THE Calcutta jute and jute goods markets have been extremely dull during the past week. The lack of overseas enquiries at first caused goods prices to decline, particularly for forward shipment. Since no raw jute quotas were issued to the mills, fibre prices also tended to ease. Since then, raw jute supplies have become a major topic of conversation in market circles. Rumours have had considerable influence, and in some ways have tended to stimulate the bullish sentiment which already existed. The delay in issuing quotas was interpreted in many different ways, and at one stage the story was circulated that the quota system had been abolished completely. This was wishful thinking on the part of operators, as abolition is most unlikely while exemptions are in force for quotas in the payment of margin deposits.

Reports about smaller fibre arrivals in the mofussil markets and the rapid rise in upcountry prices have encouraged the belief that supplies will fall short of earlier expectations. It is rumoured, however, that arrivals of raw jute in Calcutta during November have again been good, although they will probably be much less than in November 1959. Admittedly, special influences are at work this year. To begin with, the crop is late, and this must affect imports in the early part of the season. Part of the shortfall may be made up soon considering that raw jute arrivals in October 1960 were nearly 70,000 bales more than during the corresponding month of 1959. But persistent talk of shortages has induced cultivators to keep back stocks in the hope of getting better prices later. The fact that some jute has been kept back for this reason has helped boost prices in the mofussil. In turn, the rise in prices has put cultivators in a position to keep back more fibre than usual. Current prices are very remunerative for the farmers but there is a limit to their holding power, which has not yet been really tested. In some quarters, there appears to be a nervous tendency and eagerness to unload stocks. Others, however, are strongly against releasing stocks or accepting lower prices.

Gunny Market Idle

During the past week, the gunny market has been idle and prices have declined. One of the main sources of uncertainty is the United States, India's biggest customer for jute goods. Operators fear a further slump in U.S. burlap consumption and a transfer to substitutes. The fact that U.S. burlap stocks have been allowed to fall to the lowest level for two years has increased the anxiety.

Reports from various centres in the world indicate how rapidly competition for jute goods is developing. Viet-nam, it is said, is actively trying to achieve self-sufficiency in gunny bags. She proposes to build two new units for the manufacture of bags, which will boost her output to 11 million bags annually, or more than double the current level. The increased production will actually leave a small surplus for export. Steps have also been taken to expand jute and kenaf cultivation. In Thailand, there has been a very large increase in the acreage under jute with the opening up of new forest lands. Production is expected to be almost 50 percent higher than it was last year. In that case, there will be sufficient raw jute for the local State-operated mills. Thailand is also concentrating on a programme of expansion to attain self-sufficiency in gunny bags.

More Looms for Pakistan

Plans for extending Pakistan's productive capacity are being considered. The purchase of 1,000 new jute looms for East Pakistan was recently announced. A new mill of 250 looms in Sirajganj is expected to start production in 1962. Its establishment will mark the centenary of the first jute mill built in Sirajganj by a group of Dundee magnates in 1862. This mill was subsequently destroyed in an earthquake.

THE JUTE MARKETS

Manufactured Goods: The gunny markets were extremely dull at the opening of the past week. Due to the lack of overseas interest, heavy goods dropped by Rs. 1.50, so B Twills opened at Rs. 179.50 for ready delivery and January-March shipment was at a discount of Rs. 8. Hessians also fell, and 40in. 10oz. opened at Rs. 57.25 for both the near and forward positions. Some selling pressure from mills induced an easier undertone, and in spite of some forward sales of woolpacks to Australia for January-June 1961 shipment, prices continued to fall. By the week-end, ready B Twills had dropped by Rs. 2.50 to Rs. 177, but the decline was more pronounced in the forward section, where January-March B Twills had slumped by Rs. 5.50 to Rs. 166. By Monday morning, however, rates advanced by Re. 1 in both sections, but quotations were nominal in the absence of business. Prices were again forced up on Tuesday, and B Twills reached Rs. 179, with the discount for forward shipment now at Rs. 10. Hessians ruled quiet at the opening, and 40in. 10oz. showed a steady decline to Rs. 56 for ready and Rs. 55.25 for January-March shipment. In sympathy with heavy goods, prices recovered over the week-end, and showed a total improvement of about Re. 1 by Tuesday.

Opening quotations on Wednesday morning were as follows:

	Ready	Dec.	Jan.-March
40in. 7½oz.	42.85	42.85	42.00
40in. 8oz.	45.85	45.25	45.00
B Twills	178.00	170.00	167.00
Heavy Cees (Plain)	176.50	170.00	167.00
A Twills	212.00	210.00	207.00
Liverpools	200.00	198.50	197.00
Cornsacks	179.00	174.00	171.00

Raw Jute: The raw jute market was very quiet at the opening last Thursday, as the failure to issue quotas worried sellers. More offers came, and prices for Assam Bottoms dropped from Rs. 50.50 to Rs. 49.50. Mills showed little interest and the general state of the market was weak. A change took place over the week-end when it was reported from the agencies that upcountry rates had advanced by Rs. 2. This led to a hardening of Calcutta rates on Monday, and by Tuesday the previous losses were made up. There was reported to be heavy buying in the agencies by mill representatives. This, combined with the decline in imports at the main receiving centres, was the main reason for the price increases. Quotas were not issued to the mills until late on Monday, but they showed no eagerness to buy, although some business was reported. Wagon arrivals in Cossipore showed a slight improvement over the pre-

THE FOREIGN JUTE MARKETS

FIBRE PRICES REMAIN FIRM

(FROM OUR DUNDEE CORRESPONDENT)

THE Dundee jute industry is still rather amazed at fibre prices remaining at such high levels, because many people still do not believe that supplies will be exhausted before the end of the current season. They have memories of the industry being compelled to buy jute on an excited and advancing market because of the report that there would be a scarcity of the fibre. Eventually, it was found that there was no cause for panic and that much money was lost. This apart, some harm has been done to the Dundee jute industry, with the loss of customers who have changed over to paper or some other substitutes because it is now considered that jute is not worth the high cost.

Paper is much cheaper than jute and it has never yet been in keen competition with the latter. No matter to what level jute values may go, paper can always be made and sold at lower prices. In prewar days, say 1938, Calcutta hessians were selling at 15s to 16s for 40in. 10oz. a 100 yards at times, and B Twills at around 38s to 39s a 100 bags for shipment, c.i.f. U.K., while hessian yarns were often quoted at 3d a lb, and 40in. 10oz. hessians from 2.40d to 2.50d a yard. The current prices for Calcutta hessians are 85s 9d for 40in. 10oz. and 66s for 7½oz., December, and 86s 6d and 65s 3d for January-March, with B Twills at 267s 9d and 261s 3d for the respective positions of shipment, all f.o.b., Calcutta.

Dundee prices for hessian yarns are 24.60d a lb for 8 lbs C.H.W. cops and 25.75d a lb for 8 lbs J.C.H. warp, while 40in. 10oz. hessians are at 19.81d a yard, and 8oz. at 16.55d a yard, at which price only a limited volume of business is being done.

It is little wonder, therefore, that when prices are compared with those of former days, buyers are reluctant to concede the current quotations. Raw jute is being quoted around £195 for Mill Firsts £184 for Mill Lightnings, £180 for Mill Hearts and £173 for Grade Hearts, also Grade Tossa-2/3 from £185, four £180 and Continental Tossa-2/3 £175, all December-January, c.i.f. U.K.-Continent.

THE PAKISTANI JUTE MARKETS

FIBRE ARRIVALS STILL SMALL

(FROM OUR EAST PAKISTAN CORRESPONDENT)

ONCE again, wet jute has been appearing in the market. Although the percentage is not damagingly high, it is high enough to make the business profitable. There has been a slight tendency for prices to go down in the loose jute centres, but not in the main one at Narayanganj. Pucca bale prices have remained unchanged and purely nominal, with little or no business passing, excepting cuttings where there have been slight fluctuations due to occasional business. Overseas prices, however, continue to come down. The selling pressure is coming mainly from afloat jute. Buyers, although short, are holding off as far as possible in an attempt to push prices further down. With the festive season approaching, it is quite probable that there will be no rise this month. On the other hand, conditions being what they are, there is slim chance of prices coming down. It is not likely that genuine shippers are discounting prices, especially since what little jute is coming in, can be bought below E.P.C. levels. Reports from all stations upcountry indicate that arrivals are extremely scarce and that there are very few balers who are buying. In spite of the lack of buyers, the grower is not worried and is bringing in his jute in very small quantities.

Reports about Chinese business are rife, varying from the Dundee rumours that they have bought 60,000 bales to others that they have bought nothing. Reliable sources indicate that the Chinese found it much cheaper to buy jute goods than raw jute, have bought only about 15,000 bales of the latter, and have closed for January-February shipment 5 million bags at prices which are attractive to the Pakistani mills.

you have just opened
A METAL BOX CONTAINER!

Salted or plain, cashewnuts need to be sealed in a specially designed container in an inert atmosphere. This way they retain their freshness and flavour for long periods. Thanks to the container's protective qualities, India has been able to export large quantities of cashewnuts to distant lands and to earn valuable foreign exchange. The U.S.A. alone buys Rs 11 crores worth every year, making the humble cashewnut India's second largest dollar earner.

In the country's drive to expand the export of consumer goods, Metal Box, leaders in the packaging field, are playing an important role. Already, over Rs 30 crores worth of consumer goods—mostly perishables—are finding their way abroad in Metal Box containers. Scientifically designed for protection and superbly printed for sales appeal, Metal Box containers are showing how correct packaging helps to establish Indian goods in foreign markets.

Metal Box are also taking a direct part in the country's drive to earn foreign exchange by rapidly expanding the export of containers, closures, hardware and publicity media.

Over 1000 manufacturers in India are being supplied by Metal Box with scientifically designed containers and closures that go to pack Rs 100 crores worth of consumer goods every year.

WHOLESALE PRICE INDEX FALLS

THE official wholesale price index (base: year ended March 1953=100) receded by 0.7 percent to 125.5 during the week ended 19th November, 1960, compared with 126.4 (revised) for the earlier week. The index was lower by 0.9 percent when compared with the corresponding week of the previous month, but was higher by 6.3 percent than that of a year ago. Lower prices of oranges in Nagpur (−30%), jowar in Rohtak (−9%), rice in Saharanpur (−8%), in Sadar (Cooch Bihar) and Imphal (−7% each), in Ranchi (−6%) and in Nandgarh (−5%), wheat in Danduka (−8%), in Saugar (−6%) and Khagaria (−5%), gur (−8%), black pepper (−7%), milk and salt (−5% each), chillies and turmeric (−3% each), maize and potatoes (−2% each) and bajra, gram, cashewnuts, ghee and meat (−1% each) brought down the index for Food Articles by 0.9 percent to 119.7, against 120.8 for the earlier week, although the prices of oranges in Madras (+16%) and in Shillong (+5%), rice in Trivandrum (+14%), in Sambalpur (+11%) and Kalyan (+5%), jowar in Ujjain (+9%), wheat in Rajkot (+7%), onions (+6%), cloves (+5%), coconut oil and fish (+4% each), bananas (+3%), eggs, tea and coffee (+2% each) and groundnut oil and mustard oil (+1% each) were marked up. The index for Tobacco declined by 0.5 percent to 116.2, compared with 116.8 for the earlier week due to a fall in the prices of raw tobacco(−1%). The Fuel, Power, Light and Lubricants group index worked out to 120.1, against 120.0 (revised) for the previous week. The price of castor oil (+2%) moved up. Prices of raw jute (−4%), raw silk (−2%) and groundnuts (−1%) showed a fall, while those of tanning materials (+6%), cottonseed (+5%), linseed and castorseed (+3% each), rapeseed (+2%) and copra and lac (+1% each) advanced, and the index for Industrial Raw Materials receded by 0.7 percent to 146.8, compared with 147.9 (revised) for the earlier week. The index for Intermediate Products worked out to 131.5, compared with 131.4 for the previous week. Items which showed variations during the week were: linseed oil (+3%), tin and lead (+1% each) and zinc (−2%). The index for Finished Products came down by 0.7 percent to 124.2, against 125.1 for the earlier week due to a fall in the prices of jute manufactures (−5%).

INDEX NUMBERS BY GROUPS AND SUB-GROUPS

(Base: 1952-53=100)

Groups and Sub-Groups	Week Ended 19-11-60	12-11-60	21-11-59

INDO-CZECHOSLOVAK TRADE EXPANDS

India's total trade with Czechoslovakia during the quarter ended June 1960, was valued higher at Rs. 3.69 crores, against Rs 1.94 crores in the corresponding period of last year. The value of exports to, and imports from, Czechoslovakia rose to Rs. 1.83 crores and Rs. 1.86 crores in April-June 1960, from Rs. 97.1 lakhs and Rs. 96.68 lakhs, respectively, during the same period last year. Thus against a nominal surplus of Rs. 24,000 in April-June last year, India had a trade deficit of Rs. 2.79 lakhs with Czechoslovakia during the period. Ores and minerals figured prominently in the exports to Czechoslovakia, with iron ore fetching Rs. 90.9 lakhs, manganese ore Rs. 24.52 lakhs and mica Rs. 5.21 lakhs during the period. Raw skins and spices were other important items of exports earning Rs. 30.86 lakhs and Rs. 23.01 lakhs, respectively. Oils and oilseeds worth Rs. 7.5 lakhs were also shipped to Czechoslovakia. On the import side, supplies from Czechoslovakia consisted mainly of machines and tools required for India's industrial development.—N.A.F.E.N.

Calcutta Markets

FAIR GENERAL DEMAND AT TEA EXPORT SALE

EASIER TREND IN DUSTS

AT Sale No. 22, held on 5th and 7th December, the 73,293 chests on offer at the export auction, met with only a fair general demand at lower rates. Plain B.P.'s and teas for price were easier by 5nP to 10nP, while Fannings in this category were also easier, although not to the same extent. A few of the brighter liquoring B.O.P.'s and O.Fgs. met with good support but the remainder sold 20nP to 30nP below last rates. Medium B.P.'s and Fannings were also easier by 10nP to 20nP. Whole leaf grades were generally easier, while tippy teas were irregular. The brighter Darjeelings, particularly the higher grades were well supported, but prices for the poorer types once again depreciated. C.T.C. teas met with fair support, but prices were up to 30nP lower, except for a very few selected lines which sold fairly well; poorer kinds, however, were up to 40nP easier. Legg-cut teas generally sold up to 20nP below last rates.

Quotations

	1960 Rs. a kilo	1959 Rs. a lb
Clean Black Pekoe	5.30 to 5.50	2.14 to 2.20
Plain B.P.	4.50 to 4.65	2.04 to 2.12
Plain Fannings	4.80 to 4.90	2.10 to 2.18
Medium B.P.	4.70 to 4.90	2.02 to 2.12
Medium Fannings	4.90 to 5.20	2.16 to 2.24
Best Assam C.T.C. B.P.	5.60 to 6.00	2.70 to 2.90
Best Assam C.T.C. Fgs.	5.90 to 6.30	2.70 to 2.80

(Quotations are inclusive of excise duty.)

At the Internal Sale, the 23,900 packages of Dust offered met with a good general demand at lower rates. Orthodox teas eased by 10nP to 15nP, while Legg-cuts were irregularly easier. C.T.C. teas declined by 15nP.

Quotations

	1960 Rs. a kilo	1959 Rs. a lb
Medium Dooars Dust	4.60 to 4.90	2.10 to 2.18
Medium Assam Dust	4.75 to 5.00	2.06 to 2.12
Medium Assam C.T.C. Dust	5.50 to 5.65	2.10 to 2.24
Best Assam C.T.C. Dust	6.00 to 6.30 (nominal)	2.00 to 2.80

(Quotations are inclusive of excise duty).

There was a strong general demand at dearer rates for the 557 chests of Leaf on offer.

FREIGHT MARKETS FIRMER

THE firmer rates recently paid have become more widespread, and although the American market has not seen much activity, rates have been maintained. Australian grain shippers conceded better rates with Eastern States to the U.K. paying 90s for wheat ex silo. This in turn forced up the copra rate from the Philippines to Antwerp-Hamburg range to 18½ cents a bale foot f.i.o.s. The time charter section came to life and five vessels were taken for West African round trips at 17s 6d and 19s for motorships according to size. Three vessels were taken for the British Columbia-Northern Range lumber and generals trade at $(U.S.) 2.50 for 15,000-ton modern oil burners. A *Liberty* type secured $(U.S.) 2 for four to six months' scrap trading delivery and redelivery Japan, while a 12,675 d.w. motorship was taken for two years' trading at 22s and the *Wokingham*, it was reported, was fixed for a voyage across, delivery U.S. Gulf, redelivery Pakistan-India-Ceylon or Singapore, at 27s 6d on 10,015 d.w. tons. In the ordinary voyage trades, fixtures were noted from U.S.N.H. to India, Gulf to East Pakistan and British Columbia to India. With a larger enquiry circulating, rates are showing a firmer tendency which is further reflected in owners' ideas of prices for tonnage they are willing to sell. A figure of £1 million has been quoted for the sale of a new building 14,250-ton motorship with delivery prompt and a 9,558-ton motorship built in 1938 fetched £135,000 with prompt delivery Rotterdam. A steamer of 5,500 tons built 1939 has changed hands for £60,000. The scrap market has, however, weakened somewhat with Hongkong breakers quoting £16 a light weight ton for war-built steamers.

In local waters, congestion continues at Madras and slight delays are being faced at Visakhapatnam by grain ships. Work at Calcutta discharging grain vessels has shown an improvement and it remains to be seen what effect the working of ships at Haldia will have on the work in the port proper. It is understood that work at Haldia will be restricted to one ship at a time and the total tonnage to be handled is unlikely to exceed 20,000 tons by end February when the fair season ends there. Dock Labour Board personnel are to be employed and it will be interesting to compare their efficiency and cost with that of the contractor used last year. The boycott of vessels trading with Goa has again achieved prominence in Bombay where, on two vessels this week, the unions have refused labour permission to work. Press reports are contradictory, one giving the reason that other vessels handled by the agents of the ships concerned have called at Goa while the other states that sister ships of the vessels called at Goa. If the former is correct, it appears bad luck on the owners and presages some violent changes in agency arrangements.

LINSEED QUIET

The market was quiet in the past week, and activity was restricted. Supplies were stil very small. Few crushers were operating at present, and they were working on a restricted scale. With the sellers of seeds reserved and buyers for oil pausing, business was negligible. There was little activity in the oilcake market, with small local business passing daily. The latest quotation is as follows: Ready Rs. 27.25 a maund.

HIDES AND SKINS STEADY

The market continued steady. Stocks were less than in the previous week.

Bazaar Sales

(Between 28th November and 5th December, 1960)

Cowhides: Wet salted (Ord.) 50,000 pcs. on the basis of Rs. 9.25 to Rs. 13; Wet salted (Slaughtered) 17,400 pcs. on the basis of Rs. 10 to Rs. 16 and Rs. 19 to Rs. 28.

Goatskins: Wet salted (Patna, Daissee, Kustia) 57,000 pcs. on the basis of Rs. 330 to Rs. 375, Rs. 382 to Rs. 410 and Rs. 420 to Rs. 435; Wet salted (he-killed) on the basis of Rs. 4.50 and (she-killed) on the basis of Rs. 4.25 a piece; Purneah-Kissenganj 18,400 pcs. on the basis of Rs. 320 to Rs. 370; Patna-Bhagalpur (Ord.) 31,200 pcs. on the basis of Rs. 270 to Rs. 300 and Rs. 350; Patna-Muzafferpore 12,300 pcs. on the basis of Rs. 350 to Rs. 360; Muzafferpore-Patna (heavy) 7,700 pcs. on the basis of Rs. 425.

Bazaar Stocks

(5th December, 1960)

Cowhides: Wet salted 73,300 pcs.

Goatskins: Wet salted (Patna, Daissee, Kustia, Killed) 10,000 pcs.; Assam-Dinajpur 56,000 pcs; Muzafferpore-Patna-Pakur-Purneah-Kissenganj 231,000 pcs.

Refractories for all purposes...

The Kumardhubi range of refractories is now being increasingly used for boilers, coke ovens, ladles, high temperature fire furnaces and electric furnaces.

Backed by over 50 years of manufacturing experience, Kumardhubi Fireclay and Silica Works contribute a vital operational requirement in a number of industries.

THE BALLARPUR PAPER & STRAW BOARD MILLS LTD.

NOTICE

NOTICE is hereby given that the next Annual General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company at Ballarpur, District Chanda, Maharashtra, on Wednesday, the 28th December, 1960 at 11 a.m. to transact the following business :

AGENDA

1. To receive and adopt the Directors' Report and the audited Accounts of the Company for the year ended 30th June, 1960.
2. To declare Dividends for the year ended 30th June, 1960. The Directors have recommended the following dividends subject to tax deduction :—
   (i) 5% p.a. (gross 7.14%) on Five per cent Income-Tax free Redeemable Cumulative Participating Preference Shares ;
   (ii) 14.30% p.a. on Ordinary Shares.
3. To elect Directors in place of those who retire by rotation :
   (a) Seth H. P. Poddar being longest in office, retires by rotation and being eligible, offers himself for re-election ;
   (b) Shri H D. Varma also retires by rotation and as he is an Associate of the Managing Agents of the Company, a special notice has been received from a Shareholder of the Company, proposing his re-election. A notice, as such, is hereby being given for passing the following resolution with or without modification as a Special Resolution :

   RESOLVED :

   "That pursuant to Section 261 of the Companies Act, 1956, Shri H. D. Varma, an Associate of the Managing Agents of the Company, be and is hereby re-elected as a Director of the Company".

(c) (i) Lala Karam Chand Thapar, a Director of the Company who had completed 65 years of age on 21st August, 1930, shall vacate his office at the conclusion of the Annual General Meeting under Section 280 of the Companies Act, 1956. A special notice, as required under the Act, has been received by the Company that it is desirable to avail of his valuable advice by retaining him as a Director of the Company. A notice is hereby given to the Shareholders of the Company for passing the following resolution as an Ordinary Resolution under Section 281 of the Companies Act, 1956 :

RESOLVED :

"That Lala Karam Chand Thapar who is above 65 years of age, be and is hereby re-elected as a Director of the Company and that the age limit as prescribed under Section 280 of the Companies Act, 1956, shall not apply to him".

(c) (ii) As Lala Karam Chand Thapar is an Associate of the Managing Agents of the Company, a Special Notice has been received from a Shareholder of the Company proposing his election. A notice as such is hereby being given for passing the following resolution with or without modification as a Special Resolution :

RESOLVED :

"That pursuant to Section 261 of the Companies Act, 1956, Lala Karam Chand Thapar, an Associate of the Managing Agents of the Company, be and is hereby re-elected as a Director of the Company".

4. To appoint Auditors for the current year and to fix their remuneration. M/s. K. K. Mankeshwar & Company, Auditors of the Company, retire and are eligible for re-appointment.
5. To transact any other business that may be brought forward with the permission of the Chairman.

NOTE: (i) The Share Transfer Books of the Company will remain closed from 19th December to 28th December, 1960, both days inclusive.

(ii) A member entitled to attend and vote at the Meeting is entitled to appoint a proxy who need not be a member to attend and vote instead of himself.

(iii) Explanatory Note pursuant to Section 173 of the Companies Act, 1956, in respect of the above resolutions has been sent to all the Shareholders along with the Notice.

By Order of the Board,

KARAM CHAND THAPAR & BROS. PRIVATE LIMITED,

Managing Agents.

Calcutta.
Dated, the 30th November, 1960.

BANKS

H indicates that Share capital is half paid. O. C. and Dd. indicate Ordinary Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in 'accounts closed' column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

TEA COMPANIES

O., Po. and Dd indicate Ordinary, Preferred Ordinary and Deferred Shares respectively. P. next to the name of the company indicates that the Company also has Preference Shares. Figures in "accounts closed" column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

Paid-up Capital Ordinary Rs.	Net Block Account Rs.	Reserve & other Funds Rs.	Acreage under Tea	Outturn and Average Price per lb realised for crop 1958 Lbs.	1958 Rs.	1959 Lbs.	1959 Rs.	Estimate 1960 Lbs.	NAMES	Accounts closed	Mg. Agts., Secretaries, etc.	Net Profits including taxation Rs.	Dividends per cent 1957	1958	1959	Paid-up per Share Rs.	Latest Market Quotations as available until 7-12-60 Rs.	30-11-60 Rs.	A year ago Rs.

CREDIT POLICY FOR THE BUSY SEASON

THE demand for bank credit in the Calcutta and Bombay money markets has been showing a slow and steady increase during the past few weeks. The agricultural harvests have started moving, while industrial activity remains at a high level. As the busy season gathers momentum, the credit stringency is expected to become more acute. But it is doubtful whether the banks are in a position to meet the monetary requirements of trade and industry during the coming months with any degree of comfort. On 2nd December, 1960, the deposits of scheduled banks totalled Rs. 1,932.19 crores, while their advances amounted to Rs. 1,120.98 crores, the advance-deposit ratio thus working out to 58 percent. A year earlier, the deposits were Rs. 1,873.17 crores and the advances were Rs. 935.74 crores, the advance-deposit ratio thus being 50 percent. The picture given by these figures is distorted to some extent by the fact that the deposits are inflated by the P.L. 480 funds lying with the State Bank. If the State Bank's figures are excluded, the position of the remaining scheduled banks appears rather more disturbing. The latter's deposits amounted to Rs. 1,360.33 crores and their advances to Rs. 907.02 crores on 2nd December, 1960, the advance-deposit ratio being 66.7 percent. The corresponding figures for a year earlier were Rs. 1,296.34 crores, Rs. 776.54 crores, and 59.9 percent. The statistics point to three main conclusions. The first is that the loanable resources of the banking system are already pretty well stretched. The second, is that they are stretched even though investments in gilt-edged have been run down considerably. And the third is that if the resources are not reinforced by bigger deposits, or by more liberal refinancing facilities, an increase in advances of the sort which occurred during the 1959-60 busy season will be extremely difficult to sustain.

The stringency, of course, has long been brewing. During the last busy season, scheduled banks' advances rose from Rs. 927.37 crores in November 1959 to Rs. 1,129.56 crores in April 1960. The increase was reasonable enough, considering that industrial production was rising sharply, and agricultural output showed only a relatively small decrease (mainly because of the shortfall in the jute and cotton crops, and partly because of the decline in foodgrains production). The real trouble, however, arose when what was traditionally supposed to be the slack season turned out not to be slack at all. Early in May 1960, when the scheduled banks' advances stood around Rs. 1,139.62 crores, the Reserve Bank Governor warned that they should be reduced by Rs. 110 crores over the next few months, so that the banks may be well set to meet the expansion in credit needs during the 1960-61 busy season. In fact, by the middle of September 1960, the advances had been reduced by no more than Rs. 14 crores.

It cannot be said that the Reserve Bank did not try hard enough to force a reduction. It impounded 25 percent of any increase in banks' deposits after 12th March, 1960, and started impounding 50 percent of the increase after 8th May, 1960. The paraphernalia of selective credit controls was maintained. In addition, the banks were compelled to cut down their advances against shares; to keep down the ratio of their clean advances; and to stop financing *budla* transactions. Unfortunately, however, these restrictions had very little effect. Not only did the slack season contraction in bank credit turn out to be merely a small fraction of the Rs. 110 crores originally recommended by the Reserve Bank; the share and commodity markets went on booming. The evidence indicated that the Reserve Bank may have been barking up the wrong tree. Advances could not be reduced much because the monetary requirements of trade and industry were genuinely large, especially since the upsurge in industrial production had made those requirements increasingly perennial rather than seasonal. And the commodity markets went on booming because there was a large inflow of speculative, non-banking money, before which the effect of bank credit in many sectors paled into insignificance. The spectacle did not leave the Reserve Bank unmoved; in the course of these proceedings, its Governor found time to make a speech confessing that the impact of selective credit controls on money supply and prices was bound to be limited, unless general economic policies too were aimed at restricting liquidity and inflation. The point had long before been stressed in other quarters; belated recognition of it by the Reserve Bank nevertheless won it some well-deserved compliments.

Around three months ago, however, as nervousness over the approach of the 1960-61 busy season increased, the Reserve Bank decided on a fundamental change in policy. It shifted the emphasis from selective credit controls, reinforced by academic exhortations, to higher interest rates. It found that whether or not selective credit controls had channelled bank funds into "the right sectors", they had done little to ensure that the funds themselves would be adequate. So, assuming that there were too many borrowers around who were getting credit too cheaply, it decided to filter them out of the banking system by means of higher interest rates. A "floor" was fixed for the interest rates which banks were to charge their borrowers. The cost of rediscounting facilities from the Reserve Bank was raised, leaving Bank rate a lonelier symbol than ever of whatever it was supposed to be. And deposit rates were reduced, in order that the banks might be able to protect the profits which had been eroded by heavier establishment charges. But this policy did little to restrain the demand for credit, or to ensure an adequate supply of it. So the Reserve Bank was obliged to take another measure which had long been recommended: it relaxed the deposit impounding scheme. Since then, certain steps have also been taken to adjust the selective credit controls. Sugar advances have been liberalised, because sugar production has been high; jute and gunny advances have been restricted, because jute and gunny prices are high.

Unfortunately, however, there is no sign that all these measures, individually or severally, add up to an appropriate credit policy for the current busy season. The Reserve Bank has been wanting to restrict credit; channel it into "the right sectors"; and make it expensive. The Central Finance Minister, on the other hand, has just said that there is no intention of making credit much more stringent than it is now, or of raising Bank rate. To the extent that there is a certain divergence of attitudes here, Mr. Morarji Desai's would probably command the wider popular support. The reason is simple. If the Reserve Bank's selective credit controls have worked as they should, bank credit would already be confined largely to "the right sectors". If they have not, there is no reason to believe that they will work any better in the future. If, assuming that the controls have worked properly, credit still remains extremely tight throughout all sectors, there can be only one reason—which is that the supply of credit is far too inadequate. In that case, there is hardly any point in making it tighter still. To do so would merely slow down the growth of trade and industry, without necessarily bringing down prices. Whatever biblical or economic mythology may suggest, the Davids of the Reserve Bank cannot, single-handed, fight the Goliaths of inflation. If inflationary pressures are relaxing now, it is not because of anything that has been done to bank credit. It is simply because the food harvests have been good, and they are being supplemented by huge imports from the United States. The relaxation of inflationary pressures suggests that the present may be an opportune time for replenishing the supply of bank credit.

How best this can be done, it is for the Reserve Bank to decide. But the fairest beginning would be by abolishing the deposit impounding scheme completely. The scheme has outlived whatever purpose it was intended to serve, assuming there was any. It is merely helping to starve the economy of funds which it urgently needs; and depriving the banks of the opportunity of earning the money which they should now be using for branch expansion. But the abolition of the deposit impounding scheme alone will not be enough. It may, in course of time, have to be supplemented by more liberal rediscounting facilities in order to tide the banks over the agricultural busy season. It is true that the rediscounting facilities do exist, but under the series of measures introduced in October 1960 they have become more expensive. By discouraging banks from rediscounting their advances, they tend to keep down the advances altogether. The Reserve Bank no doubt believes that in this way it is able to continue fighting its brave battle against inflation. But the unfortunate fact is that if bank credit is not available, there will be increasing resort to non-bank credit, the supply of which has in recent months proved to be far from scarce. More liberal bank credit may be necessary if the growth of the organised money market is to continue.

AID AND COMMODITY PRICES

THE shortage and dearness of jute this year, the subsequent bull speculation in that fibre and in jute goods, and finally the inadequate world tea crop, have masked from Calcutta eyes the fact that in commodities in general there is still a structural excess of supply, so that buyers remain in virtual control of the markets. Jute and tea have been, in the strongest sense, mere temporary exceptions caused by factors whose influence cannot outlive a season. Every year there are one or two short-lived exceptions to the general downtrend in commodity prices (a year ago it was wool, before that natural rubber), but for anyone who takes a longer view than the gambler, it is the overall trend that matters, not the evanescent exception. In other words, there will be no foundation for persistent bullishness in commodities until the terms of trade between raw material suppliers and industrial users have changed decisively—which they show no sign of doing yet. To try to exploit a passing firmness in one commodity when all its competitors and substitutes remain weak, and when the industrial nations feel that they are in firm control of commodity markets generally, is to run grave risks. The lesson of all the nine-day bull markets of the last decade is that they cannot be maintained against the tide of world trade, which is flowing in favour of buyers.

Commodity markets so far this year have amply confirmed this trend, and incidentally justified the warnings given here in the spring (*Capital*, 10th March, "The Fall in Commodity Prices"). In coffee, although the crop is one-sixth smaller than last year's, it is still 40 percent bigger than world demand. For cocoa, where the crop has increased for the second year in succession, supply is now 10 percent above annual consumption. All the political upsets in the sugar markets (Cuba, and the U.S.A.'s reprisals) could not support prices for more than a few weeks, and these have again fallen this autumn under the influence of a 14 percent bigger European output. Similarly in copper, anarchy in the Congo and a strike in Chile could not save prices from the pressure of surpluses. Against a 6 percent rise in the output of oil, the Arab countries were powerless to prevent price cuts. In wheat, stocks are accumulating in the U.S.A., and Australia has so much grain she is hard put to store it. At the end of September, the prices of corn. lead, zinc, cotton and rubber

were all below quotations at the end of last year. It must be emphasised that these falls have occurred despite the fact that almost all raw material markets are subject, on the supply side, to the intervention of governments, monopolies or international agreements, some of which have tried to reinforce their restrictive measures sharply this year. The most that can be said of their success is that they have managed in a few cases (such as copper) to prevent the fall assuming the proportions it would take if it faithfully reflected the statistical position. Whether they can go on doing so is another matter.

The certainty is that this lack of balance between supply and demand for raw materials has structural causes and will not be remedied by any foreseeable increase in industrial activity in the West. That is to say, markets are still dominated by the following basic facts. On the demand side: western industry continues to make technological progress that economises on raw material consumption, and substitutes artificial for natural products. On the supply side: there has occurred a permanent and unjustified expansion of productive capacity which began at the time of the Korean War and which takes the form of an extension and reconversion of plantations and of a vast investment in mineral deposits. Undertaken in the years 1948-1955 in response to the Korean boom, the International Raw Materials Conference and the Paley Report, these investments in raw material production are just now bearing their full fruit, for they are by nature slow to mature.

It is not surprising that, in these conditions, interest in the "stabilisation" (i.e., support) of commodity prices should be intense in the producing countries—and nil in the consuming countries. The present relation between prices for manufactures and for commodities means that the terms of trade are providing vast annual profits to the industrialised nations and are causing growing financial difficulties for the developing nations, especially those that rely for their exchange earnings on one or two commodities. This situation cannot safely endure, and the industrialised nations will be under increasing pressure to give back to the raw-material producers in the form of aid at least a part of the profits they are now making in trade. Even if they were obliged to refund the whole of their trade profits, this would no doubt suit them quite well, for there is a considerable political advantage, in their view, in preserving the present lack of balance in world trade while they play the rôle of donors in development aid.

THE SALES TAX NET

AS with excises in the Central sphere, sales taxes have now become the largest single source of State revenue. The proceeds have progressively risen over the years as State Governments have cast their tax net more widely in order to raise money for their various projects. For example, in 1951-52, sales tax collections of all the States amounted to Rs. 54 crores; in the 1960-61 Budget, these are estimated to yield Rs. 118 crores. Land revenue collections, which used to be the highest yielding item of State revenue until sales taxes took their place, were in those years Rs. 48 crores and Rs. 101 crores, respectively. Sales taxes were resented during the early years of their introduction, but subsequently both consumers and dealers have come to accept them as unavoidable. Now, with the philosophy of perspective planning—which promises a rosy future for the sacrifice of so many good things in the present—ruling the fiscal policies of the Government, these taxes have even become respectable. And the State Governments have been quick to take advantage of the fact.

In their greed for more money, the States have bothered little about devising a convenient collection procedure. The rules of collection as well as the rates of levy are as numerous as the States themselves, barring those few items (textiles, sugar and tobacco) for which the tax has been converted into an additional Central excise after the enactment of the Central Sales Tax (Amendment) Act. The wordings of the relevant laws have been left imprecise enough to allow flexible interpretations for the convenience of State Governments; even some of the judgements pronounced by High Courts on sales tax law have not been free from ambiguity. Consequently, considerable scope exists for harrassing the trading community on one pretext or another, and as the speeches of business men or the representations of their organised bodies on different occasions have shown, this is just what has been happening everywhere. The Federation of Indian Chambers of Commerce and Industry has just produced one more brochure in which it has repeated the case for streamlining the procedure, particularly with a view to making easier the compliance with rules and reducing the cost of compliance". The difficulties which the business community has to face because of its responsibility to realise the tax, it says, are many and "the magnitude of the requirements placed on the business man is something beyond the capacity of an average dealer. The sales tax law on inter-State transactions is particularly complex, and most dealers find it difficult to comply with it because of their inability to keep themselves up to date on the whole range of rapidly changing laws. Loose wording of the rules and insufficient supply of the declaration forms, which are compulsory for an inter-State dealer (failure to complete some of these may attract a penal tax against him) are some of the other difficulties.

The brochure next goes on to make suggestions as to how best the procedure might be simplified without sacrificing revenue. The first thing it suggests is the centralisation of the tax in order to ensure uniformity in the rules, the Central Government devising some formula under which the proceeds are distributed among different States. It points out that the centralisation of tax on textiles, sugar and tobacco has actually yielded a larger sum than when the States levied their own sales taxes. In the latter case, the collection came to only Rs. 32 crores in 1957, whereas the additional Central excise which replaced the tax the next year produced Rs. 40 crores in 1959-60. The Federation takes into account such legitimate objections as have been raised by States claiming power for marginal adjustments—that local conditions in different States vary, in some cases too widely, and that a commodity may not have the same importance in all the States—but the balance of advantage, it maintains, lies in a pronounced manner with centralisation. In the present context of economic planning in which the Centre has to bear the major share of the expenditure, the fiscal autonomy of the States, "as was usually understood", loses much of its significance. Alternatively, the States should levy sales taxes only at a single point, and wherever it is feasible, at the first point. A provision should be made to exempt raw materials and accessories, as invariably sales tax is levied on the manufactured articles. In order to help matters, sales tax advisory committees should be set up by State Governments so that the business community may have a proper forum to represent its grievances. The Taxation Enquiry Committee had gone into sales tax legislation in the country very thoroughly and it was of the opinion that the procedures adopted by various States left considerable scope for rationalisation. So it suggested the setting up of an Inter-State Taxation Council for this very purpose, but the Central Government has yet to implement the recommendation. The brochure suggests that if the above body is not set up for any reason, at least a Central sales tax advisory council should be immediately constituted.

PUTTING R AND C BACK ON ITS FEET

THE accounts of Richardson and Cruddas Ltd for the four years ended June 1959, have now been published by the Special Officer, who, it may be recalled, took over the management of the concern some time ago under instructions from the Central Government. This latest report is of considerable interest in the sense that the results provide some grounds for judging whether the experiment of the Government in coming to the rescue of a private company suffering from gross mismanagement, has been a success or not. Richardson and Cruddas is one of those exercises the Government of India proposes to indulge in wherever necessary. The present results must be assessed against the background of the difficulties in which the Company was involved at the time the management was taken over by the Special Officer. To begin with, the share register and many relevant papers and vouchers had vanished. The Special Officer has been attempting since then to compile a new share register, mainly from circumstantial evidence. But it is far from being complete yet. Under the circumstances, it is scarcely to be expected that it will be completed soon to the satisfaction of all concerned. At the same time, the importance of compiling a share register cannot be ignored considering that the entire capital structure of the Company depends on one being completed satisfactorily. Meanwhile, many claims have been made for names to be registered. Of these, some are suspected as being spurious. Whether all such claims can be substantiated ultimately in a court of law remains to be seen. In any case, many spurious claims, unless legally unenforceable, might involve the Company in substantial financial losses.

The working of the Company for the year ended June 1959 is encouraging in the sense that a profit of Rs. 10.61 lakhs has been made, after providing Rs. 3.50 lakhs for taxation, Rs. 55.000 for development rebate reserve and Rs. 2.94 lakhs (against Rs. 3.43 lakhs) for depreciation. The decision to write off the holding in Burdwan Collieries Ltd appears to be justified as there was little evidence to show that it could at any time become remunerative. So an investment of Rs. 9,99,999 has been written off by transferring Rs. 7 lakhs from investment reserve and by drawing Rs. 2,99,999 from the profit. There was a loss of Rs. 7.98 lakhs during the year ended June 1953 and a debit balance of Rs. 2,75,652 was carried forward. There is now, therefore, a credit balance of Rs. 4,85,182 which is carried forward, after making all adjustments. Sales of Rs. 2.10 crores are not unsatisfactory, although they show a steadily declining trend in view of the difficulties facing Richardson and Cruddas. Work in progress at Rs. 40.12 lakhs probably indicates that difficulties are being surmounted with determination.

The passing of the dividends, under the circumstances, must not be lamented. If the Company can be rehabilitated from the damage suffered during the Mundhra regime, the shareholders may count themselves lucky. Considering the financial strain the Company is experiencing, it is not to be expected that any dividend can be paid soon. In fact, the little profit the Company can make should be ploughed back in the business in order to accentuate the process of recovery within the shortest possible time. A piece of good news is that the Special Officer has been authorised by the Calcutta High Court to prepare a scheme of management in consultation with the mortgagee bank, the State Bank of India, and the guarantor, the Government of India. It is relevant to point out that the Government of India came to the rescue of the Company earlier by providing guarantee for a loan of Rs. 95 lakhs.

A scheme for reconstruction is being prepared, but further details are not available at the moment. An important fact is that the concern is a valuable and essential production unit from the point of view of the country's planned development. Its order-book is full for the next three years, indicating that the products manufactured by Richardson and Cruddas are in good demand. The Special Officer expresses the hope that if the financial difficulty can be overcome, it should be possible to expand the business. There is scope for developing the works both in Bombay and Madras. If working turns out to be in line with expectations, it may not be long now before the Company is earning satisfactory profits. But it is difficult to say when shareholders will celebrate the recovery by receiving dividends.

