the beginning of the contact, there was some reduction in antisocial behavior, but few of them achieved the ranking of no known participation at time of termination.

The research design did not provide for an assessment of the contribution of the staff person to the reduction in the frequency of the individual antisocial behavior of the members of these street clubs. The Project staff, the police, and the community generally are in agreement, however, that the frequency of antisocial behavior was probably considerably less than the potential seemed to indicate at the outset of the Project.

The fact that a large proportion of the youths did not become chronic delinquents should not overshadow the high delinquency potential of these youths. These were children living in a changing and anxiety-ridden community, many were from broken and disorganized homes, and as a group they were in a hostile and unaccepting community. Most of the situations and circumstances that have been found to co-exist with the high incidence of antisocial behavior were present.

While claims of great success are not necessary or warranted, it is believed that the Project demonstrated that work with street clubs, or other groupings of youth with a high delinquency potential, is an effective approach to the prevention of delinquency. It is also believed that, as contrasted with work with delinquent groups, which is usually carried on outside the framework of community agencies, work with predelinquent groups can be done within the framework of existing community agencies. The experiences of the Project also suggest that group work and recreation agencies should seriously consider the assignment of a larger proportion of staff time to groupings of youths whose social adjustment is of concern to the community but who may not be ready to join a building-centered program.

# An Experiment in Reaching Asocial Adolescents Through Group Therapy

By MARION STRANAHAN AND CECILE SCHWARTZMAN

ABSTRACT: Many disturbed, potentially delinquent boys and girls by the time they are adolescent have become unreachable by all the ordinary means available in even a highly urbanized community with highly developed resources. This experiment was devised and developed in an effort to reach these adolescents in groups. To establish any measure of therapy required intensive work within the groups and later additionally in their community relationships. The attitude of the therapist that proved successful in setting up the right atmosphere with the members of the groups had to begin with the first contact. Boys' groups show clearer stages of evolution than the girls'. Certain trends in their behavior reveal the boys' maturation, for example, their behavior in the group concerning refreshments. The girls show dissimilar reactions but even more intense and complicated problems. For both boys and girls, once a certain amount of closeness and trust is established, show their need for and accept help outside the group and in their community contacts. Not only the therapist but a staff trained in special fields were needed to change these contacts to workable relationships. The degree of success is not easy to evaluate for the future, but to date there is a genuine basis for considering the experiment successful. The adolescents in the main seek out social relationships and have a greatly improved appreciation for education, work, and community authorities.

*Cecile Schwartzman, Psychiatric Social Worker, New York City, is Director of the Group Therapy Program of the Girls' Service League.*

THE Girls' Service League Group Psychotherapy Project was initiated in May 1951, under the auspices of the New York City Youth Board as a demonstration program. The purposes of this experiment were to develop techniques of group therapy which could be used with adolescents who were unsuitable for individual treatment and for whom there were no appropriate community resources. The adolescents referred to the Project had been chronically in trouble at school and in the community, and efforts by social agencies to reach them either through individual treatment or their families had been unsuccessful. The majority referred were Negro and Puerto Rican boys and girls, 13 to 15 years of age. All came from extremely deprived backgrounds, socially, economically, and emotionally.

The adolescents were predominantly selected on the relatively crude, practical basis of, first, being severe school problems because of their impulsive and destructive behavior. They were guilty, for example, of fighting, stealing, insubordination, and truancy. They also had marked learning difficulties and retarded reading capacity. The second basis on which they were chosen was their lack of response to the efforts of the social agencies and school to reach them. Likewise, their parents could not or would not respond to any guidance or social agency program.

Diagnostically these boys and girls appeared from their behavior and histories to be chiefly suffering from character disorders, with some having neurotic features and a few being borderline psychotics. A few of the group members were withdrawn and inhibited rather than the "acting-out" type. For example, one boy came to the group meetings but never spoke or actively participated until the end of the second year. Their extreme suspiciousness, anxiety, and lack of verbalization ruled out individual interviews, which could have given us a sharper clinical picture.

The boys' and girls' groups were set up with eight to ten members each; they met once a week for one hour and a half. The families of the majority were dependent on Department of Welfare assistance or had marginal incomes. Most homes were broken, and where there were fathers in the homes, it was rare to find one with employable skill. Many of the adolescents, on one or more occasions when younger, had been deserted or sent precipitately to reluctant relatives, some having gone from teeming Harlem to rural southern areas and back again.

## Establishing a Base for Psychotherapy

Although these boys and girls seemed to be extremely unpromising candidates for intensive psychotherapy, it still seemed valuable to examine some of the requirements for success in such therapy in order to determine to what extent these adolescents did or did not meet requirements. Whenever they did not, we would have to experiment until we had devised methods which might develop insight, control, and maturity. We believed the potential for such development did exist among these adolescents.

Successful intensive psychotherapy with adults requires, first, that the therapist be not only properly trained, but also capable of a genuine acceptance of and empathy for the patient with all his weaknesses and symptomatology as well as his potential or demonstrated strengths. Second, the efficacious therapeutic methods depend on the therapist's wisely timed interpretations regarding the patient's thoughts, attitudes, behavior and relationships. These interpretations illuminate for the patient how internal and external experiences that

occurred during his formative years still exercise power over him.

Third, the patient himself must have a certain capacity for insight, a degree of flexibility, and a desire for change and growth. To have these qualifications, the patient has to have had early in life some experience with people in authority who possessed some measure of steadiness, hopefulness, direction, and maturity. Desirably these authorities would be parents or substitute parents, but if not there must be, somewhere in the patient's developmental years, some individuals—teachers, relatives, physicians, members of the clergy, local leaders of all kinds, employers—who acted parentally toward him. These experiences permit potential trust, respect, and love for an authority figure such as the therapist represents, which makes psychotherapy possible. Furthermore, communication through verbalization must be a reasonably natural and important means of communication for the patient.

In considering adolescents for intensive therapy, we find that characteristically they have much less insight than adults; have a flexibility more sharply fluctuating, and goals for their own changes and growth that shift all too easily and suddenly. They may know where they have failed in the community, but they usually have little or no idea why.

The particular adolescents with whom our Project deals especially lack insight. They usually say they do not know why they were sent to the group and place all of the blame on "mean teachers." Their flexibility—that is, their capacity to adjust to new ideas and experiences, as compared with average adolescents—is unbelievably reduced. The absence of any goals as to their own changes is striking. They seem literally incapable of picturing any real betterment. Their experiences with good authorities have been and are distinctly more infrequent than is the case with adolescents usually seen in therapy. In fact, these experiences have been dangerously reduced and have been too fragmentary, not only at home but in the neighborhood, clinics, schools, playgrounds and churches with which they are more or less acquainted. These boys and girls have every reason to expect capricious, uncomprehending, selfish, exploitative, and frequently cruel or neglectful handling by adults.

Most of them have no ability to read and certainly no awareness of the intellectual life that uses and values good books. Lacking this, they have never learned of other kinds of people and ways of life. Therefore, their ego development is so attenuated that even the most casual contacts with them, not to mention the therapeutic, are difficult to make. Verbalization is not their main medium of communication. In fact, any pressure on them to verbalize intensifies their uncommunicativeness and reticence. Even under the most favorable circumstances, their verbalizing to an authority figure consists mainly of blanket denials and flagrant evasions.

To treat such adolescents, the therapist should have both the aforementioned skills and additional ones, as well as special personal traits and experience. The only methods of interpretation that we find the therapist can use are those relating strictly to the children's current reality. Even these interpretations cannot be given until the group members have a long enough experience with the therapist to accept him or her as being really on their side.

## Initial Contact Between Therapist and Adolescent

Treatment begins with a personal interview between therapist and the individual boy or girl, its aim being to

acquaint the boy or girl with the purpose of the group. At this time, the Youth Board Referral Unit has already furnished us with a case summary covering whatever family and social information has been obtainable.

To begin with the program of treatment in its most concrete form is outlined. We tell the adolescent we think the group meetings will help him get along better in school and with his peers and adults. Further, not only the leader but the group will help him overcome his problems. To show him respect, we tell him we will treat his confidences as such and not set in motion any action relating to him unless he so approves—for example, making a school or home visit.

From this first interview, we have in mind to introduce as much as—but only as much as—the individual can assimilate of an ego-building honesty, directness, and expressed acknowledgment of his actual problems.

Despite these precautions and what we judge the most appropriate handling of the initial interviews, only a little more than half the candidates reach the group meetings. To continue the ego and relationship building, we use a number of measures. One is to notify each member of each meeting by letter. Meeting places are chosen with the nearness of the adolescents' homes in mind. Another is to meet their realistic needs for carfare and to be excused from school to attend meetings. These are given with the knowledge and intent of providing them with the wherewithal an adequate parent normally supplies. Through food and play equipment provided at each meeting, we make available satisfactions needed by adolescents in social settings. Several times a year a trip is decided upon jointly to give further pleasure and a knowledge of an unknown part of the community. These devices provide both a structure for the group sessions and, more important, a positive experience in being "given to" by a parental figure. It is our belief that by giving these children a positive experience with an accepting adult we disturb the premise on which so much of their behavior and attitudes are based; namely, that all adults want to deprive them of pleasure.

What we assumed we found true. These boys and girls are too infantile in their character development, too poorly related to adults, and too conditioned to language as a source of criticism, abuse, or confusion to be reached through discussion or oral interpretation for a long time. Whatever communication they can establish has to be through "living-out" experiences with adults. They cannot enter into the rapport needed for the usual psychotherapy until they have had experiences that convince them there is an adult devoted and respectful of their needs for safety, protection, fun, and recognition whom they can trust and love. Then comes the transition to "give and take" which eventually means they can "belong" to the group. They find in the therapist the needed parental person to believe in and with whom to identify in their approaches to themselves, adult authorities, and their peers. The therapist's actions and emotions provide their first healthy model and help them develop positive feelings and attitudes within the group.

## Evolution of Boys' Groups Towards Real Group Formation

From the first group meeting, purposeful and fair reality limits are set regarding injury to one another and to property. This is the first standard of behavior set for them. In learning to adhere to it the adolescents take the first step toward their development as group members. The process of adjustment to this gradually provides opportunities to connect their behavior in the group setting to the behavior in the school room and the community. Group members gradually see, with help, the effect of their behavior on each other and the quality of the meeting. The leader's fairness, they gradually discover, can be emulated and applied by themselves. They begin to have some pride and satisfaction in feeling part of a real group. However, as will be seen, there are long phases before this goal is reached.

The reactions of the boys in the course of approximately three years of weekly meetings showed four discernable though variable phases in all groups. There is an initial brief period of "good" behavior for several weeks, during which the boys are an assembly of individuals, little interested in one another, superficially polite and restrained in their behavior, language, and use of equipment. They behave as they think adults expect them to, and their relationship to the therapist as an authoritative figure is often expressed in calling him "teacher."

The second phase of treatment is characterized by resumption of their customary behavior. They display insatiable demands, rivalries, and aggressions. The intragroup relationships resemble those of much younger children. Communication is primarily around the use of equipment. Within the group, alliances which are primarily temporary and transient are formed, and these serve chiefly for mutual support. Leadership roles change constantly. At this time the boy who is physically strongest is often accepted as the leader. The primary relationship of the group members is not to each other but to the therapist, with each individual group member trying to be "first"; each wanting the most carfare, most turns at games, most refreshments and, of course, the most attention. There is constant testing to see what the therapist will tolerate or limit. This is the most difficult period in which to apply the needed controls and to maintain an attitude of confidence that the boys can conform to reality limits.

In the third stage there is a growing favorable reaction to the therapist, often characterized by dependency regarding school problems, difficulties at home, and employment. For example, a boy will walk up hastily to the therapist and say, "My father left last night" and just as hastily walk away. For further information, the leader has to seek out the boy during or after the meeting as seems wisest.

Another boy may come up and say he's in trouble at school. By this time, the boys have learned that the therapist always offers to go to their schools, when they are either in disciplinary or academic trouble. There has never been any promise as to what can be acomplished. In fact, the therapist has often stated doubts about the efficacy of a school visit, but nevertheless he does go. The frequent success of these efforts in any one boy's behalf emboldens them to make the request for visits. Rivalry that was formerly only for cakes or equipment now extends to rivalry for remedial tutoring and school visits.

A beginning identification with the therapist's approach to situations arises in the group in this third phase. For instance, one boy clowns, disrupting the meeting. Another says, "That's probably what got you in trouble at school." In the instance of a very sick boy, a group's duplication of the leader's attitude, though they were unaware of it, was quite exact and complete. They had always recognized this boy as different, whom they had never involved in their aggressions. After months of his passive, silent behavior they would ask him if he would like to join in the

games and have fun. If he was unwilling, they would drop it and not put any further pressure on him, exactly as the leader had done.

There are periods of regression to more childish behavior, particularly when new members are introduced into the group, but acting out behavior diminishes. In general, confidences have been given to the therapist, requests for constructive help have been made, the standards of the therapist are being incorporated by the group, and the boys become individually important to each other.

During the fourth phase, group solidarity deepens and concern for one another develops. There is an expansion of identification with the therapist's standards of behavior. They are able to accept responsibility for group behavior, and the therapist can now be less active. Individual verbalization increases and group discussions about problems, life situations, and future planning supplant the games and the physical activity. They refer to their former behavior with the superiority of an adolescent for a grade-school child.

### Changing Maturity and Eating

The boys' use of refreshments gives a simple, clear indication of their growing maturity. Throughout, the therapist provides the cake. Group members take turns going to the store to buy soda, for which money is given them. This is important in itself as it demonstrates the confidence placed in them. The boys make repeated reference to this trust, showing how much it is valued. The member who gets the soda is responsible for cleaning up and returning the bottles, in compensation for which he keeps the deposit money. During the early stage of group treatment, group members will discuss their hope that few members will attend the meeting so that there will be more cake and refreshments for those present. After the division of the refreshments, they choose who is to have leftovers. This is usually accompanied by argument and calls for the supervision of the therapist. Turns for getting the soda are zealously guarded in a bookkeeping notebook set up by the boys, which they request the therapist to keep. Initially the boys spend much time deciding how to handle any boy's absence at the time of his turn. Further, they do not sit down as a group to eat together. Their anxiety about eating in the presence of the group and the leader, they originally hide by eating while they play ping pong or roam about.

The observable changes around the handling of refreshments are evident in the group's constant faith that there will be enough cake for all. Leftovers are divided fairly as a matter of routine now. They are confident also in being given fair turns at buying soda. The one group that went into the fourth year was even reluctant to go for soda lest they miss something or disrupt the comfort they were finding in the group meeting. Gradually refreshment time becomes a relaxed period following group discussion or play, in which they sit down together to eat. This is, for most of the boys, literally the first experience of participating in the equivalent of a family mealtime. At home their families have no traditional standard for this and actually possess neither the space, the furniture, nor the dishes which would permit a meal together. As with the changing reactions to refreshments, the evolution of the group can be noted in the use of carfare and behavior during trips.

### Outstanding Differences in Girls' Groups

To a large extent, the girls' groups follow the same pattern as that of the boys. There are, however, some basic differences which require us to modify techniques. Play equipment is used to foster interaction and to relieve emotional tension, but remains of less importance because the freedom to verbalize develops much more quickly with the girls than with the boys. While they obviously want refreshments, they conceal any rivalry and even gratifications about receiving food. The girls express and provoke aggression in more subtle ways: grimacing, teasing, whispering, forming cliques that persist—often along racial lines. Cultural and racial differences lead to more tension in the group and more suspicion directed toward one another and toward the therapist. The Puerto Rican girls talk in Spanish, simulating a nonexistent intimacy, to shut out the Negro girls. The latter in turn talk knowingly and secretively about boys, aware that the Puerto Rican girls are too restricted in their activities with boys to go on dates or unchaperoned to dances.

One group was particularly difficult because there was an equal number of highly overactive, unsupervised, rebellious Negro girls and overprotected, withdrawn, Spanish-speaking Puerto Rican girls. The two rival groups formed gradually tightening cliques that divided the group in two, except for one Puerto Rican girl, Carmen, whose background of neglect and lack of supervision resembled the Negro girls' background. When an explosion seemed in the making, there occurred two meetings. Only one clique was present at the first meeting, while at the second only the other was there. Carmen, the exception, was present at both. On the occasion of these separate meetings, the therapist discussed the feelings and misinterpretations of the group present regarding the other group and explained the feelings and misinterpretations of the latter for them and how naturally this had evolved. Also, how on the one hand the therapist had been shut out by the Spanish and on the other by the whispering. Carmen, a welcome member of both cliques and a natural leader, understood the situation very well. She spontaneously confirmed the leader's explanations not only in the separate groups but when they were together. She was of major assistance in dissolving the defensive defiance and developing their previously concealed desire to become a unified group. Jointly they discussed their mutual suffering from racial discrimination and faced up to the therapist's carefully timed challenge to prove they could know each other, not as members of a given race, but as individuals. Once they started to work toward this goal, they became a real group and continued to be one for two more years.

### Therapist's Work in the Community

The groups we have been describing are those which continued for over three years and ended through such natural means as employment, entering service, or marriage. There is no space here to indicate in any adequate detail the thought, effort, technical knowledge, and work that goes into maintaining these groups, not only within, but outside the group meetings. If any boy or girl's home or school situation becomes acute or his absence gives the signal that such a crisis has probably arisen, immediate action on the part of the therapist to reach the boy or girl directly is necessary. To delay doing so usually means the intensification of some realistic crisis to the point where extricating the adolescent is considerably more difficult.

No matter how acute the school, home, or community situation is, to do more than talk with the adolescent, unless he is really ready to accept any further action, will almost inevitably alienate him. To get the adolescent

ready for any intervention in his behalf, his fear that the therapist is going to be influenced by or combine with other authorities against him must be reduced to such proportions that he trusts the therapist to intervene. Once a home or school contact is made, the therapist may be sure a series of such contacts will be needed and must be made.

### NEED FOR SPECIALLY TRAINED STAFF

These adolescents have other problems whose solution calls for evaluation of their physical condition, intelligence, academic achievement, vocational aptitude, and remedial tutoring. These problems may or may not be known to them but almost without exception they will not ask for such help. Even with much preparation they can rarely face the usual community agencies that cover these fields. Almost as often these resources will not accept them either, because they do not consider them responsive and potentially successful clients. Particularly in relation to psychological testing and tutoring, which is so sharply identified with school failure by the group members, there is much less fear in going to see specialists they know to be part of the staff.

The Project therefore expanded its staff to include carefully selected and prepared experts. With this arrangement, the psychological evaluation can be completed and work can begin before the school situation is too critical or is lost altogether. Nevertheless, each group member has to be escorted by the therapist to the first appointment with any new specialist. To understand how essential and rational these arrangements are, one has to remember that so many people so often have evaluated these adolescents negatively. Only such experts as can appreciate the terror with which these adolescents expose themselves to evaluation by another and unknown authority and who, furthermore, have the essential conviction that working with them is valuable can succeed with them. These experts have to be both flexible and creative, not only to get the maximal results but to secure the adolescents' return and perseverance in coming for help. The feeling of confidence that enables the adolescent to meet the specialist is so highly precarious and tentative that this special staff must share information and co-ordinate closely with the therapist to preserve and build this confidence.

### INDICATIONS OF SUCCESS AS CURRENTLY EVALUATED

In trying to evaluate what degree of success this method and approach has had, we are well aware that only careful research can establish this clearly. Consuming demands in maintaining the current groups make it impossible to follow up systematically the groups that have terminated. We are aware that the prognosis, almost without exception, for the group members was originally poor. These boys and girls represent the most likely court, correctional, hospital (mental or chronic physical), and public relief cases of the future. At this point we can say that, with their changed attitudes and behavior, not more than 5 per cent have become known to correctional institutions. While many remained in school only so long as the law required and often truanted, nevertheless, even most of these secured employment and accepted the demands of their employers as reasonable. Perhaps three-fourths have reported back to us about having jobs, and they are surprisingly satisfied and dependable in their attitudes about work.

Approximately one fourth of the members of terminated groups have now graduated from high school and a few are in college. Certainly no one of these boys or girls would have entered college or been graduated from high school and very few even from junior high school without the group experience and the staff's tutoring and repeated intervention with, and guidance in, the school system. The preparation for and transfer to suitable school programs and schools that secured these graduations cannot be done by the boys and girls themselves, their parents, or their school advisors. Special knowledge not only of the adolescents but of the school system and much time-consuming work with teachers, tutors, school guidance counselors, and principals got these adolescents into the appropriate courses and right schools to permit their graduation. One of the most gratifying results has been that some group members who left school have returned to us for help in going to night school to continue their education.

Many of these boys and girls now belong to community centers and other recreational groups where they were not previously acceptable. The overwhelming proportion of inquiries from community agencies have been in relation to brothers and sisters and parents of the group members, with surprisingly few about the group members themselves.

When the natural reasons aforementioned for terminating the groups bring them to an end, most group members are ready for individual psychiatric treatment. Where the need is acute and time permits, the therapist continues seeing them individually. Without exception, all the other adolescents, no matter how much healthier and better functioning they are, still need individual therapy of a special character. To go on in their unhealthy, unaltered milieu with the increasing demands of maturity, they still need help to become independent, successful citizens. The pressures of providing adequate support or giving adequate care to their future families, meeting marital and domestic crises, handling problems of health and raising children are certain to provide stresses that many cannot handle unaided. The confidence and ease with which members of closed groups have returned encourage us to believe that a good percentage of these erstwhile unreachable adolescents will seek aid in their adult crises.

# A Group Dynamics Approach to the Treatment of Nonconformists in the Navy

By J. Douglas Grant and Marguerite Q. Grant

Abstract: In an attempt to bring about attitudinal and behavioral change in the nonconformist, confinees of a correctional institution for Navy and Marine offenders were placed in small closed communities. Men were selected for the research companies on the basis of fitting a certain level on a scale of interpersonal maturity. Groups were composed of high social maturity men, low maturity men, or half low maturity men and half high maturity men. Twenty confined men with three Marine supervisors lived in the same quarters; ate together; participated in competitions as a unit; and shared work, educational, and recreational experiences. The attempt was made to keep all interpersonal interactions within the group. It was hypothesized that forcing the delinquent to live with and face his interpersonal problems would bring about in him a challenging uncomfortableness which would lead to personality change. A follow-up report on each man was obtained six months after his return to military duty. The relationship between the man's interpersonal maturity level and his postinstitutional success is markedly affected by the nature of his supervision while confined.

Since 1952 the Navy has been conducting a research program [1] in the prediction and treatment of military delinquency. Three questions outline the aims of this program:

What are the personality characteristics of the recruit who will prove himself a nonconformist?

With men who demonstrate extreme nonconformity, what are the characteristics of those who will be able to modify their behavior sufficiently to adjust to the group aspects of military life?

What is the nature of the process that brings about attitudinal and behavioral change in the nonconformist so that he is able to meet the demands of military life?

This report deals with a study relevant to the second and third questions.

Camp Elliott, where the research was conducted, is a place of confinement and retraining for approximately 1000 sailors and marines who have been court-martialed. They are confined for offenses ranging from absence without leave (about 85 per cent) to murder. The average period of confinement is about four months. Between 55 and 60 per cent of the men are restored to military duty at the termination of their confinement.

It is often assumed that the man who has offended against a military law is not the same sort of person as the civilian delinquent. While it is true that the majority of military men are confined for absence offenses, which are not civilian crimes, there is considerable evidence that civilian and military delinquent groups of comparable age show similar attitudes and nonconformity patterns.[2]

[1] The opinions expressed are those of the authors. They are not to be construed as reflecting the views or endorsement of the Department of the Navy.

## Frame of Reference

The frame of reference for this research program is a theory of sequential levels of interpersonal maturity. The case for an interpersonal relations approach to delinquency has been steadily gaining ground. Donald Bloch [3] has described delinquent behavior as an effort to handle interpersonal anxiety. Croft and Grygier [4] have been able to show that the social relationships of truants and juvenile delinquents vary markedly from those of their nontruant and nondelinquent classmates. Gough and Peterson [5] and Sarbin [6] have stressed the delinquent's inability to visualize himself in the role of another person. In studying military delinquents, Osborn [7] found the main difference between repeated absence offenders and matched nonoffenders to be an inadequacy in

[2] The following point to similarities in the two populations: Offenders in both populations have similar juvenile records; norms on a delinquency potential test are very similar for prisoners in the State of California institutions and Camp Elliott; a delinquent high school population showed test scores much more similar to the Camp Elliott population than to the nondelinquent high school population.

childhood and adolescent interpersonal relationships for the offender group. The Camp Elliott Delinquency Potential Scale,[8] which at the recruit stage predicts later military delinquency, contains many interpersonal items. Most of these items relate to what has been called social imperturbability—a tendency to deny any involvement with the relationships between one's self and others.

Although this frame of reference suggests that delinquent behavior results from interactions between individuals, the emphasis has been put on delinquency proneness and what it is within the individual that he takes with him into interpersonal relationships. This approach has recently received new emphasis from the methodological work of Cronbach.[9] He has stated that we need to know much more about the "sets" that people bring with them into interpersonal situations. More needs to be understood about the nature of the delinquency proneness, in terms of interpersonal "sets," before we can study the effect of interpersonal interactions in determining delinquent behavior. The maturity levels theory maintains that these "sets" are extremely important. It further suggests that there are interpersonal problems laden with anxiety which form the core of the individual's social understanding in his efforts to integrate what is happening between himself and others as well as between others.

### MATURITY LEVELS

This theory of interpersonal maturity has been described in detail elsewhere.[10] Seven successive stages of interpersonal maturity characterize psychological development. They range from the least mature, which resembles the interpersonal interactions of a newborn infant, to an ideal of social maturity which is seldom or never reached in our present culture. Each of the seven stages or levels is defined by a crucial interpersonal problem which must be solved before further progress toward maturity can occur. All persons do not necessarily work their way through each stage but may become fixed at a particular level. Not all who are described as immature along this scale will be delinquent, but it is contended that those who are immature are more likely to find themselves in difficulties and to be apprehended for delinquency than are others.

Almost all persons who have grown to adulthood and not progressed beyond the first maturity level are found in institutions where they have to be cared for much like infants. Such personalities have not been found in a military delinquent population. At the other end of the scale, maturity levels 6 and 7 are also not represented in the Camp Elliott population. The adjustive capacity inherent in these "stages" would almost preclude delinquent activity.

A brief description of the levels of interpersonal maturity which are found in the population of military delinquents follows:

Maturity Level 2: The individual whose interpersonal understanding and behavior are integrated at this level is primarily involved with demands that the world take care of him. He sees others solely as "givers" or "withholders" and has no conception of interpersonal refinement beyond this. He is unable to explain, understand, or predict the behavior or reactions of others. He is not interested in things outside himself except as a source of supply. He behaves impulsively, unaware of the effects of his behavior on others, and is apt to explode or run away when frustrated or thwarted.

[10] C. E. Sullivan, M. Q. Grant, and J. D. Grant, "The Development of Interpersonal Maturity: Applications to Delinquency," *Psychiatry*, Vol. 20 (1957), pp. 373–85.

Maturity Level 3: The individual who operates at this level is attempting to manipulate his environment in order to get what he wants. In contrast to level 2, he is at least aware that his own behavior has something to do with whether or not he gets what he wants. He still does not differentiate, however, among people except to the extent that they can or cannot be useful to him. He sees people only as objects to be manipulated in order to get what he wants. His manipulations may take the form either of conforming to the rules of whoever seems to have the power at the moment ("If you can't lick them, join them.") or of the type of maneuvering characteristic of a "confidence man" ("Make a sucker out of him before he makes a sucker out of you."). He tends to deny having any disturbing feelings or strong emotional involvement in his relationships with others.

Maturity Level 4: An individual whose understanding and behavior are integrated at this level has internalized a set of standards by which he judges his and others' behavior. He is aware of the influence of others on him and their expectations of him. To a certain extent, he is aware of the effects of his own behavior on others. He wants to be like the people he admires and may feel guilty about not measuring up to his internalized standards. The conflict produced by the feelings of inadequacy and guilt may be internalized with consequent neurotic symptoms or acted out in antisocial behavior. Because the individual at level 4 tends to be uncomfortable about himself and because he is able to internalize values, he appears more amenable to treatment than previously described maturity levels.

Maturity Level 5: A person who functions at this level is able to see patterns of behavior; he may see himself and others behaving in the same way in different situations or see a continuity in his past, present, and future. His perceptions of himself and others are more differentiated than before. He begins to see others as complex, flexible objects which cannot be dealt with on the basis of a few single rule-of-thumb procedures. He is aware of many points of view in the world around him and sees interwoven reasons for behavior. He is able to play different roles in different situations and is thus more flexible. He is more capable of establishing and carrying through long-range plans than persons at lower levels. Delinquency, for a person at this maturity level, is apt to be situationally determined.

### THEORY OF TREATMENT

A good deal of pessimism has been expressed regarding the possibility of curing delinquents with our traditional methods of treatment or psychotherapy. Traditionally, psychotherapy was aimed at helping the neurotic whose conflicts are internalized, who carries his guilt and anxiety with him. This kind of neurotic tends to know that he is upset or uncomfortable. He may, for example, feel afraid, have bad dreams, or not be able to speak in groups. In contrast, the acting-out personality tends to dissipate his anxiety before he feels it by running away, striking out at someone, or having an affair. Since the acting-out person periodically resolves

his uncomfortableness, he abates any felt need for personality change. Traditional psychotherapeutic methods then are not appropriate for this kind of personality, since he feels no need to change and since he most certainly would run away from any therapy relationship which made him feel anxious.

Since almost all delinquents are acting-out personalities, the task in treatment becomes one of putting the offender in a nonpanic-producing correctional situation, which keeps him concerned about and facing his problems, in an attempt to bring about personality change in him. Acceptance of a need to change or grow results from a challenging uncomfortableness. Since this prerequisite for personality change—this uncomfortableness—is absent or easily dissipated, it needs to be created or maintained for the acting-out person. However, intense anxiety leads to rigidifying panic where no personality change can occur. Therefore, the goal of the treatment program here described was an attempt to create in a correctional situation a program which would produce in the subjects a challenging uncomfortableness without rigidifying panic.

The Camp Elliott research subjects were placed for six or nine weeks in groups of twenty in small closed communities called Living Groups.[11] The twenty men, with three supervisors, lived together in the same barracks, ate together, worked on a farm as a unit, held classes together, participated as a team in recreational activities. The group was "closed," not only in the sense that no new members were admitted nor old members dismissed, but also in the sense that great effort was made to eliminate interpersonal dealings with anyone outside the group. The attempt was made to establish close, continuing interpersonal relationships within the group—with no way out. Ordinarily in confinement institutions there is much opportunity for running away even while staying within the fence by getting transferred from job to job or one living unit to another or running from therapist to therapist. To as great an extent as possible, all chances for this kind of acting-out or running away from anxiety were eliminated.

Many members of this population have been running away from close relationships all their lives. They may have run away from home, left school, held jobs for very short periods—and, for our military population—85 per cent of them have run away from the military service and have absence or deserter charges against them. They may never in their lives have worked through a single interpersonal relationship. They tend to leave any relationship before it is obvious to them that they have interpersonal problems.

*Supervisors and consultants*

The three supervisors assigned to each Living Group were Marine noncommissioned officers, all of whom had volunteered for the program. They were on a two day out of three duty schedule. Two of the three supervisors were with the men on the job for half of each day; they held discussion classes with the men for the other half day. During free time and evening hours, one of the three supervisors was in the barracks available to the men for individual or small group "bull sessions." A psychologist was assigned to each team of three supervisors to act as a consultant. The psychologist was available to the confinees and supervisors for individual conferences, although every effort was made to keep as much as possible of the interpersonal relationships for group discussion.

Each consultant's main function was to conduct 90 minute, 5 days a week group therapy sessions attended by the twenty men and the supervisors. These sessions were the heart of the attempt to encourage social maturing through "forced" working through of the anxiety provided by the close, continuing interpersonal relationships. The psychologist's job was to prevent the challenging uncomfortableness from turning into rigidifying panic, yet not to allow subjects to flee the group. The focus in the group discussions was the interpersonal interactions within the group. An attempt was made to create a self-study atmosphere in which group members were encouraged to notice some interpersonal dealing of self with others or among others—to notice this interaction and to bring it to the group for discussion.

For the reader familiar with methods of psychotherapy, six or nine weeks may seem an impossibly short time in which to bring about personality change. Without presenting these short periods as ideals, it is worth remembering that the "treatment" here was a twenty-four hour a day process, a much more intensive experience than is usual in psychotherapy.

The closed Living Groups may be seen as the primary family situation revisited. Group therapy has often been likened to a family constellation with the therapist representing a parent and other group members, the siblings. In the Camp Elliott Living Groups two additional factors were present which contribute to the analogy, the twenty-four hours a day together and the "closedness" of the group. One of the characteristics of the family situation for the young child is that it is a closed system—he is trapped in it—he has no other resources. In our closed Living Groups, the men also could not escape. There is the possibility that interpersonal problems which for some reason could not be worked out in the original closed group—the family—may be worked through on such a return trip, especially with a parent figure who is perhaps more able to be supportive.

EXPERIMENTAL DESIGN

Over a two-year period, twenty-seven Living Groups were run. During most of that period three groups were running simultaneously, one handled by each of the three supervisory teams. Three aspects of the Living Group experience were systematically varied in order to measure the effect of each aspect on later success of subjects. First, the three supervisory teams were ranked in order of their predicted effectiveness in bringing about reduction in delinquency-prone attitude; this ranking of the teams was one of the variables in the experimental design.

A second aspect was the level of maturity of the group members. Six of the groups were composed only of individuals of maturity levels 4 and 5. For the discussion here, these subjects will be called high maturity subjects, keeping in mind that their maturity level is high only in relation to other confined men. Six of the groups included only maturity levels 2 and 3, here to be called the low maturity subjects. The remaining fifteen groups included maturity levels 2, 3, 4 and 5. Nine of these mixed maturity groups operated for six weeks rather than nine in order to handle scheduling difficulties.

A third aspect of the experimental design was the duration of the supervisor-group relationship. Eighteen of the groups had the same supervisory team for the entire research period, while the other nine changed supervisors and consultant every three weeks.

The Living Groups were described to

[11] "A Group Dynamics Approach to Treating Acting-Out Personalities." Presented at the Eighth V.A. Clinical Research Conference in Berkeley, November, 1953.

TABLE 1—PERCENTAGE RESTORATION SUCCESS BY MATURITY CHARACTERISTICS OF THE LIVING-GROUP AND SUPERVISORY EFFECTIVENESS

all incoming offenders at Camp Elliott, and 98 per cent of all the eligible men volunteered. In order to be eligible, the subject had to have a good chance of being restored to duty and have at least six months left on his enlistment time so that follow-up information would be available on him; and he had to have sufficient confinement time to be able to complete the research program. Eligible volunteers were tested on a battery of personality tests given routinely at Camp Elliott.[12] Two psychologists independently assessing the test profiles, made estimates of each volunteer's maturity level.[13] If the two psychologists agreed that the subject appeared to fit the maturity level of the group currently being formed, the subject was given a one-hour recorded interview. On the basis of this interview, the subjects were put into the appropriate group. No attempt was made to equalize our selection of Navy and Marine subjects, nor to have them represent their proportion in the service or in confinement.

Many interpersonal rating scales were built into the Living Group design.[14] Early and late in the research group experience, peer evaluations, supervisor-confinee, consultant-confinee, and consultant-supervisor evaluations were systematically obtained. In addition, at the completion of the research period, the subjects were again tested and interviewed to determine the effects of the program on them. This report, however, will discuss only the relationship of later duty success to (1) the individual subject's maturity level, (2) the maturity level characteristics of the group in which the subject was a member, (3) the duration of the supervisor-group relationship, (4) the predicted effectiveness of the supervisory team, and (5) the interaction of these variables.

T and R 3.35

## RESULTS

Tables 1 and 2 summarize these five relationships. (1) The high maturity subjects did significantly better ($P = .01$) on restoration to duty than low maturity subjects. (2) Success rate was

not affected by the maturity characteristics of the group; that is, high or low maturity subjects did as well following mixed maturity group experience as they did following groups composed of only low or only high maturity subjects. (3) Totaling results for all subjects over all conditions, the duration of the supervisor-group relationship did not affect the success rate. (4) Again, totaling over-all experimental conditions, no significant differences were found which can be attributed to predicted supervisory effectiveness. (5) However, the interaction between the predicted supervisory effectiveness and the maturity of the subject significantly (Analysis of variance, P = less than .05) affected restoration success. The relationship between the subject's maturity and restoration success varied markedly and consistently with the amount of exposure to the supervisory teams in the order of predicted effectiveness. For subjects spending time only with T company supervision, predicted most effective, the relationship between maturity of the subject and restoration success was high ($r_t = .45$; $N = 114$). For subjects supervised by R company only, predicted second most effective, the relationship was present but lower ($r_t = .29$; $N = 112$). For S company subjects, supervised by the predicted least effective team, the relationship vanished ($r_t = .01$; $N = 109$). If the Living Group experience was under supervision that changed every three weeks, there again was no relationship ($r_t = .01$; $N = 176$). Under conditions of changing supervision, only when the last six weeks were spent with the predicted most and next most effective teams did some relationship again emerge.

This interaction between the nature of supervision and the relationship between maturity and success was impressively consistent over several breakdowns of the data. The interaction holds for both Navy and Marine personnel, for both mixed and dichotomized maturity groups.

Another way of stating this interaction is that the over-all difference in success rate for high and low maturity subjects was found entirely under conditions of predicted effective supervision, T and R Company (C.R. = 3.35). The different success rate for high and lows failed to exist under predicted ineffective supervision (S Company) or under changing supervision. The maturity classification system appears valueless without an effectiveness of supervision classification, and an effectiveness of supervision classification appears valueless without a maturity classification.

Although further research needs to be done, these findings suggest that the cost of military recidivism could be reduced by installing a closed Living Group program with effective supervision for high maturity inmates. High maturity inmates have a high potential for improved restoration behavior but, unless subjected to an attitude-change program under effective supervision, this potential is not expressed in improved restoration behavior. This study does not support a closed Living Group program for low maturity inmates and, in fact, strongly suggests that at least aspects of an effective program for high maturity inmates can be detrimental to low maturity inmates.

Important as these applications are, the implications of these data for delinquency research in general are far greater. Correctional researchers have been finding it hard to demonstrate relationships between classification systems and postinstitutional behavior. They also have found it hard, if not impossible, to demostrate relationships between treatment situations and postinstitutional behavior. As long as the data of the Camp Elliott research are viewed as a study of single variables, its findings are comparable to earlier correctional studies; that is, no demonstratable situational (supervisory effectiveness) effect and only a low, though significant classification (maturity) effect. It is when the interaction of the situation and classification variables is considered that one finds productive relationships with restoration behavior. It now appears likely that, in many of our correctional studies, the classification and situation effects have been masking each other. Future studies need to consider all three factors: kinds of subjects, kinds of supervisors, kinds of programming. This study has demonstrated for delinquency research the point that Cronbach [15, 16] has been emphasizing for social research in general.

# A Research-Based Proposal for a Community Program of Delinquency Prevention

By Eva Rosenfeld

Abstract: Delinquent behavior among juveniles is a response to a real difficulty in achieving commonly desired goals through conventional, law-abiding behavior; delinquency is also, especially among the more "sick," a way of handling inner strain and anxiety. A community program to reduce delinquency must provide encouragement and opportunities for legitimate success for those delinquents who can profit thereby. It must also locate and offer special support and treatment to those who are too sick to be able to abandon their delinquent way of life, even when such opportunities are made availabe. To be effective, such a program must provide all the vital opportunities and special services delinquency-prone youngsters need; make these easily accessible in the community in a co-ordinated fashion; and conduct ongoing evaluation designed to improve the manner of providing each service and to measure the total impact of the program.

---

*Eva Rosenfeld, L.LM., Ph.D., New York City, is Associate Director of Research at the Central Research Unit of the Jewish Board of Guardians in New York City, where she is engaged in research on evaluation of effectiveness of psychotherapy in children. She was, from 1952 to 1957, a member of a research team conducting a series of studies on heroin use among juveniles at the Research Center for Human Relations, New York University. She is the author of various articles in professional journals.*

THIS paper presents the rationale for a community program [1] designed to control and reduce chronic delinquent behavior in all its manifestations that are common in high delinquency areas: violence, vandalism, crimes against persons and property, drug use and drug peddling, pimping, and prostitution.

The program is designed to improve the real life chances of teen-agers in the community by providing a variety of services and opportunities and by modifying the cultural climate in the area. These services and activities are to be provided in a co-ordinated fashion by a central authority connected with a university.

The rationale for the program is "research-based" in four ways. It is, first of all, based on research into what motivates and perpetuates a delinquent way of life. It is also based on research into successful techniques of social intervention and on research into the feasibility of such a program in the light of known and anticipated resistances—from within the delinquent community, from the inertia of the surrounding social system, from the covert sabotage or inadequate co-operation of those whose vested interests may appear to them to be threatened by the program. Finally, the program is "research-based" in the sense that it has been designed to include systematic self-evaluation in such a manner that either success or failure will lead to accumulation of knowledge.

This is not to imply that the status of existing knowledge—based on research or experience or theory—concerning these four aspects of the problem is satisfactory. In fact, our knowledge in this whole area is spotty and little of it is directly relevant to a community program. We simply gathered all of the relevant information that we could locate, evaluating evidence in terms of consistency of findings and relying heavily on our own knowledge accumulated in studies of sociogenic and psychogenic factors in one type of delinquent behavior: juvenile heroin use.[2]

[1] This program has been developed by Isidor Chein and Eva Rosenfeld at the Research Center for Human Relations, New York University, under a grant from the National Institute for Mental Health.

## Meaning of a Delinquent Way of Life

Delinquent behavior, as all deviant behavior, is functional to the individual in some, often crucially important ways. It is at the same time obviously maladaptive by bringing him into conflict with authority and by isolating him from the mainstream of conventional social intercourse and from realistic and societally approved opportunities to advance his status or to realize his potentialities.

In general, the various delinquent ways of life have been developed as a response not to a single instance of hurt or deprivation, but to a series of persistent and converging experiences undermining the individual's capacity and self-confidence in meeting the demands of the conventional society in conventional ways. The major source of these repetitive, persistent crippling experiences is the pathogenic family. Other sources lie in the discriminatory position of minority groups, in the interpersonally exploitative and poverty stricken street environment, in the inadequate school that does not meet the child's

[2] This knowledge has been accumulated over six years by an interdisciplinary team, under the general direction of Isidor Chein, consisting of three social psychologists: Isidor Chein, Robert S. Lee, and Daniel M. Wilner; a sociologist, Eva Rosenfeld; and a psychiatrist, Donald L. Gerard, who had studied juvenile heroin addicts before he joined the research team. Eight studies have been completed and will be referred to in the text as RCHR Reports I to VII.

learning needs. These factors all converge to lower the child's self-confidence in meeting normal challenges of learning, social interaction, and work and push him in a direction of trouble.

Within the high-delinquency areas of big cities, it may be possible to distinguish several major "styles" of delinquent ways of life: the antisocial, "acting-out" conflict gang, with their vandalism, their provoking and malicious behavior, and intergang conflict (bopping); the "detached" drug users, some homosexuals, and "loners"; and the smooth, "cool," nonviolent delinquency of the pleasure bound big or petty racketeer or conman, the drug pusher, the pimp.

Although, in the complex network of delinquencies that flourish in some neighborhoods, these various types often collaborate and mutually facilitate each other's interests, there is a basic incompatibility between the true representatives of each type. The habitual heroin user and the "bopper" exemplify such sharp incompatibility. "Bopping" gangs usually expel their addicted members or, if too many members become addicted, the character of gang activities changes drastically from violent, expressive acts to more utilitarian crimes.[3] The "cool," pseudo-bohemian delinquent expresses contemptuous disdain for the acting-out delinquent as well as for the drug addict.[4]

The differences among these subtypes of delinquents are reflected in their values, attitudes, and beliefs, as well as in the kind of delinquencies they prefer.[5] But there is a considerable body of evidence that a core cluster of these values and attitudes is apt to characterize the delinquents with whom this paper is concerned and is already discernible among the youngest teen-agers in high-delinquency areas: The rejection of conventional beliefs as "phony," untrue. Characteristically, delinquents reject the possibility that anyone—and especially official representatives of the society at large—really cares about them: "No one gives a damn." They also reject the possibility that reachable opportunities for maintaining one's self-esteem while "going straight" are available and that law-abiding effort pays. *"You can't win"* is their motto.

These beliefs are a reflection of past experience;[6] they are supported by the youths' current experiences in their disorganized, impoverished, discriminatory environments; they are further supported by the prevailing climate of values, attitudes, and beliefs in the high-delinquency areas.[7] While these beliefs,

[3] RCHR Report No. III, "Heroin Use and Street Gangs" (1954). This report is summarized in Wilner, Rosenfeld, Lee, Gerard and Chein, "Heroin Use and Street Gangs," the *Journal of Criminal Law, Criminology and Police Science*, Vol. 48, No. 4 (November–December 1957), pp. 399–409.

[4] Kenneth Marshall, "The Evocative Functions of the Language Patterns of the Be-Bop Cult," unpublished M.A. essay, College of the City of New York (1951).

[5] A lively description of the varying life styles of "zoot-hipsters," "cool-hipsters," and "bop-hipsters" will be found in a doctoral dissertation in progress at New York University by Kenneth Marshall. Albert K. Cohen's study of *Delinquent Boys: The Culture of the Gang* (Glencoe, Ill.: The Free Press, 1955) focuses on the acting-out "conflict gang"; the violent, anti-utilitarian, malicious behavior he describes applies only to the "bop-hipsters." Drug users are neither violent, nor malicious, and their crimes against property are very much utilitarian; in fact, when incidence of drug use increases in a neighborhood, malicious crimes show a downward trend and crimes that can bring financial returns increase (RCHR Report No. 1-A, "Delinquency Trends," 1954).

[6] See S. A. Szurek, "Some Impressions from Clinical Experience with Delinquents," in Kurt R. Eissler (Ed.), *Searchlights on Delinquency* (New York: International University Press, 1949), p. 124.

[7] An investigation of values, attitudes, and beliefs among eighth-grade boys in three of the high-delinquency neighborhoods in New York City revealed, among others, a cluster of pessimistic, cynical, depressive attitudes, accompanied by a sense of futility and mistrust, a rejection of conventional values, and a positive attitude to experimentation with drugs (RCHR Report No. IV, "The Cultural Climate of Juvenile Drug Use," 1956).

in turn, serve to support, justify, and sanction a delinquent way of life and are, in this sense, rationalizations, no one could deny their reality-basis; for, indeed, in each delinquent's personal experience "no one really cares" and "you can't win." And these experiences are likely to continue. The delinquent has low self-esteem, his know-how of conventional ways is very limited, and, his image of the future being unreal and hopeless, he has little motivation to think about it and work towards it.

If our aim is to induce these youths to abandon their delinquent ways of life and become law abiding, we must be able to convince them that society cares about them, that there are reachable opportunities for obtaining what they need, including status, in legitimate ways, and that "you can win."

These opportunities and this help must be brought directly into the peer culture of the street, for that is the common reservoir of beliefs, myths, information; that is the terrain in which beliefs are reality-tested; that is the armory from which the youngsters select the weapons with which they will try to cope with life.

The first feature of the proposed program, accordingly, is directed at the community. It aims to make opportunities for legitimate success available and easily accessible, and to help delinquent youth develop self-confidence and "know-how" in the conventional world.

Specifically, the following services are recommended:

Vocational guidance for work choice and work adjustment;
Extension of presently available work opportunities;
A special program of leisure activities, including encouragement of self-expression, self-determination, and participation in community affairs by youth;
Provision of rewards for approved behavior (scholarships, contest prizes, public recognition);
Provision of a larger number of good models for imitation (more male teachers, more youth workers, appearances of local boys who made good, public recognition of local adults who contribute to the community's welfare).

This part of the program assumes a certain minimum of ability for testing beliefs and attitudes against reality. But the delinquent way of life is not wholly rational. And our concern over the sort of response one is likely to get in offering help and opportunity to the delinquent youths has to do with the irrational component in their behavior, which, in turn, depends on the degree to which they are "healthy" or "sick."

## THE "SICK" DELINQUENT

In an effort to classify delinquents along a health-sickness dimension, investigators have developed many types and categories. For a community program, however, a simple distinction will suffice between "basically healthy" delinquents, operationally defined as those who will respond positively to manifestly friendly and sincere offers of help, and "sick" ones who, in the face of such offers, will only intensify their delinquent way of life.

These are, naturally, only "ideal types." In fact, there is a wide range of more or less responsive, more or less nonresponsive delinquents in every group we mentioned above: the acting-out (bop-hipsters), the detached (cool-

hipsters), and the exploitative (zoot-hipsters). In every group there are "true" representatives and "peripherals" who join for protection, or because they had no alternative choices of association, because they are attracted by the sense of belonging and solidarity that the gang offers, or simply by chance. Often, one will find in a conflict gang some members who are not attracted by violence but who go along under group pressure; or, in a drug-using group, one will find youths who take the drug occasionally, but never develop an uncontrollable craving.

The difference between the "true" and the "peripheral" delinquent, or the "sick" and the "healthy," is in the extent to which the given mode of delinquent adaptation is necessary to satisfy the individual's unconscious needs either for rebellion and aggressiveness, or for immediate gratification of cravings, or for distance and detachment, or for control of others, or for degradation and outwitting of others. These and other such needs are an outgrowth of deep-seated conflicts and of the guilt and anxiety they generate. The particular mode of delinquent adaptation is designed to minimize these; the delinquent must maintain and perpetuate his delinquent interactions and hold on to his values and beliefs or face the intolerable pain of experiencing anxiety. He develops subsidiary "self-perpetuating" mechanisms which provoke others to rejecting or exploitative behavior so that he, in turn, is confirmed in his rationalizations that "no one cares," that "you can't win," that "everybody is out to screw you"—and that, consequently, "the wise one hits first" or "the wise one doesn't give a damn."

The sick delinquent is constantly engaged in "testing" his view of the world; but he makes sure that again and again he is proved right and the "squares" wrong, mean, unfair, dishonest, or stupid weaklings. Should the "square" who reaches out to the delinquent remain unseductable, incorruptible, and sincerely friendly through the repeated "tests" and provocations, the delinquent may resort to even more drastic mechanisms for reinstating his rationalizations and he may intensify his aggressive, manipulative, or seductive efforts to such an extent that he will ultimately succeed in frightening, antagonizing, or demoralizing the person who tries to help him. If this should fail, the truly "sick" delinquent will experience panic or depression. These pitfalls of interacting with delinquents are well known to clinicians, group workers, and institutional personnel working with delinquents.[8] Those working with gangs are exposed to even more drastic group testing and to often dangerously explosive group situations (though they may be helped along by some of the "healthy" gang members).

*Preparation for negative reactions*

Since the major focus of our program was designed precisely to break down the delinquent's core of beliefs and rationalizations, preparation for the anticipated negative reaction of the "sick" delinquents must be also a part of the program.[9] This preparation is threefold.

[8] For a description of the mechanisms used by delinquents in interacting with therapists see Donald A. Bloch, "Some Concepts in the Treatment of Delinquency," *Children*, Vol. 1, No. 2 (1953); and, in general, the writings of S. A. Szurek, A. Aichhorn, F. Redl, D. Wineman, A. M. Johnson, B. Bettleheim, K. Eissler—to mention some of the most outstanding writers.

[9] The general strategy of the program is first to make available those opportunities that are likely to "reach the reachable," the responsive. The nonresponsive, the "sick," will be identified by their resistance and sifted out, with the understanding that special measures must be taken to help them. This expectation of the "sifting-out" process is based on the experience of detached group workers in various parts of the country. Cf. Walter B. Miller, "The Impact of a Community Group Work Program on Delinquent Corner Groups," *The Social Service Review*, Vol. 31, No. 4 (December 1957), pp. 390–406, and "How They Were Reached," *New York City Youth Board Monograph No. 2* (Nov. 1954).

First, there should be careful selection and training of personnel who are to work with the delinquents. These people must understand the meaning, the force, and the function to the delinquent of his testing and provoking behavior. They must know that one should not press the individual, or the gang, beyond the point of open anxiety. They must be aware of the "games," the tricks, and the subversive force of the delinquent interaction, to protect themselves from falling into traps and being subtly seduced into dishonesty or unfairness. All this means that personnel training is a second major part of the community program.

Unhappily, the aspect of training that has to do with insight into the explosive nature of personal interaction with delinquents is largely limited to psychotherapists and to psychiatrically oriented social workers. Our proposed program, therefore, provides for intensive training of group work personnel and establishment of a continuous, university-connected seminar-workshop to discuss, appraise, and constantly improve techniques of personal interaction with delinquents in the community.

Second, to be in readiness for anticipated negative reactions of the "sick" delinquents, the program should assure accessibility of treatment resources for those individuals who may break down or become isolated as the bulk of their peers become law abiding.

In recognition of the existing difficulties in securing prompt referral of cases for treatment; the duplication and bureaucratization of intake procedures; the distance of treatment centers from the "territory" of gang members; and the unpreparedness of many existing treatment centers for handling delinquents with the necessary understanding, we find it advisable to recommend establishment of local treatment facilities more accessible than most present agencies to delinquent youth and more efficient, personal, and capable of maintaining continuity of treatment in the community.

Third, the program should meet the special needs of the postinstitutionalized: parolees from reformatories, addicts released from hospitals after detoxification, the emotionally disturbed returning from residential treatment centers. These are probably the most neglected groups and yet most in need of sustained help. Their institutionalization is often a mark of the chronicity of their deviant behavior and of the pathology of their home environment. Release from institution or hospital seldom indicates a genuine improvement in the youth's capacity to manage in a nondelinquent fashion, and a return to the community is commonly followed by a return to the previous way of life. There is general consensus among experts that residential treatment effort is vitiated by lack of after-care, support, and special services in the community. The need for more half-way houses, work-training centers, residential clubs, and individual after-care contact is generally recognized by all treatment personnel.

These services are vital to the rehabilitation of the chronic delinquents. But they are also vital for the success of the whole program. For one thing, the postinstitutionalized delinquents are often the most effective carriers of the antisocial culture which the program aims at destroying. The program also aims at destroying the conviction that "no one gives a damn about us anyway"; continuing support to youths who

are blatantly antisocial is best proof that society cares.

We recommend, therefore, the provision of adequate services for postinstitutionalized youth. As with the other services, these, too, should be so located as to assure maximal benefit to local youth.

These services would include:

- A sheltered workshop for "work therapy" and as a terminal institution for those incapable of working in the open market
- Intensive after-care services for parolees and postaddicts
- A residential club for young adults
- A "youth house" for parolees, postaddicts, and postinstitutionalized individuals
- A "residence house" for inadequate young adults
- A program for the administration of low-cost morphine for "incurable" addicts.

### METHODS OF COMMUNITY INTERVENTION

It is a truism that community intervention must be based on community participation. Specifically, in our type of program, the staff must be alert to the interests, needs, feelings, and attitudes of the various segments of the community. For members of the community will be more likely to accept and use the services and opportunities offered them and their children if they are invited to participate and encouraged to discuss and help in carrying out the program. Furthermore, the adults in the area serve as models of behavior for the youngsters; in order to develop a more dignified and confident self-image among the young, one must also encourage more self-determination as a basis for a sense of dignity and confidence among the adults. Finally, in the effort to create a more unified climate of attitudes concerning the behavior of the youth, one must have the backing and help of the adults in the community.

All these are impelling reasons. But the involvement of the adults in the community in this, primarily youth-oriented program is also imperative for another kind of reason. Many, if not most, of the families of the severely disturbed youngsters function poorly and generate a great deal of tension. In some instances this tension is due to financial difficulties, in others, to primarily emotional conflicts; often both sources of strain co-exist. A community program obviously cannot hope to resolve the manifold problems of all these families, most of which are very "hard to reach." The resigned, unco-operative attitude of slum residents to suggestions for self-help is largely the result of many frustrating experiences, many efforts to no avail, years of ineffectual and protracted struggles to get landlords and city officials to provide and enforce the people's legal rights.[10]

These experiences, which parallel the experiences of the juvenile delinquent, must be countered in a similar fashion. To do so we suggest providing such services for the community in general as will lessen its sense of futility and failure in "getting to see some action" on general problems of housing, legal aid, rent control, and on the more specific problem of the "hard-core" families.

### ANTICIPATING SOURCES OF RESISTANCE TO THE PROGRAM

The program also calls for a considerable amount of co-ordination among the services of various city and social agencies and for a centralized administration of these services in the community. In our interviews with experts we were met with a common response: A program of this kind is precisely what is called for, but it is not feasible because social and city agencies will not co-operate. This opinion our experts based on their past experiences of failure in various efforts at co-ordination of services. In probing into the nature of this experience, we discovered several features of it that made it more easy for us to resist the overwhelming pessimism of the experts.

First, there has been no systematic effort to analyze the reasons for failure of past attempts at co-operation. The "wisdom of experience" was, in this case, purely impressionistic and personal.

Second, and that was to our mind crucial, the experiences of failure in previous efforts to enlist the co-operation of various agencies in combating juvenile delinquency were experiences of a different kind of efforts than envisaged in our program—much smaller in scope, much less carefully thought out; and from the outset characterized by manifest shortage of funds, personnel, and authority.

In all the bitter accounts of open defiance or subtle sabotage or "false" co-operation that was worse than stark refusal, we could detect little that seemed inevitable or inherent in the nature of the effort. Rather, what seemed at fault was the particular approach; or the manner of enlisting co-operation; or making demands that were perceived as incompatible with the main function of the agency ("turning policemen into social workers"); or failure to provide and maintain adequate material and social rewards to sustain and persevere in the program; or failure to provide solid support and auxiliary facilities to front line workers—and a host of other such factors.

Third, the pessimistic opinions of most experts were counterbalanced by a few accounts of successful attempts at bringing various agencies together. None of these was very spectacular or long lasting. They were usually initiated by people with a flare for trying what the more experienced claim is impossible.

We concluded that the "right" people using a "right" approach might possibly be somewhat more successful than sad, past experience would suggest. But what is "right" still remains an open question. This question can be answered only in the process of implementing the program. Our proposed strategy in this respect consists of several steps.

First, we propose to begin by investigating[11] the reservations and objections that various agencies which are expected to participate in the project may have, the difficulties and problems they can anticipate, and the conditions under which they are willing and able to participate.

Second, we propose to set our program up as a demonstration project in one area of the city. No agency would be totally involved in the program; rather, it would be invited to participate on an experimental basis, assigning some of its personnel as liaison representatives. The benefits to the existing agencies of participating in such an experimental project are substantial. Those of their staffs who will be working in the project area will provide a feed-back of experimental knowledge to their respective agencies. Each agency will have an opportunity to use the project area as a testing ground for new policies and methods which seem desirable but not sufficiently proven to warrant introduction in its over-all program. What will

[10] See, for instance, "The Neighborhood Center for Block Organization: An Experiment in Self-Help at the Neighborhood Level," in C. E. Murray, M. G. Bowens, and R. Hogrefe, *Group Work in Community Life* (New York: Association Press, 1954).

[11] This investigation is now under way, under the direction of Isidor Chein at the Research Center for Human Relations, New York University.

be asked of the co-operating agencies is, in fact, no more than that they continue to do their work in the project area in the best way they know, but under the most favorable circumstances and with an increased staff for whom the resources of a university will be enlisted to provide special training.

Third, we propose to carry on continuous ongoing evaluation (described below) of the success of interaction of personnel representing the various agencies and of the effectiveness of their services to the community. This type of evaluation examines both failures and successes as they occur and maintains a constant feed-back of corrective information aimed at avoiding the repetition of mistakes and constantly improving the functioning of the group.

This strategy is designed to maximize chances for success in enlisting the co-operation of the various agencies. It is also designed to salvage the learning value of failure, should the effort end in failure. At present, the pessimistic wisdom that "You can't get agencies to work together" is so amorphous and generalized that it can be used only to maintain inaction and to paralyze any renewed attempts to work together. It would be well worth any amount of effort to give this paralyzing myth a more factual, more specific form.

## EVALUATION

The nature of a program determines the kind of evaluation that can be made of its effectiveness. Since the proposed program is one of "saturation," its impact will be in a response to the total environmental change. It would therefore be impossible [12] to isolate the impact of any one feature of the program on the behavior of the youth in the area.

The evaluation would have two major aims: to assess the total impact of the project and to assess each service in terms of its own immediate objectives.

Evaluation of the total impact of the project would call for (a) the assessment of changes in the motives, interests, hopes, self-image, attitudes, self-confidence, and so on of a sample of delinquent youth (this represents the "intervening variable" which is seldom measured in evaluating this type of program) and (b) the recording of rates of symptomatic behavior in the area and in several control areas, such as, offenses against persons and against property, incidence of drug use, admission to mental hospitals from the area, crimes of pent-up energy.

Evaluation of individual services is predicated on the notion that we do not necessarily know the best way of carrying out the co-ordinating functions or of providing each of the numerous services. Experimentation with various techniques and approaches so as to provide the necessary services and fulfill the co-ordinating functions in the most effective way must, therefore, be a major aim of the program.

In other words, the program must be seen as an ongoing, continuous experiment, with evaluation directed to the main functions of the program: How to create and maintain genuine co-operation among agencies dealing with youth; how to create and maintain a more unified orientation to youth among the residents of the community and the workers of agencies that serve its youth; how to identify the best techniques for bringing each of the essential services to those youths who need them most and the most efficient methods for maintaining and making the best use of the services; and how to make all of this part of the psychological life space of the residents of the area, especially of the youth—or, in other words, how to make all of this evident in the community atmosphere.

The evaluation of the effectiveness of each group of services would, consequently, have to ascertain at any given stage of the development of the service (a) how the service is carried out and (b) how it is received by those for whom it is intended; that is, the manner in which the program's services are perceived, interpreted, and utilized by the residents in general and the various subgroups in it. If the manner in which the service is carried out, received, and used does not come up to the professed aims of the service, an effort would be made to discern what, in the way in which the service is being carried out, misfired. If the cause for the malfunctioning can be discerned, appropriate modifications can be made. This new method or approach would itself be evaluated, and so on until the end of the project.

It is thus hoped to evolve the best possible method for rendering each particular service. Evaluation, here, is a means for constant improvement rather than a basis for final judgment. In this part of the evaluation task, we would not be concerned with passing ultimate judgments in relation to the total objective of the program but with inventing, developing, testing better ways for doing the things we want to do.

The over-all success of the program at its conclusion would be judged against its two major aims: (a) stimulation of a habit of constant improvement in the services for young people in deprived areas; of a spirit of co-operation among agencies in pursuing their common aims; and of a greater consensus on problems of young people and the ways of answering their needs; (b) reduction of deviant behavior among young people in the area by making it easier for them to succeed in normal, legitimate channels.

## CONCLUSION

We have only indicated some of the major points in a proposed demonstration program. The main purpose of this paper was to elucidate some aspects of the rationale from which it has been derived; there was no room for describing the program itself. Even the rationale is presented in a highly curtailed, summary form and the mass of relevant evidence is largely omitted—also for lack of space.

For those who would like to test our rationale we would suggest this: Take a walk in a high-delinquency area of a big city and look at people's faces; spend a couple of hours in a "trouble clinic" of a settlement house; read one complete case history of a chronic delinquent. In other words, we feel that the rationale is self-evident to all who have been exposed at close hand to the conditions that breed and sustain delinquent behavior among juveniles, and that this rationale points to the program we envisage: A saturation program of *all* vital services which will be accessible to the youths in their natural habitat and co-ordinated to eliminate the shuffling of troubled youngsters from one intake worker to another, and to assure continuity of help as need for different services arises.

What is not self-evident is that it is possible to realize this type of program and that, should it be realized, it will indeed substantially lessen delinquent behavior. These questions can only be answered by trying to do in the best way we know the things we know are needed and by examining the fruits of our labor in an honest, self-critical manner, to learn how to do it better. It is the most we can do—and the least.

[12] Hypothetically, it would be possible to design such a project—by working with a large number of equated areas, one for no new service, one for each experimental service, one for every pair of experimental services, one for every combination of three services, and so on, to say nothing of replications; in practice, it would be an understatement to say that such a project would be impossible.

# Report of the Board of Directors to the Members of The American Academy of Political and Social Science for the Year 1958

(Presented by the President at the Annual Business Meeting of the Members, held at the Academy Offices, 3937 Chestnut Street, Philadelphia, 26 January 1959.)

## Officers and Staff

NO changes were made in directors, officers, or editors during the year. One staff position was discontinued, pursuant to a consolidation of duties.

## Membership

Five hundred and seventy-nine more new members were enrolled in 1958 than in 1957, and 263 fewer members died or resigned, a total improvement of 842. After being concerned for a number of years over a decline in membership, we are pleased to report that the decline has been arrested and that we have moved ahead.

## Finances

The average annual deficit for the years 1949 to 1956, inclusive, was $5,474. In 1957 there was a slight surplus—$261. This was increased to $2,423 in 1958. But because we paid for one more issue of THE ANNALS in 1958 than in 1957, we should say that our financial position in 1958 was $8,400 better than in 1957. These figures are exclusive of the $10,000 donated by Senator Joseph S. Clark. Also, they do not reflect accretions in the market value of securities. Besides $28,202 in the bank, we have a portfolio of securities worth $277,392.37. Also, we own this building, a large inventory, and all of our equipment. We have no debts. I have advised our Treasurer to reduce our bank balance by $14,000 and add a corresponding amount to our portfolio of securities.

The totals in the Operations Report do not agree with those in the Auditor's Report. They should not agree, because the Auditor's Report reflects the value of inventory and equipment, whereas our Operations Report does not deal with these matters. The two reports have been completely reconciled in a conference between the Auditor and your President.

FINANCIAL STATEMENT ON OPERATIONS, JANUARY 1958 THROUGH DECEMBER 1958

| INCOME | 1957 | 1958 | |
|---|---|---|---|
| Dues and subscriptions | $ 81,919.16 | $ 87,241.20 | |

## PUBLICATIONS

During 1958, the six volumes of THE ANNALS dealt with the following problems:

| | |
|---|---|
| January | *Understanding Alcoholism,* edited by Selden D. Bacon, Director of The Center of Alcohol Studies, Yale University. |
| March | *A Crowding Hemisphere: Population Change in the Americas,* edited by Kingsley Davis, Professor of Sociology and Social Institutions, University of California, Berkeley. |
| May | *The Satellites in Eastern Europe,* edited by Henry L. Roberts, Director, Russian Institute and the Program on East Central Europe, Columbia University. |
| July | *Asia and Future World Leadership,* edited by James C. Charlesworth, Professor of Political Science, University of Pennsylvania, and President, The American Academy of Political and Social Science. |
| September | *Unofficial Government: Pressure Groups and Lobbies,* edited by Donald C. Blaisdell, Professor of Government, The City College of New York. |
| November | *Highway Safety and Traffic Control,* edited by John W. Gibbons, Director, Publications Division, Automotive Safety Foundation. |

The publication program for 1959 includes, in addition to the January volume on China and the Overseas Chinese, edited by Howard L. Boorman, Director, Research Project on Men and Politics in Modern China, Columbia University, the following:

| | |
|---|---|
| March | *Prevention of Juvenile Delinquency,* edited by Helen L. Witmer, Director, Division of Research, Children's Bureau, Department of Health, Education, and Welfare. |
| May | *Administration of Technical Cooperation Programs,* edited by Richard W. Gable, Associate Professor, School of Public Administration, University of Southern California, Los Angeles. |
| July | *Resolving the Russian-American Deadlock,* edited by James C. Charlesworth, President, American Academy of Political and Social Science. |
| September | *American Civilization and Its Leadership Needs: 1960–1990,* edited by James C. Charlesworth, President, American Academy of Political and Social Science. |
| November | *Perspectives on Government and Science,* edited by Norman Wengert, Professor of Government and Politics, University of Maryland. |

During 1958 the book department of THE ANNALS published 405 reviews. Most of these (311) were by college and university teachers or administrators in this country; 20 were by government officials or members of the Armed Forces, 25 by foreign experts, 17 by representatives of business or other (nonprofit) organizations, 6 by editors and journalists, and 26 by individuals with no particular affiliation listed. Foreign reviews were from Germany, Lebanon, Denmark, France, Switzerland, India, Australia, Canada, and Great Britain; the greatest number of these were from the last country named. Five hundred and twenty-two books were listed in the Other Books section.

One hundred and fourteen requests to reprint material from THE ANNALS were granted. Forty of these were to college or university personnel for use in books, 11 to government officials, nonprofit organizations, or private citizens for use in books, and 4 directly to the publishers of forthcoming volumes. Sixteen requests were granted for the reproduction and use of ANNALS material in college classrooms or adult extension courses; 4 to business or nonprofit organizations for reproduction and distribution. Twenty requests by government agencies were granted, 11 of which

were from government colleges. Several of the other government requests were from the United States Information Agency for distribution abroad. Eleven permissions to use ANNALS material in other magazines were given, 3 for use in articles where the future publisher is unknown, and 5 for use in microfilmed theses. Articles were translated into several foreign languages, including Japanese, Turkish, Italian, and Danish. Two entire volumes were recorded by the Talking Book section of the Cleveland Library for the use of blind scholars.

### MEETINGS

The 1958 Spring Meeting, organized around the general subject of "Asia and Future World Leadership," generated an unusual amount of interest on the part of the members and delegates. Attendance was the largest in the President's knowledge of Academy meetings, and participation by the audience was at times heated. Some of the Ambassadors on the program made surprisingly forthright remarks.

A special conference was held in November 1958, under the auspices of the Academy and Senator Joseph S. Clark, dealing with the subject of "American Civilization and Its Leadership Needs: 1960–1990." This conference, attended by twenty national leaders in science, government, education, and the arts, was the first phase of a far-reaching project. We hope to arrive at a set of valid value judgments as to whether our national cultural objectives are properly reflected in our vocational emphases. Which key occupations are over- and which under-supplied by new talent? The next phase of the project will be a volume of THE ANNALS and a brochure, which will be widely distributed. The third phase will be a bold attempt to obtain foundation support, to implement the recommendations of the study. You will hear more about this project later. (It was made possible by Senator Clark's grant of $10,000 to the Academy.)

The 1959 Spring Meeting will deal with the subject of "Resolving the Russian-American Deadlock." We hope that there will be a minimum amount of vituperation and contumely in the addresses, and that a sincere effort will be made by the participants (representing a number of different countries) to seek solutions, however modest, to some of the disputes with which we are so familiar.

Respectfully submitted,

VISCOUNT MONTGOMERY OF ALAMEIN (Bernard Law). *The Memoirs of Field-Marshal the Viscount Montgomery of Alamein, K.G.* Pp. 508. Cleveland and New York: World Publishing Company, 1958. $6.00.

Writing some two months after the publication of this book, one is tempted to review the reviews of it, rather than the book itself. For surely few books about World War II have made such a splash as this one—all the bigger and wetter, it almost seems, for coming thirteen years later, long after the Ingersolls, the Wilmots, most of Monty's fellow actors in the great drama, and even the official historians have had their say. It would all seem to show that for the reading public World War II is still, after all, sure fire.

My own guess is that the author, not his subject, is responsible for the splash. The Field Marshal was always a hard man with whom to live or work. He was arrogant, opinionated, self-centered, and vain. One hears that his troops adored him, but this testimony does not come from the troops. There is something naive and a little tiresome in his insistence that he fought all his battles according to plan, as though, even if it were true, this were a high virtue. Disciples often outdo their masters, but Montgomery's claim that he could have ended the war in 1944 by a concentrated thrust toward Berlin goes beyond those made on his own behalf by his three chief defenders, Wilmot, Moorehead, and de Guingand. Nevertheless, the man has a compelling quality. The arrogance and self-esteem appear genuine, not a mask for insecurity. His criticisms of others, even the devastating contempt with which he obliterates some of those who differed with him—such as Sir Frederick Morgan and the British airmen—somehow seem free of bitterness. For Eisenhower, whose "broad-front" strategy he believes responsible for prolonging the war, he expresses warm affection. Curiously enough, some of his more critical reviewers criticize him with a kind of sorrowful affection, as though he had let them down.

Yet, to those who have followed the controversies stirred up by Montgomery's war-time career, the memoirs will be disappointing. On all the ancient causes célèbres of World War II, he and his disciples had their say long ago. All we get here is a brief rehash, and on some episodes, notably the Ardennes crisis of December 1944, not even that. Especially frustrating is the chapter on the battles in Normandy in mid-July 1944. Was

Montgomery really trying for a breakthrough to the Seine when he hurled upon the city of Caen three armored divisions and an aerial bombardment of unprecedented weight? Or was this attack, as he insisted, simply a phase in the unfolding of the "master plan" he had devised months before D-day, by which German armor was to be pinned down by the British and Canadians on the left, so that the Americans on the right could make the decisive breakthrough—as they did a few days later? We don't know yet, and perhaps we never will. For Montgomery's own orders and correspondence can be, and have been, cited to support both sides, and it begins to look as though all the evidence is in.

A little more than a third of the book is devoted to the author's post-war career—as occupation zone commander, Chief of the Imperial General Staff, and Deputy Supreme Commander of Supreme Headquarters Allied Powers, Europe (SHAPE). He concludes with some sober but not unhopeful advice on Western unity.

NICHOLAS MANSERGH and others. *Commonwealth Perspectives*. Pp. viii, 214. Durham, N. C.: Duke University Press for the Duke University Commonwealth-Studies Center; London: Cambridge University Press, 1958. $4.50.

In the spring of 1957 a Joint Seminar was held for social science graduate students under the auspices of the Duke University Commonwealth-Studies Center. The purpose was to introduce the Commonwealth, indicate some of its main problems, and outline the possibilities for research. The faculty contributions to this effort are now presented in this volume.

Professor Mansergh of Cambridge University traces, in his two essays, the constitutional evolution of the unique association of independent states known as the Commonwealth and views the course of the foreign policies of its members from 1945 to 1956. Most valuable is the account of how the multi-racial Commonwealth was achieved in 1948 by agreement on a formula which reconciled India's status as a republic with acceptance of "the king as the symbol of the free association of its independent member nations, and as such the Head of the Commonwealth." The constitutional evolution of the present Commonwealth has been a fascinating if not a logical process. And it has been well said of the final structure that "if it did not exist, you could not invent it." Professor Mansergh's essays go far in explaining the diversity within unity which is the chief hallmark of the Commonwealth.

Rightly an essay is devoted to the emergence of Ghana as the first African nation to achieve membership in the Commonwealth. Professor James L. Godfrey traces its development from crown colony to independent state and indicates some of the serious problems which now confront it. A stimulating contribution by Professor Joseph J. Spengler discusses the nature and implications of demographic trends in the Commonwealth. There is much to the view that in the final analysis the future character and fortunes of the Commonwealth will depend on the stork. Despite some tortuous prose and reliance upon social science jargon, this essay shows clearly the importance of population trends on the unity of the Commonwealth. What will happen if Britain ceases to be a source of population and capital to such states as Australia and New Zealand? And what will be the outcome if Britain and the older, and more industrially advanced, states in the Commonwealth are unable to provide significant amounts of capital to India, Pakistan, or Nigeria? These are questions that all students of the Commonwealth must follow closely.

The perspective on the Commonwealth is rounded out by a study by Professor Robert R. Wilson who examines rules of public law in relation to such subjects as nationality and the settlement of disputes between members. In addition to this valuable paper there is an essay on health and welfare programs in Australia and Canada by B. U. Ratchford, and one on the prospects for the Sterling Area by Brinley Thomas.

While necessarily not exhaustive, the essays in this volume constitute a valuable contribution to Commonwealth studies.

Los Angeles

J. S. FFORDE. *An International Trade in Managerial Skills*. Pp. 153. Oxford: Basil Blackwell, 1957. 18s 6d.

In recent years, a great deal has been written about the economic problems of underdeveloped countries; surprising little has been said about the deficiencies existing in these countries relative to managerial and technical skills. Nuffield College, Oxford, of which the author of the present survey is a Fellow, accepted a grant from the World Bank in 1954 to cover an inquiry into British experience relating to the following questions: If the underdeveloped countries need to import managerial and technical services, how can they best acquire and use them? How can they attract them in correct quantity and quality but on terms that are also consistent with local social and political requirements?

Four main routes are discussed along which British managerial services may flow into underdeveloped countries. These are summarized below:

First, acquiring British staff on an individual basis, person by person, for an enterprise that is wholly owned by local nationals or by the overseas government. This is termed the "individual route."

Second, acquiring the necessary assistance and collaboration by establishing an active working partnership between a local business—privately owned or not—and a British concern, or group of concerns, which has specialized knowledge and experience. This is called the "joint venture."

Third, acquiring the necessary assistance from the same type of British business but without the active local partner. This route is titled that of "product-specialized foreign investment."

Fourth, acquiring the necessary services from a type of British business which could perhaps be squeezed into route three, but is best treated as a separate route. This route is that of the "trader-industrialist."

The factors affecting the choice of route are described at length by the author. These include the following: first, the actual or desired degree of active local control; second, the source of technological or other forms of progress specific to the industry concerned, and the extent to which general participation in such progress is one of the services required to be imported from abroad; third, the degree of process differentiation present in the producing and marketing of the goods concerned; fourth, the size of the local enterprise concerned and the number of foreigners required; and, fifth, the length of time of the proposed association with foreign individuals or a foreign business, and the degree to which the services to be imported change over time.

This is an important book and one of special significance to Americans who are concerned, on the governmental or private level, with aid to underdeveloped nations. Fforde's statement that "when we talk in general about helping [these nations] in a managerial and technical field, we must better inform ourselves of an active environment and begin examining the possible and appropriate" has relevance to the American approach to countries seeking assistance in the managerial field. Far too little has been written in the United States about the problems and challenges inherent in transferring our managerial "know-how" to undeveloped countries. Fforde's book points the way to a greater understanding of the subject. Someone in the United States who is a specialist in underdeveloped economies and the managerial sciences now must write a comparable study.

GERHARD VON GLAHN. *The Occupation of Enemy Territory: A Commentary on the*

*Law and Practice of Belligerent Occupation.* Pp. xiii, 350. Minneapolis: University of Minnesota Press, 1957. $6.50.

At the cessation of hostilities at the end of World War II, a new concept of settling the peace emerged. Until this time, the treaty of peace was the customary means of terminating hostilities and restoring sovereignty to the vanquished. Following the treaty of Versailles, there was a limited occupation for the demilitarization of the Rhineland, but it took place after the treaty and for an extremely limited purpose. At the termination of hostilities after World War II, however, peace treaties were signed many years later and the intervening period was one of military occupation. This was a natural corollary of the phenomenon of total war which required the evocation of attitudinal and institutional changes in the defeated nation before it could be restored to its position among peaceful nations. The deliberate effort to induce change in the vanquished societies of Germany, Austria, Korea, Japan, and the Ryukyus was really a revolution in the conduct of foreign affairs.

The present volume surveys part of that effort. It is limited, however, to belligerent occupation which von Glahn defines as "the occupation of part or all of an enemy's territory in time of war." This means that it is concerned almost exclusively with the military occupation of Germany from the time of the invasion to the surrender in May 1945, which is the least significant portion of the total occupation. Japan and the Ryukyus and the German occupation following May 1945 are not analyzed because the author defines this as "hostile occupation . . . of the territory of a country which was surrendered completely and no longer maintains armed forces in the field." Korea and France are not discussed, because they come within a second category, also not dealt with, "occupation of neutral or allied teritory which usually takes place under a plea of military necessity but sometimes for purposes of liberation from an enemy."

Although the period thus analyzed in this volume is less significant than the subsequent period to the actual signing of the peace treaties, the limitation which the author sets is necessary for analytical purposes. It makes possible a thorough synthesis of practices allowed by international law during this period. The subject is divided into such traditional categories as proclamation, native inhabitants, neutral citizens, courts, currency, and property. Under the various headings the substance of the Hague Regulations, the Fourth Geneva Convention of 1949, and of numerous secondary sources are summarized and analyzed. The result is an extremely useful compendium of commentary on occupation during wartime. The extensive footnotes include citations to the occupations of the Ryukyus, Japan, and Korea, even though the text does not deal with these nations. An extremely helpful Appendix of pertinent documents and a comprehensive Bibliography add to the utility of this volume.

Duke University

L. JOHN MARTIN. *International Propaganda: Its Legal and Diplomatic Control.* Pp. vii, 284. Minneapolis: University of Minnesota Press, 1958. $5.75.

Most recent studies of propaganda have been preoccupied with problems of technique or with questions of its interrelationship with ideology, policy, and action. They show less of the moralistic tone found in much of the shocked or defensive writing about propaganda before World War II. While many amateur counter-propagandists —some in high places—have yet to recognize the insufficiency of responding to the initiative in communications of their opponents by "exposing" their "propaganda," scholars are learning that the persistence and power of self-serving communication calls for a more incisive and inclusive analysis.

Yet concern over the contemporary instruments of control over tendentious communication properly persists. One contribution, as yet unique, is Martin's study of the available legal and diplomatic instruments. His best chapters pull together

Princeton UNIVERSITY PRESS

**New England State Politics**

By DUANE LOCKARD

A lively, fact-filled study of New England state politics in which the author shows who has political power and under what circumstances it can be used, who can nominate or influence nomination for major offices, and who can pull great weight with the legislature, the governor, or administrators. "With a sharp eye for the significant, Lockard sets out in bold strokes the dominant features of the political systems of these states. Nor does he pull his punches. Here are the rivalries among the ethnic groups, the excesses of special interests, the weaknesses and strengths of the political parties, the vicissitudes of the vanishing Yankee, all related with insight, humor, and compassion."—*V. O. Key, Jr.* *376 pages. Maps & Charts. $6*

**Matthias Erzberger and the Dilemma of Germany Democracy**

By KLAUS EPSTEIN

Could Germany have been democratized without the catastrophe of World War I? Was she compelled by an objective view of circumstances to sign the armistice in 1918? Was there any alternative to accepting the Treaty of Versailles? Such questions as these are scrutinized in this study of the life and times of Matthias Erzberger, which deals with German politics before, during, and after World War I. *464 pages. $10*

**Norway-Sweden:**

**Union, Disunion and Scandinavian Integration**

By RAYMOND E. LINDGREN

Although they were amalgamated in a union from 1814 to 1905, Norway and Sweden were unable during that troubled period to achieve political integration. Only after the union ended in 1905 did the Scandinavian countries establish a security community, committed to economic cooperation and to the settlement of international disputes by peaceful means. In this book the author examines some of the problems faced by Norway and Sweden during the union and some of the forces that contributed to its failure and termination. Dr. Lindgren also studies the present status of Scandinavian integration and offers some conclusions to be gained from this study. *320 pages. $5*

both the legal principles and the major applications arising from international and domestic law. He glances at the possibility of extraterritorial control of states over their citizens abroad. He recounts concisely the important recent incidents where diplomacy has come into play, especially in dealing with official propaganda agencies.

His conclusions are modest and sound. The central difficulties of control arise from problems of definition and evaluation of propaganda. Law deals mostly with acts, less with conspiracy and intention, and "propaganda cannot and should not be divorced from the act it attempts to promote" (206). Thus the controller is dealing with the state in its full sovereignty, and control through international law is a dim prospect indeed so long as sovereignty persists. Since World War I, states have both intensified their controls through municipal law—covering channels and media of communication—and have broadened their freedom of action as propagandists. "The control of propaganda will remain," he concludes, "in the municipal laws of states and the bargaining power of diplomacy" (207).

Martin dallies with definitions, sketchily deals with the historical background of propaganda today, and summarizes the propaganda organization of a few major states. Events have overtaken him here, however, and he omits such a major contender as Communist China. He skirts the continuing issues of freedom of speech which underlie problems of propaganda control—issues and values which create the most serious dilemmas for those who would both enjoy and perpetuate the maximum of freedom.

But his diligent scholarship has assembled the principles, the cases, and the comment that are essential preliminaries to such discussion, as well as to a just judgment of the probable effectiveness of legal control. For this, the community of specialists in communications and the wider community of political scientists will be grateful.

### *EUROPE*

STANLEY MELLON. *The Political Uses of History: A Study of Historians in the French Restoration.* Pp. 226. Stanford: Stanford University Press, 1958. $5.00.

Mr. Mellon has produced a book which no one interested in the history of the French Restoration or in the problems of historiography in general will be able to neglect. The industry with which he has studied the writings of scores of contemporary historians, politicians, theologians, lawyers, and journalists dabbling in history is impressive. The inventory of that tremendous output of historical views and arguments bearing on the politics of the day is something to be grateful for, especially since it is plentifully illustrated with quotations.

The contestants who, in times of party strife, belabor each other with antithetical interpretations of the national past are by no means unusual phenomena. I have observed and described similar battles as they occurred in the Dutch Republic in the seventeenth, and again in the eighteenth, centuries. The French debate on the French Revolution was by no means ended by the Revolution of 1830; it was carried into the twentieth century with unflagging vehemence and hardly diminished political significance.

This debate was not confined to the actual happenings of 1789 and the following years. Both parties, the Liberals and the Royalists, were concerned to show opposing beliefs—the one that the age-old tradition of liberty had long been encroached upon by the monarchy and in the end justified the outburst of the Revolution, the other that the monarchy had been the guardian not only of the social order and of religion, but of liberty as well. To point out how badly liberty fared when the monarchy was overthrown was not enough; the earlier record of the monarchy had to be vindicated. The rival interpretations of the *Charte*, too—was it a Liberal instrument, a codification of ancient liberties made inevitable by the Revolution, or was it merely an emanation of the beneficent spirit of traditional monarchical govern-

ment—led the rival polemists into scrutinizing the past. And this was no less true for the question of the Church.

Mr. Mellon has special chapters not only on Gallicanism and Ultramontanism, but on the particular question of the Jesuits. He brings out the fact that the terrific excitement about the return of the Jesuits was not due to any fresh misdeeds which could be imputed to the small number of their new establishments, but instead to what was industriously dug up out of the history of the order. And similarly, in order to make the papacy suspect, the names of sixteenth century Pius V, Gregory XIII, Sixtus V, Gregory XIV, and of seventeenth century Innocent XI had to do service as frequently as those of the contemporary heads of the Church.

In his Introduction Mr. Mellon quotes Fiévée, who wrote, in 1818, that "our century is singular in that . . . it makes politics with memories." I think that in his own treatment of the material he is inclined to adopt this view with too little qualification. I have hinted already that in other times and in other countries "the political uses of history" were not unknown. But moreover, in his particular case, Mr. Mellon unduly heightens the impression that politics turned on nothing else but history by giving attention to that aspect too exclusively; this is in spite of his statement that we must regard his book as a study not so much of historiography as of politics.

When he represents the Liberals after the Restoration as having no recourse but to history in order to maintain themselves, he overlooks a good many things. And in fact he has failed to delineate expressly and with any distinctness the political background against which these fascinating historical debates were staged. The compromise nature of the Restoration, the salvage of some of the social and administrative reforms of the Revalution, the importance of the class of the *acquéreurs*, the survival of a large portion of the personnel of the revolutionary or Napoleonic regimes, the continuing influence of the Enlightenment —there are references to most and perhaps all of these aspects in the course of the exposition, but they have not been gathered in one consistent whole. The author talks about "the Liberals" most of the time. It is only half way through the book that he indicates—and no more than indicates—a distinction between the Liberals and the radical Left. The chapter on "The Splitting of the Coalition," which comes towards the end of the book, makes the reader realize how little has been said about that "Coalition" before. The *Charte*, which ought to have been discussed at the outset, is brought up only in an account of what first the Liberals then the Conservatives thought of it. As a result the historical discussion seems to be carried on in a political vacuum; it seems as if there were no politics outside it, which is an illusion.

The scores of writers who are introduced to us by Mr. Mellon include, naturally, a number of famous names. On some of these, as for instance on Guizot or Montlosier or Lamennais, I found him enlightening; on others, as for instance on De Maistre and Mignet, disappointing. The full treatment of lesser-known or even obscure men is particularly rewarding. Mr. Mellon's reference to Augustin Cochin's formula, *thèse de circonstances*, (p. 18, footnote, and repeatedly afterwards) is based on a misinterpretation of Cochin's text.

PIETER GEYL

MERLE FAINSOD. *Smolensk Under Soviet Rule*. Pp. x, 484. Cambridge: Harvard University Press, 1958. $8.50.

Would you like a peep into secret Soviet archives? The German capture of part of the archives of Smolensk followed by the American capture of German files has provided the opportunity. Merle Fainsod has used his incomparable knowledge to weave a pattern of exposition and interpretation to throw light on nearly every aspect of Soviet life from 1917 to 1936, when the archives cease. No student of Soviet affairs can afford to miss this account. While it will rarely surprise him, it will implement his knowledge with a mass of detail. More than that, it will re-emphasize with remarkable evidence the extraordinary opposition Soviet authority met in the peasants.

Fainsod ponders Soviet success in the face of massive peasant opposition and concludes that neither terror, nor force, nor party organization, nor a tradition of servility to the center—strong as each of these was—held the regime together, but rather that the real cause was the buildup of a network of revolutionary beneficiaries with vested interests in the perpetuation of the new order. In short the revolution was popular with powerful forces, and the vast concentration camp system which the archives expose did not become the source of such unrest as most westerners have assumed it to have been, for it was outweighed by the satisfaction of still greater numbers who achieved promotion beyond their dreams.

The most striking of the new information revealed by the archives is the fact that the state farms were, until the purge of the mid-1930's, the refuge for outlawed elements: former *kulaks*, Tsarist officers, gendarmes, and prison officials. Another area enlightened by the archives is the known but not fully documented weakness of the party organization in the villages before 1933. The party had to rely on the state apparatus to achieve its ends, for it had no members in most collective farms. The drive for collectivization in the early 1930's is revealed as a mighty influence on class hostility even to the degeneration of courts to the point where judges were dismissed for falling under the influence of the legal line rather than holding strongly to class policy.

Throughout many documents, sometimes reproduced in photographs of the original, is to be seen the mighty role played by the party, although the security police are revealed finally to have dominated even the party. Fainsod concludes that the NKVD became Stalin's special instrument to watch the party.

This volume is not a substitute for generalized volumes on the Soviet system of government. It must be viewed more as a massive appendix in amplification of the usual texts, for one needs to know much about the Soviet Union to savor its offering fully. Yet with this caution it can be recommended enthusiastically as one of the most illuminating books on the Soviet system yet to appear.

JOHN N. HAZARD
Professor of Public Law
Columbia University

GEORGE L. KLINE (Ed.). *Soviet Education*. (Studies of the Research Program on the U.S.S.R., Vol. XVIII.) Pp. xi, 192. New York: Columbia University Press, 1957. $3.50.

This book is of value primarily to people interested in the history of Soviet education. It contains nine firsthand accounts by former Soviet citizens who have been both students and teachers in a variety of Soviet educational institutions. The period they most fully describe is the decade of the 'thirties, but the late 'twenties and early 'forties are included to some extent. The contributors write about such institutions as nurseries, the middle schools, universities, and teachers' colleges. In addition there are accounts of lesser known educational experiments such as the Faculties of Special Purpose created in 1931 by order of Stalin to raise the low educational level and technical competence of the managerial "class" which at that time consisted almost entirely of poorly qualified party members.

The contributors do not merely describe, they interpret and write with feeling about their personal experiences. The reader is afforded exceptional insights into the mood of the people, into the relations between students and teachers, and into the atmosphere pervading Soviet schools and universities.

Although the contributors confirm each other in many of their observations, there are certain differences in their general estimate of political opinion in the Soviet Union. One, for example, believes that young people are successfully resisting the Bolsheviks' efforts to control them completely. Others leave the impression that the majority accepted the Soviet realities already in the early 'thirties. Concerning students' life, one asserts that there is no friendship among the young people because even one's best friend may betray one; whereas another maintains that there are areas outside politics where comradeship

and gaiety find expression. The truth thus remains colored by personal experience and is hard to ascertain. Today's Soviet youth gave the writer of this review the impression of having accepted the realities of their society and at the same time of feeling freer than they did twenty years ago to express criticism and to live a private life within the limitations set them.

FREDERIC LILGE
Professor of Education
University of California
Berkeley

HENRY W. EHRMANN. *Organized Business in France.* Pp. xx, 514. Princeton: Princeton University Press, 1957. $7.50.

This book deals with the organization, operation, and political significance of French trade associations. It is a comprehensive, penetrating, and well-organized study. An exceptional gift of exposition is necessary to describe the complex range of ideological and practical problems that the French businessman has had to face since the end of World War I, and to describe the unusual practices by which the joint interests of business groups are represented vis-a-vis government and public opinion. Ehrmann describes not only the practices of trade associations but also the underlying mentality and the policies of trade groups concerning actual social and political issues, including inflation. The social psychology of present-day France is well illustrated by the fact that in this period of inflationary pressures the hoarding of monetary gold by private persons—to escape the disadvantages of possible currency fluctuations—is permitted. The study is based on extensive documentary material, on current French literature and newspapers, and on many interviews with persons who had, and who did not have, an ax to grind.

The first part deals with the period between the end of World War I and the end of World War II. The discussion centers on the emergence of a strong, reorganized "employers' movement" from the defeat suffered by French industry in connection with the general strike in 1936; on the position of French big and small business during the twilight atmosphere preceding World War II; and on the political attitude of French entrepreneurs during the Vichy regime. Mr. Ehrmann briefly covers the period of the twenties and early thirties in which the cartel movement started in Western and Central Europe. It is the period when the French statesman Louis Loucheur used the World Economic Conference in 1927 as a forum to point out that the rivalry between the United States and Europe was the principal reason for the establishment of steel cartels, and when French statesmen of the stature of Edouard Herriot and Lucien Romier proclaimed in widely circulated books that cartels were necessary for the defense of European industry against American competition.

The second part is concerned with the present-day organization of business. The structure and operational scheme of the Central Organization of Business (*Conceil National du Patronat Français*) are analyzed along with the associations of particular business groups, large and small. In comparison with the political influence of pressure groups in the United States, the United Kingdom, and other European countries, the influence of the French business lobby is very strong and the methods of exercising that influence somewhat unusual. Mr. Ehrmann points to the dangers of these practices for democratic forms of government and effective public administration, and emphasizes that within France the abuses of private economic power are frequently criticized.

The third part contains attitudes and policies of organized business in regard to various domestic, social, and political issues and in regard to such international problems as unrestricted trade and the European Common Market. Data are supplied on slow industrial development, inflexible fiscal policy, and ineffective business methods.

The fourth part contains the conclusions of Mr. Ehrmann. "A political vacuum has resulted into which the interest groups have extended their activities and their intransigence, while the machinery of the state has veered uneasily between collaboration with and submission to the groups." He does not dare to predict the future of democracy in France in view of his findings.

Professor Ehrmann's book adds much constructive material to the discussion of French democracy and the operation of pressure groups in general. His views concerning the auspices of French democracy may be over-pessimistic. The book, however, rests upon a wealth of data not easily accessible. It deserves reading by students in all branches of social science.

ERVIN P. HEXNER
Pennsylvania State University

R. H. TAWNEY. *Business and Politics Under James I: Lionel Cranfield as Merchant and Minister.* Pp. xii, 324. New York: Cambridge University Press, 1958. $7.50.

From the "storm over the gentry," the current phase of the controversy over the nature of social change before the Puritan Revolution, many a student of English history will turn with relief and satisfaction to this latest work by Professor Tawney. He initially stimulated that controversy and it is again he who enlarges our knowledge of the context in which all the changes of that epic period took place.

In his analysis of Cranfield as London merchant and as minister of the Crown, Professor Tawney provides us with a fascinating case study in the interrelation of economics and politics under James I and does so with that command of historical evidence and that felicity of phrase which have made him one of the great masters of his craft.

He sets the stage with a brilliant survey of the European commercial scene. A close study of Cranfield's varied interests during twenty years show us how he amassed a personal fortune as merchant, chiefly in textile trade with the Continent, as City banker "putting out money for gain," and as speculator in land and in customs-farming.

He entered royal service in 1613 as Surveyor-General of the Customs and advanced through various posts to that of Lord Treasurer in 1621. In an era of declining royal revenue and rising demands from a prodigal king his role promptly became that of reformer. He sought better management of ordinary income from crown estates, labored for retrenchment in Household expenditures, attacked the "jungle" of financial practice in the Navy, and greatly increased receipts in the Court of Wards and Liveries. He became Lord Treasurer and Earl of Middlesex just when a change in foreign policy—the proposal of a Spanish marriage for Prince Charles—brought on financial crisis. Policies of reform then proved his downfall, for his erstwhile patron, George Villiers, now Duke of Buckingham, allied with the Commons against him. The upshot was Cranfield's impeachment and conviction of "bribery, extortion, oppression, wrong and deceits," an episode treated with suitable irony by the author.

This career does not prompt Tawney to generalize. He has in mind the ultimate "erosion of traditional social systems by the pressure of new interests," but he makes no effort to see in Cranfield, either as merchant or as minister, traits of "an artificially constructed type." The book is no polemic in economic interpretation. Professor Tawney's interests are more catholic, his insights deeper, and his perspective far wider. Through him we both know more and understand more about the background of the Puritan Revolution and this work will still further enhance his reputation.

ALFRED F. HAVIGHURST
Professor of History
Amherst College

ROBERT L. KOEHL. *RKFDV: German Resettlement and Population Policy 1939–1945: A History of the Reich Commission for the Strengthening of Germandom.* (Harvard Historical Monographs, No. 31). Pp. xi, 263. Cambridge: Harvard University Press, 1957. $6.50.

The contents of this book—No. 31 of the Harvard Historical Monographs, under the editorship of Oscar Handlin—are described succinctly by its sub-title: *A History of the Reich Commission for the Strengthening of Germandom—Reichskommisariat für die Festigung deutschen Volkstums* (RKFDV). The author concentrates primarily on the administrative and political history of the RKFDV and other government and party organizations which participated in the process of re-settling hundreds of thousands of Germans. Even

non-Germans were treated as those of German "racial stock" as the result of unscientific rationalizations and the same contorted logic which was applied to the race concepts in Nazi ideology. These apparent beneficiaries of the New Order were shifted mostly to conquered Eastern territories, especially to Poland, from their homes on the borders of the expanded Reich. Many were evacuated from areas which were later to remain under Soviet domination. In numerous cases the new sites were the former homes of Poles and Jews who had been removed for extermination or slave labor.

Although the book does not go into an analysis of the personal attitudes or post-war reactions of these pawns in the strategy of the Nazi policy-makers, it appears that a large number of them felt that the policies of the Third Reich would benefit them, even though they often did not receive title to their new land or were only resettled from their homesteads to camps and work in Germany, where they remained.

This book contributes to an understanding of the history of the Third Reich and its leaders by showing how their diseased *Weltanschauung* and their misinterpretations of history contributed to disaster also for their own favored sons. Himmler, whose neo-feudal concepts are recorded here, envisaged the creation of Eastern Europe as a German colony. Very likely these policies were determined by Hitler's ideas.

The student of the Nazi government will find again the familiar conflict of jurisdiction, inefficiency, the jockeying for position among the numerous groups assigned to carry out similar functions without proper co-ordination, and the competition to retain status or gain ascendancy over other persons.

The Appendix to this monograph contains a glossary of Nazi terminology, organizations, and persons, and some significant documents and decrees. One of the documents gives some statistics. A helpful Index is also included.

The major part of the source material used by Koehl was the huge mass of evidence presented at Nuremberg Trials Eight and Eleven, two of the "subsequent trials" held under United States auspices after the trial by the International Military Tribunal. It is commendable that the author also used sources not easily available, such as those coming from Poland.

No doubt this story of the manipulation of human beings and brutality will further contribute to an understanding of the political pathology of the leadership of the Third Reich. However, the book suggests avenues of research which it does not, unfortunately, explore—especially with regard to the demographic, economic, and social consequences of population movements. It is hoped, further, that this monograph will be complemented by an interpretative study of case histories, based on statements made by participants on all levels of operation. The historian of the recent past has the unique chance, for which he is rightly envied, of completing his research by interviewing the contemporaries of the events about which he writes. It is regrettable that the author did not or could not avail himself of such an opportunity.

ERIC H. BOEHM

Munich, Germany

JACOB S. SIEGEL. *The Population of Hungary.* (International Population Statistics Reports Series P-90, No. 9.) Pp. vii, 186. Washington, D. C.: U. S. Government Printing Office, 1958. (U. S. Department of Commerce, Bureau of the Census.) $1.00.

This is the latest addition to the excellent series of reports prepared by the Bureau of the Census on the population of foreign countries. The stated objective of the series is "the compilation and evaluation of population data and related information which are often available only in scattered sources or in languages other than English."

In regard to Hungary, this task is particularly complex and confusing. Account had to be taken of the demographic developments not of one state entity, but of four, widely differing in area and population: first, the pre-World War I Hungary; second, the post-war "Trianon Hungary" (1920–1938), which ceded about seven-tenths of her territory and two-thirds of her population to six neighboring countries; third, the post-Munich Hungary (1938–1945) which annexed from Czechoslovakia, Rumania, and Yugoslavia 30,000 square miles of teritory with a population of 6 million; fourth, the post-World War II Hungary reduced to her Trianon boundaries.

The demographic picture of present-day Hungary emerging from the study is as follows.

With a population of 9.8 million on January 1, 1958, and a population density of 275 per square mile, Hungary is one of the smaller and more densely populated eastern European countries. Unlike the birth-rates of most countries of the West, Hungary's showed relatively little response to wartime and immediate post-war changes; no explanation is given for this phenomenon. Her population balance was substantially affected by losses suffered by her ethnic minorities: 260,000 expulsed Germans, 220,000 exterminated Jews—Eugene Duschinsky in *The Jews in the Soviet Satellites*, p. 396, puts the number at 257,356—and 41,000 Slovaks transferred to Czechoslovakia under an exchange agreement; in addition, 158,000 Hungarian citizens perished during the war and 60,000 fled the country as political refugees. As against these losses, 70,000 Magyars escaped from Rumania and 23,000 returned from Czechoslovakia. At present, Hungary is ethnically homogeneous—95 per cent Magyars—and denominationally predominantly Catholic or Greek Catholic. Ethnic minorities constitute less than 2 per cent: 220,000 Germans and less than 100,000 Jews. The growth of the population is likely to be only moderate in the next two decades. The growth of urban population is pronounced, prompted by the Communist policy of intensified industrialization. The labor force is increasing faster than the general population.

Numerous tables and seventeen figures enhance the value of the study. The method of referring to sources is unnecessarily complicated and makes their use difficult and tiresome.

JOSEPH B. SCHECHTMAN
New York City

*Sweden and the United Nations: Report by a Special Study Group of the Swedish Institute of International Affairs.* (National Studies on International Organization.) Pp. x, 315. New York: Manhattan Publishing Company for the Carnegie Endowment for International Peace, 1956. $3.00.

This is one of the more comprehensive and informative National Studies on International Organization sponsored by the Carnegie Endowment. The product of a well-informed, six-man study group appointed by the Swedish Institute of International Affairs, it covers more ground than is indicated by the title and is an excellent analysis of recent Swedish foreign policy and its conduct—with particular regard to Sweden's stand on the United Nations and international organization in general. It is a good picture of what lies behind the attitudes of the government, the political parties, and well-informed public opinion. Attention is paid to Sweden's interest in economic co-operation and, in the brief concluding chapter, Swedish views of the need for a reform of the United Nations Charter are outlined. One may be certain that the members of the study group have the co-operation of the Foreign Office in preparing the report.

The introductory chapter is a succinct presentation of Sweden's position since World War II and underlines that the policy of "freedom from alliances," combined with a comparatively strong national defense, is neither "a doctrinal faith in neutrality nor a lack of feeling for the basic fellowship among the Western democracies." Sweden has succeeded in "combining a consistent line of neutrality with active participation in general peace-time cooperation among those democratic nations bearing the Western cultural inheritance—an inheritance which Sweden shares."

The bulk of the book consists of Professor Elis Håstad's 154-page account of Sweden's attitude toward the United Nations and Professor Hilding Eek's 76-page story of Swedish policy in the United Nations. Håstad is a professor of political science who has recently been appointed governor of his native province. An exceeding versatile, long-time member of

Parliament, he has also been a member of the Swedish delegation to the United Nations. His long chapter is by far the best account of recent Swedish policy and its setting available in English. Eek, now a professor of law at Stockholm University, was a delegate to the Geneva Freedom of Information conference, has been a member of the United Nations Secretariat, and has participated in deliberations of the United Nations Educational, Scientific and Cultural Organization. His chapter is complete and well documented.

In adition to these long reports, Dr. Bo Kärre, a member of the Secretariat of the Council of Europe, contributed a 38-page chapter on Swedish policy with regard to international organization in the economic field, which emphasizes that in this area the Swedes—given their large trade and the composition and direction thereof—have gone the whole way in seeking "free multi-lateral trade, restored over as large an area as possible."

The conclusions emphasize that the Swedes regard the United Nations as a valuable instrument for international cooperation. Sweden considers it "almost an international obligation to take part in the work of the United Nations." The Swedish attitude is also positive toward both the specialized agencies of the United Nations, and international organizations outside the United Nations system. The Charter of the United Nations is not looked upon as an "international treaty to which the country adhered primarily in order to look after its own interests. It appears rather as a constitution still in the making; a constitution with the ultimate aim of a union of the nations of the world under legally binding forms." In short, the earlier experience, as well as the war-time experience, means to Sweden that "a necessary condition for achieving peace is international solidarity in cooperation for peace."

ERIC C. BELLQUIST
Professor of Political Science
University of California
Berkeley

CHARLES D'OLIVIER FARRAN. *Atlantic Democracy: A Comparison of the Constitutions of North Atlantic Treaty Organization Member States.* Pp. ix, 203. New York: Frederick A. Praeger, 1958. $5.50.

This book may be said to have grown out of the experience of its author who teaches public international law at Liverpool University as one of the first holders of a North Atlantic Treaty Organization research fellowship. It carries a foreword by Lord Ismay, the former Secretary-General of NATO. It is divided into two sections. Part One, Power Is from the People, deals with legislative branches, electoral systems, leadership of the state, ministers, cabinets and councils of state, distribution of power, and the meaning of democracy. Part Two, Freedom Under the Law, concerns itself with the judiciary and liberties of the subject.

Considering the modest length of the book, it is not surprising that the author has devoted himself primarily to the formal constitutions rather than to the broader constitutional systems. This has the advantage of a certain simplification, but it leaves the reader with a somewhat fragmentary if not superficial knowledge of the governments discussed. At times the reference to formal provisions is so brief as to be scarcely meaningful at all—for example (p. 62), where the French Council of the Republic is described as "not an exact replica of the Senate," but no additional information is given as to its role.

Any scholar in the field of comparative government is well aware of the difficulty if not utter impossibility of keeqing abreast of changes. Hence one can only express sympathy with the author as far as the sections relating to France are concerned. It would seem, however, that cognizance might have been taken of such items as the early shift from a sixty-forty to a fifty-fifty proportion in the number of members chosen by direct election and proportional representation in the West German Bundestag, the provision for life peers in the British House of Lords, and the like. Errors such as the statement (p. 69) that an American senator "must also reside in the district from which he is chosen"—it has already been noted that he must be an inhabitant of the state in which he stands—or that (p. 67) giving the number

*Who actually rules in the Soviet Union?*

*What are the successes and failures of the Soviet economic system?*

*How has the Soviet system influenced the beliefs and social behavior of the Russian people?*

# THE SOVIET CRUCIBLE

## SOVIET GOVERNMENT IN THEORY AND PRACTICE

*Edited by* SAMUEL HENDEL,
*Professor and Chairman, Department of Government, The City College of New York*

The Soviet system—*in* theory and in practice—comes to life in this fascinating collection of writings. Here are significant selections from the works of men who shaped Soviet history, along with trenchant and divergent commentaries by distinguished scholars and authors.

To set the background, the editor explores the impact of the Tsarist heritage and Marxist-Leninist theory on Soviet policies. Theory is examined at length, since it unquestionably played a vital role in the Bolshevik revolution of 1917 and is still the *claimed* basis for every act of state power in the Soviet Union. But just how far theory, in fact, influences the shaping of Soviet policy is a controverted question which receives consideration. The editor then follows the Soviet Union through its formative years from the Bolshevik revolution to 1928, when Stalin had triumphed and the totalitarian character of Soviet institutions had been largely decided.

Subsequent sections take up contemporary Soviet political, economic, and social questions. Such fundamental political issues as the reality of the Soviet constitution's libertarian guarantees, the role of terror in the Soviet system, the true locus of ruling power, and the problem of non-violent, orderly succession are closely surveyed. The economic system is rigorously analyzed, with account taken of its successes, failures, and prospects. And finally, Dr. Hendel examines the impact of the Soviet system on the beliefs and social behavior of the people, and the prospects for a gradual break-down of Soviet totalitarianism.

BOLLINGEN SERIES XLIII

*"Undoubtedly the greatest work of its kind ever to be created by any mind in any time or any place."* —ARNOLD J. TOYNBEE

IBN KHALDÛN

*The MUQADDIMAH*

AN INTRODUCTION TO HISTORY

*Translated from the Arabic by* FRANZ ROSENTHAL

THIS first complete English translation of Ibn Khaldûn's MUQADDIMAH, or "Introduction," to his History of the World is new in The Bollingen Series. In its attempt to survey knowledge of man's cultural patterns in systematic form, the MUQADDIMAH, with the writings of Montesquieu, Spencer, and Comte, is part of the foundation of modern social science. The 14th-century scholar and statesman of Spanish-Arabic descent presents in this work his reflections and discourse on a wide variety of subjects, held together by the general theme of the nature of civilization.

"It is a wonderful experience to read . . . as rich and various, as subtle and deep . . . as the Ocean."—H. R. TREVOR-ROPER.

Illustrated. With a life of Ibn Khaldun, a textual history of *The Muqaddimah*, and a bibliography by W. J. Fischel. 6⅛″×9½″, about 1700 pp., indexed. 3 volumes, boxed. *$18.50.*

of Lords Spiritual in Britain as twenty-four detract from the value of a handbook. Predictions such as the one (p. 144) that the vice-president of the United States will probably "become something akin to a deputy prime minister in European states" seem out of place in a book of this character. Altogether the book is a useful handbook for lay readers—the author states that "it is not intended to be a work of advanced scholarship."

HAROLD ZINK
Professor of Political Science
Ohio State University

MÁIRE and LIAM DE PAOR. *Early Christian Ireland.* (Ancient Peoples and Places.) Pp. 263. New York: Frederick A. Praeger, 1958. $5.00.

The topography of Ireland is such as to promote cultural unity, with a strong historic sense, pride of lineage, and a poetic concept of nationality that long antedated any degree of political integration. Ireland was never conquered by Rome, but politically yielded to Roman artistic and literary influences. The work of St. Patrick, "a combination of mystic and able administrator" (p. 30), represented the first major Christian establishment in a wholly barbarian environment. Cut off from further Continental influences by the Germanic invasions, Ireland, in the late fifth century, came under the influence of Western Britain. Irishmen, returning from centers of learning like Lindisfarne, brought back ascetic ideas easily adaptable to Irish society, with the monastic community under its abbot easily identifiable with the clan (*tuath*) and its chieftain (*ri*). With the spread of monasticism, Patrick's organization disintegrated, and monastic communities, within their walled enclosures (*crannochs*) representing Medieval Ireland's nearest approach to town life, took over the learned traditions of the Brehons and Druids. The monastery became the "milieu which produced that most remarkable spiritual, intelectual, and artistic movement of Dark Age Europe, the 'Celtic' Church" (p. 64).

The Viking raids beginning in 795 struck at the "moment when art, literature, and learning had reached their full flower under the patronage of the Church" (p. 131). Although Viking settlements, especially of Norse origin, were founded, Ireland as a whole was never conquered, and the victory of Brian Boru at Clontarf in 1014 finally broke the power of the invaders. Delivery from Viking attacks, however, merely ushered in an era of struggles for the high kingship which persisted with varying intensity until Elizabethan times. The Norse settlements, however, coupled with the Gregorian reforms of the eleventh century, finally brought the Irish Church into full communion with Rome as indicated by the Synod of Rath Bresail in 1110.

This work by highly trained devoted students of Irish archaeology will be indispensable to any student of Irish history or of early Medieval Europe. The profusely illustrated chapters on art are as informative as they are authoritative, although the absence of captions on the plates necessitates much cross reference which might well have been minimized. The quality of the plates is excellent, however, and the colored reproduction of a page from the Book of Durrow which serves as the frontispiece impels the reader to wish that an extensive use of color plates had been feasible.

RICHARD HOSTETTER. *The Italian Socialist Movement: I: Origins (1860–1882).* Pp. xii, 444. Princeton: D. Van Nostrand Company, Inc., 1958. $6.50.

The beginning of multiple Socialist movements under the chief guidance of Nenni, Togliatti, Garibaldi, Mazzini, and others, coincided with the antithesis of the political aims of Cavour who ensured the unification of Italian states which had been formerly more or less independent. The United Kingdom assumed the responsibility for the social and political security of Crown and State. The terms social and political security were claimed by both Crown and

Labor. The dual use of these terms will be clarified in the analysis of the content to follow.

Chapter I deals with the social question and the making of Italy by way of national unity and the Party of Action, Cavour and the bourgeois alliance, the social revolution and patriotism. Chapter II covers Piedmontese and Mazzinian labor traditions, Piedmontese Societies of Mutual Aide, morality and social problems. Chapter III deals with Mazzini and the Italian labor movement and their concern with political actions by labor, and the Congresses of Florence, Parma, and Naples in 1861. In Chapters IV and V, Bakunin visits Italy in 1864–1867 presumably in the interest of the International Alliance of Socialist Democracy. Chapter VI describes the First International, the workers' societies, and international socialism. Chapters VII and VIII deal with the impact of the Paris Commune upon Mazzini, on Radical Republicans, Republican internationalism, the socialism of Garibaldi, and the Bakunin-Mazzini polemic. Chapter IX covers the Bakunin-Mazzini conflict and the Congress of Rome. Chapter X exhibits Italian socialism and "Authoritarian-Libertarian" dispute. Chapter XI describes the penetration of anarcho-socialism in the Romagna and the Garibaldian Congress Movement; XII pictures socialism in Turin, Milan, Florence, and Naples, as well as the Anarchist triumph. Chapter XIII reveals the conflict of anarcho-socialism *versus* the Italian State and society, the eclipse of Marxian influence, and the consolidation of Bakuninism. Chapters XIV and XV contain the Propaganda of Deeds, international and external Anarchist resources, Italian socialism and government of the Left, and the Congresses of Florence-Tosi and Bern. Chapter XVI covers the disintegration of the Anarchist International as organization and decapitation of the Italian International. The closing chapter XVII bares the shift to legalitarianism and "Obsequies" of the Italian Anarchist Movement.

The dreaded "Obsequies" of the anarchic movement of the early eighties were not fulfilled. But present-day Western civilization realizes the rising might of Russia and China as threats, which Khrushchev had in mind when he made his hilarious boast of forcing us within our own life span to come under the unthinkable but quite possible yoke of communist sway.

Associate Professor of Political Science, Emeritus
Johns Hopkins University

## *ASIA AND AFRICA*

JEROME B. COHEN. *Japan's Postwar Economy.* Pp. xvii, 262. Bloomington: Indiana University Press, 1958. $6.50.

Impartiality in political economy is not so easy, or even wise, as it is often presumed to be. In assessing the course of Japan's remarkable recovery of the past decade and venturing to give the outlook for the Japanese economy in his latest book, Professor Cohen is wisely partial. His brand of partiality may not be shared by many others, but it cannot be disputed that his arguments are built around a consistent framework. He does not see, or refuses to see, a dynamic future for Japan with the Socialist party in power, for he assumes, conveniently for his argument, that "their social expenditures, their lack of resistance to excessive wage demands and their unwillingness to pursue tight money or austerity programs" would conflict with the basic requirements for a viable Japan. It does not occur to him that a socialist party, mature enough to have the confidence of working people, may succeed far better in carrying out an austerity program than conservatives. The point is that an austerity program under a party for workers is a different thing from an austerity program under a party for rich people. Professor Cohen's bent towards the orthodox conservative position is further attested to by his inclination to give what I believe to be an excessive credit to the monetary policies in accounting for the recovery and also by his pessimistic attitude as regards the possible expansion of trade between China and Japan. His judgment that "the most important limiting factor in trade between the two countries is the probability that China does not have the means to pay for any large volume of imports from Japan" (183–4) suffers, to say the least, from a severe lack of imagination.

Consistently with his broad position in analyzing the past decade, Professor Cohen makes Japan's future hinge upon the expansion of world trade, specifically the trade among the so-called "free countries." Such expansion, no doubt, is a laudable objective which should gain wider support, especially on the American continent. But here Professor Cohen's sympathy with the objective carries his imagination a bit too far into a statistical error. He states: "In the nine-year period 1948–56 inclusive, world exports rose from $52.7 billion to $91.9 billion, a gain of 72 per cent. If we assume a similar gain over the next nine years, 1957–65 inclusive, the volume of world exports should reach $156.5 billion by 1965. If Japan does no better than maintain its 1956 share of world exports—2.7 per cent—its export volume in 1965 would be $4.2 billion. . . . If . . . Japan's share of world trade rises by 1965 to a modest 3.5 per cent, then Japanese exports in 1965 will amount to $5.4 billion" (pp. 134–5). This range—4.2 to 5.4 billion dollars—if achieved, appears to be more or less satisfactory in the light of the target of 5 billion dollars' worth of exports for 1965. But the trouble is that the 72 per cent gain in world exports between 1948 and 1956, even if it can be repeated, subsumes a price rise, whereas the 5 billion dollar Japanese target for 1965 is in terms of 1955 prices.

Aside from the points raised above, which are related generally to the question of future outlook and thus tend to be affected quite a bit by one's opinion and political position, I have nothing but a high praise for the most painstaking efforts of Professor Cohen in making his narrative of the recovery rich in statistical information and pertinent quotations. At several points I would differ with him in a matter of emphasis. For example, whereas he harps repeatedly on the theme of "the continued use of outmoded and obsolete machinery" in Japan, I would rather take note of big strides that have recently been made in various lines of industry. There are also a number of minor errors, such as the obtaining of 7.1 per cent annual growth rate of real per capita income in prewar Japan by simply dividing the difference in index numbers (526 minus 100) by sixty. But all these are, if I am to emulate Professor Cohen who has an apt Japanese phrase at the beginning of each chapter, what might be called *tama ni kizu*—slight flaws in a well-polished thing—that could be mended in the process of further polishing.

SHIGETO TSURU
Professor of Economics
Hitotsubashi University
Tokyo, Japan.

SOLOMON B. LEVINE. *Industrial Relations in Postwar Japan.* Pp. xiii, 200. Urbana: University of Illinois Press, 1958. $4.25.

In the sense that industrial relations form an important facet in the socio-economic complex of a society, this study answers in part that continuing question: how democratic has Japan become? Its answer is a complex but not pessimistic one.

Professor Levine, a member of the Institute of Labor and Industrial Relations at the University of Illinois with a command of Japanese and a year devoted to observations on this topic in Japan, tells us that a new set of decision-makers has grown up in industrial relations: the old triumvirate of the military, zaibatsu, and political bureaucracy has now been replaced by "the more democratic combination of professional management, organized labor, and representative government." In management, an industrial relations specialist has appeared and has come to play an important part in integrating the now organized workers into the community of enterprise, especially in the larger and more basic industries. Although he came into being when management was on the defensive, essentially to provide management with the ability to meet the requirements of the occupation reforms, he has retained his place after management's recovery of status. In the trade union movement, labor has gained on the local level the right to partial decision-making on job ten-

ure and wages and on the national level a voice in politics through the Socialists. The vocal upper level, engaged in political struggle, often obscures the more significant development of enterprise—rather than industry-wide—unionism below which is an indigenous growth containing potentialities in the opposing directions of independence or domination by the employer. Which way this develops will depend a good deal on the government, which is intruding into industrial relations in various ways, both in restricting union activity and providing increased state welfare benefits and social security.

Especially in the area of collective bargaining and labor disputes, Professor Levine provides new insights that will be of interest not only to scholars on Japan but those interested in comparative industrial relations—a field, incidentally, in which this work is a pioneer. In the final chapter on government regulation of industrial relations, Professor Levine presents a good deal of material on legal provisions but strongly hints at their lack of enforcement. This only serves to point up how much has yet to be done by way of specific on-the-spot studies. In the meantime, this careful, sound, and eminently successful attempt to frame a set of tentative overall conclusions on labor-management-government relations should serve both as a corrective to much of the superficial reporting on Japanese labor and as a guide for further research.

GEORGE O. TOTTEN
Assistant Professor of Political Science
Massachusetts Institute of Technology

NORMAN JACOBS. *The Origin of Modern Capitalism and Eastern Asia.* Pp. x, 243. New York: Oxford University Press, 1958. $3.40.

In a paper submitted at the World Historical Congress at Rome in 1955, on the differential response of China and Japan to the impact of Western science and technology, J. K. Fairbank said that the person "who grasps the true secret of Japan's success in Westernization has a key to modern Far Eastern history." The book under review is concerned with this very topic, but it does, unfortunately, not provide that key. In fact, it is difficult to say that the book contributes anything to our understanding better the contrasting economic development of Japan and China in the last hundred years, except by bringing together an assiduously collected but not clearly related mass of statements on various aspects of Chinese and Japanese economic and social history.

The stated purpose of the book is to present a sociological explanation of the origins and development of capitalism through a comparative study of the social structures of China and Japan. The theoretical basis for this undertaking is said to be presented in the second chapter of the book. After a somewhat pretentious and largely irrelevant discussion of some methodological and theoretical problems in sociology, the author lists seven "key foci" and their related "institutions" and "functions," which are "significant for the conceptualization of the origin and development of modern capitalism." The remainder of the book is devoted to a discussion of each of these key foci, such as subsistence, power, biological relatedness, evaluation, and so forth. Any interconnections between these foci and their related institutions and functions are not indicated. It is not made clear how differences in any of the key variables are functionally related with differences in others, nor is any indication given of how changes in one variable impinge upon any of the others. The bulk of the book is filled with a large number of statements contrasting this or that aspect of the social and economic life and values of China and Japan. But the totality of these facts does not make for a theory, and certainly falls far short of providing an explanation for the difference in the economic evolution of the two countries.

The book suffers not only from lack of genuine theoretical underpinning, but also from bias in execution. One example must suffice. Almost all Japanese institutions, whether guilds or religious sects, whether systems of learning or systems of inheritance, are stated to have features "as in western Europe." In fact, one scarcely discovers any institution in Japan which differed from the corresponding institution in western Europe, and one finds not a single Chinese institution which is not in full contrast with the corresponding Japanese—and hence western—one. Three questions arise in this context: First, why did Japanese institutions, which have their origin in Chinese civilization, develop in so different a direction from the country whence they were borrowed? Second, why did Japan not develop a capitalist society independently? Third, and most important of all, why are Japanese institutions, after a century of close contact with the West, still so very different from those of western countries? By trying to prove his point too well, Jacobs has opened a host of new questions! Alas, they are only pseudo questions, for had Jacobs had a true "theory," and had he proceeded with somewhat more detachment, he would have discovered the trap of his own making in which he got caught. It is a pity that so much assiduous work should have yielded no more than a singularly disappointing book.

BERT F. HOSELITZ

University of Chicago

CONRAD BRANDT. *Stalin's Failure in China, 1924–1927.* (Russian Research Center Studies 31.) Pp. xv, 226. Cambridge: Harvard University Press, 1958. $4.75.

The abortive Chinese revolution of 1924–27 was a crucial chapter in the history of China, Russia, and the international Communist movement. There is only a small literature on the subject and Mr. Brandt says that "not one of the books that deal at length with the 1920's in China gives a straightforward, comprehensive account of the history of the period." His own small book was evidently not designed to rectify this omission, although much material has become available and not a little has happened since to give us new perspective on these events.

Mr. Brandt seems to have examined this material at length in all the key languages, including—for the first time on the subject of China—the archive of Trotsky papers at Harvard. Out of all this he has fashioned a work that is rather more like a series of footnotes than a coherent history, a string of commentaries rather than any kind of consistent reinterpretation. It is not easy to see what the unprepared reader might get out of this, but for the small number of students of the period, Mr. Brandt comes up with some new facts and some new quotations that can be added to the record.

He is able, for example, to contradict the now-popular claim that Mao Tse-tung was the man who was right all the time in those early events, even when Stalin, Trotsky, and all the other Chinese Communists were wrong. Mr. Brandt's footnotes also add some bits and pieces to the story of the Chinese Communist Party's efforts to free itself from the smothering embrace of its Russian mentors.

To the issues of ideology and strategy as debated and as applied by the Russians in China at that time, Mr. Brandt does not make as much of an addition. Out of the Trotsky archive he does come up with one arrestingly new detail. He says that at a special Politbureau committee meeting in the spring of 1926, with Trotsky in the chair, it was decided to avert possible Japanese hostility by offering to assure Japan of Chinese guarantees of a deal over Manchuria, accepting Japanese control in South Manchuria and eventual "autonomy" in the whole region. Mr. Brandt unfortunately does not quote this report fully enough, but the historian interested in the interplay of pressures and motivations in the top Russian leadership will do well to pursue this particular footnote with greater interest than Mr. Brandt shows in it.

To the China issue as it became embroiled in Stalin's drive against the Trotsky Opposition, and in the Opposition's futile fight against Stalin, Mr. Brandt brings only a limited kind of discussion. His main point seems to be that the Marxist mystique about the role of the proletariat in the revolution crippled both Stalin and Trotsky in their appreciation of the Chinese situation. This is a view which merits the most serious and sophisticated examination, but neither this theme nor the whole intricate Russian-Chinese interplay that led the Chinese Communists into such a bloody catas-

trophe in China in 1927 is explored here with the needed depth or perception.

KARL A. WITTFOGEL. *Oriental Despotism: A Comparative Study of Total Power.* Pp. xix, 556. New Haven: Yale University Press, 1957. $7.50.

Dr. Wittfogel's long-awaited study is a monumental essay in comparative sociology which will stimulate most readers but satisfy few. His diffuse and elaborate thesis is not easily summarized, but the gist is as follows: In potentially fertile areas with low rainfall but a major supply of surface water, the agricultural potential could be exploited only by extensive waterworks, requiring co-ordinated and disciplined mass labor. This effort involved an organizational web covering the whole agricultural area, and those controlling this network inevitably came to wield supreme political power. Managers of the waterworks became bureaucrats of a government which prevented the organizational consolidation of nongovernmental groups. The head of the state became a thoroughgoing despot because, in contrast to feudal Europe or Japan, the army was an integral part of the bureaucracy while the dominant religion was closely attached to the state. Dr. Wittfogel spells out an elaborate configuration of institutions as characteristic of this type of society, which he variously terms "hydraulic," "agromanagerial," "agrodespotic," or "Oriental." All or parts of this configuration have spread through diffusion beyond such hydraulic areas as north China, north India, and the Fertile Crescent. The agrodespotism of Tsarist Russia, for instance, was derived in large part from Russia's Mongol conquerors, who had been "hydraulicized" through contact with China.

Dr. Wittfogel has devoted decades of scholarship to a theoretical elaboration of Oriental despotism and to amassing relevant data from more than a score of agrarian societies. But all too often his logic is deficient, his presentation nonfunctional, and his methodology slack. Few of the component hypotheses are simply and specifically stated, and even when this is done evidence is usually selectively presented. Seldom is the attempt made to define a concept or variable in terms independent of what is being proved about it. Never is a hypothesis tested by comparing unbiased samples of hydraulic and nonhydraulic societies. Parts of the thesis are persuasive, parts of the book show brilliant insight, and certain sections are radiant with original thinking, but the whole is unconvincing. Is Communist despotism in the Soviet Union really linked in a causal chain to low rainfall in north China?

Dr. Wittfogel's thesis is part of a controversy which grew out of the Marxist tradition, and he is concerned, above all, with refuting certain Marxist tenets. Moreover, he sees his theory as a weapon in the struggle against Communism, and evidences of this political crusade strongly color his scholarly achievement. If these factors make for a difficult and exasperating book, they do not substantially dim the luster of its many illuminating insights and formulations, which command respectful attention.

G. WILLIAM SKINNER
Assistant Professor of Sociology
Columbia University

IBN KHALDÛN. *The Muquaddimah: An Introduction to History.* Translated by Franz Rosenthal. Vol. I, II, and III. Pp. cxv, 481; xiv, 463; xi, 481. New York: Pantheon Books, 1958. Bollingen Series XLIII. $18.50.

The author was a learned Mohammedan scholar whose ancestors had settled in Spain during the eighth century of our era. But Ibn Khaldûn himself was born in 1332 in Tunis, where his father provided him with excellent teachers. A few years later he went to live in Fez, and it was there that he completed his education. After a residence in Granada, Spain, from 1363 to 1365, he returned to northwest Africa, and there in 1377 he completed his book known as *The Muquaddimah*, the Introduction to an enormous work, *History of the World.*

The three volumes in English translation are a great credit to American scholarship, especially in their documentation. They clearly reveal the high level of scholarship attained by the Muslims in Spain and Northern Africa during the fourteenth century. It will no longer do to depreciate civilization during that century. On the other hand, it would be equally misleading to support A. J. Toynbee, who has been quoted by both translator and publisher as a reliable appraiser. Toynbee said: "*The Muquaddimah* is undoubtedly the greatest work of its kind that has ever been created by any mind in any time or place." The author made a splendid survey of Muslim civilization in nearly all of its aspects, for which he deserves much praise; but he failed to understand Greek, Roman, and West European cultures.

His map facing p. 110 in Vol. I is vastly inferior to similar maps produced about the year 1377 in Italy. Even the Iberian and Balkan peninsulas are way out of line. Rome is located on a gulf (I, 151), and England is an island rather than a part of one (I, 159), while Burgundy is a German country. Many of his assertions are equally erroneous. "It is noteworthy how civilization always collapsed in places the Arabs took over and conquered" (I, 304). That was too bad for Spain and Sicily! Mohammed and the Koran were the supreme sources of all laws and jurisprudence (III, 3). The section on medicine is also pathetic (III, 148–152). "The earth floats upon the elementary water" (I, 110). Oresme had by this time already announced at the University of Paris the heliocentric theory of the solar system. The Pope belongs to the Melchite Christians, who "have no significance" (I, 480). "Formerly, [people] were concerned with scholarly writings" (II, 391). All the great Christian scholars are obviously ignored.

ALBERT HYMA
Professor of History
University of Michigan

WILLIAM A. HANCE. *African Economic Development.* Pp. x, 307. New York: Harper & Brothers for the Council on Foreign Relations, 1958. $4.95.

This is a most useful and interesting collection of papers on African economic features and problems. The common theme of all the essays is that of economic development, but whereas some of the chapters are pan-African, others are limited to specific topics or regions. Professor Hance's particular skill lies in the sharp focus with which he presents the detail of some single project or question while maintaining the reader's sense of perspective.

Perhaps the best examples of his technique are the chapters on the Gezira Scheme and the Volta River Project. Both of these projects are treated with the wealth of physical detail and an understanding of the African environment that make them outstanding contributions to discussions on planning projects. The Gezira Scheme, an agricultural one, demonstrates what can be done with even the most arid of African soil, given irrigation. It is also a classic example in the response of peasants in Africa to well-designed economic incentives. On both these counts it is essential reading for any student of African affairs.

The Volta River Project has an interest of quite a different kind, since it is still only a paper plan. Professor Hance's review of the available evidence indicates the existence of all the physical requirements for the success of the plan: the water power potentially available, the massive deposits of bauxite awaiting extraction and conversion to aluminum, the railway and port capacity already built or under construction, and the vast sums of capital available but not yet committed to the joint undertaking which has been proposed between the Ghana and British Governments on the one hand and the aluminum companies on the other. His analysis thus focuses on the more purely economic and political factors in the continuing hesitation. Here in a nutshell is the problem facing foreign investors in Africa. Here in the same nutshell is the problem facing African governments needing foreign capital and skill.

The other chapters in Professor Hance's collection are as full of meat but they have less interest to the economist in that they are regional studies rather than functional ones. The regions best covered are those in British—or once British—territories, and it is with British Africa that the

major part of the book is concerned. There is a most interesting account of Liberia, which poses a question but fails to answer it. There is also an essay on Madagascar, and throughout there are references to French, Belgian, and Portuguese experience but this does not give the same impression of first-hand knowledge. If the book has a fault it lies in this tendency to generalize from Anglo-Saxon attitudes, and one is left with the feeling that Professor Hance may have missed some of the more interesting experiments which are going on elsewhere in Africa.

GWENDOLEN M. CARTER and WILLIAM O. BROWN (Eds.). *Transition in Africa: Studies in Political Adaptation.* (African Research Studies, No. 1.) Pp. 158. Boston: Boston University Press for the African Research and Studies Program, Boston University, 1958. $3.00.

*Transition in Africa* is the first of a series of African research studies currently being conducted by Boston University. The purpose of this first volume is to provide additional insights into the general problems of political adaptation which must always accompany a transfer of political power and to encourage and facilitate further study of such problems within specific countries and areas of Africa where the transfer of power is in process.

These studies are made possible through the helpful financing of the Carnegie, the Rockefeller, and the Ford Foundations. The findings were first presented in panel form to the American Political Science Association under the general heading of "Problems of Political Integration in Africa."

The particular countries studied in this volume are Ghana, by David E. Apter and Robert A. Lystad; Nigeria, by L. G. Cowan; Central Africa, including Northern Rhodesia, Southern Rhodesia, and Nyasaland, by E. P. Dvorin; and Kenya, by Carl G. Rosberg, Jr. In addition to the text of the study reports, a very comprehensive Bibliography for British Africa in general, British West Africa in particular, and the specific areas studied is included. This Bibliography covers thirty-two pages of the total text and is in itself an extremely valuable addition to the increasing amount of resource information available concerning Africa.