Current News and Comment

Jaipur Udyog, Ashoka Cement

The reports of Jaipur Udyog Ltd and Ashoka Cement Ltd for the year ended March 1960 have been published. The production of both Companies has increased, but their profits have not risen in proportion, mainly because the price of cement has been fixed by the Government at a level which does not cover the cost of production adequately. The directors of both Companies hope that the Tariff Commission's enquiry into the industry will help induce the Government to increase the price of the commodity in the near future. In that event, the working results should be more satisfactory.

The working of the Jaipur Udyog plant was affected by the breakdown in a turbine, so a new turbine is being installed as a standby. The supply of inferior coal also hampered production. Transferring Rs. 38.22 lakhs (against Rs. 30 lakhs) for depreciation and Rs. 17.07 lakhs (against Rs. 22 lakhs) for development rebate, the profit has improved from Rs. 4,931 to Rs. 20.51 lakhs. A taxable ordinary dividend of 6 percent has been declared. This offers a yield of 5.2 percent at a price of Rs. 11.44 a share, and is covered more than two-and-a-half times. There was no dividend in the previous year. General reserve is allocated Rs. 3.55 lakhs. The carry-forward is Rs. 1,44,304, against Rs. 98,237 brought in. Sales increased from Rs. 3.79 crores to Rs. 5.97 crores.

The trading profit of Ashoka Cement has increased from Rs. 12.89 lakhs to Rs. 15.89 lakhs. A taxable ordinary dividend of 7 percent has been declared, offering a yield of 7.7 percent at a price of Rs. 9.12 a share. The dividend absorbs Rs. 4.20 lakhs. The dividend was passed over in the previous year. Depreciation is allocated Rs. 6.90 lakhs (against Rs. 6.52 lakhs) and general reserve Rs. 2.50 lakhs, leaving a carry-forward of Rs. 4,434, compared with Rs. 2,814 brought in. Cement production rose from 119,741 tons in 1958 to 163,453 tons in 1959. It has amounted to 158,541 tons for the 11 months ended November 1960. The factory is now working to its rated capacity.

Forge Plant for T. E. L. C. O.

The shares of the Tata Engineering and Locomotive Company have shown marked strength over the past few weeks on sustained professional support induced by reports that the Company has expansion plans on hand. According to informed sources, the Company is planning to set up in Jamshedpur a huge forge plant—the largest in the motor-vehicle industry in the country—which will be able to meet not only T.E.L.C.O.'s requirements but also cater to outside needs. The project is estimated to cost nearly Rs. 3.5 crores, and the foreign exchange requirements are placed at Rs. 2.5 crores. The plant, when ready, will help save the foreign exchange now spent on it in about two years' time. The country will not need to spent so much foreign exchange on motor-vehicle forgings. The project envisages technical collaboration from abroad but it is not yet known whether such collaboration will be from the U.S.A., the U.K. or the Continent. The equipment for the forge plant will probably come from the U.S.A.

Synthetic Detergents from Tata Oil

The Tata Oil Mills Company, it is understood, proposes to set up a plant for the manufacture of synthetic detergents which are used by laundries and also find an important application in the textile industry. The Company has received a licence to produce 3,600 tons of synthetic detergents a year. Current production in the country is estimated at around 2,000 tons a year. Demand is expected to broaden appreciably with the improvement in living standards, and under the third plan the production of synthetic detergents is to be increased to 10,000 tons by the end of 1965-66. The Company, it is reported, has also secured a licence to produce 500 tons of distilled glycerine a year in its Calcutta factory. In their last annual report, the directors indicated their intention to install a glycerine refining plant. Hitherto, the Calcutta factory had been producing only crude glycerine, which was a by-product in the manufacture of soap and it was carried to Bombay and Tatapuram for distillation. Tata Oil shares have firmed up recently from Rs. 71 to Rs. 75 following optimism about the Company's working and its new schemes.

Waterfall, Blue Mountain Estates

There has been scattered support for the shares of Waterfall Estates Ltd and Blue Mountain Estates Ltd in the Madras stock market during the past week or so, since the publication of the satisfactory results for the year ended June 1960. Both Companies have decided to issue bonus shares by capitalising reserves. Waterfall Estates proposes to give one new ordinary share for every two held, and Blue Mountain Estates one new ordinary share for every five held.

The profit of Waterfall Estates has increased from Rs. 10.70 lakhs to Rs. 12.73 lakhs. A taxable ordinary dividend of 12½ percent has been declared. This is covered four times and offers a yield of 4.8 percent at a price of Rs. 5.20 a share. The same ordinary dividend was paid in the previous year. Taxation provision receives Rs. 5.60 lakhs (against Rs. 4.50 lakhs). General reserve is allocated Rs. 2 lakhs (same) and the carry-forward is Rs. 1,94,353, against Rs. 1,17,892 brought in. The tea crop increased from 1.1 million lbs to 1.2 million lbs and the average sale price improved from Rs. 1.78 to Rs. 1.85 a lb. The coffee crop was 651,740 kilograms (against 619,353 kilograms). The estimates for 1960-61 have been made for a tea crop of 1.3 million lbs at a cost of Rs. 1.40 a lb, and for a coffee crop of 562,000 kilograms at a cost of Rs. 2.70 a kilogram.

There is a sharp rise from Rs. 7.46 lakhs to Rs. 27.61 lakhs in the profit of Blue Mountain. The same ordinary dividend of 12½ percent, taxable, has been paid. It offers a yield of 6 percent at a price of Rs. 4.15 a share and is covered more than three times. General reserve is allocated Rs. 7.50 lakhs and taxation Rs. 12.50 lakhs (against Rs. 1.90 lakhs). The carry-forward is Rs. 2,83,908, against Rs. 1,78,799 brought in. The output of tea was 1.6 million lbs (against 1.3 million lbs) and the average sale price increased from Rs. 1.95 to Rs. 3.31 a lb. The coffee crop was 987,381 kilograms (against 578,508 kilograms). The estimates for 1960-61 have been framed for a tea crop of 1.5 million lbs at a cost of Rs. 1.69 a lb, and for a coffee crop of 534,000 kilograms at a cost of Rs. 2.77 a kilogram.

Machinery Manufacturers Cuts Capital

The disappointing results of the Machinery Manufacturers Corporation Ltd for the year ended March 1960, combined with the previous losses, have forced the directors to reorganise the capital structure of the Company. They have decided to reduce the issued capital by cancelling the capital paid-up or credited as paid-up to the extent of Rs. 50 an ordinary share. It has also been decided to sub-divide the reduced value of the ordinary shares of Rs. 50 each into ordinary shares of Rs. 10 each, and to have all the ordinary shares in the authorised capital of the Corporation of the face value of Rs. 10 each. Under a scheme of compromise, all arrears of dividends on the cumulative preference shares and on special cumulative preference shares up to 31st March, 1960, amounting to Rs. 10.09 lakhs, have been cancelled. It is proposed to allot to the holders of the preference shares, ordinary shares of the face value of 50 percent of such arrears of dividends. As for the diversification of activity, the Corporation has been permitted by the Government to produce speed frames. The new line of production is likely to begin in 1961. Arrangements have been made for producing components for diesel engines at the Sonai works.

The loss is Rs. 1,041 for 1959-60, compared with a loss of Rs. 5.09 lakhs in the previous year. So the total debit balance is now Rs. 24,39,125, which is carried forward. The dividends have again been passed over. The Corporation's working was affected by a strike and by the absence of demand. There has been a substantial fall in the demand for textile equipment, but the sale of Whitins machines helped the Corporation to earn more through the agency business. The directors state that the production of carding engines has increased since January 1960.

Great Eastern Shipping Preferences

In view of the uncertainty about the tax on preference dividends, the Great Eastern Shipping Company is considering the earlier redemption of its 25,000 5½ percent tax-free cumulative preference shares of Rs. 100 each, which are due for redemption in 1965. The Company has written to its preference shareholders asking them whether they will agree to earlier redemption. The Life Insurance Corporation, which holds more than 50 percent of the shares, has agreed. The present price of the preference shares is mentioned around Rs. 91, and if the Company decides to redeem them at par, it appears to be an attractive proposition from the point of view of preference shareholders.

Aruna Sugars Offer Soon

Aruna Sugars Ltd, a new Company, will soon offer 350,000 ordinary shares of Rs. 10 each for public subscription at par. The issued capital consists of 850,000 shares. Of this, the directors and their friends will take 250,000 shares. The Madras Industrial Corporation will subscribe to 150,000 shares, and a further 100,000 shares may be arranged for subscription before the public offer is made. A sugar factory with an initial capacity of 1,000 tons of sugarcane a day will be built in Ponnadam, Madras State. The New India Development Corporation Private Ltd will supply the equipment. The estimated cost is Rs. 1.50 crores. The site of the factory has been carefully selected. The satisfactory demand for the commodity leads the directors to hope that the investment will prove remunerative. Full production may be achieved in 1962.

Sutlej Cotton: Unremitted Profits

Presenting the satisfactory results of the Sutlej Cotton Mills Ltd for the year ended March 1960, the directors mention the difficulties in remitting the profits from Pakistan. The unremitted profits in Pakistan are more than Rs. 1.50 crores. If they cannot be brought to India soon, it may not be possible

to maintain the present level of dividends, until the textile mill which is being set up in Rajasthan begins production. The working of the textile mill in Okara has been adversely affected by increased costs of production. The increase permitted in the selling prices of the commodity by the Government of Pakistan at the beginning of 1960 is not adequate to compensate for the rise in production costs. Steps have been taken to set up a textile mill in Rajasthan and the spinning section is likely to start production in 1962.

The Company's profit has increased from Rs. 73.62 lakhs to Rs. 88.45 lakhs, after transferring Rs. 3.91 lakhs (against Rs. 7.79 lakhs) for depreciation. A taxable ordinary dividend of Rs. 8.57 a share has been declared. This offers a yield of 9.1 percent at a price of Rs. 94 a share and is covered more than seven times. The ordinary dividend was Rs. 6 a share, tax-free, in the previous year. Taxation is allocated Rs. 35.61 lakhs (against Rs. 33.56 lakhs) and general reserve Rs. 36 lakhs. The carry-forward is Rs. 3,97,888, compared with Rs. 2,33,074 brought in.

Paper Project from Shahani

Shahani and Company of Bombay has secured an industrial licence for establishing a paper plant with an initial capacity of 4,500 tons a year. The factory, which will be located near Bombay, will manufacture high-grade writing and printing paper. The project is estimated to cost Rs. 1.5 crores. Negotiations for foreign collaboration are in progress. The factory is expected to go into production in 1963. The Company will have an authorised capital of Rs. 2 crores, of which Rs. 1.50 crores is likely to be issued in the first instance. It is expected to be in the market for raising capital early next year.

Greater Mysore Pulp Plant

The Greater Mysore Rayon-Grade Pulp and Paper Mills is a new Company which has been formed to undertake the manufacture of rayon-grade dissolving pulp. It is said that this will be the first venture in Asia to produce such pulp out of eucalyptus and bamboo. The factory will be located in Kalsur, near Yellapur in north Kanara. The plant will have an initial capacity of 110 tons of rayon-grade dissolving pulp a day, which will be increased to 350 tons a day in two stages over a period of three years. The project has been sponsored by Mr. S. V. Viswanathan in collaboration with Messrs Empacel of Paris. The French firm will supply technical know-how and machinery, and participate in the capital of the Company. The machinery will come on a deferred payment basis. The Mysore Government is likely to take up nearly 10 percent of the capital. The authorised capital of the Company will be Rs. 10 crores, of which Rs. 5 crores is to be issued.

Indian Plastics Fares Well

The working of Indian Plastics Ltd for the year ended March 1960 has resulted in a profit of Rs. 1.95 lakhs, against Rs. 98,914, after providing Rs. 1.63 lakhs (against Rs. 1.49 lakhs) for depreciation. Sales, at Rs. 86.16 lakhs, were Rs. 14.95 lakhs more than in the previous year. Development rebate reserve gets Rs. 40,960 (against Rs. 15,468). The preference dividends absorb Rs. 1.24 lakhs, leaving Rs. 33,618 to be carried forward, against Rs. 2,457 brought in. The directors state that the Company has entered into collaboration agreements with Graetz Kommandit Gesellschaft of West Germany, for which Government approval is awaited. Another collaboration agreement with Bakelite Gesellschaft of West Germany has already been approved. The directors are considering the scheme for the manufacture of some major radio components. The Company has introduced transistorised radio receivers during the year. In view of the unabsorbed depreciation, the managing agents have agreed not to charge the managing agency commission.

K. T. Corporation for Canning

The K. T. Corporation of Bombay is sponsoring a project at an estimated cost of Rs. 1 crore for setting up a chain of factories throughout the country for the processing, pickling, canning and preservation of fruits and vegetables. The factories are to be set up in Bombay, Poona, Benares, Muzaffarpur, Shillong, Kashmir, Bangalore and Cochin to process and can fruits and vegetables grown in these areas. The project will be operated by a new company, which is expected to enter the market for raising capital within a few months. The company has sought the collaboration of certain U.S. firms for technical know-how, advice on marketing, transport and finance. The U.S. firms, besides providing plant and machinery, might even participate in the equity capital of the company.

Bengal Deshi Cotton Export Quota

At long last, the Government of India has decided to release for export 50,000 bales of Bengal Deshi cotton, of which 2,500 bales are earmarked for co-operative societies and the balance is to be licensed on a "first come, first served" basis on presentation of shipping bills, subject to an individual quantitative ceiling of 10 percent of the quantity allowed. The cotton will be "superfine and above" in grade. The Government has also laid down that each intending exporter shall have sold and delivered after 9th December to a cotton mill and/or a factory manufacturing absorbent cotton, which are the traditional consumers of Bengal Deshi, a quantity equal to the quantity he wants to export. Shipments are valid until the end of August. The export quota last year was first announced on 3rd September, and it was followed by another instalment on 28th November. The total quantity allowed was 150,000 bales in spite of a partial failure of the 1959-60 crop which turned out to be only around 3.75 million bales. The delay in the announcement of the export quota this season, in spite of a much better crop, is due mainly to the Government's anxiety to keep prices down. Bengal Deshi has been quoted substantially above the ceiling rates even though the crop this season is larger than in 1959-60 and the overall supply of cotton is far more comfortable. The high premiums reflect the keen foreign demand for Indian Deshi cotton. With a view to ensuring adequate supplies of Bengal Deshi for the mills and factories, the Textile Commissioner recently asked them to inform him about their total requirements during the season, so that he might requisition the cotton for them if considered necessary.

The trade is disappointed over the quota announcement. It is not that the quota falls far short of the general expectations. Nor is it because exports will be confined to cotton of superfine and higher qualities. The trade is disappointed mainly because of the stipulation that exporters will qualify for their quotas only after they have sold and delivered an equal quantity of cotton to the mills or factories. On the basis of the prices prevailing here and abroad before the quota announcement on 8th December, an exporter could hope to make about Rs. 40 to Rs. 50 a bale. This margin will virtually disappear if the exporter has to purchase cotton from the market at huge premiums and sell it to the mills at the ceiling rates. Since there are very few mills which consume Bengal Deshi, they will be in a position to bargain with the intending exporters. Reports are that the mills have already started quoting prices much lower than the ceiling rates. Enquiries in the market indicate that exporters had sold about 80,000 bales of Bengal Deshi at prices ranging from 20.5d to 23d a lb for choice quality and between 19d and 22d for superfine quality. Not many shippers will now be able to meet their commitments abroad. But that need not put them to any great difficulty because all the business must have been subject to export quotas. It is natural for the trade to feel disappointed at the loss of an opportunity for profitable business. But the Government has reason to think that, with overseas demand remaining fairly keen, it should not be difficult to sell 50,000 bales of Bengal Deshi at a profit. At the same time, mills and factories consuming Deshi cotton will now get their supplies at or below the ceiling rates, which would have become very difficult otherwise. The Textile Commissioner will be saved the trouble of requisitioning Deshi cotton for the traditional consumers. The Government's decision to allow exports on the basis of shipping bills instead of registration of sales is welcome because it will encourage genuine business.

The Bengal Deshi crop this season is estimated at around 325,000 bales, against 290,000 bales in 1959-60. There is a carryover of 40,000 bales from the previous season, which brings the total supply to 365,000 bales. Allowing 120,000 bales for mill consumption (the actual consumption last season was 101,000 bales), 15,000 bales for surgical dressings and another 50,000 bales for mixing, there still remains a balance of 180,000 bales. It should, therefore, be possible to export 150,000 bales of Bengal Deshi this season. Exporters may look forward to the release of another quota for 50,000 bales or 100,000 bales after the present quota has been sold out.

NOTICE

With the weekly issue of CAPITAL which is to appear on 22nd December, it is proposed to issue a supplement of 152 pages, the Annual Review of Commerce, Trade and Industry. Besides essays on specific industries such as jute, tea, cotton textiles, coal and sugar, the Review will contain exclusive articles by well-known authors. Dr. Vera Anstey will write about India's take-off problem and Mr. Neil McInnes will discuss the economics of Indian education. Mr. Asoka Mehta will outline the reasons for the uneven progress of Indian agriculture; Dr. H. L. Dey will examine the fiscal prospects for the third five year plan; and Mr. M. M. Philip will write about the development of the overseas communications services. There will be two articles on labour problems—one by Dr. N. Das about the right to strike in public enterprises and the other by Mrs. M. Sur on the recent trends in labour relations. Specific aspects of the third plan will be discussed in detail, Mr. G. M. Laud writing on the problems of developing co-operatives, Professor P. C. Jain on the rôle of the private sector, and Professor V. G. Ramakrishna Aiyer on the question of raising resources from the rural economy. Dr. P. S. Lokanathan will examine the social aspects and implications of planning. Developments abroad which are of close interest to India will be covered in articles about the European Common Market, the European Free Trade Area, and trends in U.K. aid for overseas development. Other articles will deal with the past year's experience in such sectors of the Indian economy as life insurance, general insurance, banking, the stock markets and the freight markets. The supplement will be distributed free to all registered subscribers. Additional copies at Rs. 5 each may be obtained from the Manager, Capital, 5 Mission Row, Calcutta 1. Orders for extra copies should be placed early.

Imports Linked with Exports

The uncertainty about the import policy for betelnuts, cassia, cinnamon, cloves, mace, dates and nutmegs for the current licensing period, October 1960 to March 1961, has ended. Quotas have been cut by half. The import of betelnuts, cassia, cinnamon, mace and cloves has been linked with the export of groundnut oil and tapioca flour. Imports of dates are allowed only against exports of tinned fruits, biscuits and confectionery, syrups and juices, pickles, mollasses and cigarettes. No condition, however, attaches to the import quota for nutmegs. The trade cannot be expected to welcome either the cut in quotas or the linking of imports with a liability to export groundnut oil or tapioca flour. But the Government has apparently been encouraged to adopt this policy because of the huge margin available on imports. Indeed, the margin is so enormous that in spite of the heavy losses on exports of groundnut oil and tapioca flour, importers will still be able to make substantial profits. Against a loss of Rs. 450 to Rs. 500 a ton of groundnut oil, importers stand to make nearly Rs. 1,100 to Rs. 1,200 on each 2½ cwts of betelnut, cloves or cassia. It is extremely difficult to assess the quantity of groundnut oil or tapioca flour that might be exported against the import quotas. If importers were to export only groundnut oil, the total quantity might be around 5,000 tons or 6,000 tons. But the prospects are considered more encouraging for exporting tapioca flour than groundnut oil. This is mainly because of the more abundant supply of tapioca in the next few months. India is known to have an exportable surplus of about 48,000 tons of tapioca flour and the bulk of the crop moves into the market between December and April. Germany is reported to be an important buyer and the new incentive scheme will enable India to compete with Indonesia and Thailand which have also adopted export incentive schemes. The import policy announcement on 8th December has been followed by a rise in the prices of nearly all the items concerned. In Bombay, cinnamon has risen from Rs. 280 to Rs. 300 for 10 kilograms, and cloves have improved from Rs. 240 to Rs. 265. Groundnut futures have been marked up very close to the season's high of Rs. 212 on prospects of oil exports.

The decision of the Government to link imports with exports marks an important change in its policy. Hitherto under the export incentive scheme, exporters were given import entitlements only after they had actually shipped the goods, which caused a great strain on their financial resources because of the losses incurred on exports. But now imports are allowed to precede exports. The trade will, therefore, have made a substantial profit to pay for the loss on exports. With a view to ensuring that importers honour their export commitments, the Government has laid down that the licensees give a bond duly supported with a bank guarantee for an amount equal to the c.i.f. value of imports for fulfilment of the export obligations. But there is a real danger that the importers may not export the required goods because the loss on exports will be much larger than the amount lost by way of bank guarantee. The import trade will have only itself to blame if it were to forfeit the Government's goodwill and thus lose business which, although limited, is very lucrative. Importers should thank the Government for maintaining the established trade channels. The latter could well have asked exporters of groundnut oil and tapioca flour to import the various items concerned.

Wage Board Report on Sugar

The recommendations of the Central Wage Board for the Sugar Industry have had a mixed reception in U.P. While workers feel that they have been denied parity with the Maharashtra region where total wages work out to be the highest, employers are displeased that the Wage Board did not deem it expedient to give some favoured treatment at least to the factories in eastern U.P. The Board has simply said: "It is open to the sugar factories of this area to approach the Central or the State Government for granting relief. It may well be hoped that the national Government, interested as it is in the industrial development of the country, will give the matter sympathetic consideration." It is, however, feared that it will not be easy for either the Central or the State Government to persuade sugar workers in eastern U.P. to forgo any advantages which the Board has initially conferred upon them. Not only in eastern U.P. but elsewhere too there have been instances of individual units in the industry not doing well; the only concession prescribed by the Board in such cases is that "for the first two years, one-half of the recommended dearness allowance rates may be applied." The Board has not gone into the question of linking wages with productivity, since in the opinion of the I.L.O. expert quoted by the Board, "the nature of the sugar industry imposes certain limitations on the types of incentive schemes which would be suitable for it." All that has been recommended is a "further study with a view to introducing incentive schemes wherever possible."

Limitations of time and personnel prevented the Board from embarking on any workload study to determine the labour surplus in the mills, but it has strongly urged the Government to undertake such a study at an early date. At the same time, it has said: "While recommending the early institution of workload studies for assessment of fair workload and actual manpower requirements, the Board considers it important that such studies should be preceded by reasonably specific programmes of implementation drawn in consultation with the organisations of the interests concerned." But anyone familiar with the history of rationalisation in the textile industry will be reluctant to entertain great hopes about retrenchment or reform in the sugar industry. The statement recently laid on the table of the Lok Sabha by the Central Deputy Minister for Labour, Mr. Abid Ali, does not contain any overall estimate of the additional financial burden which the Board's recommendations will place on the industry. But there can be no doubt that it will be considerable taking into account also the marginal benefits. One good feature of the Board's report is its rejection of the claim of co-operative sugar factories for preferential treatment.

The Wage Board for the Sugar Industry, "having regard to the particular attitude of labour *à propos* balance-sheets in the north" and also other factors, has recommended a bonus formula which, for calculating net profits, rests on the regional cost schedule prepared by the Tariff Commission in 1959. In the north and central regions, 22 percent of the profits after tax, to be calculated in the prescribed manner, will be paid by the mills as bonus to their employees. Bonus at the rate of 20 percent of profits is prescribed for factories with an average seasonal crush of less than 1,000 tons. The bonus will be subject to a ceiling of three months' consolidated wages. As for Maharashtra and the southern zone, the Board has not recommended any change in the existing practice of settling bonus claims by collective bargaining. The Government's intention to set up a Bonus Commission is another reason why the Board has considered it unnecessary to evolve any new formula. In Bihar, a Bill has been passed empowering the Government to stipulate that bonuses above a prescribed sum should be credited to the provident fund or given in the form of cash savings certificates. Twelve years ago, textile workers in Bombay were given savings certificates as part of their bonus, and these were immediately encashed. But since those to be given under the Bihar legislation will not be readily encashable, there has been criticism that the measure is intended to increase the funds available for the Government.

Factory workers are not the sole claimants to a share of profits in the sugar industry. Sugarcane growers in U.P. are agitated that the factories have not been forthcoming with the deferred payments due to them as their share of the extra profits. At the meeting of the Joint Sugarcane Board for U.P. and Bihar in November, the former U.P. Chief Minister, Mr. Sampurnanand, asked the factories to make an *ad hoc* payment of deferred sugarcane prices, pending a final decision on the price-linking formula by the Tariff Commission. Just as the Wage Board for the Sugar Industry has referred to the attitude of labour to balance-sheets in the north, it would appear that cane growers, too, have their own reservations concerning these. For instance, the U.P. Co-operative Cane Unions Federation maintains that "the factories can manipulate certain aspects of their accounts, data and other relevant statistics to the disadvantage of cane growers." The insinuation has been indignantly denied by factories.

Commodity Speculators on Strike

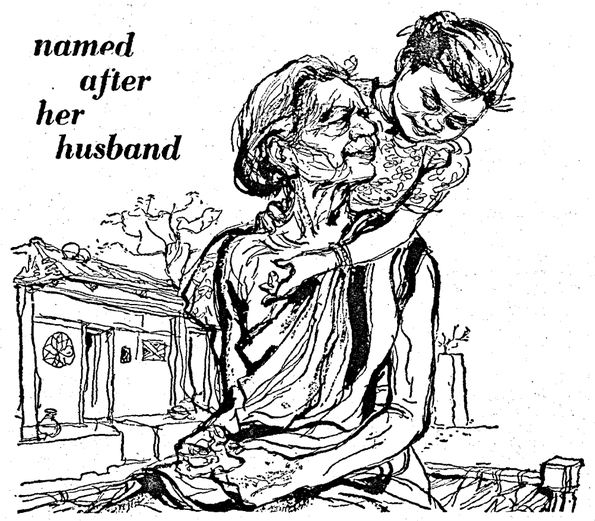
Speculators in the cotton, bullion and oilseeds markets in Bombay staged a strike last Saturday as a protest against the drastic powers which the Government and the Forward Markets Commission will assume under the Forward Contracts (Regulation) Amendment Bill. The Commission already enjoys great authority, and is now being vested with the powers of a civil court. It will be given the authority to seize documents and award punishment for offences under the Act. The punishment will include both fine and imprisonment. The Commission may, in the interests of the trade, suspend a member of any recognised association for a period of three years.

Perhaps not all is well with the working of many forward markets. But if the Forward Markets Commission has had occasion in the past to be annoyed with the markets' behaviour, it has been mainly because of the rising trend in prices. Speculators have often been blamed for rigging up prices even when the rise has merely reflected the unbalance between demand and supply. In vain has the Commission at times tried to make the market fluctuate to order. If the Amendment Bill were aimed only at ensuring better administration of the Forward Contracts (Regulation) Act, few would object. It is good to ask all associations to get themselves registered with the Commission. That kerb trading, which is clearly void, will be made illegal, also need cause no great concern. The maintenance of books of accounts in the prescribed forms for three years would be welcome. But the drastic powers which are now to be given to the Commission are hardly calculated to promote respect for the authorities, or the understanding between the trade and the Commission which is necessary for the smooth and efficient functioning of forward markets.

Nationalising Insurance in Ceylon

Having decided to nationalise life insurance, the Ceylon Government has recently circulated a Bill to set up an insurance corporation. After a date which will be notified later, the corporation alone will be allowed to transact new life business. In addition, it may transact other types of insurance business too. It is specifically stated that no insurer will be compensated for any loss he incurs, whether directly or indirectly, through the ban on his new life business. Those who have issued life policies under which the liabilities have not been discharged, will have to keep enough assets in Ceylon for discharging those liabilities. At least half the assets will have to be in the form of Ceylon Government securities. The other half will have to be in a form approved by the new corporation in writing. Some of the present life insurers may think that, with the ban on new business, they should transfer their existing business to the corporation. In that case, the corporation will investigate the financial condition of their life business, valuing the assets and liabilities pertaining to it; and then take over the life part of the business. Apart from this, the corporation will also function as a reinsurer. Every insurer will have to reinsure with the corporation a prescribed percentage of the liability under every contract of general insurance. For this, the reinsurer will receive a commission calculated at such rates as the corporation may decide.

The main point of interest in the Bill centres on the method which the Ceylon Government is adopting for nationalising life insurance, and how this method differs from the one adopted in India. The Bill indicates that the proposed corporation in Ceylon will not take over the existing business. It will thus be able to avoid the complex problems of integrating numerous companies which India had to face. There is, again, no question of compensation. In India, the position was different, as compensation was guaranteed under the Constitution. Over the years, the existing insurers in Ceylon may, one by one, ask the corporation to



Last year, 61-year old Lakshmi Hansda retired from the Jamshedpur Steel Works which she and her late husband, Sitaram Hansda, joined as a young Adivasi couple shortly after the first steel ingot was cast in 1912. The family connection with the Steel Works is maintained through two of her three sons who work there.

Lakshmi and her family — sons, daughters and grandchildren — live in the same area in Jamshedpur where she first set up her home on arrival from a Ho village in Seraikella nearly 50 years ago. That once-desolate spot is now a busy, bustling Adivasi community, with clean huts, roads, water supply and a primary school and is named Sitaramdera in memory of Lakshmi's husband.

Like men and women from other parts of India, Adivasis have found a happy home in Jamshedpur, where industry is not merely a source of livelihood but a way of life.

JAMSHEDPUR

THE STEEL CITY

The Tata Iron and Steel Company Limited JWTTN 4085

take over their business. The process is likely to be gardual. The Ceylon Government is short of trained manpower, so the existing companies are likely to continue for some time. In due course, the difficulties may be overcome, for the corporation could ask the companies to train its personnel and quite a number may opt for service with the corporation. The corporation propopses to function as a professional reinsurer like the India Reinsurance Corporation. It also proposes to transact a large amount of Government business, somewhat in the nature of the business transacted by the Indian Insurance Companies Association Pool. The undertaking is likely to be colossal. Nevertheless, it is an interesting venture and the results will be watched with interest.

Insurance: Fire Losses in U.K.

The fire loss experience of insurers in the U.K. deteriorated sharply in 1959, and the deterioration continued during the first half of this year. There has naturally been close investigation and discussion in Britain on the subject. The abruptness and extent of the worsening are illustrated by the estimate that the material damage rose from £24 million in 1958 to £44 million in 1959—an increase of 83 percent. The 1959 figure was 60 percent more than the former high of £27¾ million in 1955, 79 percent more than the average for the last ten years, and 68 percent more than the average for the last five years. Many people wonder why last year was so disastrous. They ask whether there has been any change in the physical nature of the risks, or in the materials and processes used, which has resulted in the largest fire losses in recent history. Alternatively, the question is also asked as to whether there has been a deterioration of moral values, so that managements and employees are less careful, or whether there is evidence of arson or malicious damage.

Great stress is laid on the fire risk due to size, concentrated values, and the existence of large unbroken roof areas. Undoubtedly, the rapidly increasing capacity of modern factories—in which extensive freely communicating areas provide the ideal layout for house conveyor systems of mass production—is diametrically opposed to the interests of fire protection. Mr. W. A. Jackson, Home Fire Manager of the Royal Exchange, in his address to the Insurance Institute of London, analysed the reasons for large fires in the U.K. He felt that the larger fire risk not only presents a larger volume of material and therefore monetary value which can be destroyed; it also contains correspondingly more features which may start an outbreak or create a problem for the fire brigade, and which require more appliances and water to control the incident. Similarly, the potential risk of destruction is increasing through the use of combustible rcofing materials—especially bituminous coated metal, timber and felt—which are particularly attractive in industrial areas where corrosive fumes reduce the life of unprotected metal. The position has been worsened by the use of combustible linings for thermal insulation purposes. It is unfortunate that many of the materials which are otherwise highly suitable for insulation purposes are combustible. For new buildings, the recent Thermal Insulation Act will require material to have class I surface spread of flame. But in many cases, apart from an external skin, the material may still provide fuel for the fire. A number of the existing linings have been affixed to the undersides of purlins, leaving a space through which draught can spread fire very quickly, but water from hoses and sprinklers cannot reach the burning surface of a roof and its lining until the blazing material collapses into the building and spreads the fire over a large area.

However, the factors of size, construction, concentration and susceptibility cannot account for the sudden increase in losses during 1959. These factors applied almost equally in other recent years, and have built up steadily in importance during the postwar period. Similarly, there has been no sudden alteration in processes of manufacture or in the materials used. Such factors change continually, but gradually. There have also not been any sudden alterations in fire brigade cover or efficiency. Protection has kept pace with the growth of fire risks, but again the effect has been gradual. An analysis of individual occurrences has not shown any pattern concerning the class of risk, or locality, to explain the worsening in the experience. Nor has there been evidence to show that any new cause was responsible for the outbreaks. Finally, the general prosperity of Britain does not suggest that moral hazards are responsible for the increase, nor do investigations by the police or forensic experts indicate that the fires have been started maliciously. Many of the firms whose premises have been severely damaged were working at full capacity, and they had every reason to seek freedom from interruption.

Accordingly, one is tempted to conclude that the only factor which was peculiar in 1959 was the long, hot and dry summer in Britain. It caused many materials—particularly roofs—to become so dry, baked and tinder-like that any incidence of fire resulted in an abnormally rapid spread of the outbreak. Water pressures were reduced. Sometimes mains were turned off at the vital time, and ponds which would have been used by the fire brigade dried up. The suggestion that the weather was the principal cause was confirmed, it appears, by the fact that of the increase of £20 million in the total for 1959, no less than £18½ million occurred in the period from May to October, which was recorded officially as being the driest summer in England and Wales since at least 1750. The experience during the last two months of the year was normal. Against this background, it is disturbing to find that the experience during the first half of 1960 has been even worse than during the corresponding period of last year. The excessive losses this year cannot be attributed to exceptionally dry weather. An extensive examination has led Mr. Jackson to the startling but simple conclusion that almost all the fires were started by the common hazards listed in the textbooks of 50 years ago. The main cause of fires in buildings was not nuclear fission, but smoking materials. The second cause was not jets or rockets, but children playing with matches. The third was oil lamps and stoves; and the fourth, fires in grates igniting bedding, clothing, furniture and other materials. Approximately 50 percent of all fires were due to the use of space-heating appliances. These are elementary hazards, and Mr. Jackson concluded that there is nothing more scientific than spontaneous combustion, static electricity, oxy-acetylene welding, or radio and television equipment.

THREE PERCENT LOAN

WE publish in another column a copy of a memorial that has been submitted to the Government of India and signed by a number of Banks, asking the Government to convert their holdings in the three per cent into the three and half per cent loan, on payment of such cash difference as may be just and reasonable. We have always advocated this course. In our issue of June 29th, 1897, we wrote: "However people may differ in opinion about a sterling or rupee loan, there can, we think, be no doubt about the general unanimity condemning a 3 per cent loan, for it is felt, that such a loan would not go down in India, and so far the London market has left it severely alone. It may have been, though we are somewhat inclined to doubt it, a stroke of financial genius to convert 3½ per cent paper into 3 per cent, but there is no doubt whatever that it was a political mistake. It has utterly disgusted such of the public in India as have been afflicted with it; it is severely left alone by dealers in this class of securities. "We think that Sir James Westland would do a great deal to restore confidence if he were to make some arrangement with the holders of 3 per cent loans, and allow them to convert them into a 3½ per cent loan. He might charge the 3 per cent holders a commission of 5 per cent for conversion The effect of this would be to at once make these loans a marketable security, and several banks that have large holdings would be relieved of a heavy incubus." We can add nothing more to the above.

A Ditcher's Diary

NOBODY HAS COME OUT OF THE BERUBARI AFFAIR with his reputation enhanced. Mr. Nehru impresses only Congressmen, and then not all of them, that the country must give away territory, however negligible in quantity, simply because his prestige is at stake. I am not persuaded that Dr. Roy took the same interest in Berubari two years ago as he has done lately. The Opposition in West Bengal would be more than human if it did not exploit the Congress Party's extreme embarrassment to the hilt; and I am not exactly looking forward to the threatened *hartal* tomorrow. The Opposition must know that strikes and demonstrations will not undo what the Prime Minister has done. It must also know that massive agitation of the kind projected always carries with it the extreme risk of widespread lawlessness and disorder. It has seen time and again that while it is capable of launching "movements", it is quite powerless to control them. But I am not at all hopeful that this extensive foreknowledge will influence anyone or change the course of events. Since the Government of West Bengal does not want to part with Berubari either, but only has to, perhaps it will let the strike be a success. To that extent the chances of serious clashes are happily limited. But it will be unlike the Opposition to be content with one day's glory; and then the risks will mount. The Prime Minister has promised to do everything possible to help those who will be displaced from Berubari. The record of Government-Opposition co-operation in the rehabilitation of East Pakistani refugees is so dismal that I dare not hope for anything better over the Berubari ones. Yet this is the most constructive approach. I am constrained to say that the Bengali genius for facing facts and overcoming difficulties, once truly great, is not very conspicuous at the moment. How else can one explain the indifference to Dandakaranya, which waits (but will not wait indefinitely) with developed land for Bengali refugees? It is an odd people that will moan over 4½ square miles and not seize the opportunities offered by 80,000 square miles.

IT WAS AS FAR BACK AS 1951, OR IT MIGHT HAVE been 1952, that the Abominable Snowman, the Yeti as we now call him, was voted the personality of the year in a U.K. public opinion poll. He led the late Gilbert Harding by several lengths, which I remember thinking at the time was no mean achievement for one who had never appeared in public at all. Now, nearly ten years later, he still hasn't, which seems to me to be carrying coyness too far. In fact, if a poll were to be held for the biggest humbug of 1960, I would vote the Yeti to head it; and I suspect I would not be the only one. It is bad enough that so many able-bodied, and presumably seriously-intentioned, young men should have been wandering around the Himalayas during the past ten years or so looking for him. But when one of them finds a 200-year-old scalp—which from its pictures looks for all the world like one of those felt funnels my grandmother used to strain her home-made wine through—takes it round the world for scientific inspection, and yet admits that he himself does not believe it genuine, then I think it is about time somebody took the lead in bringing this farce to an end. I am not unaware of the commercial benefits which have arisen from the Yeti myth, nor of those still to be gained by keeping it alive; I have even noted with approval that the village which has so kindly lent the scalp is to get a school to compensate its trouble. But that is no longer an excuse for carrying this tedious business any further. By all means let Scotland Yard have a look at the evidence, although I doubt if its experts will be able to say exactly who is the victim—or should it be culprit? But when this latest episode in the tiresome and interminable Yeti story is over, and the scalp is back where it belongs, then let the dossier be closed once and for all until a Yeti presents himself in person to reopen it. Let us see an end to all this pointless speculation and not-so-pointless, but equally irritating, publicity for those who are making such a good thing out of it.

AS A VENUE FOR TRICKY CONFERENCES, LANCASTER House has several successes to its credit, although on each occasion failure was only round the corner until almost the last minute. The conference now in progress has already faced several crises; at one stage the African leaders seemed unwilling to take part at all. Hard bargaining was, and is, inevitable; but judging from the tone of the British Press it seems to me that by their excessive intransigence the nationalists have lost many friends. Dr. Banda, who is fond of striking uncompromising poses in public, can be remarkably resilient in private; and it should be remembered that at the last conference—at the same Lancaster House—he made a "deal" with Mr. Macleod without securing any of his three "minimum demands". This time, optimism should be cautious; but I would not put it past him to compromise again. And of the three leaders, his position is the strongest. Messrs Kaunda and Nkomo must know that, organisationally, their Parties in Northern and Southern Rhodesia are rather weak. If the conference fails, and they have to launch movements in their respective territories, they may not do too well. And for a freedom movement, nothing is so fatal as to demonstrate its weakness; the "juju" should never be put to a test. Sir Roy Welensky has staked his whole political career on the Federation. But it must already be clear to him that if he wants to save it, and there is much to be said in its favour, it will have to be a very different kind of Federation. Sir Edgar Whitehead, with the Dominion Party harassing him all the time, has been sadly slow in introducing liberal measures; and I hope it is true, as has been suggested, that the settlers are not as myopic or as excited as Sir Edgar assumes them to be. But the fears of the settlers—who, let's face it, have made Africa what it is today—are understandable. Even Dr. Banda should understand them.

ONE LOOK AT THE ACCUMULATING FILTH AND squalor of this great city and its suburbs and there is every excuse for wondering whether such a body as the Calcutta Improvement Trust exists at all. The only proof that it does which I have seen is the rash of newspaper and poster notices inviting sealed tenders for some work or other which never seems to get done. As its title implies, the Trust ought to be improving Calcutta, but on the basis of its accomplishments so far, it might be less misleading if the name were changed to something a little less pretentious. If one takes an evening stroll near the Dhakuria Lakes (their name, I see, has now been changed to Rabindra Sarobar by some overzealous members of the Trust who would appear to have no respect for the memory of Tagore; the place simply abounds in dirt and misery) one is bound to notice signboards prohibiting bathing and the washing of clothes. But the few liveried *durwans* of the C.I.T. who are to be found roaming about—but more often drowsing or gossiping under the trees—do not appear to care one way or the other if orders are violated and the lake waters polluted. Nearby are clusters of refugee huts which would be a disgrace to any slum, let alone an erstwhile "beauty" spot such as the Lakes are supposed to be. I have not, therefore, been particularly impressed by the recent official review of the C.I.T.'s work over the past decade. The Trust has to contend with numerous edds, that I know. But so have similar public bodies in other cities in India and abroad. There have been instances of official apathy, of course; none better than the fact that the Trust had to wait more than ten years for the removal of squatters from the west bank of the Hooghly before it could resume work on linking Howrah Bridge with an adjacent road. The State Government is often indifferent in such cases, but why, I wonder, did the C.I.T. chairman not put up a stronger case, even going to the extent of resigning if he could not get his way?

WHETHER THE CHOICE OF MR. DEAN RUSK TO BE the new U.S. Secretary of State is a good one or not, neither I nor, I suspect, most other observers, are in a position to say. Which is probably why he has been chosen; when a President's popular majority is as narrow as Mr. Kennedy's, he has to be most careful about promoting only the non-controversial personalities to his key posts. This is no reflection on Mr. Rusk's abilities; it is not always the characters who make the biggest stir who can handle the trickiest jobs. And that is what makes the reported choice of Professor Galbraith as next U.S. ambassador to New Delhi so interesting; the Professor is just about as controversial as Mr. Rusk is obscure. Apart from the fact that in diplomatic matters I have an incorrigible prejudice for the professional, and anyway I can never see any good reason for changing ambassadors whenever there is a change in Washington, I expect to find Professor Galbraith's tenure (if it comes off) a most interesting one. Economists are untiring critics of other people in positions of official responsibility; it will be fascinating to watch how one performs in such a post himself. I suspect he will be no better nor worse than most. But we shall see; after all, so much depends on personal qualities as well as professional training. Professor Galbraith is an exponent of the "moral responsibility" approach to aiding under-developed countries. It is one I heartily disagree with. The idea of moral responsibility is good for neither the giver nor the receiver. Good, mutual self-interest is the only system under which, in my opinion, both sides can maintain their self respect. Moral responsibility of the rich towards the poor resembles too closely the theory on which begging is based. But begging corrupts both parties, and is certainly no basis for a future relationship of complete equality and affability between nations.

THE TITAGHUR PAPER MILLS COMPANY, LIMITED

CHAIRMAN, SIR WALTER MICHELMORE'S STATEMENT

The following statement has been circulated to shareholders of The Titaghur Paper Mills Company Limited, by the Chairman, Sir Walter Michelmore.

Once again I take this opportunity of reviewing the state of the Company's affairs and elaborating a little on the Directors' Report and Accounts. You will observe that this year these accounts have been presented in a more modern and graphic form and I hope that Shareholders will find them of interest.

The results for the year ended 31st March, 1960, as I forecast, are not so favourable as those of the previous year though there has been a considerable saving in tax due mainly to the Development Rebate allowance on No. 3 Mill. It will be noticed that the addition to the compulsory Development Reserve amounts to nearly Rs. 25 lacs.

In view of the future prospects your Directors have felt it advisable to recommend that the dividend remains at the same rate as for the previous year though, as Shareholders are aware, that dividend is now subject to deduction of tax. I should also like to explain to the holders of Second Preference and Preferred Ordinary Shares that it is proposed to pay their dividends for the year at the rates specified in the Articles of Association for one reason only that the Preference Shares (Regulation of Dividends) Bill, 1960, has not been passed at the time of the closure of these accounts. The dividends for the half year to 30th September, 1959 were grossed up in accordance with our interpretation of the law as it existed at the time of payment and, therefore, the dividends for the half year to 31st March, 1960 have been adjusted so as to pay in aggregate the same as in previous years but of course subject to deduction of tax. I can assure the holders of all Preference Shares and Preferred Ordinary Shares that when the Bill is passed into law and its effect studied such additional dividend as is due will be promptly paid.

Period of Readjustment

The Paper Industry has been passing through a period of re-adjustment following the cut in selling prices effective from 1st January, 1960. I am pleased to say that, though severe, the fall in income may not be as great as first anticipated but, nevertheless, costs of certain raw materials and coal have increased and a surcharge of 5% was imposed on railway freights from 1st April, 1960. The cost of production on which the Tariff Commission based their findings is now completely out of date and so long as the present selling price structure exists these factors cannot but have an adverse effect on the results of your Company's operations.

Despite a less prosperous outlook in the immediate future the paper industry is forging ahead and the licensed capacity by the end of the Third Plan period will, if all schemes reach completion, amount to 960,242 tons per annum and is made up as follows:

Present licensed capacity	400,000	Tons
Substantial Expansion of existing units	136,880	,,
New Major Units	225,800	,,
New Small Units	197,562	,,
	960,242	Tons

Healthy Competition

It is pleasing to note that even now there is less imbalance between demand and supply of paper and, in general, I feel that consumers are able to buy their requirements at prices in consonance with Mills' official selling prices. It is difficult to forecast whether there will be a buyers' or sellers' market during the Third Plan period but I feel myself that healthy competition will increase and it is by no means impossible that there will be an excess of supply over demand by 1965. The licensing of as many as 74 small units is an interesting development and will undoubtedly result in a wider distribution of paper and reduction in transport charges. These units, and in fact any new unit, will not have an easy time in the initial stages of development and a comprehensive training scheme for technicians is very necessary. Your Company has already undertaken training of a large body of apprentices in all branches which will no doubt be of benefit not only to these Mills but to the Industry as a whole.

The prospect of increasing competition and the slow but steady rise in cost of production has prompted your Directors to plan the next stage in the renovation programme. Considerable economies in cost of fuel and chemicals have been achieved at No. 1. Mill, which is now a well balanced unit, and it is proposed to concentrate on No. 2 Mill. It is proposed to install a large Water Tube Boiler to replace certain old and inefficient Lancashire Boilers and thus increase the production of steam and economise in coal. With the increased steam the Soda Recovery Plant will work more effectively and is to be supplemented to increase its efficiency further. The cost of caustic soda and bleach is high at No. 2 Mill and considerable benefit will be felt from the installation of an Electrolytic Bleach Plant on the lines of that at No. 1 Mill. These renovations will cost about Rs. 30 lacs and should reduce the cost of production at No. 2 Mill by about Rs. 40 per ton. The opportunity has been taken to acquire a second Water Tube Boiler which it is intended to install at No. 3 Mill in preparation for further expansion there in the future.

Mill in Orissa

Your No. 3 Mill in Orissa commenced production on 12th March, 1960, and one machine is in operation producing about 13 tons of paper per day. The second machine has been in operation at No. 2 Mill for some time and will, in the near future, be transferred to Orissa.

The operation of this mill in the first few months cannot be considered as satisfactory and it has, in fact, been working at a loss. This has been mainly due to the necessity of training local people unused to working in an industrial establishment and to interruptions caused by shortages of certain commodities. There was a short strike in July and the severe floods in August and September resulted in complete disruption of communications and it was necessary to fly down essential stores in specially chartered aeroplanes. The supply of coal to No. 3 Mill from the Talcher field has been a source of considerable anxiety and has been most irregular. Conditions have improved recently and, it is hoped, supplies will be adequate in future. The problem of disposal of effluent in the clear waters of the Mahanadi has also been a big problem but a considerable degree of success has been achieved through the measures adopted and though these were costly to install and fairly expensive to run I feel that the amenities of the district will suffer no damage.

Problem of Rail Transport

Though we have had our difficulties at No. 3 Mill the Mills in West Bengal have run satisfactorily both in the year under review and in the current year to date. Stocks of bamboo at the Mills have been considerably reduced and though adequate supplies exist at our depots the problem of rail transport is very real and we have been unable to build up an adequate stock-pile despite the assistance we have received from the Railways who have had to contend with manifold difficulties. As I have already mentioned the cost of production continues to rise and though economies have been achieved in several directions much has yet to be done. To assist us in our efforts an eminent firm of business consultants, Messrs. Urwick, Orr and Partners, have been called in to give advice on reorganisation of the costing system and their report will be available shortly.

Your Company is concerned in a further interesting development, the manufacture of paper and pulp making plant and chemical equipment. A Company has been formed named Bertrams-Scott Private Ltd. in which three well known U.K. concerns, James Bertram & Son Ltd., Bertrams Ltd. and Ernest Scott & Co., Ltd. are collaborating with the Birds/Heilgers and Yule Groups. Your Directors have agreed to provide land and buildings at Titaghur against shares in this Company. The venture is well advanced and the new Company is in a position to deal with enquiries for 50 ton paper making units and all types of paper making plant.

It has been a trying year for staff both at the Mills and Head Office and continuous endeavour will still be required. I wish to thank them on your behalf and am sure that they will continue to give of their best in the years that lie ahead.

The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on 27th December, 1960.

Money

THE CALCUTTA MONEY MARKET

INTERBANK FUNDS TIGHTER

Wednesday, 14th December.

ADVANCES have once again increased in the Calcutta money market during the past week. Most of the rise is accounted for by the sugar mills and the jute industry, both of which are showing a large increase on the previous week. Other sources of demand remain more or less the same, including the cotton mills and call for accommodation against grain and seeds storage. There has been a further tightening in the interbank market. The official call rate has now gone up to 4½ percent, at which level there are still borrowers over. It is expected that this rate will increase further in the near future.

Apart from a fair showing of tea and gunny bills, activity in the exchange market was somewhat less than during the previous week. Remittance demand remained moderate. On the London money market, the pound showed no new reaction to the British Government's cut in Bank rate, but later the undertone turned easier and sterling closed showing slight losses against the twin dollars and most important Continental currencies.

BULLION WAS QUIET IN THE ABSENCE OF INTEREST, especially from upcountry centres. Silver declined from the previous week's level of Rs. 225 to Rs. 223.62, quoted today for ready delivery. The rate for forward delivery was Rs. 223.87. The London and New York silver prices were 79½d and 91.375 cents.

Gold was easier in sympathy with silver. The price fell from Rs. 136.50 to Rs. 134.75. The sovereign was nevertheless steadier at Rs. 92.25.

DURING THE WEEK ENDED 9TH DECEMBER, Government of India Treasury bills for Rs. 17,27,75,000 were sold in favour of the Reserve Bank.

TENDERS FOR RS. 2 CRORES OF 91-DAY GOVERNMENT of India Treasury bills were opened on 13th December. The total amount offered was Rs. 2.25 crores. Tenders at Rs. 99.365 were accepted in full and those at Rs. 99.360 allotted approximately 75 percent, the average rate of acceptance being Rs. 2.548 percent a year. Tenders for Rs. 2 crores of 91-day Government of India Treasury bills will be received at all centres up to the close of business on 19th December.

IT IS STATED THAT 91-DAY INTERMEDIATE TREASURY bills will be sold from 14th December to 17th December at Rs. 99.381 percent. Sales can be stopped at any time without notice if the Government thinks it necessary. There were no sales of these bills during the period from 7th December to 10th December.

INCREASES OF RS. 34.61 CRORES TO RS. 1,862.72 crores in active notes, and of Rs. 22.78 crores to Rs. 1,874.89 crores in the total note issue, were the important features of the return of the Reserve Bank of India for the week ended 9th December, 1960. The currency expansion was covered by increasing the foreign exchange and the rupee securities of the paper currency reserve by Rs. 5 crores and Rs. 20 crores to Rs. 123.01 crores and Rs. 1,502.06 crores, respectively. This was obviously done by transferring securities from the Banking Department. So, in the latter department, foreign balances held abroad declined by Rs. 4.14 crores to Rs. 24.61 crores and investments by Rs. 10.13 crores to Rs. 193.86 crores. Deposits of the Central Government were Rs. 9.88 crores lower at Rs. 50.83 crores, but other Government accounts rose by Rs. 1.53 crores to Rs. 13.24 crores. Balances of commercial banks increased by Rs. 3.44 crores to Rs. 93.22 crores. Other loans and advances rose from Rs. 121.15 crores to Rs. 124.62 crores, of which advances to scheduled banks against usance bills amounted to Rs. 3.99 crores (Rs. 4.06 crores). Ways and means advances stood at Rs. 40.40 crores, against Rs. 35.58 crores.

THE RETURN OF THE STATE BANK OF INDIA FOR THE week ended 2nd December, 1960, shows a rise of Rs. 10 lakhs to Rs. 571.83 crores in total deposits. Investments in Government securities and other authorised investments are up by Rs. 1.97 crores and Rs. 1 lakh to Rs. 335.49 crores and Rs. 10.15 crores, respectively. Advances, including loans, cash credits, overdrafts and bills discounted and purchased, have increased by Rs. 5.97 crores to Rs. 213.93 crores. Cash and balances are, in consequence, shown at Rs. 23.83 crores or Rs. 7.72 crores less.

THE STATEMENT OF THE POSITION OF SCHEDULED banks for the week ended 2nd December, 1960, shows Demand and Time liabilities at Rs. 795.82 crores (Rs. 24.89 crores on account of borrowings from banks) and Rs. 1,136.37 crores (Rs. 17.33 crores), compared with Rs. 798.00 crores (Rs. 26.61 crores) and Rs. 1,142.12 crores (Rs. 18.13 crores), respectively, in the previous week. Cash and balances have declined by Rs. 86 lakhs and Rs. 4.74 crores to Rs. 44.76 crores and Rs. 85.89 crores, respectively. There is a rise of Rs. 1.24 crores to Rs. 686.10 crores in investments. Advances and bills discounted at Rs. 1,120.98 crores show a rise of Rs. 16.33 crores. The ratios to total liabilities of cash and balances, and of advances and discounts, are, in consequence, shown at 6.8 percent and 53 percent, against 7 percent and 56.9 percent.

TREASURY BILL MATURITIES

Details of 91 days' bills outstanding with the public on 16-12-60.

Issue Date	Maturity Date	Amount (000's Rs.)	Average Acceptance Rate
16-12-60	17-3-61	2,00,00	Rs. 2.548%
9-12-60	10-3-61	2,00,00	Rs. 2.540%
2-12-60	3-3-61	2,00,00	Rs. 2.540%

To sustain its expanding output, India's steel industry needs increased quantities of essential raw materials like iron and manganese ore, coal, limestone and refractories. By meeting a large part of this demand, Bird & Company (Private) Limited have been making significant contributions to the progress of the steel industry.

Birds have now launched on a programme of expansion, which when completed will step up considerably the annual output of these raw materials.

	PRESENT PRODUCTION	EXPECTED INCREASED PRODUCTION
Iron and manganese ore	825,000 tons	3,000,000 tons
Coal	2,250,000 tons	3,400,000 tons
Limestone	1,250,000 tons	2,100,000 tons
Refractories	90,000 tons	120,000 tons

This expansion will assure the steel industry of increased supplies of these vital raw materials.

WIDESPREAD LOSSES ON STOCK MARKET

SHARP FALL IN HIRE-PURCHASE FINANCE ISSUES

London, 14th December.

IT has been another rather depressing week in the stock exchange in spite of the cut to 5 percent in Bank rate. The previous week's modest recovery, following the earlier slide in prices, did not last long and prices resumed their downtrend to record widespread losses. There was, however, some improvement after the week-end when the new three-week account covering the Christmas holiday period opened. Business throughout remained small and movements were out of proportion to the amount of activity. The rally after the week-end reflected a healthier feeling in the market after the recent shake-out, but it failed to develop much strength. Short-dated gilt-edged securities responded modestly to the Bank rate cut, but the rest of the gilt-edged market remained in the doldrums and prices steadily lost ground. Falls extended to nearly a point on the week. Foreign bonds attracted little attention, but dollar stocks were a little better in response to Wall Street. H.-P. finance issues fell back sharply on further news of H.-P. losses and the reduced dividend of Mercantile Credit. Banking shares receded in sympathy and insurance shares also fell back. All sections of the industrial market lost ground and falls of 1s or more were general, although prices were above their worst levels. Steels were affected by news of United Steel's rights issue. Ford Motor were firm on the despatch of the formal bid. Gold shares fell back after earlier firmness and recorded little change on balance. Base metals drifted lower and oils were dull. Rubbers and teas inclined easier but Sembilan advanced sharply in rubbers in response to the bid news.

The Money Market

The event of the week in the money market was, of course, the reduction to 5 percent in Bank rate. The credit situation during the week has not been anything like as difficult as in the previous week. The authorities were always willing to assist the market and with the aid of privilege money, no house was forced into the Bank to borrow on Bank rate terms. The rate for loans has been as high as 4¾ percent, but after the reduction in Bank rate, money was obtained down to 3 percent. There was a good business in bills on most days with end-February, March and "hot" bills changing hands at 4$\frac{7}{16}$ percent prior to the Bank rate change. After the reduction in Bank rate, bill business was done on the basis of 4$\frac{1}{16}$ percent. Bill rates were lowered in line with the new Bank rate. The 91-day Treasury bill rate came down from £4 12s 5.55d to £4 9s 7.83d percent.

Activity on Wall Street

Investment quality corporate bonds pushed ahead in good style following a brief sinking spell early during the past week on Wall Street. The forward movement reflected a broadening in demand from institutional investors including pension funds, saving banks and insurance companies with several new utility issues reaching the market quickly snapped up. United States Government obligations also attracted increased buying interest attributed in part to the reducion of the Bank of England's lending rate to 5 percent from 5½ percent. Convertibles generally scored gains in line with the recent firmness in stock market values. In the foreign section, French Credit Foncier 5½ percent extended their recent advance moving up 2½ points before backing away fractionally. German nationals were mixed. Italians and Norwegians were about unchanged and Greek 7 percents were lower by over a point to sell at a new low for the year. Denmark 5½ percents backed and filled narrowly to finish unchanged. Chile 3 percent were traded at an unchanged price of $43\frac{3}{8}$ throughout the period.

Vegetable Oils Improve

Linseed oil maintained a steady to firm tone with prospective enquiries broadening during the past week in the vegetable oils market. The demand for groundnut oil expanded considerably. After a quiet period, the interim easiness was all but erased with demand showing signs of improvement.

SUGAR PRODUCTION INCREASES

Sugar production in India rose to 2.42 million tons in the 1959-60 season (November 1959 to October 1960) from 1.918 million tons in the previous season, according to the Indian Sugar Mills Association. Despatches from factories, including 30,000 tons for export, were, however, lower at 2.018 million tons during the season ended October 1960, compared with 2.105 million tons in the previous season. As a result of the increase in production and lower despatches, sugar stocks with mills were higher at 549,000 tons at the end of last month, compared with 153,000 tons at the close of October 1959. The above figures do not include the sugar produced by and despatched from mills prior to November 1960, for the season 1960-61.—N.A.F.E.N.

Stocks and Shares

BANK CREDIT UNCERTAINTIES RESTRICT TRADING

SELECTIVE INTEREST IN COAL AND SUGAR SHARES

Wednesday Evening.

THE Calcutta stock market during the past week has behaved like Buridan's ass: it has not known which way to turn. The longs and the shorts have found themselves tempted with equal quantities of hay, so share prices have moved narrowly and trading has been quiet. There is a distinct tendency not to extend commitments either way, and it is inspired by thoughts of the approaching credit stringency. The banks are presumably in the midst of the annual process of "window-dressing" their balance-sheets. What worries stock market operators is the fact that a strict check may be kept on advances against shares.

Some encouragement was derived at one time from reports that the Life Insurance Corporation had bought shares in Bombay. But satisfaction on this account has dwindled on the view that L.I.C. purchases are unlikely to be large for some time yet. Admittedly, equity yields are more attractive than they were, say, five months ago. Also, the technical position is healthy, as indicated by the carry-forward charges at last week's settlement. But the fact remains that the yields offered by first-class scrip are in many cases still too small. The scrip may be worth buying on prospects of growth, expansion or diversification; but such prospects are usually difficult to assess accurately unless company managers learn to give information more promptly and freely. One blue chip, for instance, has fallen quite substantially during the past week following reports that the earlier rumours about the company launching a special chemicals project were incorrect.

No great upsurge in stock market activity generally can be foreseen for the near future. The approach of the Christmas holidays implies that many operators will be proceeding in search of Santa Claus elsewhere than on Lyons Range. But an important event before then will be the annual general meeting of the Associated Chambers of Commerce and Industry in Calcutta next Monday. The Central Finance Minister, Mr. Morarji Desai, will be the guest speaker there. It is hoped that, the proximity of the Central Budget notwithstanding, he will be able to discuss with some precision such subjects as taxation and foreign aid prospects under the third five year plan, the rôle of the private sector, and measures to attract private foreign investment.

Indian Iron have not fluctuated much before closing around Rs. 23.46. The annual general meeting of the Company is to be held tomorrow. Among other engineerings, there has been little of interest, apart from the moderate speculative activity in Texmaco.

The feature of a rather dull week has been the broadening interest in coal shares. High-grade coal producers like Bengal, Burrakur, Equitable and Amalgamated have met with some support. The reason, apparently, is just the general feeling that the industry's output will have to be expanded fast during the third plan period if the coal shortage is not to hold up the completion of development plans. It is believed that the Government's coal policy, hitherto straitjacketed by the Industrial Policy Resolution, is being relaxed. The high-grade producers at least might be allowed to extend their operations more freely into new coal-bearing areas, since there is little hope that the National Coal Development Corporation will be able to provide much of the superior coals.

Jute shares have been dull because no investor can make out quite what is going on in the jute and gunny markets. Some interest has been taken in jute companies which are trying to diversify their activities. But in such cases the market for the scrip is very narrow, so sellers are not easy to find. For the rest, there is moderate satisfaction over the news that the jute industry as a whole has managed to produce more goods last month than in October 1960, even though it was reported to have many more looms sealed. The mills' gunny stocks increased by only 3,700 tons to 82,100 tons last month; their production, at 85,900 tons, was 1,400 tons bigger than in October. From these statistics, it does not look as if the demand for jute goods has dropped off quite as tragically as many people have been saying.

There have been a few notable features in the miscellaneous section. Orissa Mineral have been bought in the belief that the Company is doing well. Karanpura Development have continued to forge ahead on professional support. Angelo Brothers have firmed up in response to the better trend in the shellac market. Hopes of a higher dividend have lifted Airways India. But Union Carbide have fallen on selling pressure following rumours that certain expansion schemes which were being considered earlier may have been dropped.

Sugar shares are steady because the production of the commodity is expected to increase during the current season. Speculators are also cheerfully hoping for an announcement that Indian sugar will be exported to the United States. The point has perhaps been missed that in recent years the Indian mills have always suffered a loss on exports because the sugar they produce is far too expensive in world markets and therefore has to be subsidised. It is reported that the United States may pay more than the world price for the sugar she buys from India, but it remains doubtful whether this particular export will be profitable for the mills, especially when they are already getting an inflated price in the home market. The reported decision of the Supreme Court declaring the U.P. Sugarcane Cess Act, 1956, as invalid, has been received with satisfaction in the stock market.

Tea shares have been subdued. This is partly because the north Indian crop figures for November confirm that production this year will be much less than in 1959. The output last month was 54.06 million lbs, against 54.8 million lbs in November 1959. The total production until November this year thus comes to 513.56 million lbs, against 548.1 million lbs in the corresponding period of last year. The December crop in north India is always very small, so it cannot make much difference to the comparative totals. Another reason for the dull trend in tea shares is that the Wage Board for the Tea Industry has just been appointed. Congratulations have been offered to the Central Labour Ministry for having stipulated that, in considering a system of payment by results for workers, the Wage Board should "keep in view the need.....to safeguard against overwork and undue speed." It is felt that this is an aspect on which the Labour Ministry could give some

very practical advice based on its own methods of working.

Agarpara Jute

After providing Rs. 6 lakhs for depreciation (against Rs. 4.35 lakhs) and Rs. 5.10 lakhs for taxation (against Rs. 3.95 lakhs), the profit of Agarpara Co. Ltd for the year ended 31st March, 1960, has risen from Rs. 7.31 lakhs to Rs. 11.91 lakhs. The Company has declared an ordinary dividend of 10 percent, subject to deduction of income tax, against 5 percent, tax-free, in the previous year. This is covered more than two and a half times and offers a yield of 8.2 percent at a price of Rs. 12.25 a share. Development rebate reserve receives Rs. 5.50 lakhs (against Rs. 85,470) and contingency reserve Rs. 30,000 (against nil). After making other adjustments, a sum of Rs. 33,065 has been carried forward, against Rs. 25,002 brought in. The balance-sheet shows that fixed assets amount to Rs. 97.05 lakhs and current assets to Rs. 1.10 crores. The modernisation of the preparing and spinning sections of the mill is now almost complete. The Company has launched a scheme for modernising the weaving section, and licences have been granted for importing 24 automatic looms from the U.K. It has obtained a loan from the National Industrial Development Corporation for its spinning modernisation programme.

Bisra Stone

The profit of the Bisra Stone Lime Co. Ltd has risen from Rs. 13.51 lakhs to Rs. 24.54 lakhs for the year ended March 1960, after providing Rs. 3.50 lakhs (against Rs. 2.78 lakhs) for depreciation. A taxable ordinary dividend of Rs. 3 a share, including an interim of Rs. 1.25, has been declared, against Rs. 1.87, tax-free, in the previous year. Taxation absorbs Rs. 11.37 lakhs, against Rs. 6.40 lakhs. Allocations include Rs. 65,000 (against Rs. 2.03 lakhs) for statutory development rebate reserve, Rs. 7 lakhs (against Rs. 3 lakhs) for mechanisation reserve and Rs. 2.50 lakhs (against nil) for general reserve. There is a carry-forward of Rs. 35,597, against Rs. 33,561 brought in.

Dhunseri Tea

There is a rise of Rs. 2.68 lakhs to Rs. 5.47 lakhs in the profit of the Dhunseri Tea Co. Ltd for the year ended December 1959. An ordinary dividend of 23 percent, subject to deduction of tax, has been declared on the increased capital, and it absorbs Rs. 1.61 lakhs. The previous year's dividend was 20 percent, tax-free. Taxation receives Rs. 2.45 lakhs (against Rs. 1.35 lakhs). General reserve absorbs the same amount of Rs. 1 lakh. Development rebate reserve receives Rs. 15,000 (against Rs. 5,900). Making other adjustments, there remains a balance of Rs. 10,086, which is carried forward, against Rs. 8,826 brought in. The crop of the Dhunseri estate amounted to 10,597 maunds (against 9,753 maunds) and that of the Dhendai estate was 7,159 maunds (against 5,261 maunds). The average sale price of the former was Rs. 2.25 (against Rs. 2.14 a lb) and that of the latter Rs. 2.30 (against Rs. 2.36 a lb). Estimates for the current year have been made for crops of 10,000 maunds for Dhunseri at a cost of Rs. 1.47 a lb, and of 7,500 maunds for Dhendai at a cost of Rs. 1.82 a lb.

Britannia Building

The Britannia Building and Iron Co. Ltd has earned a profit of Rs. 75,036 for the year ended March 1960, against Rs. 2.90 lakhs in the previous year. The ordinary dividend has been passed over. Depreciation is allocated Rs. 14,356 (against Rs. 11,474). Development rebate reserve is allocated Rs. 37,500 (against Rs. 50,000), and reserve for bad and doubtful debts Rs. 1.25 lakhs (against nil). Transferring Rs. 1.30 lakhs from taxation reserve and making other adjustments, there is a carry-forward of Rs. 17,590, against Rs. 32,996 brought in.

National Iron

The National Iron and Steel Co. Ltd has incurred a loss of Rs. 4,49,137 for the year ended March 1960, after providing Rs. 6,08,643 for depreciation. The dividend has been passed over. Making certain adjustments, a debit balance of Rs. 3,57,972 is carried forward.

Bombay Market

PRICES DECLINE IN ABSENCE OF SUPPORT

BANK RATE ASSURANCES HAVE LITTLE EFFECT

Wednesday Noon.

THE Bombay stock market closed the past week in an uncertain mood. Prices of shares drifted downwards due more to the absence of support than to selling pressure. Concern was felt about the international political situation, and it was feared that disturbances in many countries might hamper the prospects of obtaining foreign financial assistance. The Union Finance Minister's assurance that there would be no increase in Bank rate in the near future has had virtually no effect. Operators were disinclined to extend commitments in view of the year-end closing of accounts. Trading was slow because it was thought that there might be no relaxation in margin deposits in the near future.

After an earlier improvement on reports of buying by the Life Insurance Corporation, Tata Steel reacted to Rs. 140.75 at the close on profit-taking. Indian Iron fluctuated narrowly around Rs. 23.52. Engineering shares showed losses on balance. Alcock Ashdown were sold down to Rs. 237 and Premier Construction were available at Rs. 287. Tata Locomotive lost at Rs. 294 and Mukand Iron were offered freely at Rs. 20.76. Larsen and Toubro came to hand at Rs. 35.50. In motor shares, Hindustan Motor were transacted at Rs. 19.88, as were Premier Automobile at Rs. 172.

Cotton mill shares were dull, but an optimistic assessment about the outlook was made by the trade. It was thought that production would increase due to improved supplies of raw cotton. This apart, the investigation into cloth and yarn prices by the Tariff Commission might help fix prices at more realistic levels. Bombay Dyeing declined to Rs. 62.10 and Century were lowered to Rs. 452. Kohinoor were sold at Rs. 369.50, as were Svadeshi at Rs. 222. Khatau were available at Rs. 450.25 and Simplex changed hands at Rs. 160. India United Ordinaries lacked interest at Rs. 13.12 and Apollo were freely offered at Rs. 1.32.

Movements in miscellaneous shares were in line with the general pattern. In sugar shares, Belapur lost at Rs. 380 and Walchandnagar Industries were quoted lower at Rs. 281. Phalton were taken at Rs. 183.50. Mining shares were steady, and Shivrajpur Syndicate were bought up to Rs. 71.50. The statement made by the Union Minister of Commerce and Industry about making no change in the price of cement, induced caution. Associated Cement were quoted lower at Rs. 149.50 and Digvijay declined to Rs. 151. Steamship company shares were quietly steady, and business passed in Scindia Steam at Rs. 13.96. Great Eastern Shipping were dealt in at Rs. 15.36. Shares of chemicals and dyes companies declined on fears that there might be further cuts in imports of the essential raw materials. Tata Chemical were quiet at Rs. 16.64, as were Indian Dyestuff at Rs. 445. Colour-Chem declined to Rs. 310 in spite of an optimistic assessment of the outlook made by the chairman in his address at the annual general meeting. Bombay Burmah reacted to Rs. 560 and National Rayon declined to Rs. 490.50 on profit-taking. Baroda Rayon were available at Rs. 129. Tata Oil met with scattered interest up to Rs. 74, but Ceat Tyre were sold down to Rs. 192.50.

Bank shares were quiet, and Central Bank were lowered to Rs. 54.50. Bank of India were dealt in at Rs. 108. Insurance shares were neglected, and New India Assurance declined to Rs. 54.50. British India General were transacted at Rs. 12.12.

Turnover was restricted in electric company shares and fluctuations were narrow. Ahmedabad Electric were dealt in at Rs. 84.20 and Tata Hydro came to hand at Rs. 102. Bombay Suburban were placed at Rs. 85.

Madras Market

SELECTIVE SUPPORT IN RESTRICTED ACTIVITY

SOME GOVERNMENT SCRIP IMPROVE

Wednesday Noon.

THERE was restricted activity in the Madras stock market during the past week. Selected scrip met with support and prices were occasionally higher. In Government securities, prices of Madras and Andhra State loans improved further in the absence of offers. Sugar shares were quiet on the apprehension that the recommendations of the Wage Board for increased wages might hamper profitability. Selected tea and rubber shares were in demand on reports of good prices being realised for the commodities. Good textile shares were bought on expectations of increased production. Selected miscellaneous shares attracted attention on good corporate news.

In the banking group, Indian Overseas were dealt in at Rs. 181.50 and Travancore Forward came to hand at Rs. 5.50. Business passed in Pandyan at Rs. 33. Among public utilities, South Madras were bought at Rs. 10.15 and Kumbakonam were wanted up to Rs. 9.95. Vellore were done at Rs. 12.80 and West Coast changed hands at Rs. 12.95.

Sugar shares were easier, and E.I.D. were sold down to Rs. 42. Deccan declined to Rs. 15.80 and Andhra were available at Rs. 23. United Breweries were, however, firm at Rs. 114.50 on prospects of a new share issue.

Among planting shares, Blue Mountain were dealt in at Rs. 4.32 and Cochin Malabar at Rs. 6.97. Coffee Lands lost at Rs. 19.50 on reducing the dividend from 25 percent taxable to 6 percent taxable. Consolidated Coffee were placed at Rs. 23.25 and Ouchterlony were sold down to Rs. 4.80. Parkside were steady at Rs. 30.75, as were Periakaramalai at Rs. 3.41. Teekoy were offered freely at Rs. 6.10 and Be Be at Rs. 3.06 because both the companies have passed over the dividends. Travancore Rubber and Tea were steadier at Rs. 9.55 on paying an interim taxable dividend of 4 percent. Devon were done at Rs. 4.37 and Kil Kotagiri were in demand up to Rs. 5.45. New Delhi

MR. DESAI OPPOSES ANY MAJOR INCREASE IN THIRD PLAN OUTLAY

CENTRE TO PROVIDE BIGGER SHARE OF FINANCE FOR STATE SCHEMES

(FROM OUR NEW DELHI CORRESPONDENT)

THE Central Finance Minister, Mr. Morarji Desai, according to lobby reports, has ruled out the possibility of any major upward revision of the third plan investment now fixed at Rs. 10,200 crores. He has told a meeting of the Informal Parliamentary Consultative Committee that the resources position, as far as can be judged now, does not permit taking up any additional burden. In his opinion, any big revision of the outlay can only be considered on a future occasion in the light of the progress of the third plan programmes, production trends and the price level.

The Finance Minister, it is understood, has also stated that the Centre cannot agree to the proposals of State Governments to increase the size of their plans substantially, even if they promised to find the additional resources. While not ruling out minor adjustments in outlays, Mr. Desai feels that the major increases proposed by the States will cut into the strict scheme of priorities visualised by the planners and lead to unimportant projects being taken up. Another important announcement made by the Finance Minister at the meeting, it is reported, was that there would be no increase in Bank rate for the present.

Meanwhile, the Planning Commission has finalised the pattern of outlay in State plans as follows:

(Crores of rupees)

State	Total outlay	State's share	Centre's contribution
Andhra	305	105	200
Assam	120	33	87
Bihar	337	119	218
Gujarat	230	122	108
Maharashtra	360	205	155
Kerala	170	58	112
Madhya Pradesh	300	93	207
Madras	291	101	190
Mysore	250	110	140
Orissa	160	28	132
Punjab	231	97	134
Rajasthan	236	80	156
Uttar Pradesh	497	147	350
West Bengal	250	90	160
Jammu and Kashmir	75	13	62
Total	3,812	1,401	2,411

It will be seen that, with the exception of the former Bombay State, now bifurcated into Gujarat and Maharashtra, the Centre's contribution is bigger than that of any State. In the case of West Bengal, the Centre's proposed contribution is Rs. 160 crores, compared with only Rs. 90 crores, which the State promises to make available over the five-year period.

The following are the allocations proposed for the Centrally-administered territories (in crores of rupees):

Delhi	81.8
Himachal Pradesh	27.9
Manipur	12.9
Tripura	16.9
Pondicherry	6.9
Andaman and Nicobar	9.8
Laccadive Islands	1.0
N.E.F.A.	7.5
N.E.T.A.	7.5
Total	171.6

Indo-British Trade

The total volume of trade between India and the U.K. over the first nine months of 1960, has been maintained at just about the same level as in the comparable period of 1959. India has imported less from the U.K., but has exported more, so her trade deficit so far this year is only half of that in 1959. About one-fifth of India's total imports come from the U.K., and over one quarter of her total exports go to that country. India's great need is to export more of her goods so as to pay for the increasing volume of imports needed to maintain her expanding industrial economy. In spite of the ups and downs of the U.K. domestic demand in the last three years, which included two periods of stringent credit restriction and a mild recession, the value of Indian exports to Britain has remained firm and has, indeed, shown a small but steady increase. According to official figures, India's exports to the U.K. were:

	Rupees crores	Percentage of India's total exports
1957	161.02	26.35
1958	166.29	29.19
1959	172.17	27.66
Jan.-July 1960	86.42	24.35

Official U.K. statistics for Indo-British trade during the first nine months of 1960 and the same period in 1959 are:

	(Rs. crores)	
	1960	1959
Indian exports to the U.K.	135	127
Indian imports from the U.K.	155	165

Thus Indian exports have risen by Rs. 8 crores compared with 1959, and the deficit over the nine months is down to Rs. 20 crores, compared with Rs. 38 crores in the corresponding period of last year. Indian imports from the U.K. were paid for to some extent by the U.K. Government's aid or loans in 1960-61; new loans totalling Rs. 20 crores have been announced towards the cost of imports this year. Another source of finance is the investment of private U.K. firms in Indian industry. Over the past ten years, this has averaged Rs. 20 crores a year, and a substantial part of the investment is used to pay for goods and services from Britain.

Aid for Durgapur Project Expansion

For the expansion of the Durgapur steel plant, a British technical expert will shortly visit India to finalise the details, after which the Indian Government hopes to get a project report prepared by its consultants on the basis of which it will invite tenders for plant and equipment from British firms only. The Indian Steelworks Construction Company, (I.S.C.O.N.), it is expected, will be one of the tenderers.

On the basis of the World Bank report, the western countries have not shown any interest in the projected fourth steel plant in Bokaro. They would rather like India to concentrate on consolidating and expanding her three plants before embarking on a fourth one. Even the Russians, it is believed, are no longer enthusiastic about helping India in the establishment of the fourth steel plant. Their position is understandable. From the propaganda point of view, their aid is identified with the biggest steel plant in India, whose advanced technical features have been acknowledged even by the Americans. From the political viewpoint, the Russians are already "squatting" in Ranchi and Barauni, two key places in Bihar. Will they like to help put up a steel plant in the same State, only 50 miles from Ranchi?

As for the bigger issue of foreign aid to finance India's third five year plan, the main talking point has been that the western nations are morally bound to assist under-developed countries. In other words, India has been appealing to the social conscience of the western nations. That some western nations have become rich by exploiting under-developed countries is not denied. That they still work very hard to maintain their prosperity should also not be denied. West Germany, for example, has had no colonies since 1919. It suffered a great deal of devastation during the last war. Yet it is one of the most prosperous nations in western Europe. It has become prosperous by hard work. Looking at the general picture, both the U.S.A. and Britain would first like to put their own houses in order, before planning aid to other countries. Then again, in the lengthening queue of aid-seekers, the claims of the most backward countries may have to be considered first. The Paris meeting of the "Aid to India" club was not a success. India's hopes are now pinned on the Washington meeting of the chief creditor nations in March next year.

Tariff Enquiry into Cotton Textile Industry

The Government of India's resolution, referring the question of production costs and prices in the cotton textile industry to the Tariff Commission for a full enquiry, has been published. The Commission has been asked to report on the following specific aspects, which will form the terms of reference:

(i) the cost of production of the various representative types of cloth and yarn;

(ii) the capital structure, investments and fair return on them, bearing in mind the need for continuous rehabilitation and modernisation and what would be a fair return to allow to the industry over its cost of production; and

(iii) fair ex mill prices of cloth and yarn.

The Tariff Commission has been asked to devise methods for effecting suitable adjustments from time to time in the fair ex mill prices of cloth and yarn, so as to allow for major fluctuations in the prices of raw cotton and other elements of production cost. The Commission will enquire into the distribution cost for cloth and yarn in the country, with reference to all relevant factors, including the present pattern of sales adopted by the different units of the industry and to devise a reasonable basis for determining fair retail prices for cloth and yarn.

The Government's resolution says that the question of fair prices which should be charged by the cotton textile industry to the trade and the prices which the trade should, in turn, charge to the consumers has assumed considerable imporance in the recent period. The prices of cotton textiles were under complete control (in the matters of prices, distribution, etcetera) during the war and postwar period until the lifting of such controls in the middle of 1953. Thereafter, the prices were governed by the normal conditions of supply and demand until the end of 1955. During the first half of 1956, the prices shot up to high levels and the Government had to step in by resorting to an increase in excise duty to remedy the situation.

In the latter half of 1957 and in 1958, the industry was faced with a different problem of accumulation of stocks, and marginal units particularly were reported to be experiencing difficulties. A committee was appointed to enquire into the problems and suggest remedial measures. On the basis of its *interim recommendations*, a readjustment of the rates of excise duty was done, which improved the position.

For over a year now, the price of cotton textiles has been increasing, causing undue hardship to consumers. Even after taking into consideration the difficulties faced by the industry in securing essential raw materials like cotton and other factors affecting the manufacturing costs, it has become clear that the prices are unaccountably high, requiring immediate measures to bring down and hold the price line. The resolution points out that the warning issued by the Indian Cotton Mills Federation as early as January 1960 at the suggestion of the Government, proposing certain measures to bring down prices, had only a temporary effect and that the prices have started going up again. The extent of the increase has not, however, been uniform in the several units of the industry, as each unit adopted its own pattern of price fixing.

Referring to the stand taken by the textile industry, the resolution says that it has been contended that a large slice of this increase is legitimate on account of the increase in raw cotton prices and in the wages on account of the Wage Board's award. The mills have also claimed that they should be allowed to charge extra margins to recoup their past losses. Broadly, the industry, through the Indian Cotton Mills Federation, has urged that compared with the basic period of August 1959 (i.e., just before the beginning of the cotton season 1959-60), there is a legitimate case for an increase in the prices of coarse cloth by 25 percent, lower medium cloth by 22 percent, higher medium cloth by 18 percent, fine cloth by 11½ percent and superfine cloth by 9 percent.

The impact of this increase on consumers, the resolution adds, is one of great hardship to the general public and also to the large number of persons employed in the handloom industry. Under these circumstances, the Government considers that several aspects affecting the production of cotton textiles and the prices should be referred to the Tariff Commission for a full enquiry and report.

Wage Board for Plantations

The Government of India has set up a Central Wage Board for the Plantation Industry, the composition of which is as follows: chairman—Mr. L. P. Dave; independent members—Mr. T. Manaen, M.P.; and Dr. R. Balakrishna; members representing employers—Mr. L. T. Carmichael and J. B. Soutar; members representing workers—Mr. G. Ramanujam and Mr. B. Bhagwati, M.P.