The editors, Gwendolen M. Carter and William O. Brown, point out that the whole process of transition in government is sharply and significantly brought to a focus in current equatorial Africa. Since World War II practically all of equatorial Africa has experienced varying degrees and stages of political transition. Nine countries have already achieved independence; others are preparing for it in the near future. Such transfer of government control involves massive planning. When the seat of political power is moved from outside the country or even outside the continent to internal instruments of government, the people of the territory involved need to do much rethinking and to prepare for many revisions. They need to decide whether they feel able to have a completely separate independent existence, or whether they will seek to adopt a new form of association with the former controlling power, such as is involved in commonwealth status.

The four studies made it quite clear that, whereas the problems in the four areas have great variations, there are numerous things which are common to all of them.

First, each of the countries is made up of numerous tribal groupings. Throughout the long years of their history each tribe has felt a stronger loyalty to its own group than it has to any overall area, or regional government. Thus it has been difficult to bind them together under one overall head. The new government must quickly discover ways to develop area loyalty without at the same time destroying valuable tribal controls.

Second, much as the tribal groupings desire to establish overall elected, representative forms of government, it is almost impossible for a tribe to believe that it could elect someone outside of its own tribal group who would safely represent its interests in an overall government. Broken down even further, it is difficult for an African village to believe that someone elected from another village would adequately represent their interests.

Third, the tradition of the past has been to accord to tribal chiefs a great deal of authority and respect. When a tribal group has opportunity to elect representatives to government they feel duty-bound to elect these tribal chieftains. If they do not, the chieftain suffers a great loss of dignity and status. On the other hand, he is often an older person, somewhat bound by tradition, and is not the best representative to sit in an elected legislative body.

Fourth, the constitutions which are at first drawn up by these newly independent states are often found to be inadequate. May temporary constitutions be put into operation which can be rewritten as experience dictates?

Fifth, can the people of the larger industrial centers who are rapidly becoming "westernized" satisfactorily sit in the same governmental groupings with the "bush people," who comprise a large part of the population?

In addition to these general problems which prevail in most of the African countries seeking independence each has its individual and specific problems. In Nigeria, the northern half of the country has for a long time been under Moslem rule. The southern part has been under separate tribal rule, animistic in beginnings, but recently tending toward a Christian culture. How can these operate without religious and social friction?

In Kenya, there is a much higher percentage of European settlement than in the other countries studied. There is also a higher percentage of Asian ownership and control. The African culture is likewise sharply divided into at least two divisions: those who are well educated and who are becoming wealthy, and those who, in the main, are still illiterate farming people. How can a form of government be established which will adequately represent all three or four of these groupings?

These studies sift out some of the problems and point out some of the progress and the explorations toward progress occurring in a changing Africa. Emphasized throughout the studies are the underlying sociological factors which enter into transition and adaptation in any country. Such research is to be commended.

## *AMERICAN GOVERNMENT AND HISTORY*

DAVID FELLMAN. *The Defendant's Rights.* Pp. xvi, 356. New York: Rinehart & Company, 1958. $5.00.

Dust jackets are notoriously unreliable, but the one on this volume carries the statement of a very reliable man that this is "a superb piece of work" and just the kind of book long needed in the field. It is unnecessary to add that this testimony by Robert E. Cushman is thoroughly justified.

Mr. Fellman has succeeded admirably in giving a succinct and up-to-date account in nontechnical language of the legal rights of the defendants in criminal prosecutions and also of the position of those whom he calls the quasi-defendants. After showing that procedure is important he considers in turn the preliminaries of the criminal process—arrests, the preliminary examination, and bail; the defendant's right to notice and to a fair hearing; the writ of habeas corpus; trial by jury; the right to counsel; searches and seizures; self-incrimination; double jeopardy; and cruel and unusual punishments. Emphasis is placed upon the views of the Supreme Court of the United States, but there are also broad generalizations about the tendencies of state law.

An especially valuable part of the book is the last chapter on the quasi-defendants. Under this suggestive title he focuses attention upon these groups: the loyalty defendants, investigating committee defendants, alien defendants, and passport defendants. These are the people who in our times "get into about the same fix as defendants without enjoying" their rights. Of them the author says: "I have tried to point out in what respects the procedures available for them are deficient. These constitute one of the growing edges

of our law, and there is reason to believe that we are gradually becoming aware of the plight of the quasi-defendant." He is justified in his hope that he has made a contribution to sharpening that awareness.

More books of this sort should be written by men of Mr. Fellman's reputation in his specialty. For in this day of specialization the scholar in a different branch even of the same discipline shares with the educated layman the need for a short work which he can use with the assurance that it comes from the pen of a man who knows his subject.

The author has appended sixty-eight pages of notes, largely citations; a table of cases of almost twenty-three pages; and an Index.

JAMES HART
Professor of Political Science
University of Virginia

WILLIAM O. DOUGLAS. *The Right of the People.* Pp. 238. New York: Doubleday & Company, 1958. $4.00.

This book by Mr. Justice Douglas summarizes the philosophy, in the area of civil liberties, of one of the most resolute defenders in our time of the basic rights of the individual as against the authority of the state, and of the Supreme Court as the guardian of these rights.

Along with Mr. Justice Black, the author has for two decades been the most vigorous and consistent exponent on the Supreme Court of the view that some risks must be taken if the fundamental rights of the citizen—especially the right to speak and write freely, to associate and to travel—are to be protected against erosion. The author's philosophy would, therefore, be of interest at any time; his views take on a special importance at this juncture when one of the recurrent attacks on our supreme tribunal is under way and is yet to be decisively repulsed.

It is sometimes overlooked that what has become the most vital function of the Supreme Court—the guardianship of the individual's rights against undue or arbitrary restriction by government—is inherently an unpopular function, for the simple reasons that majority views and conduct require no judicial protection and that when the Supreme Court intervenes to nullify an excessive encroachment on the rights of the citizen, the intervention is almost certain to be on behalf of an unpopular minority and consequently subject to inevitable attack. It can even be said that the more faithfully the Court performs its duty in this field the more certain and severe will be the attacks upon it.

The saving grace lies in the deep and true instinct of our people which is now asserting itself in defense of the Court's independence and integrity. An example is the recent powerful defense of the Court by Dean Erwin N. Griswold of the Harvard Law School in which he refers to the ill-advised criticism of the Court by the Conference of State Chief Justices in the summer of 1958 as a statement which "will live in history as a symptom of the times and not because of its own power as a persuasive discussion of constitutional law." Other influential voices, including that of Chief Justice Jones of the Supreme Court of Pennsylvania, have also been raised in protest against hostile criticisms of the Court so evidently caused by the racial decisions and the general tension of the times.

With reasonable confidence, therefore, we can believe that this most recent assault on the Supreme Court's all-important function as the protector of our basic liberties has passed its height and that the Court will emerge with perhaps even greater prestige than before.

If this be the result, it will be in large measure due to the consistent and vigorous course followed by the stouthearted judge whose philosophy on the rights of the individual as against his government is expounded with clarity and eloquence in *The Right of the People.*

GRENVILLE CLARK

New Hampshire

ALPHEUS T. MASON. *The Supreme Court From Taft To Warren.* Pp. xv, 250. Baton Rouge: Louisiana State University Press, 1958. $4.95.

The essays in this publication are "the outgrowth of three lectures given in the spring of 1957 at Louisiana State University." It should be said for the benefit of the lay reader that Professor Mason is an outstanding authority, a prolific writer, and a scholar who has the additional facility of addressing himself intelligently to the professionally uninitiated. This quality is admirably demonstrated in this little book.

These lectures attempt to present neither a history of the Supreme Court nor a digest of cases over the period under discussion. The author directs his attention exclusively to that controversial segment of the judicial process known as judicial review. After presenting the conventional doctrine of judicial self-restraint and demonstrating that self-restraint need not be very confining, the author discloses and appraises the Court's influence in the determination of public policy. He appears throughout to develop two parallel lines of reasoning or parallel lines of defense and attack: one, the line of self-restraint and judicial non-interference with the legislative process; the other, the line of reasoning taken by the critics of judicial lawmaking. The first position is documented largely from selected ruling opinions and the writings of "court apologists." The second position is documented largely and much more elaborately by reference to dissenting opinions supplemented from the writings of the "liberal school" of court detractors. In the end the scales are balanced heavily in favor of the attackers, partially because the authority of the author, like the proverbial butcher's thumb, adds weight throughout the discussion.

The volume will not be gleefully received by the admirers of Taft and, more especially, of Hughes. The liberal taint in Chief Justice Taft barely shows, and the "judicial statesmanship" of Hughes is presented as having added confusion and uncertainty to the judicial process rather than the contemplated stability. Professor Mason is perhaps too harsh on Hughes. Certainly the cross-section of cases presented does not characterize completely the Chief Justice's judicial temperament or contributions to American constitutional law.

These brilliant essays do not disclose unequivocally Professor Mason's personal attitude toward judicial review. They do reveal some doubt and some evidences of struggle. In any case, Professor Mason is convincing in supporting his conclusion that in declaring legislation unconstitutional the Court does more than measure the act against the language of the Constitution. These essays argue eloquently that Justices do become involved, and consciously so, in the legislative process—and perhaps in the political processes as well.

LEO PFEFFER. *Creeds in Competition: A Creative Force in American Culture.* Pp. x, 176. New York: Harper & Brothers, 1958. $3.00.

As has lawyer Pfeffer of the American Jewish Congress, I have been involved with the American Civil Liberties Union for many years in warding off the intrusions of sectarian religion in government. I am for a wall of separation between church and State, as is he. But experience teaches how difficult it is to draw the lines sharply.

Some religious intrusion into politics is legitimate, as he rightly maintains, but not the legal imposition on the majority of sectarian standards. It was all right in our culture for Protestants to urge prohibition on the country; it was not all right for Catholics to urge public support of parochial schools. It is not right for public officials to base decisions on their religious beliefs.

Dr. Pfeffer shows that all three major communions, Protestant, Catholic, and Jewish, have offended principle by attempting to impose by law their own concepts of morality. The Supreme Court, where it has had the chance, has rebuffed them. But the pressures continue. Dr. Pfeffer concludes that the "most serious challenge to American cultural patterns and values fixed by a Protestant-humanist alliance [which dominates American life] comes from Roman Catholicism." But he predicts that the challenge will be successfully met. If it modifies the patterns, that is desirable as a creative force in the competition of creeds.

The interplay of religious forces in our democracy Dr. Pfeffer regards as healthy both for our culture and for the modifications forced on the churches, even the least responsive, the Catholic. His study touches every problem raised by the impact of religion on public life and in a spirit so objectively fair that no reasonable sectarian could take valid exception.

New York City

RAY GINGER. *Altgeld's America: The Lincoln Ideal Versus Changing Realities.* Pp. 376. New York: Funk and Wagnalls Company, 1958.

As I read this book, my mind flashed back to my college days when I learned about the existence of a manuscript, written in Latin by a medieval monk, entitled "About Everything in the World, and a Few Things Besides." In modern parlance, the author has sought to cover the waterfront, and no one does that successfully.

First of all, Dr. Ginger tries to squeeze out a relationship between Lincoln and John Peter Altgeld; even as he does so, you become aware that he himself senses how tenuous and how far-fetched the link turns out to be. There is no meaningful connection in time, motivation, or conduct between the Civil War president and a governor of Illinois during the Gay Nineties, whose one claim to fame was also the cause of his downfall. He pardoned the three Haymarket riot leaders who escaped hanging.

Altgeld was really a man of minor consequence. Even padded with a soupçon of Lincoln, the author cannot find in him the substance for a full-length biography. He tries to fill the gap by giving a picture of the Illinois, and especially the Chicago, of which Altgeld was a part. This can be quite a legitimate device, and to some extent Dr. Ginger has so used it. He is at his best when he is portraying the lustful economic, political, and social life of Chicago at the turn of the century.

But I feel he goes too far when he tries to claim Thorstein Veblen and John Dewey as part of the Chicago ethos. They lived and worked there but were in no sense part of the local community. It is somewhat like seeking to identify Jesus solely with Judea.

Philadelphia, Pennsylvania

ELMER PLISCHKE. *Summit Diplomacy: Personal Diplomacy of the President of the United States.* Pp. 125. College Park: Bureau of Governmental Research, College of Business and Public Administration, University of Maryland, 1958. $2.50.

In *Summit Diplomacy*, Elmer Plischke has produced an informative work, thrusting a scholarly plow into rich new soil. As indicated by its title, this is an exploration of personal diplomacy on the part of the President of the United States, and to the extent that this involves reciprocal relations with heads of other states or governments it becomes germane to the entire problem of the conduct of foreign relations.

Structurally the volume is broken into seven chapters including the introduction. The major sections deal with presidential policy formulation, enunciation, and formalization; presidential personal communications; presidential personal diplomatic representatives; state visits; and summit conferences. The concluding chapter is devoted to an appraisal of summit diplomacy.

This organizational pattern appears to be well conceived and well executed. Clarity is preserved throughout the volume in terms of essential communication; the style is effective and forceful and moves the presentation along its way without creating patches of turgidity or torpidity. The temptation to defile into inviting valleys of irrelevant material has been resisted and the work stays on the main road of discussion of summit diplomacy.

Professor Plischke holds that the increasing use of summit diplomacy, although fostered by a large number of factors, "has been rendered physically possible by improved communications and transporta-

**BRITISH PARLIAMENTARY DEMOCRACY**
**Sydney D. Bailey**

"We like Bailey's BRITISH PARLIAMENTARY DEMOCRACY very much indeed. It is sufficiently brief to meet our particular purposes very well and yet it seems to us that it captures the essence of the parliamentary system as it has developed in Great Britain. I like Bailey's technique of tracing the gradual evolution of the parliamentary system to its present form. Ordinarily, I have doubts about the use of quotations except in a very limited fashion. But I think the relatively numerous quotations that Bailey throws in add considerable color and vividness to the points he is trying to get across. This is particularly true, I think, with respect to the fairly liberal reproduction of typical questions that are asked on the floor of the House of Commons during the question period. I think it is the best short treatment of British government I know." Landon G. Rockwell, Hamilton College, Clinton, N. Y.

tion." Thus diplomatic contact at the highest governmental level or the summit tends today to become a regular and accepted phase of the conduct of international political affairs. Plischke recognizes various other factors which enter into the creation of the complex of summit diplomacy. These may range obviously from deep conviction and sense of mission upon the part of the participant to a feeling that, since the chief executive within a national government has to assume political responsibility for the results of diplomatic decisions, he might as well seek to make these decisions himself. Besides, there is the fascination which occasionally comes to a man of power possessed as it were of a new toy, and the alternatively near-pathological urge of some leaders to play literal Mohammed and force the mountain to come to them must be noted as implicit in the interplay of advantages and disadvantages, the goods and the ills of summit diplomacy.

The most lasting difficulty, worthy of deep consideration and appraisal, noted by Plischke, is the conflict between the summit caste—essentially amateurs—and the career professionals in diplomacy. On the whole this is a work of real worth, breaking new ground; a good book which will be read widely, let us hope.

CHARLES W. SHULL
Professor of Political Science
Wayne State University

DANIEL J. BOORSTIN. *The Americans: The Colonial Experience*. Pp. 434. New York: Random House, 1958. $6.00.

Dr. Boorstin is initiating an analysis of the American experience. This volume, covering the Colonial years, will presumably be followed by several others. The project is definitely worthwhile, since American historians in the past quarter-century have been increasingly concerned with the minutiae of our developments and have tended to ignore large-scale interpretation.

This book has four main divisions. An analysis of the period of settlement gives attention to the establishment of four colonies: Massachusetts Bay, Pennsylvania, Georgia, and Virginia. Emphasizing that the Puritans were much less interested in theology itself than in the practical application of that theology to the problems of everyday life, the author finds it significant that they were able to resist the temptation of Utopia. That the Quakers of Pennsylvania did not have more influence on the shaping of our civilization may be traced to their rigidity and the fact that they "made a dogma of the absence of dogma."

It is pointed out that Georgia "became the victim of its benefactors." The specific plans made for the Georgia settlement were ill-suited for the New World and resulted in the failure of the experiment. In contrast, the author finds Virginia "an earthy effort to transplant institutions." Yet here he finds both weakness and transition, for "the virtues of 18th-century Virginia, when writ large, would seem to be vices. Localism would become sectionalism; the special interests of where a man lived would come to seem petty and disruptive."

The scond division deals with Viewpoints and Institutions. Here the author is concerned with the development of an American frame of mind. A section on Colonial medicine recounts the use of simple remedies and the appearance of a "striking emphasis—an interest in practical ways of treating particular diseases." This part concludes with a discussion of Colonial science.

A third section of the book is titled Language and the Printed Word. Here there is attention to what the author calls "The New Uniformity." Because there were thirteen colonies with no cultural capital—"never an American London or Paris"—American literary culture "began to acquire a varied responsiveness to local problems and to the manifold life of the continent." Many readers will find the section on the press very stimulating and provocative. The final division of the book contains four chapters on the role of war.

While there is no specific documentation, there is a two-column bibliographical essay running to nearly fifty pages and organized according to the divisions of the book. There is also an excellent Index. Most readers, whether intelligent laymen or trained historians, will find this a provoca-

tive volume. Certainly the author has made a fine beginning in his search for the roots of American culture and the mainsprings of our behavior.

WILLIAM MULDER. *Homeward to Zion: The Mormon Migration from Scandinavia.* Pp. xii, 375. Minneapolis: University of Minnesota Press, 1957. $7.50.

*Homeward to Zion* is a remarkable book. The author has placed himself in the background, and has, in a rare manner, put the immigrant himself on the stage where he is permitted to tell his own story.

Thirty thousand Scandinavians, preponderantly Danes, proselytes to the Mormon faith from Denmark, Sweden, and to a minor degree from Norway, sought a better future in America, impelled by religious inspiration, and helped and directed in their great adventure by the missionary activities of the Mormon Church in Utah and by its various mission headquarters in Europe and particularly in Copenhagen.

There emerge here and there from the unfolding drama of the lives of tens of thousands of simple folk, largely poor peasants, some outstanding figures. But there are no giants among them. Yet there is a grand sweep about this story of plain people engaged in a vast co-operative effort. The social and community aspects of life on the Mormon frontier give significance to the story. The drama unfolds much more than a mere repetitious account of the humdrum details of individual efforts to make a modest living in the great desert. From this volume one obtains, however, only a scant picture of the psychological experiences and problems of individuals. Here and there one does get snapshot pictures of this aspect of pioneer living, but for the most part it is a social history.

The author's forty-four pages of fine print in the Appendix disclose a vast storehouse of documentary materials including letters written by immigrants, diaries, autobiographies, memoirs newspaper articles, and so forth. In reading the book one feels as though one is leafing through these rich sources, stopping frequently to read sentences and even whole paragraphs and for the rest getting from the author a summary statement, cast in the language of the documents, of the more significant details. This to me is the most remarkable feature of the book.

The author is director of the Institute of American Studies at the University of Utah. The picture he presents of the experiences, aspirations, and achievements of the Scandinavian immigrants to Mormon Utah, while preponderantly favorable and strongly sympathetic, nevertheless does not omit the story of the very considerable proportion of immigrants who became disillusioned and left Utah for their homeland or for Iowa, Nebraska, and other States.

Finally, it should be noted that one can obtain from this volume a fairly clear picture of social and economic conditions in the old countries, especially in Denmark, in the period 1850 to 1870. This is one of many interesting features of the book.

ALVIN H. HANSEN
Professor of Economics, Emeritus
Harvard University

KENNETH O. BJORK. *West of the Great Divide: Norwegian Migration to the Pacific Coast, 1847–1893.* Pp. viii, 671. Northfield, Minn.: Norwegian-American Historical Association, 1958. $7.50.

A work such as the above has a definite advantage over a general history; it is written not only from the viewpoint of the ordinary loyal American but in addition, with justifiable pride and interest, with the intent of exhibiting the contributions of a specific group—in this case the Norwegians—to American civilization. As a result, the research involved, which extended over ten years, has the earmarks of being more thorough than that of a more general history project.

The volume is written with commendable restraint and is based on local, contemporaneous, grass-root material, such as Norwegian-language newspapers, manuscripts, and immigrant letters. The Norwegian-American Historical Association has already published more than two score of its writings, and this large volume by Professor Bjork is the last. It is a real contribution.

We learn that the discovery of gold in California first made America well known in both Norway and the American Middle West—for the potential Norwegian settlers came from both places. As was true among other national groups, there were both successes and failures for the Norwegians. Many letters warned prospective emigrants against leaving their homes without both a special willingness and aptitude for hard work and capital enough to last for a few months. This applied not only to gold mining but to other occupations, such as farming, fishing, and boat building. And the Norwegians engaged in many other occupations; they became sailors, ship captains, miners, loggers, lumbermen, hard-working Mormons, and railroad builders. In so doing they often came in contact with other Scandinavians, who are mentioned in the book. Copious statistics are offered about the Norwegians everywhere and the prominent ones mentioned by name. *West of the Great Divide* thus becomes an excellent reference work on the subject.

Perhaps the most romantic and fascinating story among the Norwegians is that of so-called "Snowshoe" Thompson, who apparently, before the railroad to the Coast was completed, carried the mail on snowshoes over the mountains of the Northwest, never officially receiving any pay. Only occasionally, for a private emergency letter or message, did he receive a gratuity large enough to keep body and soul together. The rest of the time he carried on his task for sheer adventure and love of the thing.

Culture and religion were not neglected. The Norwegians built churches, published newspapers, and organized singing societies and social welfare groups. But they were an independent lot; there were dissensions, though in general all contributed to American democracy and culture.

Of course, Professor Bjork's volume is supplied with maps, bibliographical data in footnotes, and, naturally, an Index. It adds substantially to our knowledge of the development of the West and Northwest.

ADOLPH B. BENSON

Scandinavian, Emeritus
Yale University

WILLIAM REYNOLDS BRAISTED. *The United States Navy in the Pacific, 1897–1909.* Pp. xii, 282. Austin: University of Texas Press, 1958. $5.00.

The period from the eve of the Spanish American War through the second administration of Theodore Roosevelt, though brief in time, was full of significant developments. These years witnessed among other things the territorial expansion of the United States across the Pacific, the formulation of basic American foreign policies in the Far East, and the emergence of the United States as a major naval power in the Pacific.

This most interesting and exciting era has received considerable attention from several able historians. Professor Braisted contends, and with some justification, that while scholars have combed the records of the State Department, they have failed to examine systematically those of the Army and Navy Departments which relate to foreign affairs. This book seeks to remedy this defect and its major contribution is its attempt to evaluate the Navy's influence on American foreign policy during these formative years, most of which, so far as the United States were concerned, were years of peace.

The inter-relationship of naval and diplomatic policies is kept central as the major events of the period, such as the conquest of Hawaii and the Philippines, the Boxer Rebellion and the Open Door Policy in China, the Russo-Japanese War and the several episodes in relations between the United States and Japan, climaxed by the "Big Stick" Navy cruise, are carefully and ably developed.

In surveying his findings, Professor Braisted concludes that though naval men did not dictate American foreign policy during these years, naval considerations were often determining factors in the formulation of Far Eastern policy. American naval and diplomatic policies were usually

"joined in harmonious co-operation and mutual support," as in the Boxer Uprising and Russo-Japanese War. Only once were they in sharp conflict and that was when the Navy sought an advance base on the China coast during the partition threat but found the State Department opposed. On two occasions the limitations of the Navy's power "exercised a controlling influence over American diplomacy." A major interest of Roosevelt in seeking an early peace in the Russo-Japanese War was to preserve to some extent the delicate balance of power so vital to American security in the Far East; and a significant, if not determining, factor in the Root-Tahahira exchange was the weakness of the American navy. Professor Braisted concludes his study with these words: "In a constantly changing international political scene, the United States Navy provided the balance which kept American foreign policy on an even keel" (245).

The author has ably fulfilled his hope that his research "will help establish a more accurate understanding of the Navy's function as an arm of foreign policy" (viii), and we wish to encourage him in his plan to follow this study of Navy in the Pacific with an explanation of its more recent diplomatic role in the Far East.

WILLIAM E. LIVEZEY

University of Oklahoma

WILLIAM E. LEUCHTENBURG. *The Perils of Prosperity, 1914–1932.* (The Chicago History of American Civilization Series.) Pp. ix, 313. Chicago: University of Chicago Press, 1958. $3.50.

In this fine book, the latest volume in the Chicago History of American Civilization, Professor Leuchtenburg has fulfilled admirably a difficult task: to give in brief compass a lively and authoritative account of the complex forces which shaped America in the years between the outbreak of World War I and the election of Franklin D. Roosevelt.

The first sixty-five pages deal with the war and the lost peace; the remainder concentrate primarily on the 1920's, a decade which has been undergoing some serious re-evaluation by the historians. Professor Leuchtenburg approaches the 1920's with neither the distaste which was so characteristic some twenty years ago nor the nostalgia so evident today, but with an open mind and a firm grasp of the latest historical scholarship. The result is a fresh view of a paradoxical era.

The author is particularly successful in relating the 1920's to the years which preceded and followed. By 1920, for the first time in American history, less than half the people lived in small villages and on farms, and this growing triumph of the city furnishes a key to much that happened. It largely provoked such rural counter-offensives as the Klan, anti-evolutionism, immigration restriction, and other aspects of "political fundamentalism," and it lent particular bitterness to the campaign against Al Smith in 1928. Meanwhile progressivism, leaderless and divided but far from dead, was shifting from the heavily middle-class reformism of the Theodore Roosevelt-Wilson era to the more inclusive mass-supported liberalism of the New Deal.

The "prosperity" of the 1920's brought many "perils," but perhaps the chief was the development of "single-interest government," that is, the total commitment of the Republican Party to the interests of business. It was this that led to those disastrous federal policies of the decade: tax policies increasing the maldistribution of wealth, monopoly policies adding to the rigidity of the market, farm policies encouraging an unbalanced economy, tariff policies hampering foreign trade. The Great Depression which climaxed the 1920's was the result of complex causes, and Professor Leuchtenburg does not oversimplify them, but to the concept of "single-interest government" he assigns a heavy share of the blame. His willingness to give us his critical judgment on men and measures adds to the value of a book which will prove rewarding whether the reader is a beginning student seeking an introduction to the period or a mature scholar revisiting his own experiences of the 1920's and the first depression years.

RANSOM E. NOBLE
Professor of History
Pratt Institute

LEON D. EPSTEIN. *Politics in Wisconsin.* Pp. xiv, 218. Madison: University of Wisconsin Press, 1958. $3.50.

This incisive and disciplined study of the politics of a single state presents a useful model of analysis for application to other states. Out of a series of such studies, each taking as its first concern not the uniqueness of the state but broad propositions about political behavior to be tested by comparative analysis, political scientists could develop more reliable generalizations about the American party system than those upon which we must now depend. The author has made this object his main purpose, and his analysis of Wisconsin politics is an exemplary demonstration of its feasibility and value.

The hypotheses of the study are developed from a familiar political model: a democratic political system supposed to function with two well-organized and well-defined political parties competing fairly evenly for state, as well as national, office. Within this general frame, an introductory chapter makes quite explicit the purpose, the methodology, and the limits of the study; following this, a second chapter presents concisely the relevant aspects of the Wisconsin setting—social and economic characteristics, and certain relatively fixed political institutions—while a third chapter makes a general appraisal of the party system of the state in terms of the two-party model. These chapters are followed by four of a more specialized character—size of place and the two-party vote, party organization, legislative membership, and legislative elections—while the final chapter, "Speculative Implications," returns to the author's interest in comparative politics. The presentation is throughout a model of clear statement of the propositions to be examined, careful handling of data, coherent analysis, and restrained summaries of findings.

Politics in Wisconsin during the postwar decade (1946–1956) are found to be moving steadily toward the two-party model. Democratic majorities are centered in metropolitan Milwaukee County and in urban places over 50,000; Republican majorities are anchored most firmly in areas under 10,000, and prevail also in the 10,000–50,000 class. Farm townships show the greatest fluctuation in voting behavior. Party organizations are largest and strongest in urban and suburban places; party officers have a state and national, rather than local, orientation; and party organization influence over nominations for statewide office is strongest. Legislative membership and elections reflect the persistence of some of Wisconsin's distinctive political traditions such as limited functions of party organizations and personalized campaigning. Population trends seem to favor the Democrats. These and other findings enrich our understanding of Wisconsin's politics, but the author's greater contribution is his successful development of a model for the comparative analysis of state politics and state party systems.

WALLACE S. SAYRE
Professor of Public Administration
Columbia University

STEPHEN B. SWEENEY (Ed.) with the assistance of THOMAS J. DAVY. *Education for Administrative Careers in Government Service.* (One of a Series Commemorating the 75th Anniversary of the Wharton School and the 20th Anniversary of the Fels Institute of Local and State Government, University of Pennsylvania.) Pp. 366. Philadelphia: University of Pennsylvania Press, 1958. $5.00.

This volume is a readable and timely treatment of the education now being offered, particularly by the graduate schools, for those seeking careers of administrative leadership in government service. The basis of *Education for Administrative Careers in Government Service* is the papers presented and the conclusions reached in several conferences and workshops as the participants attempted a "reconsideration of the fundamental assumptions and elements of education for the public service." Given the format of papers and discussion, there is necessarily an element of repetition, but there is compensation for the reader in the wide range of insights provided into the problem of education for the public service.

The student of public administration will not discover many new data, but he will

find a comprehensive and competent discussion of the problems and approaches to educating generalists in the public service. Curricula, teaching techniques, and the institutional setting for these programs are discussed, and there is an Appendix which reports on these in some detail. This reviewer is pleased that the approach is liberal, allowing a great deal of flexibility to the teacher in the utilization of teaching techniques and to the institution in formulating the curriculum. The importance of the role of the teacher is adequately emphasized.

A high point of this volume is the concise and penetrating paper by Wallace T. Sayre on "Trends in the Study and Teaching of Public Administration." Here is a very helpful summary analysis of the developments in the field in the last half century which recognizes the inescapable relationship of public administration to politics, political theory, and the culture of the polity. Happily the days when administration could be analyzed primarily in terms of objective principles are gone.

It is natural that attention should be paid to one of the greatest challenges and most vexing problems in education for the public service—the relationships between education for the generalist and for the functional specialist. Since this volume is concerned primarily with the education of generalists and since the public service still places far greater emphasis in recruiting on the functional specialist, this dilemma, if it be that, probably deserves even more consideration than it receives in these discussions. This study concludes that "the crux of the matter still lies in the preparation of functional specialists to assume adequately the administrative duties to which the most talented will be called," and that this is not likely "until there evolves a closer three-way partnership among professional schools, faculties of general public administration, and governmental employers."

Any extended discussion of such questions as the role, skills, responsibilities, and knowledge which are expected of the administrator is impossible here. Suffice it to say that they are covered in a scholarly and interesting manner.

The emphasis throughout is based on the sound thesis that "education and training for administrative policy-making careers is a matter of total career development." Thus administrators, colleges and universities, and governmental agencies have a joint and continuing responsibility in educating administrators who will be not only technically competent but also motivated by a well-rounded philosophy of government. Formal education and internships are only the initial stages of a continuing process.

As one puts down this volume, however, he cannot but be impressed by the caveat in the concluding paper by Stephen K. Bailey that "we had better spend at least as much time in discovering and recruiting leaders as in training them."

LAWRENCE L. PELLETIER
President
Allegheny College

MORRIS JANOWITZ, DEIL WRIGHT, and WILLIAM DELANY. *Public Administration and the Public—Perspectives toward Government in a Metropolitan Community.* (University of Michigan, Michigan Governmental Studies No. 36.) Pp. vii, 140. Ann Arbor: Bureau of Government, Institute of Public Administration, University of Michigan, 1958. No price.

Democracy is sometimes known as "government by consent." In a representative democracy the principal means of enforcing responsibility on public officeholders is the ballot. This helps explain why political scientists often concentrate their efforts on the electoral process.

In recent years there has been an increasing tendency to evaluate administrative processes as well. Most research in this area has been concerned with internal administrative problems and management procedures. As a result, the influence of public opinion on public administration has been almost overlooked. Lacking studies of this dynamic force, we have an incomplete picture of the administrative process, for public agencies are profoundly influenced by the prevailing climate of opinion. Not even a totalitarian state can ignore public opinion.

This sample survey, conducted by a training and research group of the University of Michigan, and known as the "Detroit Area" study, was designed to investigate this area. A basic premise on which it rests is the concept of "balanced" public administration. According to this theory, a bureaucracy which disregards public opinion—such as that of pre-war Germany—is despotic. If it truckles to special interest groups—as the municipal government of a company town—it is subservient. The purpose of this project was to examine the relationships between the public and the most visible line agencies in the Detroit metropolitan area, whether municipal, county, state, or national, and to ascertain how closely these relationships approached the ideal envisioned by the authors—a bureaucracy based on consent.

This investigation, which used carefully controlled sampling techniques, produced some interesting findings. On the favorable side, it indicated that most people in the area believed the public bureaucracy served their personal interests. There was no widespread conviction that public officials were corrupt. Indeed, the prestige of civil servants had risen over the years.

On the other hand most people in the area accepted "service" agencies passively because they were relatively uninformed about key welfare programs. The investigators also found evidence of "subservient imbalance" because the bureaucracy could not counter public ignorance about its operations, failed to arouse widespread and intelligent curiosity about its functions, and lacked sufficient prestige fully to achieve its goals. The fact that low socio-economic groups did not believe the public bureaucracy served their interests sufficiently was regarded as "despotic imbalance." These imbalances, they concluded, created strain and uncertainty in public administration. To remedy these conditions, they recommended that public agencies establish programs of public opinion research, like industry's "market research."

As these conclusions indicate, the monograph is highly theoretical in nature. It is intended for the specialist rather than the general public. Indeed, the director of the study frankly calls it "exploratory." It will be useful chiefly to political scientists interested in the interaction of public opinion and public bureaucracies.

FREDERICK SHAW
Research Associate
Board of Education of the City of
New York

MARQUIS CHILDS. *Eisenhower: Captive Hero: A Critical Study of the General and the President.* Pp. 310. New York: Harcourt, Brace and Company, 1958. $4.75.

This relatively brief book falls somewhere between a presidential-campaign panegyric and a comprehensive scholarly biography well documented with footnotes. The sub-title, *A Critical Study . . .*, belies the real character of the book, as it is almost wholly descriptive, anecdotal, and devoid of the author's conclusions or evaluations.

But for enjoyable light reading before the blazing fire on a long winter evening it can hardly be improved upon as an interesting narrative of the life of the President from boyhood through six years in the White House. It is written in the vivid, easy-flowing style of the skilled journalist that the author is, with the professional sense of news values and the facile pen to put the story on paper.

The narrative begins in the Abilene family home of the Eisenhowers, "on the south (wrong) side of the railway tracks." There David first gained that spirit of self-reliance and adaptability that was to carry him through the varied experiences of soldier and statesman. He is shown in his school fights with the town bully, in his violations of cadet regulations at West Point, in his disappointment over his failure to get overseas in World War I, and over irksome staff duty in Washington i the early months of World War II.

The reader goes to London with hi in 1942, then on the North African inv sion, and finally to headquarters as Co manding Officer of the Allied Expeditiona Forces. The hero of victory returns to a overwhelming New York City ticker-ta welcome and to a spectacular celebrati in Abilene befitting the American saga the legendary return of the home-town b

who had made good out in the, literally, big wide world.

He is shown in the hands of those who promoted him for the Republican nomination for the Presidency in 1952, in the intricate situations which arose in that campaign, in the conflicts with the Taft forces in the party, and in organizing his Washington "Team" for the first administration. His promotion of "modern Republicanism" in his second term and the new challenges of the school segregation issue bring the narrative to a close.

Mr. Childs places large emphasis throughout the narrative upon the simple virtues, the innate integrity, candor, and simplicity of the man, upon his humility and dedication to the service of his nation, alike in uniform and in mufti. He remains throughout his career unaffected by his high positions of authority and his exalted reputation. Asked in 1952 why he was going into politics, he replied, in honest candor, "because I feel that I should." He freely criticizes people and groups who are "thinking simply of themselves and not of the country." We are led to appreciate his "warmth of personality," "hearty geniality," "glow of idealism," and "the capacity and adaptability of the man."

The narrative is good reading in the best Horatio Alger tradition.

HAROLD R. BRUCE
Visiting Professor of Government
Pomona College

HARRY BARNARD. *Independent Man: The Life of Senator James Couzens.* Pp. viii, 376. New York: Charles Scribner's Sons, 1958. $5.95.

This is the very readable biography of a man who was successful in business and politics, but is here pictured as being so independent and blunt in both that one may wonder why he was successful. Perhaps the author, swept along by the development of a theme, over-emphasized this side of the Couzens character, but he also pictures a very industrious individual of great ability and character, and such characteristics sometimes enable men to move mountains.

James Couzens was a liberal in the era of Woodrow Wilson and was still a liberal in the age of Franklin D. Roosevelt. In between, in the days of Harding, Mellon, Coolidge, and Hoover, he was a hard thorn in the fat flesh of the Republican party. Like LaFollette and Norris and other progressives of the time, he was an incongruous Republican. This man who had made millions of dollars in business was also a thorn in the flesh of selfish and unscrupulous businessmen and financiers. The Detroit bankers, when the depression came and their banking structure was revealed as thoroughly rotten and unsubstantial, found him a very disagreeable man.

Aside from the value which this book has for the reader who is interested in the life story and the character of Couzens, it is chiefly interesting, perhaps, for its fascinating account of the beginning of the Ford Motor Company and the important part which Couzens played in it, for its information on the banking crisis in the depression, and for its evidence of the respect which Franklin D. Roosevelt and Couzens had for each other.

Furthermore, if anyone is inclined now to assume that the New Deal sprang forth full-blown after the election of Roosevelt this book may prove a reminder that the outlines of its great constructive measures had been drawn by advanced political leaders before that memorable event. While Hoover was still president, Couzens advocated unemployment insurance and old age pensions, and public works on a scale large enough to diminish unemployment.

CHARLES W. SMITH, JR.
Public Opinion Analyst
Arlington, Virginia

EARL LATHAM (Ed.). *The Philosophy and Policies of Woodrow Wilson.* Pp. xv, 266. Chicago: University of Chicago Press, 1958. $5.00.

With special acknowledgment to the Twentieth Century Fund and the Woodrow Wilson Foundation, the American Political Science Foundation has been able to present Wilson's controversial role in American political and intellectual life as viewed by fifteen authorities. The fifteen chapters include lectures delivered during the centennial celebration of the birth of Woodrow Wilson in 1956, as well as articles and chapters from books by historians and economists. The resulting volume, edited by Professor Earl Latham, Joseph B. Eastman Professor of Political Science at Amherst College, helps us to see Wilson in a fresh new light. All facets of the molder of the "New Freedom" are explored, and both his assets and liabilities are spelled out.

That Woodrow Wilson came to the presidency better prepared to face the problems of that great office than most of his predecessors has generally been accepted by all historians. The supreme irony of his administration was that his greatest challenge came in foreign affairs, the area where he was weakest. In the twelve years immediately preceding his coming to Washington he was either ignorant of, or completely unconcerned with, the elementary facts of American diplomacy. He perceived his own weakness when he remarked to a Princeton friend, "It would be the irony of fate if my administration had to deal chiefly with foreign affairs" (p. 147). He made his greatest contributions in this field because he applied the same techniques of leadership which he used with such success in domestic troubles.

Wilson was a strong executive and began immediately after March 4, 1913, to prove it. His extra-session call early in April, at which he appeared personally to present his program of tariff reform and banking and currency change, awakened the Congress and the public to what they could expect from the "scholar in politics." The President was not only strong in his convictions, but strong in the knowledge that what he was attempting would aid his determination to place the presidency in its proper perspective under the Constitution.

In appraising and recapitulating the work of the fourteen men who precede him in this volume, August Hechscher, president of the Twentieth Century Fund, has this to say:

He saved trivial things from seeming trivial; and in the greatest matters the sword he wielded seemed to carry the light of heaven upon its blade. . . . He went down a broken man. But the gods are not done, and the great issues—war or peace, life or death—continue to be the stakes for which they play (p. 258).

The reviewer believes this statement by Mr. Hechscher epitomizes the effort of Woodrow Wilson so ably presented in this volume. The varied contributions of the twenty-eighth President of the United States show his honored place in the mainstream of modern history.

JAMES J. FLYNN
Associate Professor of History
Fordham University

ELEANOR ROOSEVELT. *On My Own.* Pp. xiv, 241. New York: Harper & Brothers, 1958. $4.00.

*On My Own* is the third volume of a fascinating autobiography. Although the author was seventy-four years old in October, it seems strange to have her refer to being near the end of her active life. Her many friends all over the world will hope that she will continue to be active for many years to come.

Mrs. Roosevelt's husband died in April, 1945. It is of the intervening thirteen years since that tragic event that the author writes here.

Royalty and distinguished citizens of many countries have visited Hyde Park or have been hosts to Mrs. Roosevelt on her travels. Haile Selassie, Nehru, several members of England's royal family, Queen Juliana, Tito, the Sultan of Morocco, the Emperor and Empress of Japan, and Nikita Khrushchev have all been among this number.

Although no attempt has been made at chronology, the writer relates in some detail several of her most unusual experiences. Of significance was the visit with the English royal family and the unveiling of a statue of Franklin D. Roosevelt in Grosevenor Square in London. This monument was made possible by the English people. With perfect frankness the author states that she did not care for Winston Churchill.

With humility Mrs. Roosevelt tells of her appointment as a member of the United States delegation to the United Nations

General Assembly, of her role on Committee 3 for Human Rights, of her work to give war refugees the privilege of deciding where they would live, of her first speech before the United Nations General Assembly, and of her country's victory in this bitterly contested, highly emotional issue. Until 1953 Mrs. Roosevelt served as a delegate to the United Nations General Assembly and as a representative on the Human Rights Commission. As this commission's first chairman, this talented humanitarian worked toward the creating of better understanding among her fellow men. Her efforts culminated in the Universal Declaration of Human Rights.

Since retiring from the United Nations Assembly, the author of this book has traveled extensively. Not only has she been on several world tours but she has participated in a political campaign or two for good measure. After the 1956 presidential campaign, Mrs. Roosevelt's children urged her to "slow up" but she observed, "I could often keep going longer than they."

Several books have been written about America's most energetic lady—a title which certainly belongs to Mrs. Roosevelt—and doubtless many more will be written in the future. However, she is her best biographer. *This Is My Story*, *This I Remember* and *On My Own* constitute a notable contribution to American biographical writing.

GEORGE C. OSBORN
Professor of Social Sciences
University of Florida

## *SOCIOLOGY*

MARVIN E. WOLFGANG. *Patterns in Criminal Homicide*. Pp. xiv, 413. Philadelphia: University of Pennsylvania, 1958. $8.00.

Between the prospecting clinicians' case studies of selected offenders in custody and the sociologists' broad-ranging explorations of regional and class differentials in crime there lies a promising territory, often traversed, but still only broadly charted and sparsely settled: the comprehensive and systematic study of specific types of crime. Wolfgang's examination of the cases of 588 victims and 621 offenders involved in criminal homicide in Philadelphia from January 1, 1948 through December 31, 1952 builds a solid foundation for the further development of knowledge in this area.

The records of the Philadelphia Police Department's Homicide Squad, which provided the basic information, have the advantage of being more comprehensive than other sources as well as being inclusive of evidence that could only be gathered at the time of the initial investigation. From these records Wolfgang has obtained data about significant attributes of both the victim and the offender in an effort to determine whether there are discernible regularities and patterns associated with criminal homicide and, if so, what they might be. To this end, differentials in race, age, sex, and previous arrests for both victims and offenders, as well as the temporal patterns of criminal homicide—months, days and hours of killings—were analyzed. The often-neglected relationship between the victim and the offender was examined as were also the special situations in which killers subsequently committed suicide or their crimes were unsolved. Although this is not intended to be a comparative study, useful cross references are made between the Philadelphia data and somewhat similar, but not exactly comparable, evidence gathered by other investigators.

Criminal homicides most commonly grow out of vaguely defined altercations, domestic quarrels, jealousy, arguments over money, and robberies. More than half of the criminal homicides here examined involved close friends or relatives. Males killed more frequently than females and Negroes more frequently than whites. In 94 per cent of the cases victims and offenders were of the same race. 26 per cent of the criminal homicides in Philadelphia were precipitated by the victim who was the first to resort to physical violence. 41 per cent of all women killed were killed by their husbands, but only 11 per cent of the men were slain by their wives. These and certain other relationships are already known, at least to those who have given some attention to criminal behavior, but the refinements of these basic facts are the special contribution of Wolfgang's study. For example, the assumption that the high Negro rate of criminal behavior reflects the larger proportion of Negroes in the poorer socio-economic levels must be set against Wolfgang's evidences that even assuming that all those, both white and Negro, who committed criminal homicide were in the occupational range from semi-skilled to unemployed, the male Negro rate by class in Philadelphia was still more than eight times that of the whites. This does not, of course, imply a biological explanation but rather the need for more careful research especially with reference to the socio-psychological differentials among subgroups on the poorer socio-economic levels.

Other studies differ in their implications about the past records of killers but they have frequently indicated that those who commit criminal homicide are not likely to have had previous convictions or commitments for other offenses. Wolfgang's examination of arrest records, however, shows that 64 per cent of his offenders and 47 per cent of their victims had previous arrests, most frequently for offenses against persons. The proportion of those who killed and subsequently committed suicide appears notably less than that reported in England; yet, even so, in Philadelphia as elsewhere, more killers die by suicide than by execution.

This is a sophisticated and workmanlike study whose richness of detail and carefully stated methodology preclude an adequate brief analysis. If ever criminology comes to maturity it is likely to be due chiefly to the increasing number of competent empirical researches in specific types of crime, of which Wolfgang's *Patterns in Criminal Homicide* is a most creditable example.

RENSIS LIKERT and SAMUEL P. HAYES, JR. (Eds.). *Some Applications of Behavioural Research*. (Science and Society Series.) Pp. 333. Paris: United Nations Educational, Scientific and Cultural Organization, 1957. $3.25.

This book is the second in a new Science and Society series recently instituted by the United Nations Educational, Scientific and Cultural Organization "to spread knowledge of the practical effects of discoveries made in the various branches of the social sciences."

For the most part it consists of reports on the results of seminars held during 1954 and 1955 under the auspices of the Foundation for Research in Human Behavior in Ann Arbor, Michigan. This foundation has as one of its main activities the holding of meetings which bring together representatives of business concerns and social scientists to discuss the bearing of social science research on problems of business and other complex organizations.

The participants in the seminars here reported were drawn mainly from the University of Michigan's Institute for Social Research, business firms, and government agencies. Dr. Likert is the Director of the Institute and Dr. Hayes is the Director of the Foundation. The chapters reporting on the seminars are authored by Stanley E. Seashore, who served as rapporteur for the seminars on "Administration Leadership and Organizational Effectiveness" and "The Training of Leaders for Effective Human Relations"; Hollis W. Peter, who prepared the chapter on "Human Factors in Research Administration" and was co-author with Simon O. Lesser of the chapter on "Training Foreign Nationals in the United States"; Francis S. Bourne, who wrote the report on "Group Influences in Marketing and Public Relations"; and Irving Morrisett, who reported on the seminar on "Psychological Surveys in Business Forecasting." In addition, there is an introductory chapter on "Behavioural Research: A Guide for Effective Action" by Likert, and a final chapter "Relating Behavioural Research to the Problems of Organization" by Hayes.

It is quite difficult to evaluate a book made up of reports based on seminars. The fact that these meetings were focused on problems of consequence to representatives of business and government agencies

insured proper emphasis on the application of social science research to practical problems. Moreover, the fact that the participants had to communicate their ideas to each other resulted in a level of presentation that is comprehensible to the general reading public. However, the selection of topics for discussion was necessarily quite different, and I believe less fortunate, than it would have been had the selection been made without regard for the needs of the seminar program. In my opinion, considerably better examples exist of the practical effects of discoveries made in the social sciences than most of those reported in this book. In fact, the principal criticism that American social scientists are likely to make of the volume is that for the most part it is based on the social psychological approach of a single social science research center and consequently does not adequately represent the full range and variety of approaches and methodologies that social scientists are currently bringing to bear on a number of important practical problems.

MILTON M. GORDON. *Social Class in American Sociology.* (Duke University Press Sociological Series.) Pp. xiii, 281. Durham, N. C.: Duke University Press, 1958. $6.00.

This book combines an historical survey with a critical appraisal of the studies of class in American society which were published between the middle 1920's and the middle 1950's. Among the major works discussed at length by the author are Sorokin's pioneering volume on social mobility, the Lynds' two studies of Middletown, various publications of Warner and his associates, and Centers' study of class consciousness. A substantial number of other studies are summarized and evaluated more briefly. The critical reader will note a few unfortunate omissions, but by and large the coverage is good.

Gordon's appraisals of the various studies are developed in terms of five basic questions which are addressed to each study. First, how does a writer define the concept "class"? Second, how is the concept put into operation? Third, what are the correlates of class when so defined and used? Fourth, what does the writer have to say concerning social mobility? And finally, what does the writer have to say concerning ethnic stratification? Gordon gives far more attention to the first three of these questions than to either of the last two.

In keeping with the character of the era reviewed, methodological and conceptual problems figure prominently, while basic theoretical issues tend to be neglected. Thus, scholars with an interest in the many important theoretical issues raised by writers such as Marx, Mosca, Pareto, Veblen, Lasswell, and others of their kind will find but little of interest in this volume. However, if criticism is to be meted out because of this, such criticism should be directed at the men who have written the studies Gordon reviews more than at Gordon himself.

This reviewer is skeptical, however, that such criticism is warranted. While it is surely true that sociologists must continue to address themselves to basic theoretical issues if our understanding of stratification is to increase, it seems equally true that any satisfactory treatment of theoretical issues presumes a methodological and conceptual sophistication which did not exist in the early 1920's. Those who read this volume will discover that real advances have been made along these lines, especially in the last decade. Perhaps the most serious criticism that may be made of this very worthwhile book is that its author fails to provide his readers with a proper perspective on the era he describes. The reader is likely to come away unaware that this era represents a rather special phase in the development of the field, and that the work of the next thirty years may have a very different character from the work of the last thirty. Specifically, the next thirty years show promise of a return to the big theoretical issues, but a return which will be built on methodological and conceptual foundations laid in the era Gordon describes.

As with almost any book, there are certain specific features which prove annoying

A serious and important study of our lives in an age of mobility

CITIES IN THE MOTOR AGE

by Wilfred Owen

How can we relieve the motorist's stranglehold on our cities? How can we keep him driving happily? In this vigorous attack on the problem of our future comfort and well-being, a noted expert discusses city planning and our national highway program, and its meaning for the individual citizen as well as the nation at large.

to reviewers. In the present instance, this reviewer was dissatisfied with Gordon's too neat separation of ethnicity and social status. Also, the very lengthy treatment of the ecological school of the 1920's seems unwarranted in view of their small contribution to our understanding of stratification. However, viewed as a whole, this volume affords a very useful critical survey of the last thirty years' work in one of the major subdivisions of contemporary American sociology.

GERHARD E. LENSKI
Assistant Professor of Sociology
University of Michigan

MELVIN M. TUMIN with the assistance of others. *Desegregation: Resistance and Readiness*. Pp. xvii, 270. Princeton University Press, 1958. $5.00.

This book is a report on the attitudes toward desegregation expressed by 287 white males, eighteen years or older, who are members of the labor force in Guilford County, North Carolina. The study began as a student project in methods of social research, and reports in detail the numerous steps in the research process. The dependent variable, expressed in a variety of questions, is the degree of "readiness for desegregation." The independent variables are largely the personal backgrounds of the respondents.

As the author remarks, in view of the findings of other earlier studies, "there are preciously few surprises or novelties to be found in this report." Findings mentioned as unexpected are first, that church attendance and rural-urban residence are not related to attitudes toward desegregation —the reviewer would question whether at least the latter finding is capable of generalization—and second, that childlessness is related to attitudes toward desegregation of schools.

The author seeks to support the conclusion about each correlation by holding other variables constant. From these cross tabulations, he draws numerous conclusions which are drawn together into "ten major findings." The sample is relatively homogeneous in its unfavorable image of the Negro. Every group in the sample had lower segregationist scores on its attitude toward the schools than on its image of the Negro. The differences between various groups in the sample on their image scores tend to be smaller and less significant than the differences in their scores on school desegregation. Among the major factors responsible for, or associated with, differences in attitudes between various segments of the sample are those which locate the individual on the ladders of property, power, and prestige. A crucial variable in addition to those which define class position is "exposure to mass media." The more exposure, the more favorable the image and the greater the readiness for desegregation. A significant difference among various groups, in the sample concerns the way in which and the degree to which their scores change as one goes from image of the Negro to the ideology of social relations, to sentiment structure, to general action set, and finally to specific action set. Only the most ready group, that which sits high on the various ladders of stratification, and which is highly exposed to news of the outside world, reaches that dividing point at which we can talk in positive and absolute terms of favorable attitudes toward the Negro and some genuine readiness for desegregation. The majority of the community are neither extreme segregationists nor extreme desegregationists. The principal advocacy of social change, as is implied in the term desegregation, comes from those who have the widest perspective on themselves and their communities, and the deepest sense of stake in the community-in-process. Three types of leaders are, first, the legitimate and respected leaders who oppose desegregation; second, the legitimate and respected leaders who either do not oppose or actively favor desegregation; and third, the non-legitimate, ordinarily disrespected leaders who emerge into positions of prominence whenever the legitimate leadership fails to make its voice heard and fails to take action.

ARNOLD M. ROSE
Chairman, Department of Sociology
University of Minnesota.

P. K. WHELPTON and CLYDE V. KISER (Eds.). *Social and Psychological Factors Affecting Fertility*. Vol. V. Con-

cluding Reports and Summary of Chief Findings from the Indianapolis Study. Pp. 1088–1372. New York: Milbank Memorial Fund, 1958. $1.00.

This is the fifth and final volume of papers reporting the findings of the fertility research popularly known as the Indianapolis Study. It contains nine papers, all of them previously published in the Milbank Memorial Fund *Quarterly*. Six of the papers analyze several of the specific causal hypotheses tested by the Indianapolis research. Two further papers apply scaling techniques and factor analysis in an attempt to test fertility prediction. In the last article, the editors present a summary of the whole series of thirty-three Indianapolis papers, highlighting the outstanding findings and discussing some of the methodological lessons and implications for future investigations.

The interviewing fieldwork of the Indianapolis Study was done in 1941, but World War II delayed the analysis of the data and the publication of the results. The study represented a pioneer attempt to go beyond the collection of primary population statistics of the census type in order to investigate some of the complex causal factors underlying reproductive behavior. It constituted the first large-scale field investigation of the extent and nature of contraceptive practices among a general population sample. It confirmed the findings of previous studies that group fertility differences are largely due to differences in the effectiveness of contraceptive practices and that these are inversely related to class position. It also corroborated the fact, increasingly evident in recent decades, that the spreading of birth control among all classes of the population is altering the traditional inverse relationship. As the lower classes become adept at contraceptive practice, the highest socio-economic groups no longer have the lowest fertility.

As the editors themselves point out, the study was less successful in its attempt to unravel the social and psychological variables that underlie these relationships. Due to a variety of weaknesses in conceptualization, limitations in the sample, and deficiencies in the data, most of the twenty-three causal hypotheses formulated prior to the interviewing were neither adequately confirmed nor decisively refuted.

The methodological lessons pointed up by the Indianapolis research have already profited several subsequent investigations of fertility behavior and the social and psychological factors which affect it. One study, "Growth of American Families," is already completed. Its findings are scheduled for publication in 1959. A second investigation, "Study of Social and Psychological Factors Affecting the Future Fertility of Two-Child Families," is currently under way. Building upon the groundwork laid by the Indianapolis Study, these researches will undoubtedly contribute new knowledge about the complex relationships between social factors and psychological motives affecting fertility behavior. A word of caution needs to be added, however. Field research in fertility behavior has definite limitations. It may reveal the shifts in attitudes and motivations which directly result in reproductive "fashion changes." Yet shifts in motivations and corresponding changes in fertility behavior are themselves but reflections and symbols of underlying long-term changes in the social structure and the economic system of whole societies. Such basic factors cannot be studied by interviewing methods; they require comprehensive analysis of social structure and cultural norms in historical depth.

*Selected Studies of Migration Since World War II.* (Proceedings of the Thirty-Fourth Annual Conference of the Milbank Memorial Fund, October 1957, at the New York Academy of Medicine, Part III.) Pp. 244. New York: Milbank Memorial Fund, 1958. No price.

The report on the Annual Conference of the Milbank Memorial Fund held in 1946 focused on the postwar problems of migration. Since that time, changes have occurred both in the particular problems of migration on which demographers have concentrated and in the techniques by which migration is measured and analyzed. These changes were the subject of one section of the thirty-fourth Annual Conference held in 1957. The papers presented and some of the discussion which they precipitated are presented in *Selected Studies of Migration Since World War II.*

The selections are grouped in three sections. The first, International Context, contains Dudley Kirk's comprehensive summary of the principal migratory movements since World War II. This discussion shows how the legacy of displaced persons and refugees caused by World War II has been successfully liquidated while new postwar forced migrations, especially in Asia, have not been as successfully resolved. On the whole, Dr. Kirk found that free international migration is less than in the past and that the most important migrations today are the internal migrations from rural to urban areas and within metropolitan areas. Irene B. Taeuber's paper on internal migration in Japan and Rupert B. Vance's paper on immigration policy illustrate Dr. Kirk's points. On the basis of her well-designed analysis of population change and movement, Dr. Taeuber shows the importance of internal migration to the industrialization of Japan's total economy and the urbanization of the regional population. Professor Vance examines the requirements that must be met if immigration is to be economically and socially sound; he emphasizes that if world migrations are to occur, they must be planned in the context of national policy.

The second section, Domestic Setting, contains four papers on migration within the United States. Included here is Ernest Rubin's evaluation of current laws regulating immigration to the United States and his arguments for a more flexible system. The papers of C. Horace Hamilton, Donald J. Bogue, and Everett S. Lee concern themselves with different aspects of the social and economic implications of migration—educational selectivity among rural-urban migrants, metropolitan development and the suburban movement, and the relationship between migration and mental disease. All of these suggest the strong need for continued research on migration. Especially worthy of consideration is Dr. Bogue's suggestion that the time has come to launch into the longitudinal study of migration following out the experience of real cohorts.

The final group of papers includes John K. Folger's discussion of the desirable characteristics of a new model to explain migration, Joseph J. Spengler's theoretical discussion of the economic effects of migration, and Simon Kuznets' and Dorothy S. Thomas' joint paper on the relation between economic growth and internal migration. This last paper illustrates the value of an interdisciplinary approach to the analysis of migration, points to the critical part that migration plays in demographic and economic development, and emphasizes the need for more refined data in order to permit more conclusive investigation of the relationship between population movement and economic opportunities.

Together, these selections attest to the progress in migration research during the last ten years; perhaps more important, they point to fruitful areas for further progress in the years ahead.

SIDNEY GOLDSTEIN
Assistant Professor of Sociology
Brown University

ARNOLD SCHRIER. *Ireland and the American Emigration, 1850–1900.* Pp. x, 210. Minneapolis: University of Minnesota Press, 1958. $4.50.

Irish immigrants to this country were estimated at one-sixth of the American population in 1775. They were a large contingent in the armies under Washington. Their continuous emigration is notable for its length of time and unique in that it included a larger proportion of the contributing population than did that of any other country. It was, in fact, an important factor in the decline of the Irish population by nearly one-half between 1841 and 1901. The exodus of about 4.8 millions, from 1820 to 1900, considerably exceeded the remaining Irish population in 1901. The total was exceeded only by the number of German emigrants of the period. About 85 per cent of the nineteenth century emigrants, mostly young persons equally divided between the sexes, came to this country. By 1860 one-sixth of all persons born in Ireland and still living were

in this country; by 1926 nearly one-third of all living natives of the Irish Free State were abroad. Nevertheless, Ireland has had a relatively low rate of natural increase since 1850. It is thus a demographic and economic anomaly among the nations of western Europe.

It is little wonder that emigration became an accepted fact of life for Irish youth and in due course had marked effects on local customs and life expectations. We have had numerous studies of the Irish in America and their influence on our military, economic, political, and religious history, but Schrier's work is one of a very short list devoted to the impact of the exodus on native life. While he contributes far less to one's understanding of the structure of Irish society as an integrated scheme of folkways, mores, and institutions than does Conrad Arensberg, he does give an intimate and revealing picture of the personal reactions to the inevitable and wholesale departure of sons and daughters to a promised land from which few would ever return. His study is as documented as a meticulous Ph.D. thesis, including nineteen tables and forty pages of notes, some of which are as interesting as the text.

The "push" factors, such as man-land ratio, land laws, size of holdings, and the miserable but static outlook, are scantily treated in comparison with the "lure of America." This lure was constantly reenforced by countless letters from overseas with their glowing accounts of a land where work was plenty and wages high, where one could wear good clothes and need not tip his hat to a supercilious upper class, but could instead acquire a sense of personal dignity and personal worth. Most of these letters seem to have been written after the sea voyages of the 1840's and early 1850's which cost thousands of lives. Moreover, there is but slight reference to the inhumane exploitation to which many were subjected after landing, often at the hands of their fellow countrymen.

Returning emigrants, called "returned Yanks," were few, but their elegant clothes and ready cash made each a temporary sensation and an alluring advertisement. Strong family ties led to a bountiful stream of funds—over $250,000,000 in the half-century—from America to be used for rent, family needs, fares for America, repair and building of churches, and Home Rule propaganda.

The author portrays well the futile protest of press and pulpit. He gives an impressive picture of the emotional conflicts aroused by the departure of kinfolk and friends and their expression in "the American wake," song, and poetry.

On the whole, this is a worthwhile addition to the literature of migration. The author is so immersed in the details of his study that he fails to give the reader any lively sense of the broader historical significance of the emigration. He seems to miss entirely the basic role of religious domination in Irish history. Though he repeats that the Church took no official position on the exodus, he gives evidences of the fears of local priests and the strong protests of higher officials. He notes the pre-famine school for training missionaries, of whom over 1000 have been sent to this country, and the preparation of guides for the emigrants by priests. Was it a mere historical accident that in spite of huge emigration and small fertility many countrymen still lived in mud huts and that the percentage of pauperism remained fairly steady for decades? Ireland, especially the area of the Irish Free State, missed the modernizing effects of the renaissance, the reformation, and the industrial revolution. One monsignor boasts that the Free State "is the only integral Catholic State in the world; a Catholic culture as it existed in the Middle Ages." But another Irish champion, Shane Leslie, has said: "Religion has been the underlying inspiration, consolation and it must be said the smouldering poison of Irish life."

FRANK H. HANKINS
Smith College

ORVILLE G. BRIM, JR. *Sociology and the Field of Education.* Prepared for the American Sociological Society. Pp. 93. New York: Russell Sage Foundation, 1958. $1.00.

This paper-backed publication is the third in a series of studies which aim to "channel the work of the investigator into the hands of those who are the practitioners." Previous volumes related to the fields of corrections and of mental health.

As the title implies, the purpose of this little volume is to point out the interrelation of sociology and education. It reviews basic educational studies in which the concepts and theories of sociology were employed and indicates those in which they have been neglected. The author concludes by pointing out the occupational opportunities in education which the sociologist has assumed as well as those he should assume if sociology is to make its maximum contribution to education.

Among the fields which have been studied the author lists, for example, the aims of education in terms of behavioral rather than subject-matter learning, demographic studies, relative educational opportunity based on racial differences, selection and education of atypical children, career patterns of teachers at various levels, and sociometry.

Some of the fields in which more research is suggested are the following: the aims of formal education in relation to the objectives of other community agencies; the influence of the school and especially the college upon student personality; the impact of different types—vocational, academic, and extracurricular—and different amounts of education on the individual's intellectual development and attitudes; and the role of various members of the educational galaxy: members of school and college boards, chief administrative officers, teachers, students, and service personnel.

The volume includes a selected bibliography covering research in each of the areas discussed in this study.

This little volume makes a significant contribution to the interrelationship of sociology and education by summarizing research now under way and by suggesting the areas omitted or in need of further research. The author concludes on an encouraging note: "In this field research funds are available; educators are willing, even enthusiastic, to give support; and some of the most fundamental problems of sociology are manifest in the educational process and await attention. There seems little more that the professional sociologist would want."

FRANCIS J. BROWN
Staff Associate
American Council on Education
Washington, D. C.

EMILE DURKHEIM. *Socialism and Saint-Simon.* Edited by Alvin W. Gouldner; translated by Charlotte Sattler. Pp. xxix, 240. Yellow Springs, Ohio: Antioch Press, 1958. $5.00.

Emile Durkheim's eminence in sociology warrants making available in English this significant and previously untranslated work. A translator should not, as the editor properly notes, distort by modernizing, nor by creating stylistic elegance where the original lacked it. The present translation, however, including the translation of the introduction to the original French edition, done from a difficult manuscript by Marcel Mauss after Durkheim's death, is needlessly awkward as English prose, is sometimes obscure, and at other times simply distorts the original.

This specific work provides an opportunity, which the present editor has not utilized adequately, for a major interpretative essay on Durkheim's thought. At the start of his introduction Professor Gouldner takes too much for granted, and writes solely for the informed, without adequate context or setting. Subsequently, in an endeavor to correct too-simple interpretations by Talcott Parsons and others, he rather seriously distorts Durkheim's meaning and significance. He correctly states that Durkheim was not purely Comtean. But, having noted that Comte had been a disciple of Saint-Simon, he then stresses the later break as though it were purely idological, not very largely personal.

No doubt Professor Gouldner is correct in insisting that Durkheim was critical of Comte's view that moral consensus, as the basis of social solidarity, constituted the central condition for social survival. Essentially, Durkheim was pointing out the tendency for the dogmas and commitments which constitute such a consensus to suffer a cultural time lag and inhibit necessary

adaptation. In rapidly moving industrial society such adaptation is vital. Durkheim, in his search for its conditions and his analysis of the impediments thereto, was precisely loyal to the essence of Comtean positivism, and in search of the morality appropriate to the actualities of technological society.

Gouldner correctly notes the interdependence in Durkheim's analysis of concepts of solidarity, of division of labor, of anomie and suicide, and of socialism, as well as, less directly, of an attitude toward international relations and war. These constituted key points and critical issues in the search for an appropriate consensus, for an order and organization which, overcoming maladjustments, would allow men, fulfilling themselves in functional roles, to be effective members of society and happy persons.

The ideological rapprochement of Durkheim and Marx, which Gouldner duly stresses, did not, however, consist primarily in their common awareness of exploitation and its disruptive effects, where surely the differences as to implications and inevitabilities are vital. Rather, it resided in their common awareness that the industrial order, with its development and practical use of science, was the central concept of modern life, and the instrumentality which made a generalized pursuit of happiness a meaningful venture with a possibly favorable outcome. Yet on the conditions therefore, the means thereto, and the degree of likely attainment thereof, Durkheim was surely very far from Marx. And, one may add, much closer to, and the legitimate heir of, Auguste Comte.