The following are the terms of reference:

(1) to work out a wage structure based on the principles of fair wages as set forth in the report of the Committee on Fair Wages as far as practicable;

(2) in evolving a wege structure, the Board should, in addition to the considerations relating to fair wages, also take into account:

(i) the needs of the industry in a developing economy;

(ii) the system of payment by results;

(iii) the special characteristics of the industry in various regions and areas;

(iv) categories of workers to be covered may be according to the definition of workmen in the Industrial Disputes Act; and

(v) working hours in the industry.

It is explained that whenever applying the system of payment by results, the Board will keep in view the need for fixing a minimum (fall-back) wage and also to safeguard against overwork and undue speed. The headquarters of the Board will be located in Calcutta.

Developing Petro-chemical Industry

The Government of India has set up an inter-departmental committee to study the question of

developing the petro-chemical industry in the country and to evolve a plan for organising the industry during the third and fourth five year plans. The committee consists of (1) Dr. G. P. Kane, Senior Industrial Adviser (Chemicals), Ministry of Commerce and Industry, as chairman; (2) Mr. K. K. Sahni, Joint Secretary, Ministry of Steel, Mines and Fuel, Department of Mines and Fuel; (3) Dr. J. S. Ahluwalia, chemical engineer, Ministry of Steel, Mines and Fuel, Department of Mines and Fuel; (4) Mr. K. Vyasulu, Chief (Ind.), and Planning Commission; (5) Dr. A. Seetharamaiah, Development Officer, Ministry of Commerce and Industry, Development Wing, as member-secretary.

The terms of reference are as follows: (a) an assessment of the types and quantities of materials whose production may have to be organised in petro-chemical industries; (b) to evolve a suitable pattern for development in India in the context of the integrated pattern of petro-chemical production in advanced countries; (c) to assess the extent to which aromatic as well as aliphatic raw materials may have to be produced as petro-chemicals during the period 1961-71. and (d) to recommend the pattern of development of petro-chemical industries in the country. The committee is to submit its report within four months.

Negotiating Credit Arrangements

The Government of India has decided that all importers of capital goods wishing to negotiate loans with credit agencies abroad, should secure its prior approval before entering into negotiations. The requests for such approval should be addressed to the Special Officer (Capital Goods), Capital Goods Division, Office of the Chief Controller of Imports and Exports, New Delhi, furnishing the required particulars as indicated in the current *Red Book*. Approval to negotiate with credit agencies abroad will ordinarily only be granted where the value of the equipment which it is proposed to import, exceeds Rs. 1.5 crores. For smaller schemes, foreign exchange loans are available from the Industrial Finance Corporation of India, the Industrial Credit and Investment Corporation of India, and the National Small Industries Corporation. Licences for such smaller schemes can also be issued against foreign exchange loans available to the Government, and under the special trade and payments arrangements negotiated with certain countries by the Indian Government.

Recognising Export Houses

It has been decided to recognise a limited number of private trading concerns as export houses. One may be recognised by the Government if its memorandum and articles of association contain suitable provisions stating:

(a) The range of goods with which it proposes to deal and the countries to which it will be exporting goods (it is not necessary to limit exports to any one country). The commodities selected will, as far as possible, be such as are not normally exported in large quantities to the countries referred to. Further, it will undertake the export of more difficult or non-traditional items and to difficult destinations.

(b) That a minimum of 50 percent of the net profit should be set aside and used as trade development reserve.

(c) The aims and objects indicating the policy which will be adopted in the matter of: (i) purchase and sale of goods for export; (ii) development of brand publicity in foreign markets; (iii) arbitration for settlement of commercial disputes.

(d) That in case any corporation owned by the Government is a shareholder in an export house, its managing director will be a person approved by the Central Government (Company Law Department) as required under Section 269 of the Companies Act, 1956.

(e) That the Central Government will have a right to nominate a director on the board of directors of an export house, even if the Central Government does not hold any shares.

(f) That the memorandum and articles of association will not be amended without obtaining the concurrence of the Central Government.

If an export house agrees to observe the above conditions and is recognised, the Government will extend the following facilities:

(i) The recognised export house will be granted incentives and facilities available to individual exporters in accordance with the rules and regulations in force. The services offered by it will be kept in mind in routing foreign trade enquiries or transactions wherever possible.

(ii) The export house will be granted facilities in the matter of rebates, refunds or drawback of duties, preferential freight rates, transport facilities, etcetera, as are available to individual exporters.

(iii) Commercial representatives of the Government of India abroad will forward to the export house enquiries and references concerning the export of Indian commodities.

(iv) Facilities will be provided to the export house to undertake the study of markets and to conduct surveys of consumer tastes in foreign countries.

(v) Whenever possible, the representatives of export houses will be included in selected trade delegations sponsored by the Government.

(vi) Reasonable facilities will be accorded to the export house to enable it to participate in international fairs and exhibitions.

(vii) The export house will be given reasonable facilities to open branches in foreign countries, if considered necessary.

(viii) Individual barters or compensation arrangements submitted by the export house will be examined on merits and reasonable facilities will be accorded.

Aid to Khadi

About Rs. 62.18 crores was allotted for the development of the *khadi* industry during the second five year plan. The Planning Commission has tentatively allotted Rs. 69 crores for the development of the industry during the next five years. Most of the *khadi* schemes are sponsored through the All-India Khadi and Village Industries Commission, which is wholly financed and assisted by the Government. Apart from the Commission and its recognised institutions which are all looked after by the Commission or through the State khadi and village industries boards, very little activity concerning *khadi* and village industries is undertaken by the Government directly. The figures of the value of production and sales of *khadi* during 1960-61 as at the end of September 1960, are as follows: Rs. 3.35 crores and Rs. 2.60 crores, respectively.

Canadian Aid for Technological Institutes

The Government of Canada has agreed that a part of the counterpart funds representing rupees earned by the sale of its 1958 wheat gift of $10 million, will be earmarked for the development of higher technological institutes in India.

Trade Agreement with Indonesia

Negotiations for the revision of the trade agreement with Indonesia are likely to take place in February-March 1961. In the meantime, action is being taken to extend the agreement until 31st March, 1961.

Indian Iron Ore for Rumania

Negotiations with a Rumanian delegation for the export of iron ore are in progress in New Delhi.

Indian Tea Exports to Russia

The quantity of Indian tea exported to Russia in 1959-60 was 23,261,000 lbs, compared with 29,081,000 lbs in 1958-59. India supplies unblended tea in bulk to Russia. It is graded and packed to suit the requirements of the people there.

Economic Production of Aluminium

The cost of aluminium production, it is stated, could be reduced only if the following conditions are fulfilled: (i) the plant is an integrated one, i.e., reduction of bauxite to alumina and the refining of alumina into aluminium is done in the same place and is in the vicinity of bauxite deposits; (ii) the plant is of the minimum economic size, namely, 20,000 tons a year; and (iii) electric power is made available at a cheap rate. The present units in the country do not fulfil the first two conditions. Those which will fulfil them will go into production during the third five year plan.

Railway Siding for Durgapur

The Durgapur Industries Board is constructing a railway siding which will serve a number of industries, the coal mining machinery project being one of them. The capital cost of Rs. 16 lakhs is being borne by the Board. The parties using the railway siding will share the annual recurring expenditure for the siding, which will include depreciation charges and interest on the capital.

Engineering College in Rourkela

It has been decided to establish a regional engineering college in Rourkela during the third five year plan period. The college will conduct degree courses in engineering with an admission capacity of 250 students a year.

Foreign Exchange for Shipping

The majority of the shipping, shipbuilding and ship-repairing firms which were asked have not yet furnished their requirements of foreign exchange. The matter will be examined further on receipt of their replies, it was stated in the Lok Sabha.

Technical Agreement with Krupp-Demag

A proposal for the extension of the technical consultancy agreement with Krupp-Demag concerning the Rourkela steel project is being considered by Hindustan Steel Ltd.

Adviser for Sethusamudram Project

Captain J. R. Davies, R.N.R. (retired), of Britain has been asked to advise the Indian Government on the navigational requirements of the Sethusamudram project. It is proposed to cut a ship canal to connect Palk Strait with the Gulf of Mannar to avoid the longer trip round Ceylon. This would mean a saving in distance up to a maximum of 362 miles; and consequent saving in time of voyages up to a day and a half, if the Sethusamudram project, as designed by the committee, is executed on the lines recommended.

Dredging of Bombay Harbour Entrance Channel

On the basis of a careful survey of the Bombay harbour entrance channel and after taking into account the depth required for the passage of deep-draft vessels, a scheme comprising three phases has been prepared for the dredging of the channel. The first two phases covering its middle and the northern portions will be executed by contract dredging. The third phase covering the southern portion is not so urgent and is likely to be executed departmentally after the new dredger at present being built for the Bombay Port Trust in the Netherlands is received. On the basis of the model experiments conducted by the Central Water and Power Research Station, Poona, two sites—one off the Thal Reef and the other off the Prong's Reef near the mouth of the harbour—have been selected for the disposal of the spoil in the flood and ebb tides, respectively. At present, the governing depth in the entrance channel is 30 feet. It is proposed to dredge the channel to a depth of 33 feet. In addition, an anchorage dredged to a depth of 38 feet will be provided to accommodate three deep-draft tankers.

Manufacture of High-tensile Steel Wire

The Government has given licences to manufacture high-tensile steel wire to the following:

Name of the firm	Capacity tons a year
1. Messrs Aluminium Industries Ltd, Kundara, Kerala	6,000
2. Messrs Hindustan Kokoku Wire Ltd, New Delhi	6,000
3. Messrs Gannon Dunkerley and Company Ltd, Bombay	3,000
4. Messrs Pre-stressed Concrete Company (South India) Private Ltd, Madras	1,200
5. Mr. Harshavardhan J. Shah, Bombay	10,000
6. Messrs Special Steels Ltd, Bombay	10,000
7. Messrs Hindustan Steel Products Ltd, Hyderabad	2,000

In addition, permission under the Iron and Steel (Control) Order has been given to the following for the manufacture of high-tensile wire (capacity tons a year): (1) Messrs Hindusthan Rolling and Wires (Private) Limited, Delhi, 3,000; (2) Messrs Kasabone Wire Company, Bombay, 2,100; (3) Mr. Roshanlal Gupta (Messrs Surendra Engineering Works), Jullundur City, 3,000; (4) Messrs Globewide Wire Industries, Hyderabad, 1,000.

The following firms have also been permitted to manufacture high-tensile wire within the capacity sanctioned for various types of wire, although no capacity has been specified in the licence for high-tensile wire: (1) Messrs Indian Steel and Wire Products Ltd, Jamshedpur; (2) Messrs Hindustan Wires Ltd, Calcutta; (3) Messrs Power (Cables) Private Ltd, Kalyan, Bombay; (4) Messrs Tej Pauls (Private) Ltd, Bombay; (5) Messrs Devidayal Cable Industries (Private) Ltd, Darukhana, Bombay; (6) Messrs B. R. Herman and Mohata (India) Private Ltd, Ulhasnagar, Bombay; (7) Messrs Usha Automobiles and Engineering (Private) Ltd, Ranchi; (8) Messrs Sant Ram and Sons, Ludhiana; (9) Messrs Sen and Pandit Industries Limited, Kalyani, West Bengal; and (10) Messrs Hind Construction Ltd, Calcutta.

Diesel Traction for Goods Trains

It is proposed to have diesel traction for goods trains on about 3,800 miles of the busy sections during the third plan period for the movement of coal, raw materials for steel plants and other through freight traffic.

Agricultural Machinery Production

The present position of the industries engaged in the production of power-driven agricultural machinery is as follows:

Industry	No. of units	Annual capacity licensed	Production 1959	Production up to Sept. 1960
(1) Power-driven pumps	63	140,094 Nos.	85,067 Nos.	72,900 Nos.
(2) Diesel engines	26	53,455 Nos.	30,335 Nos.	30,790 Nos.
(3) Agricultural tractors	4	10,000 Nos.	—	20*
(4) Tractor-drawn agricultural implements	2			

*This relates to a firm which went into production in September 1960

The location of these industries is as follows: (1) power-driven pumps: West Bengal, Madras, Madhya Pradesh, Uttar Pradesh, Delhi, Kerala, Bihar and Maharashtra. (2) diesel engines: Maharashtra, Madras, West Bengal, Punjab, Delhi, Gujarat and Uttar Pradesh. (3) agricultural tractors and tractor-drawn implement: Maharashtra, Madras, Punjab and Gujarat.

The interests of the power-driven pump and diesel engine industries are looked after by a development council set up under the Industries (Development and Regulation) Act, 1951. These two industries have developed well with an indigenous content of 85 percent to 95 percent and above. As for agricultural tractors, indigenous production has just begun and the capacity sanctioned is expected to meet the requirements of

the country at the end of the third five year plan. The main problem of the industry is the availability of raw materials, particularly steel, including alloy steel. This problem will be solved to a great extent with the commissioning of the steel projects.

Imports against Exports

The import policy for six more items during the current licensing period (October 1960 to March 1961) has been announced. Imports of four items, namely, betelnuts, mace, cassia and cinnamon, and cloves, have been linked with the export of groundnut oil and tapioca flour. *Ad hoc* licences for the import of betelnuts will be issued to established importers for a value equal to their entitlement at 2½ percent of half of their best year's imports on the conditions that the licensee will, within six months of the import of betelnuts, export groundnut oil or tapioca flour, either direct or through an export council or association or through an established exporter, at the rate of one ton of groundnut oil or eight tons of tapioca flour for every 7.5 cwts. of betelnuts. For cloves, *ad hoc* licences will be issued to established importers for a value equal to their entitlement at 5 percent of half of their best year's imports on the condition that the licensee will, within six months of the imports, effect exports of groundnut oil or tapioca flour. For every 2.5 cwts. of cloves, one ton of groundnut oil or eight tons of tapioca flour should be exported. In the case of mace, *ad hoc* licences will be issued to established importers for a value equal to their entitlement at 5 percent of half of their best year's imports. For every 2.5 cwts. of mace to be imported, two tons of groundnut oil or 16 tons of tapioca flour should be exported. *Ad hoc* licences for imports of cassia and cinnamon will be issued to established importers for a value equal to their entitlement at 5 percent of half of their best year's imports of cardamom, cassia and cinnamon. For every 2.5 cwts. of cassia and cinnamon, one ton of groundnut oil or eight tons of tapioca flour should be exported.

For the import of dates, established importers will be given *ad hoc* licences for a value equal to their entitlement at 20 percent of half of their best year's imports on the condition that the licensee, within six months of the date of importing dates, will effect the export of tinned fruits, biscuits and confectionery, syrups and juices, pickles, molasses, cigarettes and bidis, etcetera, up to a value of 50 percent of the imports. In all these cases, licensees will be required to give a bond duly supported with bank guarantee for an amount equal to the c.i.f. value of imports for fulfilment of the export obligation. For nutmegs, the quota for established importers will be 5 percent.

Imports from Pakistan

The Government of India has decided to grant licences for the import of 12 items from Pakistan under the trade agreement with the Government of Pakistan signed on 21st March, 1960. The items are fresh fruits, betel leaves, *dhanicha* seeds, *chuna khari* pearls, eggs and poultry, books and periodicals (in Indian and Pakistani languages), gramophone records (in Indian and Pakistani languages), films, exposed (in Indian and Pakistani languages), fish dry and salted, betelnuts, drugs and medicines including Unani and Ayurvedic, and mother of pearl shells. The trade agreement provides for the import of these items from Pakistan against payments in non-convertible Indian rupees. Licences will now be issued subject to this condition.

Head, Wrightson Subsidiary

A well-known British engineering firm which has had close links with India for many years is forming a new subsidiary with administrative headquarters in Calcutta. Head, Wrightson and Company Ltd, of Thornby-on-Tees, County Durham, has announced the registration of Head, Wrightson India Ltd, which will act as a contracting company for the supply—as far as possible from Indian sources—of various types of plant to the designs of the parent company. As a wholly-owned subsidiary, the new organisation will make the fullest use of the manufacturing facilities in India for the class of work concerned in both the public and the private fields of enterprise. Head, Wrightson has been responsible for supplying much of the specialist equipment used in Indian basic industries today. It is at present playing a large part in the Durgapur steel works project, and is supplying all the steel-making plant together with much of the ancillary equipment. The chairman of Head, Wrightson India Ltd will be Mr. Peter Wrightson. Mr. Vaughan Pendred has been appointed managing director. A rupee company is likely to be incorporated within the next three years as a further measure.

Special Agricultural Production Programme

Four out of seven selected States have launched the intensive agricultural district programme—popularly known as the "package programme." While Madras launched the scheme at the beginning of the last *kharif* season, Rajasthan, Andhra Pradesh and Bihar have started the programme during the current *rabi* season. Uttar Pradesh, Punjab and Madhya Pradesh have made arrangements partially to implement it during the *rabi* and fully from the *kharif* next. The training programme, for key officials for implementing the intensive drive in the seven selected districts, began in Nilokheri last week.

Full requirements of nitrogenous and phosphatic fertilisers for these districts are being met through indigenous production and imports. The supply of good quality seed to the farmers has also been arranged. Reserve Bank officials have already visited Ludhiana (Punjab), Aligarh (U.P.) and Pali (Rajasthan), to examine in consultation with the local bank, how the Bank could help in building a proper credit structure for meeting the needs of these districts. They will be visiting the remaining districts within the next one or two months. The Central Government has also communicated to the States its decision in matters such as State participation in the share capital at the primary agricultural societies' level, contribution by the Government to bad debt funds to induce primary credit co-operative societies and district co-operative banks to make more funds available for agricultural purposes. All the State Governments concerned, it is understood, have issued instructions to officers at the district level, liberalising their financial and administrative powers for ensuring freedom of action.

SIGNIFICANCE OF THE CUT IN U.K. BANK RATE

NO EARLY RELAXATION OF CREDIT SQUEEZE EXPECTED

(FROM OUR LONDON CORRESPONDENT)

THE U.K. Bank rate has been reduced by another ½ percent, bringing it down to 5 percent. Last week's announcement occasioned little surprise in the City, where the move had been expected, and indeed was discounted a few days earlier by a slight revival of interest in the gilt-edged market following quite a setback earlier. At this particular juncture, the cut in Bank rate can be explained as a purely technical move designed to bring short-term money rates in London into closer adjustment with those ruling abroad. Apart from doing the banks a good turn in view of their liquidity difficulties, the cut has no real significance in relation to the domestic economy. On the other hand, it should be quite helpful to the United States by calling a halt to the "hot money" inflow which has undoubtedly played a part in creating the balance of payments problem with which the authorities there are now faced. The U.K. Government has made it clear that nothing is going to hustle it into credit relaxation measures until such time as it is satisfied that inflationary dangers will not be set in train as a result.

This was made abundantly clear in the House of Commons when an Opposition demand that the Government should take immediate emergency action to relieve the unemployment and short-time working in the motor-car industry and set up a working party to consider the future of the industry was decisively defeated by 317 votes to 228. Mr. Maudling, President of the U.K. Board of Trade, said that hire-purchase restrictions would be relaxed as soon as possible, but he emphasised that the Government must be ready to impose restrictions on the home market if it was essential to maintain the balance of payments. In so far as it was consistent with national policies and the need to preserve the balance of payments and the position of sterling, the Government would certainly give help to the industry, Mr. Maudling said.

The monthly figure of changes in the sterling area's gold and convertible currencies reserves is at present of little positive value as an indicator of genuine progress in international payments. They rose in November by £10 million to a total of £1,131 million—a net gain this year so far of £154 million, and the best figure since September of last year. The November increase compares with a fall in the same month last year of £18 million and a true increase in October of £46 million. The only firm conclusion to be drawn from the difference between the October and November movements is that the reduction in Bank rate on 27th October helped reduce the flow of short-term capital to London, which throughout this year has disguised an otherwise indifferent showing. This will be accentuated by the further cut now made.

The inflow of capital seeking the high returns offered on short-term investments has enabled the U.K. Government to wipe out several major debts from the slate. At the end of this month, £66 million is due in repayment of the North American debt. It seems, therefore, that the net rise in the gold reserves during the whole of this year may be little more than £100 million. That is not without its uses, and, of course, Britain's borrowing powers have been rehabilitated. But the future seems to rest largely on her performance in export trade.

Exports Hit by U.S. Action

At the worst, the U.S. decision to forbid the expenditure of foreign aid funds on goods in Britain or 18 other countries with relatively strong economies may damage the U.K.'s export trade by about £21 million a year. This was the estimate of Government experts after the announcement from Washington that money supplied by the International Co-operation Administration must in future be spent on goods and services of American origin or in countries with weak economies. In the last full year for which figures are available—July 1958 to June 1959—about $59 million out of the total I.C.A. allocation of $964 million were spent in Britain. In the nine months from July 1959 to March 1960, Britain's share was about $48 million out of $625 million.

Although many details have to be ascertained, it is clear that the estimated loss to British firms of about £21 million a year will be spread over a wide range of capital goods. In particular, makers of heavy machinery, some machine tools, farming equipment, bicycles, heating apparatus and boilers and textiles expect that they might be affected. These goods were being supplied to India and other Far Eastern countries under the foreign aid plan. The only consolation for British firms is that this "discrimination" is not confined to the U.K. Other countries affected are West Germany, France, Italy, Japan,(Australia, Austria, Belgium, Canada, Denmark, Luxembourg, Monaco, the Netherlands, New Zealand, Norway, South Africa, Sweden, Switzerland, and Hongkong.

Big Drop in Hire-purchase Sales

The outstanding hire-purchase debt fell by £7 million in October to £945 million. Although hire-purchase controls were brought back in April, the debt did not fall until August; since then it has dropped by £15 million, or an average of £5 million a month. Between November 1958, and April this year—when no controls were in operation—the debt rose at an average monthly rate of £25 million. Hire-purchase sales by shops selling household goods were higher in October than in September, but they were 30-percent less than in October last year. Credit sales of hardware, radio, and electrical goods shops were down by a third, compared with a year previously, and sales by furniture and furnishing shops were down by a quarter. The hire-purchase debt owed directly to shops fell by £2 million to £322 million during October. Debt owed to hire-purchase finance houses fell by £5 million to £623 million, and credit given by finance houses in October fell slightly below the September figure.

Other U.K. Board of Trade figures indicate that retail sales for clothing and footwear were again particularly good in October—in sharp contrast with trade in shops selling household appliances. Retail sales in October—adjusted to allow for seasonal influences—were much the same as in September. In value, they were more than 3-percent higher than in October last year; but as prices were about 1 percent up, the rise in the volume of sales of between 2 percent and 3 percent was smaller than in the third and second quarters of this year. Retail sales for clothing and footwear were as much as 13 percent or 14 percent higher than in October last year. Prices were between 1 percent and 2 percent up.

Disquieting Reports

In view of the many disquieting reports from the trade, motor-vehicle hire-purchase activity last month appears to have been held at a generally satisfactory level. According to *Hire-purchase Information*, total contracts for November were 104,108, compared with 110,909 in October and 107,553 in November 1959. As was to be expected, the number of contracts for new motor-cars was lower, at 9,050 for the month, against 10,012 for October and 12,749 for November last year. Contracts for used motor-cars, however, were onl slightly below the October level and, at 52,52 were 678 up on the figure for November 1959.

Instalment business in commercial vehicles re mained at a high level, contracts for new vehicl totalling 5,688, against 5,712 in October and 5,1 a year ago. For used vehicles, the total was 11,122 compared with 11,485 and 10,118, respectively. Wit the approach of winter, contracts for new an used caravans dropped, and there was also a cc traction in credit sales of motor-cycles and scoote Contracts for new machines totalled 3,654, co pared with 6,784 in October and 8,492 in Novem last year. The total for used motor-cycles a scooters, at 14,994, was 2,028 below the Octob figure, but 533 higher than a year ago.

Robens Plan for Coal

Mr. Alfred Robens, who takes over as chairma of the National Coal Board early next year, se in London that the industry's target should be provide 200 million tons a year. "I shall not h tate to use every weapon in the armoury to car out and hold this target which I so fervently b lieve to be in the interests of the coal industry a of the nation." Mr. Robens said that he had f quently been told that 200 million tons wou be a very optimistic estimate. His answer w that the coal industry itself could affect the trer by its energy, initiative and determination. F the first time, it was possible to give the industr a fixed objective. By the late 1970s, electricit could take half its output. The demand in gener industry for fuel was strongly threatened by o but the U.K. Coal Board was determined to mee the threat.

The Government had indicated that the fu requirements of Britain by 1965 would be 3. million tons of coal equivalent a year, b Mr. Robens could not accept the date. He thoug that it would be nearer 1970 before a figure o 300 million tons would be reached. In spite of th glut of coal in Europe, British sales there are for ing ahead, and this year Britain would have sol abroad about one-third more coal than in 195. A very strong case could be made against th

QUIET TREND IN JUTE AND GUNNY MARKETS

ANXIETY ABOUT NEW RESTRICTIONS ON BANK CREDIT

THE past week has been extremely quiet in the Calcutta jute and jute goods markets. Prices have declined, with fibre leading the way. The undertone, however, is difficult to assess, as many operators continue to hold bullish ideas They feel that, with the present productive capacity of the industry, it is doubtful whether any large increase in demand could be met. But no such increase seems likely, judging from the I.J.M.A. gunny stock figures which have just been published. The market has eased on learning that mills' stocks of jute goods during November rose by 3,700 tons, most of the increase being in sacking.

Some people in the markets say that the effects of the recent loom sealing moves will show better in the December output figures than in the November ones just issued. The latter indicate that, compared with October, production last month increased by 1,400 tons—from 84,500 tons to 85,900 tons. Hessian production fell by 1,000 tons to 32,000 tons (37.3 percent). But the output of sacking rose by 2,000 tons to 47,200 tons (55 percent) and of other goods by 400 tons to 6,700 tons (7.7 percent). Working hours remained the same in both months—208. The increase in production may be accounted for by the rise of about 1½ percent in the looms on the heavier sacking constructions. The average production an hour during the month was 412 tons, which is slightly higher than in the previous month.

Raw Jute Quotas

The raw jute quota system continues to work well, and this week quotas were issued promptly on Monday. Once again, mills have not been eager to buy. Those having their own agencies continue to take up almost the entire quantity. Continued buying upcountry has kept the mofussil markets fairly steady, and the fall in rates has not been as pronounced as in Calcutta. Only limited business is reported, but even so some mills have found it difficult to obtain their requirements. Since the basic price of raw jute fell below Rs. 50, many of the larger sellers, who are known to be holding big stocks, have withdrawn from the market. Even ready bills of lading have not been put on offer, but have been taken into stock as many sellers have bullish ideas. Some, however, are anxious to liquidate their holdings at almost any price, and this has perhaps given the impression that the market is easier than operators try to claim.

I.J.M.A. Gunny Stocks

Stocks of jute goods held by member-mills reporting to the I.J.M.A. increased by 3,700 tons to 82,100 tons during November. They consisted of 30,100 tons of hessians (36.7 percent), 43,100 tons of sacking (52.5 percent) and 8,900 tons of other goods (10.8 percent). There was a rise of nearly 2 percent in the proportion of sacking stocks, which corresponded with the increase in the percentage of sacking produced during the month. The total stock figure remained just below the level of the monthly production figure.

Credit Restrictions

The Reserve Bank has issued a directive asking scheduled banks to reduce the advances given against security documents on raw jute and jute goods. This has caused jute sellers a great deal of anxiety, and the markets have declined. It is understood that a maximum of 60 percent of the value has been recommended for advances against jute documents to parties other than mills, and 75 percent to mills. These proportions are much lower than what some banks usually give. Raw jute sellers will be particularly hard hit. Nearly all their business is conducted on advances against documents, usually through their brokers, who pass the bills through the bank and obtain the necessary overdraft to finance the seller. If the banks restrict advances to 60 percent, the sellers will be cut down to about 50 percent, as the brokers invariably keep 10 percent in hand. It is understood that the credit restrictions have been imposed with a view to curtailing speculative activity, and also to ensure that there will be no further rapid rise in raw jute and jute goods prices. If money is tight, it is unlikely that prices will rise. The action may help bring to light hidden stocks of jute.

THE JUTE MARKETS

Manufactured Goods: Because of the small business in B Twills done with Ghana, heavy goods rose at the opening last Thursday. December B Twills moved up to Rs. 177 and January-March to Rs. 169. But 40in. 10oz. hessians showed no change at Rs. 56 for both the near and forward positions. The rise was soon countered by the publication of the I.J.M.A. stock figures which showed an increase of 3,700 tons in November. Over the next two days, prices fluctuated within narrow limits, but movements were mostly downwards. By the week-end, B Twills were down to Rs. 174, with the forward delivery discount increasing to Rs. 9. Hessian prices showed a drop of Rs. 1.25 or Rs. 1.50 and ruled around Rs. 54.50. Overseas interest at this stage was negligible, and business of any description was small. There was no support for the market. Reports of restrictions on bank advances against raw jute and jute goods had an adverse effect, so the undertone was weak.

Opening quotations on Wednesday morning were as follows:

	Dec.	Jan.	Jan.-March
40in. 7½oz.	42.35	41.25	40.75
40in. 8oz.	45.50	44.25	43.75
B Twills	173.50	167.50	164.00
Heavy Cees (Plain)	173.50	167.50	164.00
A Twills	207.00	203.00	200.50
Liverpools	196.00	193.00	191.50
Cornsacks	175.00	172.50	169.00

Raw Jute: Very little activity was reported in the jute market. Quotas were issued, but only small business was done, so prices showed a declining tendency. Upcountry markets continued to rule above the parity of Calcutta rates, but a fair amount of agency buying by some of the larger houses continued. Imports were still small, being much less than the average for this time of year. Many of the larger sellers withdrew from the market, and indicated that they would stock jute until prices rose again. Assam rates at the opening were based on Rs. 50.50 a maund, which was 50nP less than last week's closing prices. For the rest of the week, 50nP was taken off daily, and by Monday morning, indications were down to Rs. 49.50. Many were keen to sell, and business was always possible below the indicated rates. Wagon arrivals in Cossipore showed a slight rise, and a total of 740 wagons was reported, but this was below the average for the time of year. Towards the close, the market eased considerably and more jute came on offer. Sellers holding stocks became anxious about their advances from banks.

Opening quotations on Wednesday morning were as follows:

	Landed at Mills (Basis Bottoms) Rs. a 100 kilos	Rs. a md.	Shipment
Assam	130.00	48.50	December
Northern	127.25	47.50	"

I.J.M.A. STOCK FIGURES FOR NOVEMBER

The Indian Jute Mills Association reports the total stocks of jute goods at the end of November as follows:

Description	30th November, 1960 Lakh Yds. (000 Metres)	000 Tons (000 Metric Tons)	31st October, 1960 Lakh Yds. (000 Metres)	000 Tons (000 Metric Tons)	Increase over (+) or decrease from (−) last month Lakh Yds. (000 Metres)	000 Tons (000 Metric Tons)	30th November, 1959 Lakh Yds. (000 Metres)	000 Tons (000 Metric Tons)
Hessian cloth and bag	10.95 (10.01.30)	30.1 (30.6)	11.21 (10.24.84)	30.5 (30.9)	−26 (−23.54)	−0.4 (−0.3)	9.55 (8.71.51)	26.6 (27.0)
Sacking cloth and bag	10.07 (9.21.15)	43.1 (43.8)	9.35 (8.54.64)	29.5 (40.1)	+72 (+66.51)	+3.6 (+3.7)	6.78 (6.19.93)	28.7 (29.1)
Others		8.9 (9.0)		8.4 (3.6)		+0.5 (+0.4)		9.9 (10.1)
Grand Total		82.1 (83.4)		78.4 (79.6)		+3.7 (+3.8)		65.2 (65.2)

N.B.—These figures are based on replies received and represent all members of the Association and Gagalbhai with estimates for two non-member mills. The figures in brackets are metric measures, based on the actual (detailed) figures, and are more precise.

I.J.M.A. PRODUCTION FIGURES FOR NOVEMBER

The Indian Jute Mills Association reports the total production of jute goods for November as follows:

Description	Quantity	
1. Gunny Bags		
(a) Hessian	3,512 tons 1,23.2 lakh yds. 88.6 lakh nos.	(3,568 metric tons) (1,17,25 thousand metres)
(b) Sacking	46,205 tons 10,67.8 lakh yds. 4,78.4 lakh nos.	(47,048 metric tons) (9,75,57 thousand metres)
2. Gunny Cloth		
(a) Hessian	28,460 tons 10,54.9 lakh yds.	(29,917 metric tons) (9,61,56 thousand metres)
(b) Sacking	943 tons 20.9 lakh yds.	(958 metric tons) (19,09 thousand metres)
3. Other Manufactures	6,715 tons	(6,823 metric tons)
4. Total Production (All kinds)	85,935 tons	(87,314 metric tons)

Summary

	(00,0'0 yds. and 000 metres) Nov. '60	Oct. '60	Nov. '59	(000 tons and metric tons) Nov. '60	Oct. '60	Nov. '59
Hessian	11.83 (10.81.81)	12.40 (11.33.99)	13.55 (12,38.54)	32.0 (32.5)	33.0 (33.6)	36.6 (37.2)
Sacking	10.29 (9,95,46)	10.57 (9,66,72)	10.74 (9,82,50)	47.2 (48.0)	45.2 (45.9)	45.7 (46.4)
Others *				6.7 (6.8)	6.3 (6.4)	5.7 (5.8)
Grand Total				85.9 (87.3)	84.5 (85.9)	88.0 (89.4)
Hours worked				208.0	208.0	200.5

N.B.—These statistics are based on replies received and represent all members of the Association and Gagalbhai with estimates for two non-member mills. The figures in brackets are metric measures, and those of length, being based on the actual (detailed) figures, are more precise.

THE FOREIGN JUTE MARKETS

FIBRE PRICES DECLINE

(FROM OUR DUNDEE CORRESPONDENT)

RAW jute prices in Dundee declined by £6 a ton or £8 a ton during the past week, so traders heaved a sigh of relief. Some people say that it is not a fall of £6 a ton or £8 a ton that they want to see but some £60 or £80 a ton, so that consumers of jute yarns and cloth will again come into the market with orders of some magnitude. Business is still confined to small quantities to meet urgent needs and, unfortunately, too many sellers are now in a position to supply customers with immediate delivery.

The outlook for the future is pretty poor in Dundee and on the Continent. The dragging decline is worse than any sudden big fall in prices since it keeps off buyers. Many anticipated the advance in prices and took the usual precaution of placing orders for large quantities of yarns and cloth. So they have sufficient stocks to enable them to stay out of the market for a long time. But those who are not in that fortunate position have to enter the market periodically, although enough business is not being done to keep spinners and manufacturers busy. There is bound to be an extension of short-time working or general curtailment of production which is already being resorted to in most mills and factories. Dundee jute workers are not, therefore, to have a happy Christmas or New Year.

Mill Firsts have declined to £188 a ton. Mill Lightnings to £176, Mill Hearts to £172 and Grade Hearts to £168, all lowest for December-January shipment, c.i.f. U.K.-Continent. Grade Tossa-2/3 is now at £180, fours at £175 and Continental Tossa-2/3 £172, same shipment, while good marks of Daissee-2/3 are from £175. There are offers of secured lots at a few pounds a ton afloat but spinners are not much interested.

The Calcutta goods market has been irregular; prices quoted by sellers in Dundee vary by as much as a few shillings for hessians. For December shipment, quotations are from 83s 9d to 85s, for 40in. 10oz. and 64s to 65s 3d for 7½oz., with January-March at 84s and 64s, respectively, and April-June at 83s 9d and 63s 3d, also B Twills at 260s to 270s 6d, 256s 9d and 253s 9d for the respective positions of shipment, all f.o.b., Calcutta. In the early positions, the low prices are for se-

STEEL manufacture at MUKAND

In 1940, Mukand employed 694 men; in June 1960—2,187. Over the past seven years, production figures have soared—18,234 tons in 1952/53; 49,787 tons in 1959/60. This increase is a reflection of a good management of finances:—

	1957/58 (Rs. in lacs)	1958/59	1959/60
Capital	51	51	71
Depreciation provided up to date	32	36	41
Profits retained in business to date	25	35	45
Profit for the year	19	30	32
Dividend for the year	5	5	8

Mukand manufacture high-grade steel products—bars, rods and castings. Presently an expansion programme is under way. It will cope with the growing influx of big orders—like the one placed by the Railways with Mukand on 16th July 1960 for 4,035 sets of Centre Buffer Couplers valued at 84 lacs.

Mukand provides India's new and growing industries with the quality steel components they must have.

cured lots. Dundee yarn and cloth prices remained unchanged last week.

THE PAKISTANI JUTE MARKETS

FIBRE CONTINUES TO FALL

(FROM OUR EAST PAKISTAN CORRESPONDENT).

PURCHASES by overseas buyers during the second half of November amounted to only a little over 100,000 bales. A large proportion represented a purchase of nearly 30,000 bales by China, earlier reported as only 15,000 bales. The next largest buyer was Poland with 13,860 bales, followed by France with 8,450 bales and the U.S.A. with 8,500 bales. The purchases for November, therefore, totalled only 218,746 bales, which is a very low figure. The total purchases so far amount to 540,000 bales below those of the last season. From this, it is apparent that overseas buyers have probably managed with afloat jute and the long position of London traders who have stopped buying from Pakistan in a successful attempt to bring down prices. From the peak of mid-October at £182 for Export Firsts, E.P.C.s now stand at £108 for these grades. Local prices, too, have come down from Rs. 400 a bale for Export Firsts to Rs. 350 a bale. Cuttings, which reached a peak of Rs. 250 a bale business done, are now down to Rs. 185 a bale.

In the loose market, prices have also come down, but much more slowly. From Rs. 70 a maund which was paid at one time for B Bottoms, it is now possible to buy in Narayanganj at Rs. 56 a maund.

These reduced prices in the overseas market are, of course, largely due to the fact that buyers are able to hold off. In the Narayanganj pucca bale market, the reason is lack of finance and, therefore, lack of holding power of most buyers. Upcountry, however, in the loose market any loss resulting from the fall in prices has been suffered almost entirely by middlemen and smaller stockists. The growers and larger stockists have neither reduced nor released their jute, and this is apparent from the fact that very small quantities of *raki* jute are coming in, although seed cut jute is making its appearance in normal quantities everywhere.

Except for the usual small spurt of buying just before the holidays, little or no business is expected this month. However with only 2 million bales of purchases so far of which nearly 150,000 bales must be September shipment yet undelivered, it is hard to believe that consuming countries can hold off much longer. The weakness in the Narayanganj market gives an impression of a very large long position, with balers eager to unload. But it is likely that revival of buying from overseas interest will clear the long position and create a steadier market. One is led to expect more interest from overseas, partly from the fact that the small purchases which have been made have all been for earlier shipments and nominated steamers.

The highly speculative cuttings market remains an enigma this season. There is no doubt that partly due to a larger tossa crop in relation to white, the percentage of N.C.s will be lower this season. Furthermore, the white jute itself has had a smaller percentage of root. It is apparent that India must come in to buy cuttings once again. From the operations during the past week, it appears that there are still balers who are short of cuttings and are covering against their commitments. This may cause a rise in the price of cuttings. On the other hand, the price level is now so high that it cannot be economical for overseas buyers to purchase cuttings. In India, Assam Bottoms can be bought at about the same price as Narayanganj cuttings which last week were more expensive in the local pucca bale market than Export Lightnings during July.

JUTE GOODS EXPORTS TO BELGIUM RISE

India is now the leading supplier of jute bags to Belgium, according to trade sources. The rise in exports from India is attributed to the boom period through which the Belgian chemical industry is passing. Practically all jute bags imports into Belgium are treated as temporary imports and are exempt from the payment of Customs duty. The bags are used almost entirely by the chemical industry, particularly for fertilisers. Imports of jute fabrics into Belgium are also increasing, but India's share in this item is negligible. The major supplier of jute fabrics is Poland. Trade circles point out that while imports of jute fabrics into Belgium are rising fast, exports from Belgium of articles made of jute are also maintaining a steady level. These are valued at 239 million francs in 1958, 307 million francs in 1959 and 221 million francs during the period January-August 1960. While Poland remains the principal supplier of jute goods to Belgium, on the export side, the United States is Belgium's best customer. India stands a good chance of sharing in this market, it is stated, if she can offer quality goods at competitive prices.—N.A.F.E.N.

Books

LAW ON ESTATE DUTY

The Estate Duty Act, 1953. By D. H. Nanavati. (Published by N. M. Tripathi Private Ltd, Princess Street, Bombay 2. Price Rs. 25).

Mr. Nanavati's book is not an annotation but an unorthodox commentary on the Estate Duty Act, 1953. It gives a well-integrated picture of a very technical subject. In the notes under each section, there is a cross-reference to different pages in the commentary. But it does not contain any cross-reference to other relevant sections of the statute, which is essential in complicated tax laws. The estate duty legislation in India—introduced for the first time in 1953—closely follows the U.K. Act of much earlier origin. The Indian lawyer will find this book useful since it embodies numerous English precedents. There is a useful comparative table of Indian and U.K. legislation, but the relevant provisions of the latter should have been included in an appendix along with the various notifications issued by the Central Government under Section 4(2) of the Estate Duty Act, 1953, and the relevant rules of the Original Side of different High Courts in India. Sections 5 and 6 which impose the levy throw a very wide net to earn revenue—the property is dutiable whenever it passes or is deemed to pass on death, even if the deceased had no interest in the property. Chapter 2 measures this dimension; it also contains a thorough analysis of many problems. The presentation is clear and straightforward. Even a layman will know, in a simple case, how and to whom to submit the estate duty returns.

To evade tax is illegal but to avoid is not. The author gives invaluable advice to assessees; he suggests on Page 36 how a donor could avoid duty by sitting at the side instead of at the head of the dinner table. Mr. Nanavati has repeated the main conclusions of the Estate Duty Act, 1953. An introductory chapter giving the broad contours of the subject and a summary of the conclusions at the end of every chapter will turn his commentary into a good text-book. A few pages devoted to the problem of construction and interpretation of the taxing statute will be welcome. The book is quite up-to-date since it incorporates the latest amendments of 1958. Clear type, the quality of paper and the reasonable price are additional attractions.

SURVEY OF STEEL DEMAND

Appraisal of Steel Demand. Compiled by the National Council of Applied Economic Research. (Published by Asia Publishing House, Bombay. Price Rs. 10, pages 138.)

The Council of Scientific and Industrial Research decided to conduct a survey of India's capacity to absorb 4.5 million tons of steel output planned for 1960-61. Some doubted whether the country would be able to absorb the targetted output at the end of the second plan. The price of Indian steel, involving the operation of an equalisation fund, has ruled higher than the international levels; and this, according to the Council, will be a serious limiting factor for raising the demand. Because of low incomes, the markets in underdeveloped countries for commodities like steel and aluminium might not be large enough to support modern plants with huge capacity. The Council's study is based on the micro approach, involving the study of end-uses of steel in quantities and categories by a number of industries. Besides, the requirements of industries for 1960-61 have been estimated in the light of their short-term programmes. The demand for steel in 1960-61 has been estimated at 3.6 million tons. The forecast for 1965-66 is 7.2 million tons and for 1970-71 12.9 million tons. The Council concludes that at no time during the third and fourth plans is there any likelihood of demand lagging behind supply. It recommends the establishment of machinery to collect data relating to the demand for steel on a continuing basis. The study contains 99 tables and is valuable.

RAILWAY ADMINISTRATION

Indian Railways. By Amba Prasad. (Published by Asia Publishing House, Bombay. Price Rs. 22.50, pages 435.)

The problems of the Indian railways are not the same as those of other industries and commercial enterprises. This is due to the fact that the nature of railway administration in India is very different from that of other businesses. Dr. Amba Prasad analyses the difference between the two kinds of enterprises and discusses the special characteristics of the railways. Besides, he formulates principles which should govern railway administration in general. The book, which is based on the author's doctoral thesis presented to the Delhi University, also studies the Indian railway administration in a historical perspective. It takes into account the various systems of management which prevailed in India during the period 1921-52, with particular reference to company and State management. Dr. Prasad also sifts the material available for a proper evaluation of the different phases of railway administration. For example, without believing the posters on railway platforms that "the accidents are caused, they do not happen", he makes the interesting observation (Page 211): "It is now well established that a majority of accidents (1954-56) on the railways are due to the failure of human element". The book is a comprehensive study of India's largest national enterprise.

This Age of Sillimanite

WITHOUT REFRACTORIES

the WATER we drink cannot be purified by lime and chlorine, both produced with the aid of Refractories.

FOOD is obtained with the aid of potash, phosphates and nitrogenous fertilizers, none of which can be produced in adequate quantities without Refractories. CLOTHING cannot be produced in sufficient quantities if Refractories are not available for the power plant. Power plants using Refractories provide your home with heat for COOKING, LIGHT for comfort, and power for essential domestic appliances. It would be impossible to construct FURNACES to extract metal from ORES or to operate Rail Road LOCOMOTIVES. There will not be high octane AVIATION spirit nor LUBRICANTS as suitable furnaces cannot be constructed. STEEL plates cannot be produced for building SHIPS. It will be impossible to make LORRIES TANKS GUNS SHELLS Invasion BARGES BATTLESHIPS even ALUMINIUM and MAGNESIUM used in the manufacture of AEROPLANES cannot be produced. CHEMICALS used in explosives cannot be manufactured. The large POWERPLANTS supplying power, heat and light cannot operate.

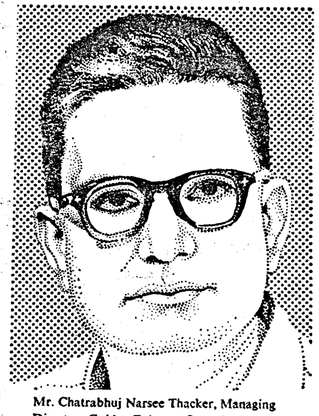
WHY WE ADVERTISE—10

quality products at attractive prices



Mr. Chatrabhuj Narsee Thacker, Managing Director, Golden Tobacco Co. Private Ltd.

One of the most encouraging world developments in recent years has been the emergence of Advertising as a *tour de force* in the spheres of commerce and industry. The principal aim of Advertising is to secure, maintain and increase the distribution and consumption of a product. Consequently, when a new product is launched, Advertising triggers the first sale. It is the goodness of the goods that produces repeat sales. No one will venture to advertise if there were no repeat sales, because it is common knowledge that a manufacturer's existence depends upon repeat sales.

We who are in the tobacco industry are deeply conscious of the fact that Advertising cannot sell poor merchandise. Experience of over three decades has convinced us that we must have satisfied customers to stay in business. Therefore, it has been our constant endeavour to manufacture and market quality cigarettes that will satisfy the customer and create goodwill for advertised brands.

In cigarette advertising the manufacturer appeals directly to the consumer but does not sell his goods to the public without intermediaries—the wholesaler and the retailer. Advertising creates the demand which induces the wholesaler and the retailer to stock the goods. In the cigarette industry, as in many others, competitive Advertising has forced manufacturers to take pains constantly to improve their products. This is beneficial to the consumer as he is offered high quality goods at attractive prices.

Advertising enables the manufacturer to pass on the benefits of mass-production economy to the consumer.

isa Good Advertising Serves *You*

COCONUT OIL PRICES RISING

SEASONAL FALL IN PRODUCTION AFFECTS SUPPLIES

(FROM OUR SOUTH INDIAN CORRESPONDENT)

THE sharp rise in coconut oil prices continues, the latest quotation for spot delivery oil from Cochin being Rs. 268 a quintal. Trade circles give the following reasons for the unusual increase in price: first, there is a seasonal fall in indigenous production of coconuts and, secondly, the non-availability of imported copra has affected supplies. Besides, the recent shift in the Central Government's import policy relating to copra has had a bad effect on the coconut oil market. It has aggravated scarcity conditions and has given rise to panic among millers, apart from encouraging speculation. The oil market is, however, expected to ease in the near future. There is only one month to go for the new season to begin in Kerala. Meanwhile, the import position is also likely to improve. The Central Deputy Minister for Commerce recently said in Parliament that groundnut oil exporters were allowed to import only 175 tons of copra under the new export promotion scheme. This is very much short of the quantity anticipated by the Kerala oil milling industry. The latter's fears, which were to some extent responsible for the recent unhealthy rise in oil prices, should have been removed by the Central Deputy Minister's assurances. Millers are expected to get their quota of Ceylon copra in their capacity as actual users. Trade circles expect that normal inflow of Ceylon copra will start soon.

Pepper Prices Fall

Larger arrivals of new crop pepper is reported from Cochin and other terminal markets on the west coast, although foreign demand has not shown any substantial improvement. Consequently, prices are showing a tendency to fall. The Cochin market recorded a fall of Rs. 20 a quintal last week over the previous week's closing rate. Spot delivery new crop pepper was selling at Rs. 345 a quintal on 10th December. Forward positions were: December Rs. 365 and January Rs. 375.

Cardamom Prices Rise

There was a change for the better in the second auction sale for the new season's cardamom at the Cochin market on 5th December. Contrary to the experience in the first sale a couple of weeks ago, there was a good general demand at enhanced rates. Inferior and medium grades found good support and tended dearer. Best varieties met with lesser competition, and their prices were barely steady. The maximum and minimum prices realised in this sale were Rs. 10.10 for black seeds and Rs. 7.35 for light pods, the average sale price being Rs. 8.31 a lb, compared with Rs. 7.70 a lb in the first sale and Rs. 9.78 a lb in the corresponding sale of the last season.

Labour Troubles in Kerala Estates

Some isolated cases of labour disturbances have been reported from Kerala estates. A general and complete strike—sponsored by the two trade unions affiliated to the I.N.T.U.C. and H.M.S.—has been declared on the Peirce Leslie's Kinalur rubber estates in Malbar. Over 600 workers are involved in it, and the country is losing over 10,000 lbs of rubber a day on account of the strike. The major demand of workers is that the wage rates should be enhanced, according to a Press note issued by the Association of Planters of Kerala. Wage rates in the plantation industry are governed by industrywide agreement, so they do not vary from estate to estate. As for Kinalur and other estates in the Malabar area, there is also a special tripartite agreement of 8th July, 1957, to the effect that the current rates may continue until they are revised as a result of the recommendations of a committee which the Kerala Government was contemplating to appoint at that time. Its report is now with the State Government.

Meanwhile, on the recommendation of the Central Tripartite Industrial Committee on Plantations, the Government of India has decided to constitute wage boards for revising plantation wage rates, and the personnel of the board for the tea section has just been announced. According to the Association of Planters of Kerala, the disregard of the fact that Central Wage Boards will shortly examine the question of wage rates indicates "scant courtesy" for the tripartite decision on the basis of which the boards are being constituted. The fact that the strike has been called when the settlement of 8th July, 1957, is in force makes it "clearly illegal". The Association further argues that the whole procedure is a violation of the Nainital Code of Discipline. The Hind Mazdoor Sabha union has declared a strike without giving notice, the Association says. The strike issue was recently raised in Kerala Legislature by a P.-S.P. member from Malabar. In his reply, the State Labour Minister upheld the stand of the management. He appealed to workers to withdraw the strike in view of the management's conciliatory attitude on demands other than wage rates. The Minister said that for any revision of wage rates, workers would have to wait till the recommendations of the national wage board were available.

Abuse and Intimidation

Thenmalay valley in south Kerala has been simmering for nearly two months now. It is stated that towards the middle of September, a long list of demands was served on the managements of four large estates in the area. According to the Association of Planters of Kerala, a *satyagraha* was started in front of the group hospital situated on the Isfield estate early in October. This was accompanied by abuse and intimidation of the medical officer. Towards the end of the month, rubber tappers on Isfield were physically prevented —through intimidation and threats of violence— from going to work. The management had to call in the police. On 9th November, a hunger strike was started in front of the group hospital but was dropped after six days. On 28th November, a *satyagraha* was started in front of the Isfield office. As a part of this move, an unruly mob consisting of certain trade union leaders, some outsiders and a few estate workers broke into the office in a "violent and aggressive mood" on 7th December, the superintendent held his ground but his assistant had to climb out to safety through a back window, the Association's statement says.

In both these cases, Government machinery had promptly moved in—the Labour Department for conciliation and the police to maintain law and order. Planters do not seem to have any complaint against the present Government as far as labour relations are concerned. But when the State was under communist rule, there were frequent complaints from planters and other industrialists that they were not getting a fair deal from the Government. The position has changed now. Under the new Congress-P.-S.P. Government, the police is behaving impartially and equal protection is given to everybody. The rule of law has been re-established in Kerala and the law and order situation is normal. The new Government is exploring the possibilities of establishing long-term industrial truce and for avoiding labour troubles under the initiative of the State Governor, Mr. V. V. Giri.

CALCUTTA TEA AUCTIONS IN NOVEMBER

PRICES OF MEDIUM GRADES FALL

FOUR sales were held in November, and offerings amounted to 277,529 packages. Demand was strong and general throughout the month: both export and internal buyers were operating freely, say Messrs Carritt Moran and Co. Private Ltd in their monthly tea market review. The better liquoring Assam B.O.P.s and O.Fs with declining quality came in for a fair enquiry but were irregular and easier. In the first sale, medium B.P.s inclined easier, but thereafter with more enquiry were fully firm to dearer, while in the final sale they were much dearer. Medium fannings showed little variation in price over the previous month and were about firm. Teas for price and plain B.P.s were in good demand at last rates, while similar fannings were well supported and in the final sale were at times considerably dearer. During the first two sales, legg-cut teas were about firm but in the later sales prices declined. Leaf grades continued to be well supported except for the poorer and rougher types which declined. Darjeelings—particularly the brighter liquoring higher grades—were strongly competed for and often dearer; the poor types, however, eased further. Some useful prices were paid for tippy teas but these were an irregular feature.

A further seasonal improvement in Darjeeling teas was noticeable in November, and there were a number of fair flavouring teas on offer. Orthodox grades from Assam maintained a satisfactory standard but there was very little tip in the leaf and only a very few tippy iteas were on offer. Cup quality was about average for the time of year. Both leaf appearance and liquors of the C.T.C. teas showed little change from the previous month, but there were rather more secondary fibrous grades on offer.

Sale No. 21 " "	4.63	(2.10)	4.33	(1.97)

(Inclusive of zonal excise duty)

The Internal Market

The 2,856 packages of internal leaf offered met with a good demand and sold well. The few green teas on offer were well supported at dearer rates. There was 113,656 packages of dusts in the five sales held during the month. A good demand was seen throughout, although prices generally showed a decline. The plainer orthodox dusts met with useful support in all sales, and prices generally held steady. The smaller and brighter liquoring Assam kinds, however, registered a progressive decline, with closing rates well below those of the previous month. Legg-cut Dooars were irregular, although prices followed the easier trend. Medium C.T.C. descriptions met with less active demand and were considerably lower, registering a decline of 10nP to 20nP in each auction. The best grades followed a similar trend, while selected lines sold well.

Quotations

	1960-61 A kilo Rs. nP	1959-60 A kilo Rs. nP
Sale No. 17 Clean Plain Dust	4.83	4.38
Sale No. 18 " " "	4.90	4.42
Sale No. 19 " " "	4.88	4.51
Sale No. 20 " " "	4.85	4.51
Sale No. 21 " " "	4.83	4.82

(Inclusive of zonal excise duty)

Export sales up to and including Sale No. 20 totalled 1,049,375 chests at an average price of Rs. 5.71, compared with 1,134,005 chests at an average price of Rs. 5.25 for the same period of the previous season. Internal sales at 7,008 chests of leaf and 350,802 chests of dust (average prices Rs. 4.45 and Rs. 5.35) go against 12,118 chests and 365,908 chests, respectively (against Rs. 3.92 and Rs. 4.43) of the corresponding period of the previous season.

The estimated north Indian crop to the end of October 1960 was 208.43 million kilograms (459.50 million lbs), compared with 223.77 million kilograms (493.31 million lbs) to the same date of last year. The average figure at this date for the three years 1957-59 was 218.95 million kilograms (482.70 million lbs).

A further 5-percent Export quota was released on 6th November, bringing the total to 60 percent of the crop basis of estates. The release, however, did not affect the market. It remained steady at ¼nP, at which rate some business was done. Sellers' quotations remained firm at ¼nP.

Arrivals (in chests) in Calcutta warehouses during the period 24th October, 1960 to 23rd November, 1960, with the corresponding figures of the previous year in parentheses were: by steamer 459,659 (606,930), by rail 218,847 (168,692) and by air 7,550 (6,541) chests. From the beginning of the season 1st April, 1960 to 23rd November, 1960, arrivals have been: by steamer 1,840,808 (2,476,447), by rail 651,355 (796,728) and by air 46,492 (52,793), making a total of 2,538,655 (3,325,968) chests.

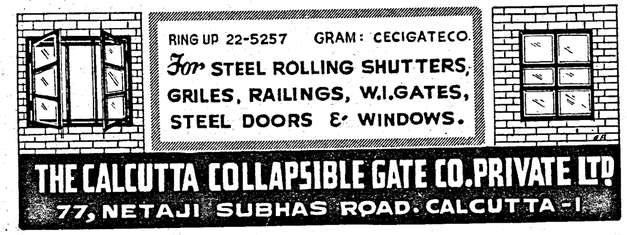
U.S. TEA IMPORTS IN SEPTEMBER

Tea imports into the U.S.A. during September 1960 increased to 8.22 million lbs, from 6.92 million lbs in the corresponding month of last year, according to official sources in New York. The increase was mainly due to bigger supplies from Ceylon—3.57 million lbs, against 2.64 million lbs in Septtmber 1959. Supplies from British East Africa also improved from 292,690 lbs to 576,420 lbs On the other hand, tea imports from India declined from 1.79 million lbs to 1.61 million lbs. —N.A.F.E.N.

COCHIN TEA SALES

At Sale No. 48, 660,000 kilograms of tea were on offer. There was a less general demand. Plain and low mediums were barely steady while mediums and good mediums were 20nP to 30nP easier. Best liquoring grades were irregular and easier.

At Dust Sale S, 220,000 kilograms of tea were were on offer. There was a strong demand, and the market was fully firm.



Scruffy and Smarty

Scruffy: *"He and I were classmates. Today he pretends not to recognise me. And yet I stood at the top of the class."*

Smarty: "Don't hate yourself for what you are. Perhaps you should blame your clothes..."

Scruffy: *"Clothes!!! I could buy up this town with the money I spend on them."*

Smarty: "Maybe. But you haven't chosen well. Why not buy BINNY'S suitings? BINNY'S Quality Control their production. Defects, invisible to the naked eye, that might have crept into the cloth are carefully eliminated at every stage of production. That is why BINNY'S suitings are smart looking and long lasting."

JWT/BY-650

BINNY - a great name in textiles

BINNY'S manufacture nearly 90 million yards of cloth every year. Here are some of the varieties they make:

Shirtings - Khaki Drills - Bleached & Dyed Drills - Anticrease Suitings - Tussores - Union Fabrics - Towels - Silk Sarees - Rugs - etc etc.

WE STOCK QUALITY FABRICS BINNY & CO. MADRAS-LTD.

Commodity Markets

STRIKE IN CHILEAN COPPER MINE AFFECTS SUPPLIES

RISE IN WORLD CONSUMPTION EXPECTED

COPPER from the Chuquicamata mine in Chile is nearly all consumed in Europe. Supplies in the latter would certainly have been inadequate if the strike at Chuquicamata had continued much beyond mid-November. It is calculated, however, that nine weeks will elapse between the resumption of operations and the first arrivals in the London market of copper produced at that mine since the strike. Supplies will not be plentiful in December, so it is unfortunate that deliveries of copper bought by producers in September—when it seemed the price needed such artificial support—have to be made in December. As these deliveries will probably be equivalent to more than half the stocks in London Metal Exchange warehouses—and these stocks are not at present large—tight conditions and firm prices are in prospect.

This situation is, however, temporary. It does not basically change the state of surplus which has weakened the price of copper in 1960 and is likely to keep it relatively low in 1961. Taking a broader view of the position, Sir Ronald Prain, chairman of Rhodesian Selection Trust, regards the surplus as temporary : he foresees an increase in the world consumption of copper sufficient to justify producers' plans. In his annual statement, he reiterated his faith in a managed price for copper, and he claimed that the fabricators who, as consumers of the metal, had been generally hostile to the idea, were changing their attitude towards it. The *Metal Bulletin* is sceptical. Commenting on the statement by Sir Ronald Prain, it says in the leading article in its issue of 25th November : "It is our understanding that in the U.K. there is more unanimity among major buyers in opposing (a fixed-price scheme) than there has been for some time." Perhaps in other countries, where copper prices are virtually fixed already, the idea of a worldwide fixed price is more appealing.

Cutbacks in U.S. Zinc Production

Yet another reassessment of the worldwide position of zinc suggests that the surplus of this metal forecast by the U. N. Lead and Zinc Study Group in September—reversing a previous estimate by that body—will not materialise. It seems that cutbacks in American production of zinc will be much larger than had been sppposed ; and the latest available figures of consumption in the U.K. were larger than had been expected. However, these figures of consumption are not up-to-date, and towards the end of November, the London market became painfully aware of the implications of the recession in the motor-car industry, so the price of zinc reacted sharply.

Scarcity of Tin

The one major metal which seems to be definitely scarce is tin. The latest monthly review of tin by A. Strauss, metal merchants, estimates an excess of consumption over supplies in 1960 by 10,000 tons or 15,000 tons. The deficit implies further substantial withdrawals from consumers' stocks, particularly in the United States. But, as the review remarks, "this process cannot go on indefinitely."

WHOLESALE PRICE INDEX FALLS

THE official wholesale price index (base : year ended March 1953=100) receded by 0.2 percent to 125.3 during the week ended 26th November, 1960, compared with 125.5 for the earlier week. The index was lower by 0.9 percent when compared with the corresponding week of the previous month, but was higher by 6.5 percent than that of a year ago. The monthly average for November 1960, stood at 126.0, against 126.3 (revised) for October 1960, and 118.3 for November 1959. The index for Food Articles declined by 0.3 percent to 119.3 due to a fall in the prices of milk in Bombay (−22%), rice in Nizamabad (−20%), in Chiplum (−10%), in Nagpur (−9%), in Trivandrum (−6%) and in Kanpur (−5%), jowar in Hubli (−16%), in Hyderabad (−6%) and in Nagpur and Jhansi (−5% each), bananas (−10%), wheat in Rajkot (−8%), in Bombay city (−7%) and in Bahraich (−5%), salt (−6%), potatoes (−5%), cashewnuts and black pepper (−3% each), maize, gur and cardamoms (−2% each) and barley, masur, gingelly oil, fish and chillies (−1% each), although the prices of jowar in Rohtak (+26%), onions (+24%), rice in Cuttack (+12%), in Matiahat (+8%) and in Cooch Behar (Sadar) and in Kozhikode (+7% each), milk in Ludhiana (+12%) and in Calcutta (+11%), wheat in Rewa (+8%) and in Kotah (+5%), urad (+4%), bajra, tea and betelnuts (+2% each) ragi, mustard oil and eggs (+1% each) showed advances. The index for Tobacco also fell by 2.5 percent to 113.3 as a result of a decline in the prices of raw tobacco (−3%). The Fuel, Power, Light and Lubricants group index worked out to 120.2, against 120.1 for the earlier week. The prices of castor oil (+1%) showed an increase during the week. Lower prices of cottonseed (−7%) and raw jute (−5%) brought down the index for Industrial Raw Materials by 0.3 percent to 146.6, compared with 147.1 (revised) for the previous week. The prices of lac (+5%), groundnuts (+4%), tanning materials (+2%), and raw silk, linseed, rapeseed, copra and raw skins (+1% each), however, moved up. The index for Intermediate Products advanced by 0.4 percent to 132.0 due to a rise in the prices of linseed oil (+2%) and zinc (+1%), although the price of lead (−2%) declined. The Finished Products index also rose by 0.5 percent to 124.8, against 124.2 for the previous week. Items which showed variations during the week were : general chemicals (+3%), jute manufactures and oilcakes (+2% each), handloom cloth (+1%) and bricks and tiles (−1%).

Every new factory is a part of India's fast development... and Goodlass Nerolac are proud to supply the protective paints which help strengthen and preserve these factories, ensuring that they remain smart and productive for years!

With twenty-five years' manufacturing experience in India, backed by a century of technical and scientific development, Goodlass Nerolac manufacture all types of industrial paints... maintain a *free* technical service to study customers' needs, and supply *special* paints, *specially-formulated*, to meet these needs.

India's leading manufacturers of industrial paints and finishes

PROTECTION TO CONTINUE FOR TRANSFORMER INDUSTRY

THE Government of India has accepted the Tariff Commission's recommendation that protection to the power and distribution transformer industry should be continued at the existing rate of duty of 10 percent *ad valorem* for a further period of three years ended 31st December, 1963, and that the protectivity duty should be made applicable to power and distribution transformers up to 10,000 kVA and 132 kV on the H.T. side, and parts of such transformers, not otherwise specified. The Government resolution on the Commission's report, which was published recently, states that the Government has also accepted the recommendation concerning the continuance of the present practice of assessing transformer oil imported with transformers to duty at the same rate as is applicable to transformer oil imported separately, and steps will be taken to implement it in due course. The Government has taken note of the recommendations of the Commission for a thorough scrutiny of applications for the import of transformers up to 10,000 kVA and 132 kV on the H.T. side, classification of imported power and distribution transformers by voltage, etcetera. Steps will be taken to implement them as far as possible.

USING PETROLEUM FOR HIGHER BLAST FURNACE EFFICIENCY

For more than two years, one of Stanvac's affiliate companies in the U.S. has been conducting a concentrated programme which promises to result in an important iron manufacturing development. The concept which has now been developed by scientific studies and experiments is that hydrocarbons, particularly heavy oil of high heat content, can be successfully injected into the bottom of blast furnaces and, in many circumstances, can increase capacity and decrease costs of "hot metal" production.

Revealing this, a company spokesman explained that this development was a result from a comprehensive overall programme undertaken to explore new uses for petroleum products. This work for iron-making could be of substantial importance to two basic industries—steel and oil. The scientific principles underlying the new development involve taking advantage of the chemical properties of oil as well as its heat-producing ability. Blast furnaces produce pig iron in hot liquid form by extracting oxygen from iron oxide. The blast furnace is actually more of a chemical plant than a furnace. Oil, which contains hydrogen, contributes additional "reducing" gas to speed the reduction of ore into iron. Coke, iron ore and limestone are fed into the top and hot air into the bottom of blast furnaces where temperatures reach some 3,500 degrees F. With the new fuelling method, oil can be injected along with the heated air. The petroleum fuel serves as part of the source of heat and of the "reducing" gases.

One of the most important developments for this application of oil is the fuel injection and control system. Since blast furnaces "stay on the line" for as long as eight continuous years, this system must be so designed that it can be installed into large furnaces without interruption in the use of the furnaces. In arriving at a suitable system, the company designed, built and operated a pilot plant simulating that part of a blast furnace most critical to oil injection. A unit of this system was later installed and tested in a hot operating large-scale furnace with complete success. The company noted that some U. S. and European steel firms had been working along similar lines with natural gas injection, and that there are reports that some Russian blast furnaces are using natural gas to increase their iron-making capacity.

U.K. FIRM WINS AERIAL SURVEY CONTRACT FOR PART OF EUROPE-TO-INDIA ROAD

The British firm of Fairey Air Surveys Ltd. has been awarded a contract to map 270 miles of road in Iran as part of a major road reconstruction project to link Turkey with Teheran. The road will form part of the route which links the capitals of Europe with India and the Far East. The survey has been ordered by an Iranian firm of consulting engineers, E.T.C.O., and comprises the mapping of approximately 430 kilometres (269 miles) of road between Zendjan and Marand, in north-east Iran. The aerial photography will be executed with the collaboration of the National Cartographic Centre of Iran, with whom Fairey Air Surveys was previously closely associated under a consulting and training agreement. The film will be processed in Iran and then flown back to Fairey Air Surveys' airfield and base at White Waltham, near Maidenhead, Berkshire, for map-making. A Fairey survey team has already arrived in the field, and is operating from the town and airfield of Tabriz and the towns of Mianeh and Zendjan. It is expected that field surveys will be completed before winter weather conditions begin to retard progress, and the subsequent mapping and plotting of cross sections should be in full swing during the first half of 1961.

A NEW AUTOMATIC RADAR FOR SHIPS

A new "true course" marine radar has recently been demonstrated by the A.E.I. Electronics Division. This new equipment, the B.T.H. "Escort" type 601 manufactured by the Associated Electrical Industries Ltd, London, brings, for the first time, the science of the electronic computer to the aid of the marine navigator. The "Escort" radar which is already in service aboard the British passenger liners *Queen Elizabeth* and *Queen Mary* is claimed to be the most advanced and safest radar afloat. The equipment is indeed versatile and may be switched to present either: relative ship's-head-up, relative Azimuth stabilised, or true motion displays. It is entirely auto-aligning and automatic in operation so that the ship's officer may concentrate his attention on the radar picture without distractions and without the need to adjust, correct or reset the display.

Perhaps the most interesting feature of the equipment is the analogue computer, true motion generator which, while simple and compact, provides an outstandingly accurate true course display which is self-monitered and autocorrecting. It is entirely electronic and incorporates a number of new semiconductor devices also manufactured by A.E.I. These silicon and germanium diodes perform the function of valve rectifiers, but have the advantage of being much more robust and reliable; having no heater electrodes, they greatly reduce the power consumption of the equipment. The "true course" generator is very versatile yet simple in operation and the difficulties which, in the past necessitated a "true motion" generator of electromechanical design have been overcome and the limitations of mechanical techniques surmounted.

THIRD OPEN HEARTH FURNACE AT DURGAPUR STEEL WORKS

The third open hearth furnace of the Durgapur steel works, which was commissioned on 5th November achieved the feat of tapping four heats in the space of 24 hours on 8th November, producing a total of 760 metric tons of steel. The tap-to-tap time for one heat was five hours and 35 minutes, which compares very well with the designed rate of 10 hours for this 200-ton furnace. The furnace uses 80 percent of desiliconised metal and 20 percent of scrap.

GOOD GENERAL DEMAND AT TEA EXPORT SALE

DUST PRICES RISE

AT Sale No. 23, held on 12th and 14th December, the 73,604 packages on offer at the Export auction met with a good general demand, although at prices which were irregular and often easier. Except for a few selected lines which were keenly competed for, most C.T.C. teas were easier by 20nP to 40nP. The poorer and fibrous sorts were a weak feature of the sale. There was a fair enquiry for medium B.O.P.'s and O.Fgs., although they were lower by 10nP to 20nP. Medium B.P.'s and Fannings were well supported, but at times slightly easier. "Teas for price" and common Brokens were steady, while plain Fannings were firm, some of the cleaner types being substantially dearer. Non-wither descriptions found support at about last rates. Whole-leaf grades were irregular, while the very few tippy teas on offer generally tended easier. Brighter Darjeelings, especially the higher grades, were well-supported while the plainer sorts again showed a decline.

Quotations

	1960 Rs. a kilo	1959 Rs. a lb
Clean Black Pekoe	5.30 to 5.45	2.18 to 2.24
Plain B.P.	4.50 to 4.65	2.04 to 2.12
Plain Fannings	4.80 to 4.95	2.10 to 2.18
Medium B.P.	4.70 to 4.90	2.02 to 2.12
Medium Fannings	4.90 to 5.20	2.16 to 2.24
Best Assam C.T.C. B.P.	5.50 to 5.90	2.55 to 2.75
Best Assam C.T.C. Fgs.	5.80 to 6.30	2.55 to 2.75

(Quotations are inclusive of excise duty.)

At the Internal Sale, the demand for the 24,898 packages of Dusts on offer was more active and general than in recent weeks. Orthodox descriptions suitable for export opened on an easier tone but strengthened as the sale progressed. The smaller and brighter liquoring kinds were firm and sometimes dearer. Legg-cut Dooars Dusts were generally lower with the exception of the smaller descriptions which sold well. Best C.T.C. teas sold well and were sometimes dearer. Medium descriptions in this category, however, came to an easier market, although there was more support for the brighter sorts.

Quotations

	1960 Rs. a kilo	1959 Rs. a lb.
Medium Dooars Dust	4.70 to 4.95	1.10 to 2.16
Medium Assam Dust	4.70 to 5.10	2.06 to 2.10
Medium Assam C.T.C. Dust	5.40 to 5.65	2.16 to 2.24
Best Assam C.T.C. Dust	6.00 to 6.30 (Nominal)	2.50 to 2.80

(Quotations are inclusive of excise duty.)

The 827 packages of Leaf on offer sold at irregular rates.

LINSEED DULL

The linseed market was dull in the past week, but the price was steady. There were small arrivals from the centres. Mills were keen buyers, but sellers were hesitant. The oil market was steady. Stocks were very small, and sellers were not inclined to do forward business. The oilcake market was firm due to good local demand. Foreign prices increased, but they were lower than the Indian ones. The latest quotation is as follows: Ready Rs. 27.25 a maund.

HIDES AND SKINS STEADY

The market was steady. Stocks were higher than in the previous week.

Bazaar Sales

(Between 6th December and 12th December, 1960)

Cowhides: Wet salted (Ord.) 16,000 pcs. on the basis of Rs. 9.50 to Rs. 12.75 and Rs. 13 to Rs. 15; Wet salted (Slaughtered) 27,200 pcs. on the basis of Rs. 10 to Rs. 16, Rs. 19 to Rs. 28 and Rs. 30 to Rs. 32. Wet salted (Ord.) 4,000 pcs. on the basis of 94nP a lb.

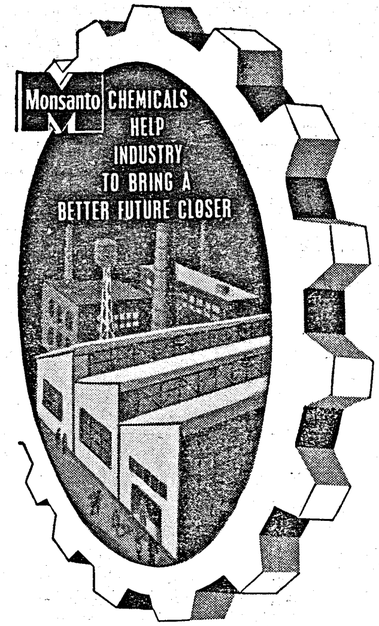
Goatskins: Wet salted (Patna, Daissee, Kustia) 72,600 pcs. on the basis of Rs. 330 to Rs. 350, Rs. 480 to Rs. 510 and Rs. 415 to Rs. 430; Wet salted (he-killed) on the basis of Rs. 4.50 and (she-killed) on the basis of Rs. 4.25 a piece; Assam 6,500 pcs. on the basis of Rs. 270 to Rs. 315; Purneah-Kissenganj 8,100 pcs. on the basis of Rs. 345 to Rs. 360; Patna (Ord.) 27,500 pcs. on the basis of Rs. 270 to Rs. 300; Purneah-Cooch Behar (heavy) 6,800 pcs. on the basis of Rs. 425 to Rs. 460 and Rs. 465 to Rs. 470.

Bazaar Stocks

(12th December, 1960)

Cowhides: Wet salted 80,500 pcs.

Goatskins: Wet salted (Daissee, Kustia, Killed) 36,000 pcs.; Assam-Dinajpur 68,000 pcs.; Muzafferpore-Patna - Pakur-Purneah - Kissenganj 226,000 pcs.



Monsanto works constantly both to develop new, better chemicals—and to improve those chemicals already used in every major industry.

PHARMACEUTICALS
acetylsalicylic acid, phenacetin, benzoic acid, phenol, phenolphthalein, germicides are but a few of the many Monsanto products in this field.

RUBBER
Monsanto's accelerators help speed vulcanisation, add quality. Anti-oxidants improve resistance, prevent early cracking, give increased flexibility.

TEXTILES
Monsanto Syton is widely used in spinning cottons and woollens, increases yarn strength, allows for reduction in twist.

PRESERVATIVES
Monsanto's pentachlorophenol chemicals help to preserve a wide range of products. Monsanto sodium benzoate helps prevent corrosion.

PAINT
Monsanto's chemicals are used extensively in the manufacture of high-quality paints, varnishes and lacquers.

SYTON is a Registered Trade Mark

Monsanto
chemicals for every industry

WORLD-WIDE EXPERIENCE

Nowhere on earth—and nowhere on the sea or in the air for that matter—can you be far from an S.T.C. installation! It's all in a day's work for S.T.C. to be called upon to establish telecommunication systems on a continental or intercontinental scale. Yet for all this experience in handling vast projects, S.T.C. have an unerring eye for detail too. That's why the smallest S.T.C. component is a masterpiece of manufacture . . . an object lesson in dependability. And remember, all this skill and experience are *yours* to enlist whenever there's a telecommunications problem on the agenda.

BANKS

H indicates that Share capital is half paid. O. C. and Dd indicate Ordinary. Contributory and Deferred Shares respectively. P next to the name of the company indicates that the company also has Preference Shares. Figures in 'accounts closed' column indicate the months of the calendar year in which accounts are closed. For Managing Agents refer to the Key (last page) under the numbers indicated.

ASSOCHAM PRESIDENT ASKS FOR MORE EFFICIENCY

THE maximum efficient use of existing resources is as important a factor in maintaining economic expansion as the multiplication of development projects, especially when foreign exchange for the purchase of new capacity is in such short supply. This, in effect, was the main theme of the address the Assocham President, Mr. H. M. L. Williams, delivered to the annual general meeting last Monday. It is one which seems particularly appropriate to the country's present economic circumstances, and which the Government of India is too apt to lose sight of in its largely justifiable enthusiasm for more and bigger development projects. But the current shortage of foreign exchange is going to frustrate a great deal of this enthusiasm during the next few years; why then, asks Mr. Williams, should not more attention be given to making the most of the production capacity, both private and public, which already exists? Why indeed. As any industrialist will confirm, there is a great deal that can be done to increase output from, and improve the efficiency of, existing resources. It is a business man's instinct to do this in his own province if only to ensure the maximum profits for his shareholders; where an adequate awareness of the problem is still lacking is in governing circles, because attention there is centred on other things. In his reply to the President's address, the Union Finance Minister, Mr. Morarji Desai, did not ignore the point that Government policy could be improved to encourage maximum use of present resources. But, understandably, he was unable to go beyond the policies of the Government he represents. And the unfortunate fact his speech revealed was that New Delhi remains determined to reject the bulk of all suggestions that its actions and policies may be restricting the expansion of some branches of the economy at the same time as they are directed towards developing others.

In no field is this ambivalence more obvious than that of foreign exchange. Mr. Desai may be correct in claiming that foreign exchange for development is nowadays distinct from that available for financing imports. But it has not always been so, and Mr. Williams was voicing the concern of every business man that the first call on any "untied" aid which may be received in future should be the maintenance of output from existing capacity, not the installation of new. The Government claims that this has always been the order of priority, and to prove it often points to the undeniable fact that even at the height of the crisis two years ago, no industry in the country had to close down owing to lack of imported raw materials. But the margin of safety has sometimes been a narrow one, and anyway the credit should go to India's western friends, who have provided the necessary foreign exchange when emergency has threatened, rather than to the good management of the Government of India. The only really relevant fact is that the foreign exchange cuts during the second plan period fell almost exclusively on private industry and consumption; the public sector actually increased its requirements. The fear that haunts Mr. Williams, and the business men he represents, is that this is what will happen again as soon as the third five year plan runs into serious foreign exchange difficulties. If what the Finance Minister says about the non-transferable nature of foreign aid these days turns out to be true, then so much the better. But so far the Government has shown little inclination to accept these limitations with good grace and to resist the temptation to appropriate for its own development purposes whatever untied foreign aid is made available whether private industry needs it urgently or not. It has even refused to trim all unnecessary foreign exchange expenditure, such as the sum Mr. Malaviya intends to spend to replace that offered by the private oil companies and refused for what appear to be purely political reasons.

It seemed clear from Mr. Desai's speech that the Government remains convinced of the virtues of the present high level of taxation on traditional export industries such as tea and jute goods, and of the unrealistic labour policies which burden them, by the hope that new exporting industries will soon supplant their primacy. But Mr. Williams was right in emphasising their continuing importance, and deserves full support for his claim that the restrictions on their more efficient operation be reduced. Whatever the Government may think at the present time, it is simply not going to be possible in the foreseeable future for India to increase significantly her earnings from new exports. Markets are not gained overnight. Nor are they won by the high prices and low quality which are symptomatic of India's present stage of development. Other nations have found it necessary to cheapen their goods artificially and boost quality over a considerable period in order to establish their markets, and for that kind of operation, the rupee is currently much too overvalued. Short of subsidising her new exports—which would amount to a selective devaluation and would probably attract reprisals—India has little hope of forcing her way on a large scale into existing export markets in competition with such producers as China, Japan, Hongkong, West Germany, Britain and the United States. Some intrusions there will be. But short of a general devaluation of the rupee, there seems little that India can do to expand her new exports to any significant extent. Yet devaluation would increase the present gap in the balance of payments by making imports dearer while being unable, significantly, to expand traditional exports, which still earn the bulk of India's foreign exchange, because demand for them is probably fairly inelastic. The conclusion from such an analysis is, therefore, that traditional exports should be encouraged to increase their earnings to the maximum at the current parity of the rupee, and Mr. Williams was certainly justified in urging this on the Government as a policy for the third plan period.

There are also excellent reasons for his plea that State trading in exports be confined to "nation-to-nation trading in raw material and semi-processed commodities." Even in this limited field, State exporting is unlikely to show much commercial advantage over the more conventional, but considerably more expert, export trading of the kind that exists at the moment. It is not generally known to the public what damage has already been done by State exporting, particularly, for instance, in manganese ore; if it were, the Government would have considerable difficulty in justifying its expansion on the lines apparently intended. There are no virtues in State trading as such, and as a method of raising revenue the best that can be said of it is that many alternative and less wasteful ways exist of doing the same thing. The reasons for its promotion in this country so far have little to do with economics; they are almost exclusively political, and recently have tended to be in complete defiance of previous assurances given by Government spokesmen. If the maximum use is ever to be made of the country's limited resources, there are excellent grounds for dropping State trading altogether in both exports and imports, except perhaps in the few exceptional cases where Government-monopoly trading is being met with on the other side.

The pleas Mr. Williams made for the more economic use of resources other than foreign exchange—better use of labour, more rational location of industry and development areas, more attention to power production, and railway and road expansion—also served to highlight the present anomalies of Government policy. The obsession with large, politically-inspired and publicly financed projects has been to the detriment of, among other things, the so-called "infra-structure" of the economy. Now, if the best use is to be made of existing capacity, efforts will have to be made to bring these less glamorous supporting items into line. A fast road or a new railway line may not have the propaganda advantages of a steel plant, but their contribution to the national income may be nearly as large, and when lack of foreign exchange makes it necessary to postpone construction of the steel plant anyway, the interlude can best be put to use by building up the indispensable supporting capacity. One after another during the past two years, business men have expressed the fear that when the large development projects are complete and operating, insufficient markets will exist for their products. The Government has usually denied this with more force than conviction, but public opinion would be more impressed if steps were taken under the third plan to expand the secondary group of industries, which usually means medium ones in the private sector. Despite its occasional enthusiasm for auxiliary industries as feeders of the larger ones, the Government has so far taken far too little interest in this group and has never hesitated under the second plan to divert what foreign exchange might be available for expansion into its own large-scale projects.