THOMAS I. COOK
Professor of Political Science
Johns Hopkins University

JEROME HALL. *Studies in Jurisprudence and Criminal Theory*. Pp. vi, 300. New York: Oceana Publications, 1958. $6.00.

Professor Jerome Hall has for many years rightly been regarded as one of the most eminent American experts on criminal law and jurisprudence. His books *Theft, Law, and Society; General Principles of Criminal Law;* and *Readings in Jurisprudence* have become classics in their fields. The present collection of fifteen essays, which have been, with three exceptions, published previously, but to some extent brought up to date, deals in nearly equal parts with problems of jurisprudence and criminal law. In the first nine chapters such matters as "American Tendencies in Legal Philosophy and the Definition of 'Law'," "The Progress of American Jurisprudence, 1906–1956," and certain wider issues such as "Legal Theory and Jurisprudence," "Integrative Jurisprudence," and "Plato's Legal Philosophy" are discussed with the learning and acumen to be expected from the author; his knowledge not only of legal but also of philosophical literature is impressive. There is a certain amount of repetition and overlapping, difficult to avoid in collections of this kind, but what the author has to say, for example, on legal realism and legal positivism is good enough to be read twice. In these essays Professor Hall once more appears as the doughty fighter for the supremacy—or at least for the equal rights—of the law and legal theory against such rivals as, among others, political theory. On the other hand, he repeatedly stresses the need for close co-operation between law and sociology and for the admission of value judgments in jurisprudence—"the demand for a *wertfrei* social science falls short" (p. 123). Chapter VI on "Culture, Comparative Law and Jurisprudence," based on lectures given in Korea in 1954 and not previously published, is particularly significant in this respect.

The last six chapters are devoted to the theory of criminal law, and here, too, the author is most anxious to underline the need for proper legal safeguards of individual liberty against certain ideas of the school of "Social Defence." He insists on the strict interpretation of criminal statutes and regards "the moral quality of criminal law" as "the major issue of our times," which "permeates all the social disciplines" (p. 244). Criminal liability should be based only upon moral culpability, and in a sound theory of punishment all three elements—justice, deterrence, and reformation—are essential. In all these points, and many others which are equally fundamental, we can, with occasional reservations, accept the author's views; but here and there we would do so even more willingly if he would be less inclined to knock against open doors, to indulge in dangerous generalizations, or attack bogies which are largely of his own making, such as "criminologists' demands for wholly indeterminate sentences" (p. 273), or the handing over of the decision in criminal trials to the psychiatrists—as if they, as a body, had ever asked for it. Any generalization of this kind, whether it refers to "the" criminal or to "the" criminologist or "the" psychiatrist, should be avoided. Whereas Chapter XIV on the "Revision of Criminal Law—Objectives and Methods" is one of the best in the book and should be studied by every would-be legislator, the last Chapter XV, "Psychiatry and Criminal Responsibility," with its well-known defense of the doomed McNaghten Rules, is probably the least convincing. It is to be regretted that the author has paid no attention to twentieth-century developments in the law and practice relating to mental disorder and crime on the European Continent; they are more helpful than even the most ingenious attempts to save the McNaghten Rules.

University of London

GRESHAM M. SYKES. *The Society of Captives: A Study of a Maximum Security Prison*. Pp. xx, 144. Princeton: Princeton University Press, 1958. $3.75.

The author avows that he wrote this book about the New Jersey State Maximum Security Prison from a sociological point of view, without expressing a bias either for or against imprisonment. While he has not completely concealed his disapproval of prisons, he has turned out a fairly accurate description of the relationships among convicts and between convicts and their guards.

He remains on firm ground so long as he deals with the essential character of prison life and the nature of the interaction between the two main social groups of the prison—the guards and the inmates. He realizes, as few people do, that the psychological effect of certain aspects of modern prison life may actually be more brutal than the physical cruelty once commonly practiced in American prisons. In this respect the book has universal validity, and Sykes' description could be applied to almost any American prison.

It is when the author attempts to go beyond this point that his ground becomes less solid. His research method consisted chiefly of talking to convicts and guards, and while this seems fully satisfactory as a means of "getting the feel" of a prison, it does not provide the data needed for a truly scientific study. But Sykes tries anyway to force his material to assume form and to crystallize into a set of principles impressive enough to be set off in italics.

Sykes assigns an extended chapter to a discussion of prison argot and the roles reflected in this argot. Here he contributes to the romanticized picture of convict life so often drawn by non-practicing criminologists. Unquestionably there are words which have special meaning to the underworld and to prisoners, and some of the words used by Sykes have a wide currency. But the speech of American prisoners has become more and more like that of any other group of American males, and even the experienced and professional convict would be mystified by most of the words appearing in the glossaries of prison jargon which are so often appended to textbooks on criminology.

Sykes also betrays his ingenuousness when he asserts that the 1952 riot at the Trenton prison stemmed from the middle 1940's when prison officials began to reverse the institution's tendency to drift toward more complete inmate control. He denies that the weaknesses and deficiencies identified by the Governor's investigating committee—overcrowding, idleness, heavy turnover in the custodial force, archaic disciplinary practices, inadequacies of the physical plant, heterogeneity of the inmate population, indifferent rehabilitation program, careless work assignments, inadequate salaries for guards, shortage of necessities—together created a powderkeg

which might be set off by a spark. More likely Sykes has identified the spark, and the investigating committee the "root causes."

Yet he closes his book on a realistic note, recognizing that prisons will be with us for some years to come, that they must necessarily remain authoritarian, that they cannot be expected to rehabilitate all of their charges, and that their social systems represent the chief factor in the failure or success of their rehabilitation programs.

Sykes' book must be recognized as an unusually capable and thoughtful discussion of the American prison, and it should be read by the general public, practicing penologists, students, and professors.

United States Department of Justice

G. H. S. BUSHNELL. *Peru.* (Ancient Peoples and Places Series.) Pp. 207. New York: Frederick A. Praeger, 1957. $5.00.

This is a volume of the new series of British publications, edited by Glyn Daniel, called Ancient Peoples and Places. The series is designed "to bring to life a specific people or place in the ancient world" for the interested public and the archaeologist who is not a specialist in the particular field concerned.

This volume is certainly the most readable treatment of pre-Columbian Peru that has appeared since Philip Means' *Ancient Civilization of the Andes*, which is now out of date in both its archaeological and historical treatments of early Peruvian life.

Bushnell follows one of the several current systems of classifying the stages of development of Peruvian Indian culture, starting with Early Hunters and ending with the Imperialist Period (the Inca Empire). The plates are excellent, although they run rather too much to pottery, to the detriment of an appreciation of architecture, textiles, metal work, and carving in wood, bone, and stone.

Nevertheless, for the person who contemplates a trip to the west coast of South America this book is to be highly recommended. For those who would like to supplement it with a more thorough treatment of the subject, with a larger bibliography, J. Alden Mason's *Ancient Civilizations of Peru* (Penguin) is a fine companion volume.

## *ECONOMICS*

SIMON N. WHITNEY. *Antitrust Policies: American Experience in Twenty Industries.* (Vols. I & II). Pp. xxiii, 560; x, 541. New York: Twentieth Century Fund, 1958. $10.00.

This study, initiated by the Twentieth Century Fund in 1950, was designed to answer the question "How effective have the antitrust acts actually been in curbing monopolies and restoring the conditions of competition? It consists of four principal parts: First, a set of brief descriptive essays on eight major industries averaging sixty-two pages in length. The industries thus covered are meat packing, petroleum, chemical manufactures, steel, paper, bituminous coal, automobiles, and cotton textiles. Second, there is a set of twenty much briefer—average length, twenty-eight pages—industry case studies focused around particularly important antitrust cases: namely cast iron pipe, tobacco products, anthracite, aluminum, shoe machinery, motion pictures, tin cans, farm machinery, corn refining, cement, pullman cars, and insurance; third, a twenty-seven page introduction to antitrust legislation, a forty-seven page summary of the case material presented in parts one and two above, a nine page evaluation of the antitrust laws; and fourth, an eight page review of the book by the Twentieth Century Fund Committee on Antitrust Policy, and fifty-six pages of comments on particular chapters by a variety of persons not connected with the Twentieth Century Fund.

Dr. Whitney came to this study from a background of government and academic service. At the time the study began he was a professor at New York University; at the completion of the study he was Director of the Bureau of Economics of the Federal Trade Commission. Dr. Whitney's approach to the question of the effectiveness of the antitrust acts is essentially that of the historian—for each industry the existing literature was carefully surveyed and summarized and tentative conclusions drawn. The resulting case studies then were checked and supplemented by persons intimately associated with the industries in question. For each industry, Dr. Whitney presents a terse description of products and firms, a history of antitrust suits, concise statements regarding competetive status and industry performance, a summary, and a thumbnail evaluation. As an example of these thumbnail evaluations, the one for petroleum reads as follows: "The antitrust laws, by breaking up the old monopoly and forbidding price agreements, while permitting free leasing of equipment, pooling of patents, and rounding out of integrated companies through mergers, have helped shape the structure and behavior of this outstandingly successful industry." For cotton textiles, Dr. Whitney reports, "The antitrust laws have had little influence on the cotton textile industry in view of its structure of many small firms; this same structure made it for a long time a 'sick industry,' but it improved after 1940 by discarding machinery and because of revived demand; and there is a good chance, though far from a certainty, that the integration movement will transform it into an industry like others in the United States today—progressive and profitable." While there will be disagreement with the tone of these evaluations, the case studies themselves collect in one place a large amount of information, are uniformly well done, and should prove most valuable.

At the close of his book—and perhaps before he started—Dr. Whitney is of the opinion that "The pure competition of small firms, each producing as much as it can . . . would not be dynamic or progressive." "While monopolies have been shown to possess grave defects . . . the *hope* of winning profits which certain kinds of monopolistic position provide is a driving force for both business firm and individual without which our economy might well stagnate." From this vantage point, the antitrust laws help maintain a balance between competition and monopoly and are "effect as well as cause of the competitive spirit in the United States."

As may already be guessed, this study will be of little use to analytically minded economists even though it presents a wealth of descriptive material. Few hypotheses are put forward or tested and careful definitions, for example, of "efficiency," "progressiveness," or "dynamics," are lacking. Little use is made of the models which have been constructed by analytic economists either as framework for description or for evaluation. But an approach such as these comments would suggest might not be appropriate in a book addressed to an audience of "intelligent laymen." On the other hand, Dr. Whitney has chosen to concentrate on United States experience alone rather than compare industrial performance in several countries in which various sorts of social-control schemes are employed. But perhaps it is unfair to criticize Dr. Whitney for not doing something he chose not to do. Given Dr. Whitney's approach and audience, the book is well done and useful.

JOHN A. BUTTRICK
Associate Professor of Economics
University of Minnesota

*An Appraisal of the 1950 Census Income Data.* (Studies in Income and Wealth, Vol. XXIII by the Conference on Research in Income and Wealth.) A Report of the National Bureau of Economic Research, New York. Pp. x, 450. Princeton: Princeton University Press, 1958. $10.00.

This book, Volume XXIII of Studies in Income and Wealth published by the National Bureau, presents the findings of the 1956 Conference on Research in Income and Wealth. It includes more than a dozen major papers contributed—with comments—by more than three dozen participants.

It deals with the nature, reliability, and utilization of income data included in the decennial census of 1950. This census asked separate questions on wages and salaries, income from self-employment, and income from other sources. Attempts were

made by the participants at the conference to conduct matching studies comparing census income data with income data from the Internal Revenue Service, the Survey of Consumer Finances, the records of the Bureau of Old Age and Survivor Insurance, the Current Population Survey, and so forth. In spite of the impracticability of such comparisons, some useful results were obtained. It appears that, due in large part to response variations, the census underreports income, particularly that from sources other than wages and salaries and from self-employment.

The conference pointed out that even had census income data been more accurate, we would still not have a clear picture of either the total compensation for productive services or of the total purchasing power of consumers. Money income is no longer indicative of either. Trends in collective bargaining contracts with various fringe benefits, in executive compensation with supplementary advantages, in tax-free income disguised as business expense, in investment policies of individuals which do not result in accurate disclosure of current income, and so forth, all tend to obscure rather than reveal total income.

So far as the utilization of census income data is concerned, the conference pointed out that the data received from Current Population Surveys, while not as extensive as that called for in the decennial census, are more commonly used. The reader gets the impression that perhaps the Statistical Commission of the Economic and Social Council of the United Nations may have been correct in questioning whether the decennial census is the most logical vehicle for collecting income data.

Like many studies by the National Bureau, this book raises more questions than it answers. In so doing it helps to stimulate further study and research. Students of national income will find this book useful, although its technical nature will probably discourage the general reader.

H. E. HOAGLAND
Professor of Business Finance, Emeritus
Ohio State University

EDWARD H. CHAMBERLIN and others. *Labor Unions and Public Policy.* Pp. 177. Washington, D. C.: American Enterprise Association, 1958. $4.50.

The four essays in this volume proceed from the shared assumption that labor unions have attained a dangerously powerful position in American society. As Professor Edward H. Chamberlin expresses it, "unions today in the United States unquestionably dominate the vital mass production industries, mining, construction, public utilities, communications, and rail and truck transportation."

Professor Chamberlin deals with a wide range of labor relations problems in his essay "The Economic Analysis of Labor Union Power." However, he is chiefly concerned with the economic effects of union monopoly power in the labor market, and he believes that ". . . if the public is to be protected from unreasonable monopoly power, a body of law *appropriate to the labor market* has an importance at least equal to that which [in the United States] is generally taken for granted in the product market." Such legal restraints would provide, he believes, an obvious and effective alternative to monetary and fiscal anti-inflationary measures since a decrease of labor's economic strength would reduce inflationary pressures at their presumed source.

An interesting, though hardly an intentional attack on Chamberlin's position is presented by Professor Philip D. Bradley who analyzes the case for and against union security provisions. His argument runs along the following lines: Most proponents of "involuntary unionism" base their case on the "free rider" argument, which rests chiefly on the proposition that unions create or obtain economic benefits through collective bargaining on behalf of the workers whom they represent. There is, however, no empirical evidence for such claims. Therefore, the union benefit doctrine is really an empty shell. Is it possible to concur with Chamberlin's analysis of the tremendous economic power amassed by trade unions and to agree, at the same time, with Bradley's argument that unions neither create nor obtain economic benefits?

Gerard D. Reilly is primarily concerned with the dual danger of growing federal jurisdiction to regulate labor relations at the expense of the states and the emergence of that strange zone called "no man's land" where federal power holds sway but is not asserted and where states may not seek to interpose their own powers in place of a passive federal government. To help solve the problem Mr. Reilly endorses the Smith-McClellan bill which provides that "in the absence of express language in a Congressional act purporting to occupy the field in which it operated, the act should not be construed as superseding state laws which are not 'in direct and positive conflict' with the Federal statute." The analysis is not particularly concerned with the possible consequences of the bill, if enacted into law, for a multitude of problems in labor-management relations and collective bargaining, administration, federal-state relations, and so forth.

Under the title "Legal Immunities of Labor Unions" Dean Roscoe Pound compares the legal position of labor unions in contemporary society with the position historically occupied before the law by kings and nobles, governments, clerics, landlords, soldiers and, of course, husbands. As a uniquely favored group—"uniquely" because the immunities of the others have long ago been voided or weakened—organized labor may with impunity commit acts and enforce policies which, in Dean Pound's view, would subject other organizations at the very least to crippling damage suits, or worse. There are, of course, very serious doubts relating to comparability.

The general viewpoint shared by the four studies seems so close to the known position of national business and industrial organizations as to be indistinguishable from it. The tone of the presentation and the teleological character of the arguments raise serious questions of objectivity. Certainly, Chamberlin is right in pleading that "one should abandon the clichés of 'pro-labor' and 'anti-labor' and make an earnest attempt to move on to a more fruitful level of thought," but if these studies claim to represent such an attempt, they do not quite reach their objective.

and Labor Relations
Cornell University

W. BRADDOCK HICKMAN. *Corporate Bond Quality and Investor Experience.* (National Bureau of Economic Research, Financial Research Program, Studies in Corporate Bond Financing, No. 2.) Pp. xxix, 536. Princeton: Princeton University Press, 1958. $10.00.

This volume represents the second study in corporate bond financing undertaken under the Financial Research Program of the National Bureau. This follows an initial study by the same author on *The Volume of Corporate Bond Financing*, published in 1953. While the first study dealt, as the title indicates, with the total amount of corporate bond financing, the present volume is concerned with investor experience with bonds of different qualities. The study is confined to straight bonds—bonds with a definite maturity date and a stated coupon rate of interest—and the emphasis is on the larger issues of $5,000,000 or more.

The lay reader will find the presentation highly technical in spots and of little interest except for the Introduction and Summary (pp. 3–27) which precede the main body of the text. A list of fourteen conclusions at the end of this summary (pp. 25–27) pin-points the findings of the author and furnishes a good bit of interesting information.

Even the individual investor, who has considerable competence in investment techniques and analysis, will probably not find much that is helpful to him in the present study. On the other hand, it should prove very useful to those analysts, and others, who are responsible for the investment policies of financial institutions which are in a position to hold a large and varied portfolio of bond investments over relatively long periods of time.

The reason for the foregoing statement is that the conclusions reached in the study apply to the action of given classes of bonds in the aggregate and over a period of several decades, not to individual issues. For example, Mr. Hickman found that "life-span yields realized on the aggregate of bonds studied equaled yields promised at offering, so that the net loss rate, measured in current dollars, was zero" (p. 25). Obviously, although true of the aggregate

of issues studied, various individual issues would show losses, others gains, over the promised yield. It should be added that Mr. Hickman is at pains to call attention to this fact in connection with most of the conclusions arrived at in the study.

The statement that the volume under review does not have popular appeal is in no sense intended to be derogatory. It comprises the results of a careful and painstaking piece of research of the high standard that has come to be associated with National Bureau publications.

Lehigh University

A. D. H. KAPLAN, JOEL B. DIRLAM, and ROBERT F. LANZILLOTTI. *Pricing in Big Business: A Case Approach.* Pp. xiv, 344. Washington, D. C.: Brookings Institution, 1958. $5.00.

Product pricing, especially by big business corporations, has been a matter of keen public interest for a long time. Preconceptions interfere with objectivity in this area, and the inaccessibility of the needed information or the circumstances under which is has been obtained have more often than not strengthened the preconceptions.

Using interviews for the most part—the guiding questionnaire is described in the Appendix of the study—the authors of this volume sought pricing information from top management in a number of large-scale enterprises in the fields of primary production, manufacturing, and marketing. Among them were such companies as Swift & Company, United States Steel, General Motors, General Electric, Johns-Manville, and the Aluminum Company of America. The choice of corporations for interview was based on several factors: dominant size, accessibility, likelihood of co-operation, and the pertinence of their experience. The main objective was to get information about pricing policy, methods, and practices within the context of broad company policy concerning all phases of its activities.

The study is divided into the following parts and subdivisions: Part I deals with case materials which are treated under three headings—pricing selected products, company pricing policies, and pricing organization; Part II is concerned with analysis and interpretation in which consideration is given to the major influences on pricing policies. Here the influences of the character of the product, interdependence of the product mix, the influence of the antitrust laws, and the role of price leadership, size, and pricing authority are discussed.

To reduce the diversities between companies and their policies to some order the authors used the following policy classifications: pricing to receive a target return on investment; stabilization of price and margin; pricing to maintain or improve market position; pricing to meet or follow competition; and pricing subordinated to product differentiation. The authors are careful to point out that all price-making by any one company is not ruled by a single policy. This is particularly the case where there is considerable variation in the product mix.

This is a useful study in the field of pricing and price policies in big business. Some readers will be disappointed with it, however, if they expect that it will reveal a fully ordered business behavior in arriving at pricing decisions. Apparently the investigators rarely found such evidence. Intuitive judgments concerning what the customers and competitors may do, together with various cost approximations, seem to be the rule in formulating price policies. And profit maximization in the short run is often subordinated to other more dominant factors.

WILLIAM A. CARTER
Professor of Economics
Dartmouth College

## *RELIGION AND PHILOSOPHY*

GERALD HOLTON (Ed.). *Science and the Modern Mind: A Symposium.* Pp. ix, 110. Boston: Beacon Press, 1958. $3.95.

This volume consists of nine essays which were presented at a Conference of the American Academy of Arts and Sciences in honor of Professors P. W. Bridgman and Philipp Frank on the occasion of their retirement from teaching at Harvard University. Edited by Gerald Holton, the symposium was designed to focus attention on what each "specialist" may contribute toward fruitful communication between scholars and literate laymen engaged in public affairs.

The first three essays, by Henry Guerlac, Harcourt Brown, and Giorgio de Santillana, sketch the historical backgrounds of modern science as these have affected our views of the universe within, such as Freud's image of man, or without, such as Einstein's relativity model. The next three contributors, Philipp Frank, Robert Oppenheimer, and Jerome S. Brunner, focus on the concepts of science which have set up conflicts between new and old views. In the remaining three articles P. W. Bridgman, Charles Morris, and Howard Mumford Jones turn toward the future. While dubious of any master-plan for organizing our diverse fields of learning, the authors do converge toward the conclusion that there is no overall conflict between the sciences and the humanities and find common ground in the devotion to the ideals of the world of scholarship. Here the sciences and the humanities emerge as "complementary activities" with no "spite fences." But as Howard Mumford Jones points out in the concluding essay, it still remains for the humanist to match the scientist in semantic skill, thus cultivating in "the more thoughtful part of the American people right notions of the sciences and the humanities as modes of knowledge and of experience." Certainly the present book provides a model for the manner in which this may be achieved. It is skillfully assembled, gracefully written, and beautifully printed; the "specialists" here collaborating successfully harmonize their separate disciplines and lift them out of academic privacy into the forum of universality.

OLIVER L. REISER
Professor of Philosophy
University of Pittsburgh

HANS JONAS. *The Gnostic Religion: The Message of the Alien God and the Beginnings of Christianity.* Pp. xviii, 302. Boston: Beacon Press, 1958. $6.00.

In a brief notice it is utterly impossible to do more than to recommend this book as a very useful—in English, unique—introduction to and survey of the swampy morass which is commonly styled Gnosticism. Professor Jonas is no newcomer or enthusiastic amateur in this field. His earlier work, *Gnosis und spätantiker Geist* (Vol. I, 1934; Vol. II, 1954), has long been prized by specialists. The present volume, while of necessity surveying much the same field, contains some distinct amplification and is intended for the general student, not the specialized expert. It will make him stretch even though it is clearly written, at times with an understanding and almost passionate appreciation of notions and sects long dismissed as "fables and endless genealogies" and "oppositions of the knowledge which is falsely so called," by hostile Christian fathers whose attacks were long our only sources of knowledge.

Jonas has made effective use of the ever-broadening amount of source materials, sources in some cases produced by the Gnostics themselves. Thus the *Apocryphon of John*, long known to be existing in Berlin, and occasionally referred to, published now after sixty years (1955); the sensational find of a whole library of Gnostic materials in Coptic—thirteen codices, containing forty-four different treatises—made at Chenoboskion in Upper Egypt (1945–46); and the recent (1956) publication of one of its principal tracts, the *Gospel of Truth*, not inconceivably the writing of none other than Valentinus himself—these are used to a modest degree, together with many others, in the present study.

Firmly convinced that Harnack's famous description of Gnosticism as "the acute Hellenization of Christianity" is wrong, and that recent attempts to see this religion as a derivative of Judaism are only more fruitful failures, Jonas sees it in essence as the protest of the East, long held under the throttling domination of the West, against the latter's unlimited veneration of the cosmos, of which God was essentially the culmination. Instead, for these iconoclastic rebels, God is not merely extra- and supra-mundane, he is actually

contra-mundane, utterly unknown and "altogether other," to a degree which even Karl Barth might despair devising.

The volume begins with a very illuminating background study of "East and West in Hellenism," which every historian will want to weigh, and a very useful survey of the semantic elements found in common in all Gnostic thought—the discovery of the hidden principle of the terrestrial man and his heavenly original, and his supreme concern about his destiny in which three elements bulk large: the reminder of the heavenly origin and transcendent history of man, the promise of redemption, with the role of the heaven-sent redeemer, and the instruction as to how to live henceforth in this evil, demon-ridden world in preparation for his final ascent. After this introduction Jonas turns to a consideration of representative systems: Simon Magus, the "Hymn of the Pearl," the teaching of Marcion, the "Poimandres" of Hermes Trismegistus, Valentinus, and the teachings of Mani; the latter two being in Jonas' eye the culmination of the two basic forms of Gnosticism, which he styles, respectively, "Syrian-Egyptian" and "Iranian." The last main section of the book is a very thought-producing and pointed discussion of "Gnosticism and the Classical Mind," in which he climaxes his basic thesis of East *vs.* West: had Gnosticism not found itself confronted with the hostility it did, it would never have reached the height it achieved.

It is a pleasure to recomend with little reserve a book which is a real contribution to the mapping-out of a most forbidding *arcana*, in which most of us find very welcome a guide who knows the terrain and languages.

MORTON S. ENSLIN
Professor of Biblical Languages
and Literature
The Theological School
St. Lawrence University

JOHN HERMAN RANDALL, JR. *The Role of Knowledge in Western Religion.* Pp. x, 147. Boston: Star King Press, 1958. $3.50.

Many theologians have taught that the Christian religion requires a kind of knowledge accessible only by belief or religious experience or revelation. Others have denied this. Thus diverse and contradictory claims have arisen concerning knowledge in religion. Professor Randall traces the history of this struggle with the problem of religious knowledge which has occurred through the centuries since Plato.

At present, says the author, the prevailing view denies that religious belief and doctrine involve knowledge. The affirmations of faith are symbols, so it is claimed, not in the sense of giving any information, but in the sense of producing states of mind such as "the courage to be." There is no God other than the psychological function of belief in God. This belief produces the needed change in a man's life and does whatever is required in the practice of religion. "Religion is a way of feeling and acting, not a way of understanding and explaining. Religious beliefs are tools to be employed in the practice of religion" (p. 12).

Up to the last pages the author seems to agree with this claim. But in a postscript he seems to reverse himself. Here he insists that we must know God to the end that we may distinguish the supreme values which organize our lives and give them significance (p. 141).

The apparent contradiction between the body of the book and this postscript may be resolved if we note certain distinctions which I believe the author intends to make. The primary function of religion is not to provide knowledge but to change man's life from the evil to the good. To do this intelligently one must have knowledge of what produces this change and also knowledge distinguishing the good from the evil. This knowledge must be obtained by the same principles and methods used in getting secular knowledge. It cannot be had simply by accepting religious belief or undergoing religious experience. Yet it is religious knowledge because it is sought with the religious motive to solve the problem which is the distinctive concern of religion. It is knowledge of God because God is whatever in truth produces the change and provides the values sought by way of religious commitment.

Contrary to the author's claim, Wieman does not identify God with an abstract principle.

All who are concerned about religion in our time should read this book.

HENRY NELSON WIEMAN
Visiting Professor of Philosophy
Southern Illinois University

MICHAEL POLANYI. *Personal Knowledge: Towards a Post-Critical Philosophy.* Pp. xiv, 428. Chicago: University of Chicago Press, 1958. $6.75.

"The purpose of this book," writes Michael Polanyi, "is to show that complete objectivity as usually attributed to the exact sciences is a delusion and is in fact a false ideal." Polanyi, who held the Chair of Physical Chemistry at Manchester University, where he was also Professor of Social Studies, has based *Personal Knowledge* on his Gifford Lectures of 1951–52. He writes well, and has constructed a powerful argument. Even where the reader might not agree, he is sure to learn.

It is believed widely that science, unlike any other human pursuit, attains objective, impersonal knowledge, and that it accepts ideas only when the empirical evidence is sufficient. Polanyi answers that in the 148 years between Copernicus' *De Revolutionibus* and Newton's *Principia* there was no decisive evidence in favor of Copernicus' belief that the earth went around the sun. Yet, more and more, scientists accepted it. Einstein's theory of relativity was completely accepted before empirical evidence was found. Why? Because, Polanyi says, empirical evidence for any large-scale theory is a complex and delicate matter. We are rarely sure what we are proving. But scientists have always, in the end, accepted theories which have intellectual beauty, the beauty of rational structure, of order. "We recognize intellectual beauty as a guide to discovery and as a mark of truth." Polanyi approves a remark attributed to Gauss: "I have had my solutions for a long time but I do not yet know how I am to arrive at them."

For Polanyi, science is not just a convenient summary of experience, as Mach held. Its statements are about a reality beyond experience, and express a "commitment" by the scientist that they are true. Just so, the scientist is committed to the practice and principles of science, as he would be to any faith. Commitment to values and acceptance of the internal evidence of beauty are of the very essence of scientific research, which is not itself science, but art. Man is man and not a calculating machine, in science as in art. And man is devoted to science, not just because its results are true, but because of its history and traditions as part of our civilization.

Neo-Darwinism has been accepted as true, according to Polanyi, only because it fits the prejudices of those with a mechanistic conception of the universe. A man is a conscious, responsible "person" and no purely mechanistic argument is adequate to explain him. It is more likely to deny both consciousness and responsibility. "Darwinism," Polanyi thinks, "has diverted attention for a century from the descent of man by investigating the *conditions* of evolution and overlooking its *action*. Evolution can be understood only as a feat of emergence."

RALPH ROSS
Professor of Humanities
University of Minnesota

MORTIMER J. ADLER. *The Idea of Freedom: A Dialectical Examination of the Conceptions of Freedom.* Pp. xxvii, 689. Garden City, N. Y.: Doubleday & Company for The Institute for Philosophical Research, 1958. $7.50.

In effect, this book seems to be a sort of *dictionnaire raisonée* of the philosophical usage of the word "freedom" from the days of the Greeks to the present. The author and his helpers maintain that the varieties of usage by philosophers presage a single species and their diverse disagreements a "single minimal agreement" which must be the ground of their disagreements, the matrix of their differences, and "indispensable to the controversy" between them. This book purports to elicit a single concept—almost a Platonic ideal—of freedom. Mr. Adler presents the attempt to "identify" this one idea which the many

of freedom exemplify and express as the first product of an undertaking. A second volume is to lay bare "the genuine disagreements," presumably as against the false and mistaken ones which the present work exposes.

The two works together are to consummate the researches of some twenty members of an Institute for Philosophical Research, financed from Ford monies, which Mr. Adler directs. Their labors on the present volume involved restating and transmuting into "neutral" terms the expression of more than one hundred discussants of freedom, chosen from the much greater multitude who have argued about it during the last two and one-half millennia. The result is first a classification of the diversities into three major and two minor groups. The major ones are "freedom of self-realization," "freedom of self-perfection," and "freedom of self-determination," and are determined by whether the "freedom" is related to outer circumstance, personal acquisition, or is inward to the nature of the self. The minor ones are "political liberty"—presented as a diversification of "self-realization"—and "collective freedom"—presented as a variant on "self-perfection." All the classes are identified finally as a single freedom which is, for any man, the "ability or power whereby he can make what he does his own action and what he achieves his property."

The process of reduction by which this identity is produced and disclosed Mr. Adler calls "dialectic"—according to its subtitle, his book is *A Dialectical Examination of the Conceptions of Freedom*. He manifests an invincible faith that dialectic can disclose "the objective truth" about freedom as it also can about law, justice, knowledge, and what have you—perhaps even God. He has been an eager missionary of its rites and rotes ever since 1927 when he set down his first gospel of it in a bright book entitled *Dialectic*. Fully a sixth of the present work consists of an exposition of this mode of discourse, as it looks to Mr. Adler *circa* 1958. He does concede that other methods are in use, but seems sure that the way to the certainties of "objective truth" is dialectic. It is needless to say that persons aware of the record of discourse and the alternatives among methods are little likely to share Mr. Adler's faith, or that their scepticism would include also his imaginative dialectical reconstructions and identifications of the idea of freedom, and of their "neutrality."

H. M. KALLEN
Research Professor in Social Philosophy
New School for Social Research

MILTON R. KONVITZ and CLINTON ROSSITER (Eds.). *Aspects of Liberty: Essays Presented to Robert E. Cushman*. Pp. viii, 355. Ithaca: Cornell University Press, 1958. $5.50.

Those who have known Robert E. Cushman are delighted, of course, that so fine an offering in appreciation of his services to the study of politics has been made. It is a volume of distinguished contributors, and it covers a wide range of issues in the field of civil liberty, although it does not treat all of the questions that have been argued during the past several years.

In contrast with many works on civil liberty, the contributors to this volume have attempted to face the issue of a philosophy of rights and freedom. The most difficult task is assumed by Profesor Rossiter who undertakes to define liberty. Rossiter notes that he does "not mean to question the splendid doctrine of inherent, inalienable, even God-given rights" (p. 19), and Professor Catlin says that "the moral basis (and limitation) for the claims of civil liberties lies in their being not only stated as 'civil' by positive law, but also in their being reasonable in Natural Law" (p. 72). Can we not say, indeed, that this volume indicates a future trend in serious analysis of this problem, when it is not motivated primarily by the analysis of court interpretations?

This volume covers the use of material from the behavioral social sciences in civil rights cases and the historical aspects of our tradition, including the court presided over by John Marshall; it treats most effectively of the international aspects of the protection of civil rights; it compares civil liberty in America and in England and on the Continent since the war; and finally it considers the Fourteenth Amendment, the federal system, and due process of law. One is particularly grateful for the candid treatment of civil liberty in England. Professor Carr writes: "The English soapbox orator may not speak wherever his fancy dictates, for English law does not recognize any general right to hold public meetings in streets and parks. Instead, he must go to one of those relatively few spots, such as Hyde Park, that have been set aside for this purpose" (p. 243).

In criticism, one may say there is in this volume what amounts to a self-conscious avoidance of the issue of communism. Many thoughtful people have been concerned with the civil rights of subversives, the defense and criticism of the security programs, the right of Congress to look in Communist infiltration of government or the professions, and whether, indeed, there is a similarity of issue between domestic and international communism. These items seem to be too carefully avoided.

FRANCIS G. WILSON
Professor of Political Science
University of Illinois

MICHEL VILLEY. *Leçons d'histoire de la philosophie du droit*. Pp. 437. Paris: Dalloz, 1957. No price.

The history of the philosophy of law, presently enjoying scholarly interest in other parts of the world, would have been left rather on the sidelines in France if Michel Villey had not made it the object of his studies. No one is more qualified in many respects than he for such a task, which requires the qualifications of the jurist and historian as well as those of the philosopher. To his other abilities, Mr. Villey adds the great clarity and elegance of a personal and commanding style.

More than one hundred pages of introduction trace the history of the philosophies which, since antiquity, have influenced the diverse juridical systems of our civilization. Other philosophies and other civilizations have necessarily been omitted —notably, those of the Far East. Greek philosophy and its influence on Roman law are mentioned briefly, as are Christian theology as the source of a theocracy under which, in the Middle Ages, our Occident lived for about six centuries; the ideological sources of our present juridical system; and science and scientism and the crisis of law in the nineteenth century. There is a conclusion dealing with the twentieth century. The whole, provided with a valuable Bibliography, constitutes a richer outline than Friedman's, except for the portion dealing with the nineteenth century.

The second part, the most substantial in size (pp. 119–379), includes "fourteen essays on the relationship of law and philosophy." Essays? M. Villey is modest, because these are dense, vigorous, and original studies. The first, "Two Concepts of Natural Law in Antiquity," in which Aristotle and the Stoics are contrasted, is of particular value. M. Villey skillfully considers the difficult problem of Aristotle's influence on Roman law—perhaps only an indirect influence, but nevertheless considerable. As for the Stoics, they adhere to Plato's idealistic concept of natural law, which, through Cicero, utilizing chiefly Panetius, "errupts in Roman Law." In the "Logic of Aristotle and Roman Law," Villey, extending previous studies on didactic literature in Roman law, shows how this logic, reflecting a true concept of science in antiquity, has impregnated the background and the framework of the solutions of numerous didactic works in Roman law, as well as the works on natural law by Gratien and St. Thomas.

We must also bring to attention two studies (Chap. XI and Chap. XIV) on the notion of subjective law, which Villey believes to be outside of ancient civilization and Roman law, and which belongs to the scope of modern philosophy since the time of Duns Scotus and William of Occam. This notion will perhaps be criticized, but it could not be ignored, and the discussion which will result will probably be very fruitful. All these studies of the second part have the same stamp and are witnesses to the same care in seeking to determine the relationship between doctrines and institutions and to reveal the incidence of various doctrines. They lead to this

essential result: a renewed concept of natural law that needs today perhaps to be reconciled with the contributions of sociology and historical science.

A third part, much shorter (pp. 381–437), under the title of History and Law, has to do with the influence of history on our present-day juridical thought. Villey shows what weight the historic movement of the nineteenth century bears upon contemporary opinion. He comments on the ideas of Vico, Comte, Hegel, and Marx, and, in the footsteps of Dilthey and Raymond Aron, with reference to Toynbee—to whom about fifteen dense pages are devoted—criticizes their postulate of fatalistic progress.

This part of the book closes with several quite bold pages on the "conception of history." This is a reconsideration of an old theme, but one that is not without continuing interest. Must not the historian be interested in what others besides himself think of his discipline? An attitude of unawareness may lead to an isolation from which utility would suffer. Has not H. Marrou understood this? The historian should be aware of working in agreement with the reality of the present. But that does not prevent history from being scientific; certain imperatives are always imposed: to see the texts—all the texts—to criticize them, and to judge them without bias. History "does constitute a scientific genre" in so far as the historian follows certain rules. As for its usefulness, history can be indeed in part a function of the present and it is not amiss, for example, that in a given country in which a particular period brings up certain constitutional problems, studies be undertaken on the history of political structure. Villey has not said the contrary, but should one go to the point of writing with him "History is the science of the present" (p. 431)?

These reservations can only underline the interest and the strong appeal of a book thoughtfully conceived and richly original, which ought to be read by historians, philosophers, jurists and, indeed, by all interested individuals.

J. F. LEMARIGNIER
Professor of the University of Paris

## ERRATUM

In describing lobbying activities in the State of Nebraska, in an article I wrote for the September 1958 issue of THE ANNALS, I used incorrect figures. This statement reads: ". . . (in 1957) in Nebraska where 779 lobbyists registered and 731 of their employers." These figures should refer not to the number of registered lobbyists and their employers but *to the number of expense statements filed by lobbyists and their employers* in 1957.

As reported to me, by the office of the Secretary of State of Nebraska, for the year 1957, 140 lobbyists and 173 of their employers registered while 779 expense statements were filed by lobbyists totalling expenses of $117,703 and employers filed 731 expense statements totalling $155,576.

I regret this misstatement.

BELLE ZELLER
*Professor of Political Science*
Brooklyn College

## LETTERS TO THE EDITOR

November 23, 1958

Dear Sir:

The review of *Czechoslovakia*, edited by Vratislav Busek and Nicolas Spulber, which appeared in your March, 1958, issue contains some harsh words which, in my humble opinion, are not justified.

The reviewer cites a few words from Duchacek's chapter on education to support his charge that the book contains "numerous misconceptions in the interpretation of Czechoslovakian history" and "considerable evidence . . . that some authors, writing rather hastily, are even unacquainted with some important historical facts, or ignore them." The author had stressed the "imperial and Western origin" of Charles University, "founded by the Roman Emperor and King of Bohemia Charles IV in 1348," against attempts by Czech Communists to disassociate it from Western culture and the past of Bohemia as part of the Holy Roman Empire. The reviewer presents these words as evidence of the author's alleged support for the theory of his German political enemies in the dispute over the "national" origin of Charles University—Mr. Duchacek is a former chairman of the foreign relations committee of the Czechoslovak National Assembly.

The reviewer states that Charles University was founded as a "Czech institution in 1348." In the fourteenth century institutions of learning were international, open to scholars of all countries united within the Catholic Church. At Charles University they were then grouped into four "nations" on a territorial, not ethnological, basis. The "Bohemian" nation comprised Czech, German, and Hungarian subjects of the King of Bohemia. It was not until 1882 that Charles University was divided into a Czech and a German university.

The dispute as to which of these was the true successor of ancient Charles University did not at all concern Charles' title of "Emperor" or his coronation in Rome in 1355. Elected German kings, called "Kings of the Romans," claimed a legal right to become Roman "Emperors," which title was used after their coronation with the imperial crown; except for the empty title, this coronation had lost all real significance and their prerogatives were recognized from the time of their election and coronation as "Roman Kings." The dispute really involved the question of whether Charles had founded Charles University in his capacity as King of Bohemia—he succeeded his father in August, 1346; crowned September, 1347—or in his capacity as "King of the Romans"—elected July, 1346; crowned November, 1346. The document establishing Charles University was issued under the Golden Bull of the Roman Kings by *Karolus dei gratia Romanorum rex semper augustus et Boemie rex.* Despite this, Czech historians developed strong arguments in favor of the former theory, which is obviously supported by Duchacek, listing (the Czech) Charles University as founded in 1348, next to "German University (1882)," on p. 158.

Charging that Charles "became" Holy Roman Emperor "seven years later, in 1355," the reviewer confuses the more or less meaningless formality of the Roman coronation as emperor with Charles' succession to the throne of the "King of the Romans," by his election in 1346, which was the true source of his imperial powers. Like Duchacek, other reputable historians take the "short cut" of referring to the founder of Charles University as "Emperor" even as of 1348. For example, see Vol. 6, *Cambridge Medieval History*, p. 596 or Vol. I of Watts, *A History of Western Civilization*, p. 293.

Limitations of space prevent me from dealing in detail with some of the other charges. Although pre-war problems of Czechoslovakia, Tiso's Slovak puppet state, and the cession to Russia in 1945 of Ruthenia, all predate the topic of the book—Czechoslovakia under the Communists, i.e., after 1948—there are numerous references to these matters throughout the book, to the extent necessary to show the historical background of the period with which it deals. Questions as to the reasons for the necessity of using "official" Czechoslovakian sources, and a lack of "critical analysis," could have found their answers in the explanatory remarks in the book's Foreword.

Very truly yours,
JOHN G. LEXA
*Lecturer on Comparative Law*
New York University Law School

December 5, 1958

Dear Sir:

I am sorry to report that, regarding the founding of Charles University as a "Czech institution in 1348," both Mr. Lexa and the author of the original chapter seem to be unacquainted with the several academic volumes, published in 1948 on the 600th anniversary of the founding of this institution, and supporting my point—although Lexa hints that there were "Czech historians [who] developed strong arguments in favor of the former theory. . . ." Permit me to cite just one of these works, authored by Professor Otakar Odložilík, now of the University of Pennsylvania, *The Caroline University 1348–1948* (Prague: Orbis, 1948), wherein Odložilík refers to Charles IV as King (see pp. 13–14) and quotes the Foundation Charter of Charles, who "hoped that the ranks of educated

people in the nation would be increased by such as could not afford to go to distant places for study" (p. 15), and thus established the University "to the end that the loyal inhabitants of our land . . . ." (p. 14). Mr. Lexa, as well as the responsible editors of this volume, has evidently failed to survey and utilize all the relevant academic literature, especially where relevance is not only defined a priori but also emerges in the course of the research itself. It is true that all research information seldom appears in neatly packaged form for the researcher; but this, in turn, obligates every serious scholar to seek it out and find it in the most unlikely places. In fact, after analyzing Lexa's objections to my "harsh words which . . . are not justified," I am sorry to report that, after re-examining his claims and after re-reading the book in question, I am now really convinced that I was not harsh enough when evaluating the work in my original review. My apologies for that!

Since Mr. Lexa is a Lecturer in Comparative Law, he should know better than to charge me with confusing "the more or less *meaningless formality* of the Roman coronation as emperor . . ."—Italics are mine. To learn that "meaningless formality" has no legal effect is quite an exciting legalistic novelty in itself.

Regarding Lexa's claim that there are "numerous references" to Tiso's Slovak puppet state, and the cession of Ruthenia to Russia in 1945, unnoticed by me, let me quote what I did say: "As for the name of Josef Tiso, Slovakia's President under Hitler, or of his Prime Minister, Bela Tuka, they are not even listed in the Index. And what about the problem of Carpathian Russia (Ruthenia) since it was the first territorial acquisition of Czechoslovakia's territory?" Maybe the editors did not deem Tiso and Tuka worthy of noticing in their index—but since these stooges of Hitler even had their state declare, officially, war on the United States, the reviewer is convinced that they should have been listed. Equally strong is my conviction that Carpathian Ruthenia deserves more consideration than mere passing references in the book (pp. 3, 5, 7, 11, 17, 130).

Lexa misquotes Editor Robert F. Byrnes when claiming that "Questions as to the reasons for the necessity of using 'official' Czechoslovakian sources, and a lack of 'critical analysis,' could have found their answers in the explanatory remarks in the book's Foreword." This is what Byrnes states: ". . . little analysis has been made anywhere in the world of recent developments in East-Central Europe. . . . In a sense, each chapter of each volume . . . represents pioneer research . . ." (p. vi). If the work under review is a good example of "pioneer research," then the results are indeed meager, if not downright pitiful in some instances.

Sincerely yours,
JOSEPH S. ROUCEK

Now ready for all concerned with

**THE MIDDLE EAST**

REVISED EDITION of the recognized modern authority on the history, geography, economy, peoples, and cultures of the entire Middle East.

**▶ CARAVAN**
**THE STORY OF THE MIDDLE EAST**
**By Carleton S. Coon**

Hundreds of revisions and an entirely new chapter on current conditions make the new edition of this famous book on the Middle East indispensable for everyone who requires a basic knowledge of the area. 16 pages of informative photographs. Glossary. Bibliography. Index of place names. Index of names of persons, peoples, and deities. End paper maps. $6.00

**▶ A Short History of American Foreign Policy and Diplomacy**
**By Samuel Flagg Bemis**

For this spirited text the Pulitzer prize winning historian has edited his own classic *A Diplomatic History of the United States.* Compression of earlier periods has afforded space for a more extended treatment of American diplomacy in the twentieth century, including American foreign policy in the Atomic Age. Profusely illustrated with maps, charts, and diagrams. $10.00

**▶ Graphic Guide to World History**
**By Michael Rheta Martin and Geoffrey Bruun**

This unique reference work is designed to help teachers and students of history and the humanities identify characters and events and relate them to their historical context. Sections covering 19 chronological periods provide a guide to what was happening in *all* important countries at a given time. With 19 maps and ample index. Prob. $5.00

# FOREWORD

The acceleration of interest and activity in the process of "helping people help themselves" is one of the most exciting developments in international affairs and holds out more promise for lasting solutions of many of the world's problems than do other more costly and dramatic programs. Technical co-operation, technical assistance, Point Four, the Expanded Program are various terms applied to the basic process of people aiding people.

The co-operative exchange of scientific and technical knowledge and skill has been carried on in almost all of the fundamental fields of human activity: health, agriculture, education, public administration, industry, mining, fisheries, transportation, engineering, communication, community development, and so forth.

The process of sharing has taken many forms. Oldest are the private programs conducted by religious agencies, foundations, and business firms. Public programs have been both bilateral and multilateral. The Point Four program of the United States and the agreements entered into between Soviet bloc nations and certain less-developed countries are examples of the former. The multilateral approach encompasses the programs of international organizations, like the United Nations and its specialized agencies, the International Bank for Reconstruction and Development, and the International Monetary Fund, as well as regional programs, such as those of the Organization of American States and the Colombo Plan for South and Southeast Asia. In addition, a number of programs have involved both public and private agencies, as in the case of the International Co-operation Administration-university contracts to provide assistance abroad, or a public agency in one country aiding a private organization in another.

The motivation behind all technical co-operation efforts varies widely according to the sponsoring agency and the expressed needs of the recipient. Humanitarian objectives underlie most co-operative programs, but the motive seems to be especially prominent in the work of religious and private foundations. The desire to accomplish economic development pervades many of the multilateral programs while the enhancement of national interests, either directly or indirectly, dominates the bilateral programs. Elements of each motivation run through all programs.

The accumulating experience with technical co-operation reveals that its success depends as much, perhaps more, on the effectiveness of its administration as it does on the worth-whileness of the objectives, the amount of money spent, the nature of the assisting agency, or the zeal of the recipient. With good reason administration has been called the slow boat in the convoy of technical co-operation.

The critical importance of administration, first of all, is related to the serious shortage of the resources needed to acomplish long-run social and economic development. Money, materiel, and qualified personnel are never abundant; they are particularly scarce in this field. Administration, then, is vital because of the pressing need to make the most of resources and opportunities which are in short supply.[1]

Futhermore, technical co-operation may have long-run consequences beyond or apart from the success or failure of the immediate project. This phenomenon

[1] Edwin A. Bock, *Fifty Years of Technical Assistance* (Chicago: Public Administration Clearing House, 1954), p. x.

was elaborated on at length in the book edited by Margaret Mead, *Cultural Patterns and Technical Change*.[2] Thus, in the administration of technical co-operation the desired objectives must be achieved without at the same time causing more lasting and harmful effects on the social, moral, or political lives of the people. In the process effective administration may serve as demonstration which encourages honest and efficient administration in the host country. In countless cases technical assistance has stumbled on the inability of the host country to administer the project it needs and undertakes.

Yet, relatively little attention has been given to the administrative side of technical assistance although the literature in the general field is rapidly expanding. Philip Glick, in the Preface to one of the few thorough studies of administration of technical assistance to date, puts the matter bluntly: ". . . bad administration can destroy a good idea and . . . international technical assistance is a very good idea indeed and worth the most careful nurture."[3]

This volume examines technical co-operation from the perspective of its administration: its forms, problems, and illustrative cases. A notable omission is an article by a recipient of technical assistance. Efforts to solicit such an article met repeated failure. One prominent government official of a Middle Eastern country responded: "I do not consider it politically wise to undertake this task because I could only criticize very strongly the program and this, under present circumstances, would not be very wise, not only for me but for our relationship with the U.S. Government as well."

The feeling that critical analysis should be avoided is encountered all too often. One is admonished: "Don't rock the boat." Objective evaluation of limited aspects of a program is sometimes interpreted as wholesale castigation of the total program. Political considerations, the fear that any criticism is dangerous, the lofty ideals being sought, and the genuine good will of the participants are among the justifications for avoiding criticism. Yet, responsible, intelligent, and constructive evaluation should be encouraged in a field which is so new and experimental and where the possibility of making mistakes is so great. It is essential for sound policy development and evaluation. It is necessary to improve the means of carrying on technical co-operation and to avoid repeating mistakes.

There is a need for a frame of reference within which the administration of technical co-operation can be systematically evaluated. Standards and criteria for evaluating the effectiveness of technical assistance must be developed. Answers must be sought for such questions as, How can the results of technical co-operation be measured in meaningful terms? How can the direct effects be determined? Improvement of living standards is an objective criterion, but what values do different cultures attach to the various aspects of living standards? Does the program suit the actual needs of the country? How do you evaluate a program which appears to achieve its immediate objectives but has adverse repercussions—or fails to achieve the long-run objectives while accomplishing immedite benefits? How can one measure the change in human feeling from despair to hope?

Many other questions need to be answered in the specific cases of hundreds of on-going programs and projects. How does one know what is the best organizational form for technical co-operation. Does the technical expert have a respon-

[2] (New York: The New World Library of World Literature, 1955).

[3] *The Administration of Technical Assistance: Growth in the Americas* (Chicago: The University of Chicago Press, 1957), p. xi.

sibility for helping to identify needs and propose projects? How are the various multilateral and bilateral programs being co-ordinated? Should the expert be an adviser, participant, employee, or supervisor? Should he engage in the building of support for his project? How do we know what to transfer and how is transfer accomplished? Are we transmitting weaknesses and defects along with the good?

Since technical assistance is worth doing it is worth doing well. Conscious attention to the problems of administration and systematic evaluation are required. The luxury of criticism from the sanctuary of fiction is not adequate to the task. There is another face to *The Ugly American*[4] which is worthy of more realistic analysis. Technical experts are real people facing new and difficult tasks, not stereotypes of "good guys" and "bad guys." The problems with which they wrestle daily are more fundamental than the amount of vermouth to put in a martini. While it is true that we need a "force of well-trained, well-chosen, hard-working and dedicated professionals," it is not necessary nor desirable that they be willing to "risk their health" in the pursuit of their objective.

This issue has been prepared as an introduction to the problems of administration of technical assistance in the hope that constructive evaluation will result and that the process of helping people help themselves will constantly be improved.

RICHARD W. GABLE

*Richard W. Gable, Ph.D., Los Angeles, California, is Associate Professor in the School of Public Administration, University of Southern California. From 1955 to 1957 he taught in the Institute for Administrative Affairs, University of Tehran, Iran, as a part of a project in technical assistance which USC has been conducting under a contract with the International Cooperation Administration. Currently he is serving as a consultant to an Executive Development Project USC is conducting for civil servants of Pakistan under an ICA contract. He has also taught at Stanford University, Ohio State University, and the University of California at Los Angeles. His publications include Public Control of Economic Enterprise (1956), co-authored with Harold Koontz, and articles in scholarly journals.*

# An American Aid Mission Director's View of Technical Co-operation

By Alvin Roseman

Abstract: Economic development is now a prime national imperative in the less-advanced countries of the world. Technical co-operation—the organized international transfer of technical knowledge and skills—is one of the ways in which the more developed countries can aid less advanced ones to achieve their aspirations. The principal requirements for economic growth are a development climate, capital, and modern technology. The creation of an environment conducive to progress is a task for indigenous political leadership. Once that leadership faces up to its responsibilities, technical co-operation can contribute substantially to the country's economic growth—especially in assistance in economic planning; in introducing new techniques in agriculture, industry, and the public services; in the development of extension methods for spreading technical knowledge; and in the training of professional and technical manpower. A key characteristic of the United States' technical co-operation program is its emphasis upon mutuality with the participating country. This type of collaborative relationship sometimes may be immediately less effective than the direct operational methods employed by the Soviet bloc aid programs. However, it provides a sounder basis for strengthening the capacity of less-developed countries to meet their own problems. The success of United States technical aid depends very largely upon the capability of American administrators and technicians in the field of human relations and upon their understanding of the role of their technical specialties in the larger problems of economic and social advancement.

*Alvin Roseman is Director of the American Economic Aid Mission to Cambodia. His previous positions overseas include assignments as United States Representative to the United Nations organizations at Geneva, Switzerland; as Deputy Director of the American Mission for Aid to Greece; and as Deputy Chief of the United Nations Relief and Rehabilitation Administration's Missions to the Middle East and Balkans. He has also served as Chief of the International Activities Division of the United States Bureau of the Budget and as a member of the United States Delegation at various United Nations and other international conferences. The views expressed in this article are personal.*

SOME months ago I happened to be chatting with a Cabinet Member of a newly developing country—not the one where I am presently assigned—in which both the United States and the Union of Soviet Socialist Republics are providing large amounts of economic aid. The Minister was commenting upon the difference in approach in the aid programs of the two major powers.

> When the Russians agree to give us something under their program, they show us the design, tell us where they would like the site, bring in their architects, engineers, foremen and skilled workmen and materials, and proceed to construct the building. You Americans, on the other hand, want us to determine the plan, want us to select the location, want us to contract with a construction firm and, while you are always willing to give us technical advice and help in these matters—and in the case of my country, are also willing to bear most of the costs of the project—you always compel us to make the difficult decisions.

My Minister friend undoubtedly exaggerated the differences in the administration of Soviet and American aid. Moreover, his own country, and the reluctance of his government to make decisions, are somewhat atypical. But his contrast between the direct Russian operations and the technical advisory methods traditional in the United States economic aid program points up the question of whether or not our American approach is still sound in these days of Soviet bloc challenge to the United States in assistance to less-developed nations.

Throughout the less advanced countries of the world, economic development has now become a national imperative second only to the maintenance of sovereignty and of public order. As a matter of enlightened self-interest, the United States recognizes that aiding these nations towards the fulfillment of their hopes for economic advance is one of the keys to a peaceful and prosperous world.

The obstacles which the less-developed countries face in their efforts to achieve economic progress are manifold, but they usually fall into three principal categories. There is almost universal desire for economic improvement but hesitation—and in some cases, resistance—in coping with the changes in the traditional political, economic, and social way of doing things that such progress inevitably requires. There is a paucity of local capital for investment in productive enterprises and an insufficient amount of governmental revenue to support the public services required for economic advance. And there is a dearth of indigenous personnel with the experience required for planning, organizing, and operating an effective program of economic development.

## Technical Co-operation and Economic Development

To what extent can technical co-operation—the international transfer of technical knowledge and skills—help these countries to surmount these obstacles?

Even the most massive foreign aid program provides only a small fraction of a country's economic effort. External assistance may be able to supply the critical extra margin which enables a nation to break through the barriers which impede its progress. But it is an elementary fact, though one which often needs repetition, that the fundamental basis of economic development is the more effective use of the country's own resources and the increased productivity of its labor force.

The creation of a development climate —a combination of political, economic, and social factors conducive to progress —is a prerequisite to national economic growth. The establishment of such an environment is a task for indigenous political leadership. In most countries it means a more stable government, sufficiently rooted in popular support to enable the leadership to overcome traditional inertia, cultural resistances to innovation, and the opposition of groups benefiting excessively from a semifeudal economic and social order. It may mean a political struggle for a better system of land tenure or for a reversal of the obsession that any foreign investment can only be another aspect of colonialism. Such a climate requires public confidence in governmental integrity and purpose and belief that a better standard of living is realizable in the not-too-distant future. Accompanying it usually is the emergence of an entrepreneurial middle class which looks ahead to the possibility of economic progress and the accumulation of capital.

With the establishment of an atmosphere conducive to growth, a country may begin to make real advance in a second major requirement for economic development—the capital necessary for investment. A few very fortunate nations have natural resources, such as oil, which provide a ready source of capital for other aspects of development. For most less-developed countries the process of capital formation is slower and more difficult. They are characteristically agricultural societies. Their production may be increased by the introduction of new agricultural techniques, but the export of their farm products is subject to the vagaries of international raw-material prices. Nevertheless, it is primarily through greater agricultural productivity, diversification of single crop economies, improved marketing, and similar measures that these countries can begin to accumulate a surplus above consumption requirements for investment in light industries, in transportation, and in other forms of economic advancement.

Technical co-operation can contribute both to the creation of a development climate and to the formation of capital. The necessary political leadership must come from within the country. The willingness and ability of that leadership to maintain steady progress against domestic obstacles cannot be created by external aid. But by making available information concerning present-day technology; by counseling national officials in the introduction of improved methods in agriculture, industry, and public services; and by helping them disseminate innovations, technical co-operation can provide some of the supporting sinews for a program of modernization. Through advice on economic planning and economic policy, it may be able to assist a country to avoid attractive pitfalls and delusions and help in the mobilization of domestic capital and in the attraction of foreign investment. It can aid in the improvement of public administration and in the encouragement and training of an emerging entrepreneurial class. Through assistance in education and public health, it can aid in developing the literate, skilled, and healthy labor force necessary for increased productivity. And by providing key national officials with opportunities to study the economic development experience of other countries, technical co-operation can help them enlarge their horizons and better equip themselves to deal with the problems of economic growth.

## Technical Co-operation in Planning Economic Development

Assisting a country to formulate clear and practicable ideas about its own economic development may, in the long run, be the most significant function of technical co-operation. In today's aspiring world, a national economic plan is almost as much an attribute of sovereignty as a national flag. Nor is such a plan necessarily an indication of a

commitment to some form of statism. Every nation is confronted with competitive claimants for limited governmental resources. Even if no formal plan is established, the government's own budget reflects a series of decisions concerning the use of public funds for economic growth. Some measure of economic planning, expressed or not, is inherent in the country's monetary and credit policy, its tax system, and the measures it takes to encourage or to regulate domestic and foreign commerce.

The extent and nature of the American participation in the formulation of the country's development plans often is determined, not by any thoroughly considered doctrine as to the function of foreign advisers, but rather by the personal relations which exist between members of the American group and key national officials. Countries which have only recently gained their independence are hypersensitive about national sovereignty. Their leaders do not wish to appear to substitute a new group of foreign advisers for the recently departed colonial representatives. At the same time they are usually aware of the limitations of their own knowledge and desire the inconspicuous counsel of those who are familiar with other countries' experience.

The United States regards nations receiving American aid not as satellites or dependencies, but as sovereign equals who are voluntarily collaborating in a joint effort. American advisers who appreciate the conflicts which confront national officials, and who are skilled in dealing with their sensitivities, usually find ways in which they can make contributions to national planning. Even when there is resistance to official formal participation by American experts, the American mission may sometimes have its most significant influence in national planning through the mutual confidence which develops between the American technicians in specialized fields of agriculture, transportation, education and the like, and second or third echelon officials of the government, who in turn advise their own ministerial superiors.

## THE PRINCIPLE OF MUTUALITY

The use of the term "technical co-operation" rather than "technical assistance" as the official name of the American technical aid program is more than mere semantics or diplomatic politeness. Close collaboration between the recipient government and the United States in the formulation and execution of the activities to be undertaken is inherent in the concept.

Representatives of the two governments must agree about what is to be done under the program; where and for how long the activities are to be carried out; and how much each country will contribute in manpower, money, and material for the joint undertaking. The process of reaching agreement with national officials on those aspects of the country's total development effort which will receive United States assistance is ordinarily one of give-and-take discussion. In some instances, the government has well-formulated ideas; in others, its plans are vague and it may look to the United States representatives to advance specific proposals.

Out of a negotiation of this character, the American Aid Mission seeks to achieve a mutually agreed plan of collaborative activities which represents the optimum use of the funds and personnel resources at its disposal. The Mission is bound, of course, by certain general policies of the United States Government and by the specific laws and regulations governing the American aid program. Certain of the government's proposals may appear to it to be inappropriate for United States aid, because they seem unsound (whatever their local sponsors may think of them); or they are of relatively low priority; or they require funds, personnel, or equipment beyond what the United States is willing or able to supply. While the Mission is well aware that its basic work is with the governmental services of the country, rather than directly with the local population, it also attempts to include some projects which provide opportunities to make evident to the people of the country that the United States shares their own government's concern about their welfare.

This concept of "jointness" as a fundamental method of operation is one of the basic differences between American economic aid—not only in technical co-operation, but also in more massive forms of economic assistance—and the aid programs of the Soviet bloc. Through the partnership relationship with their indigenous opposite numbers, which the Americans seek to establish in every phase of program formulation and program execution, there is a continuous exchange of information and experience. The educative process is a constant, collaborative, and often almost unconscious one which grows out of mutual identification in a common purpose.

As the Cabinet Minister whose complaint was cited at the beginning of this paper indicated, this concept of mutuality may, in the short run, be less effective than a direct arrangement under which the United States accepted more complete responsibility. It might be more expeditious for the Americans to adopt the Soviet technique of a "packaged job," in which almost all the work is done by foreign technicians and the local officials are relieved of responsibility and worry. But the objective of the American program is to help the less-developed country to increase the knowledge of its own people in fields important to economic development and to improve their skills in applying that knowledge to the nation's economic needs. If, as Americans generally believe, people learn best by doing, the direct operational approach would not achieve this basic United States' goal.

Activities planned and carried out primarily by foreign technicians are not likely to establish a foundation for continued economic growth. Sooner or later the foreigners leave and, when they do, they have not prepared the country to deal with its own problems. The technical co-operation program places its emphasis upon the creation or strengthening of indigenous institutions and services which will carry on under their own impetus after American technicians and other American aid have been withdrawn. The development of these institutions—economic planning organizations, agricultural extension services, systems of public health administration, educational facilities suited to the country's needs, credit banks, and industrial development centers—and the training of competent personnel to operate them, take time and patience. But the result is a solid, rooted growth rather than a fragile transplantation.

## FINANCING TECHNICAL CO-OPERATION

The American Mission usually also seeks those activities which promise, over a period of several years, to involve an increasing financial contribution by the indigenous government and a decrease in the relative proportion of financing by the United States. The principle that the host government should bear a part of the cost of the joint undertaking is an important one; it assures that the government regards the activity as of sufficient importance to justify the expenditure of its own funds. In the initial stages the national authorities' ability to assume a substantial proportion of the total cost may be limited, but if the activity is soundly conceived and developed, their

share should increase. If, after a period of demonstration, the government does not consider the project of sufficient importance to justify a larger financial contribution, the Mission may well question whether the activity should be continued.

The internal budgetary resources of some newly developing countries are so limited that the government may not be able to carry the local currency costs of technical co-operation without curtailing other essential public services. The paucity of revenues may be so severe that the national authorities may consider it impossible for them to pay the salaries of the additional local personnel required, for example, to begin an agricultural extension service. United States legislation does not permit the funds appropriated for technical co-operation to be used for this type of expense.

The American Mission's response to this type of situation usually is to suggest a re-examination of the government's other expenditures to determine whether economies may not be made which would furnish the funds for these local costs. If this does not provide the requisite funds, the joint program may have to be curtailed. In extraordinary circumstances, in countries in which the United States is providing other forms of economic aid which result in the generation of "counterpart" local currency through the sales of American-financed imported commodities, it may be possible for the Mission temporarily to supplement the national government's resources through the use of such counterpart funds. This type of budgetary subvention may be justified as an emergency measure to assist a newly developing country to inaugurate the initial and most urgent steps towards economic growth. Like all subsidies, however, it is difficult to curtail. As the government's revenues improve, the financing of the salaries and other operational expenses of local technicians is ordinarily the first reduction sought in the American program.

### TYPES OF AMERICAN AID

Technical co-operation is only one of the types of economic aid the United States provides to less developed areas. A number of countries receive large-scale defense support aid to enable them to carry the extraordinary military burdens they have undertaken to protect their own independence and as part of the mutual defense of the Free World. Other nations are granted special economic assistance to help them meet critical economic needs. The sale of United States surplus agricultural commodities for local currencies provides funds which are used for certain types of economic development activity. American assistance for major capital needs, such as industrial plants, irrigation, electric power, roads and ports, is increasingly being furnished through long-term loans under the recently established Development Loan Fund. The Export-Import Bank also makes loans for certain types of economic development projects.

Each of these types of assistance involves an element of technical aid. For capital projects, reconnaissance surveys must be undertaken, detailed engineering and economic studies must be made, and complex applications for loans must be prepared. Technical training of local personnel is usually required to equip them for work in the construction phase and in the management of the completed project. Some aspects of this technical assistance may be provided as part of the capital financing; increasingly, however, assistance in the preliminary phases is being supplied as part of the technical co-operation program. Technical co-operation thus provides the "make ready" aspects of major capital undertakings.

### CO-ORDINATION WITH OTHER AID PROGRAMS

The United States is not the only nation which supplies economic and technical assistance to underdeveloped countries. Almost every major Free World power carries on some activity of this character on a direct bilateral basis or through the Colombo Plan or other regional arrangements. The Soviet Union, the Chinese Communist regime, and several of the Soviet satellites provide both economic aid and technical assistance. In addition, the United Nations and its specialized agencies and the Organization of American States have far-flung programs of mutilateral technical aid.

The assistance programs of other Free World countries and of the multilateral agencies basically have a similarity of interest with those of the United States. While some aid-giving countries have special political or economic interests in certain less-developed areas, which the United States may not share, the identity of viewpoints are much greater than are the differences. Thus the relationships between the American program and the technical co-operation activities of other like-minded nations and of international agencies are usually matters which can be dealt with through local administrative co-ordination.

Ideally, the host government itself should provide the co-ordinative mechanism. The national government is the source of requests for assistance, and it is to its own interest that each available source of aid is used in the most effective manner and that duplication of effort is avoided. In some countries, the national authorities have established such a co-ordinating device, usually as part of the Ministry of Plan or as an inter-Ministerial committee. In others, especially those in which the government itself is still relatively weak and inexperienced, the task of working out mutually satisfactory relationships among the Free World aid sources must often be undertaken informally by the various resident aid missions. In either case, information concerning prospective programs and current operations is informally exchanged and potential conflicts are avoided. The needs of most developing countries are so great that the basic problem is that of how best to use all available sources of help.

A more complex problem exists in those countries which are accepting aid both from the Free World and from the Soviet bloc. Americans are convinced that the long-range objectives of the Soviet bloc aid programs are to establish Communist political and economic domination, but this viewpoint is not necessarily shared by the recipient nations. The United States has not withdrawn its aid program from these nations merely because the country has accepted Soviet bloc aid. Rather it has continued its activities in the expectation that the host government would learn from its experience about the true motivation of Soviet activity.

Since there can be no real identity of interest between Soviet bloc aid programs and American ones, the American aid mission does not co-ordinate its efforts with those of its Communist competitors. Instead, it works out with the government procedures to avoid any commingling of American funds, personnel, or equipment with those supplied by the Soviets. It attempts to demonstrate the advantages of American aid by its own superior performance and its scrupulous avoidance of objectionable political activity.

### THE HUMAN RELATIONSHIP

Many foreign students of the American scene have remarked that the economic progress of the United States is attributable as much to success in

achieving co-operation and mutual tolerance among the diverse sectors of our society as it is to the natural resources with which we have been endowed. Every American is well aware that racial and social tensions are still one of our domestic problems. And yet those who have objectively observed the work of United States technicians in less-developed countries are often struck with the success with which many Americans have established sound relationships with their indigenous opposite numbers. Many of these technicians have been gravely deficient in knowledge of local languages and local customs; some of them have committed serious errors; but, on the whole, their record of performance has probably been more productive than that of personnel provided by European or Asian countries under other technical assistance programs.

Part of this success may reflect the outgoing "frontier" democracy which characterizes so many Americans. Part of it may also be the consequence of our well-known desire to be liked, which, in spite of its frequent awkwardness, often creates a reciprocal attitude on the part of those with whom Americans work. Part of it may grow out of increasing recognition that most Americans have accepted overseas assignments because of a basic desire to perform a useful service, rather than out of any absence of economic opportunity in their own country.

The most conspicuous element in American success, however, has been the willingness of United States technicians to get their hands dirty. In the status societies of many newly developing countries, local officials, who have traditionally regarded the purpose of education as that of relief from the necessity of manual labor, have not always initially welcomed the American technician's enthusiasm for showing a farmer how to manure a field or an equipment operator how to grease a piece of machinery, instead of describing the process or directing a laborer who does the physical work. But once the local technician overcomes his fear of losing status, he usually begins to appreciate the efficacy of his American colleague's methods. The American's conviction that all work is dignified communicates itself to others and forms the foundation for a sense of common effort.

In many parts of the world, Americans have learned that our own technology is not necessarily superior to that of other nations which are also providing technical aid to less-developed areas. Some of our normal practices are too complex or too expensive for these countries. Our technicians have often had to re-learn the methods used in their own grandfathers' times and use them rather than those employed in the United States today. But technical co-operation in essence is an interpersonal activity, and in the art or human relationships we have an overriding advantage over our totalitarian competitors. If we can staff our missions overseas with American technicians and administrators who have both professional competence and personal skill in building mutuality in every aspect of their work, and who also understand the relationship between their technical specialties and the larger problems of economic and social changes, we can expect increasing success in our assistance programs. We can also look forward to progress in achieving the larger United States objectives of aiding newly developing countries to maintain their independence and to strengthen their participation in the Free World community.

# A Resident Representative's View of Technical Co-operation

By HARRY L. SPENCE, JR.

ABSTRACT: The Technical Assistance Board, composed of a central secretariat and a network of Resident Representatives' field offices, plays a significant part in the planning, co-ordinating, and servicing of the United Nations Expanded Program of Technical Assistance. The success of the Program is evidenced by the almost unanimous support given it by both the receiving and contributing countries. The need and desire of improving the Program's impact upon the economic and social development of the world, requires constant evaluation studies and administrative adjustments to meet the realistic conditions determined from operation experience. The Resident Representative, functioning at the country level, witnesses the technical assistance operation from the closest point and, therefore, holds a key position in guiding the administration of the Program.

*Harry L. Spence, Jr. is Resident Representative of the United Nations Technical Assistance Board in Pakistan. He served as Resident Representative in Afghanistan during 1952–54 and in Libya from 1955 until his assignment to Pakistan in October 1958. From 1929 to 1941 he was a member of the University of Idaho, Agricultural Extension Service, as Agronomist and later as Assistant Director of the Extension Service. From 1942 to 1952 he operated a large livestock and fruit producing and processing enterprise in Idaho.*

IN undertaking to record one's views and experience with the administration of the United Nations Technical Assistance Program (ETAP) from the observation point of a Resident Representative, it is important that the reader understands that extreme variations, country to country, in the environmental conditions, the program's composition, national considerations and long established customs, plus the personality of the individual Resident Representative, may all contribute to rather marked differences in the problems which are faced and the approach taken in conducting the duties of a Resident Representative in any one country. It is with this criterion that an attempt is made to record *one* Resident Representative's personal observations, problems experienced, and appraisals as well as suggestions which are based on over six years' experience serving the UN family in three countries.

## A DEFINITION

I have been asked to present some of the problems which confront a Resident Representative: Surely one of the first of these is to achieve an understanding of the functions of the job in their proper perspective in relation to the Technical Assistance Program.

Elsewhere in this publication, Mr. David Owen has described the structure of the United Nations Expanded Program of Technical Assistance—probably the most fully multilateral source of economic aid currently in existence. Mr. Owen is Executive Chairman of the Technical Assistance Board, which is the co-ordinating and executive body of the Program, operating out of United Nations Headquarters in New York. The Resident Representatives of the Board are its field arms, scattered to such points as Kabul, Khartoum, Phnom Penh, La Paz, Bengasi, and Accra. They are the Board's means of direct contact with experts, with governments, non-UN agencies, and all the other individuals and organizations which are concerned with technical aid.

The Resident Representative is generally assigned to one country for a period of one to three or four years. Although he establishes himself in an office provided by the government in the capital city, he also visits the outlying towns and districts where a good deal of the Program is being carried out. Officially, the Resident Representative is a point of reference between the government to which he is accredited and the various international organizations which make up the operating bodies of the United Nations technical assistance program. In practice, he tries to be—at one and the same time—an executive, an administrator, a diplomat, an economist, and a public relations officer.

It can well be seen then that the Resident Representative's terms of reference are broad in principle but rather vague in positive definition. This is perhaps due to the extreme variation in the requirements of each country office and to the fact that the job has grown slowly and haltingly parallel to the growth of a completely new and unique structure for aid. At any rate, the lack of a definitive job description often places the Resident Representative in a position where improvisation is the rule and flexibility an absolute necessity.

## FUNCTIONS

As field co-ordinator of the UN and agency program, the Resident Representative assists in the planning, the execution, and, later, the evaluation of the country's program. He keeps in close touch with the work of experts and helps to smooth out some of the inevitable problems that come up in the course of their work. He is responsible for maintaining liaison with representatives of other technical assistance programs within the country to prevent overlapping or duplication of efforts. He assists experts by maintaining secretarial, transportation, and general administrative services—including the obtaining of visas and passport renewals, the making of travel arrangements, and dealing with currency conversion problems. The Resident Representative maintains central files on all technical assistance projects. He frequently assists government and UN agencies with the selection and preparation of fellows who will be sent abroad for training by the international organizations; later, it is his job to follow up the results of this training to see if it is being used as originally planned. In practice, Resident Representatives are often considered by governments as senior representatives of the United Nations and are usually accorded a rank equivalent to that of an ambassador or minister.

The life and work of a Resident Representative are shaped to a large extent by his position at the center of a fairly large group of individual technical experts. At one time during my service in Libya, our technical assistance group numbered eighty-seven experts representing thirty-six different nationalities. I was there to help them carry out their work as effectively as possible and to give each one the feeling of belonging to a team, especially where he or she might not, by virtue of background or assignment, be integrated with the group. Working with a diverse group of knowledgeable people is certainly one of the great rewards of the post of Resident Representative, but it presents its share of problems. Unfortunately, the international civil service has not yet matured to the point where there are commonly accepted codes and philosophies that can be applied uniformly by experts.

Of the 8,000 experts recruited and sent on missions during the past eight and one-half years, the greatest number were individuals accepting their first overseas assignment. A completely strange environment can often have strange effects on an individual's behavior. Any person should be entitled to live his private personal life in accordance with his own set codes and standards, but he must have great tolerance for other people's ways of life and not attempt to force others to accept his own. He must accept living and working conditions which will vary greatly from those to which he is accustomed and must be able to adjust his way of life as closely as possible to that of nationals in similar positions with whom he works.

These are not easy adjustments for many people to make, and they often bring about family problems and attitudes which affect the professional performance of the individual. It is natural that being in a different land without close friends, the members of the mission often call upon the Resident Representative to assist in solving their personal problems. The Resident Representative thus finds it necessary and advisable to accept a degree of responsibility for both the expert and his dependents' happiness and welfare.

As further illustrations of the rather wide divergence of problems which arise in administering a technical assistance program within a country, a few examples might be listed: personal negotiation for the release of a technical assistance expert held by a tribal group as the result of an unfortunate traffic accident; negotiations for an exit visa for an expert and his family held in the country because of a case for damages which had been filed in a religious court; diplomatic settlement of a territorial violation innocently incurred by an expert carrying out his job. These examples, though perhaps of minor im-

portance, are recorded to illustrate the rather complex nature of the administration of a technical assistance mission in the host country.

### CO-ORDINATION

In the majority of countries, the United Nations technical assistance program is but one segment of the technical assistance offered. A number of nations are offering technical assistance programs either on a straight bilateral basis or through a combination of countries, such as the Colombo Plan. In addition there are numerous foundations and independent or private groups assisting governments of the less-developed countries in their economic and social development. Few of the receiving countries are yet equipped with personnel or organization capable of full co-ordination of these total resources to a point where the maximum use or ideal effectiveness is obtained. Too often, the aid-giving agencies themselves have not been able to achieve the most fully effective co-ordination of their activities in the same country.

While a real effort has been made to develop an exchange of information and agreements between programs at a high level, experience has shown that the country level is the most important and effective point of co-ordination; there, it is largely the result of personal relations brought about by daily contact and understanding among those responsible for the administration of the various technical assistance programs.

It must also be remembered that while a closely co-ordinated relationship between the various aid-giving services is always encouraged and sought by receiving governments, activities do not always entirely reflect that policy. While cases of overlapping, if not duplication, still exist, there has been a vast improvement during the past few years. It is, however, important that continued attention be given towards developing a uniform procedure to assure total co-ordination of all technical assistance programs since an *ad hoc* arrangement depends too greatly on the personalities concerned, a rather unreliable factor when multinationalities are involved.

### PROGRAM PLANNING

Effective planning is and will remain the key to the success of any technical assistance program. During the first five years the United Nations technical assistance program was administered by dividing the total resources available for any one year on a fixed percentage basis between the various participating UN organizations. In turn the organizations through consultations with the various governments developed their program for each country.

In 1956 the Economic and Social Council (ECOSOC) adopted what has become known as the Country Planning Procedure. As Mr. Owen has noted in his article, under the latter system the fixed percentage formula was abolished and the total funds were divided to give each country a target figure under which it has full freedom to develop its program to best fit its needs.[1] While there is still a division of opinion among participating agencies as to the workability of country planning, experience at the country level would confirm its soundness. Unfortunately the plan has not always been given a full opportunity to function because of the very human tendency of government ministries and UN agencies themselves to believe that their work is of the greatest priority. A minister of agriculture, for example, may be primarily interested in obtaining all of the support possible which will further the agricultural program in his country, when agriculture is of

[1] See also Arthur Goldschmidt's discussion of country programing procedures, this issue of THE ANNALS, pp. 54–55.

course only one segment of an over-all development program, and the program must be properly balanced for the best promotion of a sound economic and social structure.

It is therefore relatively easy for these considerations to upset the true theory of country planning. A successful technical assistance program must be measured to the specific needs of the country—and these vary widely—country to country. Fortunately there has been a steady buildup of planning and co-ordinating machinery in many of the less-developed countries, in many cases through the aid of the technical assistance program itself. Gradually, definite goals towards economic and social development are being established, and they will help to ensure that funds are employed in the proper ratios.

The Resident Representative during the planning period works closely with the technical representatives of the agencies in consultation with the responsible government officials to develop the program. Representing, as he does, the entire UN family and the interests of the government, he is able to advise and assist in the over-all co-ordination of the planning process.

### EVALUATION

During the early stages of the United Nations technical assistance program little time or thought could be, or was, directed to evaluating the results of what had already been done. It is strongly felt that we have now reached a point where evaluation must be constantly applied if the program is to be virile and efficiently operated. Mistakes and shortfalls in efficiency during the early years can be readily understood when one considers the broad scope of the program and the total lack of experience in administering an international program of its nature and size. Program evaluation is a most important and necessary exercise yet extremely difficult due to the lack of a criterion which lends itself to a uniform application for vastly differing projects. Nevertheless, future increase in the effectiveness of the technical assistance program depends largely upon the frank recognition of weaknesses and mistakes which have been experienced during these early years and the application of corrective measures which will increase the delivered quality of the program to its maximum.

The Resident Representative, in the past three years, has taken a leading role in the evaluation process—always in consultation with governments. During the early years of operations, governments did not have effective facilities for program evaluations. This is no longer the case, and governments are much more carefully studying and appraising the results of the technical assistance program.

Looking at international technical assistance from the vantage point of a field representative, and drawing on the experience that I have already had with evaluation, I might point out some of the ways in which technical assistance could be made to yield even greater results: First of all, technical aid must be recognized as the partnership arrangement which it is—with the host government and the aid-giving organization bearing an equal responsibility.

Many of the project failures or low efficiency experienced are due principally to lack of proper interest or servicing by governments. In nearly all cases, the receiving government is responsible for all supplies and personnel which can be obtained locally, plus office, secretarial, transportation, and general service required by the project. Therefore, before a project is begun and the expert arrives, full assurance of the availability of necessary servicing must be ascertained. These principles are spelled

out in the Basic Agreement signed by all governments. However, conditions in most countries are such that the different divisions of government are not fully cognizant of their responsibilities, and as a result an expert might spend several months in obtaining the facilities and support which largely determine the success or failure of his project. Greater attention at the time of programing, to the clear definition of each party's obligations, and before sending the expert to the country, would without question result in greater effectiveness of the technical assistance program.

## THE EXPERT

The contribution made by the United Nations Expanded Program of technical assistance is almost entirely dependent upon the performance of the experts, as only a relatively small percentage of the funds are used for equipment, and none for capital outlay. This is a significant difference when compared with the bilateral approach to technical assistance. It is therefore imperative that the standard of experts be held at a high level, and a project may be seriously delayed until the right man is found. One of the known obstacles to recruitment is the fact that the vast majority of contracts offered are of one year duration. While it is true that the majority of such contracts are extended from year to year, as the work requires, there is a lack of security of tenure which many qualified experts hesitate to accept. As a result it has been difficult to build up a pool of technicians who might be developed into an international career service. Many of the present experts accept appointments only because they are able to obtain a leave of absence from their established positions to which they can return after one or two years. A solution to this problem which would offer a career service for international trained technicians would greatly strengthen the program.

A second problem arises after the expert's arrival in his country of assignment. It is a relatively easy matter to judge a person's academic and professional qualifications from a curriculum vitae, but a much more difficult task to judge his personality and his ability to adjust to new environmental conditions. Usually, inability to adjust to the working and living environment will be evident after three to four months, and early transfer of the expert who obviously cannot adjust would be the wise solution. Such an expert might upon transfer to new conditions perform an outstanding job.

From my own experience with the needs of experts, it would certainly seem that every man and woman selected for a foreign technical assistance assignment should be thoroughly briefed in the history and background of the people and country of his assignment, as well as in the wide objectives of the United Nations. There is, of course, in addition, the need to be aware of the living conditions available to foreign experts, necessary supplies and equipment which must be taken to the country, medical and health facilities available, as well as churches and schools resources available. Every agency does attempt to brief its experts and a large share of the responsibility falls upon the Resident Representatives, as it should, following the expert's arrival in the country. However, there are numerous opportunities of improving and adopting uniform procedures.

## TRAINING

For an expert to be successful, he must have certain minimum services such as office or laboratory facilities and supplies, secretarial help, and transportation. These services are normally a responsibility of the receiving government. Many countries in which the technical assistance program operates are virtually unable to fulfil these obligations because of shortage of foreign exchange and almost complete lack of trained people. The Office of the Resident Representative of TAB assists the experts by furnishing such services within a very limited field office budget. Comparisons will confirm that the expenditure for administration of the UN technical assistance program at the field level is by far the lowest among the technical aid-giving organizations.

The shortage of trained personnel in the less-developed countries becomes even more critical when it is reflected in the lack of national counterparts to work along with international experts. At least one counterpart should be provided for every expert, so that he can take over when the UN help is withdrawn. To help governments intensify the training program for their own people, a large part of technical assistance funds have been devoted to fellowships for training abroad, clerical and technical training within the country, regional institutes and training centers, as well as seminars and study tours in nearly every field.

There are two common problems experienced in the fellowship training program to which additional attention should be given. First, the development of a system which assures the selection of candidates solely on merit. Political as well as family pressures must be guarded against. Second, assurances must be obtained that the candidates will be given the opportunity to utilize fully the training on the completion of studies. Effective co-ordination of the training program between the aid-giving organizations operating in the country must also be perfected to maintain proper balance between the fields of training. In addition to assisting with the co-ordination, selection, briefing, and administrative arrangements for travel of the trainees, the Resident Representative maintains records on all training programs and follows up each candidate's activities after his return to his country to assure maximum utilization of his or her services. In the past some criticism has been directed at the UN and agencies for not devoting a larger percentage of funds to the fellowships and training phases of the technical assistance program. However, experience to date would indicate that the number of fellowships awarded closely parallels the availability of qualified candidates in most countries. As primary and secondary systems of education turn out a greater number of students, there will be greater need for advanced and specialized study. At present the training of workers who have established positions in government produces the maximum immediate benefits.

Experience with the fellowships program would also lead one to the conviction that training should be carried out in places where conditions are closely similar to the trainee's home environment. A fellow who studies for an extended period of time in the more advanced countries often has difficulties in adjusting to working conditions existing in his home country. The UN family is in an excellent position to place each fellow in the most appropriate country of study since it has established a network of facilities all over the world.

## CONCLUSION

An attempt at frank but constructive appraisal of the administration of the United Nations ETAP program, based upon the experience of one Resident Representative who has actively observed the program in but three of the ninety odd countries and territories where technical assistance is being fur-

nished, cannot be taken as representing a majority's views. The United Nations ETAP program, however, born without previous experience or tradition, is now nearing maturity. To guarantee that the program continues to be viable, energetic, and keyed to ever-changing conditions, constant review and evaluation is imperative together with the flexibility necessary to permit acceptance of needed adjustments.

Any attempt at documenting the observations, experiences, and personal conclusions of the administration of a program as vast and varying as that of the United Nations technical assistance, regardless of how objectively it might be made, could create some questions in the minds of the laymen as to its effectiveness in assisting the less-developed countries of the world in raising the living standards of their people. The almost total acceptance and support given the program by the countries of the world should still any doubt of its outstanding contribution. To one who has spent nearly seven years in the less-developed countries participating in the administration of the United Nations technical assistance program, no small question or doubt remains on the wisdom of those who created the technical assistance program or upon the amazing record of accomplishments made during the past eight and one-half years of operation. Its total beneficial impact upon the lives of millions of human beings and upon the stability of many governments cannot be fully or accurately measured. The program must continue to grow, but sound growth can occur only by benefiting from the lessons of the past and putting forth every effort to bring the program to maximum effectiveness.

# A Congressman's View of Technical Co-operation

By PORTER HARDY, JR.

ABSTRACT: According to the Act of International Development of 1950, technical co-operation programs are "Programs for the international interchange of technical knowledge and skills designed to contribute to the integrated development of the economic resources and productive capacities of economically underdeveloped areas." To carry out this program the United States sends technicians to host countries, brings host countries personnel to the United States for training, and contributes to the joint support of bureaus in the host country. Since technical co-operation is primarily a program of education, the emphasis is on the transfer of skills and know-how. Before a program can be successful, three elements must be present. The initial demand must come from the host country —because the idea of self-help is inherent in technical co-operation, it must believe in and want the project. Further the host country must be willing to contribute its own funds to the project. When a program or project has been agreed upon, there must be proper planning. A realistic estimate must be made of the type and amount of knowledge and skill which can be supplied by us and of the time required to provide this education. It is also important to be aware of how much can be absorbed by the host country, keeping in mind the difference in culture between the host country and our own. When these elements are not present in the technical co-operation program or project, failures will result. Failures which have occurred so far have been ones of administration. —Ed.

*Porter Hardy, Jr., LL.D., Washington, D. C., has been a Member of Congress from the 2d Virginia District since 1947. During the Eighty-fourth Congress, he was Chairman of the subcommittee on international operations and Chairman of the select committee on survivor benefits. He is the author of Servicemen's and Veteran Survivors Benefit legislation, PL 881 and is a member of the committees on Armed Services and Government Operations. In 1951, Mr. Hardy was named First Citizen of Portsmouth, Virginia.*

ADVOCATES of particular points of view commonly characterize as opponents those who are not enthusiastic supporters. For example, if a Congressman makes a speech or writes an article criticizing the conduct of a particular government program, he is forthwith considered as against it. When, as is often the case, he couples with his criticisms a pledge of support for the program he is apt to be accused, as politicians sometimes are, of talking out of both sides of his mouth at once, doubtless with an eye on the next election.

More careful observers recognize constructive criticism. They know that the adverse comments which Congressmen make about given activities of government do not always have ulterior motives. Instead, critical observations by Congressmen may often arise out of a sincere belief in and a profound concern for the very things being criticized. It is out of a concern for the success of our technical co-operation programs that I find myself in the role of critic.

We in the Congress have listened carefully year after year to the reports of performance and claims of accomplishment for these programs which are sent up by the International Cooperation Administration and the Department of State. Along with most of my colleagues from both sides of the aisle I have consistently voted funds for their continuance. But, as chairman of a House subcommittee charged with the duty of studying United States international operations, I have also had some special opportunities to observe their day-to-day conduct, and I have not always been gratified by what I saw. It is out of the experience of the past four years, in which I have studied at close hand technical co-operation programs from Iran to Uruguay, and from Cambodia to Mexico, that my judgments have been formed.

## AIMS AND PHILOSOPHY OF PROGRAM

The objectives of this program are most inspiring and unselfish, particularly for an activity undertaken by one government on behalf of another. The technical co-operation program is founded in hope and optimism. It envisions a future in which, through the sharing of technical knowledge and skills, a better life can be created for millions of people in other lands—people for whom over the centuries tomorrow has always been bleak.

It is by no means accidental that the United States has led the way in this bold and imaginative undertaking. The stoic acceptance of life as it is has never been an American characteristic. We have always considered ourselves masters of our fate. Coupled with this confidence is a deep humanitarian urge which impels Americans into action whenever they see human misery caused by poverty, starvation, disease, and ignorance.

Moreover, when such conditions exist in lands with untapped resources, to an American it appears that what is needed is the application of American know-how to make the stubborn earth yield its stored abundance, to push back the ancient enemy of disease, to feed and clothe and house the people and give them the hope for tomorrow which seems so tragically lacking.

This is the central objective of the technical co-operation program. This is the valid element which finds a response in the heart of every American. This is why Congress so consistently supports this effort.

A praiseworthy objective, however, does not by itself assure success. Good intentions must be matched by wise

actions. It is from this standpoint that it becomes the duty of even the most ardent supporters of technical co-operation programs carefully and coolly to examine the nature of these activities and the way they are carried out.

Section 418(a) of the Act for International Development of 1950 defines technical co-operation programs as

> . . . Programs for the international interchange of technical knowledge and skills designed to contribute to the balanced and integrated development of the economic resources and productive capacities of economically underdeveloped areas.

The United States contributes to this effort in three ways: by sending United States technicians to work in the host countries, by bringing host country personnel to the United States for training, and by contributing to the support of special joint bureaus set up within the host governments to carry out technical assistance programs. The emphasis throughout is intended to be upon the transfer of skills and know-how. Any expenditure for capital equipment is supposed to be limited to that needed for demonstration purposes only. It is, in other words, intended to be a program of education, not of economic aid.

The implications of this form of foreign aid are worth noting. One of the presuppositions of technical co-operation programs is that there are human and physical resources in the host country which will be employed as soon as the necessary know-how is made available. Another presupposition is that the host country can and will initiate, or take over and continue on its own, a given activity once the method of doing it has been adequately demonstrated. Finally, the concept presupposes that technical co-operation funds will not be employed to continue a given activity after know-how has been acquired by the host country. If additional United States dollars are necessary, they should either be provided through private sources or through other categories of the Mutual Security Program.

Out of a total of nearly 4 billion dollars of the President's budget request for the fiscal year 1959 mutual security program, 164 million dollars—about 4 per cent—was for technical co-operation. Thus the technical co-operation programs do not involve large sums of money when compared to the billions which we spend each year on other foreign aid activities. A portion of this amount represented United States contributions to technical co-operation programs carried out through international organizations like the United Nations and the Organization of American States. Of the total, however, 142 million dollars was for bilateral programs set up by agreement between the United States and individual host countries. The following comments relate principally to the bilateral programs.

I have already expressed myself as being impressed with the inspirational aspects of technical co-operation. It provides "people to people" contact—an element which should be supplied but is generally lacking in other aspects of our foreign aid program. Military assistance programs all over the world serve to protect the freedom of countries and their citizens—but the impact of such programs is not felt directly by the people. Military hardware does not fill empty stomachs. Economic assistance dollars too often are used for monumental projects such as dams and roads —projects which are primarily dedications to national pride. Although over a long period of time they contribute to an improved economy, they have little or no significance in the here and now for the ordinary man. The only programs that immediately encourage

and directly help the individual are those embraced under the Point Four concept—that is, technical co-operation. Through these programs, individuals are helped to better health, to useful and enlightening education, to a more adequate diet, and to improved sanitation and housing.

In the current year over 3,000 American technicians are working abroad in some 50 countries. Most of these technicians are working with their counterparts overseas in the fields of food production, public health, and education. These are basic areas for the improvement of living standards. Some programs have been broadened, in response to changing needs, to help solve problems of transportation, housing, industrial management, public administration, and community development.

### AGRICULTURE

In many countries technical co-operation programs have shown the way to better methods of cultivation, improved plant varieties and breeds of farm animals. Through these and the application of fertilizer to crops, improved tools and implements, control of plant diseases and insect pests, the production of food for hungry and growing populations has been vastly increased.

Even slightly improved tools or better methods of cultivation often make immediate and striking improvement. In Iran, a demonstration of the advantages of using a moldboard plow instead of a pointed stick in sugar beet cultivation resulted in three times the yield. In Ethiopia, a simple change to row planting of corn instead of broadcast planting increased production from 18 bushels an acre to 30 bushels.

Agricultural vocational schools and colleges have been opened in a dozen countries as a result of technical co-operation. Through agricultural extension activities, additional channels have been opened through which a continuous supply of scientific information flows to the farmers themselves in a form which they can understand and apply.

### HEALTH AND EDUCATION

The original activity of technical co-operation in Venezuela was in malaria control. In three years, malaria dropped from third place to sixth among causes of death. In the Philippines, malaria incidence fell 68 per cent as a result of DDT spraying. The malaria control program, in addition to its striking accomplishments toward better health, had the important side effect of tremendous expansion in food production—particularly in Indonesia and Iran. Mosquito control restored to cultivation much highly productive land which previously had been abandoned because of malaria.

The surge of interest in education in all newly developing countries is a phenomenon of the present era. In 1946–47 in Cambodia there were 38,000 children in primary schools; in 1955–56 attendance was 241,000. In Iran, since the United States technical co-operation program began in that country, school enrollment has increased from 20,000 in 1948 to 45,000 in 1955. The great need everywhere is for trained teachers, and technical co-operation projects in education have concentrated on filling this need, helping to give preservice training to more than 17,000 teachers and in-service training to more than 46,000.

I have given only a few examples to illustrate the operation of this program and the benefits it has produced.

Let us consider in more detail another example of accomplishment, in order to discuss the criteria applicable to a technical co-operation activity. In Chile, the government had sought over many years to establish a satisfactory program of preventive medicine. As part of the United States technical co-operation program in the field of health, during the period from 1943 to 1953, five health centers were established and operated in strategic locations. These centers have since been turned over to the Chilean government, which continues to operate them today. More important, using these original centers as a pattern, the Chilean government has constructed ten additional health centers in Santiago Province alone and has made such centers the basic field unit in a reorganization of the Chilean National Health Service.

All the elements of a successful technical cooperation project were present in this case: (1) The project dealt with a problem which had been of concern to the host government; (2) it involved a demonstration of a method of solving the problem; (3) it resulted not only in an activity which could be and was turned over to the host government, but it stimulated expanded and continuing action by the host government in this particular field.

We have, as a matter of United States policy, sought to insure the presence of these elements by stipulating three conditions to be met in carrying out a technical co-operation activity. First, the host country must request it. Second, the host country must pay a fair share of its cost. Third, it must be related to efforts being made by the host country itself.

### HOST COUNTRY REQUEST

These are wise provisions which, if adhered to with reasonable consistency, would guarantee that every program and project was a truly co-operative undertaking. If we conduct only those programs which the host country requests we can be sure that we are responding to a genuinely felt need; by the contribution of host country funds, local interest in a program's success can be both measured and sustained; and by establishing a relationship with other activities and plans of the host country not only can we contribute to balanced progress and development but the encouraging effect of our help can spread beyond the individual programs.

Unfortunately, in altogether too many instances, these sensible rules have been broken. Investigations by our Subcommittee disclosed that some projects were being implemented where host country approval had been obtained through insistence by United States representatives rather than as a result of a bona fide interest on the part of the host government. To be sure, a formal request by the host government was on file, but it was little more than a piece of paper drawn up to meet technical requirements. Sometimes these projects originated simply because particular United States specialists were available and wanted to undertake them. In other instances, pressure from Washington was put upon United States field personnel to get certain types of projects under way. Almost invariably, as might be expected, such projects ultimately were financed almost entirely with United States funds. The interest of the host countries was as small as their contributions.

### HOST COUNTRY CONTRIBUTION

The second requirement, that the host country contribute a fair share to the support of projects, has also been applied very unevenly. In one country we found that the United States has been paying over 1 million dollars a year to support an agricultural program on the basis, not that the host country could not support it, but that it would not. In another, our technical co-operation funds were being used not to supply know-how but to underwrite a routine government activity, which is not in the spirit of the technical co-operation legislation. In a third coun-

try, a major agricultural project was of such little interest to the host country that when the time came to put in its contribution it refused to do so, even though we had allocated more than three-quarters of a million United States dollars to it.

The proportion of local support for individual programs and projects varies widely even within a single country. What appears to emerge is that host country contributions have been made to some projects and not to others, depending on the extent of host country interest in them. This, of course, is why the "fair share" requirement was instituted in the first place, but it has not been fully or adequately adhered to by United States administrators.

The importance of the level of host country contributions cannot be overemphasized. It is not a matter of specific amounts of money, for these might vary considerably from country to country and even from time to time within a given country, depending on the local financial situation. What is crucial is that the most reliable index of a host country's interest in a program or project is not how much it is willing to have the United States invest in it, but how much the country itself is willing to contribute.

The heart of technical co-operation is the idea of self-help. There is little to be gained by imposing on others plans and ideas in which they have no interest. These programs are intended to be co-operative efforts. Unless the recipient country wants and believes in a project or program, enough to put its own funds into it at whatever level it can afford, the co-operation aspect is lost.

In this connection, reports given to the Congress on the extent of host country contributions have been more than a little misleading. These are usually expressed for comparative purposes in terms of equivalent dollars. Yet, by the use of par-value exchange rates which have no current significance, the contributions of some countries have been greatly exaggerated. We found, for example, one country where local contributions as presented to Congress had been magnified in this way by a factor of twenty. In other instances, under a category called "contributions in kind," a dollar value had been placed on a number of intangibles and everything conceivable has been counted as a host country contribution, including duties they had waived collecting on imports for the program. Most ridiculous of all was reporting, as a host country cash contribution, the local currency obtained by the sale of United States commodities we had given them.

As I have pointed out earlier, local contributions, when account is taken of the general financial situation of the host country, can be most revealing about local acceptance of programs and projects. I therefore believe that more effort must be made to adhere to the "fair share" rule than is now the case. I make this observation out of a conviction that the planning of programs, their day-to-day conduct, and their chance of achieving their ultimate goals will be improved thereby.

### PROJECT PLANNING

The third requirement, that programs be related to efforts being made by the host country itself, brings up the question of planning. What seems to be absent in most cases is a realistic estimate of the situation. Projects are often initiated with only the most hazy idea of how extensive a problem is involved, without determining in advance the availability of the technical personnel who will be needed, and without fixing a goal by which progress toward completion can be measured. Few projects are based on the kind of preliminary survey and analysis which would determine how much of what kind of technical knowledge or skill needs to be and can be supplied over what period of time. In place of careful planning, the tendency is simply to initiate and to expand programs, in the words of one overseas United States program officer, "to provide facilities which haven't been provided heretofore."

It is this approach which leads to pressures from Washington and even from officials in the field to get projects under way, not so much because they are relevant to local needs, but because a similar activity is under way in some adjacent country. This is hardly a sound basis for relating programs to activities of the host country, and it has accounted for a number of notable failures. Fits and starts in other cases have occurred because the problem of recruiting technical personnel to carry out the work was not adequately considered. In Uruguay, for example, a program in health was delayed for more than a year after the chief of the program arrived because four or five technicians could not be supplied.

### CONCLUSION

Reviewing these observations, it is clear that most of the faults in technical co-operation programs are matters of administration. Yet, paradoxically, some of them are at the same time tributes to the good intentions and zeal of the administrators who have been activated by a strong desire to obtain tangible results and impatient in their haste to reach ultimate goals. One can applaud enthusiasm—but not when it initiates action with inadequate planning and results in wasteful errors caused by hasty judgments.

A basic trouble, I am coming to believe, lies in a failure to appreciate the fact that there are significant limits to the rate at which technical knowledge and skill can be absorbed by an underdeveloped economy. As Americans we are attuned to a dynamic and open society in which technological change is rapidly assimilated. We must keep in mind the fact that the differing societies of many underdeveloped lands cannot now make use of all the skills we can offer them. First, some far-reaching changes must take place in the nature of the societies themselves. What I am referring to, of course, is the problem generally called "cultural lag." For example, it may be possible in a given country to suggest improved methods of agriculture and yet have few of them adopted because to do so may require a revision of age-old traditions of land tenure and ownership and perhaps even of family relationships. Similarly, technical improvements in tax administration may require a totally different view of the role of government within a given culture. Such changes do not come about quickly nor do they result from the availability of technical knowledge. The need for improved skills may be apparent now, but the demand for them may require cultural changes which time alone can bring.

No one is better fitted to take such considerations into account than host country officials who, of necessity, are representative of their own culture. This is why the participation of the host government in planning and carrying out technical co-operation programs is of such paramount importance. This is why unilateral judgments by United States officials of what projects are to be undertaken should be discouraged.

It can, of course, be argued that adhering strictly to the rules might result in a reduction in the number and scope of activities now under way. This, indeed, might prove to be the case and in some instances it might be wise. It is also possible that sounder programs might result. In addition, there is a

real possibility that when full account is taken of the limits imposed by cultural lag, to say nothing of administrative matters like the recruitment of adequate numbers and kinds of United States technical personnel, the seemingly modest level at which these activities are operating may turn out to be very nearly the maximum which is currently feasible.

I have not commented on the relationship of these programs to our more costly undertakings in the fields of outright economic assistance and military aid. Obviously they are related, since improved economies and greater military strength require added technical knowledge and skills. Conversely, the full use of such knowledge and skills may depend upon the addition of considerable amounts of physical capital.

Technical co-operation is basically education, and it is as an educational activity that it must be assessed. In my view, its fundamental concept is sound. The broad policy guides which have been set up for its conduct are inherently wise. If to the good intentions of the United States officials administering these programs there can be added sounder judgment and a greater degree of common sense, I believe we will more fully accomplish our purpose.

For its part, Congress, I am sure, will continue to give this activity its strong support. It is to be expected, however, that a careful Congressional eye will be kept on technical co-operation operations and that the sharpest criticisms will still come from those members of Congress who most devoutly want these programs to succeed.

# The United Nations Expanded Program of Technical Assistance—A Multilateral Approach

By DAVID OWEN

ABSTRACT: The United Nations and its family of agencies are only one of many sources of technical assistance in an era which has come to understand and to put into wide practice the concept of sharing economic skill and knowledge. In keeping with the nature of the Organization, the United Nations has organized a Program that gives every country the opportunity of being a partner in economic development. The word "multilateral" has come into its own as a description of this new kind of assistance, but it cannot do justice to the unique blending of the experience of almost every country in the world. The United Nations Charter pledges that the Organization will "promote higher standards of living, full employment and conditions of economic and social progress and development. . . ." Through the Technical Assistance Program, the UN has come a long way towards fulfilling this mandate.

---

*David Owen, LL.D., is Executive Chairman of the Technical Assistance Board of the United Nations. He has held several academic and research appointments in England before World War II. During the war he became Personal Assistant to Sir Stafford Cripps and accompanied him on his historic mission to India in 1942. He remained with Sir Stafford as his Personal Assistant in the Office of the Lord Privy Seal and the Ministry of Aircraft Production. Later Mr. Owen became Officer-in-Charge of League of Nations Affairs in the British Foreign Office, and he was a member of the British Delegation to the San Francisco Conference. Following the signing of the Charter of the United Nations Mr. Owen was appointed Deputy Executive Secretary to the Preparatory Commission of the United Nations and as such he opened the first office of the Organization in London. In April 1946, Mr. Owen was appointed Assistant Secretary-General in charge of Economic Affairs.*

IN THE eight-and-a-half years during which I have had the privilege of serving as Executive Chairman of the United Nations Technical Assistance Board, I have been able to visit many of the economically less-developed countries of the world. I have seen for myself what the United Nations family and the other sources of economic aid and technical assistance have been accomplishing, and to measure this against the need which still exists. As our experience has broadened over the years, two main conclusions have emerged more and more clearly. First, it has become evident that the international organizations which take part in the United Nations Expanded Program of Technical Assistance provide a "most acceptable" —frequently *the* most acceptable—form of outside assistance. This aid is acceptable because it comes from an indisputably impartial source, because it offers a partnership approach to development and—most important of all—because it has proved itself effective in actual operation. The second conclusion—and this has been made clear in exchanges of views with government officials—is that international assistance is being provided on all too small a scale.

The technical assistance programs of the United Nations and the specialized agencies are, at one and the same time, modest and far-reaching. They are modest in financial resources and in comparison with the expressed needs of over half the countries of the world. They are far-reaching in the area they cover, in the extent of participation of different peoples and agencies, and in the complexity of their operations. The administration of the Program, therefore, requires us to take advantage of an almost limitless range of facilities within the very definite limit of funds. The operation of the Program as it applies to the process of initiating and guiding projects and to procedures of financial management and administrative "housekeeping" is based on fairly explicit directives of the Economic and Social Council (ECOSOC) and the General Assembly of the United Nations. These directives, however, and the Program itself have changed perceptibly from year to year as the international organizations have responded to the changing requirements of governments and to the practical lessons of experience in the field.

## ORIGINS OF THE PROGRAM

Internationally organized or multinational technical assistance predates the United Nations by many years. The International Labor Organization (ILO), which came into being in 1919 in association with the League of Nations, was sending out "advisers" at the request of some of its Member Governments between the World Wars, and it continued this practice after it became a specialized agency of the United Nations. Other specialized agencies—notably the World Health Organization (WHO), the Food and Agriculture Organization (FAO), and the United Nations Educational, Scientific and Cultural Organization (UNESCO)—found soon after their creation that Member States sought out technical advice in their respective fields of competence. This advice was given in the form of survey missions, fellowship awards, and assignment of regular staff members for technical consultations. Later, when requests became so numerous as to deplete the regular staffs of the organizations concerned, the agencies hired experts for this purpose.

Some of the most important aspects of economic and social development, however, did not fall within the competence of any specialized agency; and the United Nations soon found that the facilities of its own Department of Economic and Social Affairs were being called upon when Member Governments wanted guidance on such matters as the setting up of a public administration institute, the drafting of an economic development plan, the institution of social welfare services, improvement of transport and communications and allied fields.

These advisory services by the United Nations and the agencies were financed by drawing on the regular budgets of the organizations concerned, and a portion of the budgets of the United Nations and several of the agencies is still used to provide technical aid. It became clear, however, as the years brought an ever-greater volume of requests from more and more governments, that the regular resources of the international organizations could no longer meet what was obviously a growing demand for multilateral assistance. As far as the United Nations itself is concerned, an historic step was taken at the third session of the General Assembly, held in Paris in 1948, when a resolution provided for a modest sum of $300,000 to be put aside by the UN each year, specifically to give technical assistance for economic development. Soon after, at the beginning of 1949, President Truman gave his renowned inaugural address proposing, as Point Four, a United States economic development and technical co-operation program. At that time, feeling in favor of a similar program under United Nations auspices began to crystallize among delegations to the Economic and Social Council and the General Assembly.

## AN EXPANDED PROGRAM

By the middle of 1949, the eighteen members of the United Nations Economic and Social Council had drafted a resolution, with the aim of establishing a joint UN and agency program, which would be financed from a special technical assistance account voluntarily contributed by governments. Resolution 222 (IX) of the Council received General Assembly sanction at the end of the year, and the Expanded Program of Technical Assistance for the Economic Development of Less-Developed Countries came into existence.

Participating in the Program and sharing in the special account are the United Nations itself and eight other members of the UN family: the International Labor Organization, the Food and Agriculture Organization, the United Nations Educational, Scientific and Cultural Organization, the International Civil Aviation Organization (ICAO), the World Health Organization, the World Meteorological Organization (WMO), the International Telecommunication Union (ITU), and the International Atomic Energy Agency (IAEA). The last-named agency is, of course, new to the Program and is giving technical assistance for the first time in 1959. The fields of each of the agencies are apparent from their respective titles. Together with the UN, they are prepared to help governments meet almost any kind of economic or social problem conceivable, from the most basic question such as the use of the hoe to the more sophisticated and modern use of radio isotopes.

The International Bank for Reconstruction and Development (Bank) and the International Monetary Fund (Fund)—two other specialized agencies whose services to governments do not quite fall within the definition of technical assistance, but are closely related —co-ordinate their work with the Expanded Program, as do such agencies as United Nations International Children's Emergency Fund (UNICEF), the UN Korean Reconstruction Agency, and the United Nations Relief and Works Agency for Palestine Refugees in the Near East.

### SOURCE OF FUNDS

For 1959, some eighty-five governments, members of the UN or one of the specialized agencies, are expected to contribute over $30,000,000 so that we may continue our work this year. This total represents a significant increase over the $20,000,000 pledged by fifty-four governments in 1950–51, but it is still considerably short of the amount which the Technical Assistance Board (TAB) estimates as necessary to meet the most immediate needs presented to the Program.

At a Conference held for the purpose, generally in October of each year, governments make known the sums they are ready to pledge for the following twelve months. The fact that financial support must be renewed on an annual basis and the uncertainty of the amount which will be available from one year to the next accounted for some of the earliest and most acute management problems which faced the Program. The step taken by several governments to announce their pledges for several years in advance and the steady increase in financial support have alleviated the problem somewhat, but year-to-year financing remains inconsistent with the long-term nature of technical assistance.

Funds for field activities are used to the extent of 70 per cent to provide governments with the services of internationally recruited experts. Their assignments vary from a few months to several years. Because of the financial problem which I have just noted, experts' contracts are usually given for only one year and are renewed as their work requires it—and if funds are available. About 20 per cent of the Program's resources are used to provide fellowships for study abroad by nationals of the economically less-developed countries. The remaining 10 or 11 per cent goes for the purchase of a limited quantity of equipment, which is used by experts for demonstration purposes. In general, governments have regarded as most urgent the supply of expert services and fellowship study facilities. What funds remain after these most pressing needs have been met are not sufficient to provide equipment on an adequate scale. The lack of enough equipment has proved a drawback in quite a number of projects.

### GUIDING PRINCIPLES

Although the methods employed in the administrative management and the field operations of the Expanded Program have been modified over the years, in the light of experience, the guiding principles remain the same as the ones set down in our basic resolution: Assistance is given only at the specific request of a government; governments undertake specific obligations in regard to the payment of local costs in connection with the aid they are receiving, and they are further obliged to provide counterpart personnel and facilities so that the work of international experts will be perpetuated after they have finished their assignments; every request for assistance must be justified on the grounds that it will have a direct bearing on the economic development of the country; and, needless to say, the aid given is free of any political consideration.

If there is any doubt of the force which a United Nations resolution can have, it may be well to recapitulate the statistical results nine years after adoption of resolution 222 (IX). The United Nations and the specialized agencies have been able to give at least some assistance to a total of 135 countries. Between mid-1950, when the Program actually started operations, and 1958, over 8,000 men and women have served in the field as experts. In the same period, some 16,000 trainees from the less-developed countries have studied abroad under fellowship awards, with placement facilities arranged by the international organizations.

### ADMINISTRATION AND CO-ORDINATION

Since the Expanded Program was to operate from the outset through the individual facilities of the UN and several specialized agencies, a co-ordinating and executive body was created along with the Program itself. This body—the Technical Assistance Board—consists of a representative of each of the participating organizations, and an Executive Chairman, aided by a small secretariat located at UN Headquarters in New York. The Board itself meets three times a year in New York or Geneva.

The Board ensures that the activities of its individual member organizations, insofar as technical assistance is concerned, are co-ordinated into one comprehensive program. Where the execution of the program calls for common methods of operation, it draws up uniform management procedures for the various organizations to follow; and in matters of concern to all member organizations of the Board, it serves as a central point of contact for governments and for the many programs in and outside of the UN whose interests are closely related: for example, the United States Technical Assistance Program, the Colombo Plan, the Bank, the Fund, and UNICEF.

The creation of the TAB facilitated the solution of many co-ordination problems from the outset. It became clear, however, from the earliest months of operation, that a far more comprehensive system of co-ordination would be necessary if the needs of governments were to have adequate attention.

At first the means was a modest network of field offices of the TAB in those countries where the size of the Program required some immediate means of co-ordination. Each office is headed by a Resident Representative [1] or a TAB liaison officer who may have a deputy but who is most often aided only by a small clerical staff provided by the host government. The Resident Representative serves as a point of contact between the different experts and between the experts and government ministries. He acts on behalf of the Board and of the individual organizations which comprise the Board. He helps to evaluate the effectiveness of the Program in his area and maintains contact with the representatives of other aid programs.

Perhaps his most important function is the role which he plays in helping the government to decide on, and submit, its yearly list of requests for aid. This year, there are thirty-nine TAB field offices spread through Africa, South and Southeast Asia, the Far East and the Middle East, and Latin America. Two of them, in El Salvador and Thailand, are regional in scope. The system can still be called modest in point of the number of Resident Representatives and other field staff involved, but it has grown appreciably in area covered and in stature. I believe that the Resident Representatives have played an essential part in the effective organization of the Program, helping us to respond to the special needs of different countries and helping the governments themselves to make the best use of the aid available.

### PROGRAM PLANNING AND APPROACH

During the course of 1959, our plans call for an expenditure of some $33,000,000 to meet requests which have been received from more than 100 countries and territories. The process by which the Program is planned differs considerably from the practice in the first five years of operation, when

[1] See also Arthur Goldschmidt for a discussion of the role of the Resident Representative, this issue of THE ANNALS, pp. 55–56.

the international organizations and the Board allocated priorities among the flood of requests which came in throughout the year. Now the responsibility for fixing priorities is solely in the province of the requesting government. The Board's task is to decide upon the total amount, out of the annual resources, which can be made available for the provision of technical assistance to each government.

At this date in 1959, the Board has already estimated the total amount for each country for 1960, and governments are deciding on the projects which can be accommodated within the funds expected to be available for 1960. The governments are receiving technical advice from officials and experts of the UN and the specialized agencies and assistance from the TAB Resident Representatives, but the choice clearly rests with the governments themselves. From this emphasis in recent years upon planning and decision by the governments concerned has sprung an increasing awareness of the need for national development plans. Frequently, Expanded Program specialists have been called in to help in the formulation of such plans, particularly in such newly independent countries as Libya, Morocco, and Tunisia.

The number of countries from which expert services, study facilities, and financial resources are drawn provides perhaps the most distinctive feature of the Expanded Program. Experts have been recruited from over seventy countries, largely from Western Europe and North America. At the same time, the contribution in technical knowledge and experience of experts from many of the economically less-developed countries themselves has proved to be an invaluable asset. Frequently, a problem will yield more readily to the attack of an expert informed by experience and understanding of life in a country whose circumstances are not dissimilar.

There are occasions when it is inappropriate to send an expert from, or to place a fellow in, an economically advanced country. Several community development experts have been recruited from India, where self-help work in the village has progressed to a point where a corps of practically trained community development workers and leaders has been built up, some of whom can be freed to assist in other countries. Several years ago the Government of Paraguay asked for the services of a postal administration expert who could help national authorities with the complete reorganization of the postal service. The expert provided under the Expanded Program was a former Director of the Postal Services of Colombia. He had the advantages of speaking a language common to Paraguay and of being familiar with many of the problems which had come earlier to his own country. The expert's successful and productive four-year stay in Paraguay demonstrated the benefit of applying the experience of one less-developed country to another.

The system of fellowship placement also takes advantage of the world-wide network of facilities. Industrial workers from Turkey and Yugoslavia have been trained in factories in England, Germany, and France; young scientists have taken advantage of excellent technological institutes in India; aviation ground crews from Latin American countries have been sent to Mexico by the International Civil Aviation Organization (ICAO), which has sponsored a civil aviation training center adjoining the Mexico City Airport.

Curiously enough, so telling a use of such a wide range of facilities sprang, in part, from a financial problem which in the early years seemed to threaten the effective execution of the program. In making their financial contributions,

most governments indicated that they were to be in nonconvertible national currencies. Since each currency restricted in this way could not be spent outside the contributing country, the United Nations and the specialized agencies of necessity had to undertake a thorough development of the resources that were available through contributions in more than sixty national currencies. The results have exceeded our best expectations.

### THE HUMAN ELEMENT

Such success as the United Nations Technical Assistance Program has achieved has been due primarily, I believe, to the recruitment of exceptionally able and devoted men and women who have had the patience to apply themselves diligently, yet with imagination, to tasks which are often humble in themselves but which are nevertheless part of a grand design.

It is not difficult to list the qualities that make a good technical assistance expert, but the process of selecting human beings who possess them is far from easy. The mobilization of thousands of experts in almost all the major branches of contemporary knowledge has compelled the UN family of organizations to develop an intricate network of lines of information, extending throughout the world, by means of which the best qualified people can be found. University faculties, professional associations, government departments, the expert knowledge within the specialized agencies themselves, all are pressed into service. So varied and urgent are the requests, that in Europe —which supplies more than half of the total number of experts—many countries have set up central bodies to advise and assist in the search for suitable candidates. When a qualified candidate has been found, he is asked to free himself from other commitments to take on what is most frequently a temporar job, at a possible reduction in his cus tomary salary, in conditions which migh be very strange to him. Given thes considerations, we can be most gratefu for the missionary spirit which makes UN field job attractive to many com fortably placed people.

It is difficult to single out, among th thousands of men and women who hav already taken part in this Program, ex amples of exceptional talent for givin technical assistance. I would certainl have to include a whole team of expert who are living in the scattered village of the Andean Range of South America Living and working at altitudes o 10,000 feet and higher, these me have organized village clinics, carpentr shops, and schools for people who hav rarely before known kindness from out siders. I can also think of the Belgia agricultural economist who was aske by the Government of Haiti to advis on the establishment of credit institu tions and who became the guiding spiri of an entire community. By showin the people how they could market thei crops advantageously, he gave them th added income to improve their way o life—but more than that, he gave them the will and the impetus to do so.

Perhaps the greater number of ou field staff work under conditions whic are considerably less colorful and les adaptable to "story-telling": Nonethe less, from their offices in governmen ministries and research institutes, an from their work in factories and labo ratories they have contributed just a dramatically to the economic growth o the less-developed countries. I have i mind a team of experts from the Unite States, India, Belgium, and the Nether lands who helped the Government o Egypt to establish and operate a pub lic administration institute, where aca demic and practical training is bein provided to Egypt's future civil serv

ants. Another team in the Philippines initiated the idea for, and helped to create, a center for the training of statisticians. Also in the Philippines, a new Forest Products Research Institute, a branch of the University of the Philippines, is training specialists who will know how to take better advantage of their country's forest wealth. International experts, again, were involved in the planning and establishment of the Institute.

These are not undertakings that show immediate measurable results, but other projects do. In Yugoslavia, for example, many thousands of dollars have been saved in dozens of factories and industrial establishments because the management, foremen, or workers picked up suggestions from technical assistance experts or because they brought back new ideas from fellowship training in other countries. In Morocco and Tunisia, more than a million children have been treated for the dreaded eye disease, trachoma, in a five-year campaign directed by the World Health Organization. It is a well-known fact that many millions of children and adults all over the world have benefitted from WHO's work in malaria control, which is part of the technical assistance program.

### DIFFERENT LEVELS OF AID

It is a long step from the average rural village to the inside of a government ministry, but UN experts can be found in both places. Although not foreseen in the first design for a multilateral aid program, a further method of giving assistance was soon developed. Soon after the program was launched, the Government of Bolivia asked for experts who would serve essentially as temporary government officials, helping to formulate policy in such matters as customs and tariffs, banking and credit, acting as executives rather than advisers. The competence of the team members selected, and their impartiality, stimulated interest in other countries. Beginning in 1959, a modest fund has been set aside so that additional help of this kind can be given to several countries which have asked for it. The fund will provide an Operational and Executive Personnel Service. The creation of the Service is one of several recent signs that the United Nations Technical Assistance Program is not resting on its early successes.

Indeed, the results of the first nine years of multilateral aid have stimulated the General Assembly and the Economic and Social Council to consider other ways in which present services and facilities can be extended to the peoples of the world. In doing so, both bodies have given expression to the feeling that the capacity of the international organizations to meet the basic needs of many countries is limited chiefly by meager resources and the continuing uncertainty over what funds will be available from one year to the next.

One outcome of this feeling has been the recent establishment of a new UN economic program. The Special Fund, as it is called, will begin this year to provide systematic and sustained assistance in fields essential to the integrated economic and social development of the less-developed countries, and it will work very closely with the Expanded Program. The Special Fund has been designed to undertake a smaller number of projects, but to concentrate greater resources on each, and to commit the resources over a greater period of time than the Expanded Program is able to do. Special Fund projects may take the form of surveys, research, and training institutions; demonstration centers; and pilot projects.

It would be a valuable help to governments in preparing the way for capital investment projects in many different fields.

# The United States Point Four Program—A Bilateral Approach

By ROLLIN S. ATWOOD

ABSTRACT: Bilateral technical co-operation programs are being carried out by the International Cooperation Administration and the governments of approximately sixty-five underdeveloped countries of the world. These are countries which have requested assistance from the United States Government in those activities which are felt to be fundamental to their economic and social development. Programs in these countries are jointly planned, staffed, and financed. The International Cooperation Administration operates through the medium of a United States Overseas Mission, the Director of which reports to the United States Ambassador in the particular country. Programs are designed to demonstrate techniques and train local technicians and administrators. As soon as these objectives have been accomplished, negotiations are initiated to have the projects absorbed as normal functions of the country in question or to be terminated.

---

*Rollin S. Atwood, Ph.D., Washington, D. C., is Regional Director for Latin America of the International Cooperation Administration. He has served with the Department of State since 1942. From 1928 to 1942 he was a member of the faculty of the University of Florida. He was elected Honorary Fellow of the Swedish Anthropology and Geography Society in 1937 and was the recipient of the Cervantes Metal of the Instituto de las Españas in 1942. Dr. Atwood is the author of The Localization of the Cotton Industry in Lancashire, England (1930) and co-author of Workbooks in Geography.*

BILATERAL technical co-operation is a concept with roots deep in history. It has been recognized as an integral part of relations between the nations of this hemisphere from the day of their independence. In fact, co-operation played an extremely important role in the achievement, and has characterized the successful maintenance of that precious independence whenever, however, and wherever it has been threatened. For more than fifty years religious organizations of the United States have been sending missionaries to Latin America. The efforts of these people have been largely in the fields of education, health, agriculture, and social and religious services. Many other organizations such as industrial firms, foundations, universities, and the United States Department of Agriculture have conducted projects of technical assistance.

During the period 1939-50, which was the ten year period prior to the launching of the Point Four Program, the United States Government conducted two programs within Latin America. The first of these was known as the Interdepartmental Committee on Scientific and Cultural Cooperation. This was the first organized and systematic intergovernmental technical co-operation program in Latin America. More than twenty-five government bureaus were members of this Committee and the Assistant Secretary of State for Public Affairs was its Chairman. The Committee began operations in 1940 with a budget of $370,500. This budget increased to about $4,000,000 per year during its last three years, 1948–50. The second program which came into being during this 1939–50 period was the Institute of Inter-American Affairs. The Institute was organized as a government-owned corporation in 1942 and is still in existence today as an integral part of the administrative structure of the International Cooperation Administration.

The present period in the history of technical co-operation began with the President Truman inaugural address of January 1949 which culminated in the Point Four Program a year and half later when Congress passed the Act for International Development. This was the point at which the concept of technical assistance was extended to underdeveloped countries throughout the world. From the inception of Point Four until the present time, the United States technical co-operation program has undergone a number of organizational changes.[1] In October of 1950 the Technical Cooperation Administration was established within the Department of State. In October of 1951 the Mutual Security Act of 1951 was enacted. Under this Act the Office of the Director of Mutual Security was established to co-ordinate military, economic, and technical assistance. In August of 1953 the Foreign Operations Administration was established. The functions of the Mutual Security Agency and the Technical Cooperation Administration were transferred to the Foreign Operations Administration. In July of 1955 the International Cooperation Administration was established within the Department of State. The Foreign Operations Administration was abolished.

The technical co-operation program in Latin America has gradually increased over the years and has embraced new fields of economic and social development. In the early years it was concentrated in the fields of agriculture, health, and education. Today it is operating in additional fields such as transportation, marketing, industry, administrative and management training, labor, housing, community development, and economic

[1] See Philip M. Glick, *The Administration of Technical Assistance* (Chicago: The University of Chicago Press, 1957).

planning. Over the years it has increased from a program that represented expenditures in the nature of 10 or 12 million dollars, with the United States supplying 90 per cent of the funds, to a program today which calls for the expenditure of slightly less than 90 million dollars, with the United States supplying approximately one-third of this amount. In 1942 the technical co-operation program in Latin America was made up almost entirely of United States technicians. Today it is a program with a total of 28,363 employees of which approximately 1,000 are United States nationals.

## How a Typical Bilateral Program is Developed

The first step is that of a country indicating that it desires United States co-operation in helping to carry out a program to solve its economic and social problems. The International Cooperation Administration staff in the country concerned must first of all evaluate on a continuing basis all aspects of the economic and social development of that country. Special attention is given to the trends which can be recognized in the economic development and the extent to which this development is balanced or out of balance. This is done day by day and week by week and involves daily and weekly staff meetings which include International Cooperation Administration personnel, economic and political officers of the Embassy, and specialized attachés such as Treasury, Agriculture, Minerals, Labor. It also involves close working relations with representatives of international agencies, such as the International Bank, the International Monetary Fund, and specialized agencies of the United Nations. It also includes discussions with business and labor leaders and officials of host government departments and agencies. A running account is kept of the strengths and weaknesses in the economic balance sheet of the country. Emerging problems both long-term and short-term are discussed frankly and fully with responsible officials of the host governments. As the plan and programs of the host government are developed to cope with their national problems, the character and scope of the external assistance required to solve these problems are fully considered. The part which will presumably be played by private enterprise and the external financing by private and public banks or institutions are all carefully evaluated. Following this, a mutual decision is reached as to the type of United States government co-operation required. The national interests and policy objectives of both countries must be accommodated before a joint program is approved. Naturally this type of economic and technical co-operation requires a maximum degree of flexibility and the ability to make long-term commitments. On the basis of the discussions, review and evaluation of the host country's project proposals and additional screening by International Cooperation Administration offices in Washington, a decision is made to implement the projects. New projects are worked into the existing pattern of operations to provide the maximum economic benefits based on mutually agreed upon objectives.

### *Social revolution in less-developed nations*

The underdeveloped countries of the world have been experiencing an extremely rapid economic and social revolution. There are, of course, sharp differences in the scope and rate country by country. The overriding fact however is that economic development is taking place at a rate far beyond the capacity of a majority of the people to understand. As it touches the lives of

more and more people, as it is bound to do, the reactions are personal and perfectly human. People resent the things they do not understand. Economic and industrial development must be accompanied by an understanding of the technical components, but of even greater importance, there must be developed an intelligent understanding and sympathetic appreciation of the human consequences of economic development. People must be able to adjust to the changing environment. They must be able to take part in the process that is going on around them. They must realize that they can achieve their most cherished objectives of a better life without losing freedom, independence, or dignity of the individual. They must come to appreciate through results, not promises, that personal initiative combined with technical skills and hard work will bring better homes, better farms and industries, better education, better health for them and for their children. They must discover that they can do it themselves if the determination and the right tools are available.

For the people of a country to have a feeling of achievement with regard to economic and social development, the country must have a balanced development program. If not, only one group, one segment, or one region will benefit, often at the expense of another.

The growing pains associated with rapid industrialization have served to intensify the zeal of most Latin American governments as well as of most governments in underdeveloped countries in other parts of the world. To expand their own activities, to satisfy the extremely vocal popular demand, the cries of the people have been for more housing, more schools, potable water supplies, and more roads. All too often, however, local budgets have been augmented to build public monuments, to keep up with the Joneses, in terms of tanks and jet planes and to provide liberal financing for facilities which would better have been left to private enterprise. Thus there has been, and will continue to be for some years, a serious shortage of local capital available on a long- and medium-term basis to finance those aspects of the economic and social development which have been seriously neglected.

Technical co-operation which helps to bring about balance in the economic development of a country will be of increasing importance as the industrialization of underdeveloped countries surges forward. An increasing portion of the transfer of strictly technical skills, especially in the fields of industry and mining is being supplied by private enterprise. Training in public administration, management and the accompanying experience in labor management relations is being considered in the bilateral program. We are also working directly with private industry in this important field and an increasing portion of this aspect of technical co-operation is being assumed by industry itself. Continued training and demonstration will be necessary for some time in the fields of health and sanitation, education, agriculture, transportation, and marketing. Those concerned with technical co-operation are giving more attention to improving the training capabilities within each of the host countries. We are also making increased use of trained local personnel throughout the entire program.

On the basis of experience, we should consider as a supplement to technical co-operation long-term loans to finance development in the neglected economic and social fields. The effective results of the total program could be multiplied many fold. It is probably safe to assume that over the next ten years private investment will continue to increase and that more funds will be available for the type of economic development

financed by the Export-Import Bank, the International Bank for Reconstruction and Development, the International Finance Corporation, and the Development Loan Fund.

## ORGANIZATION: FIELD LEVEL

Basic differences between countries as far as desires and needs are concerned give rise to somewhat different patterns of organization and operation throughout the International Cooperation Administration program when looked at on a world-wide basis. In general, however, International Cooperation Administration activities are operated through the medium of what is known as a United States Operations Mission (USOM). The Mission Director in any country operates under the over-all supervision of the United States Ambassador in that country. Within the structure of the Mission, the amount of money available, the number of personnel and the exact operating pattern are determined primarily on the basis of requirements as established in the program planning carried out in co-operation with the government officials of the country in question. If one of the problems being tackled in a particular country is that of agricultural development, there will be an agricultural division in the USOM. This agricultural division will be staffed with those United States specialists and local technicians deemed necessary to deal effectively with the problem. In some instances problems are dealt with which, by and large, are considered of short duration. Where this is the case, instead of having a division set up and staffed to work on the problem, the Mission may have simply a number of specialists in pertinent fields who are brought into the country to work on particular problems. In general, these specialists would work within the framework of the Mission but in very close collaboration with the personnel of the host government agencies involved in the particular problem.

### *The Servicio*

The Institute of Inter-American Affairs worked out a unique system of co-ordination with government officials of a host country. This device was known as the "Servicio." It is probably the most interesting mechanism for international technical co-operation that has as yet been devised. The "Servicio" is a government entity, specifically established by the host government within one of its ministries to administer jointly with United States technicians a group of projects in a major functional field, such as agriculture or public health. The purpose of the "Servicio" is to create a program that will be jointly operated, the two partners being the ministry within which the "Servicio" has been established and the technical mission sent by the United States to work with that ministry. There are great differences in the pattern of operations between "Servicios" in the various countries. Their particular method of operation must of necessity be molded by local conditions, local laws, and the personalities who operate them. The common denominator, however, for "Servicios" in all countries in which this device is used is that of joint operations. The mechanisms or mechanics of getting the job done vary from country to country. However, the underlying concept of joint operations remains the same.

The director of the "Servicio" is at the same time head of the corresponding division within the United States Operations Mission. He is an American and reports administratively to the International Cooperation Administration Mission Director for the country. The "Servicio" would also have a co-director who would be a national of the host country. Personnel within the "Servicio" would be largely nationals with only those

United States technicians needed because of their special skills in training and demonstration activities. The financing of the "Servicio" is handled jointly by the ministry in the host country and the United States Government. Approximately 80 per cent of the costs of operating the "Servicio" are borne by the host government and 20 per cent borne by the United States. At the time a "Servicio" is established there is an agreement between the host country and the International Cooperation Administration Mission. This agreement provides for the type of program to be operated by the "Servicio," the financial arrangement between the host government and the United States Government, and also provides for joint approval of all personnel to be hired by the "Servicio." After a project has been in operation for sufficient time to have accomplished its objectives or to operate "on its own," every effort is made to have that particular project taken over by the appropriate agency of the government of the host country. In other words, when sufficient demonstration work has been done and there are enough local people trained in a particular activity, discussions are entered into between the appropriate ministry of the host government and the USOM to determine just how and when the activity will be absorbed by the host government as a normal part of its operations.