It is probably in this field of encouraging medium industries in the private sector that the greatest scope for the improvement of Government policy to encourage maximum efficiency lies. As Mr. Williams pointed out, in so many different ways—through the restrictive provisions of the Company Law, the burden of corporate and individual taxation, labour legislation, and so on—current policy and the operation of the bureaucracy are hampering this sector probably more than any other. A good deal of the reason for this is suspected to be simply official prejudice, and Mr. Desai's words offered little hope that the Government is beginning to understand the damage it is doing. But certainly, as Mr. Williams implied, reforms and relaxations are now long overdue, and especially if maximum use is to be made during the third plan period of existing resources and capacity.

The same cramping effects of current Government policy are hampering the flow of private foreign capital to India, if only because most of the enterprises sponsored by foreign interests tend to be located in this secondary sector. From what Mr. Desai said, it is fairly clear that most of the points made about India's disadvantages in attracting foreign capital in competition with other indigent nations continue to make no impression whatever on the Government. Whether or not they have on the Finance Minister personally is, of course, another matter. But facts remain even if somebody chooses to ignore them, and the obvious consequences in this particular case are that India is not going to get the maximum possible supply of foreign exchange from an increasingly important source. A point worth making here is that unless foreign investors these days are actively attracted, they are likely to dwell too heavily on the experience of recent years in such countries as Indonesia, Egypt and Cuba. India's record has so far been exemplary, and successive Government spokesmen affirm that it will continue to be so. But each of these countries, especially the last two named, have behaved in an equally exemplary fashion in their time, only to change when revolutionary governments have taken over. A foreign investor is likely in future to need a good deal of encouragement to overcome the fear that India might not some day go the same way. Unlikely as such a contingency appears from here, it must always be remembered that a foreign businessman is apt to look at things from a different angle. And if he is to be induced on an increasing scale to take the risks which he may honestly believe exist in the Indian situation, he is going to need much more active encouragement on the lines suggested by Mr. Williams.

The theme of this year's Presidential address will, therefore, be recognised as a very useful one indeed, and certainly deserving of the Government's most careful attention. There is no doubt at this stage that the first problem of the third five year plan is going to be the shortage of foreign exchange: it follows logically then that if the tempo of economic growth is not to falter, every

possibility of the country's existing plant, equipment and resources will have to be exploited to the full. Whether or not that takes place depends to a considerable extent on Government policy; public spirit apart, the business man can generally be relied upon to play his part in maximising efficiency by the normal and healthy stimulus of the profit motive.

ARBITRARY ABOUT PREFERENCES

BOTH houses of Parliament have passed the Preference Shares (Regulation of Dividends) Bill, increasing the stipulated tax-free dividends on preference shares by 30 percent and the taxable dividends by 11 percent. The Bill originally proposed raising the dividends by 25 percent and 7 percent, respectively. The bigger increases now stipulated are no doubt welcome. But whether the Bill will remove the anomalies which have been introduced by the Finance Acts of 1959 and 1960, is a different matter. The Acts have complicated the system of paying preference dividends. The "grossing" privilege was abolished by the Finance Act of 1959 when it ended the legal fiction under which the tax paid by a company on the portion of the profit constituting the dividends was deemed as having been paid by its shareholders. The abolition of the "grossing" privilege meant that shareholders were not only deprived of the advantage of getting a tax credit for the tax paid by the company; the payment of preference dividends also became more complicated because it was stipulated that a prior tax deduction would have to be made from the dividends at source. The latter tax is in the nature of an advance payment by shareholders on their dividend incomes, so they are entitled to obtain a tax credit to the extent of the tax deducted from the dividend at source. This tax would have to be paid by shareholders in any case, because dividend incomes are included in their total incomes. The present system of asking shareholders to pay the tax in advance is thus of no great significance in assessing the merits of the Bill.

When the new system of corporate taxation was introduced, companies were confused. They could not sort out what was the appropriate way in which preference dividends should be paid. As a result, different companies adopted different practices, according to their interpretation of the law. In order to avoid legal difficulties, many of them decided to pay substantially smaller preference dividends than before. Later, the Central Finance Minister clarified his intentions. He claimed that the tax burden on companies had been reduced by removing the wealth tax and the excess dividends tax and by cutting the corporate tax from 51.5 percent to 45 percent. The benefits of the reduction, he said, should be passed on to ordinary as well as preference shareholders. The intention was fine. But it was not easy to implement in practice. Nobody denied that bigger dividends should be paid in order to compensate shareholders for the loss of the "grossing" privilege. Companies were free to pay the ordinary shareholders more. But there were legal complications in paying more to preference shareholders. In the case of the latter, many thought that an amendment of the articles of association of the company would be necessary; this could not be done except with the approval of 75 percent of each class of shareholders. Such a majority would have been extremely difficult to get.

Under the new Bill, preference dividends are to be increased according to the recommendations of a select committee of Parliament. But even with this increase, not all preference shareholders will get as much as they used to before. For example, on a preference share of Rs. 100, carrying a tax-free dividend of 10 percent, a shareholder will now receive a gross dividend of Rs. 13 a share; he used to get a gross dividend of Rs. 14.60 before. In the case of a 10 percent taxable preference share of Rs. 100, the gross dividend will now be Rs. 8.88, after deducting the company income tax of 20 percent from the increased dividend of Rs. 11.10. Under the former system, the gross dividend was Rs. 10. Both tax-free and taxable preference shareholders will thus still be worse off than before. The net dividend payments actually received by shareholders will also be less. After deducting the prior tax from the dividend at source, the tax-free preference shareholder will receive a net payment of Rs. 9.10 instead of Rs. 10. The taxable preference shareholder will get a net payment of Rs. 6.22, against Rs. 6.85 before. Some say that the prior tax deduction at source should not worry the shareholder. But, as others have pointed out, the fact is that many shareholders are concerned mainly with the net payment they actually receive. They often do not want to suffer the bother of obtaining tax refunds. For them, the attractions of preference shares have been whittled down to this extent.

The smaller dividend apart, it is difficult to find any logical reasoning underlying the basis on which preference dividends are to be increased. The Bill itself does not indicate what the reasoning is. It is, of course, argued generally that the dividends should be increased in order to compensate shareholders for the loss of the "grossing" privilege. It is also said that the compensation cannot be full, since the company income tax has been reduced and so the value of the former "grossing" privilege would have been less. The argument has some theoretical validity. But, at the same time, it should be pointed out that if the purpose of the increase in dividends is to compensate shareholders for the loss of the "grossing" privilege, the uncertainty concerning these dividends will continue. In other words, future changes in the rate of company income tax may automatically imply corresponding changes in the size of the preference dividends. In that case, the steady returns which preference shares are supposed to give may not be quite so steady.

With the new Bill, fresh uncertainties are likely to arise for many companies which have already increased the stipulated tax-free dividends in order to compensate their shareholders. Some of them have done so by amending their articles of association; others had proposed to do the same. It is not clear whether these companies will be forced to pay dividends according to the new law, or whether they can go on paying dividends according to the increased rates they have already adopted. If they have to pay the dividends according to the new law, shareholders may complain. This is because some of these companies have raised their preference dividends in such a way that shareholders receive the same net payment as before, after deducting the prior tax from the dividends at source. Companies which have increased the dividends in this manner cannot be blamed; because of the legal subtleties, nobody could say definitely whether or not a tax-free dividend meant that a company would also have to pay the prior tax deduction from its own resources. In any case, when companies issued tax-free preference shares before the Finance Act of 1959 came up, investors bought the shares on the tacit understanding that they would get a fixed net amount, free of all taxes. The point is relevant because the Bill intends to regulate dividends on preference shares which were issued up to 1st April, 1960. In the case of preference shares which have been issued since that date, there is no need for special legislative safeguards, because the shares have been bought in full knowledge of the implications of the Finance Acts.

In sum, the increase in preference dividends proposed by the Bill will partly mitigate the injustice done to preference shareholders. But the whole problem of preference dividends may still not be solved in a satisfactory and permanent way. As things stand, it is difficult to see how the complexities introduced by fiscal changes can be removed by legislation. Perhaps it is not even fair that the payment of preference dividends should be regulated by law. After all, what dividends a company should pay is something which should be decided between the company and its shareholders. The payment of preference dividends depends basically on the contract between them. It might thus have been better if the size of the preference dividends had been left to the discretion of the companies concerned. To facilitate increases, the law could have been amended in order to make it easier to change the articles of association for the express purpose of raising preference dividends.

TESTING-TIME FOR STERLING

IT was said in the middle of 1960 that all the world's financial centres were confident of sterling, except London. Before the year-end London's scepticism penetrated into other centres. The weakening of the pound against the dollar could not be explained simply as a strengthening of the dollar, for quotations for the pound in terms of most European currencies were declining similarly. Nor could the lowering of the London Bank rate, in October and again in December, account fully for the adverse trend, for the reductions to 5 percent left London's rate still comparatively high. Changes in money rates are certainly important, in so far as they stimulate or moderate or stabilise the flow of funds. These funds are not specially significant in themselves. If the net return on foreign funds invested or deposited in London, allowing for the cost of covering the exchange risk, is higher than the corresponding return elsewhere, funds will naturally flow to London, and, if the exchange risk is covered, their presence there will not necessarily imply confidence in sterling. The funds are an important factor in the present situation because they can flow out again in response to changes in relative money rates or if confidence in the currency deteriorates, and also because they have until recently concealed the underlying trend of sterling and are no longer capable of doing so.

In normal years the U.K. needs a credit balance of payments of some hundreds of millions of pounds on current account to offset a debit balance of payments on capital account and to continue the slow process of building the reserve. Financial opinion was disturbed when the current account for the fourth quarter of 1959 showed a deficit of £20 million. The first quarter of 1960, seasonally a more favourable period, yielded a surplus of £44 million, followed by a deficit of £9 million in the second quarter. The figures for the third quarter, published in December, show an alarmingly large deficit of £101 million, compared with a surplus of £4 million in the same quarter of 1959. If the position has deteriorated in the fourth quarter of 1960 as it did in the fourth quarter of 1959, the current account for the year will show not a surplus of some hundreds of millions but a deficit of approximately £100 million. In any normal year such figures would cause a crisis in the currency, but such a result has been averted by an abnormal surplus on capital account. Seasonally favourable conditions in the first quarter of 1961 can further delay a crisis, and this seasonal factor would normally continue into the second quarter. The important question is whether the underlying position can be strengthened in the next few months enough to avert a crisis about the middle of 1961.

It may be assumed that the authorities will try to retain the short-term foreign funds throughout this difficult period—which implies that their contribution to any further downward trend in world money rates will be very cautious. It may be assumed also that any measures deemed to be needed to strengthen the nation's external account will be resolutely applied. But it would be unwise to forget that the authorities imposed such restraints as they thought were necessary in 1960 and that the external account deteriorated rapidly nonetheless. Statistically, the deterioration resulted from a much wider gap between imports and exports, which invisible earnings could not fill, and that wider gap resulted from a big increase in imports with no corresponding increase in exports. Most observers believed that the increase in imports was temporary—attributable largely to stock-building—and that a more normal relation between the two sides of the visible account would be established spontaneously; but there are reasons to believe now that imports, mainly free from quota-restrictions, have expanded permanently. Even so, they may fall naturally some way below the peaks of 1960. Whether exports will rise naturally from the unsatisfactory levels of 1960 is more questionable; and it is by no means clear what policy could raise them artificially.

Unfortunately, the other countries of the sterling area are mostly experiencing similar troubles. As the proceeds of their exports are not enough to pay for all their imports, they have drawn on their sterling reserves in London. That action would not strain the currency or reduce the gold reserve if the withdrawn funds were all spent in the sterling area, but in fact substantial deficits with non-sterling countries have developed. The potential pressure on sterling and the reserve in 1961 is certainly severe, but the general feeling in London is that the worst will not happen. It is hoped that the Treasury will show itself prepared to make full use of the available drawing rights on the International Monetary Fund if the short-term funds are withdrawn more rapidly than is at present envisaged, for such a demonstration would help to restore confidence. The reserve, though not adequate for all contingencies, can safely react to the outflow of funds in reasonable quantities, just as it reacted to the inflow.

To tighten restrictions merely because the reserves were declining would be a dangerously negative policy, when the forces of recession in the world are already strong. But it must be recognised that the recent weakening of sterling is attributable in some measure to the Americans' restrictive measures to defend the dollar, and that when this restrictive process is started it cannot easily be stopped at any point other than that where it was started. It is not too soon to consider the problem that strengthening one currency means weakening another. The dollar and the pound are international currencies, and a struggle between them, each trying to maintain or to regain its "rightful" position, would not help to stabilise the world's finances.

Current News and Comment

Indian Iron Cautious

The downward drift in Indian Iron shares during the past week or so largely reflects the cautious assessment of the outlook which has been made by Sir Biren Mookerjee, chairman, in his statement at the annual general meeting of the Company in Calcutta last Thursday. (The text of the statement is printed on a later page.) The working of the Company has been hampered by inadequate supplies of the proper quality of coal. It is unfortunate that no great improvement in this sphere can be expected in the near future. The Government's policy for raising the production of high-grade coal is becoming more realistic. But no substantial increase in output is likely for quite a long time because the development of collieries and the installation of coal washeries will take time. Under the circumstances, it may not be possible to work the Indian Iron plant up to its newly-extended capacity because of the shortage of the right types of coal. If working is hampered in this manner, unit costs will increase.

In any case, the profit outlook is likely to be governed to a large extent by the new retention prices which will be fixed for the period from 1st April, 1960. It is hoped that, in fixing the retention prices, the difficulties of the industry will be considered, and steel producers will be compensated for increases in costs resulting from circumstances which are outside their control. An important factor to consider here is the settling of periodic claims for escalation of the retention prices. Hitherto, these claims have usually been settled after inordinate delays. The delays have prevented the steel companies from publishing their annual accounts in time. The Government should be prompt and business-like in settling claims.

Sir Biren said that concern has been felt about the shortage of limestone required by the iron and steel industry in general. Indian Iron is in a fortunate position, because it long ago ensured supplies for itself by making suitable arrangements. Unless the arrangements are disturbed, it will not have to face any difficulty. It is only fair that the Company should be permitted to enjoy the benefits of its foresight in arranging limestone supplies. An important point for investors to note is that the management and workers of Indian Iron have negotiated a settlement concerning the profit-sharing bonus for a period of four years beginning from the year 1959-60. It is hoped that labour troubles will decrease as a result.

Madras Rubber Offer Soon

Fuller details are now available about the Madras Rubber Factory Ltd which has been converted from a private company into a public one for undertaking the manufacture of Mansfield tyres and tubes in collaboration with the Mansfield Tire and Rubber Company of the U.S.A. The annual production at present proposed by the Company is 204,000 tyres and an equal number of tubes for heavy lorries and buses, and 96,000 tyres and tubes for motor-cars and motor-cycles. In addition, the Company will produce 10 million lbs of camelback and tread rubber. The foreign collaborator will provide the know-how and ensure that the quality of the tyres is up to international standards. It has also permitted the Madras Rubber Factory to export to all world markets, except the United States and Canada, tyres having the "Mansfield" trade mark and name.

The project is estimated to cost Rs. 2.20 crores. The U.S. Export-Import Bank has sanctioned a long-term loan of $2.5 million (roughly Rs. 1.20 crores). The balance of Rs. 1 crore is to be raised from the market through the issue of 1 million equity shares. The authorised capital of the Company is Rs. 4 crores, made up of 3 million equity shares and 1 million 6½ percent, tax-free, cumulative preference shares, both of Rs. 10 each Out of this, 250,000 equity shares have already been issued and paid up. The present issue is for Rs. 1 crore. Of this, the U.S. firm is taking up shares worth Rs. 25 lakhs against payment for machinery to be purchased from America. Shares of the value of Rs. 12.5 lakhs have been allotted to the promoters, directors, managing agents and their friends. Brokers and underwriters have agreed to take up shares worth Rs. 12.5 lakhs. The balance of 500,000 shares is now being offered to the public. Lists for public subscription will open in the third week of January.

Raneegunge Coal Expanding

The Raneegunge Coal Association Ltd proposes to increase its authorised capital from Rs. 24 lakhs to Rs. 1 crore by creating 510,000 ordinary shares of Rs. 10 each and 25,000 preference shares of Rs. 100 each. The idea is to raise further capital for financing the expansion in activities. During the year ended March 1960, the development of all sections has made satisfactory progress. The decline from 459,649 tons to 439,978 tons in raisings was due to flooding in some areas. But the working during the current year, it is believed, has improved. Despatches fell from 506,436 tons to 437,168 tons.

The Company's profit has declined from Rs. 15.38 lakhs to Rs. 10.21 lakhs, after providing Rs. 5.02 lakhs (against Rs. 4.80 lakhs) for depreciation. A taxable ordinary dividend of 15 percent has been declared. This offers a yield of 9.3 percent at the price of Rs 16.12 a share and is covered more than twice. The ordinary dividend was 10 percent, tax-free, in the previous year. Taxation is allocated Rs. 4.80 lakhs (against Rs. 9 lakhs), machinery replacement and development reserve Rs. 90,000 (against Rs. 2.90 lakhs) and development rebate reserve Rs. 1.22 lakhs (against Rs. 1.06 lakhs). The carry-forward is Rs. 8,663, compared with Rs. 5,488 brought in. B. N. Elias and Co. Private Ltd resigned as managing agent after 15th August, 1960. Now it is proposed to appoint Orient Investment Private Ltd as managing agent for a period of ten years with effect from 1st January, 1961.

Sone Valley Cement Disappoints

The Sone Valley Portland Cement Co. Ltd has produced disappointing results for the year ended December 1959. The profit has declined from from Rs. 5.87 lakhs to Rs. 34,336, after providing Rs. 59,167 (against Rs. 5.19 lakhs) for depreciation. The depreciation provision is inadequate as earnings have been poor. The dividend has been passed over. The carry-forward is Rs. 62,049, compared with Rs. 27,712 brought in. The output of cement declined from 206,380 tons in 1958 to 167,425 tons in 1959, but has amounted to 167,560 during the ten months ended October 1960. Measures have been taken to modernise the equipment and increase the installed capacity. It is proposed to raise the authorised capital from Rs. 75 lakhs to Rs. 2 crores by creating 2,500,000 new shares of Rs. 5 each. The scrip have recently been listed in the Bombay stock market. Referring to the unsatisfactory working, the directors say that the price of cement does not cover the increased production costs. But they hope that the present enquiry by the Tariff Commission will persuade the Government to fix prices at a more realistic level.

A. C. C. Profit Rises

The working results of the Associated Cement Companies for the year ended July 1960 show a net profit of Rs. 1.45 crores, against Rs. 1.29 crores in the previous year. This is after providing Rs. 2.39 crores for depreciation (against Rs. 2.12 crores), Rs. 70.03 lakhs for development rebate reserve (against Rs. 74.15 lakhs) and Rs. 1.10 crores for taxation (against Rs. 1 crore). With Rs. 92,495 brought in and Rs 84.5 lakhs drawn from general reserve, the amount available for appropriation is Rs. 2.31 crores. From this, the directors have provided Rs. 1.77 lakhs for amortisation reserve. The dividend of Rs. 12 a share, subject to deduction of tax, absorbs Rs. 2.29 crores, leaving Rs. 42,021 to be carried forward. Sales of cement, coal, firebricks and machinery at Rs. 27.08 crores are Rs. 1.53 crores higher than in the previous year. Closing stocks have declined from Rs. 1.29 crores to Rs. 1.17 crores.

It is stated that while there has been some improvement in the gross profit and in the net profit after tax, the results are not encouraging. This is because, in spite of technical improvements which have increased efficiency and production, costs have risen steadily. The inflationary rise in prices, enhanced railway freight, increase in power costs, higher incidence of wages and dearness allowances and the increasing burden of depreciation on account of the much higher cost of expansion and rehabilitation have been the main contributory factors. The Wage Board's recommendations have not been fully neutralised, since instead of computing costs on actual production, the rated capacity has been taken as the base. In spite of steadily rising costs for over two years, the Government has referred the whole question of cement prices to the Tariff Commission. This means that the industry will have to bear not only the entire rise in costs which has occurred since January 1958, but also the further rise which will occur until 1st July, 1961, when a new retention price is likely to come into effect.

Production, although somewhat higher than in the previous year, suffered for a variety of reasons. The cut in output due to the lack of workable orders in the early months of the year, breakdown of crushing machinery at one factory, coal shortage and the inadequacy of railway transport (both for carrying raw materials inwards and the movement of cement outwards), were the main contributory causes. So neither production nor despatches could attain the level of installed capacity. In Pakistan, there was a slight setback on account of labour scarcity and the shortage of railway wagons. However, the Company's expansion and modernisation schemes are making satisfactory progress. Extension of the Shahabad works, raising its capacity from 400,000 tons to 565,000 tons a year, was completed in June 1960. But the full benefit of the extended capacity is not likely to be obtained for some time as the Mysore State Electricity Board is reported to be unable to meet the requirements of additional power as yet. The second phase of the extension to the Kymore works, raising the capacity from 360,000 tons to 573,000 tons, has now been completed. The flotation plant installed in Chaibasa for the beneficiation of limestone was commissioned in July 1960. The coal washery plant at the Nowrdozabad colli-

ery was put into operation in February 1960. Work on the slag cement project in Chaibasa and the slag granulation plant in Jamshedpur has been almost completed. Regular production of slag cement, which will raise the annual capacity of the factory from 310,000 tons to 480,000 tons, is expected to commence by about the middle of 1961. Work has been started on the extension of the Katni factory for the manufacture of refractories. Its capacity is to be increased from 17,640 tons to 30,000 tons.

The Company has taken up 99,600 equity shares of Rs. 100 each in A.C.C.-Vickers-Babcock Ltd, against payment in cash. The construction of the factory in Durgapur is proceeding satisfactorily. The directors say that the Company has not availed itself of the Government's sanction to the issue of bonus shares in view of the heavy tax it attracts. It is interesting to note that the percentage of net profit to sales realisations, which worked out to around 12.5 in 1955-56, was only slightly higher than 5 in 1959-60. The net worth of the Company at the end of July 1960 comes to Rs. 29.86 crores. At the current price of Rs. 149, the ordinary shares offer a net yield of about 5.6 percent.

Indian Steel and Wire Strong

There has been an improvement in the working of Indian Steel and Wire Products Ltd during the year ended March 1960. Sales have increased from Rs. 4.15 crores to Rs. 5.48 crores. The profit is Rs. 3.09 lakhs higher at Rs. 81.73 lakhs, after transferring Rs. 7.95 lakhs (against Rs. 8.47 lakhs) to depreciation. Profits have not increased in proportion to sales because production costs have risen. A taxable ordinary dividend of 23 percent has been declared. It is covered more than three-and-a-half times and offers a yield of 9.9 percent at a price of Rs. 23.33 share. The ordinary dividend was 16¼ percent, tax-free, in the previous year. Development rebate is allocated Rs. 1.15 lakhs (against Rs. 1.40 lakhs) and taxation Rs. 41 lakhs (against Rs. 44.45 lakhs). The carry-forward is Rs. 10,91,465, compared with Rs. 12,96,128 brought in.

The balance-sheet figures are impressive. Reserves and surpluses are more than Rs. 2.63 crores, against an ordinary share capital of Rs. 96.80 lakhs. Investments total more than Rs. 58.72 lakhs. Investments in I.R.C. Weldmesh Private Ltd and Containers and Closures Ltd have proved remunerative as the two Companies have declared satisfactory dividends. The Metal Corporation of India Ltd, in which Indian Steel and Wire Products has big interest, is making progress, and is expected to earn good profits in the near future. Current assets amount to Rs. 1.26 crores and fixed assets are more than Rs. 70.31 lakhs. The equipment for the new wire rod mill is expected soon and the unit is likely to begin production in 1961.

Loss for East Indian Coal

The shares of the East Indian Coal Co. Ltd have been in demand around Rs. 32 in the Calcutta stock market for two main reasons. Firstly, it is believed that high-grade coal producers will be given fresh incentives in order to increase output. Secondly, the working of the Company has improved recently and the expansion scheme is making progress. The unsatisfactory results for the year ended April 1960, which have just been published, have not, therefore, been given much attention by investors. A loss of £945 has been incurred, after providing £17,949 for depreciation and £2,251 for taxation on investment income. Transferring £20,000 from dividend equalisation reserve, a taxable ordinary dividend of 7½ percent has been declared, absorbing £18,000. It offers a yield of 3.1 percent at the price of Rs. 32 a share. The ordinary dividend was 9¾ percent, taxable, in the previous year. The carry-forward is £7,006, compared with £9,562 brought in. Raisings increased from 574,849 tons to 583,111 tons, but despatches declined from 591,599 tons to 519,824 tons due to the shortage of wagons. The transport situation has improved considerably in recent months and it is expected that the Company's production may be more than 758,000 tons during the current year. With the increase in output, unit production costs should decline.

As for development schemes, a ropeway is being built at the Bararee colliery. The installation will be financed by borrowing from banks, but later it is proposed to fund the debt by issuing debentures. An application for the purpose is likely to be made soon to the Controller of Capital Issues. The directors state that the Government of India has given notice of its intention to prospect the area comprising the Company's Sutikdih colliery, which has not been worked since 1928 but which contains large reserves of Selected grade coal. It was the Company's intention to reopen Sutikdih after completing the reorganisation and expansion programmes at the Bararee and South Bulliari collieries. So a suit has been filed in the Supreme Court to restrain the Government from taking any action under the notification received by East Indian Coal. Referring to the statutory price of coal, the directors say that it is unremunerative at present in view of the increase in production costs. They hope that a Company like East Indian Coal, which is undertaking big development projects in order to increase the production of Selected grade coal, will be allowed a higher selling price so that the capital expenditure can be amortised in a reasonable number of years.

Ganges Jute Modernising

The spinning section of the Ganges Manufacturing Co. Ltd, a Calcutta jute concern, has been modernised to a great extent and the entire programme is likely to be completed soon. As soon as the modernisation scheme is completed, it is proposed to shut down the No. 2 mill and concentrate production on the No. 1 mill. Arrangements have been completed for a loan from the National Industrial Development Corporation for financing the modernisation. Satisfactory results have been achieved during the year ended March 1960. The profit has increased from Rs. 4.92 lakhs to Rs. 24.90 lakhs, after providing Rs. 3.68 lakhs (against Rs. 3.97 lakhs) for depreciation. A taxable ordinary dividend of 10 percent has been declared after a long interval. In fact, this is the highest dividend in the past 30 years or so. It offers a yield of 9.3 percent at the price of Rs. 10.75 a share and is covered slightly less than three times. Development rebate reserve is allocated Rs. 16.898 and general reserve Rs. 5 lakhs. The carry-forward is Rs. 56,359, against a debit balance of Rs. 8,77,459 brought in. The arrears of preference dividends have also been paid.

Madras Aluminium Plant

The Madras Aluminium Company will set up its plant in Mettur. Work is expected to start in March 1961, and in 1962 the Company will undertake the reduction of bauxite to alumina, leading to full production in 1963. Montecatini of Italy is designing the plant. The machinery will be ordered soon from that country. The technical aid and the erection charges, it is reported, will be met by the issue of shares worth Rs. 1.2 crores to Montecatini. The latter will be represented on the board. The project will provide employment opportunities for about 7,000 people in Salem district. Surplus alumina will be shipped to Italy after 1962 for the use of Montecatini under an arrangement already concluded. The deferred payment agreement will remain effective up to 1974, and it is to be met in lire. The Industrial Finance Corporation will acquire shares worth Rs. 1.2 crores and the Madras Financial Corporation will take shares worth Rs 1.5 crores. The directors and the investing public will have to provide Rs. 2.1 crores. The project is eventually expected to produce 20,000 tons of aluminium a year, but this will not entail any extra outlay in the future. Mr. R. Venkataswami Naidu, chairman, has said that the bauxite resources in the Shevaroy hills (about 60 miles from Mettur) are the best in India.

Carbide from Travancore Electro-Chemical

Travancore Electro-Chemical Industries Ltd is ready to go ahead with its plans for manufacturing calcium carbide on a commercial scale. The results obtained from the working of the pilot plant have been encouraging. During its development stage, the Company has been able to produce calcium carbide of a quality which fully meets the requirements of the British Standard Specifications. It now proposes to set up a plant with an annual capacity of 10,000 tons of calcium carbide. The licence for importing machinery has been obtained from the Central Government, and the Company has secured the collaboration of Messrs Deutscher Innen-Und Aussenhandel Invest Export of East Germany for the supply of a complete carbide plant and of technical know-how. No foreign exchange expenditure is involved because the payment for plant, machinery and technical know-how is to be made in rupees.

The entire project is estimated to cost Rs. 40 lakhs, of which Rs. 20 lakhs will be spent on plant and machinery and another Rs. 12.5 lakhs on land, buildings and on erecting the plant. A sum of Rs. 7 lakhs will be needed as working capital. The Kerala Government is taking keen interest in the project; it has already invested Rs. 5 lakhs in 5,000 equity shares of Rs. 100 each. Suppliers of machinery have agreed to give the Company a credit of Rs. 13.5 lakhs at a nominal rate of interest of 3 percent to be repaid in ten equal six-monthly instalments. About Rs. 11.5 lakhs are to be raised from banks and other financial institutions. The balance of Rs. 10 lakhs is to be raised from the market through the issue of 10,000 equity shares of Rs. 100 each. The Company is expected to enter the market for public subscription in the first week of January.

Tractors and Farm Equipment Project

Tractors and Farm Equipment (Private) Ltd is the name of a new Company which has been formed in south India to undertake the manufacture of tractors and farm equipment. It is a joint venture: Simpson and Company, Madras, which has sponsored the project, will hold 51 percent of the shares, and Massey Ferguson and Company, which has been operating from Bangalore for eight years, will provide the remaining 49 percent. The Company's authorised capital will be Rs. 2 crores. The factory will be located in Sembium near Perambur at the Simpson industrial estate, and it is expected to be completed in one year. Meanwhile, temporary arrangements are being made for assembling imported equipment in Sembium. The licensed capacity of the factory will be 7,000 tractors a year on a double-shift basis. India's total tractor requirements are estimated at 12,000 a year. The factory will manufacture two types of tractors—Massey Ferguson 35 and Massey Ferguson 65, costing Rs. 11,000 and Rs. 16,000, respectively, exclusive of import duty. The promoters claim that the tractors will be 20 percent or 30 percent cheaper than the imported ones. To begin with, only 50 percent of the components will be made locally, but after two years, the indigenous content is likely to increase to about 85 percent. The tractors will be operated by diesel oil engines.

Himalayan Refractories Plant

Himalayan Tiles and Marbles Private Ltd of Bombay, which is engaged in the manufacture of pipes, poles, flooring terazzo tiles, hollow blocks, etcetera, proposes to set up a plant for making basic refractories and fireclay bricks in Bokaro, Bihar, where a new steel plant is to be set up by the Central Government. The Company has secured a licence for manufacturing 24,000 tons of basic refractories and 6,000 tons of fireclay bricks a year. It is now negotiating with foreign firms for financial and technical collaboration for the new enterprise. The project is to be operated by a new Company called Himalayan Refractories Ltd which will have an authorised capital of Rs. 1 crore. Himalayan Tiles will act as managing agent of the new Company. The proposed plant, when ready, will result in a considerable saving of foreign exchange. Raw materials such as magnesite, chromite and fireclay are available in plenty in India.

Premiums on New Issues

The craze for buying shares of new companies, which lasted until about the end of July, has given place to a feeling of despondency. Not long ago, even application forms had to be "rationed" at times; now it is difficult to dispose of some of the newly acquired shares. Synthetics and Chemicals, which once commanded a fantastic premium of Rs. 225, could be bought last week at a premium of only Rs. 42. Jayant Paper go abegging at par; a few months ago, they were wanted at a premium of Rs. 75. The Rs 100-paid Baroda Rayon can be had at Rs. 115. The premiums on Citric India, Hindustan Twyford, Isaac Holdens and Bharat Bijlee have shrunk to modest figures which cannot make good the loss of interest on the application money. The steep decline in premiums underlines the highly speculative nature of the recent boom in the stock markets. The setback is welcome if it can restore a proper sense of perspective among investors.

Oilseeds Prices Rise

Oilseeds prices in Bombay hit new highs for the current season last week. Groundnut February contract was bid up to Rs. 214.12 a 250 kilos and castor May to Rs. 182.50 a 250 kilos. Linseed May touched a new high of Rs. 35 a 50 kilos. Prices have continued to rise in spite of official warnings, but this is not surprising. The Government wants to increase exports of groundnut and groundnut oil when there is hardly any exportable surplus even though this season's crop is considered to be a little better than last year's. The market could not react bearishly to the announcement of an export quota of 20,000 tons of groundnut H.P.S. and the linking of groundnut oil exports with imports of certain spices. The continued strength in castorseed is attributable mainly to the record castor oil exports this year. Not until about the end of January will the market need to think seriously about new crop arrivals. Linseed has recorded an impressive rise recently, because linseed oil is one of the cheapest edible oils and can be profitably mixed with rapeseed oil.

The Forward Markets Commission finds no justification for the rise in oilseeds prices. But it has only itself to blame if it cannot assess the demand and supply correctly. It is apparently determined to use the vast powers it commands to discourage bull speculation. The bye-laws of the associations recognised for groundnut, groundnut oil, rapeseed and mustardseed trading have been amended so as to provide powers for the governing bodies of the associations and the Forward Markets Commission to take the following steps when they consider it expedient to do so: (1) to fix limits on the volume of trading and on the total open position controlled by members; (2) to withhold outward payment of clearing dues to members for a specified period; and (3) to make the maximum or the minimum price, when fixed, applicable to the rate for settlement of contracts on the due date.

Meanwhile, margins have been tightened appreciably. A trader has to pay margin at the rate of Rs. 100 a 250 kilos on his forward purchases when the closing rate is Rs. 212 or higher, whereas banks charge only a 40 percent margin on advances against groundnuts. Having failed to check the rising trend in prices through margins, the Commission has persuaded the board of the Oilseeds Exchange to fix a ceiling of Rs. 220. Business in futures will automatically stop when this rate is reached, although it is already very limited because of the stiff margin. But the Commission is not worried about the price of ready groundnuts. Last year, groundnuts were marked up to around Rs. 250 a candy while there was a ceiling of Rs. 225 for futures, although it is the price of ready groundnuts which really matters. Castorseed, the price of which should cause no concern at all unless it adversely affects exports, has also been brought under a stiffer margin. Bulls will now have to pay a margin at the rate of Rs. 20 a 250 kilos when the closing price is Rs. 177 or higher and the margin will be Rs. 40 when the price rises above Rs. 187. Castor futures reacted sharply from Rs. 182.37 to Rs. 177.50 last Saturday following the announcement about the margin at Rs. 177.

NOTICE

There will be no issue of CAPITAL on 29th December, 1960, as the markets will be closed for the Christmas holidays. The first issue of the New Year will be published on Thursday, 5th January, 1961.

Rayon Exports Fall

Exports of rayon fabrics from India in November realised only Rs. 9.27 lakhs—the lowest figure since August 1959, when exports hit a low of Rs. 7.5 lakhs due to the suspension of the incentive scheme. Shipments in October were valued at Rs. 22.79 lakhs and those for September at Rs. 32.57 lakhs. Little comfort can be derived from the fact that exports in the January-November 1960 period, at Rs. 340.6 lakhs, do not compare unfavourably with the January-November 1959 figure of Rs. 340.9 lakhs. October and November are regarded as the most favourable months for the export of rayon fabrics, presumably on account of Christmas buying. Last year these two months accounted for Rs. 54.40 lakhs worth of goods. Exports in October-November 1958 made a staggering total of Rs. 382.5 lakhs, but that was attributable mainly to the abuse of the incentive scheme which compelled the authorities to suspend the scheme for some time and to modify it later. Enquiries from the trade indicate that the marked decline in exports in the past two months, particularly in November, is due mainly to the introduction of the new scheme for quality control of exports. Considerable quantities of rayon fabrics cannot qualify for export because they do not conform to the new standards and specifications. Apparently, the industry is not yet able to adjust its production to the higher standards set for exports. Exporters say that the quality control scheme should be suitably modified in the light of what the industry can produce with its present equipment; otherwise, exports will suffer badly.

Worries of Oilseeds Crushers

The standing complaint of the organised oilseeds crushing industry that it is being discriminated against was recently refuted by the Central Minister for Commerce and Industry, Mr. Lal Bahadur Shastri, at the annual session of the oil Technologists Association of India in Kanpur. He said that instead of talking about unfair competition from *ghanis* and hand-presses the organised industry should show better results. Exports of oil, oilseeds and oilcakes in 1959 had been worth Rs. 39 crores. There had been an increase in domestic production from 6.1 million tons in 1957-58 to 7 million tons in 1958-59. A 32-percent increase in production has been provided for in the third plan, but this may not be achieved by merely sending circulars to the Chief Ministers of States, as Mr. Shastri has done. In U.P., which is responsible for about one-sixth of the total oilseeds output of India, the mills crush only about 250,000 tons, against the State's total production of 1 million tons. The installed capacity of the mills is 800,000 tons. The main reason for the full installed capacity not being used is that the industry expanded haphazardly when mustard oil was in great demand in consuming areas like Bengal, Bihar, Orissa and Assam during the second World War. Kanpur, Agra, Aligarh and Hathras are the chief oil-producing centres in the State, mustard oil and rapeseed oil accounting for the major share of edible oils.

If the oilseeds crushing industry is to be put on its feet again, the emphasis on mustard oil production must cease and diversification of production established. Mr. Shastri referred to the soap industry, but here the problem is one of increasing consumption through the reduction of prices. One way this could be done is through the recovery of the by-product glycerine. As for cottonseed, Mr. Shastri said that the Government has set up an *ad hoc* committee for developing the cottonseed oil industry. The services of a Technical Co-operation mission expert have also been offered to cottonseed crushers. But the Minister exhorted Indian oil technologists not to imitate American methods wholesale like replacing the plant every four years, since the cost will be prohibitive. As for the paint industry, Mr. Shastri said that a plan for indigenous fabrication is getting the Government's attention and that India will become self-sufficient by the end of the third plan. The Indian sector of the industry has also entered into arrangements for collaboration with foreign producers who will supply the technical know-how.

U. P. Sugarcane Cess

The invalidation of the U.P. Sugarcane Cess Act by the Supreme Court has created a ticklish problem for the State Government. The Act empowered the latter to levy a cess not exceeding 25nP a maund on the entry of sugarcane into the premises of a sugar factory. On behalf of the U.P. Government, it was contended before the Supreme Court that Entry 52 of the State List in the Constitution enabled the State to frame legislation concerning "taxes on the entry of goods into a local area for consumption, use or sale therein." After reviewing the history of constitutional legislation in India and the use of the term "local area" in legislative enactments, the Court came to the conclusion that by local area was meant an area on which an octroi was leviable, i.e., an area administered by a municipality, local board or *panchayat*. The premises of a factory could not be said to be a "local area" and Section 3 of the U.P. Cane Cess Act did not, therefore, fall within Entry 52 of the State List.

The Government was collecting the cess from 1953. The Act of 1956 repealed that of 1953, but it stipulated that all notifications under the earlier law were enforceable as if they had been issued under the later Act. The annual collections in U.P. amounted to Rs. 5 crores. Replying to questions in the Lok Sabha, Mr. S. K. Patil, Central Minister for Food and Agriculture, said recently that there could be no question of refunding the money to the industry and that the Government was consulting legal experts about how to save the situation. One member, Mr. Braj Raj Singh, pointed out that since the sugar prices fixed by the Government took into account also the sugarcane cess payable by factories, there should be an immediate reduction in the price of sugarcane.

In U.P., besides the cane cess, factories also have to pay a commission to co-operative societies. The total incidence a maund of sugar on account of these impositions works out to Rs. 2-6. Assam, Rajasthan, Madhya Pradesh, Orissa, Kerala and West Bengal have no sugarcane cess. Other States have varying rates of cane cess and commission for co-operative societies. At last year's annual meeting of the U.P. branch of the Indian Sugar Mills Association, the president suggested that one way of solving the difficulty might be to fix an all-India minimum price for sugarcane so as to include cane cess and co-operative societies' commission. He said: "Although there is an all-India minimum price of sugarcane, factories in U.P. are required to pay cane cess at 3 annas a maund and co-operative societies' commission at 9 pies a maund. In all other States, except Bihar, cane cess was imposed much later. Even now it is much lower in many States, and there is no cane cess in some of them. As far as co-operative societies' commission is concerned, this burden

exists in no other State except Punjab and Bihar where also only 60 percent of the supplies are through co-operatives." Although the Supreme Court judgment has been in relation to only the U.P. Cane Cess Act, it is obvious that if the cess is levied in any of the other States under Entry 52 of the State List, its collection may also become unconstitutional.

Report on Cloth Consumption

While delivering the convocation address at the Harcourt Butler Technological Institute in Kanpur, Mr. Lal Bahadur Shastri, Central Minister for Commerce and Industry, regretted that textile millowners in Kanpur have not come forward for putting up a building for research in textiles. Research institutes have already been established in Ahmedabad, Coimbatore and Bombay. The Textile Fund Committee, which has its headquarters in Bombay, is willing to give a substantial grant only if Kanpur industrialists also make their contribution. Meanwhile, the Marketing Research Corporation of India has compiled a report on the pattern of consumption of cotton textiles and other fabrics in Uttar Pradesh. It states that the village is the most suitable place for increasing cotton textile consumption. A larger percentage of current expenditure in rural areas, it says, will be on cotton cloth than in towns and cities. The U. P. enquiry has shown that the peak consumption of cotton fabrics is in the low-income groups, to which the mass of the rural population belongs. A low-income group, in this survey, refers to people who earn above Rs. 90 but not more than Rs. 300. Even in the cities, in the lowest-income bracket, a 10 percent rise in income leads to an increase of over 14 percent in the demand for cotton cloth, whereas in the highest-income group, a similar rise in income leads to a mere 3 percent increase in demand.