During the years of technical cooperation programs in Latin America there has been a wide variety of projects undertaken and terminated successfully. The manner in which the project has been continued in each country varies with the type of project and the economic and financial conditions in the country. Private enterprise has taken over such projects as could be put on a sound commercial basis. In some cases it is a governmental unit which continues the work. Local governments have initiated the development of local water supply or sewage systems once the techniques have been demonstrated. Vocational school or area health programs are most often taken over by the central government. Agricultural programs are generally taken over by the Ministry of Agriculture. More than 2,000 individual and readily identifiable projects have been turned over or terminated since the Latin American technical co-operation program began in 1942.

## ORGANIZATION: WASHINGTON LEVEL

The International Cooperation Administration is a semiautonomous agency within the Department of State. The operating part of the program is divided into four regional offices: Office of Latin America; Office of Far East; Office of Near East and South Asia; and Office of Africa and Europe. There is a Deputy Director for Operations to whom each of the four Regional Directors report. Within each regional office there are area directors and desk officers. Each area director is responsible for operations within a specific geographical area. His staff is made up of desk officers who are responsible for one or more countries. The desk officer is a key man in the organization in that he must have his finger on the pulse of everything that is happening within the country to which he is assigned. He serves as the connecting link between the Mission Director in the field and the Washington organization. In addition to working on problems which must be dealt with within the International Cooperation Administration organization, the desk officer must maintain close contact with the appropriate offices in the Department of State and with such agencies as the Development Loan Fund, Export-Import Bank, International Monetary Fund, and the World Bank.

Apart from the operating arm of ICA's Washington organization there are offices for program and planning, technical services, congressional relations, and management. Each of these offices operates under the direction of a Deputy Director who reports to the Director of the International Cooperation Administration, who in turn reports to the Secretary of State.

Co-ordination of the program within ICA is accomplished through the medium of staff meetings. Co-ordination and supervision of field programs is accomplished through correspondence, cables, field travel, and meetings with field people.

## PROBLEMS

The problems with which the International Cooperation Administration has to deal are not all unique to this organization. Many of them are very similar to those faced by most other government agencies and many private corporations. Those problems which are rather unique to the International Cooperation Administration are generated by the complexity of the program.

The ability to attract and hold competent personnel is probably one of the most serious problems. Working effectively in foreign countries requires a degree of competence and a set of personal characteristics not normally required for work within the United States. A technician must have outstanding technical skills, outstanding personal qualities, language ability, unwavering loyalty to the United States Government and its policies, and something of a missionary spirit if he or she is to be effective in a foreign situation. The International Cooperation Administration is constantly trying to attract better qualified people and is intensifying its efforts to up-grade present employees.

Another major problem facing the organization has to do with understanding: on the part of the United States taxpayer, of the people in countries who are not receiving technical assistance but are nevertheless watching what the United States is doing, and of the people in those countries who are recipients of technical and financial assistance. The International Cooperation Administration is constantly striving to improve its methods and techniques and trying to further activities within the underdeveloped countries which will improve the lot of the average citizen. While problems will continue to exist there is much evidence indicating that substantial progress is being made and that in the over-all the bilateral approach to the situation in underdeveloped countries is making substantial inroads on poverty and attitudes.

The community of basic beliefs and common goals which characterize the inter-American family of nations is the strongest asset this hemisphere has. The religious and spiritual foundations which support our political, economic, and social objectives and guide us in the achievement of our common goals—are the surest guarantee of the freedom and happiness of our peoples and the star of hope for millions who seek that freedom and happiness.

# Sino-Soviet Bloc Technical Assistance—Another Bilateral Approach

By Waldemar A. Nielsen and Zoran S. Hodjera

Abstract: Beginning in 1953 after the death of Stalin, the Soviet bloc broke out of its economic isolationism and began a program of aid, trade, and technical assistance directed primarily at the less-developed countries on the periphery of the Communist bloc. This program is moving steadily forward. The bloc technical assistance program is almost entirely on a credit basis, is geographically concentrated in a few key countries, and is smaller in world-wide scale than that of the United States. The organizational and co-ordinating arrangements seem adequate and effective. The methods used in negotiating with recipient governments are skillful and flexible. The bloc is also expanding its program of scholarships for students from non-Communist countries. The general economic effects of bloc aid and technical assistance cannot yet be judged. The psychological effects are more apparent, and this aspect has clearly been give careful attention in the planning and administration of the whole program. The political effects, which are the real objective of the program, are mixed: Growing prestige of the Soviets in some areas, growing skepticism about their purposes in others. But the long run political benefits from a Soviet point of view may yet be considerable.

*Waldemar A. Nielsen, New York City, economist and political scientist, is Associate Director of the International Affairs Program of the Ford Foundation. He did social science research in the United States Department of Agriculture (1940–43) and in the State Department (1946–47). Mr. Nielsen was Special Assistant to the Secretary of Commerce (1947–48), European Director of Information for the Marshall Plan (1948–52), Deputy Director of the Behavioral Sciences Program of the Ford Foundation (1953), and Assistant to the President of the Foundation (1954–56). He is a Rhodes Scholar and a contributor to national magazines.*

*Zoran S. Hodjera is an economist completing his doctoral studies in economics of underdeveloped areas at Columbia University, New York. He has done graduate work in the Institute of International Studies, Geneva, Switzerland, and in 1951–52 he was associated with the European office of the United Nations, Geneva.*

During 1958, the program of the Sino-Soviet bloc countries to enlarge and deepen their economic relations with the less-developed Free World countries moved steadily forward.[1] In the twelve month period, 601 million dollars of new credits and grants were extended for industrial equipment and technical assistance. The expansion of trading relationships proceeded in parallel. Trade and payments agreements with non-Communist countries increased from 149 with 28 countries at the end of 1957 to 177 with 31 countries at the end of 1958. Bloc trade promotion delegations were active, particularly in the Middle East and Southeast Asia, and well-financed exhibitions of bloc products were to be seen at trade fairs in many countries. Bloc trade with the less-developed countries increased steadily from 1953 through 1957. In the first half of 1958 bloc exports to the less-developed countries continued to rise at a significant rate, but imports showed a decline, reflecting in part the drop in world prices of some of the major commodity components.

An integral element of Soviet bloc credit agreements is the provision of technical assistance, and this aspect has shown a particularly sharp growth during 1958. In the latter half of 1957, 1,585 bloc technicians worked for one month or more on economic assignment in less-developed countries outside of the Soviet sphere. In the last six months of 1958, this total rose to 2,800.[2] Table 1 shows the breakdown by various countries and regions.

[1] Because of the extent to which their economic and technical assistance efforts are co-ordinated as well as because of the political ties which bind them together, the bloc countries in this analysis are considered as a unit.

[2] Totals exclude bloc personnel engaged purely in trade promotion, regular members of embassy staffs, and the considerable number of technicians engaged in military assistance projects; inclusion of the latter would raise the total by another 50 per cent.

TABLE 1—Estimates of Soviet Bloc Economic Aid Personnel in Selected Countries July–December 1957 and July–December 1958[a]

| Countries | Second Half 1957 | Second Half 1958 |
|---|---|---|
| Middle East and Africa | 555 | 1,105 |
| Egypt | 360 | 535 |
| Ethiopia | 0 | 25 |
| Iran | 5 | 10 |
| Syria | 110 | 275 |
| Turkey | 15 | 60 |
| Yemen | 55 | 200 |

| Argentina | 50 | 45 |
| Brazil, Chile, Mexico | 5 | 0 |
| Europe | 60 | 15 |
| Yugoslavia | 50 | 10 |
| Greece | 10 | 5 |
| Total[b] | 1,585 | 2,800 |

[a] Data are based on unclassified information, unpublished as of February 1959, collected by United States Government agencies.

[b] Figures, which are rounded to nearest 5, include only bloc personnel on economic assignment for one month or more during the six-month period.

## Technical Assistance: Soviet Style

As used by the bloc countries, the term technical assistance means essentially the provision of experts or training for compensation from a contracting government, often in conjunction with credit sales of equipment. This type of training and expert assistance resembles

that of Western private firms in connection with construction contracts and the sale of industrial equipment abroad. In the United States technical assistance is normally understood to mean expert advice and training given by one country to another—over and above the ordinary flow of technicians and training growing out of commercial trade and contracts.

In discussing Soviet bloc technical assistance, because of the fundamentally different character of Communist economic conceptions, we are obliged to warp further the meaning of an already somewhat unclear term. In all comparisons of bloc and Western technical assistance it must be remembered that the Western total, to be comparable with bloc figures, should include not only government-financed activity but also that of private foundations and voluntary organizations, plus a very large amount of privately organized commercial exchange.

Because bloc technical assistance arrangements are embedded in the credit agreements between bloc countries and the less-developed Free World countries, the content and characteristics of these agreements must be reviewed in some detail.

Typically, Soviet credits are for a period of twelve years and bear an interest rate of 2½ per cent, which is considerably below that charged by the World Bank and the United States Export-Import Bank. Satellite credits are sometimes for shorter periods and carry interest rates higher than those of the USSR. There is commonly a grace period before repayment begins, and repayment can often be made in goods or in local currency. World market prices are used generally as a yardstick for setting the value of bloc equipment to be delivered, but in the case of services the cost to the recipient country of bloc technicians is considerably below the going rate for comparable experts from the Western countries.

The bloc has concentrated its economic efforts in the Middle East, Africa, and South and Southeast Asia. Within these areas it has been further concentrated: Egypt, Syria, Yemen have received 97 per cent of the economic aid to the Middle East and Africa; Afghanistan, India, and Indonesia have received 82 per cent of the aid to South and Southeast Asia. Although numerous cultural delegations have gone to the countries south of the Sahara in Africa and despite various aid offers, no major assistance agreements in this region have yet been concluded.[3] In Latin America, there have been a number of offers of technical assistance and credit, but until recently activity has been very limited. However, one of the major developments of 1958 was the signing of the first major agreement in the Western Hemisphere, a 100 million dollar credit to Argentina. In Europe, Yugoslavia was involved in a web of economic arrangements with the other Communist countries while a member of the bloc. In 1948, however, the Soviets broke all assistance agreements. In 1956 new credits were extended totalling 464 million dollars of which 300 million dollars have subsequently been indefinitely postponed, canceled, or allowed to expire.

In general, bloc credits have been focused on the financing of specific development projects, particularly in basic industries such as steel and textiles and in overhead investments like irrigation works, power, roads, and communications. To a much smaller extent they have involved equipment for the production of consumer goods and for agricultural development. Table 2 indicates the type and range of projects financed in three selected countries.

[3] Subsequent to the time of preparation of this article, February 1959, important bloc credits to Iraq and Guinea have been reported.

## TYPES OF TECHNICAL ASSISTANCE

In the large majority of bloc credit agreements, provision is made for Soviet style technical assistance, that is the hiring of specialized services by the contracting country. Most commonly, experts are used to assist in preliminary

TABLE 2—SOVIET BLOC CREDIT AND TECHNICAL ASSISTANCE PROJECTS IN THREE SELECTED FREE WORLD COUNTRIES[a]

| RECIPIENT FREE WORLD COUNTRY | SUPPLYING BLOC COUNTRY | PROJECT |
|---|---|---|
| EGYPT | EAST GERMANY | High-tension line |

[a] Source: Unclassified data, unpublished as of February, 1959, collected by official United States agencies.

engineering surveys, to supervise construction, and to direct the installation of equipment. Agreements have sometimes provided for basic resource surveys, the training of operating personnel either in the Free World country or in the bloc countries, economic advisory services, and mineral prospecting.

Scientific and educational facilities have been financed as special projects in a few cases. Among the more important examples are an atomic energy laboratory and an oil research plant in Egypt and an institution for advanced technical training in India. In Burma, the Soviets agreed to build and equip a complete scientific institute. According to a Russian announcement, the project would provide living accommodations for 1,000 students, apartments for the faculty and staff, a 500-seat assembly hall, a 100,000-volume library, reading rooms, restaurant, sports grounds, swimming pool, and 18 fully equipped laboratories.[4]

Because the available data are fragmentary, and because of definitional problems, estimates of the value of bloc technical assistance are necessarily crude. In mid-1958 Joseph Berliner judged the cumulative total, 1953–58, to be in the order of magnitude of 5 to

[4] Izvestia, February 19, 1956, quoted in *Soviet Technical Assistance*, Staff Study No. 7, Committee on Foreign Relations, United States Senate, Washington, D. C., July 12, 1956.

10 million dollars.[5] Since some forty technical assistance missions had then been identified, he assumed a total of 80 to avoid underestimating, assumed the cost of each to be $100,000, and arrived at a rough figure of 8 million dollars as a basis for his estimate.

If one were to add the value of scientific apparatus and training facilities, the cumulative total would increase by some 3 or 4 million dollars.

A quite different approach would be to calculate the current rate of technical assistance by taking the number of personnel and imputing a value to their services. The figures in Table 1 do not include technicians who worked abroad for less than one month nor do they give extra weight to those working for periods longer than one month. A monthly average of 600 for the most recent period in which data are available would therefore be a conservative estimate. Assuming a minimum direct cost of $500 per month for salary, maintenance and travel, the current monthly rate would approximate $300,000, or $3,600,000 per year. Assuming a monthly value of services at the approximate cost of maintaining an American technician abroad, namely $1,250, the current monthly value of bloc technical assistance would be $750,000 or an annual rate of $9,000,000. The actual cost of these services in local currency to the recipient less-developed countries is probably somewhere between these two extremes.

In summary, the bloc economic assistance effort has clear differences in scope and content from that of the United States government: In world-wide terms, the bloc program is much smaller; it is highly concentrated geographically in contrast to the widely dispersed United States program; it is almost entirely on a credit basis whereas the United States program is on a grant basis; and it is focused on individual industrial projects whereas the United States effort supports general development programs and agricultural development as well.

Important as these differences are, there are other and even more fundamental contrasts in organization, technique, and objectives.

## ORGANIZATION AND OVER-ALL CO-ORDINATION

Since 1953, the Soviet Union has repeatedly reorganized its system for administering foreign aid and technical assistance, each time raising the responsible agency to higher status and more comprehensive authority. At the present time, and since July 1957, such programs are directed by the State Committee for External Economic Relations of the Soviet Council of Ministers.[6] The Committee, which reports directly to the Council of Ministers, includes top level officials and is not a subordinate element of the Ministry of Foreign Affairs nor of any of the economic ministries. Its operating staff is organized on both a geographic and a functional basis. It probably administers military as well as economic assistance; it has sections for scientific and technical co-operation; it includes several foreign trade agencies which have been transferred to it from the Ministry for Foreign Trade.

In the past, such co-ordination as has been required within the bloc has apparently been handled directly between Moscow and the various agencies of the satellite countries dealing with foreign economic and technical matters. In recent months, however, it appears that plans have been laid for a greater degree of co-ordinated bloc economic policy and operations for the seven-year period, 1959–65. From meetings of the Coun-

[5] Joseph S. Berliner, *Soviet Economic Aid* (New York: Frederick A. Praeger, 1958), p. 46.

[6] *The Sino-Soviet Economic Offensive in the Less Developed Countries*, United States Department of State, May 1958, p. 27.

cil on Mutual Economic Assistance (CEMA) in Warsaw in late 1958, there emerged reports of extensive discussion of means of creating a single, unified economy in the area,[7] including the concentration of research and development activities and of training activities for scientists and specialists from all countries. Apparently, consideration has also been given to the co-ordination of plans in the several bloc countries in bidding for major contracts for new factories and installations in the less-developed countries.

Although many details of the structure and procedure for planning, co-ordinating, and administering bloc economic assistance are not known, it is clear that essential co-ordination has been achieved and that the arrangements have functioned adequately. The bureaucracy in the USSR and the bloc has been able to act with speed, flexibility, and on occasion, finesse. Co-operation and participation by the satellites has been achieved and political, military, propaganda, and economic policies have been successfully orchestrated.

### TECHNIQUES OF NEGOTIATION

In economic dealings with the non-Communist less-developed countries, the Soviets have largely cast aside traditional methods of diplomacy. Preparatory contacts have taken a variety of informal channels—offers contained in speeches by delegates to the United Nations, in official newspaper articles, in propaganda broadcasts, in interviews at diplomatic receptions, in public letters from Soviet leaders, and so forth. With a fine sense of theatre, the basic negotiations have often been conducted by top Communist officials on state visits abroad. Such visits have often been timed at a moment of emergency in the economy or foreign policy of the recipient country. And in the old tradition of oriental potentates, handsome gifts have frequently been distributed to sweeten the general atmosphere of negotiations—a sports stadium to Burma, autobuses to Afghanistan, tractors to India, jet airliners to Syria and Egypt.

Once preliminary negotiations have been completed, concrete steps to implement the agreement are taken promptly. For example, Bulganin and Khrushchev visited Afghanistan in mid-December 1955 and a general aid and technical assistance agreement was concluded in three days, the Soviet Union pledging a loan of 100 million dollars. By the first of March 1956 the implementing agreement was signed specifying the individual projects to be financed. In May, the first equipment and experts began to arrive.

During the same period, incidentally, Afghanistan decided to establish diplomatic relations with Communist China, began trade negotiations with Czechoslovakia, and joined the Soviet Union in a declaration calling for general disarmament and a ban on atomic weapons.

### LOCAL ADMINISTRATION OF BLOC TECHNICAL ASSISTANCE

In the local administration of aid and technical assistance, the bloc countries follow methods and conceptions radically different from those commonly employed by the American government. First, the assistance is provided on a project-by-project basis. The recipient country is not required to develop a general plan or framework for development in terms of which specific projects have to be justified. Second, bloc negotiators tend to confine their action to the acceptance or rejection of individual project proposals from the recipient country, whereas United States operations missions typically become involved in the whole development planning process. Third, bloc technicians and experts as required are brought in for a specific project and in the great majority of cases remain only for a few weeks. Fourth, they usually live as a group in a location near the project and have little direct contact with their embassy in the country. Fifth, the bloc embassies do not maintain resident staffs of economists and development experts as is the case with American embassies in less-developed countries. Finally, it appears that the bloc countries do not require detailed accounting of the use of funds and comprehensive progress reports.

[7] Fritz Schenk and Richard Lowenthal, "Economic Integration," *New Leader*, January 19, 1959.

### COMPETENCE AND BEHAVIOR OF BLOC TECHNICIANS

From various kinds of evidence—newspaper reports, impressions of American technicians who have worked in the underdeveloped areas, official American reports, estimates of United Nations officials dealing with technical assistance, and statements by representatives of recipient countries—it seems clear that bloc technicians who go abroad are fully qualified in their particular specialties. Here and there, as in the case of a sugar refinery project in Indonesia, there seems to have been some mismanagement. But generally their performance seems to be equal to that of their Western counterparts.

Contrary to some widely circulated reports,[8] bloc technicians on the whole do not seem to have superior linguistic skills. There are exceptions, as in Afghanistan where apparently a high proportion of the Soviet technicians were brought from Turkestan, Kazakhstan and Uzbekistan, where languages related to those in Afghanistan are spoken. But ordinarily Soviet technicians are not specially trained in the language of the countries to which they are sent. They generally rely on interpreters and frequently use the Western language which is best known in the foreign locality.[9]

In personal behavior, they have impressed people in the recipient countries as hardworking and serious, even to the point of being dull and wooden in personal relationships. On the whole, there appears to be little contact between the bloc specialists and the citizens of the less-developed countries apart from the work situation.

The evidence available is not conclusive that Soviet technicians have been used for espionage or agitation. On the contrary, although they have probably been expected to prepare the kind of economic intelligence reports which most countries expect of their experts who travel abroad, it seems that the Soviets prefer to leave delicate political functions to professionals.

### SCHOLARSHIP AND EDUCATIONAL EXCHANGES

From a political as well as economic point of view, one of the interesting elements of bloc technical assistance has been the training of nationals from the less-developed countries in schools in the Communist bloc. In part this exchange is related to projects built with bloc credits, as in the case of several hundred Indian engineers and technicians being trained in the Soviet Union for work at the huge Bhilai steel plant. And in part it is based on bilateral educational exchange agreements administered separately from the technical assistance programs.

Since 1954, scholarships in increasing numbers have been offered by the Soviet

[8] E.g., William J. Lederer and Eugene Burdick, *The Ugly American* (New York: W. W. Norton and Co., 1958), p. 274.

[9] *Soviet Language and Area Programs for Asia and Africa*, Division of Research and Analysis for USSR and Eastern Europe, United States Department of State, unclassified, Aug. 5, 1958.

Union and the other Communist nations. Although there was a generally hesitant reaction when such offers were first made, the rate of acceptance has increased and the number of students from Free World countries going to the bloc for training in 1958 was double that for 1957.[10] By Free World standards, however, the total volume remains small. Foreign students in the Soviet Union in 1958, including those from bloc countries, totaled 15,000, or a little more than ⅓ of the 43,391 foreign students in the United States during the period.[11] Of the Soviet total, it is reported that some 2,000 were from less-developed countries, principally Africa, the Middle East, and Asia; of the United States total, 27,000 came from Asia, Latin America, the Middle East and Africa.

A noteworthy aspect of bloc educational exchanges is the concerted effort made in a few selected countries. The United Arab Republic, where the USSR, Rumania, Hungary, Czechoslovakia, and East Germany all made special scholarship offers in 1958, is one focus of attention. Another is Algeria, from which students have traditionally gone to French universities for advanced training. They have experienced progressively greater difficulties as the Algerian war has intensified and the Soviet Union, East Germany, Czechoslovakia, and Communist China have all come forth in recent months with attractive scholarship offers for study in the East.

## Economic, Psychological, and Political Results

Bloc aid programs are only five years old. The bloc countries are still evolving their policies and experimenting with techniques. It is thus much too early to make any definitive assessment of results; but some tentative conclusions can be ventured.

From an economic viewpoint, a few of the projects financed, such as the paving of streets in Kabul, seem to have little more than propagandistic justification. But the great bulk of the assistance has gone for overhead investment and basic industrial projects, which are the economic sectors where the most serious bottlenecks to development frequently are found. These are at the same time the sectors which yield the greatest external economies over the long run and which make possible the most marked increases in productivity. On the whole, the list of bloc financed projects is creditable, and economic benefits to the recipient countries are undeniable. Moreover, given the relatively minor scale of bloc assistance, there is probably not much lost by operating on a project-by-project basis without attempting to fit each action into an overall development plan.

However, because of the enormous needs of Asia and the Middle East for development capital, needs which are compounded by rapid population growth, bloc assistance on the present scale cannot have decisive economic effect. On the other hand, the psychological and political consequences may be considerable. By the very act of providing assistance the Soviet Union and the bloc countries have neutralized the criticism of being indifferent to the needs of impoverished areas of the world, an awkward posture in which their refusal to provide aid prior to 1953 had placed them. Also, at a time of growing Soviet prestige because of industrial advance and military and scientific achievement, foreign economic assistance has added an appearance of respectability and responsibility to the naked fact of power.

[10] *Soviet Bloc Student Exchanges, 1958–59*, Division of Research and Analysis for USSR and Eastern Europe, United States Department of State, unclassified, Nov. 21, 1958.

[11] *Open Doors, 1958* (New York: Institute of International Education, June 1958).

At every step the bloc countries have been alert to the propaganda possibilities of economic assistance and have tailored the terms of agreements to fit local sensibilities and situations.[12] Administrative methods as well have been designed to minimize frictions with the recipient country and to reenforce the theme of "aid without strings." Through extensive publicity, concentration on visible and sometimes spectacular projects, and high geographical concentration in key countries, widespread popular awareness and approval has been created.

Whether more sophisticated leadership elements in the less-developed countries have been equally well impressed is another matter. Within the past year there have been two cases, Yugoslavia and Finland, in which the Soviet Union in headlong fashion attempted to exploit trade and aid relationships for political purposes. Perhaps as a consequence, public figures in a number of the countries which are major recipients of aid have indicated uneasiness about the aims and methods of Soviet policy. In Indonesia, in 1957, parliamentary doubts about the wisdom of accepting further bloc assistance delayed ratification of Soviet aid agreement. Nehru in 1958 for the first time publicly expressed fundamental concern and disagreement with the philosophy of Communism. Nasser in the United Arab Republic in early 1959 began a vigorous roundup of Communist elements.

But such signs of possibly increasing resistance far from cancel the long-range and subtle political gains which the Communist countries may reap. Their aid has been useful in stirring anti-Western sentiment in the Middle East, in embarrassing and diminishing the prestige of pro-Western governments, and in encouraging others to take a more neutral position in the East-West conflict. Their programs are spreading consciousness of Soviet strength and capability, familiarity with bloc equipment, and use of the ruble as an international currency. Hundreds of technicians trained in the bloc countries are returning home each year having acquired in addition to new skills a new ideological perspective. Bloc financed industrial projects in recipient countries have given local Communist party organizations new talking points, new encouragement, new prestige.

The patience of Communist leaders in awaiting long-range rewards is reenforced by deep doctrinal convictions. They believe the present governments in the less-developed countries eventually will be overwhelmed and are convinced that nothing less than Communist regimes with totalitarian methods of rigid planning and compulsory sacrifice by the populations can succeed in producing a rapid rate of development. Second, imbued as they are with Marxist conceptions of the social and political effects of industrialization, they undoubtedly attach importance to the concentration of assistance in the industrial sector in order to encourage the growth of a labor class and trade unions in the less-developed countries which in turn, they are confident, will generate revolutionary pressures.

Given the continuing vulnerability of the less-developed Free World countries, the mixed but still considerable success of bloc aid to date, and the clear capacity of the bloc to extend the scale of such activity in the future, it is likely that the economic front may become more active and important in the next phase of the cold war.

# Program Planning and Development

By Arthur Goldschmidt

Abstract: Program planning and development of technical assistance must take place at the level of the recipient country. Once the resources for technical assistance available to a country are determined, the government itself must identify its needs and establish its priorities—whether the assistance is to come from local, international, or bilateral sources. The "country programing" procedures under which the United Nations Expanded Program for Technical Assistance is established annually have helped to strengthen the program planning machinery of recipient countries. The single purpose, voluntary nature, and multilateral management of the United Nations program make it peculiarly acceptable as an instrument for assisting in creating and strengthening local institutions including ministries and other bodies responsible for planning and programing. The Expanded Program has also been successful in undertaking projects involving several recipient countries in major joint programs. While the United Nations program has an important place in technical assistance, its financing has not kept pace with growing bilateral programs of the United States, the USSR, and other countries. It may therefore be desirable to emphasize the possible role of the United Nations program in the process of development and co-ordination of other technical assistance activities.

---

*Arthur Goldschmidt, United Nations, New York, is Director of the Bureau of Technical Assistance Operations, which has succeeded the Technical Assistance Administration of the United Nations. He came to the Administration in 1950 where he was initially Director of Co-ordination and Planning. He recently completed a year's assignment in Iran. Prior to his service in the United Nations, Mr. Goldschmidt had eighteen years of service with the United States Government primarily in the Public Works Administration and the Department of the Interior where he was Director of the Division of Power. He was on the Preparatory Committee and member of the United States Delegation to the United Nations Scientific Conference on the Conservation and Utilization of Resources; a member of the United States Interdepartmental Executive Committee on Economic Foreign Policy and the Advisory Committee on Technical Assistance; an adviser to the United States Delegation to the Economic and Social Council in 1950.*

## Resources and Requirements

THE * principal resources of technical and professional skills available to the governments of the developing countries are in their own trained nationals. The technical assistance programs, bilateral and multilateral, can only fill the gaps or broaden the base of these indigenous resources, or help to energize and support them. Outsiders can and do create and operate new services or institutions quite separate from any local initiative; but such superimposed interventions are not technical assistance, however useful they may be to the development of a country. Technical assistance consists of helping countries to help themselves.

Because the technical assistance programs provide only a fraction of the technical and professional resources of the developing countries, they cannot be a ready-made import, but must be locally tailored to meet the differing requirements of recipient countries. The programing of technical assistance cannot therefore be a global process of the agencies providing it, but must be an intimate local process of the governments and the institutions receiving it.

There is great variety in the technical assistance from abroad that is available to interested governments. Those that can pay for it can secure the services of a growing number of individuals, consulting firms, and business institutions experienced in providing assistance. Geographically limited multilateral programs such as the Colombo Plan and the program of the Organization of American States are available to their member governments. An increasing number of bilateral programs, variously limited geographically or as to technical or professional fields, are coming into being in addition to the relatively large United States program of technical co-operation. From these resources, and from the United Nations Expanded Program of Technical Assistance, potential recipients may secure the foreign component of their requirements for technical skills.

The needs for technical assistance in the developing countries are equally varied. The process of economic development is complex and its components are so diverse and interrelated that there are few technical and professional skills not required in some measure by countries seeking to guide or accelerate that process. In each sector of the economy, in each ministry and agency, at various levels in both central and local governments, the development process shows up the need for new skills and new institutions. The process of programing technical assistance, multilateral or bilateral, is the matching of available technical resources to those needs and the identification of priorities in the use of those resources.

In the first ten years of intergovernmental technical assistance to less-developed countries this programing process has occupied much of the attention both of the agencies providing technical assistance and the recipient governments. The United Nations Expanded Program of Technical Assistance has made major contribution to the initiation c strengthening of that process in man of the countries that it has served. Th further extension, development, and in stitutionalization of the work of pro graming technical assistance by recipien countries present the most importan possibility for improving the effective ness of technical assistance, bilateral an multilateral alike. More than this, i can aid in establishing an institutiona mechanism in the developing countrie

* The views expressed in this article are those of the author and not necessarily those of the United Nations or other members of its secretariat.

for planning and the making of decisions in other areas of their administration of economic development.

### THE PRINCIPLE OF COUNTRY PROGRAMING

It is a basic principle of the United Nations Expanded Program of Technical Assistance that the recipient countries themselves determine the scope and shape of the technical assistance provided to them by the nine international participating organizations.[1] This principle is buttressed by three interrelated characteristics of the program: its single purpose, its voluntary nature, and its multilateral management.

The single purpose of the Expanded Program is to help governments help themselves in their efforts at economic and social development. It does not seek to change their political and social institutions; its experts must be chosen "not only for their technical competence, but also for their sympathetic understanding of the cultural backgrounds and specific needs of the countries to be assisted."[2] No expert may engage in political activities. The technical assistance "shall not be a means of foreign economic and political interference in the internal affairs" of the recipient countries. The donor government has no voice in determining how its individual contribution may be spent: "Contributions shall be made without limitation as to use by a specific agency or in a specific country or for a specific project."

The voluntary nature of the program is reflected both in its financing as well as in the expenditure of its funds. The 200 million dollars that governments have made available to the program since 1949 were contributed in amounts and currencies that each donor decided in light of its own estimates of its abilities. Governments also have a voice in determining the availability of any of their nationals as experts or of the use of their facilities for training individuals in their institutions. No assistance is provided to any government except upon its specific request. Within the confines of the amounts available and subject to the limitation imposed by commitments on continuing projects, each government determines each year the scope, shape, and content of its own program. The recipient government, moreover, describes the precise jobs to be done and has a voice in the selection of the experts to do them; it nominates its candidates for fellowships for training and observation abroad; it determines its own participation in any joint activity such as a seminar, study tour, or training center. All assistance to a recipient country must be provided "as far as possible in the form which that country desires."

The multilateral management of the program is perhaps the most distinguishing characteristic of the United Nations Expanded Program. While the pledging of funds is undertaken by a special conference called by the 82-member General Assembly of the United Nations, contributions are not confined to Member Governments. Voluntary contributions have been received from eighty-eight governments. Any government that is a member of the United Nations or of any of the specialized agencies may participate as a recipient.

Governments exercise their responsibility for policy determination and program approval through the 24-member Technical Assistance Committee (TAC), consisting of the 18 members of the Economic and Social Council augmented by 6 members who may be from any other Government Member of the United Nations or one of the specialized agencies "having an important interest in the Expanded Programme of Technical Assistance."[3] This Committee is representative of both donor and recipient governments and of all parts of the world concerned with the program.

The members of the staffs of the participating organizations that carry out the program are appointed with due regard to geographical representation. This applies also to the staff of the Technical Assistance Board (TAB), on which each of the participating organizations is represented. There are few countries not represented on the staffs of one or more of these agencies. At this time, the heads of the nine organizations represent seven different nationalities (there is currently one vacancy).

The program itself is fully multilateral in its operations: In 1957 the roster of experts included sixty-seven nationalities, and fellows studied in ninety-three countries and territories. Of the twenty-five hundred experts in the program in 1957 about 24 per cent came from the less-developed areas of the world—Asia and the Far East, the Middle East, Africa, and Latin America. Similarly, study opportunities for more than 2,000 fellowship holders were equally widely distributed; more than 28 per cent of the host facilities were supplied by areas other than Europe, Canada, and the United States.

The strength of the multilateral approach has largely been in this use of the world's resources of profesional skills and training opportunities. It permits a closer alignment of the expert's qualifications to the needs of the country being assisted. But more than this, it involves the recipient countries as donors of assistance as well, making the program a truly co-operative one of sharing the blessedness of giving.

### ALLOCATION OF RESOURCES

The principle of country programing makes the United Nations Expanded Program simply a sum of its parts: The various programs that governments themselves determine to be necessary to their economic and social development. But before the recipient governments can establish their programs, the available resources must be divided among them. This is done each year by the participating agencies and their joint body, the Technical Assistance Board, with the approval of the Technical Assistance Committee. Based upon an assumption of the amount of funds likely to be available for the following year, the Board establishes a "planning share" for each of the participating agencies, proportionate to the agency's share of the previous year's program.

Each agency divides its planning shares among the requesting countries. This division is based upon requests received, programs under way, or indications of need. The agency proposals are reviewed by the Board and fitted together to establish targets for each recipient country. The countries are informed of their targets for the following calendar year in May of each year and are expected to plan their programs within the target figure. These programs are transmitted to the Board and the participating organizations by July 1. The country programs are reviewed by the agencies and the Board and consolidated in a global program submitted to the Technical Assistance Committee after the Pledging Conference has established the amount of funds that can be expected to be available. The Committee reviews and approves the program and authorizes allocation of funds to the participating organizations in proportion to their shares of the approved over-all program.

This program exercise provides the

[1] The participating organizations are listed in David Owen's article, this issue of THE ANNALS, p. 27.

[2] This and the following quotations in this and the next paragraph are from Resolution 222 (IX) of the Economic and Social Council.

[3] Resolution 647 (XXIII) of the Economic and Social Council.

basis for initial co-ordination among the participating organizations and for supervision by the Technical Assistance Committee of the fairness of the allocation of resources.

### COUNTRY PROGRAMING PROCEDURES

The recipient governments are assisted in developing their programs by the Resident Representatives of the Technical Assistance Board, the experts, and the mission chiefs or country representatives of the participating organizations in the field, often augmented during the May-June programing period by staff from the headquarters or regional offices of the agencies. Except that they must honor commitments of the agencies continuing from the previous year's programs, the governments may utilize the target figures supplied by the Board without reference to the proposed agency subtotals. A government may utilize all the funds made available to it for one field of assistance and it may ask for experts only or utilize its entire target figure for fellowship opportunities. The participating organizations can and do propose programs, but the government itself disposes.

This procedure, giving the recipient governments unhampered freedom to establish the content of their own programs, grew out of dissatisfaction with the original arrangement under which there was an *a priori* division of resources among the six agencies then engaged in the program.[4]

The original plan of dividing the funds among the agencies was not solely a scheme for meeting the needs of the participating organizations: in part it reflected an earlier assumption—not wholly unwarranted—that balanced development would have to be injected into the program of each country from the outside; that governments of less-developed countries were themselves less-developed and would not always have the capacity to identify their own needs effectively; and that agencies experienced with the problems of development in similar countries would be able more readily to propose practical programs and establish priorities. It was then believed that the fresh view of an objective outsider would be clearer than that of custom-ridden, inexperienced local officials caught in the myopia of their own culture.

There were, however, three basic weaknesses in this view:

The international agencies were themselves too new and their staffs too inexperienced to guide effectively the programs of the countries to be aided.

The recipient countries were often extremely sensitive to outside interference, were not fully convinced of the objectivity of foreign advisers, and were unwilling to agree to programs masterminded from a distance. Paul Hoffman recognized this attitude in his dictum that technical assistance cannot be exported, it can only be imported.

And finally, the processes of development and economic growth are too uncertainly known, the circumstances are too variable and the resources that must be brought into play are too varied to establish precise prefabricated formulae for each country to be assisted.

Paradoxically, it has been largely since the reins of programing were firmly turned over to the recipient countries that the influence of the agencies has been more fully felt. In part, this has been because the agencies are now more effective instruments for program planning: They have nearly ten years of

[4] See the discussion of financing the Expanded Program operations in Rowland Egger's article, this issue of THE ANNALS, pp. 82–83.

experience behind them. Their staffs have worked intimately with their counterparts in many countries. Similiarly, the officials of recipient countries have become accustomed to technical assistance and are more at home with the foreign expert and willing to work with him; they know his values and his limitations. The technical assistance programs, multilateral and bilateral, have made it possible for many of these officials to travel abroad and see their own problems being dealt with in other ways. The program has established a "consumer acceptance" that makes possible a greater degree of agency participation in planning than could be assumed in its early phases. The participating organizations can now transmit successful projects from one country to another for adaptation and can help to avoid initiation of undertakings that have failed elsewhere.

### ROLE OF THE RESIDENT REPRESENTATIVE

With "country programming" has come an increase in the number and effectiveness of the Resident Representatives—officials of the Technical Assistance Board whose duties are to represent the Board with the recipient governments and provide co-ordination in the planning and execution of the program. These officials, who are generally assigned to a country for two or more years, become familiar with the workings of the government as well as with the experts and agency representatives. They frequently become key advisers on programs and are an important means of co-ordination between government agencies, with bilateral programs, and between the participating organizations. Their precise role has never been fully defined except in connection with the annual country programing procedure, and indeed it depends in large measure on the individual and upon the relationship that he establishes with the officials of the government.

Resident Representatives of the Technical Assistance Board have been appointed for twenty-eight countries. In addition, regional representatives provide similar services in Southeast Asia and in Central America. The size of the country program and the willingness of the recipient government to provide facilities for the Resident Representatives determine their appointment.

Resident Representatives, unlike the Country Directors of the United States Operations Mission, do not have large staffs working under their direction. At best they may have an internationally recruited deputy and secretary and a small locally recruited staff of clerical and maintenance workers. They do not head a mission to the government, for the experts in the Expanded Program are not considered a mission. The office of the Resident Representative is generally more nearly an extraordinary extension of the government. Although the Resident Representatives are usually included in the diplomatic lists, they are not diplomats; their governmental contacts generally reach to areas of government far below and beyond those usually touched upon by diplomats.

In their day-to-day operations, Resident Representatives may have the close co-operation of agency representatives in the country. Such agency representatives have been appointed by the Food and Agriculture Organization (FAO), the World Health Organization (WHO), and the United Nations Educational, Scientific and Cultural Organization (UNESCO) in some countries to provide a measure of local oversight and co-ordination of the programs of these agencies. The Resident Representatives are also in touch with the experts assigned to the country, but they are not generally in the chain of command over such experts. They may furnish experts

with office facilities, stenographic services, or transport where these are meagre in the government departments, but in general the experts under the Expanded Program are scattered among the government agencies and working with their local counterparts in government offices.

The key aspect of the Resident Representative's assignment comes in the programing of the expanded program funds available to the government. The country programs must be drawn up by the requesting government "in consultation with the resident representatives." [5] Here he assists in resolving the conflicts between government departments and between participating organizations. He must assist in seeing that the limited resources available to the government are used in a manner to meet the most urgent needs and to assure that all interests concerned with technical assistance are given a hearing in determining priorities. Agency representatives and experts may become partisans of the departments of governments with which they work or of fields of interest with which they are concerned; the Resident Representative is expected to remain the impartial referee.

### GOVERNMENTAL MACHINERY

The most far-reaching consequence of country programing has been its role in the development within recipient governments themselves of the necessary mechanisms for channelling and screening their requirements and establishing priorities. Departments of governments can no longer apply directly to the participating organizations for the assistance they want, but are required to put forward their requests as part of the country program. This calls for a measure of consultation and co-ordination that is rare in most governments, developed and underdeveloped alike. While early in the program recipient governments sought to develop some organized approach to channelling technical assistance requests, country programing has resulted in the strengthening of this process and in broadening the scope of the governmental units to which it is assigned. In a recent review [6] of this aspect of the program, central planning and co-ordination units of thirty-eight of the recipient governments were studied in some detail. Twenty-three of these had been merged with the highest economic policy-making bodies of the government, either interministerial committees or the Prime Minister's office or special ministries for economics, planning, or finance that are responsible for over-all economic planning.

Country programing has not necessarily created the central planning and co-ordinating units, but there is little doubt that it has greatly strengthened them. In fact, some of the governments themselves have credited the program with this result by stressing that the "country programming procedure stimulates closer cooperation and teamwork among their own ministries in promoting national development activities." Moreover, experts provided by the Technical Assistance Program have been used to strengthen these and other central planning and co-ordinating units. The Program has assisted nearly forty governments in the process of planning or programing economic development—in a majority of cases in creating or developing the agencies or institutions necessary to the process.

### PROGRAM CO-ORDINATION

Of the thirty-eight central programing units for channelling and co-ordinating requests for assistance from the Expanded Program studied, twenty-four were also responsible for reviewing and formulating requests involving other technical assistance programs. This is perhaps the most significant development in co-ordination of the multilateral and bilateral programs. Since the inception of the Expanded Program, which coincided with the beginning of the Point Four program of the United States, the importance of co-ordination has been emphasized. But complete exchanges of information between the multilateral program and the United States and Colombo Plan programs, supplemented by frequent consultations, could not prevent duplication and overlapping in these country-oriented programs. Co-ordination, like program planning, cannot be achieved effectively anywhere except at the level of the recipient government.

As additional governments have taken up the task of providing assistance on a bilateral basis, co-ordination and consultation become more difficult as well as more essential. The geographical scope of bilateral technical assistance has been significantly increased in recent years. While world-wide interest has been centered on the initiative of the USSR in technical assistance, the Norwegian, French, West German, Italian, Israeli, Japanese, and other efforts are relatively unknown. This increase in the opportunities for help from bilateral sources over those available ten years ago makes it increasingly important, from the standpoint of donor governments as well as recipients, that the co-ordinating mechanisms and procedures be strengthened to provide a prudent and orderly use of available resources.

The experience of the multilateral program in the creation and strengthening of the governmental agencies necessary for program development and co-ordination suggests a possible role for the United Nations program in meeting the growing problem of providing more effective co-ordination of technical assistance programs generally. The Expanded Program operates in substantially all of the countries concerned with technical assistance. Its limited resources as well as its terms of reference make it no competitive threat to the large United States and USSR programs or those of the many other governments providing bilateral technical assistance programs. Because it is operated and managed on a truly multilateral basis, and controlled by an international body consisting of donor and recipient governments alike, it enjoys a special status. This is reflected in its use by recipient governments for projects of a nature not often considered for bilateral handling. Economic planning and programing, organization of government agencies, customs matters, and other projects touching on the sovereignty of governments have been successfully prosecuted under the United Nations program. Complex intergovernmental projects have also been undertaken effectively. The program for instance has brought the five Central American governments together for planning their economic and industrial development: This has involved working on joint problems of transport, industrialization, public administration training, and the problem of a common market with the help of United Nations experts.

The use of the international agencies in the planning and co-ordination of a program involving bilateral assistance has had an auspicious beginning in the joint project for planning the development of the Lower Mekong River in Southeast Asia. Here the governments of Thailand, Laos, Cambodia, and Vietnam, through which the Mekong flows, with the guidance of the Economic Commission for Asia and the Far East, have turned to the United Nations and the specialized agencies to assist in assuring that the bilateral assistance that has

[5] Resolution 542 (XVIII) of the Economic and Social Council.

[6] Annual Report of the Technical Assistance Board for 1957, E/3080 (New York: United Nations, 1958).

been offered by the United States, French, Japanese, New Zealand, Canadian, and other governments would be put to use under a plan and schedule worked out by experts supplied under the Expanded Program. This plan was initiated by an international mission headed by Lt. General Wheeler, former head of the United States Corps of Engineers, together with engineering colleagues from Canada, France, Japan and India, who outlined the work needed to be done effectively to plan the development of the Mekong. Further international studies will fill out the plan. Meanwhile, however, bilateral agreements have been negotiated to undertake various phases of the plan. An American engineering team is undertaking the basic hydrologic studies of the main channel. Japanese engineers are studying the principal tributaries. French equipment and New Zealand boats are being furnished under their respective contributions.

It was originally assumed by its founders that the Expanded Program would grow to become the major resource of technical assistance for the less-developed countries. United States policy, based upon that assumption, has considered its bilateral program to be a temporary one to be eliminated as the international program grew. But the multilateral program has not grown as fast as bilateral programs, even with the addition of the Special Projects Fund, which will greatly increase the multilateral resources available in 1959. It may well be that a more realistic view of the future role of the multilateral program may be found in emphasizing its experience in the process of program development and co-ordination, as a means of assisting the recipient governments in establishing priorities and utilizing the great bilateral resources available to them. Such an additional responsibility should not diminish the use of the multilateral program for direct technical assistance, especially for those assignments for which multilateral aid is singularly suited. The increased use of the Expanded Program in program development and co-ordination would necessarily have to grow out of a broadened awareness on the part of the recipient governments of the important role of assistance in the very process of receiving assistance. It would also depend upon the willingness of governments providing bilateral assistance to accept fully the practice as well as the principle of co-ordination.

# The Choice of Instruments for Technical Co-operation

By PHILIP M. GLICK

ABSTRACT: The choice of suitable instruments for giving technical and economic assistance is crucial to the success of the bilateral and multilateral programs. Here, choice is controlled not alone by the needs of the immediate task but also by the characteristics of public administration in less-developed countries and by the current status of agriculture, industry, health, and education. In the last eighteen years the programs have developed eleven instruments. Classified by principal function, these are: (a) preparation for program planning—the economic survey; (b) advice and instruction within the host country—the advisory mission; the visiting professor; seminars, conferences, and workshops; the training center; (c) fellowships for study and training abroad; and (d) joint operations—the Servicio; the operating mission; the university contract; other private contracts; the proposed international administrative service. The instruments for joint operation must form the backbone of the co-operative programs because technical assistance, to be effective, must go beyond advice and demonstration. Only in joint operations can the introduction and the administration of the new technology be adequately taught. Even without joint operations the programs can perform many useful tasks—but that is to fall short of the announced goal: Aiding the host countries to develop economies of self-sustaining growth.

---

*Philip M. Glick, J.D., Washington, D. C., is a member of the law firm of Dorfman and Glick. During 1948–53 he was General Counsel of the Institute of Inter-American Affairs and the Technical Co-operation Administration, United States Department of State, which then administered the United States bilateral technical assistance program. Earlier, he served as Assistant Solicitor, United States Department of Agriculture, and then as General Counsel, successively, of the War Relocation Authority and the Public Housing Administration. In 1953–55 he was Visiting Professor of Economic Development and Cultural Change at the University of Chicago. He is the author of The Administration of Technical Assistance (1957).*

## THE PROBLEM OF CHOICE

NO manufacturer would attempt to fasten the aluminum plates of an aircraft with needle and thread. The devising of instruments suitable to their compound tasks is equally important in the bilateral and multilateral programs for assisting the less-developed countries to build national economies of self-sustaining growth.

For this purpose, the choice of instruments is controlled not only by the nature of the immediate task to be performed but also by certain environmental factors, such as the basic conditions of life and economic activity; the current status of agriculture, industry, health, and education; and the characteristics of public administration.

The average life expectancy is little over thirty years in the countries now generally described as underdeveloped. The incidence of preventable diseases is high. The average working life of those who do attain the productive ages is low because high death rates and disease hamper productivity. The average food supply for each individual is only 350 calories per day above the life-sustaining minimum.

The average annual per-capita income is less than $150. The levels of industrial investment are low, and only small amounts of mechanical energy are available to supplement the energy of human arm and back. Transportation and communication systems are gravely inadequate.

Agricultural income and crop yields are low. Planting, tillage, and harvesting practices of hundreds of years ago still largely prevail. Until recently many of these countries have had only rudimentary beginnings of national public health programs. Rural schools in these primarily agricultural countries have suffered from neglect. Three-fourths of the population ten years of age and over are illiterate.

The governments in these countries, with scattered exceptions, are unstable and highly centralized; political democracy is weak; there is a serious shortage of trained administrative personnel; government officers work part time, at low salaries, and little is expected of them. Governmental appointments scarcely pay lip service to merit principles; petty corruption in government office is frequent, and major corruption not rare; distrust of government officers has developed monumental complexities in paper work and procedural formality; and both academic and in-service training in administration is new, abstract, fumbling.

These facts mean more than that the poor countries are very poor. They mean that the instruments selected as the means to assist governments and peoples living and functioning in such social and economic environments to "move into the twentieth century," to develop strong and sufficient growing national economies, must be adequate to solve a problem of that nature, scale, and complexity.

Clearly, the task is not just to provide additional capital for investment because there are few enterprises to receive it, few skilled people to make the management decisions, few trained and healthy workers. New institutions must be created, new processes started, the basic "social capital" of schools and hospitals, transportation and communication, governmental skill in maintaining law and order, must itself be developed. Only against such frank definition of the problem to be solved can we properly measure the adequacy of the instruments to be employed.

Moreover, each of the country to be aided has its own history, traditions, and values, its own culture pattern. The ability of the visiting technician or administrator to work successfully with his counterparts in the host government will depend upon his understanding sympathetically the society in which he has agreed to work; its attitudes toward work and leisure; the nature of its belief in progress; its belief or disbelief in the dignity of manual labor; its conception of the importance of machines and creature comforts; its notion of the proper role of government; and its social definition of the proper spheres and activities for its racial minorities, white-collar workers, women, and children. The myriad relationships among these beliefs, practices, and values, despite their many internal inconsistencies, give them a tough, coherent pattern. Change is not easily introduced or happily welcomed.

## THE AVAILABLE INSTRUMENTS

In the years since 1940, the bilateral and multilateral programs have developed, between them, ten useful instruments, and the Secretary General of the United Nations has recently proposed an eleventh. The fashioning of eleven instruments in eighteen years is a good record. In fact, referring to each as an instrument is oversimplification; each is a method followed with variations. This section will attempt to describe these instruments. An evaluation of their comparative effectiveness will follow. Having made this the subject of a chapter in a book,[1] I need give no more here than a short summary.

### *The broad economic survey*

The United Nations introduced the survey report as the basis for formulating a national program of economic development in 1949, in Haiti, and later prepared similar reports for Bolivia and El Salvador. The International Bank for Reconstruction and Development adopted the device in publishing such a survey for Colombia in 1950. By common consent such reports are now made only by the Bank, which carefully includes representatives of the bilateral and multilateral programs on the survey teams. The Bank reports now serve to guide not only action on loan applications but also the planning activities for technical and economic assistance.

An economic survey, by its nature, cannot do any of the things that need to be done to stimulate economic growth. Its purpose is to establish a reliable basis for enabling host country and co-operating agency to determine what technical and economic assistance the country requires and is ready to use and what tasks should be given priority. For example, the Bank's report on Colombia discussed the standard of living, national income and product, capital formation, agriculture, industry, fuels, transport, health and welfare, electric power, housing, education, public finance, monetary policy, and organization for planning and administration.

When a survey has been made, the ones who have learned most from it are the members of the survey team. This has led to the growing practice of including in these teams leading officers of the government for whose primary benefit the survey is made.

### *Technical missions: advisory and operating*

The best known instrument, one used in all the programs, is the technical mission. There are two broad types, the advisory and the operating mission; each has had a quite different history and is likely to have a quite different future.

At first, advisory missions took the form of a group of men who studied, say, a government department and sub-

[1] *The Administration of Technical Assistance* (Chicago: University of Chicago Press, 1957), Chap. II, p. 51.

mitted a report with recommendations. Several years of the frustrating experience that such reports tended to be profoundly ignored has created a shift within the technique of the advisory mission from the preparation of studious reports to the assignment of advisers who confer frequently with those to be advised, so that recommendations may be given in small doses, in varying degrees of formality, over a period of time. (There is little excuse for the fact that the United Nations program after eight years of such frustration still not infrequently sends an advisory mission to prepare a lengthy report.)

Even when permitted to advise in continuous small doses, the adviser has little organizational maneuverability. He finds it difficult to establish an effective base from which to secure access to the controlling facts and influence the taking of the necessary action at the proper time. It is folk wisdom that it is not easy to give or take advice. There is a high incidence of discouragement among members of advisory missions. A surprisingly large number take refuge in bitter criticism of the host governments.

And so, although no one ever formulated the notion of an operating mission that would be free of such defects and would supersede the advisory mission, many missions took on operating responsibilities, sometimes at the urgent request of the host government, sometimes by almost imperceptible development out of the mission's advisory work. The essence of the distinction is that the operating mission joins with the host government in the direct performance of the defined task.

### *The advice and instruction tool*

The visiting professors, training centers, seminars, and conference techniques are an application to international co-operation of long established educational methods. The procedure takes several forms but consists essentially of sending people who neither advise nor join in operations, but teach. They may teach as a visiting professor in a university or research center, or participate in seminars or "workshops" to which government personnel and others go for intensive periods of study. Or they may serve for short or long periods as faculty members in a specially organized training center.

These methods are little used in the United States bilateral program but are frequent in those of both the United Nations and the Organization of American States (OAS). The regional training center is the major instrument in the OAS program.

### *Joint operation through a Servicio*

The great bulk of the work performed in the bilateral program in Latin America (and in a few countries in the Eastern Hemisphere) is done through the Servicio. This is a new type of public agency, invented by the Institute of Inter-American Affairs (US) and the Latin American Governments. It is used by none of the multilateral agencies.

The Servicio is an entity specially created by the host government within one of its ministries, by statute or executive decree, to administer jointly with foreign technicians a group of projects in a major functional field, such as agriculture or public health. Its essential purpose is to bring into existence a program that will be jointly operated, the two partners being the ministry and the technical mission. Behavioristic in their educational psychology, the creators of the Servicio believed they could effectively teach and demonstrate only by working with their hosts daily, over a long period, in the same organization, on tasks they could share. Less than that, they believed—advising them, showing them how, but not doing it with them in a joint enterprise—would be to "plow the sea."

Some forty-two Servicios are at work in Latin America alone. They differ greatly in their pattern of operations, being necessarily molded by local conditions, local laws, and chiefly by the personalities who operate them. There is a long distance, which the Servicio tries to bridge, between the formulation of a good idea and its translation into a living institution in which a trained body of men perform tasks they understand, with suitable tools, on a practical time schedule, to reach objectives agreed upon.

The theory of the Servicio, from which, in practice, many Servicio directors frequently fall away, calls for joint operations from beginning to end. To promote such union, the technical mission relies upon two requirements: Each project in the program must be agreed upon by the host minister and the head of the United States mission, and all projects are to be financed out of a joint fund made up of local currency contributed by the ministry and dollars contributed by the mission. The right to exercise a joint voice in administering all activities is almost literally "purchased"—by each partner.

To promote the freedom of action which the Servicio must enjoy to enable it to introduce new administrative patterns, the intergovernmental agreement to create each Servicio specifically provides that it shall not be bound by the rules and procedures of the parent ministry, but shall establish such arrangements and controls as the minister and the Servicio director (nearly always the head of the United States technical mission) shall jointly devise. This freedom carries a correlative danger; it opens the door to so extreme a degree of autonomy for the Servicio that the ministry may be unable to learn anything from Servicio operations. It also opens the door, where the members of the mission are impatient for results and forget that theirs is not to do but to teach by doing jointly, to the Servicio's becoming a competitor of its own parent ministry.

Successful operation of so daring and subtle an administrative instrument requires broad delegation of authority from the Washington headquarters to the top United States officers of the Servicio. Such delegation has in fact been alternately granted and recalled, and yet the Servicio cannot achieve true mutuality without it.

As soon as competent national officers are available to serve as co-directors of Servicios with their United States counterparts, such co-directorships should (I believe; but the point is in controversy among students of the Servicio) be established. The experience of Servicio Especial de Saude Publica (SESP) in Brazil demonstrates this, and the case is strengthened by the less happy experience of the public health Servicios in Mexico and Uruguay which failed to appoint co-directors when the situation became ripe.

### *The university and other private contracts*

Three types of university contracts can be identified. The earliest ones did little more than "borrow" university personnel for duty overseas. A second type is a contract under which the university assumes responsibility for the administration of a defined segment of a country program, not always an educational activity. The third type, which carries exceptional promise for the future, establishes a university-to-university relationship under which a United States university undertakes to work directly with a university in the host country to improve research and educational practice.

The late Dr. Henry G. Bennett, first Administrator of the Technical Coopera-

tion Administration, was the father of the interuniversity contract. He saw in it an instrument through which the Land-Grant Colleges, in particular, could assist universities in the less-developed countries in the trilogy of functions that has become characteristic for our Land-Grant Colleges: agricultural education, experiment stations, and extension.

Some troublesome problems are emerging. The universities tend to confuse the three types of contracts described and wish to believe that they are merely receiving a grant from the International Cooperation Administration (ICA) to finance educational work overseas. ICA today probably attempts too much supervision of the university-to-university contracts and too little of the other varieties of college contracts. In turn, the universities too frequently assume these difficult responsibilities casually, fail to see the vast difference between campus activities and international technical assistance, and fail to make the whole set of institutional resources available to support the faculty members sent abroad.

The International Cooperation Administration (US) makes many contracts with individuals or firms to enable them to provide new technical, engineering, or management services for a fee. The multilateral agencies almost never use this instrument. These contracts sometimes cost more than the alternative of recruiting government personnel, but they give the program additional administrative resources. Skilled persons may sometimes be employed by contract who would refuse government employment. Many private firms can initiate operations more rapidly than the government. And there are places where technical assistance from a private source, even when financed by the United States, is more acceptable than direct United States Government participation, as in some of the dependent territories. The same preference has been shown in certain sensitive operations, as in helping a government to formulate currency-exchange regulations or to administer supervised agricultural credit.

*Overseas fellowships*

Fellowships for training and study overseas is the oldest of the instruments, and yet the least developed of them all, and the least well used. Training is, of course, the overriding objective of all technical assistance activities, whether in making surveys, in technical missions, in Servicios, or under private contracts. The local training in many cases, however, needs supplementation from a fellowship for study abroad.

Bilateral and multilateral agencies alike use this technique and alike are struggling with the problems of selecting fellows who can make specific contributions to developmental needs, of devising solutions to the difficulties raised by language and cultural differences, of finding instructors who can translate the technology of a rich country into forms assimilable in a poor country, of persuading the mother countries to make suitable use of the trainee's new skills on his return.

*An international administrative service*

In May 1956, Secretary-General Hammarskjold made his first plea for creation of a new international civil service of officers who could serve as "public officials integrated in the national administrations of [the less-developed] countries while maintaining their international status." The suggestion has since been detailed and was approved by the General Assembly late in 1958. It will provide specialists to perform duties of an "executive or operational" character within the service of the government of a less-developed country. They will be more than advisers, they will exercise authority and carry responsibility.

## THE CHOICE OF PROPER TOOLS

The available instruments can be classified in various ways. The following fourfold grouping emphasizes the purposes for which they are suitable: (a) preparation for program planning—the economic survey; (b) advice and instruction within the host country—the advisory mission; the visiting professor; seminars, conferences, and workshops; the training center; (c) fellowships for study and training abroad; and (d) joint operations—the Servicio; the operating mission; the university contract; other private contracts; the proposed international administrative service.

In many countries the programs are sufficiently large and varied to call into play all these instruments. Those who ponder the organization of technical co-operation within a country should understudy the orchestra conductor. They will need to control both volume and balance, and they must be able sometimes to call on the string instruments and sometimes on the brass.

But they must not procrusteanize. The authors of a new project need to cast it into a form molded around the specific needs being addressed—as these are shaped by the characteristics of country and locale—and not simply into the form of one or another of the devices already developed. The emphasis should not be on uniformity; the needs are diverse.

One way to stimulate the invention of better methods is to see the comparative advantages and disadvantages of those in use.

Advice and teaching, both within the host country and abroad, through classes and a variety of informal ways, are both indispensable and insufficient. Technical co-operation must go beyond advice and instruction. It must, through various methods of joint operation, build new institutions that actually use the new technology for economic development. The four or five instruments through which such operations may be carried on must be seen, then, as the backbone of a technical co-operation program. They are the instruments that must be relied upon to do most of the work.

A number of persons can be exposed to the new technology through advisory missions, training grants, visiting professors, and training centers. But the purpose of technical co-operation is broader than that. It is comforting to contemplate how many villages have been given their first medical center in these programs, how many plows have been introduced, how many individuals have had their horizons broadened. Yet, such serendipity is self-deceptive. The responsibility these programs have assumed is not just to scatter good works in isolated places, however intrinsically worth-while, but to spark and fuel the growth to vigor of entire national economies.

If, under the prevailing conditions already described, the programs are to succeed in introducing technological change, they must release the capacities of the more competent national personnel by lifting the smothering effect of the prevailing environment. This will take more than teaching and advice.

The budding science of government administration may borrow knowledge here from physics and biology. They have developed the concept of "the critical point," defined as the point at which nature takes on new patterns of behavior. The critical point at which water ceases to behave as a liquid and begins to behave as a gas is reached only at a given temperature under given barometric conditions. It is not too much to say that the history of the

technical co-operation programs has already demonstrated that government and other institutions in an underdeveloped society may be brought, through advice and demonstration, to approach the critical point at which they will undergo institutional change, but they can be brought to arrive at it only through our joining in conducting with them operations in the course of which new ways of practice become habitual through frequent performance.

*The Servicio: assets and liabilities*

Thus far, the Servicio has proved the strongest of the operating instruments. It assumes responsibility for getting a number of things done, and in the process it demonstrates and trains. It can use the services of both specialists and generalists, technicians and administrators, and many junior officers. It can establish its own regulations for personnel, fiscal, and other transactions and thereby demonstrate what improved public administration can contribute to economic development. It can combine long-range planning with short-term adjustments to emerging problems. It can induce increased expenditures for desirable purposes by the host government. It creates an administrative environment in which good work habits rub off onto all who are associated in the enterprise.

On the other hand, the Servicio has a built-in tendency to become dominated by the foreign technicians, to by-pass the ministry of which it is a part, and to become an enterprise competitive with the ministry. Only continuous vigilance and a strong sense of its purpose can protect it against these pitfalls. Some governments are reluctant to establish new Servicios (in a few cases, to continue some now operating) because of this built-in tendency and in part because the Servicio necessarily gives the visiting technician so much of a responsible voice in administration. In many situations, therefore, an operating mission will be acceptable where a Servicio may be unwelcome. Where the government already has substantial programs under way, it may be impossible to establish a Servicio without creating antagonisms and administrative complexity. The Servicio is never suitable for small or short-term projects alone. It is appropriate only where a broad operating program is required. Similarly, it is never suitable for regulatory or police programs. It is not true, however, as some maintain, that the Servicio is suitable only in very backward countries. One of the most successful Servicios is Brazil's public health Servicio, SESP. In fact, where the country is so backward that it has few competent nationals who can share the higher responsibilities with their visitor counterparts, the Servicio tends to become too much of a United States directed operation. It will function much better where nationals can gradually take over the more responsible positions, including the directorship.

The operating technical mission is a simpler device than the Servicio, suitable for less complex operations. It has less tendency to degenerate into a purely United States operation. It can be adapted to the performance of many necessary tasks even where the host is already doing much on its own. It has, however, less financial and procedural freedom and less power to induce host government financial contributions. It is less suitable for large operations, can less readily find a place for junior foreign technicians, and is more at the mercy of instability in the host government. The Servicio is a specialized form of the operating mission.

The greatest value of the university contract is in the establishment of a university-to-university relationship in which it can help improve the research and teaching practices of foreign universities. These relationships also broaden United States popular understanding of foreign countries and improve the training facilities within the United States that can serve foreign trainees. Some university contracts, however, have called upon educational institutions to give direct assistance to other governments on problems wholly outside the experience and skills of an educational institution. An operating mission or a Servicio would have been a better instrument in many such cases.

Similarly, other government-financed private contracts can supplement government personnel with skills not otherwise obtainable. In many cases a host government will prefer a contract with a private firm, because of the prestige many of them enjoy, or because of the activity's sensitivity.

All these instruments are likely to work more effectively if at least one Servicio is functioning in the country. Acting on behalf of the country director, it can give administrative service to all the visiting technicians, short-term and long-term. The country program can thus enjoy a hard core of competent continuous administration on which all personnel can lean.

The United Nations program does not use the Servicio device, but it can. That a multinational team can administer an operating program is proved by every specialized agency. The crux here is the shortage of UN economic aid funds; without joint financing there is no hope of winning acceptance of joint administrative control. But the new Special Fund and the proposed International Development Association promise to make such funds available. There is, however, no need for the United Nations to copy the Servicio; the kernel is the idea of joint operation, and the United Nations may well be able to devise a more successful technique for that purpose.

Concerning the new international administrative service, one must wait and see. It differs sufficiently from the only partially successful earlier United Nations experiment in Bolivia to carry a warm promise of achievement.

## CONCLUSION

We have been talking of the methods of organizing the flow of technical and economic assistance as the instruments of such aid. In a larger sense, the entire program is but an instrument. In emphasizing the importance of the choice of proper tools, we must avoid the fallacy of making that choice seem to be the only, or even the most important, decision to be made. International technical co-operation cannot succeed without adequate program planning, without appropriate administrative organization in headquarters and field offices, without adequate funds—including large doses of investment capital timely applied—without highly competent culture-adaptable personnel. But even if these other fundamental needs are met, the program's administrators must choose operating instruments that carry a cutting edge.

# The Government Contract as an Administrative Device

By Henry Reining, Jr.

Abstract: A considerable fraction of the United States technical assistance program is carried out by contract. Profit contracts are traditional with the government. Contracts with voluntary organizations are rooted in religious missions and war relief. University contracts are new but have quickly reached considerable proportions. The typical university contract is for a term of three years and is related directly to an institution in the host country with the United States Government acting as a third party. There have been many problems with these contracts but many adjustments have been made by the International Cooperation Administration. An Office of Contract Relations has been created, policies adopted, a manual and an illustrative contract published. Within that Office, a basic division has been made in the handling of profit and nonprofit contracts. Security clearance, an unsympathetic Congress, understaffing within the ICA itself, and inadequate opportunity for preparation to enter upon contracts and once in, to study and plan prior to commencing operations, are among the remaining problems. The universities on the whole have done well, but there have been failures. Co-ordination of contract and Mission efforts in the field has been a continuing problem, but have been considerably ameliorated recently. The balance sheet shows that there has been profit for all concerned. Finally there are presented ten operating assumptions for the newcomer to the field.

---

*Henry Reining, Jr., Los Angeles, California, is an experienced contractor with ICA. He is currently managing two contracts at the University of Southern California as Dean of its School of Public Administration. This past summer he completed a survey for ICA as to management education programs in Brazil, where he acted as a member of the first UN professor-consultant team to help establish the Brazilian School of Public Administration, 1951–52. Other foreign assignments have included working with the University of Michigan contract at the University of the Philippines in 1954. He was for ten years Educational Director of the National Institute of Public Affairs in Washington, D. C. He has been with an industrial consulting firm in New York and has acted as a top staff member of the Port of New York Authority. A number of local, state, and national consulting assignments have included a survey of Boulder City, Nevada, on the basis of which a municipality has been created separate from the Hoover Dam operations. He is President of the Mangore Corporation.*

One third to one half the total technical assistance program of the United States is carried on by contract. Strangely enough, little has been said in the literature of foreign aid on the contract as a device. There has been only one study specifically on the subject.[1] Yet the contract as a device to give aid overseas apparently falls within the anticipation of the policy makers who wrote the enabling legislation. They instructed that ". . . the participation of private agencies and persons shall be sought to the greatest extent possible."[2]

## Advantages of the Contract Device

Theoretically, the use of the contract has several advantages as a device of technical assistance. The ability to command otherwise unobtainable talent and services is an important advantage. The government does not need to dislodge the technical expert from his regular employment when he is "hired" by contract rather than directly. He remains employed by the corporation or firm, the university or voluntary service organization where he is making his career. His retirement arrangements are not disrupted; his promotion prospects are not dimmed.

The government theoretically gets more than a technician when it contracts with private organizations: It also gets the support-in-depth that such organizations—especially the universities, church-affiliated, and foundation groups—are capable of because of their other resources. In short, the government can invoke the force of the whole institution. Universities, for instance, have veritable networks of contacts and associations—professional, institutional, social and personal—which can be solicited into the enterprise.

Dr. Henry G. Bennett who, as first Director of the Technical Cooperation Administraton, is given the credit for inventing the university contract,[3] apparently had these things in mind when he created the device. Originally thinking of the land-grant colleges,[4] Dr. Bennett conceived of a directness of relationship between the United States and host country technicians that was impossible to achieve at the diplomatic level. Contract personnel could work with host country personnel without regard to the difference of government affiliation or national origin. They could come together on a professional or technical, indeed, on a grass-roots level.

Educational, religious, and commercial organizations also have a freedom of action, whether at home or abroad, that is denied to government agencies.

[1] Jerome Jacobson Associates, *The Use of Private Contractors in Foreign Aid Programs.* A Study Prepared at the Request of the Special Committee to Study the Foreign Aid Program, U. S. Senate, 85th Congress, 1st Session (Washington D. C.: U. S. Government Printing Office, 1957). Incidentally, this study points out that if one were to compare the number of technicians on contract with those on direct hire, the proportion would favor the former by 2 to 1. These are admittedly rough estimates. Philip M. Glick in his National Planning Association study, *The Administration of Technical Assistance: Growth in the Americas* (Chicago: University of Chicago Press, 1957), estimates the ratio of contract to direct U. S. hire employees as between 30 and 40%. The Department of State publication, *The Mutual Security Program Fiscal Year 1958: A Summary Presentation* (Washington, D. C., June 1957), p. 58, speaks of 1500 of the "4600 U. S. technicians working overseas" as being contract employees.

[2] Mutual Security Act, as amended, sec. 413a.

[3] According to John A. Hannah, President, Michigan State University and himself deeply involved in the same development. See his talk, American Council on Education, *University Projects Abroad.* Papers presented at the Conference on University Contracts Abroad, East Lansing, November 17–18, 1955 (Washington, D. C.: American Council on Education, 1956), p. 51.

[4] Glick, *op. cit.* (note 1 *supra*), p. 92.

They are not under bureaucratic restraints, at least not those of a governmental nature. They can operate on an interinstitutional basis without always worrying about clearing with the Washington office or about meeting pertinent government protocol.

A final advantage, especially in the use of nonprofit contractors, is that it becomes possible for the government to get into certain countries, such as the neutralist ones, which would refuse aid or co-operation if offered directly by our governmental agencies. The contractor can operate within the government, even on the governmental process itself as in the case of public administration programs, without any interference with the sovereignty of the host country.

### TYPES OF CONTRACTORS

The contracts the International Cooperation Administration (ICA) enters into can be divided into the profit and the nonprofit ones. There is nothing new about government contracts with profit-making commercial firms. Through such contracts the government can draw into overseas work highly skilled talent not otherwise available and obtain other essential services.

The nonprofit contracts can be divided into those with voluntary groups and those with universities. Fifty-six voluntary, nonprofit groups were under contract in the field of technical assistance as of April 1958. These included such well-known foundations as Rockefeller, Ford, and Carnegie; special-area interest groups such as the American Korean Foundation, the Asia Foundation, and the Near-East Foundation; and a number of religious groups, such as the American Friends Service Committee, American Jewish Joint Distribution Committee, Catholic Relief Services, and Lutheran World Relief. These groups had 10 million dollars worth of contracts in eighteen different countries, involving several times that many agencies in the host countries.

It seems quite clear even from the foregoing brief analysis that the United States Government gains immeasurably through this co-operation with the voluntary agencies. The government enlists the support and activity of this three score of dedicated groups who were already at work on the very objectives for which government funds themselves are appropriate. These groups with their established programs made it profitable for the United States Government to enter into the contracts to expand their activities and diversify them much more cheaply and effectively than the government could have done starting afresh. Finally these voluntary agencies can operate in a humanitarian atmosphere of good will which would not be possible for a government agency regardless of the nature of the service rendered.[5]

That all is not perfect with such contracts is equally clear. The most troublesome problem is with the religious groups. With them, there is the risk for the government of seeming to prefer one denomination over another, then there is the risk of religious proselyting or the appearance of it even when not present.[6] None of these difficulties has

[5] The following studies are illuminating: Edwin G. Bock, *Fifty Years of Technical Assistance: Some Administrative Experiences of United States Voluntary Agencies* (Chicago: Public Administration Clearing House, 1954); American Council of Voluntary Agencies for Foreign Service, *The Role of Voluntary Agencies in Technical Assistance* (New York: The Council, 1953); James G. Maddox, *Technical Assistance by Religious Agencies in Latin America* (Chicago: University of Chicago Press, 1956); Merle Curti and Kendall Birr, *Prelude to Point Four: American Technical Missions Overseas* (Madison: University of Wisconsin Press, 1954).

[6] All this was recognized by these groups themselves from the outset. American Council of Voluntary Agencies for Foreign Service, Inc., *op. cit.* (note 5 *supra*), p. 132.

proved to be insurmountable; the voluntary groups have gotten approval in the Congressional inspections which have been made.

In numbers and dollars committed, the voluntary group contracts have not been as important as either the contracts-for-a-fee or with the universities. However, in terms of total impact, including their own funds expended, their history, and their promise for indefinite continuity, contracts with these agencies have been important indeed.

The first university contract dates from 1951, but once the device was inaugurated the number of contracts increased rapidly. A high point was reached in 1954. Then the pace slackened somewhat. By July of 1956, fifty-two universities were operating eighty-one contracts in thirty-eight countries. Currently there are fifty-three universities with seventy-nine contracts in thirty-two countries.[7]

### NATURE OF THE UNIVERSITY CONTRACT

What are these contracts like? Usually their duration has been for a term of three years, although many have been extended beyond that period. The contracts set up a relationship between the United States university and a university in the host country, with a ministry of that country or directly with the International Cooperation Administration (ICA) itself. The purpose may be broad and general or narrow and specific. The variety just about runs the gamut of possibility: The establishment of instructional programs such as colleges of agriculture, medicine, public and business administration; the inception of research programs in these and other fields; the provision of specific services such as agricultural extension, industrial development, educational films. One purpose is uniformly present, namely the education and training of host country personnel, both academic and technical, both within the host country and at the United States university itself.

The activities engaged in by the contracting university correspond to these objectives—class room and in-service instruction and advice as to courses and curricula; the stocking of libraries; the establishment of research facilities; the provision of audio-visual and other instructional materials; advice on teaching, research, and other methods; and help to the host institution as to the qualifications and selection of participants in training programs. It is indeed a broad scope of activity.

The fields of work which have received the most attention under university contracts are agriculture and education. For the first five years of universities' contracts (1951–56) the larger number of contracts were for these fields, 54.4 million dollars out of a 68 million dollar total. Public and business administration was a poor third accounting for about 5½ million dollars. Public health and engineering ranked next. Labor, information, and community development received attention as well. Incidentally, this corresponds quite well with the major objects of expenditure for technical co-operation as a whole.[8]

With what countries are these contracts established? The clue is provided by major United States foreign policy efforts. Just as the Near East and the Orient have received other attention, so

[7] A number of contracts had of course expired by this time; International Cooperation Administration, *Quarterly Summary Statements, ICA-Financed University Contracts in Operation as of December 31, 1958* (Mimeographed, Washington, D. C., 1958).

[8] According to the 1958 U. S. Budget; see p. 59, The Department of State, *op. cit.* (note 1 *supra*) except that public administration, public health and engineering, respectively, reversed their order on the list.

do they have the greater number of university contracts, 56 out of the 79 which are currently in operation. Latin America has 16; Africa, 6 and Europe 1.

*Nature of participating universities*

What universities hold these contracts? As one might suspect from the origins of the program and their predispositions toward agriculture, engineering, and education, the state and the Agricultural and Mechanical universities have participated most actively in these contracts abroad. Their dominance is all the more emphasized by the fact that whereas twenty-one institutions hold two or more contracts, of these only four are independent or private universities. Only one independent university holds three contracts; thirteen state institutions hold three or more contracts. And two state universities hold four contracts each.[9]

There are no particular conclusions to be drawn from this distribution of contracts other than those already alluded to. It does raise the question, however, as to how the selection is made of the university with which to contract when a certain country asks for assistance. Apparently just about every conceivable method has been utilized. Host countries have had a voice in the selection process. Mission directors and other top United States personnel abroad have made suggestions. Currently, the trend seems to be for the ICA program staff to feel out those institutions of higher learning which seem qualified to carry out the project contemplated, to get expressions of interest from those who respond affirmatively, and to proceed to a contract by a process of elimination and negotiation. It is difficult to conceive how it could be done differently.[10] The question as to how well the ICA has done in its selections is impossible to answer; it probably never will be answered, given all the intangibles of such situations and the factors over which the ICA cannot be expected to have had any control.

## PROBLEMS WITH THE UNIVERSITY CONTRACT

Fault has no doubt lain on both sides. There certainly have been many problems. One has been delay. It has not been unusual for a year to transpire between the initial contacts and the final approval of a contract. The same length of time or longer has frequently been necessary to secure an amendment to an existing contract. Delays have been particularly destructive in university contracts because the academic time schedule itself requires long, lead time for faculty assignments, and so forth.

To be sure, delay is inherent and unavoidable in the complex environment of foreign aid. There are involved many divisions and several levels of the ICA itself, the meeting of the multitudinous rules and regulations common to the federal government, the many agencies and persons of the host country involved. At the level of the contracting university itself there is time spent dealing with the department of instruction concerned and academic and business officials. This necessary time allowance everyone has been willing to concede. But for a long time, there was in the ICA no common point of reference for contract work. Contracts were everybody's business in that agency and consequently nobody's in terms of definite responsibility. The contracting university felt that evasive tactics were

[9] American Council on Education, Office of Institutional Projects Abroad, *University Campus Coordinators* (Mimeographed, Washington, D. C., October 20, 1958).

[10] See the ICA Manual and Illustrative Contract; Jerome Jacobson Associates, *op. cit.* (note 1 *supra*), pp. 7–8, 30–34; American Council on Voluntary Agencies, *op. cit.* (note 5 *supra*), pp. 126–33.

being used. This situation fortunately has been corrected. An office of contract relations was established on March 3, 1956—after five years of university contract experience!

Another common complaint was that every contract was a "new voyage to the Indies, only to discover America." Great time was consumed because there was no policy, no standard, no common terms for contracts. Each one had to be drawn from scratch. The situation got so bad that the Universities in Conference Assembled demanded an end to the contract and the substitution of the foundation grant type of financing. This the ICA found unable to do, but it did publish an illustrative contract with standard paragraphs; it produced a manual for contractors; and it made some important policy decisions as guidelines for contracting with the universities. Perhaps even more important, all these things were done co-operatively involving a working group of five university representatives named by the Office of Institutional Projects Abroad.

*Restrictive measures*

One of the common complaints during the early years was that the government contracts with universities were unnecessarily restrictive. The government insisted on all sorts of precautions and required certain financial risks which might be appropriate to the profit-making contract but were completely inappropriate to nonprofit institutions—especially to universities. The universities insisted that profit and nonprofit contracts should be handled in a different way and indeed, be different. The ICA has met much of this difficulty by creating within the Office of Contract Relations two basic divisions to work on the two different kinds of contracts. This has helped greatly, in the opinion of contractors. Also, the ICA removed as many mandatory orders as possible and gave to the universities greater discretion as to the hiring, maintenance, and salaries of overseas-serving personnel, attaching these actions to the established procedures and practices of the contractor rather than to more complex government regulations.

Security clearance for contract employees has been and continues, in a lessening measure, to be a problem creating delay. For a time there was no consistency in its application. Then an attempt was made, after ICA came into the picture, to apply the clearance rule universally. Such alleviation as has been gained has resulted because of the ICA's relenting on security checks for on-campus personnel and because security officers began to give a fairly quick tentative clearance on university faculty proposed for overseas service, based on a check of the files, and to complete the full field investigation only when derogatory information was discovered. On the whole, the situation has been improved; the delays due to security clearance have been lessened.

In all fairness, it should be added that ICA has had to contend in such matters with a waspish Congress. It was fair game in those days, and still is to some extent, for Congressmen who were defeated in their efforts to cut or drastically reduce foreign aid appropriations, to harass the agency of such aid. The harboring of Communist sympathizers and homosexuals was all too ready a charge for such legislators to make. Unfortunately, it must be added further that the Congressmen succeeded with some members of the ICA and did scare them into a mental state of insistence that the security door be barred and bolted as well as locked. Such Congressional onslaughts plus the general reluctance of the United States public to recognize foreign aid as a continuing obligation of the nation drove many fine people out of the ICA too. Small

wonder there were delays. Small wonder that the ICA has seemed slow to learn from the contracting experiences of other federal agencies, indeed from past technical assistance experience itself. Small wonder that there has been so little effort made to capture and record our foreign efforts, let alone to evaluate those efforts for the purpose of improvement.

*Proper preparation*

The fault has by no means been one-sided. A most frequent failure has been the reluctance, refusal, or inability of the universities to make a proper assessment of the situation; to plan adequately and prepare both personnel and facilities to do the new job in a strange land, using a foreign language; to install an unknown service or institution in a cultural context which has not of itself produced such a service and which therefore can be counted upon to have many built-in resistances to the new venture. There have been two parts to this common failure: First, an inadequate survey preceding the contract negotiations; second, an inadequate opportunity or inclination for the contracting university to "tool up" for its contract obligations.

If a complete preliminary survey is not made, then chances are that the project will not be satisfactorily described and that as a consequence the contract itself will be faulty. It is indeed amazing how many contracts have been rushed into without a full description of the program and of the respective roles of the contracting parties and their personnel, even without adequate financing. Overseas efforts at best are difficult and demanding. Yet seldom is the preliminary, that is, precontract survey longer than a few weeks. Some have taken only a few days. A number of contracts have been entered into without the contracting institution or any of its representatives ever having set foot in the host country. Can such preliminaries possibly be adequate, leaving aside entirely the quality of the survey?

Even after the contract has been established, proper preparation remains a problem. There is great pressure to "get started" once the contract has been signed. This is natural especially since almost inevitably some months, maybe a year or more have elapsed since the host country first brought its need to the attention of the United States Operations Mission (USOM) in that country. But such hurry does not give the opportunity to answer the question, "Get started with what, how, when, where?"

Furthermore, there is not one university contractor who feels he has been given half a chance to prepare his staff for their overseas duties before their dispatch and after their arrival there. Contract personnel are usually totally ignorant of the history, religion, and culture of the host country. Only last year, 1958, after the ICA itself received funds for training its own personnel, did it start to make any concessions to the preparation of contract personnel. And these concessions are still far from being adequate.

Is it surprising then that we Americans keep on trying to do overseas exactly as we do at home, even when it is foredoomed to failure? We have not taken, or been permitted to take, the steps to find out what is foredoomed and what is not. Nor have our faculty members been permitted to learn better, either beforehand or on the job.

The universities should at least get credit for the fact that from the first they have rung the changes on this complaint. One of the very earliest formal presentations made to the ICA by the Committee on Institutional Projects Overseas involved this point.

It must be admitted that universities have not always done their best as contractors. Some have acted as though they were willing to try anything as long as they secured the contract. A number of universities have accepted contracts not at all related to research and education or anything else with which they have been familiar. Others have entered into contracts despite the absence of facilities, especially expert personnel to carry out the obligations of the contract.

Some have simply not met their obligations. They have recruited staff from elsewhere and have not sent their own faculty overseas, or if they have, have not sent their best. They have not recognized or have refused to admit the inherent difficulty of the new task. They have not "shifted gears" into cross-cultural activity. Overseas projects have been regarded as secondary rather than as primary obligations. The need to change programs and procedures, to meet the new demands in new ways has not been met. Students and scholars have been admitted into graduate programs, for example, without the addition of facilities and staff to meet the special problems of foreign participants; nor has accommodation been made in traditional curricula to permit the foreign scholar to prepare to meet the problems he will encounter when he returns home. In short, in some cases the universities have belied the premise on which contracts have been let, namely, that they will bring their total resources to bear in helping the host country institution help itself. Fortunately, in the main, the promise has been kept. The total effect has been beneficial, so far as we know, and the United States universities themselves have benefited greatly.

*Field co-ordination*

The field relationship of contractor staff and Mission staff has been a problem from the outset. Part of this was because some of the universities accepting contracts in the early days acted as though they were getting a grant to do something on their own, only to find that they had contracted to carry out part of an ICA program, under ICA supervision.

The American Council on Education, Office of Institutional Projects Abroad, published a statement concerning the working relationships between the, then, Foreign Operations Administration (FOA) and college project staffs in the field. The statement called for "well-planned educational activities, under the guidance of professional staff, on the one hand and on the other, upon their development within the broad framework of public policy," as interpreted by the country director of the United States Operations Mission. In other words, the contract chief and the Mission Director were to keep each other informed currently, were to keep out of each other's jurisdictions, and were to work together in terms of broad objectives of foreign aid, guided by United States public policy. The diplomatic guidance of the United States Ambassador was also acknowledged. This statement, in the main, was accepted by the FOA, and this acceptance helped a great deal to clear the air and in time to secure the kind of co-ordination and separation of function which was required for effective contract operations.

Another thing that helped was the recognition that the better form of university contract was the so-called third-party, rather than the direct university-to-ICA kind. As time went on more and more contracts were written to relate the United States university directly to the host university or institution, with the United States acting as an interested party, but nevertheless the third party. With the contractor directly related to the host institution, the Mission staff's relationship became more general in character and less apt to

cause trouble, at least of a day-to-day variety.[11] Again the problem of field co-ordination has not been entirely solved, but it has been considerably ameliorated.

*Other problems*

There is not space in this article for a full discussion of the problems attending the university contract as a device of technical assistance. Let us simply list a few more:

The term of most contracts has been too short to match the normally long period of time required to develop teaching and research institutions and to install and get acceptance for new services related to such institutions. Three years has been standard. The result has been that many contracts have had to be extended, some more than once. Others have expired prior to real assurance of continuation of the "investment."[12]

There probably has been insufficient evaluation by ICA of program accomplishment in most contracts. Part of this is due to a "means orientation" rather than an "ends orientation" on the part of ICA staff—the apparent domination of the ICA administration, from time to time, by the lawyer and the auditor rather than by the program division chief. The greater part of this fault is probably due to the starvation rations on which Congress has kept ICA staffs. ICA and its predecessor agencies have never had enough money for administrative purposes, never enough staff to give surveillance to contracts, let alone evaluate their results.

[11] National Planning Association, Special Policy Committee on Technical Cooperation, *Technical Cooperation in Latin America: Recommendations for the Future*, pp. 104–105 (Washington, D. C., 1956).

[12] Paul Beckett called the present system "fit and jerk" programming, *Western Political Quarterly*, Vol. 11, No. 3 (September 1958), p. 440.

The establishment of overhead rates on university contracts remains a problem. The present effort to separate overhead rates for off-campus from those for on-campus activities is not tenable; the rate attached to personal services only is not logical; the whole effort of ICA to cut down on universities' overhead rates is much more appropriate to the profit than it is to the nonprofit contracts. The same kind of problem attaches to other financing, as well. In few contracts has enough money been permitted for so-called indirect costs. For example, seldom is the work of overall supervision of a contract, as at the dean's level, adequately recognized or reimbursed. There is one phase which is not repaid at all and that is the precontract negotiations. Many man-hours may go into travel, discussions with ICA, drafting of documents, for which absolutely no monetary allowance is ever made. For profit contracts, this kind of risk-taking may be all right. It does not fit the atmosphere of a university, especially of the smaller institution which must subsist on private financing.

The illustrative contract will not solve all contracting problems. A great deal of tailoring will still be necessary to each individual project, to local needs both at the host institution and at the home campus and to specialized objectives and activities, as well. Policies and standards will help a great deal but there is still need for intelligent and sympathetic negotiating, on both sides of the bargaining table. In the language of diplomacy, what is needed here is a cessation of "individual treaties" in such contracts, and the adoption of the policy of "most favored nation" treatment—that is, a new benefit to one is added for all.

Has ICA almost exhausted the number of interested and qualified universities with which to contract? In fact, as suggested above, some contracts may well have been entered into with institutions who were not qualified. Yet the needs continue to grow. Is there need for some kind of "conditioning contract" whereby Uncle Sam would pay for a university to brief and orient its staff and to adapt its facilities to the contracted task?

Finally, is ICA making maximum utilization out of strengths it itself has helped create and develop in the universities? For example, at the present time ICA has been given funds for training of its own staff. Can ICA do this itself successfully? Can the Foreign Service Institute? How about bringing all interested parties—not just the ICA but also the United Nations, the Organization of American States, and the foundations—together into a scheme to create centers for overseas education and training? Courses and curricula for government personnel and for contractors'; predeparture briefing and orientation; continued training for experienced personnel; perhaps even debriefing experiences and sabbatical spending for both government and academic personnel, not to mention contract research, especially of the evaluation kind—all this and more could be done at a number of centers. This should be not only in terms of language and of regional and national culture, but should also include role identification, considering how different the role of almost every technician who goes overseas is from the one he is accustomed to playing at home. The shift of role from "operator" to "adviser" is illustrative and most common.

## THE BALANCE: PROFIT OR LOSS?

This article may be considered by some as full of criticism which it is. The criticism is offered, however, with the motivation to be constructive.

What then is the balance? How has the contract worked as a device of foreign aid? It has worked. There have been mistakes and failures. But the net has been considerable gain.

The government of the United States has gained along the lines already suggested and now that there is more of an attitude of partnership on both parts, the gains should increase considerably.

The universities have gained a great deal as well. The faculty members who have been overseas have, in the main, returned refreshed and refurbished intellectually, with many new ideas for teaching and research. The students and faculty on the home campus have also gained both from direct contact with students and scholars from other countries and from the innovations and improvements made in courses and curricula for the accommodation of those scholars. The kind of soul searching and review which the cross-cultural contacts force upon the academic body is a salutary influence.

Broadened intellectual horizons have in turn been provided for the local communities which have played host to foreign scholars and educators and to the professional societies, service clubs, and other groups, which have sponsored, entertained, heard speeches from, and seen the exhibits of those scholars and educators.

It is impossible to quantify many of these gains. Some are so intangible as to resist definition. It would certainly be shortchanging the equation to measure results only in terms of new area and language programs.

Overseas, results can be quantified in terms of new institutions and services installed by contract and enduring for the indefinite future. Furthermore, and perhaps even more important have been the lasting influences of the impact of United States educational ideas and attitudes on the whole educational system of host countries. The attitude of the university as a service institution

wherein a highly trained faculty helps the community to solve its problems instead of as an ivory tower into which the intellectual elite retire from the mundane; the seminar, the work shop, the conference, and the discussion group as substitutes for the formal lecture as the exclusive teaching device; the participation of the student through such instructional devices and by independent use of the library, the laboratory, and the field survey—these and many other academic changes have been left behind in the host countries albeit many have been unconsciously acquired and indirectly inspired.

The people of the United States have gained too in that the contractors who are now experienced in the foreign aid business—especially the universities and voluntary service agencies—constitute an anchor to windward for public policy and a protection against political storms and abrupt administrative changes within the government itself. Poetic? Perhaps, but let us remember that the United States foreign aid program has had even more directors than name changes! Steadying influences are indeed necessary, outside as well as inside.

## OPERATING ASSUMPTIONS FOR THE NEWCOMER

And how should you who is considering this contract business for the first time, look upon it all? To enter or not to enter?

Do enter, but as you do, bear certain assumptions in mind.

You will gain from an overseas contract albeit not financially, since you will put more into it than you will get out, in money.

You will find it hard-going: One of the most challenging tasks you have ever faced. Be prepared to contemplate change in everything and everybody involved including yourself. United States higher education, you will find is heavily "culture-bound," and so are you.

You will put in what will appear to be endless hours of contract consideration and negotiation—it is a time-consuming process, and you will not be paid for most of it nor will your expenses direct and indirect be reimbursed.

You will not have enough time for the precontract survey; even if you had a year—you will likely have three weeks—it would not be enough.

You will not have enough time, money, or facility to give your overseas faculty and staff the language, culture, and role training they require either prior to departure or after arrival at their post of duty. Again, a whole year would be inadequate, given the dimensions of the need.

You will have "trouble" with the ICA, both in the contract negotiations and afterwards, both in Washington and in the host country. The academic and the bureaucratic worlds are two different planets, one inhabited by a breed of men accustomed to academic freedom, the other by a race accustomed to hierarchical restraints. But the chances are you will surmount these troubles. You will emerge from the fray thanking God for your brothers, the program men in ICA, be they from the Agriculture, Education, Industry, Public Administration or some other Division.

You will have "trouble" with the host country institutions. You may have what you consider to be a complete set of commitments spelled out for your host; but your host will not meet those commitments fully and expeditiously. Why? Not because he does not want to but because he cannot and because he does not know how. Be prepared to help him, even with his commitments to you, and you will win him in an "arena" of co-operation in which he will be particularly appreciative. The key struggle will be to get him to accept, really accept, the total responsibility for whatever you turn over to him.

You will have "trouble" with your own university to bring into play all the resources you should command for your overseas contract. Better make sure you have firm topside support before you sign that contract! Otherwise you will find the Business Office and the Curriculum Committee and the Graduate Dean and the other instructional departments—even your own will cause you concern—resisting your requests for help and for change in heretofore well-established practices, desperately needed though you may argue these are. Your colleagues will not understand until they in turn have been cross-culturally baptized.

The term of your contract will not be long enough for you to accomplish completely what should be done, even if your contract is extended once or twice during its life. Getting acceptance for cultural change—and that is involved in every trial of foreign aid— is a long, long task; you will be through before you are ready unless you are one of the lucky ones and secure foundation and other private support so as to be able to continue American influence and "conscience" on the spot. The conflict arises out of the fact that cultural change is measureable only in generations; government contracts are measured in years, and Congressional appropriations are made a year at a time.

You will not be sure after you are all done whether your efforts have been a success or a failure. You will feel good about some things and badly about others. You will wish there were standards of performance against which to measure yours. You will probably come away from your overseas contract experience feeling that, all things considered, you have gotten more than you gave.

# Financing Technical Co-operation

By Rowland Egger

Abstract: The major problems of financing both multilateral and bilateral technical co-operation derive from the precarious year-to-year underwriting of the programs and from the organizational and administrative separation of technical and economic co-operation, including investment. Congressional attitudes toward continuing commitment to the United Nations Expanded Program, plus annual reauthorization of the bilateral program, create uncertainties which prevent technical co-operation staff from going forward with the recipient countries in the formulation of long-term national economic and social development programs. The lack of such long-term programs, moreover, prevents the development of bench marks and priorities for the proper planning and budgeting of both technical and economic assistance. Technical co-operation is in consequence largely occupied with a string of accidental, *ad hoc*, opportunistically undertaken projects, few of which relate themselves effectively to major ongoing influences in general economic and social change. This situation is exacerbated by the complete separation of technical and economic co-operation in the United Nations system and the substantial separation of technical and economic co-operation in a large part of the Mutual Security Program. The financing problems of technical co-operation will not be solved apart from the solution of the larger problem of financing economic development and until it is properly reintegrated into multilateral and bilateral programs of economic assistance.

---

*Rowland Egger, Ph.D., Charlottesville, Virginia, is Chairman of the Departments of Political Science and Foreign Affairs at the University of Virginia, where he has been a member of the faculty since 1931. He was Director of the Budget of the Commonwealth of Virginia, 1939–42; General Manager and Director of the Bolivian Development Corporation, 1942–47; Vice-President of the United Nations Administrative Tribunal, 1949–51; Associate Director of Public Administration Clearing House, 1950–53; Administrative Adviser to the Prime Minister of Pakistan, 1953; and Near East Representative of the Ford Foundation, 1954–56.*

TECHNICAL co-operation has become one of the blessed words of the English language. During the decade since the gentleman from Independence enunciated the principle of Point Four, it has been incorporated into the public and official vocabulary and is currently used as though it had precision, content, and limitation. In fact, it has none of these characteristics.

It has never been possible to distinguish satisfactorily between technical and economic assistance in the bilateral programs—and for that matter, some military assistance partakes strongly of the nature of technical and economic co-operation, and vice versa. In the multilateral context, the distinction between regular and Expanded Program activities is a purely artificial accounting device, and the difference between economic and technical aid on the part of the lending agencies is sometimes hard to define. This inevitable vagueness has perplexed and irritated the Senate Committee on Foreign Relations, the Congressional appropriations subcommittees, the United Nations General Assembly, and Committee Five for a long time.

It must be expected, therefore, that the semantic obscurity of "technical co-operation," which is only slightly less uncategorical than "underdeveloped country," should sometimes be evident in any discussion of its financial foundations. Perhaps the prudent approach to the problem is to deal only with the major institutionalized governmental programs specifically identified as technical co-operation. As *The Ugly American* suggests, this may result in the omission of some of the more colorful, and possibly the more significant, forays into social and economic change; however, it at least keeps the discussion within identifiable limits.

## Multilateral Technical Co-operation

Multilateral technical co-operation is currently managed through six international agencies: the United Nations, the Colombo Plan, the Organization of American States, the Commission for Technical Co-operation in Africa South of the Sahara, the Caribbean Commission, and the South Pacific Commission. The budgets of the three latter agencies are so small that they need not concern us. As has been suggested, some technical and economic co-operation is afforded by agencies such as the North Atlantic Treaty Organization, the Southeast Asia Treaty Organization, and others, but these activities are not identified as technical co-operation and will not be considered here.

Technical co-operation in the United Nations rests upon bifurcated financial pediments.[1] First, the "regular" programs of technical assistance undertaken by the United Nations and the specialized agencies, which in many cases antedate the establishment of the Expanded Program in 1950, are financed from the assessed budgets of the organizations. Second, the Expanded Program of Technical Assistance, actually administered by the United Nations and the specialized agencies, is financed through voluntary contributions to a sort of international community chest on the part of Member States and other well-wishers of multilateral technical co-operation.

Operationally, the distinction is hardly worth drawing. Projects have been moved from regular to expanded programs and back again, and sometimes

[1] Walter R. Sharp, *International Technical Assistance* (Chicago: Public Administration Service, 1952), pp. 8–14 and 59–106, summarizes the regular program activities as of the time of the establishment of the Expanded Program.

it is difficult to ascertain where the project belongs until the final accounting is made. This is as it should be, and rigidity with respect to project financing on the basis of the derivation of funds would immeasurably complicate an already difficult and perplexing administrative problem. On the other hand, the fact that the organizations are engaged in the same kinds of activities supported by Expanded Program funds from their regular budgets and are engaged in surveys and research under their regular programs which by the most ephemeral psychological accommodation on the part of the accountants could be transformed into projects eligible for Expanded Program financing, militates strongly against effective control by the Technical Assistance Board (TAB) of even Expanded Program activities.

## UN Regular Program Operations

As the report of the Technical Assistance Board for 1957 points out:

> The amount of technical assistance provided under the Regular Programmes varies widely as between one Participating Organization and another. For example, in the Regular Programmes of ICAO and ITU there is at present virtually no provision for technical assistance of the kind given under the Expanded Programme. The regular budget of the ILO provides only small sums specifically earmarked for technical assistance, and that of FAO none at all. On the other hand, UNTAA, UNESCO and, more especially WHO, provide a substantial volume of technical assistance under their Regular Programmes, even though each of them handles a much larger volume of assistance under the Expanded Programme.[2]

Technical co-operation financed from the regular budgets of participating organizations is paid for, of course, by the annual assessments made by the organizations upon the Member States for the total expenses of the organization. The percentage rates of assessment against the United States for 1958 were as follows: United Nations 32.51; Food and Agriculture Organization (FAO) 32.51; International Civil Aviation Organization (ICAO) 33.33; International Labor Organization (ILO) 25.00; International Telecommunication Union (ITU) 4.88; United Nations Educational, Scientific and Cultural Organization (UNESCO) 31.30; Universal Postal Union (UPU) 2.71; World Health Organization (WHO) 32.38; World Meteorological Organization (WMO) 15.19; International Atomic Energy Agency (IAEA) 33.33.[3]

It should be noted that neither the International Bank for Reconstruction and Development nor the International Monetary Fund participate in the Expanded Program so that all of their technical assistance operations are, in effect, Regular Program. The Bank spent in 1958, $639,347 for services to Member Countries, largely technical assistance.[4] The Fund does not separately designate technical co-operation in its administrative budget, but its activities in the field are substantial.[5] The administrative budgets of both organizations are sustained, of course, from earnings on their capital and are not assessed against Member States.

## Expanded Program Operations

The Expanded Program of the United Nations is financed from voluntary contributions made annually at a pledging conference usually held toward the end of the session of the General Assembly. From the inception of the Expanded Program in 1950 until the programing of 1956 operations, the money secured by the pledging conferences was distributed according to a percentage formula set up by the General Assembly as follows: United Nations 23; ILO 11; FAO 29; UNESCO 14; ICAO 1, WHO 22.[6] This purely arbitrary pie cutting was unsatisfactory to many of the national delegations, and largely under the leadership of France, the Economic and Social Council in 1954 took certain limited steps toward the integration of operations carried on with the voluntary contributions. It required the development of projects on the basis of country programs formulated by the requesting governments in consultation with resident representatives of the United Nations Technical Assistance Board and the allocation of funds to organizations in accordance with approved projects. However, a stop-loss order was included, which prevents any organization from receiving less than 85 per cent of the amount received the previous year.[7]

The Technical Assistance Board, which is the co-ordinating mechanism of the Expanded Program, except for its independent chairman is composed of the executive heads of the specialized agencies participating in Expanded Program funds. The heads of the technical co-operation programs in the several agencies normally sit for their principals in the Board. In other words, the co-ordinators are the same as the co-ordinated. In these circumstances it is understandable that the status quo ante in respect to the allocation of voluntary contributions to the participating agencies has been maintained with some rigor and that, except for very minor variations, the money is apportioned in about the same relative amounts provided for in the original formula.

In 1958 total pledges by 84 governments for the support of the Expanded Program were $32,317,900. The United States pledged $15,500,000 or 45 per cent of total contributions, whichever was the smaller. Total contributions of $34,444,445 would have been required to collect the maximum United States pledge; the actual United States contribution is approximately $14,543,000. Eleven other governments, including the Federal Republic of Germany which is not a member of the United Nations, account with the United States for about 83 per cent of all pledges. These are: Australia $625,000; Brazil $832,400; Canada $2,000,000; Denmark $579,100; France $1,542,900; Federal Republic of Germany $952,400; India $525,000; Netherlands $1,092,500; Sweden $792,600; USSR $1,000,000; United Kingdom $2,240,000.[8]

The USSR contribution, which with the pledges of the rest of the Communist bloc came to $1,349,600 in 1958, is far from an unmixed blessing.[9] The contributions are in the main in nonconvertible rubles, zlotys, and others. The USSR, moreover, has refused to permit

The scheme is described in detail in the *Report of the Technical Assistance Board 1955* (United Nations, 1956), E/2842, paragraphs 32–33 and 393–400. See also Goldschmidt's discussion of country programing procedures, this issue of THE ANNALS, pp. 54–55.

[8] *United States Contributions to International Organizations* (note 3, *supra*) pp. 76–77. Total adjusted in accordance with additional pledges reported by TAB in *Annual Report of the Technical Assistance Board for 1957* (United Nations, 1958), pp. 93–94.

[9] See Robert L. Allen, "United Nations Technical Assistance: Soviet and East European Participation," *International Organization*, Vol. 11, No. 615 (Autumn 1957).

more than 25 per cent of its contribution to be converted into other currencies, and then only for projects which it approves. To be sure, other countries make contributions in nonconvertible currencies or currencies of limited convertibility to the Expanded Program; but while the British pound has until very recently been nonconvertible, there has always been a brisk demand for British pounds in connection with projects undertaken under the Expanded Program. The same demand for Iron Curtain currencies does not exist. In effect the UN administers two programs of technical co-operation—one for countries in which it can utilize Soviet bloc currencies and another for other countries requesting assistance. Much of the Soviet bloc contribution can, as a practical matter, be used only for supplies and equipment from the Iron Curtain countries since few Soviet experts come to the multilateral programs and no experts go to the Soviet. The net effect of Soviet policies is to subvert the multilateral program of the UN and to make it in some places, such as India, a mere appendage of Soviet export operations. As a practical matter, the Expanded Program would be substantially better off if the Communist bloc would keep their pledges, like their money, at home.

Allocational data for 1958 have not yet been published, but there is little reason to think that they will differ substantially from 1957. Total regular earmarkings for 1957 were $31,321,327, of which the percentages attributable to the various participating organizations and the TAB were as follows: United Nations Technical Assistance Administration (UNTAA) 21; ILO 11; FAO 25; UNESCO 14; ICAO 4; WHO 17; ITO 1; WMO 1; TAB 6.[10] Bearing in mind that the total has been required to accommodate the TAB overhead, plus participation by ITU and WMO not provided for in the original formula, it seems clear that disturbances in the financing patterns of the participating agencies under the new dispensation have been held to a minimum.

## THE COLOMBO PLAN

The Colombo Plan for Co-operative Economic Development in South and Southeast Asia, which is neither an organization nor an operation, grew out of the meeting of Commonwealth Foreign Ministers in Ceylon in January 1950.[11] This meeting was concerned with the problem of raising living standards in the countries of South and Southeast Asia. The Consultative Committee created by the meeting of Foreign Ministers met in Sydney in May 1950. It recommended: (1) that each of the countries in South and Southeast Asia draw up a broadly based six-year plan of economic development to cover the period July 1, 1951 to June 30, 1957; (2) that members of the Consultative Committee pledge themselves to a program of technical assistance amounting to a maximum of 8 millions over a period of three years from July 1, 1950. These pledges have from time to time been expanded and renewed.

The only central machinery established by the Colombo Plan is a small secretariat at Ceylon which expedites bilateral negotiations; however, the Consultative Committee continues to meet regularly. The Plan itself provides no experts, offers no fellowships or study grants, manages no investments. When a country in the area requires a foreign technician, it makes a request to Ceylon, which in turn puts the requesting government in touch with a government having available the kind of help required. From that point on, negotiations are bilateral. If an expert is sent, the cost is charged to the sending country's pledge to the total technical co-operation expenditure.

[11] A good summary of Colombo Plan operations is contained in *Technical Assistance*, Senate Report No. 139, 85th Congress, 1st Session (Washington, 1957), pp. 211–14.

The Colombo Plan is mainly significant for its emphasis on national economic planning as the foundation for economic development; the importance which it has given to training; its success in combining technical and economic aid. This does not mean that the Colombo Plan has been any more successful than other schemes of technical co-operation. Some of the national plans of economic development drawn up for the initial six-year period were no better than those which have been cobbled together in response to the Expanded Program of the United Nations. Pakistan's first six-year plan, as its prime architect, Chaudri Mohammed Ali, freely admitted, was little more than a string of projects which collapsed completely after the cessation of hostilities in Korea depressed the world jute market. India, on the other hand, had done a considerable amount of work even before Partition on establishing a scheme of priorities for national economic development. The Tata Plan and the Five-Year Plan had produced a body of fairly competent technicians and no little economic and political sophistication in respect to purposeful social and economic change. While its current six-year plan shows some signs of disorientation, in contrast to the remarkable achievements of Pakistan and the Littauer School during the past four years, economic planning at least on the subcontinent is still a going concern.

The Colombo Plan has also put much more emphasis on training than has either the United Nations or the United States bilateral programs. The United Nations ratio of trainees to experts, under both regular and expanded programs, is about 0.9 trainees to 1 expert. The United States ratio is about 1.3 trainees to 1 expert. Colombo Plan trainees number about 7 to each expert.

The combination of technical and economic aid in the same project, which has been carried to an advanced stage in many projects engineered under the auspices of the Colombo Plan, is also highly instructive. This has permitted and fostered the maintenance of a close reciprocal relationship between co-operation and economic and social development which has sometimes become attenuated in programs such as those of the United Nations and the United States, where the authority and responsibility for technical co-operation and for economic assistance have become rather widely separated. Technical co-operation that is not directly and visibly related to economic development is not very different from the kind of mere "do-good" for which the nations striving for economic change have little need or desire in these parlous times. On the other hand, foreign investment and domestic economic change that is not built upon solid foundations of economic and social knowledge can readily defeat the objectives of development programs and hinder, rather than aid, the process of orderly social improvement. In addition, as every knowledgeable civil servant knows, it is much easier to finance the cost of adequate technical preparation as a part of the cost of getting the work done than as an independent undertaking that must be justified separately from the end product itself.

## THE ORGANIZATION OF AMERICAN STATES

The Organization of American States and its associated specialized agencies conduct technical assistance activities in a pattern somewhat similar to that of the United Nations and raise some of

the same problems of interorganizational relationships.[12]

First, it should be noted that the specialized agencies associated with the Organization of American States have for some time engaged in certain technical assistance activities and financed these operations from their regular assessed budgets. The activities of the Pan American Sanitary Bureau in the promotion of public health, for example, antedated by many years the formal establishment of the OAS at Bogotá in 1948. Other specialized agencies, such as the Inter-American Institute of Agricultural Sciences and the Inter-American Statistical Institute have similarly carried on technical assistance work as a part of their regular operations, as has the Pan American Union. The percentages of the regular budgets of these organizations currently assessed against the United States are as follows: OAS 66; Inter-American Children's Institute 40; Inter-American Indian Institute 17.39; Inter-American Institute of Agricultural Sciences 67.23; Pan American Institute of Geography and History 39.02; Pan American Sanitary Bureau 66.[13] The budget of the Statistical Institute is provided by OAS.

However, shortly after President Truman's 1949 inaugural address, the Inter-American Economic and Social Council established a Committee on Technical Co-operation to develop a special technical assistance program for OAS. This was done, and a Coordinating Committee on Technical Assistance, composed of the executive heads of the participating agencies or their representatives, was established generally to manage and supervise the program. The participating agencies are: The American International Institute for the Protection of Childhood, the Inter-American Indian Institute, the Inter-American Institute of Agricultural Sciences, the Inter-American Statistical Institute, the Inter-American Institute of Geography and History, the Pan-American Sanitary Bureau, and the Pan American Union, which is the General Secretariat of the Organization of American States.

The annual work programs developed by the Coordinating Committee, reviewed by the Committee on Technical Assistance, and finally approved by the Economic and Social Council, are financed by voluntary pledges from the 21 republics. Total pledges for 1957 were $1,787,587, of which the United States pledged 70 per cent, or $1,251,311.[14]

The special technical co-operation program financed by voluntary contributions supplies no direct technical assistance. Direct technical assistance is provided by the regular programs of the participating organizations. The special program is centered entirely in a series of regional training operations desired by member governments and sponsored by the participating organizations, sometimes in collaboration with national governmental agencies. As in the UN Expanded Program, money must be apportioned to participating agencies. But OAS fortunately avoided the UN experience and started out with specific projects as the center of fiscal and administrative gravity. Hence the allocation of funds to a participating organization in the OAS program is in fact an incident of project authorization. In the UN it is only in theory an incident of project authorization; the converse is more likely to be true. The Pan American Union, moreover, started out with a firmer hand on the special program and has maintained more control than the United Nations secretariat has ever been able to exercise. The kind of work undertaken under the OAS special program, being essentially institutional in character, perhaps lends itself better to integrated management than the scattered techniques of the United Nations and the specialized agencies.

Despite the generally favorable recognition accorded to the regional training approach to technical assistance, for which Alberto Lleras is primarily responsible, the special OAS program is criticized for some of the same shortcomings of the UN program—inadequate articulation of technical and economic assistance and inadequate national economic planning as a foundation for purposeful social and economic change.

## Bilateral Technical Co-operation

Bilateral technical co-operation constitutes about 4.66 per cent of the total Mutual Security Program. Of the total Mutual Security Agency (MSA) new funds appropriated for the fiscal year ended June 30, 1958 in the amount of 2,769 million dollars, technical co-operation received 130 million dollars. The bigger portion goes for other purposes—military assistance 1,340 million dollars, defense support 689 million dollars, the development loan fund 300 million dollars, special assistance 225 million dollars, and special multilateral and other programs 85 million dollars.[15] All this comes from direct appropriations from the United States Treasury and is financed by tax and other revenues of the United States Government.

These technical co-operation funds go primarily to maintain some 4,500 United States nationals, more or less expert, in about 65 countries and overseas possessions of other countries in which technical co-operation agreements are operative and to finance fellowships for 5,300-odd persons from countries receiving technical assistance for study and training in the United States. Of the technicians abroad, approximately 40 per cent are in the Far East, 31 per cent in the Near East and South Asia, 20 per cent in Latin America, 7 per cent in Africa, and 2 per cent in Europe. Some of the larger missions include Korea with over 400 technicians; Thailand with more than 350; Vietnam with about 300; Iran with almost 300; Pakistan with 250; and Turkey, India, and Cambodia with about 200 each. Of the trainees, about 30 per cent are from the Far East, 13 per cent from the Near East, 25 per cent from Europe, 31 per cent from Latin America, and 1 per cent from Africa.[16]

Although the general bilateral program of technical co-operation will soon be ten years old, and although the regional program inaugurated by the Coordinator of Inter-American Affairs began almost a decade earlier, the political mythology of the Congress insists upon regarding technical co-operation as a transient phenomenon. The Mutual Security Act annually extends for one year the program of technical co-operation and authorizes, also for one year, appropriations from which funds for the support of the program are allocated. This one-year-at-a-time program authorization is despite a report of the same committee which considers the Mutual Security Act to the effect that: [17]

> It cannot be too strongly emphasized nor too often reiterated that technical assistance is a long-range program in which continuity of effort is at least as important as magnitude of effort. A basic project can hardly be well-started in a year, much less com-

[12] See Philip M. Glick's excellent chapter on the OAS program in his *The Administration of Technical Assistance: Growth in the Americas* (Chicago: University of Chicago Press, 1957), pp. 318–37. This is the best analysis in depth of technical assistance administration that has so far been made.

[17] *Op. cit.* (note 11 *supra*), p. 27.

pleted in that time. The subcommittee has seen projects operated by private agencies which turned out to be highly successful, but which had to be carried on for as long as 6 or 7 years before they began to take hold.

In American politics it is understandable that a Congressional committee should at times ignore the request of the President, as the Senate Committee on Foreign Relations has, for more realistic enabling legislation for mutual security. It is understandable that one Congressional committee should ignore the advice of another. But for a committee to ignore pointedly the advice of its own subcommittee emphasizes the extent to which the mutual security program has become the tool of personal power politics amongst Congressional committee chairmen.[18]

Some of the reluctance of Congress to provide authorization and financing of technical co-operation on a continuing basis may be attributable to the shaky programmatic foundations of technical co-operation budgeting. Presentations by the International Cooperation Administration (ICA) to the Bureau of the Budget and the Congress are based upon "illustrative" project budgets rather than anything resembling firm work programs. To a limited extent this is inevitable, since ICA does not initiate technical co-operation projects, and it is difficult to forecast the demands of receiving governments for technical co-operation. On the other hand, one of the major factors contributing to the planless and wholly *ad hoc* basis of project formulation is the failure of technical co-operation to develop the kind of systematic planning for economic development in countries receiving technical assistance that would provide criteria for the judgment of project priorities. An astute observer of bilateral technical co-operation in Latin America where technical co-operation has had the longest history and where administrative arrangements should be the best developed, has written: [19]

> The habits of independent operation which IIAA's field missions had enjoyed since 1942 were reluctantly yielded and in some countries not surrendered at all. Where the country director and the heads of the principal technical missions had themselves come to realize the need for broader planning, they welcomed the new structure and it worked reasonably well. In other countries it was difficult, as late as 1955, to see evidence that program planning for economic development was seriously pursued.

On the other hand, Congress has been little more willing to give long-term authorization for military assistance, which is planned and budgeted on a fairly comprehensive country-program basis. This suggests that something besides the adequacy of program and budgetary mechanics underlies the unwillingness of Congress to concede that technical co-operation is a continuing function of the United States Government.

## Unsolved Financing Problems

Obviously, the major unsolved problems of both multilateral and bilateral technical co-operation are their precarious financial underwriting. The annual pledging conferences of the United Nations and the Organization of American States and the annual renewal of authority and funds for the bilateral program of the United States Government provide no adequate foundations upon which a planned and systematic attack on problems of economic development can be based. Even the loose-knit Colombo Plan, which established no elaborate central administrative machinery, started off with technical co-operation support pledged for a three-year period. There has never been a time when either the United Nations Expanded Program or the United States Point Four program could look that far ahead.

This does not mean that the programs have been starved. On the contrary, there are strong reasons for thinking that the Senate committee was correct in its estimate that the present levels of technical co-operation represent about the optimum capacity of the recipient countries to absorb technical assistance and use the kind of technical training the programs provide.[20] The problem is not the inadequacy of funds available for technical co-operation but the uncertainty under which the organizers of technical co-operation must operate. This is, of course, primarily a psychological matter. But United States Congressional policy seems to have been carefully calculated to maximize the uncertainty and to prevent any reassuring conclusions from being drawn from the fact that we have actually pledged and paid our part of the United Nations Expanded Program each year or from the fact that we have extended the authorization and appropriated substantial funds for the bilateral program in each session of Congress.

There is no real assurance, either at the UN or in Washington, that technical co-operation will be continued. This means, as has been pointed out, that: [21]

> At the present time our overseas operations are gravely burdened by the necessity of coping with ten- and twenty-year problems with four- or five-year projects manned by one- or two-year personnel.... We cannot keep repeating the first year of our programs; sometime we have got to get on to the second and third and tenth and twentieth year.

This very precariousness of financial underwriting, on the other hand, militates against the kind of technical assistance capable of stimulating and co-operating in the formulation of soundly based national plans of economic development that would get technical co-operation off its present *ad hoc* and largely opportunistic basis into the main stream of national and international affairs. For example, although only nine of the thirty-eight countries included in the TAB evaluation review in 1957 had anything resembling adequate plans of economic development, the Expanded Program was devoting only 14 per cent of total field program expenditures to national planning development and the improvement of public administration.[22] Although it is not possible to make a meaningful comparison with the United States bilateral program, its contribution to the furtherance of planning for national economic development is largely imperceptible.

Furthermore, although ICA makes a considerable point of the increase in "project-type" assistance, in which the bilateral program supplies technical "know-how" and equipment for specific projects, the fact remains that the project program is still only a little more than half of the total program.[23] This is a substantial improvement, however, over 1953 and 1954, when the project program was about one-sixth of the total. Since the United Nations program of technical co-operation is not accompanied by defense support, development assistance, and other economic aid, none of its work is "project-type" assistance in the ICA sense of the term.

On the other hand, the complete sepa-

ration of Expanded Program technical co-operation from the activities of the Bank, the Fund, and the International Finance Corporation has tended further to shunt the Expanded Program out of the main stream of economic development activities. It is of some significance that the over-all surveys which in several countries have provided the basic data for national economic development planning have been made under the auspices of the Bank itself; the Expanded Program has had little or no part in them.

This separation of general technical co-operation and investment and economic assistance, most pronounced in the United Nations program and the OAS program, not only tends to establish a low ceiling for technical co-operation financing, but divides economic development activities which should never be permitted to pull apart. No ILO technical assistance mission, for example, should go into a country to establish or revise its labor and social security legislation and administration without understanding fully the ramifications of its work in respect of investments, production costs, and profits. No International Bank for Reconstruction and Development and International Finance Corporation mission should go into a country with funds for investment in industrial or commercial development without understanding fully the implications of its investment with respect to wages, conditions of labor, social security, education, health, and the public welfare. No social worker or public health expert should go into a country without understanding that his business is fundamentally economic development, and no industrial or transportation adviser should go in without understanding that his business is fundamentally the improvement of living conditions. The supreme business of all of them, of course, is to help in the building of indigenous institutions for the management and development of a democratic polity and economy.

# The Role of the Technical Expert

By LYNTON K. CALDWELL

ABSTRACT: Insofar as we can realistically speak of an expert's "role" it is shaped by four principal elements, only one of which can be relied upon to approximate constancy. These elements are the technical co-operation agency, the expert himself, the requirements of the task to be fulfilled, and the host government. Each of these elements is subject to variations and contradictions that make it improbable that a generally satisfactory definition of the expert's role will be discovered accidentally. The great variety of technical co-operation tasks and the individual differences among experts make generalizations concerning the role of experts of questionable validity. Insofar as clarity of purpose regarding objectives is shared by the technical co-operation agency, its expert, and the host government, clarification of the expert's role becomes more nearly possible. Responsibility for the clarification necessarily rests primarily with the co-operation agency. It is in the planning of the project and in the selection and briefing of the expert that the shared objectives of the project are brought to focus on the particular task to which the expert is assigned and hence on the role which he is to play.

---

*Lynton K. Caldwell, Ph.D., Bloomington, Indiana, is Professor of Government and Director of the Institute of Training for Public Service at Indiana University. He has served on the faculties of the University of Chicago, Syracuse University and the University of California (Berkeley). He has undertaken a number of technical co-operation assignments abroad in the field of public administration principally in Colombia, Philippines, Turkey, Thailand and Indonesia. He is the author of The Administrative Theories of Hamilton and Jefferson (1944), The Government and Administration of New York (1954), and numerous articles relating to government and public administration.*

THE ROLE of the expert is compounded of a number of elements, principal among which are: definition of his task by the agency employing him; his own view of his role; the knowledge, skills, and action that his task requires; and receptivity in the host country where he is to work. When related in a mutually consistent manner, these elements provide a basis for clarity of decision as to what the expert should do—when, where, and how. But when these elements are inconsistent, or in conflict one with another, the expert will at best experience frustration and at worst he will experience failure.

To the degree that communication and comprehension are refined and perfected, the operating problems of the expert are minimized. Unfortunately for the expert, the processes of human communication and of understanding are grossly imperfect. Technical co-operation is therefore much less "technical" than the term might suggest.

The environment of the expert is characterized by relativity and uncertainty. It is rarely definable in extremes of black and white, but rather in an infinity of grays that vary in scope and intensity with change of time and circumstance. There is no attaining absolute harmony among the elements that determine his role. Thus the expert works in an environment in which operating problems, being inevitable, should be anticipated. Only through correctly appraising the problems with which he is confronted can he discover how most effectively to play the role for which he has been cast.

The role of the expert in technical co-operation does not really differ in principle from many other occupational roles in society. The elements of: definition of the job by the employer, employee self-image, employee's knowledge and skills, and expectations of clientele combine to form the roles of the members of any administrative organization. What is distinctive about the role of the expert in international technical co-operation is the degree to which disparities exist among these elements and hence the multiplication of points at which misunderstanding and conflict may occur.

Cultural differences underlie most of the operating problems encountered in technical co-operation. Where recognized and understood, differences in values, attitudes, and customs may be taken into account and possibly dealt with successfully. Misunderstanding and conflict are more likely to occur when deep-seated cultural values indirectly and unobtrusively influence policies and attitudes in the institutional framework within which the expert works. The expert may fail to interpret these policies and attitudes correctly because he has not perceived the cultural forces that make them intelligible.

Where cultural differences within national boundaries are pronounced, many of the difficulties which confront the expert in the international environment emerge. Efforts of the government of the United States to influence and assist the American Indians provide numerous illustrations. In the international context, the experiences of various missionary ventures and of colonial administrations are instructive. What they teach is that the factors which determine the success of the technically qualified expert are, broadly speaking, cultural.

Cultural differences, including psychological differences, condition human relations in whatever context they occur. Only through realistic appraisal of the influence of these cultural factors upon the task before him can the technical co-operation expert discover how to play his role effectively. This appraisal may be intuitive as well as conscious and systematic; it will in some measure unavoidably be subjective. If the expert is to play a constructive role, the "sizing-up" of his job must be somewhere near correct. To the extent that he is unable to appraise the conditioning circumstances correctly, constructive accomplishment on his part is largely a matter of chance.

## AGENCY CONCEPT OF THE JOB

Initial determination of the role of the expert is begun by the government that requests technical co-operation, but the formal definition of that role is principally a responsibility of the agency that supplies it. The agency may be any of several types. It may be an international organization, such as the United Nations; it may be an agency established by a national government, as for example the United States International Cooperation Administration; or it may be a nongovernmental philanthropic foundation or consulting firm. The agencies that initially define the expert's job obviously set the conditions that influence the choice of individuals to fill the job, and the subsequent development of the expert's role in relation to the job.

The fewer the commitments of the technical co-operation agency, the simpler and easier will be the definition of its mission and, to this extent, of the expert's role. As the number of voices seeking to define the mission of the agency increases, the chances for a consistent, generally acceptable definition diminish. Thus private consulting firms and foundations are ostensibly better able to develop a clear concept of the technical co-operation job than is the governmental or international agency that must try to reconcile larger and more complex differences of viewpoint, interest, and objective.

When the newly recruited technical co-operation expert first attempts to find out just what his agency expects of him, his introduction to the frustrations of his assignment begins. He discovers, but not always as readily as he should, that his employing agency is an abstraction. The reality is the officials, line, and staff, who negotiate agreements, draft contracts, write policy directives, control expenditures and enforce personnel rules. The expert may discover that the executive officer who must authorize his transportation and housing in the field does not necessarily have the same concept of his role as the program officer who prepared the specifications for his assignment. He may learn to his dismay that the concept of his job held by agency representatives in the field is not necessarily the one he understood to be held at agency headquarters.

As he moves to implement his assignment in action, he may find himself pulled up short by budget or personnel officers who are proceeding along lines of reasoning quite dissimilar from those that are uppermost in his mind. Technical co-operation operations abroad tend to exaggerate the already existing differences between line and staff responsibilities. The staff continues to function within the confines of its own culture or administrative milieu whereas the line, to which the expert belongs, must adapt to conditions in the host country.

### *Defining the task*

In the course of time, the expert discovers that the agency concept of his role is a composite of diverse objectives assumptions, and attitudes. Idiosyncracies of agency administrators, the various regulations and procedures of the agency, the prevailing political situation in Congress or in Committee Five, the relative temperature of the cold war—all are random examples of the types of factors that may influence the agency concept of the expert's job.

It is not in the nature of the situation for anyone in his agency to be able to tell him fully or exactly what his

role is intended to be. And, in any event, the capacity of the employing agency to define his role is limited by the specific nature of the work to be done and circumstances in the host country which influence the shaping of his role regardless of intentions in his employing agency.

In brief, the expert needs to understand at an early stage in his work that his agency cannot, indeed should not, provide him with a complete or wholly consistent definition of his task. This is not necessarily an undesirable state of affairs, particularly when, as often happens, the expert is engaged in an exploratory or pioneering venture. But the expert does need agency support in identifying the forces and factors that shape his job in order to avoid embarrassment to himself and disaster to his program. He needs to know the apparent limits of the possible and the permissible so that if these boundaries present obstacles to his assignment, he may prepare himself to cope with them.

Certainly the agency can increase the possibilities for successful technical cooperation insofar as it can achieve clarity and consistency in its purposes and operations. Effective executive leadership at the top levels of technical cooperation agencies is an essential condition for the formulation and propagation of agency concepts that give unity and drive to agency programs. Where top policy leadership falters, subsidiary influences in the agency—notably legal, fiscal, and careerist—gain in relative strength. Lacking guidance from the top, they proceed to affect agency policy in their own respective ways, sometimes in a manner inconsistent with agency program objectives. The agency cannot and should not attempt to define completely the expert's role; but to the extent that the agency heads are unclear or indecisive regarding goals and objectives, the agency cannot provide the guidance and support that the expert may rightfully expect from it.

## SELF-IMAGE OF THE EXPERT

Even if circumstances did not compel the expert to play a large part in the definition of his role, his behavior would in any case be influenced by his concept of himself in relation to his concept of the task.

There is an obvious relationship between the expert's self-image and the reasons he entered international technical co-operation work. The reasons are usually mixed. They are not necessarily consistent, and they are always personalized beyond any possibility of categorical analysis. Among the reasons that motivate experts, the following may be identified as fairly common: urge to help people in need of his expertise, desire for change and adventure, professional challenge of the assignment, improved living standard, sense of obligation to his employer, and escape from some of life's insoluable complications.

The motives of the expert may therefore be influenced by factors unrelated to his actual assignment in the field. Dissatisfaction with his job at home, difficult domestic relations, desire to enhance his professional reputation, or merely to earn more money may be the decisive factors in his decision to accept an assignment abroad. These self-serving factors may, but do not of necessity, preclude the expert's giving his best to his field assignment. If theoretically "appropriate" motives were an exclusive basis for determining which experts engaged in international technical cooperation work, their numbers would indeed be few. Selfless motivation offers no assurance of an expert's effectiveness.

The self-image of the expert in relation to his task involves also his assumptions regarding the people with whom he is to work, particularly the nationals of the host country. What he thinks

the host country people think of him, what he wants them to think of him will also influence his appraisal of the total situation and his role in it. Casual observation, insofar as it can be relied upon, indicates that the American technical expert characteristically differs from his European or Asian counterpart in his greater concern for being liked and his lesser sophistication in relations with host country peoples. As a result, the behavior of some American experts abroad is puzzling to host country associates. Their apparent disregard of national values and sensitivities does not seem to square with protestations of friendliness. Nevertheless, the open friendliness of many American experts has often won friends where the status-conscious reserve of certain experts from older cultures has imposed an additional barrier between the expert and the host country people.

There is a myth pervasive among large numbers of Americans that, beneath superficial dissimilarities, people everywhere are fundamentally the same. In a rigorously limited sense the belief may be valid; in the broad generalizing sense in which it is often used, it is untrue and misleading. The myth makes mischief when the American expert convinces himself that people everywhere really want to be like Americans and that present dissimilarities are largely the consequence of "regressive" forces such as economic underprivilege, colonialism, tradition-bound authoritarianism, communalism, and "immorality."

A misconception of this sort can seriously prejudice the ability of the expert to play a constructive role abroad. He may in effect become a missionary more concerned with the cultural transformation of the host country than with the specific problem for which his assistance has been sought. In host country eyes, he may well be an egregious meddler who must be tolerated if he cannot be dismissed. Non-Western peoples in particular have developed immunities to gratuitous interference by well-meaning representatives of more "advanced" cultures. The expert is permitted to keep himself busy in relatively harmless ways while host country officials employ tactics of procrastination, deliberation, and delay until his tour of duty ends.

In brief, the self-image of the expert may be neither more nor less realistic than those of people in other walks of life. It is the effect of his self-image on the situation in which he operates that makes it important. For in his situation, human relations assume a problematic character that is much greater than he would ordinarily experience in his own country or among his own people.

## REQUIREMENTS OF THE TASK

The tasks for which technical cooperation is sought are not abstract technical problems; they involve factors of time, place, and people. The interrelations between these factors and the particular need for which the knowledge and skills of the expert are sought are seldom understood and interpreted in the same way by all of the parties concerned. Top leadership in the technical co-operation agencies, and frequently also in host countries, tends to appraise the task of the expert in political terms whereas the expert and sometimes his host country counterparts tend to think in technical or professional terms. Technical co-operation administrators, having ideas of their own about what is good for the host country, may not be altogether frank with host country officials about what they intend that the expert accomplish. And there are circumstances, some of which will presently be detailed, under which host country officials cannot or will not define the technical co-operation task in realistic terms. National pride, political insecurity, lack

of information or understanding are among the more apparent reasons for an inapt projection of the task by host country officials.

The expert arrives on the scene of action to begin his work. How will his task shape his role? Particularly if he is inexperienced in international technical co-operation, the factors in the task that in the beginning will appear most important are the demands made upon his particular brand of expertise, upon his professional knowledge and skills, as for example engineering, medicine, agriculture, or accounting. These technical requirements of the task are important and do shape the expert's role; but they also entail factors of place and people. If, for example, the expert's task involves improving potato culture in the Peruvian Andes, he may have to consider how to obtain changes in agriculture as practiced by the Andean Indian whose culture belongs more to the sixteenth than to the twentieth century and who notoriously lacks enthusiasm for "improvement." Time, climate, and culture make potato growing in Peru a problem somewhat different from potato culture in Maine, even though the botanical behavior of potatoes may be roughly the same.

The professional badge that the expert wears cannot therefore adequately identify his role. The role follows partly from the profession in relation to the task, but the task invariably imposes additional requirements upon the human relations skills of the expert with particular emphasis on ability to communicate.

Effective communication may require the expert to know the language of the country in which he works—a knowledge of several languages and dialects may be required. But the expert must be able to communicate in his own language and this is not only a matter of linguistics but also a matter of mental attitude. Ability to listen, awareness of nuances of meaning and emotion, sensitivity to the situation—these also are part of the process of communication.

Perhaps the only universal and constant requirement that all technical co-operation tasks impose on the expert is gaining the confidence of those with whom he must work. Confidence in this sense does not necessarily mean affection, friendship, or trust in all instances. It does entail respect for and trust in the integrity and judgment of the expert insofar as his expertise is concerned. Experts have sometimes aroused the hostility of host country officials when their technical advice or service inadvertently interfered with cherished political schemes or ambitions. Nevertheless, these same experts have often been highly regarded as objective and accurate advisers even though their advice was distasteful and perhaps unacceptable. If the expert loses the confidence of the host country officials, his usefulness ends, no matter how right he may be. He can no longer successfully perform the technical aspects of his task because the human relations requirements of his work are no longer met. The task of the expert cannot therefore adequately be understood in wholly technical terms.

## RECEPTIVITY IN THE HOST COUNTRY

Regardless of how the expert or his agency defines his role, circumstances in the host country will have a great deal to do with how the role may be played. There are at least three factors, quite independent of the personality or formalized assignment of the expert, that shape his task and exert a general influence on the situation in which he works.

The first of these is the receptivity of the host country to technical co-operation from abroad in principle and from the expert's country in particular. Guaging the expectations and receptivity of host country officials is seldom easy. The officials do not always fully reveal their purposes in requests for technical co-operation. They may be persuaded to accept co-operation that they do not fully understand or desire. Moreover, the individuals filling public offices may change. Those who negotiated a technical co-operation agreement may be out of office when the expert arrives and discovers that the original enthusiasm and support for his program has disappeared.