The Marketing Research Corporation has recommended setting up a more elaborate rural field organisation to gather and analyse data, so that demand may be projected and supply adjusted to it in a more scientific and co-ordinated way. It also states that organisational adjustments in the cotton textile industry will help produce better results. Mr. R. C. Saraiya, chairman of the Cotton Textiles Fund Committee, in a foreword to the Research Corporation's report, has pointed out that it is necessary to carry out market research not only on the volume of demand for cotton textiles but also on the varieties in demand, the channels of distribution, the inroads—if any—made on the demand for cotton textiles by other competing fabrics and other relevant trends. This will enable the industry to order its production and marketing programme better.

U.S. Business Conditions

The business news of recent weeks has been mixed, indicating on balance neither acceleration nor reversal of the mild downward trend, says the First National City Bank of New York in its latest monthly letter on U.S. business and economic conditions. Renewed decline in manufacturers' new order inflows, and some further increase in unemployment, provide evidence of continued weakness, but contrasting indications of resiliency are found in the good showing of personal income, retail sales and construction contracts. The 1961 motor-vehicle models have had an encouraging initial reception. The flow of new orders to manufacturers was stimulated earlier in the autumn by increased defence procurement, but business buying policies remain cautious. Business men in general appear basically confident but not inclined towards either expansion or marked curtailment of activity; a wait-and-see attitude towards new capital investment is evident in recent survey findings that current plans for plant and equipment expenditures in 1961 are only 3 percent below the 1960 level.

The cautious approach towards forward planning and current purchasing, in spite of a predominance of opinion that the decline will be relatively shallow and brief, may partly reflect the disappointments suffered when predictions of booming sales and profits in 1960 went wrong. There is also considerable uncertainty and a growing awareness that the ground rules are somewhat different this time. As the U.S. Secretary of the Treasury, Mr. R. Anderson, remarked at the recent World Bank and Fund meetings, "the economic environment of 1960 is a *new* environment. After almost 20 years of recurrent inflationary pressures, it is understandable that a free economy would have to undergo some deep-seated adjustments once appropriate fiscal and monetary policies had struck down both the fear and the fact of inflation." Additional considerations contribute to the restrained mood. Never before in the postwar period have balance-of-payments considerations so limited the use of monetary and fiscal policies to combat recession or promote growth. Nor are the uncertainties accompanying the change in the U.S. Administration conducive to early abandonment of the wait-and-see attitude by business. The decisions which the new Administration must make on defence, unemployment, tax reform and numerous other fiscal and economic problems are big question marks.

The implications of even a sideways or moderately downward drift in the economy over an extended period have been illustrated by the October labour force figures. Including the armed forces, 70 million persons had jobs, more than in any previous October. Nevertheless, business during 1960 has not provided enough new employment opportunities to absorb the growth in the labour force. Expressed as a seasonally adjusted percentage of the civilian labour force, unemployment averaged 5.1 percent during the first half, rose to 5.7 percent in the third quarter, and reached 6.4 percent in October, the highest rate since late 1958. Altogether, 3.6 million persons were reported as out of work in October, an increasing share of them unemployed for 15 weeks or more. As outdoor work declines, unemployment ordinarily rises during the winter months, and an increase of no more than the usual seasonal proportions would boost the number out of work by roughly 1½ million by January or February 1961. Thus, the new Administration is likely to find more than 5 million unemployed at the time it takes office. This, however, would be a seasonal peak, normally followed during the spring months by a decline in the figures.

NOTICE

With this week's issue of CAPITAL is being issued a supplement of 152 pages, the Annual Review of Trade, Commerce and Industry. Besides essays on specific industries such as jute, tea, cotton textiles, coal and sugar, the Review contains exclusive articles by well-known authors. Dr. Vera Anstey writes about India's take-off problem and Mr. Neil McInnes discusses the economics of Indian education. Mr. Asoka Mehta outlines the reasons for the uneven progress of Indian agriculture; Dr. H. L. Dey examines the fiscal prospects for the third five year plan; and Mr. M. M. Philip writes about the development of the overseas communications services. There are two articles on labour problems—one by Dr. N. Das about the right to strike in public enterprises and the other by Mrs. M. Sur on the recent trends in labour relations. Specific aspects of the third plan are discussed in detail, Mr. G. M. Laud writing on the problems of developing co-operatives, Professor P.C. Jain on the rôle of the private sector, and Professor V. G. Ramakrishna Aiyer on the question of raising resources from the rural economy. Dr. P. S. Lokanathan examines the social aspects and implications of planning. Developments abroad which are of close interest to India are covered in articles about the European Common Market, the European Free Trade Area, and trends in U.K. aid for overseas development. Other articles deal with the past year's experience in such sectors of the Indian economy as life insurance, general insurance, banking, the stock markets and the freight markets. The supplement is being distributed free to all registered subscribers. Additional copies at Rs. 5 each may be obtained from the Manager, Capital, 5 Mission Row, Calcutta 1. Orders for extra copies should be placed early.

Tea Market Trends

Reviewing conditions in the tea market in his address at the annual general meeting of Calcutta Tea Traders Association last week in Calcutta, the chairman, Mr. R. G. Hales, said that as the 1959 crop was expeditiously disposed of—the last export sale of the season being held in March 1960 and the last Dust sale in June 1960—there was practically no carry-forward for the current season. Regular weekly sales could, therefore, be held only from mid-July 1960. This year's crop is small because of the adverse weather experienced early in the season. Parts of Assam, particularly the Sibsagar, Nowgong, Jorhat and Tezpur districts, were severely hit by drought—the worst for 40 years. The crops of some estates would fall by as much as 40 percent. Cachar too was badly hit, and it was reported that some estates were able to harvest only 40 percent or 50 percent of their estimated crop. The drought was so severe in some areas that tea bushes actually died and many others had their growth retarded. It might be many years before they reach full bearing again. Consequently, the estimated crop until the end of November is 233 million kilograms, or 15.6 million kilograms less than in the same period of last year. Average prices so far (including those of Dusts and internal leaf), however, have shown an increase of approximately 49nP a kilogram over the previous season.

Discussing export trends, Mr. Hales said that shipments so far this year from north India are 11.7 million kilograms less than in the corresponding period of last year. Exports to the U.K., the Sudan and Turkey have shown the greatest fall, while Russia and the United Arab Republic have taken more. Offerings of leaf for internal consumption have been relatively small, consisting mainly of stalky secondary grades. With the Indian Government's liberal export policy for tea, this situation is likely to continue for some years. To compel the trade, in the immediate interests of export promotion, to sell more abroad by artificially restricting supplies to the internal market, which is not only large but is expanding, is not a sound policy, the chairman thought.

S. T. C. Fails in Camphor Trade

The price of camphor has risen steadily due to import restrictions, so retailers in Madras have urged that the State Trading Corporation be relieved of control over its distribution. They say that the auctions held by the Customs cannot remove the chronic shortage of the commodity; it should be sold through co-operatives in order to avoid profiteering. It is reported that tablet manufacturers are in great difficulty because of the shortage of camphor. So the gap between the imported price of camphor and the retail rate has widened. The allocation of quotas for those making tablets from imported camphor has not apparently provided a solution. Since the controlled price of Rs. 3.26 a lb is unreal and the retail rate is Rs. 30 a lb, retailers think that the S.T.C.'s monopoly import has helped nobody.

"CAPITAL" CHRISTMAS TOY FUND

WE acknowledge, with thanks, the receipt of the following donations:

Rs. 35
Staff of M.M. and Co, New Delhi.

Rs. 15
P. L. Roy

Rs. 14
Anonymous

Rs 10 each
J. W. Bryans, S.C.B.

Total Rs. 84

Previously acknowledged Rs. 3,849.55
Grand Total Rs. 3,933.55.

THE SUPPLY OF CURRENCY

WE hear that the Government of India are greatly exercised in mind by the threatened renewal of gold imports, and are making efforts to obtain estimates of the amount likely to arrive within the next few months. This anxiety on their part is another proof of the unsuitability of our present currency arrangements. The most detailed knowledge of the actual trade of the country combined with the most profound science in all the principles of money and circulation will not enable any man or set of men to foretell what additions should be made to the currency of India in any given month, quarter or year; and the Government of India should not allow itself to be placed in a position which will admit of any risk of failure on its part to meet the demand for rupees in exchange for gold. All that it need do is to follow the advice of the Bengal Chamber of Commerce and make a point of maintaining about 12 crores of Rupees in the Paper Currency Reserve. When once the Rupee portion of the Reserve has been raised to this limit, there will be no more tightness in the Indian money markets, because under the Indian Gold Note Act, the Exchange Banks will be able to obtain promptly all the rupees they require against deposits of gold in London. Nor need the Government of India fear any difficulty of maintaining the gold portion of the Reserve at or about the limit of £5,000,000 mentioned in the Secretary of State's Despatch of 1st March last, and the Rupees portion at or about the limit of 12 crores, if they will extend the provisions of the Gold Note Act to the ports in Australia where there are branches of the London mint, viz., Melbourne, Sydney and Perth. All the Government of India need do is to put the Gold Note Act in operation in London, and at these ports whenever the rupee portion of the Reserve falls below 12 crores, and to stop operations under the Gold Note Act when the rupee portion is above 12 crores, the telegraphic transfers under the Act to be issued, at 1s. 4 1/32d as long as gold can be transmitted on the present cheap terms by parcel post, and raised to 1s 4 3/32d when these terms are raised to ordinary freight rates. No bank will ship gold to India if it can obtain telegraphic transfer or bills on the Indian Paper Currency Reserve at equal rates in the case of transfer and 1/32d per rupee less in the case of bills; and the gold received from the Banks can be employed in Australia and London in the purchase of silver for coinage in India in order to replace the rupees disbursed in payment of these transfers or bills.

A Ditcher's Diary

MONDAY MORNINGS, I ALWAYS FEEL, ARE NOT IDEAL occasions for holding important meetings. Perhaps that is why this year's Assocham general meeting seemed to me to lack some of its predecessors' vitality. Or it might have been simply the contrast with two years ago when there was a feeling that the Finance Minister had not attached as much importance to the preparation of his speech as Assocham audiences habitually attach to its delivery, and with last year when everybody was wondering whether the same thing would happen again. It did not; and so those present this time were probably expecting precisely what they got—a carefully prepared and equally carefully non-committal address which could be interpreted more or less as the listener pleased, but which anyway left him in no greater state of enlightenment than he was before. The President, Mr. H. M. L. Williams, gave a speech which, I thought, was admirably constructive and more than usually lacking in complaints. I suspect the reason for this was not that the business community has no complaints, but was because, at least in public, Government spokesmen are notoriously unsympathetic about them, if indeed they do not simply deny their existence altogether. Mr. Desai's categorical rejection of the disincentive effects of high taxation on the inflow of private foreign capital was, I felt, a classical example of this sort of thing. I should have thought it would have occurred to the Government by now that the fact foreign capital is coming to India is no proof that the present tax system does not act as a disincentive; the point is that much more would be forthcoming if the tax burden were lighter. Apart from such slight blemishes, I considered Mr. Desai's speech lucid, to the point, and just about as helpful as it could be under the circumstances. I felt I could not agree with him, though, about the futility of arguing the merits of the private sector against the public having been accepted by all. It has not been accepted by me, for one. Mr. Desai may not agree, but I still consider that the Government's doctrinaire preference for the public sector where private enterprise could equally well do the job—or, say, in the case of the coal and oil industries, could do it better—is chiefly responsible for the economic difficulties the country is in, and from which it is unlikely to find relief until such socialistic policies have been changed.

TAKE-OVER BIDS IN POLITICS ARE, APPARENTLY, NO monopoly of soldiers, as developments last week in Ethiopia and Nepal dramatically showed. I had a suspicion that the Ethiopian effort would fail, for old Haile Selassie has not occupied his throne for 30 years or so without learning a few tricks about the difficult art of political survival. I am happy that he is back in power, for without him we might witness in Ethiopia another frightful Congo. It is also true that, although certainly an autocrat, he is known to be a benevolent one. In recent years he has spent much money and energy on education, without which a people is simply not fit for democracy. Why do I not apply this to India? Because here there is an enlightened political leadership, a middle class and a national temperament which is generally against violence. None of these conditions obtain in Africa. Justice in Ethiopia is often harsh; and I hope His Imperial Majesty means to be humane when the rebels surrender in acceptance of the proclaimed amnesty. In Nepal, if the King had many complaints against his Government, he certainly said very little about them in public. The politicians have been promised trials of various kinds; but until these have happened, many people will deduce that the King has acted somewhat arbitrarily. King Mahendra, it must be said, carried out his operation rather neatly. Nobody, apparently, knew of it in advance; and the army and the police must have been loyal to him. This, I am afraid, will make the resumption of democracy difficult in Nepal, for the next elected Government will be sorely tempted to indoctrinate the armed and police forces, so that the next attempted take-over may not be quite so easy.

IT IS, IN THEORY, POSSIBLE I SUPPOSE THAT THERE are people still whose hearts are broken if they are not asked to parties at Government House where tea is the strongest liquid served—to the accompaniment of cashew nuts, sometimes salted. To be entertained by Congress Ministers is not much fun either; and I am reminded of Churchill's reply to an angry House of Commons which had held it against General Montgomery that he had invited some captured Nazi generals to dinner. Churchill said the Nazis deserved it: dining with "Monty" is a dismal experience; "he does not smoke, he does not drink, and he does not know a single smutty story". But I cannot see that so-called anti-social elements of Punjab will have their withers wrung through being blacklisted by Sardar Pratap Singh Kairon in the matter of entertainment. The list, I find, will be confidential; and its ultimate compiler is the Chief Minister himself, who has been the subject of much unanswered criticism. The Congress Party's embarrassment over charges of corruption is understandable; but every effort made to face them has been pathetic, deceiving nobody except the Congress itself. Why do the leaders not realise that the charges are against them and not against "the others"? That any enquiry made is *ab initio* unconvincing? Such being the case, it is not very clever of Mr. Kairon, to say nothing of some others, to pretend that the people expect him to catch and punish the culprits: he is himself among the accused. Gone is the time when the "top people" of the Congress were above suspicion; today almost everybody is convinced that they are themselves involved in corruption or connive at it for what is conceived to be in the interests of the Party, which is, of course, equated by them with the country. The Congress is in no mood to face the question seriously, not until the elections anyway; and if the parlour game of guessing who may be on the list and who not amuses the Congress leaders in Punjab, they should not delude themselves that the country is amused too. It is not.

THE EXPORT OF INDIAN COTTON *saris* TO THE U.K. is increasing, or so Mr. Nityanand Kanungo, Union Commerce Minister, told a questioner in the Lok Sabha the other day. I would not care to contradict his statistics, but the inference he draws from them—that the *sari* is gaining in popularity in Britain—seems a very shaky one indeed. The answer, surely, is obvious: there are more Indian women in the U.K. than ever before; and they tend to come from the poorer classes instead of the richer ones, who have always been fairly numerous there, hence the demand for cotton. The point is that Mr. Kanungo was probably incorrect if he meant to infer that the *sari* was gaining popularity among British women; if it were, the demand would surely be concentrated on more expensive materials. Now, having made that clear, I shall go on to say that British women are perhaps more interested in wearing *saris* than they used to be. But only as novelties, and then chiefly for evening wear. Why this should be so is not difficult to guess. The *sari* is most becoming and colourful; it is novel, at least so far as Britain is concerned: and in these days when long evening dresses are almost out of fashion, a *sari* can be a god-send to those unfortunate members of the fair sex whose charms increase in direct proportion to the extent to which their piedal extremities are discreetly obscured. British women are probably becoming aware, along with their Indian sisters, that, physiologically and dietetically speaking, a *sari* can hide a multitude of sins. That is not to say the *sari* has a brilliant future in the U.K.; it is not an easy garment to wear, it is unsuited to the modern workaday world, and in a cold country it is simply not warm enough. I have a theory that the days of the *sari* are numbered even here in India. Such unsewn garments are appropriate enough to a poor country. But when India becomes richer, it will increasingly be her misfortune to fall prey to the world's fashion dictators; and what in my opinion eventually dooms the *sari* is the fact that in its present form it offers little or no scope for their expensive, and increasingly grotesque, depredations.

Capital's CHRISTMAS TOY FUND CLOSED LAST Tuesday evening. At least, it did so far as this year's *effective* total is concerned; contributions received from now on, although extremely acceptable, of course, will have to be held over until next Christmas. The final figure was Rs. 3,933.55, compared with that for 1959 of Rs. 4,257.50. When a carry-forward of Rs. 385.05 is deducted from the 1960 total and one of Rs. 447.93 from the previous year's figure, it will be seen that this year's collection, at Rs. 3,548.50, is lower than last year's by Rs. 261.07, a figure which compares with one of Rs. 323.95 for the difference between the totals. What all this boils down to is that our collection has fallen again this year, although not by quite as much as is suggested in the comparison of round totals. This is disappointing, because it means that some children will go without. But it has its encouraging side, too, because the final shortfall on collections, Rs. 261.07, is lower than the Rs. 340.95 which was the *difference* between last year's performance and this year's at the time I made my last appeal on 8th November. Which shows that Calcutta's charity is capable of rallying to the cause when called upon. But the fact of the smaller total remains, and some poor children on Christmas morning are unlikely to be consoled by the above arithmetic, or by the excuse that there have been so many other calls on people's charity this year. May I extend my thanks to all those who have contributed, and to those who have not may I say that now is an excellent time for making a New Year's resolution to do so next time. And to all *Capital's* readers may I wish a Merry Christmas and a Happy and Prosperous New Year.

PROGRESS OF THE SUGAR INDUSTRY

By S. K. Patil

Minister of Food and Agriculture, Government of India

THE sugar industry has attained a new peak output, estimated at 2.42 million tons, during the 1959-60 season, exceeding the previous record of 2,029,000 tons in 1956-57 and the second plan annual production target of 2.25 million tons. While there has been notable expansion during the second plan in the production capacity of the industry, the sharp increase in production during 1959-60, in spite of the continuance of control, is due in no small measure to the shift in emphasis from distribution measures alone to increased production with the aid of incentives to cane-growers and the factories. At the beginning of the 1959-60 season, the Government announced the grant of a concession of 31nP a maund on the price of sugarcane to factories starting crushing before November 1959, from the date of crushing up to 14th November, 1959, in western Uttar Pradesh and to factories starting crushing before 10th November, 1959, up to 21st November, 1959, in eastern Uttar Pradesh and northern Bihar. Secondly, a rebate of 50 percent in the basic excise duty of Rs. 11.25 a cwt. was given on all sugar produced in the season in excess of the average production of the two previous seasons, the rebate being sharable by both the factory and the growers. For factories which started production only in 1957-58 or did not produce in 1957-58, the basis of the rebate was to be considered on merits. Thirdly, the minimum sugarcane price for the 1959-60 crop was raised from Rs. 1.44 to Rs. 1.62 a maund for delivery at factory gate and similarly for delivery at production centres connected by rail. These incentives have been continued for the 1960-61 season.

Flattering Record

Looking back over the past decade, one sees a flattering record of progress on the whole for the sugar industry. The first five year plan had a production target of 1.5 million tons. Assessment of the installed capacity of the industry justified the target, provided measures were taken for increasing the supply of sugarcane to the factories so as to raise the number of working days from 100 to 120, using idle capacity, shifting unfavourably located factories to new sites and expanding the uneconomic units. Soon after the withdrawal of control over sugar in December 1952, it became evident that the domestic demand for sugar was substantially higher than had been estimated earlier. To bridge the gap between demand and domestic production, imports were resorted to; from 1954 to 1956, about 1.4 million tons of sugar were imported. Meanwhile, the policy of restricted development followed at the commencement of the first plan gave place to one of large expansion. Additional capacity of 1 million tons was licensed, raising the installed capacity from 1.5 million tons to 2.5 million tons and the annual production target from 1.5 million tons to 2.25 million tons, to be achieved by 1960-61. The additional capacity of 1 million tons was to be secured through the expansion of existing factories and the establishment of new ones.

The expansion programmes have been carried out by 34 factories out of the 71 to whom licences for expansion were granted. The intrusion of foreign exchange difficulties in the way of expansion has hastened arrangements for the manufacture of machinery in India. Another significant development has been the establishment of sugar factories by cane-growers themselves on a co-operative basis. Out of 52 new factories licensed, 33 factories, including 22 co-operatives, had gone into production by the 1959-60 season. In the 1959-60 season, co-operative factories accounted for 285,000 tons of production, equivalent to 11.7 percent of the total output of 2,421,000 tons.

Production and Consumption

There has been a progressive increase in the number of working sugar factories, from 139 in 1950-51 to 168 in the 1959-60 season. Sugar production has more than doubled, from 1,116,000 tons in 1950-51 to 2,421,000 tons in 1959-60. At the same time, consumption has also been rising more or less continuously from 1,081,000 tons in 1950-51 to 2,220,000 tons in 1959-60 Against the first five year plan increase in sugar production of 66.4 percent, the consumption rose by 80 percent. During the first four years of the second plan, although production has increased by 19 percent against a 14 percent increase in total consumption, the rise in sugar production has been rather erratic, as shown by the table below:

SUGAR PRODUCTION AND CONSUMPTION

	Number of working factories	Installed capacity (0,000 tons)	Average number of working days	Sugar production (00,000 tons)	Sugar consumption (00,000 tons)
1950-51	139	15	101	11.16	10.81
1951-52	140	15	132	14.94	11.63
1952-53	134	15	113	12.97	16.62
1953-54	134	15	86	10.01	18.07
1954-55	136	15	132	15.90	17.23
1955-56	143	16	145	18.62	19.41
1956-57	147	17.3	150	20.29	19.66
1957-58	158	18.7	129	19.78	20.42
1958-59	164	20	118	19.19	20.80
1959-60	168	20.8	136	24.21	22.20

Between 1950-51 and 1953-54, sugar production remained lower than the corresponding installed capacity, while from 1954-55 onwards, the production, except for a slight decline in 1958-59, outpaced capacity. The behaviour of sugar production is conditioned to a large extent by the unforeseen hand of nature in the production of cane. In view of the large increase in consumption, due to expansion of incomes caused by the large-scale investments of the first two plans and the much bigger size of investments expected to be undertaken in the subsequent plan periods, along with the estimated rate of 2.3 percent annual increase in population in the third plan period compared with 1.6 percent in the first and 2 percent in the second plan, any serious disequilibrium in the demand for and supply of sugar has to be avoided. Preliminary estimates based on the present trend of consumption and the likely increase in production, change in dietary habits and increase in purchasing power, indicate that the internal demand for sugar will be of the order of 3 million tons by the end of the third five year plan period. While, therefore, the annual target of sugar output has been tentatively fixed at 3 million tons for the third five year plan, the intsalled capacity has been kept at 250,000 tons higher than the production target, to provide for unforeseen contingencies.

Alongside the increase in production, there has of late been a trend towards wider dispersal of the industry. Between 1955-56 and 1959-60, not only has the large concentration of the sugar industry in Uttar Pradesh and Bihar witnessed a gradual decline, but the relative contribution of these States to total sugar production has also gone down. This is shown in he table given below:

STATEWISE NUMBER OF FACTORIES AND THEIR PERCENTAGE CONTRIBUTION TO TOTAL SUGAR PRODUCTION

	Number of factories					Percentage of production to total production				
	1955-56	1956-57	1957-58	1958-59	1959-60	1955-56	1956-57	1957-58	1958-59	1959-60
Uttar Pradesh	68	68	70	69	70	53.1	53.2	47.6	46.3	50.4
Bihar	28	28	28	28	28	17.1	15.4	13.9	16.2	13.4
Bombay	15	16	27	21	28	10.9	11.8	16.2	16.7	16.6
Andhra Pradesh	8	10	11	11	11	4.8	7.0	7.7	6.2	5.7
Madras	4	4	5	5	5	2.8	3.2	3.4	3.9	3.5
Other States	20	21	23	23	25	11.9	9.4	11.2	10.7	10.4
	143	147	164	157	168	100.0	100.0	100.0	100.0	100.0

During 1955-56, Uttar Pradesh and Bihar accounted for 67 percent of the country's sugar factories and 70 percent of the total output of sugar. But during 1959-60, their share of factories came down to 58 percent and of total output to 64 percent. On the other hand, during this period, the relative contribution of Bombay and Andhra Pradesh both in number of factories and in total production has witnessed an increase, due mainly to increases in acreage and production of sugarcane, higher recovery and establishment of new factories.

Factors Governing Production

Production of sugar depends on the duration of the season and the percentage of recovery. The duration of the season, in turn, depends on the availability of a sufficient quantity of cane. The following table gives an idea of the inter-State and annual variations in the percentage of cane crushed to the total cane crop of each State :

State	1955-56	1956-57	1957-58	1958-59
Uttar Pradesh	34.65	32.06	31.06	30.38
Bihar	111.99	90.58	61.65	52.42
Bombay	31.42	34.69	39.01	36.50
Andhra Pradesh	28.26	30.39	31.20	19.35
Punjab	7.66	11.88	12.97	11.10
Madhya Pradesh	33.13	38.94	27.84	24.94
Mysore	19.54	15.03	22.19	20.85
Madras	19.54	20.82	25.16	23.27
Rajasthan	32.01	32.34	21.29	18.47
Kerala	26.28	37.96	28.93	26.00
Orissa	4.79	4.79	4.45	4.10
West Bengal	7.42	8.38	7.01	5.96

Since 1955-56, the increase in the percentage of cane crushed to the total crop in the deficit States of Bombay, Madras, Mysore and Kerala is attributed largely to locational advantages enjoyed by the industry in these States in relation to the quality of cane Of the total quantity of sugarcane produced in 1958-59 in each State, the maximum percentage of cane crushed for the manufacture of crystal sugar is 52 percent in Bihar. It varies from 30 percent to 38 percent in Uttar Pradesh, Andhra Pradesh, Bombay and Kerala; from 18 percent to 25 percent in Rajasthan, Mysore, Madras and Madhya Pradesh; and is only 11 percent in Punjab and 6 percent in West Bengal.

These figures show that ordinarily there should be no difficulty for sugar factories in the different States obtaining their entire requirements of sugarcane for the manufacture of white sugar. But that is not the whole story. In Uttar Pradesh, Bihar and Punjab, the supply of cane to sugar factories depends to a considerable extent on the demand of sugarcane for *gur* manufacture, which in turn depends on the comparative prices of sugarcane fixed for supply to factories and for *gur* production. The problem of diversion of cane supplies was particularly acute in western Uttar Pradesh. Some steps have been taken to meet it. The tax advantage enjoyed by *khandsari* manufacturers in Uttar Pradesh has been reduced by the levy of an excise duty of Rs. 4.2 a maund. as also by the State Government levying a cess and a co-operative societies' commission on *khandsari* sugar. The U.P. Government's Khandsari Sugar Manufacturers Order, 1959, discourages *khandsari* units from being established in sugar factory areas, and is further designed to exercise locational control. The raising of the minimum prices of cane from the 1959-60 season is intended to ensure regular supplies to factories, assisted by other measures.

Sugar Recovery

No less vital is the question of sugar recovery. Sugar recovery depends on the quality of sugarcane, the length of the crushing season and the overall operating efficiency of the sugar factory. The table below gives the average sugar recovery in the different regions, compared with the all-India average recovery:

Region	1951-52	1955-56	1956-57	1957-58	1958-59
Western U.P.	9.01	9.62	9.80	9.94	9.94
Eastern U.P.	9.63	10.00	9.44	9.92	9.48
Bihar	10.32	9.76	9.37	10.17	9.79
Bombay	11.08	11.72	10.60	11.15	11.46
Andhra Pradesh, Madras, Mysore and Kerala	9.58	9.47	9.16	9.39	9.53
Madhya Pradesh, Orissa, West Bengal and Assam	9.59	9.56	9.17	9.69	9.61
Punjab and Rajasthan	8.86	9.02	9.14	9.41	8.63
	9.57	9.83	9.73	10.02	9.84

Although during the last four years, sugar recovery has generally been higher in all the States except Bihar, there has been no sustained rise in recovery. In Bihar, there has been a distinct fall from 10.32 percent in 1951-52 to 9.93 percent in 1959. In western Uttar Pradesh, the recovery has on the whole improved, but in eastern Uttar Pradesh, it has been erratic. In Bombay, on the other hand, not only has the recovery risen from 11.08 percent in 1951-52 to 11.46 percent in 1958-59, but it is appreciably higher than in Uttar Pradesh and Bihar, which together still account for more than 60 percent of the total sugar production. Further, in spite of an increase in the all-India average yield an acre of cane from 13.4 tons in 1957-58 to 14.7 tons in 1958-59, the average cane yield in 1958-59 was appreciably lower in Uttar Pradesh at 11.1 tons and in Bihar at 14.5 tons, compared with 37.4 tons in Andhra Pradesh, 25.5 tons in Bombay and 24.7 tons in Mysore. The comparatively low sugar recovery, coupled with low yield of cane an acre, in Uttar Pradesh and Bihar is particularly disquieting, as these two circumstances keep costs of production higher in these major producing States. The quality and the yield of sugarcane have to be raised substantially in Uttar Pradesh and Bihar.

To improve the sugar recovery and yield an acre, a scheme for payment for cane on a quality basis is being tried as an experimental measure in a few sugar factories under the guidance of the director of the National Sugar Institute, Kanpur. Sugarcane development schemes are under varying stages of implementation in the major sugarcane-growing States. These include raising and distribution of improved, disease-free seeds, plant protection, increased irrigation facilities, construction of roads in factory areas, campaign for intensive manuring of sugarcane, and publicity and propaganda for using improved methods of cultivation. However, intensive methods, not merely through propaganda but by direct assistance to cane-growers, are needed to increase the sugar content of cane. The State Governments should use for this purpose the sums collected through the cess.

Molasses Disposal

The efficient use of by-products is another way of reducing costs. The aggregate annual installed capacity of the industrial and power alcohol industry has risen since the commencement of the second plan by a mere 4.17 million gallons, that is, from 26.70 million gallons in 1956 to 30.47 million gallons in 1959, against the target of 36 million gallons. The development of the alcohol industry is necessary in the first place to provide an outlet for the large quantity of molasses thrown out in the process of making sugar. The disposal of molasses even at the offered price of 25nP a maund will lead to a reduction of Rs. 8.34 a ton of sugar. The increased production of alcohol has a vital rôle in the industrial economy of the country. Based on alcohol produced from molasses, a scheme for manufacturing synthetic rubber is on hand. The National Sugar Institute, Kanpur, has done research on using molasses for recovering aconotic acid, and producing glycerine, lubric acid, calcium lactate, latic acid and acetic acid.

Fair Price

The problem of fixing sugar prices remains far from simple. Consequent on the rise in prices of sugar on the announcement of the export policy in June 1957, the Government had fixed ex-factory prices for the surplus areas of Uttar Pradesh and northern Bihar. Punjab was the only deficit State which was brought within control and that was to prevent high prices in Punjab and to facilitate the enforcement of controlled prices in western Uttar Pradesh. The controlled ex-factory price has contributed to stabilising the price of sugarcane and protecting the interests of the consumer. But this price has come up against objections. Last year, when sugar recovery came down from 9.93 percent to 9.60 percent in Uttar Pradesh and from 9.91 percent to 9.78 percent in Bihar due to the inferior quality of cane, the industry approached the Government for an appropriate upward revision in the ex-factory price to compensate it for the loss. The cane-growers, from their side, urged that the costs provided for in the ex-factory price were on the high side. The Tariff Commission, to whom the Government of India referred the matter, came to the conclusion that the controlled prices for Uttar Pradesh, northern Bihar and Punjab were already higher than the prices it found to be fair after providing reasonable ex-factory cost, selling expenses, excise duty and return to industry and that the prices did not require any upward revision. The Commission recommended that from year to year, the price for each region should be determined according to duration and recovery in each of the four regions, in accordance with the regional schedules laid down by it, using the data of factories located in the region, and, thereafter, the cane cost would have to be added to arrive at the fair price. The Government accepted these recommendations, along with the one recommending a fair return of 12 percent to the industry. On further representation by the industry, the price formula has again been referred to the Tariff Commission.

The Government is alive to the fact that it is only by increasing sugar production appreciably and building a satisfactory stock position that the expanding requirements for domestic consumption at reasonable prices, as also the need for exports, could be met. In view of the need to secure foreign exchange, the production target of 3 million tons of sugar for the third plan is being reconsidered. The sharp rise of 500,000 tons in one year's production should not obscure the many deep-seated problems of the industry. There is hardly any ground for complacency, as in view of the erratic behaviour of the sugarcane crop, the situation has to be watched for a few seasons and effective steps taken to step up substantially the quality and yield of cane over the whole of the northern region.

ASSAM SILLIMANITE LIMITED

ANOTHER GOOD YEAR: UPWARD TREND OF PROFITS

MR. S. M. WAHI'S STATEMENT

The Ninth Annual General Meeting of Assam Sillimanite Ltd. was held on December 19 at Gauhati, Assam.

Mr. S. M. Wahi, the Chairman, in the course of his statement said :—

The Company has made some further progress during the past year, with production increased to 6,957 tons and transportation from the Mine reaching a figure of 7,107 tons. The improvement effected in the working of the Company has reflected itself in the profits being Rs. 3,18,488.09, available for disbursement. The shareholders get Rs. 1,80,000 less tax; Rs. 1,05,873 goes to Income-tax and Rs. 32,615.09 has been taken over to next year. On the basis of the above working results, the Board decided to declare an interim dividend of 6% in October and this has been recommended to the shareholders to be approved as the final dividend for the year.

The Directors' Report and the Balance Sheet along with the Auditors' Report have been with you for some time and, with your permission, I shall take them as read.

The Main Refractory Plant at Ramgarh

You will, I am sure, want to know what progress has been made with regard to establishment of the Refractory Plant at Ramgarh, Bihar, to which I had referred in my speech last year. Due to the delay in the Government's approval of the Investment and Stock Option Agreements, the original deliveries of Plant & Machinery offered by the suppliers in Germany have been greatly altered. The phasing of the Project had to be redone on the basis of firm quotations and deliveries now offered for Plant & Machinery.

The revised project would cost Rs. 81.23 lacs for the First Stage and Rs. 47.60 lacs for the Second Stage. In the First Stage 29,000 tons valued at Rs. 96.20 lacs of finished high class refractory bricks and shapes, mortars and mixes would be manufactured. On the basis of the present plans, orders for Plant & Machinery to be imported would be placed during January 1961. According to the deliveries stipulated, shipments could be expected by July 1962 and, after erection, production should commence from October 1962. Thus in the financial year 1963 approximately 6 months working results would be reflected in an estimated production of finished products worth about Rs. 48.10 lacs.

The Initial Refractory Project

The working results of the financial years 1961 and 1962 would, therefore, reflect no gains from this new Project, while the investments and expenses would, of course, be there. The Directors had, therefore, decided to cover this interim gap by :—

(a) establishing immediately a Refractory Plant at Ramgarh, using indigenously procured Plant & Machinery, with an installed capacity of 5,000 to 6,000 tons ;

(b) increasing production at the Mine by another 25% over the existing figure of 7,000 tons, through further capital outlay on Plant and Machinery for mining;

(c) development of Fireclay deposits recently acquired in and around the vicinity of Ramgarh Project for own consumption and sale.

With these developments and forward planning, it is expected that the Company would be in a position to have the desired Profitability and Cash Flow during 1961 and 1962. It would, however, be quite a strain initially to develop these Projects from the existing financial resources of the Company. The Initial Project would go into production from January 1961, producing 6,000 tons of Fireclay Bricks and Shapes for the industries in the vicinity.

You are aware of the need to gear our development to the dynamic requirements of the country. The prosperity of this country is largely conditioned by the way it solves the problems of its major industries. There is a rapid expansion of the steel and other industries in the country both in the Public and Private Sectors and there is a gap between the installed capacity for refractories and the anticipated requirements in the Second and Third Five Year Plan periods. The present installed capacity of refractories in India is 500,000 tons per annum approximately where as the anticipated requirements by the end of the Second Five Year Plan period alone are estimated at twice the present installed capacity. Imports of refractories are consuming a large chunk of foreign exchange of the country. With the big industrial development, these requirements will continue to rise even beyond the one million ton target envisaged at the end of the Second Five Year Plan.

Expansion of Mining Operations

There is only one other point that I shall touch before I conclude. The Company's diversion in the field of industry should not be allowed to lessen its interest in covering the mining operations. The expansion which was planned in last year in respect of our mining operations has been undertaken at Sonapahar Mine and will be gradually extended to the areas in other States where we have received prospecting licences and are obtaining the mining leases.

The personnel at the Mine with their hard work have made Sonapahar an excellent spot. Some good labour welfare work has also been done including the establishment of a fine children's school. With a pretty lake recently completed and with pineapple orchards along with other agricultural developments, Sonapahar is growing to be an attractive spot for the people of the locality.

The Mine Manager with his enthusiasm for flying, has established a runway which has made Sonapahar approachable by air in 20 minutes flying time from Gauhati. A small aircraft recently acquired by the Company would prove extremely useful for prospecting and mapping new deposits in the hilly terrain around Sonapahar. A new life seems to be bubbling in this tribal area, hitherto disconnected from the rest of the World. Several such underdeveloped areas have to be developed in India and Sonapahar could easily be set as a good example. And in all this the unceasing efforts of the staff have to be appreciated.

(The above statement is not a report of the proceedings of the Annual General Meeting referred to)

THE CALCUTTA MONEY MARKET

SMALL RISE IN ADVANCES

Wednesday, 21st December.

ADVANCES continued to rise in the Calcutta money market during the past week, but the rate of increase has been appreciably slower. The only source of demand which shows a significant expansion is the call for accommodation against grains and seeds storage in upcountry areas. The offtake of the cotton mills and the sugar industry remains more or less the same, as does that of the engineering, and iron and steel industries. Demand from the jute mills shows a small decline, probably on account of margin requirements recently introduced by the Reserve Bank. The inter-bank market is now extremely tight due to end-year considerations, such as tax payments. The call rate is unchanged at 4½ percent.

The exchange market has been moderately active during the past week, with a fair supply of tea bills in evidence. Gunny bills have been scarcer. Remittance demand has been fair On the London money market, the pound has been firmer and has closed with fair gains against most important currencies with the exception of the Italian lira. Against this currency, and one or two minor Scandinavian ones, the pound has recorded slight losses.

BULLION WAS QUIET DURING THE PAST WEEK ON profit-taking. Silver declined from the previous week's level of Rs. 223.62 to Rs. 223, quoted today for ready delivery. The rate for forward was Rs. 222.50. The London and New York silver prices were 79½d and 91.375 cents.

Gold was easier in sympathy with silver. The price declined from Rs. 136.25 to Rs. 135.50. The sovereign at Rs. 92 showed a loss of 25nP.

DURING THE WEEK ENDED 16TH DECEMBER, GOVERNment of India Treasury bills for Rs. 124.53,50,000 were sold in favour of the Reserve Bank.

TENDERS FOR Rs 2 CRORES OF 91-DAY GOVERNMENT of India Treasury bills were opened on 20th December. The total amount offered was Rs. 2 crores. Tenders at Rs. 99.360 and above were accepted in full. The total amount accepted was Rs. 2 crores, the average rate of acceptance being Rs. 2.550 percent a year. Tenders for Rs. 2 crores of 91-day Government of India Treasury bills will be received at all centres up to the close of business on 2nd January.

IT IS STATED THAT 91-DAY INTERMEDIATE TREASURY bills will be sold from 21st December to 30th December at Rs. 99.381 percent, subject to the condition that sales can be stopped at any time without notice if the Government thinks it necessary. These bills, sold from 14th December to 17th December, amounted to Rs. 9,00,000.

THERE WAS A DECLINE OF Rs. 1.61 CRORES TO Rs. 1.861.11 crores in active notes in the return of the Reserve Bank of India for the week ended 16th December, 1960. The total note issue was only Rs. 5 lakhs higher at Rs. 1,874.94 crores. Notes held in the Banking Department consequently rose by Rs. 1.66 crores to Rs. 13.82 crores. Deposits of the Government of India were Rs. 4 lakhs higher at Rs. 50.87 crores and other Government accounts rose by Rs. 15.16 crores to Rs. 28.40 crores. Balances of commercial banks fell by Rs. 7.91 crores to Rs. 85.31 crores. Balances held abroad rose by Rs. 2.49 crores to Rs. 27.10 crores. Investments at Rs. 205.89 crores showed a rise of Rs. 12.03 crores. Other loans and advances increased from Rs 124.62 crores to Rs. 132.37 crores, of which advances to scheduled banks against usance bills amounted to Rs. 7.57 crores (Rs. 3.93 crores). Ways and means advances stood at Rs. 34.05 crores, against Rs. 40.40 crores.

THE RETURN OF THE STATE BANK OF INDIA FOR THE week ended 9th December. 1960, shows a rise of Rs. 5.97 crores to Rs. 577.83 crores in total deposits. Investments in Government securities are down by Rs. 10.32 crores to Rs. 325.17 crores, while other authorised investments are up by Rs. 5 lakhs to Rs. 10.20 crores. Advances, including loans, cash credit, overdrafts, and bills discounted and purchased, have increased by Rs. 4.89 crores to Rs. 218.87 crores. Cash and balances are, in consequence, shown at Rs. 27.63 crores or Rs. 3.80 crores higher.

THE STATEMENT OF THE POSITION OF SCHEDULED banks for the week ended 9th December, 1960. shows Demand and Time liabilities at Rs. 795.17 crores (Rs. 21.88 crores on account of borrowings from banks) and Rs. 1,135.51 crores (Rs. 16.44 crores), compared with Rs. 795.82 crores (Rs. 24.89 crores) and Rs. 1,136.37 crores (Rs. 17.33 crores), respectively, in the previous week. Cash and balances with the Reserve Bank have increased by Rs. 4 lakhs and Rs 4.01 crores to Rs. 44.80 crores and Rs. 89.90 crores, respectively. There is a drop of Rs. 11.72 crores to Rs. 674.38 crores in investments. Advances and bills discounted at Rs. 1,130.28 crores show a rise of Rs. 9.30 crores. The ratios to total liabilities of cash and balances, and of advances and discounts, are, in consequence, shown at 7 percent and 58.5 percent, against 6.8 percent and 58.0 percent.