The newly developing countries that are the principal recipients of international technical co-operation vary considerably in their receptivity to foreign expertise. They also vary in the types of programs that they welcome. Where public officials are highly sensitized to the possibility of foreign interference in their domestic affairs (as in countries formerly under colonial administration), the expert may be constrained to play a more cautious role than in countries in which no excessive fears of foreign intervention are nourished.

A second factor is the attitude of host country officials concerning the need for the expert's services. Where demand for the service is great and technological skills are weak, the expert may find himself pressed to engage in operational duties—to perform services that the host country has no personnel of its own to provide.

It is often easy for the expert to enter into the operational role. He may know better how to perform the particular service than anyone in the host country. He may indeed have been recruited for an operating assignment and this may be the role in which he can make the greatest immediate contribution. However, he may be tempted into an operating role under less appropriate circumstances. In default of host country support, he may assume operating responsibilities in order to attain the appearance of having achieved technical co-operation objectives. In so doing he risks defeating what may have been his original purpose—to help the host country help itself through developing new capacities in its nationals. Unfortunately, host country officials may be willing to permit him to act as a substitute for one of their own nationals if thereby they obtain the semblance of a successful program and a service with minimal cost to their national budget. The results may superficially appear successful to the expert's superiors at home. But the more fundamental objectives of international technical co-operation are seldom realized in this manner.

### *Readiness of host country to use new knowledge*

A closely related third factor is the readiness of the country to respond to or to support the particular brand of knowledge that the expert represents. Careful program planning should have ascertained the ability of the host country to attain the level of personnel skills and financial support needed to complement and to sustain the work of the expert. But the expert needs to understand that the concern of the host government for his particular services will almost necessarily be sporadic and will be placed (sometimes lost) in a broad, politically colored context. If the expert understands this, he may better overcome feelings of neglect and ingratitude, and he may be better prepared to cope with the delays and false starts that must be reckoned with in technical co-operation work.

The enthusiasm and ambition of host country officials sometimes make them overly optimistic regarding their ability to utilize the level of technical service that they seek. They may, for example, prepare to establish new universities

when by any objective appraisal of need, attention to elementary and secondary schools should claim priority. Another illustration may be drawn from a South American country, where experts arrived to install expensive therapeutic equipment for a hospital only to discover that no technicians had been trained to the point of readiness to receive instruction in the operation of the equipment. If the expert's assignment is inadequately programed in relation to host country readiness to play its role in the co-operative venture, difficulties and disappointments can be safely predicted.

As with American states receiving federal grants, there is sometimes an understandable tendency among nations receiving international technical assistance to obtain such aid as may be available with a minimum of commitment. At worst this may lead to acceptance of programs for which the government in question has no real understanding or enthusiasm and of experts for which it has little use. Under these circumstances it may be impossible to formulate any workable role for the expert.

For example, some years ago a Middle Eastern government requested international technical co-operation to establish machinery for advice on matters of high-level economic policy. A distinguished team of experts was assembled in the country prepared to begin work. Meanwhile, however, the heads of the government changed their minds about the desirability of providing machinery for advice that they had reason to believe might prove annoying or embarrassing. But they were not prepared to admit that they had made a mistake. In consequence, the experts were required week after week to cool their heels in the capital city. They were not permitted to proceed with their assignment; neither were they permitted to abandon it. After several months of frustrating negotiations, this abortive mission was terminated, but with deplorable cost in wasted funds and human resources.

Misguided enthusiasm, national pride, and political importunities among host country officials unfortunately give rise to circumstances in which the expert may find himself confronted with a script quite different from that for the role which he expected to play. When he arrives in the host country it is too late to call off the assignment except under most exceptional circumstances. Realistic and timely appraisal of the expectations and capacities of the host government by the assisting agency and its expert therefore becomes an essential stage in the definition of the role of the expert.

## CLARIFYING THE ROLE OF THE EXPERT

Of the four principal elements that influence the expert's role, the agency concept of his task is the one most susceptible of modification. The greatest opportunity for substantial clarification of the expert's role rests with the agency that extends technical co-operation and employs the expert. For reasons already detailed, the three other elements that shape his role are less amenable to change.

The requirements of the task, technical and behavioral, are fixed by the very nature of the things to be done. They can be changed only insofar as other factors change; for example, the way in which host country officials interpret the task. But it is not realistic to rely altogether upon host country officials for clarifying the expert's role. They must, of course, be involved in the clarification, but we have noted numerous reasons why they cannot assume full responsibility for it. Nor can the expert himself be fully trusted to define his own role even though he will inevitaby shape its development. The expert brings not only knowledge and skills to his task but also a self-image and a complex of personal, sometimes contradictory, motives. In the absence of institutional guidance and direction, these personal factors could seriously distort the role required of him if the purposes of technical co-operation are to be fulfilled.

We are thus ultimately forced back upon the fundamental question regarding the role of the technical expert: What is the purpose of the technical co-operation assignment for which his services are enlisted? Definition of purpose is the inescapable responsibility of the agency that extends assistance and provides the expertise in technical co-operation projects. To the extent that those who formulate and execute the policies at top levels in technical co-operation agencies are unable to achieve clarity or consistency of purpose, it is futile to seek objective clarification of the expert's role in other places.

# Personnel Management for Technical Co-operation

By Ronald W. Jones

Abstract: Since technical co-operation is achieved primarily through people, personnel management assumes particular importance in the effective administration of the programs. While many of the problems are common to domestic activities, many others arise out of the unique nature of this type of program. Requirements are primarily for technical specialists having sufficient experience and maturity to serve as advisers to newly developing countries. Therefore most of those entering this field necessarily do so at mid career without the benefit of specialized preparatory training or experience. Few will have had previous overseas work experience, still fewer in an activity in which the entire family plays a significant role in achieving the objectives of the program for which the father is employed. Until recently, the United States had little experience in building a continuing overseas staff of technicians, ranging from health educators to economists, to agronomists, to tax experts, and others. Over the past few years, however, the International Cooperation Administration has undertaken a fundamental reorientation of its overseas personnel system to better meet the longer range as well as the immediate needs of co-operative programs with sixty-odd newly developing countries. In this review of major problems of personnel management for international technical co-operation, the approaches which ICA is finding practicable are presented as illustrative of principles and techniques which may have broader applicability.

---

*Ronald W. Jones, Washington, D. C., has been Chief of the Career Development Division, Office of Personnel, International Cooperation Administration since this division was established in April 1957. He has served in various capacities with ICA and predecessor agencies since 1950 except for 1952–55, when he was Ford Foundation Consultant on Program Evaluation to the Government of India. During this period, he also carried out similiar consultant assignments with the Governments of Burma and Pakistan, respectively.*

That personnel management is accorded separate treatment in this compendium suggests there must be something fundamentally unique about the personnel requirements of technical co-operation programs. There is. The staff member new to this type of activity finds himself, first of all, "away from his home," perhaps for the first time. He and his family must learn how to adjust effectively to a completely new cultural, social, and even physical environment. They must learn how to gain acceptance as "foreigners" and by their acts and attitudes reflect credit upon their organization and their country. Few will have had previous experience of the entire family's playing a significant role in achieving the total objectives of the program in which the father is employed. And every one of them must play this role "in a goldfish bowl," so to speak, twenty-four hours a day, 365 days a year.

On the professional side, the employee also typically finds himself in a new role: That of an adviser, a demonstrator, a stimulator in a technical field in which his whole prior experience probably has been as a "doer." To elaborate the qualifications necessary to perform this essential function effectively would carry us far beyond our present purpose. Suffice it to say that technicians engaged in technical co-operation programs obviously must have the expertise which newly developing countries so sorely need to achieve progressive development and internal stability. More importantly, they also must have the ability to put their knowledge to work on practical problems in a way which will help develop the capabilities of co-operating country technicians to cope effectively with similar problems in the future.

On another front, the very nature of technical co-operation programs necessitates unique approaches to personnel programing and management. Being co-operative programs, it is as necessary as it is reasonable that the host government be a full partner in deciding both the program content and the number and qualifications of "outside" technicians needed to carry it out. Unless the means as well as the purpose of foreign assistance is acceptable to the receiving country, how can they be effective in furthering mutual objectives? From an operating standpoint, however, the time required for this step is an additional factor in planning both recruitment and reassignments; hence, in the timely filling of positions.

While many of the problems of personnel management for technical co-operation are broadly common to all public and private organizations engaged in this type of activity, each organization necessarily must approach them in light of its own particular situation. About three years ago, the International Cooperation Administration (ICA) began a fundamental reorientation of its overseas personnel system to better meet the longer range as well as the immediate needs of the Mutual Security Program. Toward making the succeeding review of a few of the broad personnel management problems confronting most organizations conducting technical co-operation programs more specific, we shall illustrate briefly these ICA approaches to meeting these respective problems.

## Personnel Programing

What does any organization have reason to expect from its personnel system? Basically: A staff of the quality, composition, and size required to carry out its program in an efficient and timely manner. Personnel programing must, therefore, be geared in the first instance to translating the substantive program into specific personnel requirements and relating them to probable availability of

staff to meet them. Secondly, and more importantly, it must be geared to meeting dynamic personnel requirements at the time and place planned throughout the program implementation stage. The mechanism, therefore, must provide for advance time scheduling of a multiplicity of interrelated actions. Finally, in a continuing technical co-operation activity, the system for personnel programing must make adequate provision for furthering simultaneously other desirable personnel management practices—for example, balanced staffing in the sense of teaming complementary skills and experience, periodic transfer, selective assignments to broaden the experience and develop the capabilities of individual staff members, enhance retention of qualified staff.

In meeting this combination of overall and specific personnel programing requirements, ICA employs three primary tools:

Staffing Patterns (tables of organization) as the primary bases for advance planning of the number and type of staff required to carry out an approved country program, combined with the Personnel Roster reflecting the most pertinent information for each incumbent—for example, time at present post, home leave eligibility date, expected continuity in program.

An Assignment Board which co-ordinates the planning of all assignments and insures not only proper matching of the employee's qualifications and the duties he is to perform, but also that his capabilities are best utilized and developed.

A Completion of Tour Report submitted by the employee and his Mission six months prior to completion of a regular two-year tour of duty which brings their respective recommendations on the employee's immediate future systematically into Assignment Board consideration at the very outset.

## KNOWING THE STAFF: THE KEYSTONE TO PURPOSIVE PERSONNEL DECISIONS

Seldom is the adage "to act wisely one first must know the facts" more applicable than in the field of personnel management. The hopes, aspirations, and basic satisfactions of people are involved as well as efficiency in achievement of program objectives. And, it is not enough that the system provide top management with the knowledge about the staff which it needs for informed personnel decisions. The individual staff members must have confidence that decisions are arrived at objectively in full consideration of their particular capabilities in comparison with those of all others throughout the organization.

Without necessarily arguing that the same approach is equally applicable to all organizations engaged in international technical co-operation programs, experience has demonstrated that for ICA centralized control of assignments, promotions, and related major personnel actions best meets the needs. We should hasten to add, however, that each Mission Director is delegated sufficient flexibility in use of staff assigned to him to best meet current program requirements. Put another way, there is flexibility in the use of staff during a given tour of duty so long as it does not basically affect future use of this employee elsewhere in the total program.

Accurate, comprehensive records on employee performance and professional potential are vital prerequisites to well-informed personnel decisions in this type of situation. Fully as important is the use of this information in such a way as to insure objectivity and fairness to every individual employee. For these purposes, ICA uses four primary interrelated techniques:

Employee Appraisal (Efficiency Report) covering not only an evaluation of the employee's performance of present duties but also that of a wide range of personal and related qualities indicative of strengths and weaknesses for future assignments. In addition to a comprehensive factor rating, this periodic evaluation also includes a narrative discussion of various aspects of the individual's performance and potential.

The Completion of Tour Report, discussed in the previous section, provides the Mission's current evaluation of the employee and recommendation for his next assignment.

An Employee Career Appraisal is designed to elicit the individual's judgment of his best longer range role in the program and the kind of assignments—including training—which will best prepare him for reaching this goal.

Evaluation Panels have been introduced to synthesize all of the above and other relevant—and documented—knowledge about individual employees in making a comparative evaluation of the capabilities of each employee who has completed two or more years in the ICA service overseas. These comparative evaluations, covering an employee's entire professional career, focus primarily upon his future potential and how best to use and develop it. All major personnel decisions—assignments, promotions, terminations, training, commitments with respect to security of employment—are guided by the results of these comprehensive, competitive annual reviews by Evaluation Panels. The second round of these annual Evaluation Panel reviews is now in progress. They are proving invaluable as means for making knowledge about staff an effective tool for purposive personnel management.

## PERSONAL RANK AND FLEXIBILITY

To achieve the essential flexibility in use of staff to best meet dynamic program needs, ICA has adopted a "personal rank" system for setting the grade and salary for the level of officer (Foreign Service Reserve) staff. Each employee's grade and salary is established competitively on the basis of his qualifications and potential value in the ICA program overseas. Entrance grade and salary for a new employee are set by a Selection Panel. This Panel considers his qualifications—both technical and personal—in relation to those of other candidates and of present employees in the same occupational field. Personal Ranks for in-service staff were established on the basis of Evaluation Panel reviews.

Under this system, the individual's Personal Rank—grade and salary—remain fixed until changed as a result of competitive evaluation by an Evaluation Panel. While assignments normally are made to positions classified at the same level, they may be to positions carried on the Staffing Pattern at higher or lower grades if program needs warrant. In either event the employee's salary grade remains at that of his Personal Rank.

The advantages of this flexibility in meeting current priority requirements are fairly apparent. In addition, ability to use qualified staff elsewhere in the program, when they finish their assignments in a particular country, without necessarily waiting for an opening at exactly the same grade level, helps materially to reduce time loss in transfers and also complete loss of individuals needed in the program. The flexibility provided by a Personal Rank system also contributes significantly to security of employment for those who are qualified for and desirous of continuing in the program.

## THE LANGUAGE REQUIREMENT

Ideally every man, woman, and child going abroad for service in technical

co-operation programs should be able to converse fluently in the language of the country in which they will be living and working. Not only would the employee's technical effectiveness be higher. He and his entire family would find adjustment to their new environment much easier, their contacts with the people of their new community mutually more interesting and reassuring. Realities, however, strew the path to this "ideal" with well-nigh insurmountable obstacles. The sixty-odd countries in which ICA operates, for example, comprise considerably more than a hundred different language-dialect areas. Many of these languages are exceedingly difficult to master. Gaining a working proficiency of even the easiest ones requires months of intensive instruction; the more difficult ones up to several years. Transfers to best meet program needs frequently mean starting over with a new language. Basing selection for assignment primarily upon language competence would be to sacrifice unduly technical qualifications in most instances. Keeping a person for long periods in the same country merely because he knows the language would also be to sacrifice other priority objectives of over-all sound personnel management.

About a year ago, in initiating a substantially expanded and intensified program of language instruction for its overseas personnel, ICA adopted a selective job-related approach as being best suited to its immediate needs. Like those of the entire new personnel system, of which language training is an integral part, the policies underlying this program are aimed toward meeting the longer range as well as the immediate needs of the Mutual Security Program. To identify priorities, the importance of language to effective total performance of each position in each country was established at the outset, primarily on the basis of judgment of the Mission to that country. At the same time, each employee reported his best estimate of his own proficiency in foreign languages. Between them the two provide a basis for establishing individual language training needs.

The importance of language to job effectiveness is but one side of the equation. On the other are the practical considerations of feasibility of equipping an incumbent with the proficiency needed. These necessitated varying the approach to different language areas to take account of the difficulty of the language, its transferability to positions in other co-operating countries, and so on. Also consideration had to be taken of the feasibility and comparative advantages, in different situations, of providing language training away from the post and at the post, respectively. Here the time flow of numbers to be trained and the amount and intensity of instruction to be given assume particular importance.

Out of these considerations have evolved five basic patterns of language instruction each tailored to the needs and the feasibility of meeting them in the near future in different situations. In carrying out this language training program, ICA utilizes primarily the language instruction facilities of the Foreign Service Institute in providing the actual training. Shared use of these facilities by ICA, the Department of State, and the United States Information Agency makes it possible to provide, at minimum cost, the quality of instruction and technical linguistic supervision so essential to efficient language training.

This effort to make language a positive tool for enhancing the effectiveness of technical co-operation is yet in its infancy. Many operational problems are still to be fully resolved. And, at best, meeting the language requirements of a diverse and dynamic technical co-operation program is a continuing and long range undertaking. The objectives, nonetheless, are well worth the effort toward achievement.

## DEVELOPING THE PERSONNEL RESOURCE

A comprehensive exploration of the unique character of the employee development "problem" in technical co-operation programs, and the opportunities for and experience of various organizations in increasing the effectiveness of staff performance through planned approaches to employee development would require a separate book in itself. Such a book needs to be written some day. A number of individuals and institutions already have done or have under way exceedingly promising research on various aspects of this problem. But, for the present, let us consider only a few of the major areas.

### *Orientation*

How effectively a person performs in any new position depends in large measure upon how well he understands what is to be done and the total environment in which the activity takes place. Orientation as a planned and systematic activity of the respective organization aims toward facilitating and expediting this essential learning and adjustment process.

How long would be required to adequately prepare a family for their first overseas assignment in a technical co-operation program is hard to say. Certainly longer than ICA, and no doubt most other organizations, can practicably devote to it. In any event, prearrival orientation can never meet the total need. A foreign culture remains an abstraction until a person is in it and has a chance to see and feel the contrasts with his accustomed surroundings.

All ICA employees new to the overseas service participate in a fairly comprehensive three-week orientation program preparatory to departure for their respective missions. In content this program focuses upon the purpose and objectives of the Mutual Security Program; the organization and methods for achieving these objectives; and the sensitizing of the employee to major cultural, social, economic, and political factors in adjustment to a foreign environment. This predeparture orientation is extended and particularized to the respective country by systematic programs conducted at each mission.

### *Career development planning*

Purposive assignment—in the sense of best utilizing and developing an individual's capabilities—necessarily must aim toward some concept of that person's best use in the program at some time in the future. Unless all concerned with the assignment aim toward the same goal, there can but be disagreement and compromise. If the employee's own expectations are inconsistent with the longer range plans conceived by those responsible for his assignment, he is likely to be dissatisfied with the intermediate steps. And, unless the basic facts regarding his potential are adequate and accurately analyzed, achieving his actual best use over time may be purely accidental.

Systematic career development planning is basically a research job. It cannot be done satisfactorily amidst the pressures surrounding individual assignments. Conversely, however, no plan, regardless how carefully prepared, can be more than a guide in the actual assignment process. But, used as guides, and changed as new evidence warrants, individual career plans based upon comprehensive knowledgeable evaluations and discussion with the employee have a real contribution to make to efficient personnel management for technical co-operation as well as for other types of programs.

The International Cooperation Ad-

ministration is moving progressively toward such a system of career planning for selected employees. The annual comparative appraisals made by Evaluation Panels together with the materials from which they are derived—including Employee Career Appraisals—provide an excellent basis for systematic forward planning. Experience of the Department of State and the United States Information Agency has demonstrated such an approach to be feasible in an international service. While the process will be more complex, there is no apparent reason why the basic concept cannot also be adapted to the international technical co-operation field.

*Staff development training*

Training needs in technical co-operation are of two broad types. One is that common to all organizations: Developmental training aimed toward expanding a particular kind or level of competence for which there is a special need or/and the employee's capabilities for higher responsibility. The second broad type is essentially peculiar to technical co-operation personnel. This is the need for periodically updating and revitalizing the technician's knowledge and skills which literally increases with continuity of a technician's service. This is inherent in the technician's role of transporting and adapting technical expertise from a technologically more advanced economy to one which is less developed. The longer the technician works continuously with one project, the farther out of date his own contribution becomes. Thus, periodic training assignments, designed to keep his technical competence fresh and vigorous, can make significant contributions to efficiency of performance.

Beginning in fiscal year 1958, ICA launched—as an integral part of its reoriented overseas personnel system—a comprehensive program of staff development training focusing upon the complex needs outlined above. Operationally, the approach to evaluation of individual training needs is a three-step process: The agency's interest in the man, that is, his potential for future service; how training would enhance his contribution to furthering the Mutual Security Program; and finally the prospective returns in relation to costs including other requirements for his services at a particular time. Training, where given, therefore, must, and does, take a variety of forms. In each respective case the content, method, and duration are tailored to the needs of that particular situation.

In meeting its training needs, ICA utilizes existing facilities of other agencies, universities, colleges, business firms, and others to the fullest extent. In some cases, however, special training programs have to be developed to meet needs unique to this agency. For example, the programing of technical and economic assistance to newly developing countries requires a kind of specialized competence which neither regular academic courses nor work experience in the United States adequately provides. To meet the particular needs in this area, an Institute on ICA Development Programing has been developed and is being conducted for ICA by the School of Advanced International Studies, Johns Hopkins University.

In addition to these staff development training activities, ICA also has in operation two companion training programs. Both are designed to bring into the program a number of carefully selected younger staff members who have the potential for growing with experience in the program. Prior to initial assignment to regular duty positions, they are given the kind of broad-based work/training experience in the techniques and methods of technical co-operation with newly developing countries which will prepare them for assuming positions of higher responsibility. This type of training program provides a means for at least partially meeting the problem of filling positions from below which is especially difficult in technical co-operation programs where needs are predominantly for staff sufficiently experienced and mature to serve as technical advisers to co-operating countries. They also provide opportunities for well-qualified, but less experienced, persons interested in technical co-operation as a career to follow before they get too settled in other occupations.

## SELECTIVITY IN EMPLOYMENT

Few will seriously question that employment for service in international technical co-operation programs must be highly selective. Precisely how to select the "right" people and avoid sending any who may fail, however, is a different matter. True, there are some guidelines. For example, experience has demonstrated that evidences of inflexibility, emotional instability, a dominating personality, alcoholism, domestic strife, fear of living abroad, and a number of related factors are danger signals. While the converse of these negative characteristics usually tend to be on the plus side, there is no guarantee that this will be true in the individual case. Fortunately, factors affecting success and failure of Americans in technical co-operation and other types of public and private activities overseas are receiving increasing attention by institutions and individual scholars as a field for significant action-oriented research.

The national research project on the Education and Training of Americans for Overseas Service being conducted by the Maxwell Graduate School of Citizenship and Public Affairs, Syracuse University, for example, is producing a wealth of valuable insights into what to look and watch out for in selecting new employees for assignments abroad.

From research studies of this type and operating experience of organizations engaged in technical co-operation activities, three broad conclusions appear quite clear. First, that personal qualifications are, if anything, more important to success abroad than is pure technical competence. Second, adaptability of the employee's wife and children to a foreign environment warrants fully as much consideration as that of the employee.[1] Behavior of a wife and/or children can more than undo an excellent technician's contribution. Conversely the family can and does make a highly significant contribution toward achievement of over-all objectives of the program when its attitude is positive and its conduct exemplary. Finally, successful performance at home is no guarantee of success abroad.

More definitive knowledge about factors in success and failure and their relative importance would be very helpful. In actual practice, however, the selection problem is less one of knowing what to look for than of identifying positive and negative characteristics prior to employment. The technical competence side is fairly easy; personality traits and family adaptability to a foreign environment very difficult. Despite these handicaps, ICA experience over the years has been quite good. The number sent overseas who, in retrospect, should not have gone has been gratifyingly small. The vast majority have performed as well or better than could be expected, many with distinction under very trying circumstances.

Even so, practicable means have continually been sought for learning more about the prospective employee and

[1] For example see Harlan Cleveland, "The Pretty Americans," *Harper's Magazine* (March 1959).

evaluating this information more critically before an offer of employment is made. At present, these include a record of the individual's work experience and performance, education and other professional qualifications; his credit history; comprehensive reference checks covering both technical and personal qualifications; security investigation; and medical examination. In addition, the prospective employee and his family are interviewed in their home by a person knowledgeable about the personal and family qualifications required in the ICA program overseas. To economize both time and funds, these interviews are conducted by ICA consultants located throughout the country who are employed on a part-time basis. This feature was introduced only a few months ago, and early results strongly commend its continued use.

Evaluation of each candidate's qualifications—both technical and personal—for service in the ICA program overseas is by a Selection Panel. For those judged to be of the caliber needed, these Panels recommend the grade and salary appropriate to the individual's qualifications and potential value to the program. Thus systematic group judgment is applied both to selection and to determination of the Personal Rank with which the individual enters the ICA overseas service.

### MEETING REQUIREMENT NEEDS

Some no doubt will wonder why recruitment comes at the end instead of the beginning of this discussion of personnel management. Obviously a staff has to be recruited before it can be managed. And it is equally self-evident that regardless of its effectiveness in utilizing and developing the staff once employed, a personnel system's success depends largely on its ability to fully staff the program it services. Dropping individuals whose performance, while not unsatisfactory, is below the high quality needed is difficult when the alternative is a lengthy vacancy. Selectivity of employees inevitably varies directly with the number of candidates available. Holding staff members out of regular duty positions for fuller orientation, language training, or substantive training which clearly would be a good investment in the long run must be weighed in relation to immediate program needs.

In short, all of the other aspects of personnel management discussed earlier affect or are affected by the organization's ability to provide enough staff members of the right kind at the time and place needed. To these aspects must be added the fact that in technical co-operation programs, requirements are primarily for specialists sufficiently mature and experienced to serve as advisers to co-operating countries and be so accepted by that country and its own technicians. This requires recruitment, for the most part, of persons already settled in a domestic career. Furthermore, the recruits usually have children of an age where educational facilities and related considerations assume particular significance.

In meeting its recruitment needs, ICA employs a variety of techniques and facilities. Primary emphasis must be upon "pin point recruitment" for specialties needed. Active co-operation of other agencies and the colleges and universities is invaluable. Recently this agency has experimented with paid advertisements in professional journals. Results have been highly encouraging. Effective contacts at professional society meetings also pay dividends.

To facilitate personalized recruitment —always the most effective in meeting specialized requirements—ICA uses a number of consultants on an "as needed" basis. For economy, these consultants are persons located throughout the country who are highly knowledgable of ICA needs in their respective subject matter specialties. Selected overseas staff also are given specific recruitment assignments in conjunction with their home leave. Means such as these are proving valuable supplements to the direct recruitment efforts of the headquarters staff.

In addition to recruitment, as such, two management devices are built into the overseas personnel system to facilitate meeting program needs. These are the Employment and Reassignment Complements: Positions established in ICA in Washington and used on a revolving basis for temporary assignment of selected overseas personnel. The Employment Complement makes it possible to employ a well-qualified candidate at the time he is available without waiting for all the details of co-operating country clearance to be completed. In addition to those actually employed temporarily on this Complement, its availability enables recruitment in general to be positive from the outset, thus helping to reduce declinations during the processing period which seldom can be less than several weeks.

The Reassignment Complement serves to reduce the recruitment load. This Complement makes possible the retention in temporary duty status of overseas staff members the agency definitely needs to meet future program requirements but for whom a specific job assignment cannot be made when they complete their home leave. Most frequently, the need to use this facility arises out of positions being abolished or from delay in effecting country clearance. It also is used in those cases where a temporary medical disability precludes immediate reassignment to an overseas post. Since it was established in October 1956, upward of 200 well-qualified persons have been retained temporarily on this Complement. Many of these no doubt would have been lost to the agency had their only alternative been an indefinite period of leave without pay. Not only would this have required recruitment of replacements; these replacements usually could not have brought with them that added and invaluable qualification of proven capability to perform effectively in technical co-operation overseas.

### IS TECHNICAL CO-OPERATION A CAREER FIELD?

To give a flat yes or no answer to the general question of career opportunities in technical co-operation would be foolhardy at best and misleading at the worst. Too much depends upon the field and breadth of the individual's specialty. If he is a nuclear physicist, for example, the prospects would be pretty slim. Conversely, if his field were teacher training or agricultural extension or one of the other broad fields in which most newly developing countries need and request assistance, the outlook would be quite different.

In short, technical and personal qualifications vis-à-vis the volume of comparable requirements are the paramount determinants. For the person who has that combination of education, experience, interest, adaptability, and flexibility in large demand in technical co-operation programs, there is every reason for him to expect to find a challenging and professionally rewarding career in the technical co-operation field.

As has been indicated throughout the earlier sections of this paper, the ICA overseas personnel system is designed to meet the longer range as well as the immediate personnel requirements of the technical and economic co-operation programs with sixty-odd newly developing countries which this agency has responsibility for administering. It has evolved out of experience with operating this type of program since 1942. It is

concerned with the management of an overseas staff some 95 per cent of which is engaged in the technical co-operation phase of the Mutual Security Program. It is premised upon the assumption that the responsibilities which the United States has newly assumed for technical and economic co-operation with developing countries will require sustained effort for a considerable period ahead. The fundamentals of this system were presented to, and concurred in, by the Congress in 1957 and progress toward getting it installed reviewed in 1958. More significantly, on its own initiative, the Congress increased the appropriation for fiscal year 1959 requested by the Executive branch for bilateral technical co-operation by 8 million dollars ". . . primarily for personnel improvement." This not only lent added confidence in the objectives sought but very materially speeded up progress toward their achievement.

While not a career service in a formal sense, the ICA overseas personnel system embodies the principal desirable features of such a service. It therefore provides a useful case study of the adaptation of basic personnel management principles and practices to the unique requirements of technical co-operation activities. Progress and results thus far have been most encouraging.

# Technical Co-operation for Administrative Improvement

By GEORGE W. LAWSON, JR.

ABSTRACT: The program providing aid in administrative improvements in governments is extensive. Need for improvement is found in all levels and branches of government. Approaches to management improvement include the individual expert or adviser, the contract, and the development of local institutions. Problems in this field are those arising from the formerly dependent status of a country; those resulting from the new independent status; and administrative problems of developing countries. The United States adviser should not try to transplant our methods of management to the host country, but should try to find solutions adaptable to the culture of a particular nation. He usually trains host government personnel and looks for promising trainees. The mature leading officials prefer on-the-job training, and in-service programs have been instituted in many countries. Academic training is effective at the junior level only. A better known aspect of technical co-operation is that of training foreign officials and students in the United States; it is also an important part of technical co-operation in management. Training grants may involve academic training, observation, organized experience, or a combination of these. Observation tours are usually combined with other forms of training. There have been some outstanding accomplishments in the management improvement program of technical assistance, however, there is need for further activity in this field.—Ed.

---

*George W. Lawson, Jr., Washington, D. C., is Chief of the Public Administration Division of The International Cooperation Administration. He served previously, from 1952 to 1955, with ICA and predecessor agencies in Korea as Special Assistant for programs and operations and in Washington as Budget Director. He was in the International Activities Branch of the United States Bureau of the Budget from 1945 to 1952; the last two years he served as Chief of the Branch. During this period Mr. Lawson participated in the United States delegation to the preparatory commission for the IRO on the problems of refugees. IN 1944–45 he served briefly with UNRRA. He spent the years 1943–45 in the Office of the Administrator, National Housing Agency.*

NEARLY all technical co-operation involves administrative improvement in one way or another. The malaria eradication project may be bogged down because the wrong kind of insecticide was ordered by the purchasing office. The vocational education program may be lagging because the ministry of finance is slow in paying contractors engaged in putting up the needed buildings. The irrigation project may be stalled while needed equipment is rusting on the docks because the shipping papers have been lost. Unfortunately, all too often the need for administrative improvement is recognized only after projects have slowed to a walk, or ground to a halt.

Assisting governments accomplish administrative improvement has become big business. In 1958 the United Nations and the United States Government applied over 11 million dollars directly to technical co-operation in public administration.

Frequently, projects in administrative improvement result from a discovery that an administrative shortcoming is general rather than peculiar to the ministry in which it first appeared. Examples are weaknesses in supply management, record keeping, and statistics.

The need for improvement has been found at all levels of government—in the offices of presidents and prime ministers, in the ministries, the provinces, the states, the districts, the barrios, and the villages. Management improvement has been pursued in the executive, the legislative, and the judicial branches and in government enterprises—railroads, post offices, and electric power systems.

There have been a number of surveys of the need for management improvement. In 1953, John Blandford surveyed twenty Latin American countries, found much activity in progress, much still to be done. The International Bank for Reconstruction and Development in its economic surveys frequently discovers the need to improve administration. The Bell Mission to the Philippines in 1950 sparked a large co-operative effort to achieve management improvement that has produced impressive results. The economic debacle following the Mossadegh regime brought to Iran a realization of need for management improvement in government.

## APPROACHES TO MANAGEMENT IMPROVEMENT

A number of approaches are being used in the solution of management problems through technical co-operation. I will attempt to describe the more important. There is first the individual expert. He may be a member of a co-operative agriculture or other field party, he may be attached to a management team—either a firm engaged for this purpose or a Public Administration Division in a United States Operation Mission—or he may be a lone management adviser. The management expert may be a "direct-hire" employee, on the payroll, of the International Co-operation Administration (ICA) or a United Nations specialized agency. He may have a contract with the assisting agency to provide his services to the host country. Or he may have a contract with the host country, financed by the assisting agency. The management adviser who is an integral part of a joint field party in health, for example, has some distinct advantages. He tends to have the support and confidence of the other members of the field party. He can concentrate his efforts in one ministry. However, many of his management problems will have their solution in other ministries—finance, civil service, supply.

The adviser who is a member of a public administration division of a United States mission will have other

experts upon whom to draw for the solution of various facets of management problems. The Public Administration Division will normally have an entrée into several ministries—thus increasing the opportunity to solve interministerial problems, and will normally have a "backstop office" to provide specialized information or other assistance. One of the possible disadvantages of this approach is that a public administration adviser may be regarded as an interloper by other technicians in other disciplines in the same ministry. In addition, he may be so highly specialized in the techniques of "management" that he fails to see the forest for the trees.

The lone adviser may be in the country to survey the need for additional management assistance. He may have come to help solve a particular problem. He may be required to oversee the work of one or more contractors. His success will depend upon his task being clearly defined and of manageable proportions. It will depend upon the degree of support his work receives from the host country officials as well as the way he fulfills his role, his professional and personal qualities, and the cultural barriers he encounters.

### *The contract and development of local institutes*

Management firms under contract either to the assisting agency, the host country, or both have also been used. Universities on occasion have the furnishing of management advice and research into management problems as a part of their contracts with assisting agencies.

The contract has certain distinct advantages in providing technical assistance where management improvement is needed in very complex situations. A contractor can usually be found who has had extensive experience in solving the various types of management problems encountered in the host country. A successful firm will normally have available a sizable number of capable people who can be dispatched fairly quickly. If the firm is large, it will have a highly desirable degree of flexibility in assigning specialists for short periods to do particular jobs. Good firms provide competent leadership.

Contractors are best used where the management problem is one of clearly definable size and scope, where a team can go in, make a study, recommend a course of action, and to the extent that their recommendations are accepted, install the system or procedure and train host government personnel to carry on. In some cases the contract is more acceptable to the host country, which may not wish to appear to be taking management advice from officers of a foreign government.

There have been some highly successful management firm contracts especially where the contractor can provide a team which has worked together before on similar problems, where they have some language facility and previous foreign experience. One of the disadvantages is that contracts are more expensive man-for-man than "direct hire" personnel.

A longer run approach to the improvement of administration has been through the development of local institutions to train personnel in both business and public administration. Typically, public administration institutes are attached to an existing university although in a few instances they are located in a ministry or a staff agency of the host government.

Locally created institutes are being equipped to provide a wide range of training from typing to input-output analysis. Some offer graduate level work, others undergraduate work, still others offer both. Some offer training only for government employees, others limit

themselves to pre-entry programs. In a number of instances the institutes are inaugurating research programs and consulting services in order to develop teaching materials and to train both faculty and students.

## EXAMPLES OF MANAGEMENT IMPROVEMENT PROJECTS

In 1958 the United States Government was co-operating in one hundred projects in public administration designed to contribute to the solution of such problems as the lack of management know-how; antiquated tax, customs, and fiscal systems; inefficiently organized government services; complex, burdensome controls on business.

In the Philippines an International Cooperation Administration financed contractor working with a Philippine Reorganization Commission concluded a government reorganization project which produced some forty-one reorganization plans. It also trained the Filipino staff in a newly established Management Services Division of the Budget Commission to put the plans into operation. The Budget Commission, assisted by another ICA financed contractor, completed the installation of performance budgeting for the entire government. Improvements in tax collection have nearly doubled revenues in four years without changes in either tax rates or base.

In Iran a unique institution has been established with the technical assistance of ICA advisers. The High Council for Administrative Improvement—composed of permanent Administrative Under Secretaries—has met weekly for over a year to obtain government-wide consideration of problems between ministries. The "permanent" under secretary concept has so far weathered nearly all ministerial changes, including that of prime minister.

In the Philippines through a contract with the University of Michigan (terminated in 1955) an Institute of Public Administration has been firmly established and is now under Philippine leadership. The Rockefeller Foundation is supporting one American professor at the Institute to assist in its continued development. The Institute was instrumental in founding EROPA, the Eastern Regional Organization for Public Administration, and is conducting "third-country training" for government employees from neighboring countries.

In Italy, with assistance provided through an ICA financed contract with the University of California, there has been developed at the University of Bologna a School of Public Administration (now assisted by the Ford Foundation) designed to prepare students for service in the Italian Government. The Ministry of Treasury has pledged five years' support to the school in the form of funds and the annual assignment of thirty to forty civil servants for advanced training in public administration.

The Wharton School of the University of Pennsylvania is helping the University of Karachi develop an Institute of Business and Public Administration. The Institute now has a student body of approximately 650 students, including evening school and special students, and has generated great interest and support in the business community.

### *Programs in Latin America*

In the Central Bank of Paraguay the work of two short-term consultants resulted in the establishment of an audit unit, the reconciliation of all figures on the balance sheet, a change in the system of unsecured loans from a commercial bank, and a drastic reduction in the number of governmental accounts.

In São Paulo, Brazil, the Michigan State University has helped the Brazilians establish a school of business administration that is winning support from the business community in the form of scholarships; an active market for graduates; and demand for expansion of research, consulting services, and management seminars.

In Peru a "Working Guide for Elementary Training in Records Management" growing out of his field experience was prepared in Spanish by an ICA technician. It has been reproduced and distributed throughout Latin America.

In Panama, the first codification of the nation's 2,600 laws and 7,000 executive decrees enacted since the nation's founding in 1903 was produced. As a result of the project, the business man or lawyer can find a law or decree if he knows its subject, date of enactment, or the ministry to which it applied. A staff of Panamanian law students trained under this project had, at the time this paper was written, almost completed a study to determine which of the laws are now in effect.

In Costa Rica an ICA technician helped to draft and install one of the best personnel systems in Central America. Costa Ricans are now advising their neighbors on improved personnel practices.

## PROBLEMS IN ACCOMPLISHING IMPROVEMENT

What sort of problems does the American technician encounter as he sets about to help promote administrative improvement in a developing country? An ICA public administration adviser recently summarized several years of field observation of the problems that may face the management technician newly arrived in a developing country.[1] The problems he found fall into three general categories: Those arising from the formerly dependent status of the country; those resulting from new independent status; administrative problems of developing countries generally.

The formerly dependent status of a number of the developing countries presents the United States management technician with administrative systems of whose origins he may be only slightly, if at all, familiar. They may be British, French, Dutch, or sometimes once removed, as in Iraq where institutions essentially French in origin were introduced during the Turkish regime. He will encounter holdover administrators, now titled advisers, but actually directors behind the scenes. These advisers frequently resist change and may be at the very least unfriendly to the newly arrived technical assistant. Frequently there will be a scarcity of native administrators; the colonial powers too often neglected to train such people for supervisory and administrative positions.

There may be well-established business relations and subtle cultural and social ties to the former mother country that will have implications both favorable and unfavorable for administrative improvement.

New independent status will have created problems which the management technician must understand. There will be a pressing need to man the new government for a long time after it emerges from the exciting first months of independence. Good people will be in demand as legislators, as policy makers, as administrators. Some posts will be filled by persons who are not prepared for them. Frequent changes in personnel, including cabinet ministers, cause difficulties of uncertainty concerning policies, programs, and staff responsibilities. Able men will be called upon to do double or triple duty. Excessive nationalism may create suspicion of for-

[1] Joseph R. Starr, "Inaugurating Country Programs in Public Administration," unpublished manuscript.

eign advisers, even when their help has been requested by the new independent government. Just when the new administration has begun to settle down, a coup or a revolution may push some of the ablest men aside.

There will be great demand for new state services, in education, and social welfare. Plans, promises, and expectation will far outstrip manpower resources. The new government, for one reason or another, will probably be in charge of a high percentage of major enterprises in the nation. It is then compelled to attempt the resolution of manifold and complex administrative problems.

The management technician will certainly encounter at least some of the ordinary administrative difficulties found in most developing countries. A partial list would include a general shortage of qualified personnel; low professional standards of government employees; no tradition of public service; inadequate salaries of civil servants; overcentralization and inadequate delegation of authority; cumbersome governmental procedures; bad working conditions; poor records systems—with antiquated filing systems; poor budget and accounting systems; lack of training facilities at all levels—secretarial, in-service, university, business, and public administration; weak general housekeeping services; absence of training materials—textbooks, manuals, training films, audio-visual aids; ignorance of staff work, with the need for co-ordination between agencies unrecognized or quite inadequate; improper distribution of functions—some ministers take their favorite functions with them as they change ministries.

## METHODS OF IMPROVING MANAGEMENT

How does the technician go about helping to improve management in the host country? The successful management adviser does not attempt to transplant the methods of his own country. He avoids frequent reference to "the way we do it in the United States." He studies the problem to be solved, develops a number of alternative solutions, lets the host government official select the best solution offered—or stimulates him to develop a new one better suited to the local culture and environment.

While pursuing his advisory activities the alert technician is constantly looking for opportunities to improve management through the training of host government personnel. He is constantly on the lookout for promising trainees. Their training may take a number of forms—in-service, conference, seminar, workshop, academic, observation, on-the-job. The training may be obtained in the host country, in the United States, or in a third country.

As a general rule, the mature official of high caliber does not take kindly to academic training. For him, training must be of the on-the-job character—such as is implicit in the relationship between such officials and the foreign adviser—or it must take the form of a round-table conference with his peers—perhaps under the guidance of an outside expert.

Management officials at the middle level, too, are loathe to "go back to school." In most foreign countries, it is not the custom for a man to continue with formal study once he has begun his career. Hence the need for seminars, conferences, observation tours.[2]

Academic training is effective primarily with junior officials who are selected on the basis of their future potential.

[2] These observations often apply to public officials in the United States except that "going back to school" does not carry the stigma in this country that prevails in many of the less-developed countries in which public administration programs are going forward.

In-service training has been initiated in a number of countries under technical co-operation programs. Projects have ranged from secretarial courses in Guatemala to organization and methods in Iran. Courses are normally run in government quarters during working hours.

A good many of these courses have been highly successful—besides improving basic skills they have opened up opportunities for major administrative improvements. Sometimes the foreign technicians have done too much of the training themselves; they have not developed local teachers. The idea of "training trainers" is being increasingly stressed.

Some of those engaged in technical assistance in management believe that the effort with the best chance of producing lasting benefit will be the management training institutions being established in the developing countries. The technical co-operation objectives here are generally to train a staff of competent teachers, either in the host country or abroad, to construct a curriculum designed to meet the most pressing management needs in the country, to introduce improved teaching methods and standards of scholarship. Research and management service to local government of business are frequently subsidiary purposes.

The college contract has been used most frequently by the ICA in helping to build management training institutions. The UN has generally used its own experts. The Ford and Rockefeller Foundations have also supported the development of institutions which give management training—usually with the assistance of American universities.

## TRAINING OF FOREIGN OFFICIALS IN THE UNITED STATES

Perhaps the best known aspect of technical co-operation is that which brings foreign officials and students to the United States for training. It is an important part of technical co-operation in management. In 1958, the ICA alone brought 881 men and women to the United States for such training. The UN, the foundations, the trainee's own governments, individual benefactors, and businesses send additional people abroad for management training every year.

The people coming from abroad to be trained are called variously, participants, scholars, fellows, associates, and visitors. The training grant may involve academic training, observation, organized experience, or a combination of two or more of these.

Each of the devices has its advantages and disadvantages. Where a university has developed courses specifically for foreign students—as in taxation at Harvard, local government at Wayne State, economic development at Vanderbilt—the student can gain much from the experience. But regular graduate and undergraduate courses may contain considerable material of no particular relevance for the foreign student and may be presented at too rapid a pace. From the university's point of view, the special course requires extra effort and expense because of the need for especially prepared materials and more personal consultation with individual students.

A few courses are being offered in a foreign language at American colleges and it may be expected that there will be more of this in the future. Believing that facility with English is important to the success of foreign students enrolled in American universities, the ICA requires a minimum score of 70 in written and oral categories on the American Language Center test. If he needs it, the trainee is also given intensive language training after his arrival in the United States.

Observation tours are usually combined with some other form of training.

The observation tour will normally involve visits ranging from a few hours to several weeks at installations, projects, government offices, business firms, industrial plants, and universities. The tours may last as little as a month or may run for as much as six months, depending on the level and scope of the visitor's interests, the length of time he can be spared from his work at home, and the availability of suitable things for him to see. Occasionally high-ranking visitors or groups with the same general interests from the same country will be accompanied by interpreters. Government officials, business firms, educational institutions, local and national associations have been generous in providing the foreign trainees with time, information, and social activities. It has not been a one-way street. Many of the hosts have learned much about the world around them from these charming visitors.

When they arrive, the visitors want to see as many places as possible; when they leave they often complain that they were scheduled at a nightmarish pace, that did not stay in any one place long enough to really learn very much. It is difficult for their advisers to find the golden mean.

Organized experiences have taken several forms. An executive development scheme for members of Pakistan's Superior Civil Service is bringing to the United States for management seminars and workshops at the University of Southern California and on-the-job associations with local, state, and federal officials, two groups of fifteen to twenty of these top Pakistani officials each year for three years. This training of the leading civil servants is expected to prepare the ground for further efforts to introduce modern management concepts in Pakistan.

The ICA has developed workshops in personnel, organization and methods, supply management, budgeting, and accounting. The workshops utilize role-playing, case studies, lectures, group projects, carefully planned and conducted observation tours. These workshops frequently are timed to allow the participant to obtain some academic training as well. Increasing use is being made of assignments of trainees to actual survey parties or as members of staff in state, local, and quasi-governmental agencies. This device is highly regarded but is difficult to arrange for large numbers of trainees.

Every study so far made of public administration trainees, whether trained in the United States, in a third country, or in their own country, has shown that a substantial majority of the people's skills and knowledge are effectively utilized after receiving training under technical co-operation projects. The test here, however, is not whether the returned trainee is found back in the public service—the real test is that the returnee displays a change of attitude toward his work. Has he learned the problem-solving approach, the search for available facts as a basis for finding the answer to a problem? Has he abandoned the practice of attempting to solve problems by intuition? Does he now appreciate the necessity and feasibility of delegation of authority, of reaching decisions through consultation, of group work, of co-ordination? Has he discovered that the administrative problems of his country or agency are not unique and that the experiences of other countries or agencies may contribute to the solution of problems confronting him?

It is difficult to say which method of training is more effective, just as it is difficult to say which of the several ways of technical co-operation in administration is the most effective. There is naturally some slippage due to faulty selection and to changes in the situation at home which is beyond the control of the trainee or the training agency.

The people concerned with providing technical assistance in management improvement can point to a number of outstanding accomplishments, but there is no room for complacency. They see a continuing need for administrative improvement if the people of the developing countries are to realize their aspirations for economic, political, and social improvement.

# The Cultural Curtain

By Dorothy Lee

Abstract: The introduction of technical change into non-Western cultures has, in the past, been done rather haphazardly. Even when the motivation for such efforts has been completely humanitarian, the effects are frequently unfortunate. At times it is impossible to introduce changes because of cultural resistance; on other occasions an "improvement" in a culture has had disastrous ramifications because neither the values of the culture nor the relationship of the environment were considered. It is possible, however, to overcome the difficulties presented by cultural differences. Careful study of a culture is needed; this must include a consideration of motivations, values, the symbolic significance of even seemingly unimportant acts, and a consideration also of all of the dangers inherent in the disturbance of the delicate balance between a culture and its local environment. Such study can result in the introduction of technological improvement which neither destroys the culture it is designed to improve nor opens up a Pandora's box of dangerous secondary results.—Ed.

*Dorothy Lee, Ph.D., Detroit, Michigan, has been on the staff of The Merrill-Palmer School since 1953. She taught Anthropology at Vassar College, 1940–1953. She has written articles on the conceptual and value aspects of culture for professional journals. She wrote the major portion of Cultural Patterns and Technical Change (1953) edited by Margaret Mead.*

PROGRAMS of induced change are being initiated with increasing concern for the requirements of organization and planning, as well as for the technical training and selection of workers. Yet, throughout the years, their success or failure cannot be explained solely on the basis of these factors. Proposed changes which were clearly necessary and beneficial have often been summarily rejected by the people concerned, or have met with apathy and indifference. Programs have been launched successfully only to fail in the long run. Worse than this, the change itself has sometimes been readily accepted, but has brought unpremeditated results in its wake—destruction of the fabric of the society, loss of the meaning of life, and other unimaginable hardships.

## The Factor of Culture

In such cases, the factor which has been overlooked, the factor which has made for difficulties of communication, is that of culture. Perhaps a proposed program runs completely counter to the religious tenets of a people. For example, it is reported that the Girl Scout manuals which were recently sent from the United States to a school in Indonesia were thrown away unused. The people to whom they were sent are Mohammedans, and they explained that as Moslems they found it abominable to have human beings equated with bears, beavers, and wolves, and to have girls urged to name themselves after animals.[1] Sometimes no account is taken of social groupings. In this country, when Navahos were resettled on irrigated farmland, the arrangements went counter to their established groupings. They were established as individual families of parents and children, far from their relatives, despite the fact that they had been used to working their fields co-operatively in larger units, along extended kinship lines. For these and similar reasons, the project did not prosper.[2]

Most of all, we have often been unaware of the importance of the totality of a way of life. Students of culture are coming to realize that any practice or concept is linked to, as well as supports, many other practices and beliefs which eventually constitute the whole cultural framework; and that it has a special function within this framework. A person from a different culture often finds it difficult to discover or recognize this function; it is easy to see the trait as merely a queer custom. So, in our ignorance, we have tampered with one trait, not realizing that thus we were actually tampering with the whole.

Until recent years, changes were introduced, whenever they appeared obviously necessary or desirable, by traders, missionaries, or colonial governments in a piecemeal or even haphazard fashion. Though some such changes were introduced through the rapacity of traders or the exigencies of colonization, many stemmed from humanitarian motives, and were clearly indicated at least in the eyes of the Western agents.

It was clear to workers in South Africa, for example, that when infants nursed until they were two or more they exhausted their mothers physically and interfered with their work. Bottle feeding was introduced. Soon the mothers were even more exhausted, because they began to bear children every year. The taboo on intercourse during lactation no longer worked to space their children at intervals of three or four years. Again, it was clear to colonial governments and missionaries that infanticide and head-hunting, as well as the poor sanitation attending childbirth, were evils to be

[2] Tom Sasaki and John Adair's article in *Human Problems in Technological Change*, edited by Edward H. Spicer (New York: Russell Sage Foundation, 1952), pp. 97–111.

eradicated. Yet they never considered the results of such an eradication and were unprepared for the enormous increase in population in areas where population and food resources had previously been kept in balance. The consequence of their humanitarianism was overcrowding, malnutrition, and a sentence of emigration for people deeply attached to their homeland.

What went wrong here? The change had obviously been effectively introduced; it had been accepted by the people, or at any rate it had not been rejected. In fact, it had probably been welcomed. But this was not enough. The agents literally had not known what they were doing. They knew nothing of the cultural framework of the society with which they were dealing, and they tampered in ignorance with one of its sustaining parts. They knew nothing of the ecological relationship with the habitat which the culture helped maintain. This is not to say that, knowing this, they would have refrained from acting to save lives and abolish fear; but rather that they would have taken account of the function of the traits which they were changing or displacing, and then would have acted accordingly.

## Recognition of Total Pattern

We have learned since then that, in taking account of the cultural factor, we have to consider not only the function which the trait serves within the whole cultural framework, but also the role the trait plays in relating man to his habitat. Man adjusts to his environment by means of his culture. When he moves to a cold climate, he does not grow fur. He builds an igloo and lives warmly in it, grouped closely with his family; or he invents central heating and makes possible the comfort and privacy which he values; or, like the Sioux, he teaches himself physical endurance, he exalts the virtue of hardihood and learns to take the cold in his stride proudly. But each society does this in its own way, meets its environment through its own particular culture, through a patterned constellation of traits. Sometimes the cultural adjustment works hardship on the members of the society and its neighbors, or is an out-and-out evil from the point of view of Western culture, as for example, infanticide and ritual murder. Sometimes, we merely regard a practice as wrong, or as based on ignorance and move in to help without considering the whole picture. So progressive Turkish farmers were persuaded by Western-educated Village Institute workers to remove from their fields the stones which served to keep the moisture in through the long dry weeks of the summer; as a result their crops withered, while those of the conservative farmers prospered.

In addition, we have learned to take into consideration the function of each trait as an integral part of the whole. We have learned that no trait is too small or unimportant to be manipulated safely, without repercussion. For instance, earlier in this century, an apparently slight and insignificant change was introduced among the Australian Yir Yoront. A Mission was established among them and the missionaries gave steel axes as gifts to adult men and women, and to young people of both sexes. The axe was not new to the Yir Yoront; they already had stone axes. Yet this one friendly gesture, according to Lauriston Sharp, is probably responsible for the eventual destruction of the entire internal social structure of the group as well as of its intertribal relationships.

The ownership of an axe had been, up to then, a badge of adult masculinity. Traditionally, only adult men could own them. Axes were loaned by an adult man to a younger man, and by a man to a woman; and along these established lines of axe-borrowing fell the relations between man and wife, older brother and younger brother, father and son. Now axes were owned by women and young men, and the established relations became confused. The symbol of authority was lost and authority itself became unclear; this gave rise to confusion, and to the insecurity of uncertainty. In addition, the stone for the axes was quarried far to the south, and was traded north along a route of trade partners, who also participated in the ceremonials of one another's groups. All these relations, all this participation in the rich life of the ceremonials of other groups, was now lost. The small and obviously desirable change from stone to steel axes turned out to be neither insignificant nor beneficial.[8]

## Culture Taken into Account

To balance such unfortunate occurrences, we have many cases where change has been introduced with happy results, by agents who have had knowledge and understanding of the culture of the group with which they were dealing. Such is the work of the British Health Centre in Natal, which was established in 1940. These workers studied the ramifications of the entire culture, as well as the history of the Zulu group with which they were dealing. According to the report written in 1953, the comprehensive health program they proposed to institute suggested the introduction of change in three areas: in food habits, in the treatment of tuberculosis, and in practices which led to erosion. The first of these was definitely successful; the second only partially so; and the third was not attempted because investigation showed that if it could have been effectively introduced, it would have taken away from the people practices which were of great value to them.

The first undertaking was of a kind which is usually very difficult to carry out. The effect of malnutrition is not directly demonstrable; it is difficult to explain to people why a change in their food habits is necessary. Why interfere with them? What harm do they do? An attempt to change them usually meets, in addition, obstacles stemming from the emotional and symbolic significance of food. Among the Zulu, general resistance stemmed from their close tie to their ancestors. This, they said, had been the diet of the ancestors; it was the sanctioned diet. The ancestors, who were concerned with the daily affairs of the people, would be angered if the diet was changed. The team, however, armed with history, showed the people that the diet had in fact been richer and more varied in ancestral times, before the coming of the Whites.

There were additional difficulties when it came to the attempt to increase the consumption of milk, particularly among women of childbearing age. These came from a taboo protecting the cattle, which represented perhaps the greatest value to the Zulu. Women, in any reproductive capacity, while pregnant or lactating or lochial or while menstruating, were dangerous to the cattle, and should therefore avoid all contact with them; to consume milk was to come into such contact. To prevent all possibility of error, girls after pubescence were forbidden milk at all times. In addition, people could consume the milk only of the right cattle; these were the cattle owned by the head of the household to whose kinship group they belonged. This meant that, if they were away from the appropriate cattle, they could not include milk in their diet.

The team of workers recognized and respected the strength of the religious beliefs that supported these customs.

[8] Lauriston Sharp's article in *ibid.*, pp. 69–90.

They did not attempt to tamper with them. Instead, they hit upon a simple solution. They introduced powdered milk. Though the nature of this was known, it could not be associated, either symbolically or emotionally, with cattle.

In their attack on tuberculosis, the team of workers again met resistance. For people who found deep satisfaction in eating out of a common dish and living in close contact with friends and relatives, the concept of isolation was thoroughly unacceptable. To go to a hospital a hundred miles away, to be long ill away from all loved ones, to face the probability of dying away from home and the protection of the ancestors, was a terrifying prospect. Besides, the Zulu had no reason to doubt the efficacy of their curative methods. These stemmed logically from a set of premises which the Western workers could not prove to be wrong, although they knew them to be so. Through a consistent effort at understanding and responding to the cultural roots of the resistance, the workers finally did make some progress in changing methods of treatment. However, they had to abandon their plan to enlighten the people as to how tuberculosis was spread because, to these Zulu, any disease associated with labored breathing or pains in the chest was due to the machinations of an ill-wisher. Therefore to tell a father that his daughter had brought tuberculosis into the family would be to accuse her of being an evil witch. If they had insisted on keeping their Western plan of a "good" attack on tuberculosis, they would have endangered their entire tuberculosis program.

When the team came to consider the question of erosion, they found out that the pressing need was for the reduction of the herds of cattle. Yet the meaning of life for the Zulu man was bound up with the lives of his cattle. He saw in them the link between himself and his ancestors. With them he validated his marriages, and created and strengthened all affinal bonds. He knew and loved each one of his cattle, each detail of their personal appearance and each idiosyncracy. To ask these people to reduce their herds would have been tantamount to asking them to destroy a loved family member or the strength of their social bonds, or to give up an important part of the value of life. So the team abandoned this part of their program, at least temporarily; they wisely decided to refrain from destroying value.[4] In fact, the people's values would probably have defeated all attempts to institute voluntary reduction of herds.

## VALUES AND CHANGE

The factor of values is often responsible for the rejection of a proposed change. For instance, the Baiga of Central India refused to be persuaded to change from a digging stick to a plough in the cultivation of their fields. The earth for them was a generous, loved, and kindly mother. With a stick they could help her gently to bring forth fruit for them; they could not bring themselves to cut her "with knives."[5]

In fact, when attempts at mechanization, or even at the introduction of an iron plough to replace the light wooden plough, have necessitated the consolidation of scattered holdings into one continuous field, they have sometimes been defeated by this factor of value. People have not wanted to part with one small plot in exchange for another contiguous to their other holdings because, as Dube says of the village his group studied, "The earth occupies a mother's position, and parting with any fragment of it is nearly tantamount to separation from the Mother."[6]

Fertilization of arable land has also been widely rejected on the basis of value, in this case of the value of what we might call autonomy—the autonomy of land and plants. So Cambodian farmers have generally rejected fertilization as interference.[7] And in Ettawah, a village leader saw green manuring as an act of violence against the living plant: "Green manuring involves a very cruel act of plowing under the sanhemp leaf and stalk before they are ripe. This act involves violence."[8]

If we manage to change the practices of such people without understanding the function they serve we may be taking away from them sources of deep emotional satisfaction and security. If what they see us urging them to do is a violation of the rights of land and nature in general, we are also forfeiting their respect, and our claims to democratic principles will accordingly be considered hypocritical.

However, a profound knowledge of the culture may help the worker to rest his proposed change upon the basis of the cultural values, and even to enlist these in his work. This has been done by perceptive agents of change. In Ettawa, for instance, when the worker suggested green manuring as a means for greater agricultural production, the leader countered rejecting all improvement: "Our culture teaches us not to be too greedy or anxious for more economic production. Remember that Kabir, the saint poet, prayed to God, 'Give me only so much wealth that my family may meet its average needs, that I may not remain hungry, and that the saints or mendicants may not go away from my door hungry.'" The worker, versed in the principles of Brahmanism, argued convincingly that it was important to increase production, since most villagers found themselves unable to meet these sacred obligations to the family, the religious mendicants, and themselves.[9]

## CROSS-CULTURAL COMMUNICATION

There is more to effective cross-cultural relations, however, than the recognition of the integrity of culture and a respect for cultural values. The entire structure of premises and assumptions differs from culture to culture. The background of concepts and categories and expectations which shapes our perceptions differs; and the symbolic meaning of an act differs according to cultural background.

I see a Cretan woman, for instance, meticulously picking up every breadcrumb which has fallen on the floor.[10] What I see is a house-proud woman, keeping her floor unlittered, neat and clean. Someone else sees a hungry woman, saving every scrap of food. But the Cretan woman is neither. She is not performing a utilitarian act; to her it has a religious significance. She is fulfilling a sacred duty to bread, the sacred food. If she leaves it on the floor, she may be responsible for an act of sacrilege; someone might step on it and thus desecrate it. Therefore, it is imperative for me not only to observe this act, but to perceive it in terms of the framework in which it finds its motivation and derives its meaning. Other-

wise I might be tempted to give the woman food, or a broom, in an irrelevant and possibly insulting attempt to help.

The woman's act conveyed reverence; it was a meaningful rather than a utilitarian act. And the meaning of an act is hard for the foreign agent to discover. Yet to overlook symbolic or religious meaning is often disastrous. We have made such mistakes, as when, to combat Communism, we made posters showing pictures of great religious figures contrasted to pictures of Stalin and Lenin; to the Moslem Indonesians a pictured Mohammed was anathema.[11]

It is also a mistake to assume that our own symbols are universal. Thus, for me to seat a guest on my right is to show him public honor; my Chinese guest would view this as a slight since for him the left is the place of honor. To me, a room of my own means coveted privacy and convenience, as well as prestige. If my firm gives me a desk in an office shared with others, or my hostess offers the only guest room to another friend and expects me to double up with the children, I shall probably feel slighted. To people of another culture, a room of one's own may spell rejection or deprivation.

At best, to be blind to the symbolism of the culture with which we are dealing may mean that we cannot communicate effectively. And we cannot depend on our own inventiveness, or our knowledge of so-called human nature. We have to discover the symbols of the people with whom we are dealing. I know that it would never have occurred to me to teach reading with the imagery which Nahuatl teachers were advised by the Mexican government to use: Introducing the words as friends, urging the child to search for his new friend in the population of the page, and later in other such "communities."[12] Yet symbolic meaning can be discovered; the examples I have given so far have all been reported by perceptive people coming from outside the cultural group they were observing.

Another obstacle to cross-cultural communication is the difference in perception between people of different cultural backgrounds. Here the foreign agent of change labors under a double handicap. He perceives according to his own familiar categories, and he is perceived according to unfamiliar categories. The anthropologist, Malinowski, working with South Sea islanders forty years ago, was asked what kind of magic he used to grow yams in England. This question assumed fallaciously that Malinowski farmed, that when he farmed he naturally grew yams, and that he worked magic over his yams. Our questions must often be as irrelevant when we deal with people in cross-cultural situations, but the assumptions behind them are usually held unconsciously and are therefore hard to eradicate. A young Hopi schoolboy, the Christian son of a Christian mother who had herself attended a white mission school, recently asked a white visitor to what clan she belonged. Many anthropologists return from field trips unaware of having made equivalent mistakes.

An occurrence is often perceived as a fact according to the precepts of the culture. The Hopi Talayesua, for example, knowing four to be the valid number, perceives that cocks crow four times before daybreak.[13] We observe the unhurried pace of others and perceive them as lazy or inefficient, yet Jane Belo, who describes the sauntering

[13] Leo W. Simmons, *Sun Chief, The Autobiography of a Hopi Indian* (New Haven, Conn.: Yale University Press, 1942), p. 62.

of the Balinese, goes on to speak of her neighbors in Bali, who—a family with two children of eight and ten—"sauntered" fifty miles to a temple and back in less than twelve hours.[14]

And so our own acts, our own motivations, are usually perceived not as we see them but according to the cultural framework of those who see us. It is enlightening to read how the Sioux chief, Sitting Bull, perceived the achievements of civilization in the eighteen seventies: "They claim this mother of ours, the Earth, for their own use, and fence their neighbors away from her, and deface her with their buildings and their refuse. They compel her to produce out of season, and when sterile she is made to take medicine in order to produce again. All this is sacrilege."[15]

Throughout the world, we have offered material aid to groups of people who recognize responsibility only to their families and their relatives, and cannot understand why anyone should want to help complete strangers. We saw ourselves as generous, or as laudable for recognizing our responsibility; they often saw us as naive, perhaps stupid; or they could explain our queer act only as an attempt at a form of bribery.

## LOGICAL TENETS

In Western culture, we have the notion of opposites which are mutually exclusive. This notion shapes our thinking as well as our acts, and has made for much difficulty in our attempts to introduce change among people who do not have this notion. Among most societies of my own knowledge this notion does not exist. What we call opposites do not oppose, nor do they exclude each other. A test which was recently given to Zuni children based on pairs of opposites failed because "good" and "bad," for example, were not opposites for the Zuni.

In China, our mutually exclusive opposites enclose a complementary whole. In Japan, they set limits for the "in-between path of moderation." In such societies we have not "either-or" but "either-and." Our Western workers have to introduce change to people who can hold two contradictory stands simultaneously, and who cannot see why we insist that they give up the old while accepting the new.

The co-existence of either-or is in fact very common throughout the world. Chinese Communist leaders made use of it, as the yin-yang principle, in presenting thought control and decentralization to the people as complementary. In the United States, the Navaho see no difficulty in considering their divine beings as simultaneously good and bad, and a sick man, in becoming identified with such a being during the curing process, asks to become both good and bad.

We take it for granted that certain conclusions follow from certain premises. We learn, for instance, that the Cambodians are not attached to their land and are ready to leave it and acquire another piece. So we conclude from this that they are therefore ready to contemplate study in a foreign country or to emigrate. But we are wrong. In fact, it seems that most Cambodians would rather be executed than leave their homeland since, if Cambodians die elsewhere, their souls may be unable to find their way back to be reborn as Cambodian. Their constitution outlaws punishment by exile as too harsh a sentence.[16]

### PROGRESS AND ASPIRATIONS

Many of us in Western society assume that progress is good and is naturally recognized as such by all. But in many other societies progress is not a goal, nor a desired good beckoning to action. We can possibly introduce change to these people as the eradication of ills, but not in the name of the "bigger and better," or even of the new. We have assumed that, if people had a higher income, they would spend it in the interests of what is in our own view a higher standard of living; we have found to our confusion that this is not necessarily so. From the Middle East, from the Far East, from Africa come reports that when the price of agricultural products or the level of wages is raised, people work less since they can maintain their known and tried way of life with less effort. We have learned that people have to be helped to recognize their wants and aspirations. And beyond this, we have helped them to see that it is possible to achieve what they want, to translate their dreams into plans. Occasionally, we have interfered to the extent of creating aspirations where none seemed to be present.