HEAD OFFICE: NEW DELHI

STEEL PRODUCTION SOARS BY 173% AT MUKAND

In 1940, Mukand employed 694 men; in June 1960—2,187. Over the past seven years, production figures have soared—18,234 tons in 1952/53; 49,787 tons in 1959/60. This increase is a reflection of a good management of finances:—

	1957/58	1958/59	1959/60
	(Rs. in lacs)		
Capital	51	51	71
Depreciation provided up to date	32	36	41
Profits retained in business to date	25	35	45
Profit for the year	19	30	32
Dividend for the year	5	5	8

Mukand manufacture high-grade steel products—bars, rods and castings. Presently an expansion programme is under way. It will cope with the growing influx of big orders—like the one placed by the Railways with Mukand on 16th July 1960 for 4,035 sets of Centre Buffer Couplers valued at 84 lacs.

Mukand provides India's new and growing industries with the quality steel components they must have.

MUKAND STEEL STRENGTHENS THE NATION

THE INDIAN IRON AND STEEL COMPANY LIMITED

CHAIRMAN, SIR BIREN MOOKERJEE'S ADDRESS

The Annual General Meeting of the Indian Iron and Steel Co. Ltd., was held at the Registered Office of the Company on Thursday, the 15th December, 1960. In supplement of his statement issued with the Accounts and Directors Report for the year ended 31st March, 1960, the Chairman, Sir Biren Mookerjee, said at the Meeting :

Gentlemen :

I have pleasure in welcoming you to this the Fortythird Ordinary General Meeting of the Company and with your permission will take the Notice calling the Meeting as read.

I must apologise for the delay that has this year again taken place in presentation of the Accounts. This however is due to no fault on the part of the Company but to the inordinate delay to which our claim for escalation of the steel retention prices has been subjected by Government. As I have explained in previous years, the amounts involved in these escalation claims are of such magnitude that your Directors have not felt it desirable that Accounts should be put forward other than on the basis of confirmed figures, and it was accordingly necessary to await official notification by Government of the increase in question which was not issued until the 10th November, 1960. It is a matter of concern to me that this delay which seems inseparable from all dealings with Government should occur. An essential of industrial management is that prompt decision should be taken on all matters that arise and as one contemplates the delay to which a simple matter like the adjustment of our retention prices in terms of a signed and sealed agreement can be subjected and the multifarious departmental references that appear to be involved, one cannot escape misgivings as more and more of the industry of the country passes into the hands of the public sector and control of the private sector becomes increasingly severe.

Profit-sharing Bonus

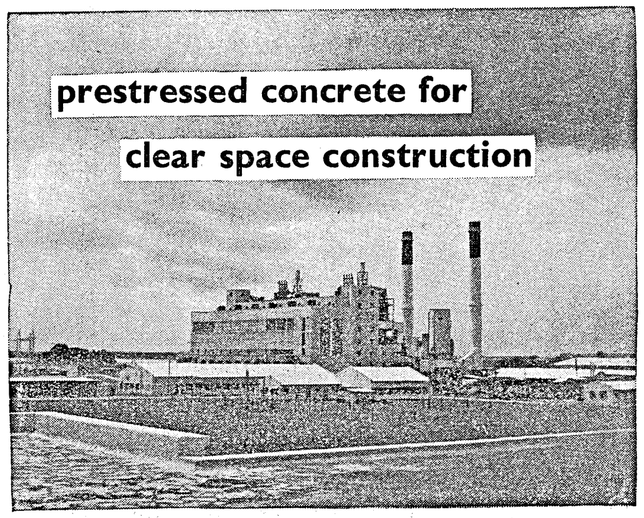
I am pleased to inform you that since the issue of my Statement accompanying the Report of your Directors, we have been able through the medium of conciliation proceedings to reach an agreement with the Labour Union on the matter of profit sharing bonus covering a period of four years commencing with the year 1959-60. The wrangling that has occurred each year in the past over the question of bonus has been most distracting both to the management and the workers alike and it is a matter for satisfaction that it has been possible now to negotiate a settlement of this difficult issue. The terms of the agreement will provide a minimum total distributable bonus of Rs. 46,80,000 ; Rs. 49,80,000 ; Rs. 53,30,000 and Rs. 56,80,000 for the four years involved, with a maximum for the respective years of Rs. 48,80,000 ; Rs. 52,30,000 ; Rs. 55,80,000 and Rs. 59,80,000.

In my Statement I dealt at some lengtli with the present extremely difficult coal situation which confronts the country and urged that to meet the crisis Government should relax its ideological restrictions on the development of the private sector of the coal industry. I am glad to see that the necessity for this course of action has at last been appreciated and it now remains for an all out effort to be made to retrieve the situation in the shortest possible time. The development of collieries and the installation of coal washeries must however of necessity take some years and during this time the position as it affects the iron and steel industry will remain of the utmost seriousness In these circumstances which prevent us from working up our expanded plant to its designed capacity, you will not I think expect of me an indication as to the financial prospects of the Company for the current or future years since the whole position as you will realise turns on the new steel retention prices to apply as from the 1st April, 1960 that are presently under negotiation with Government. I can only say that I am confident that a realistic view of the position will be taken by Government so that the Company may not be penalised on account of circumstances that are entirely outside its control.

Supply of Limestone

On the subject of raw materials I must also mention the gravity of the situation that has been allowed to develop in regard to the availability of limestone of the quality required by the iron and steel industry. The danger of the position in the light of the large expansion of the industry was foreseen by your management some years ago and warning given to Government. At that time steps were taken by your Company to supplement and safeguard its own sources of supply. It is greatly to be hoped that the sanctity of contracts will be preserved and that those who had the prudence and foresight to realise the situation and to cover their position, will not be made to suffer for the shortcomings of others in this respect.

N.B. This does not purport to be a report of the proceedings of the Annual General Meeting which will be sent to shareholders in due course.



Durgapur Thermal Power Station

Prestressed Concrete Plank Roofing was adopted for the Durgapur Thermal Power Station because of its lightness thus reducing the cost of the foundation and superstructure. It also made rapid construction possible.

A conventional cast-in-situ roof was ruled out because of the unusual height between roof and floor.

The roof area covered was 50,000 sq. ft. The job was completed in about twelve months.

An additional feature is thermal insulation with foam concrete blocks.

STOCK MARKET IMPROVES

INDUSTRIALS BETTER

London, 21st December.

BRIGHT conditions prevailed in the stock market during the past week and a modest improvement was recorded in gilt-edged securities and industrials. Other sections of the market were neglected and not greatly changed. There was little force behind the improvement, however, and price movements were usually small. The approaching Christmas holiday reduced activity to a very low level and the volume of business from day to day was the smallest for two years. The rally in industrials was mainly due to technical considerations and the cessation of selling after the recent shake-out. Many weak speculative positions were eliminated during recent weeks and the technical state of the market was healthier than for some considerable time. Nevertheless, there was little to encourage buyers and demand remained very small. The November overseas trade figures were awaited with some apprehension, but immediately following their publication, the market improved. Second thoughts, however, brought an easier trend, particularly on consideration of the third quarter's balance of payments figures which showed a further deterioration in the position. Steadier conditions developed later and the tone of the market was satisfactory. On the week, a fairly widespread list of small gains were recorded in the industrial market, but best prices were not always maintained. Steel shares were the most active section following further annual statements Gilt-edged securities were very quiet, but a small investment demand enabled prices to hold steady Gold shares tended to drift lower in the absence of interest. Coppers improved at one time and tins were firm, but other base metal shares were dull. Oil shares moved erratically. Quiet but mainly steady conditions prevailed in the rubber share market, while tea shares attracted very little attention.

The Money Market

Quiet conditions prevailed in Lombard Street during the past week. Money supplies were restricted by seasonal influences, but although credit was difficult to obtain, there was no occasion for the market to borrow on Bank rate terms. On most days, the authorities provided sufficient assistance to relieve stresses on the market. Rates for day-to-day loans varied between 4⅜ percent and 3⅜ percent with outside banks offering at 3 percent. Business in bills fluctuated with interest subdued by approaching year-end factors. February, March and "hots" changed hands at 4-13/32 percent, but after Friday's treasury bill tender, the same bills are now being dealt in on the basis of 4-9/32 percent.

U.S. Gold Loss

On 9th December, the United States lost $14,339,915 worth of gold, the Treasury department announced.

U.S. Business Outlook

Near-term prospects for business are for further softness, but the recession now in progress probably will be mild and by the second-half of 1961, the economy will have reversed the downward movement. This comment was made by the economist for Tricontinental Corporation, the largest U.S. investment company and the Broad Street group of mutual funds in the *Business Situation*, a monthly review prepared for the management of the investment companies by the economics department under the direction of Dr. J. W. Harriman. Reports during November continued to reflect contraction in the economy, Dr. Harriman said. "Leading economic indicators are still pointing down".

Increase in European Capital

Mr. Per Jacobson, Managing Director of the International Monetary Fund, has said that he expects Europe to have more capital available in years to come for investment abroad, including in the United States. Europe could presumably repurchase assets now owned by Americans in Europe, and take a larger part in assisting the less developed areas, Mr. Jacobson said in a speech prepared for delivery to members of the U.S. Institute of Life Insurance at their annual meeting. Although there has been a "less pessimistic" evaluation of the U.S. balance of payments problems and a calmer attitude in recent weeks on the foreign exchange and gold markets, Mr. Jacobson said that the United States could not expect any immediate relief for its balance of payments. "This country will still have to continue with cautious fiscal and credit policies and watch the trends of costs", he said. He believed it would be beneficial if the United States abolished the Federal Reserve System obligations to minimum 25 percent gold backing against notes and deposits, and at the same time, remove the limitation of a rate of interest of 4¼ percent on the issue of Government securities with a maturity of more than five years. Mr. Jacobson said that recently there had been signs of moderation of the boom in Europe and of a further relaxation in business activity in the United States. But in certain fields business conditions in the United States were today "somewhat healthier than they were a year ago". He did not think the recent relaxation in the U.S.A. could be compared with a cyclical decline in business activity.

Stocks and Shares

EQUITIES DRIFT DOWNWARDS IN RESTRICTED ACTIVITY

ASSOCHAM SPEECHES CAUSE MILD ANXIETY

Wednesday Evening.

HAVING for some days not known which way to look, the Calcutta stock market has decided to look down during the past week. Equity prices have been drifting to lower levels, not because investors are on the rampage to sell, but rather because they see no reason to buy. Some of them presumably are having difficulty in adjusting their share advances from banks ; others have been reminded by the Central Finance Minister's presence in this city that Budget time is approaching and, as he himself confessed, his major preoccupation at the moment is how the resources are going to be found for the third five year plan.

This confession was made during the major event of the week—the annual general meeting of the Associated Chambers of Commerce on Monday. The stock market did not expect major policy announcements to be made there, and indeed none were. But it did expect that, in view of the acute shortage of external resources, Mr. Desai might say something to encourage the inflow of private foreign investment. He did not. On the contrary, the two main points which stood out in his well-delivered speech were bearish in implication, even if they were not exactly new.

The first point was that Mr. Desai does not think there is very much he can do to reduce the burden of personal and corporate taxation. Why the stock market should react bearishly to a statement such as this, will probably be beyond the understanding of many ; one would have thought that the prospect had already been explained in fair detail in the draft outline of the third plan. But perhaps what has really worried operators is the Finance Minister's statement that he is not concerned with what tax concessions other capital-hungry countries give ; he is not going to enter any worldwide race to lure investors with fiscal carrots.

The second point has perhaps been more bearish. It has been so because it highlights the seriousness of the foreign exchange shortage. The very logical plea was made that, when allocating foreign exchange, the Government should try to keep existing industries running to full capacity with an adequate supply of imported raw materials and components ; only after these requirements have been satisfied should exchange be allocated for starting new projects. The Finance Minister's reply to this was succinct. He said that very often the Government does not have the freedom to decide whether raw materials should be imported for old industries or capital goods for new ones. Maintenance imports have to be paid for out of what the country earns from its exports—which are too small. On the other hand, much of the foreign aid which comes is "tied" to specific projects, and cannot be diverted for buying raw materials.

The implication of all this has been fairly simple to Lyons Range. It is that many existing industries will have to keep running below their full capacity unless exports increase sharply or unless more "untied" foreign aid is received. The rise in exports is nowhere in sight ; some bally-hoo has been heard during the past week about India's exports reaching a record level during 1960, but the fact is that the increase is pretty small and it is due mainly to higher prices, not larger volume. As for getting "untied" loans from abroad, the prospects are dismal, partly because India's gay abandon in spawning white elephants has not met with universal approval.

All this may sound rather bearish, so it is necessary to enter the qualification here that the stock market has been doing no more than slowly reconciling itself to the long-known facts of the economic situation. The process of reconciliation should now be nearing completion ; in that case, stability at the lower levels may be foreseen. Nobody expects a spectacular burst of activity after the hangover of Christmas week passes ; thoughts of the Budget will still be there to subdue any possible extravagance among the bulls. But, at the same time, the growing tempo of discussion on the third five year plan may serve to buoy investors' spirits as they reassess the growth prospects for their companies. Today's settlement has passed off uneventfully.

Indian Iron have tended downward for the greater part of the week before closing at Rs. 23.16. The statement made by the chairman, Sir Biren Mookerjee, at the annual general meeting of the Company last Thursday, contained few encouraging features (it is reviewed more fully in the "Current News and Comment" of this week's *Capital*). Other engineering issues have drifted lower in sympathy with the market leader, including such recently fancied scrip as Guest, Keen, Williams and Indian Oxygen.

Price movements in the coal section have been narrow, the little interest still being concentrated selectively on such shares as Bengal, Burrakur and East Indian.

Jutes remain neglected, in spite of the sharp rise in gunny prices this week following the announcement of the Indian Government tender for sacking bags for extra-quick delivery. Rumours that measures are being devised so as to compel the mills to sell jute goods more freely, have worried investors.

Among miscellaneous issues, a large parcel of Rohtas shares has changed hands, and it is reported that the technical position of the scrip is better as a result. Karanpura Development, which attracted a good deal of speculative buying recently, have now eased on profit-taking. Sone Valley Cement are disappointed by the latest report and accounts. Indian Steel and Wire Products have shown little reaction to a satisfactory report. Dyer Meakin are strong because the Company's results have been excellent.

Tea shares are quiet.

Cherra-Chhatak Ropeway

The profit of Cherra-Chhatak Ropeway Co. Ltd for the year ended 31st March, 1960, amounts to Rs. 97,508, against a loss of Rs. 21,416. An ordinary dividend of 45nP a share, subject to deduction of income tax, has been declared, absorbing Rs. 42,750. This is covered more than twice and offers a yield of 9.4 percent at a price of Rs. 4.81 a share. The dividend was passed over in the previous year. A sum of Rs. 44,000 has been allocated to provision for income tax. After making other adjustments, an amount of Rs. 3,674 has been carried forward. The balance-sheet shows that fixed assets amount to Rs. 1.39 lakhs and current assets to Rs. 4.92 lakhs. The Company's reserves and surplus total Rs. 4.77 lakhs. Coal raisings increased from 23,900 tons to 26,754 tons and deliveries from 23,051 tons to 27,157 tons.

Arrah-Sasaram Light Railway

After providing Rs. 75,713 for depreciation (against Rs. 55,779) and Rs. 1.44 lakhs for taxation (against Rs. 1.23 lakhs), the profit of the Arrah-Sasaram Light Railway Co. Ltd for the year ended 31st March, 1960, has increased from Rs. 67,149 to Rs. 1.04 lakhs. The Company has declared an ordinary dividend of 5 percent, subject to deduction of income tax, against 3 percent, tax-free, in the previous year. This offers a yield of 14.3 percent at a price of Rs. 35 a share. A sum of Rs. 4,013 has been carried forward, against Rs. 8,938 brought in. The balance-sheet shows that fixed assets amount to Rs. 34.94 lakhs and current assets to Rs. 73,296. The Company's reserves and surplus total Rs. 6.04 lakhs.

Naga Hills Tea

The Naga Hills Tea Co. Ltd has earned a profit of Rs. 2.84 lakhs for the year ended December 1959, against Rs. 1.98 lakhs in the previous year. A taxable ordinary dividend of 5 percent has been declared, compared with 5 percent, tax-free, in the previous year. Depreciation absorbs Rs. 16,244 (against 13,559). Taxation reserve is allocated Rs. 1.14 lakhs and reserve fund Rs. 50,000. Making various adjustments and bringing in a debit balance of Rs. 31,552, there is a carry-forward of Rs. 68,932. Production amounted to 9,215 maunds (against 9,004 maunds). The average sale price was Rs. 1.90 (against Rs. 1.75 a lb). Estimates for

the current year provide for a crop of 9,000 maunds at a cost of Rs. 11.30 lakhs.

Chaparmukh-Silghat Railway

The Chaparmukh-Silghat Railway Co. Ltd has earned a gross profit of Rs. 4.03 lakhs for the year ended March 1960, against Rs. 3.78 lakhs in the previous year. A dividend of Rs. 2.90 a share, subject to deduction of tax, has been declared, and it absorbs Rs. 89,900. The previous year's dividend was Rs. 2 a share, tax-free. After making various adjustments, there remains a balance of Rs. 8,276, which is carried forward, against Rs. 14,071 brought in.

Bombay Market

BUDGET FEARS BRING QUIETER CONDITIONS

CREDIT STRINGENCY ALSO CURBS ACTIVITY

Wednesday Noon.

THE Bombay stock market was quiet during the past week and transactions were much diminished. Fluctuations were moderate and mixed. Operators were busy adjusting their year-end accounts and have been upset by fears of further taxation in the coming Budget. It was feared that the foreign exchange shortage might reduce the imports of foreign raw materials further. In fact, rayon shares dipped substantially on rumours that the imports of rayon pulp would be reduced considerably in the near future. The growing shortage of credit because of the increased busy season demand restrained activities.

Tata Steel were sluggish around Rs. 140.25 and Indian Iron declined to Rs. 23.08 on a careful assessment of the future outlook made by the chairman of the Company in his statement to shareholders at the annual general meeting held in Calcutta last week. Engineering shares were subdued, and Alcock Ashdown declined to Rs. 238. Tata Locomotive were available at Rs. 294 and Premier Construction were lowered to Rs. 289. Larsen and Toubro lost at Rs. 35.25 Motor shares were quiet, and Hindustan Motor declined to Rs. 19.64. Premier Automobile were sold down to Rs. 164.

Except for a temporary flutter in Century on professional support, cotton mill shares were subdued on further cuts in prices of cloth and yarn. Century closed at Rs. 454 and Bombay Dyeing were offered freely at Rs. 60.80. Kohinoor lost at Rs. 265 and Simplex were dealt in at Rs. 160. Svadeshi came to hand at Rs. 224 and Khatau were done at Rs. 452.50. India United ordinaries were sold down to Rs. 13 and Apollo were quoted at Rs. 1.30 without attracting any interest.

Prices of miscellaneous shares were softer in the absence of support. Sugar shares were sold on the apprehension that companies would be affected by the proposal of the Maharashtra Government to impose ceilings on agricultural landholdings. Belapur drifted back to Rs. 340 and Phalton were quoted lower at Rs. 161.50. Walchandnagar Industries were offered freely at Rs. 250. Steamship company shares were quiet and sellers predominated. Scindia Steam declined to Rs. 14.68, as did Great Eastern Shipping to Rs. 15.20. Mining shares were quietly steady and business passed in Shivrajpur Syndicate at Rs. 70.50. There was little interest in cement shares and prices were lower where changed. Associated Cement were dealt in at Rs. 149 and Digvijay were transacted at Rs. 145. Bombay Burmah reacted to Rs. 599 on profit-taking and National Rayon fell sharply to Rs. 477 on selling pressure. Gwalior Rayon lost at Rs. 39.50. Voltas met with scattered support at Rs. 262.50 and Tata Oil were done at Rs. 73.50. Chemical shares were quiet on the view that the working of companies might be hampered by cuts in the import of foreign raw materials. Tata Chemical were quiet at Rs. 16.64 and Indian Dyestuff declined to Rs. 436.25. Shares on the cash list lost further ground, and Premier Tyre were quoted lower at Rs. 79. Ceat Tyre were offered at Rs. 212.50.

Banking and insurance shares were quiet. Central Bank of India declined to Rs. 53, as did Bank of Baroda to Rs. 82. New India Assurance were available at Rs. 53.50.

Electric supply company shares were neglected. Ahmedabad were sold down to Rs 85.20 and Tata Hydro were quoted at Rs. 102.50. Bombay Suburban were placed at Rs. 85.50.

Madras Market

BUSINESS DECLINES ON LACK OF INTEREST

CLOTH PRICE CUTS HIT SENTIMENT

Wednesday Noon.

THERE was a substantial decline in turnover in the Madras stock market during the past week and business was reduced almost to a trickle. Interest was lacking because operators could not take any constructive view at the present time. Further cuts in prices of cloth and yarn subdued sentiment. Prospects of further taxation in the coming Budget restrained activities.

Turnover in Government securities was limited because institutional support was absent. Banks were busy in window-dressing their balance-sheets in view of the year-end closing of accounts. Planting shares were quiet on uncertainties concerning the marketing outlook. Coffee shares were subdued on the view that there would be excessive supplies in the near future. Except for scattered interest in selected miscellaneous industrials on good corporate news, there were more sellers than buyers and prices drifted downwards.

Among public utilities, business passed in South Madras at Rs. 10 and in Ellore at Rs. 16.55. Berhampur were transacted at Rs. 6. In the banking group, Indian Overseas were dealt in at Rs. 180 and Indian were done at Rs. 170.

Sellers predominated in sugar shares at lower levels. E.I.D. lost at Rs. 42 and Deccan were sold down to Rs. 15.45 India were dealt in up to Rs. 12.25 and K.C.P. were transacted at Rs. 26. United Breweries were steady at Rs. 114.50 and scattered support was taken in Mysore up to Rs. 60.50.

Among planting shares, Blue Mountain were quoted at Rs. 4.15, as were Cochin Malabar at Rs. 6.95. Consolidated Coffee were taken at Rs. 23 and Ouchterlony were placed at Rs. 4.70. Business passed in Periakaramalai up to Rs. 3.37 and Chembra were in demand up to Rs. 5.48 on the decision to issue bonus shares in the proportion of one new share for every two held. Chandramalai were transacted at Rs. 3 on paying a taxable dividend of 10 percent. Neelamalai were quoted at Rs 4.80 on declaring a taxable dividend of 7½ percent. Nelliampathy were done at Rs. 2.82 on paying a taxable dividend of 30 percent. Panchura were steady around Rs. 5.10 on the payment of a taxable dividend of 40 percent. Sheveroy were dealt in at Rs. 1.87 on declaring a taxable dividend of 9 percent. Kil Kotagiri were steady at Rs. 5.30, as were United Nilgiri at Rs. 23.31.

In textile shares, Lakshmi were soft at Rs. 149 and Madura were quoted lower at Rs. 34.70. Travancore Rayon declined to Rs. 33 on selling pressure and Coimbatore Spinning were soft at Rs. 43.25 on fears that the dividend might be passed over. Bangalore Woollen were quoted lower at Rs 197.25 and Buckingham were placed at Rs. 198. Kothari were indicated at Rs. 11.80 and Premier were done up to Rs 225.

Among miscellaneous shares, Ashok Leyland were quoted at Rs. 8.12 ex-rights and the Company has issued 3.4 million ordinary shares of Rs 5 each. Aluminium Industries were placed at Rs. 22.40. India Cement reacted to Rs. 5.83 ex-rights and the company has issued 1.5 million ordinary shares of Rs. 5 each. Mysore Industrial and Testing Laboratories were steady at Rs. 8.02 ex-rights. The Company has declared a taxable dividend of 16 percent and has issued 93,750 ordinary shares of Rs. 5 each at par Seshasayee Paper were steady at Rs. 5, as were Spencer at Rs. 22.62. Standard Motor were done up to Rs 17 and business passed in Textool at Rs. 189. Tube Investment were steady at Rs. 291 and Parry's Confectionery were in demand up to Rs. 5.30. F.A.C.T. were sold down to Rs. 9.75 and Enfield were dealt in up to Rs. 15.75.

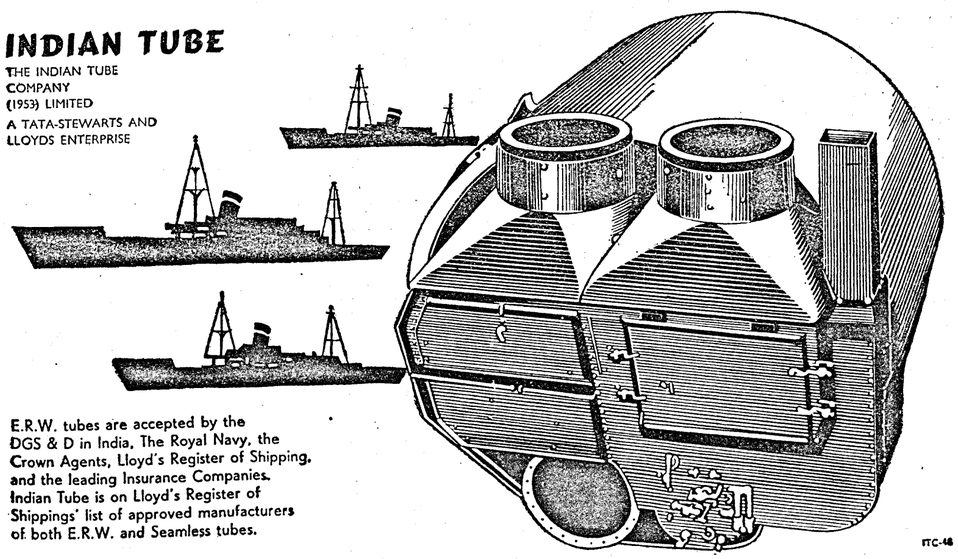
E.R.W. MARINE BOILER TUBES

Recognised for their outstanding performance E.R.W. steel boiler tubes, manufactured by Indian Tube, are specially designed for protracted use in land, loco and marine boilers. High frequency current ensures efficient welding, and normalising is carried out in controlled atmosphere furnaces to produce a ductile tube with a smooth, blue finish. Rigid quality control from the raw material stage to the finished product guarantees that Indian Tube's E.R.W. tubes will meet all the tests specified by Lloyd's Register of Shipping. E.R.W. tubes are, in every respect, the equivalent of seamless tubes of similar dimensions.

INDIAN TUBE

THE INDIAN TUBE COMPANY (1953) LIMITED
A TATA-STEWARTS AND LLOYDS ENTERPRISE



E.R.W. tubes are accepted by the DGS & D in India, The Royal Navy, the Crown Agents, Lloyd's Register of Shipping, and the leading Insurance Companies. Indian Tube is on Lloyd's Register of Shippings' list of approved manufacturers of both E.R.W. and Seamless tubes.

ITC-48

MEETING OF ASSOCIATED CHAMBERS

TEXT OF RESOLUTIONS ADOPTED

AT the annual general meeting of the Associated Chambers of Commerce of India in Calcutta this week, the following six resolutions were adopted unanimously:

Encouragement of Foreign Investment—Bombay Chamber of Commerce and Industry. Recognising that large foreign exchange resources are essential to the success of the third five year plan and that additional private foreign investment can make a substantial contribution to India's industrial development, the Associated Chambers of Commerce of India are nevertheless conscious that India is only one of the many under-developed countries in need of investment from abroad and are concerned lest India's attractions as a place for investment be subordinated to the no less pressing demands of these other countries. While appreciating the scope of existing incentives to industrial development, the Chambers consider that their value is largely offset by aspects of the tax structure and by the degree of regulation and control of corporate enterprise which is in excess of what many potential foreign investors can be expected readily to accept. The Chambers, therefore, draw the attention of the Government to the need for early action to remove deterrents and re-consider incentives with the object of attracting the volume of investment which could and should be achieved from foreign investors.

Power Supplies—Madras Chamber of Commerce. The Associated Chambers of Commerce of India note with apprehension the evidence, in the shape of power cuts, rationing of power supplies and inability to give power to new consumers, of increasing strains on the country's electrical power resources and the indications that power shortage is alredy a major factor inhibiting the proper growth of industrial enterprise in most areas of the country. Convinced that urgent action is now necessary to ensure adequate supplies throughout the third five year plan period, the Chambers recommend:

(a) a comprehensive review of the country's requirements of electric power and of the measures necessary to fulfil them;

(b) the granting of a high priority to the allocation of foreign exchange for the import of the necessary generating and other plant and equipment; and

(c) consideration of measures whereby the electric supply industry can be enabled to expand its existing resources, particularly by a reappraisal of the restrictions imposed by the Electricity (Supply) Act to enable that strengthening of company finance which expansion requires.

Transport and Communications—Bengal Chamber of Commerce and Industry. While acknowledging the action taken by the Government of India to deal with many aspects of the problems of transport and communications, the Associated Chambers are concerned at the indications that the expansion of all forms of transport and of the necessary ancillary works is not keeping pace with rapidly increasing movement requirements. They are perturbed by the failure in some quarters to make use of existing equipment and facilities to the full and by the costly and wasteful interruptions to production and distribution which result. They, therefore, urge that:

(a) further steps should be taken to expand railway facilities to meet growing requirements for the transport of raw materials needed as a result of the increase in steel and mineral production, and that, in the meantime, particular attention should be paid to improving movement facilities and co-ordination of traffic and wagon movements, particularly at ports and at the main industrial centres;

(b) early action should be taken on plans to supplement the capacity of all ports and to improve port working by the provision of additional mechanical equipment, with particular emphasis on the handling of bulk cargo, by the introduction of incentive schemes for labour, where necessary, and by a general improvement in port administration;

(c) urgent attention should be given to the improvement of facilities for road transport, particularly by raising the standard of and completing the national highways, increasing the number of new feeder roads, removing administrative difficulties in the inter-State carriage of goods by road and reducing taxation on road transport vehicles;

(d) the use of coastal shipping services and the development of inland water transport in order to relieve the railways of some of the burden of increased traffic, should be accelerated.

Implementation of Agricultural Policy—Upper India Chamber of Commerce. Having noted with appreciation the successful arrangements made by the Central Ministry of Food to ensure adequate stocks of cereals over the next four years, the Associated Chambers of Commerce of India urge that the efforts of the Central and State Governments to augment agricultural production should nevertheless be intensified as a matter of first importance and priority. The means by which agricultural production may be improved, particularly by the greater use of existing irrigation facilities, improved strains of seed, the more general and intensive application of fertilisers and manure, the introduction of efficient storage methods, and the wider resort to the use of plant protection measures, are now generally appreciated. The Chambers, therefore, consider that the emphasis in policy should be on bringing such means within the reach of cultivators. With this object, the Chambers recommend that the national and State agricultural administrative machinery should be overhauled as a matter of urgency in order to ensure that the policy for agriculture is implemented with practical efficiency, especially at the district level.

Need for Higher Productivity and Efficiency—Punjab and Delhi Chamber of Commerce. The Associated Chambers of Commerce of India consider that it is vital, in the present circumstances of development in India, to make the most intensive and economic use of the limited available resources of plant, machinery and trained technical and managerial personnel. They, therefore, urge that renewed attention be given to the various measures by which increased productivity from existing resources can be stimulated and the maximum outturn from existing factors of production achieved. In particular, they invite attention to the deleterious effects of the present inadequate supplies of raw materials and essential spare parts resulting in low productivity and under-utilisation of existing installed capacity. Attention is also drawn to the widespread need for the general adoption of incentive schemes accompanied by measures to emphasise to the public and organised labour that the real benefits of wage increases can only be achieved by increased productivity.

Labour Relations—Madras Chamber of Commerce. The Associated Chambers of Commerce of India attach the greatest importance to the improvement of direct relations between management and employees and to the evolution of realistic collective bargaining as an essential element in satisfactory industrial relations. They observe with regret the frequency with which such developments are frustrated by the activities of minority groups among workers or trade unions and by breaches of faith or agreements by irresponsible labour leaders. The Chambers accordingly urge that the appropriate departments of Government, both Central and State, should encourage and assist employers and workers in resisting the efforts of irresponsible or mischievous persons to disrupt or destroy agreements or settlements voluntarily made or to interfere in situations where satisfactory labour relations already exist.

DISCUSSION ON ASSOCHAM RESOLUTIONS

THE resolutions adopted at the meeting of the Associated Chambers of Commerce deal with a variety of subjects which have dominated the thoughts of trade and industry during the past year. Foreign investment understandably receives priority at a time when the shortage of external resources is acute. Deficiencies in the infrastructure which supports the working of industry are covered in the resolutions on power supplies, and on transport and communications. Important problems are dealt with in the two resolutions on productivity and labour relations. The need to raise farm production is stressed in the resolution on the need for implementing agricultural policy effectively.

Introducing the resolution on encouraging foreign investment, Mr. C. H. Campbell (Bombay Chamber) pointed out that the inflow of new private foreign capital in recent years has been extremely small. Potential investors are worried by political uncertainties, especially since governmental control over industry is extensive. Taxation is too heavy, and many of the incentives provided are to a considerable extent "self-cancelling." Decisions under the Industries (Development and Regulation) Act tend to be delayed unduly, and the company law is rigorous. The resolution was seconded by Sir John Brown (Bengal Chamber), who discussed in some detail the position of the foreign minority holder of capital in an Indian company.

Moving the resolution on power supplies, Mr. R. M. King (Madras Chamber) declared that the shortage of electricity in Madras State is likely to grow. A comprehensive survey of the country's power requirements and resources is urgently necessary. If enough electricity is not available, industrial expansion will suffer, so more foreign exchange should be allocated for power development schemes. Seconding the resolution, Mr. F. C. Badhwar (Punjab and Delhi Chamber) said that the inadequacy of power supplies throughout the country is becoming more acute. Mr. N. Stenhouse (Bengal Chamber) added that the standard rate of return fixed for electricity undertakings should be raised.

The resolution on transport and communications was proposed by Mr. H. Mackay Tallack (Bengal Chamber), who said that the railways have handled more traffic this year, but their achievement falls considerably short of the target set under the second plan. The inadequacy of transport facilities for coal has been glaring. Railway development needs to be pushed forward vigorously, and a small permanent board should be set up at the Centre to co-ordinate the growth of all forms of transport. Mr. N. M. Wagle (Bombay Chamber), who seconded the resolution, spoke about the difficulties experienced at Bombay port and in western India generally. Mr. D. W. Law (Cochin Chamber) pointed out that the operating efficiency of the railways has decreased.

Moving the resolution on agricultural policy, Mr. H. L. Khanna (Upper India Chamber) said that there should be greater co-ordination between the Central and State Governments in implementing schemes for raising agricultural production. It is no use addressing scientific orations to farmers. They should be shown the value of improved methods of cultivation. The Centre and the States should make an intensive effort to raise rural productivity in selected areas; and they should then see to it that the results are brought to the notice of cultivators elsewhere. The resolution was seconded by Mr. E. F. G. Hunter (Madras Chamber), who said that "the strengthening of the personnel of the agricultural department is the first imperative; there should be an agricultural officer in each *taluk*, with an adequate number of demonstrators under him." More care needs to be shown in choosing and training officials for work among farmers.

Introducing the resolution on productivity, Mr. H. C. Mahindra (Punjab and Delhi Chamber) said that in recent years, the question of raising productivity has received greater attention. But the practical results so far have been "distressingly meagre." The work of the National Productivity Council needs to be greatly intensified, so that the population becomes more productivity-conscious. At present, there is a widespread reluctance to accept changes and experiments aimed at improving efficiency. Labour, in particular, is often afraid that as a result of such changes, the work-load will increase or employment will shrink. This is the sort of attitude which has to be discouraged. Seconding the resolution, Mr. J. M. Lall (Bengal Chamber) emphasised the need to reduce production costs; this cannot be done, he added, if labour refuses to produce more or work on incentive schemes, and if the size of manufacturing units is restricted to uneconomic levels.

Proposing the resolution on labour relations, Mr. E. F. G. Hunter (Madras Chamber) declared that sound relations with employees can be built only on the foundation of the spirit of collective bargaining, without the intervention of the Government or any outside authority. At the same time, collective bargaining is unlikely to be fruitful if workers are represented by more than one union, particularly since the unions usually have different political affiliations. Where there is already a representative union in a factory, the registration of a rival union should not be permitted. The Government should not take cognisance of a dispute raised by a minority union for terminating an award or an agreement. Effective action should be taken against the leaders of unions who promote illegal strikes. The code of discipline in industry has to be applied rigidly and impartially if it is to be effective. The resolution was seconded by Mr. K. M. Wilcox (Upper India Chamber), who said that if the Government wishes to improve relations between management and labour, there should be a scrupulous enforcement of the labour code in undertakings belonging to the public sector.

PROFESSOR GALBRAITH STRESSES NEED FOR BIGGER SURPLUSES FROM STATE CONCERNS

SUBSTANTIAL FOREIGN AID FOR INDIAN COAL INDUSTRY

(FROM OUR NEW DELHI CORRESPONDENT)

PROFESSOR Galbraith's name is being mentioned as the next U.S. Ambassador to India. The professor was in this country in April last year, when at the instance of the Planning Commission, he submitted two notes—one on foreign resources for the third plan and the other on the rationale of Indian economic organisation. These notes should be read with special interest in view of his possible assignment in New Delhi.

Discussing foreign resources for the third five year plan, Professor Galbraith said: "Before coming to India, I had concluded that much of the preliminary thinking on the third five year plan was concerned with avoiding the problems and crisis of the second plan. The men of sound judgment, those inveterate gamblers of our time, were arguing successfully that India with her rapid increase in population and her even more rapid increase in aspirations, should try the reckless experiment of economic stagnation. I am vastly pleased, now that I am here, to see that there is a strong contrary view. Whether a Rs. 10,000 crores plan, a figure on which discussions seem to be settling, is the proper size, I cannot say. The strain on resources will always be great. But such a plan would be smaller relative to what is available than the second plan. However, it is not my purpose to comment further on this except to say that any safe, sound and indeed, any tolerable plan must be big.

"I would like to comment on the discussion of foreign resources and foreign aid in the preliminary papers I have seen. Of the total investment of Rs. 10,000 crores, it has been suggested that Rs. 1,000 crores are to come in the form of grants and loans from abroad. (This is in addition to the sum of Rs. 400 crores to Rs. 500 crores which may be required for meeting the obligations falling due during the third plan period on account of foreign loans incurred during the second plan.) This compares with a probable Rs. 1,400 crores in the present plan. It would be 10 percent of total net investment and 18 percent of the increase in gross national product during the plan period. In the present plan, foreign aid will be about 23 percent of net investment and 55 percent to 60 percent of the increase in product. On these comparative grounds, the figure of Rs. 1,000 crores for foreign assistance does not look excessive. Nevertheless, the planning papers and discussion seem to be defensive on this figure. It is suggested that foreign assistance is to be cut sharply in the later years of the third plan. And a major aim of this plan period is to make India independent of such assistance. The arguments for this are several: dependence on loans and grants will jeopardise India's political independence; the debt is becoming excessively burdensome. Interest and repayment are a heavy burden on the balance of payments. It is not surprising that anyone who argues for independence of overseas grants or loans wins immediate approval. However, so many dubious and false propositions are implict in these seemingly impeccable conclusions that the critic has a sense of surfeit.

Political and Moral Questions

"The political and moral questions may be disposed of first. It is unlikely that India, having escaped the British Raj, will succumb to the control of its creditors. Among the ominous figures in Indian history, Eugene Black is unlikely to rank with Robert Clive, Warren Hastings or even the late Lord Curzon. It is true that in the past some small countries have been taken in hand for their debts, but this is not the fate of great nations. Had it been so, the United States in the nineteenth century, always a large debtor and sometimes an unreliable one, would have succumbed to Baring Bros. Creditors will always presume to make suggestions to debtors. Debtors, if they are otherwise strong, need not hear or fear. Some articulate Americans are unquestionably troubled by Indian socialism. But as many, and I am sure many more, defend India's right to make her own choice in her own way.

"Some of the Indian objections to grants and loans is evidently moral. They proceed from what in the United States are called the copybook maxims. 'Neither a lender nor a borrower be.' However, this cogent advice has never been followed by those who have won wealth. Those immoral but practical souls have always borrowed liberally. The moral precepts covering debt and assistance reflect mostly the desire of the well-to-do to be relieved of responsibility for the poor. How much better if they live with austerity and look after themselves. These are not necessarily the precepts for a developing country.

"It is quite true that service charges on loans are increasing. In the current year, they are Rs. 23 crores. In the second year of the third plan, according to some preliminary projections, they may reach a peak of Rs. 100 crores. But, save in the fiscal imagination, these are not a unique or a decisive element in the balance of payments. They must be covered. But so much the growing payments for oil. Should the burden become too severe, arrangements can always be sought, at least on the Government loans, for extending periods of repayment. There is no crime in this. It is frequent commercial practice. Such extensions, as far as inter-governmental loans are concerned, might be easier to arrange than new borrowing.

Foreign Resources

"I come now to the affirmative case for employing foreign resources to the full. Growing countries have almost always borrowed. Even Russia has frequently indicated its desire to do so. The purpose is not to save resources for internal consumption, and this should not be the goal. (Belts cannot, of course, be tightened when there is nothing under them and people cannot afford them in any case.) Rather foreign resources increase the pace of advance and provide capital equipment which is not available in the country and which would not be paid for from ordinary foreign exchange earnings. Repayment is from the earnings of the capital. Since this claims only a part of the returns on sensible investment, there is a net gain from the transaction. In the last century, private capital nourished the development of many countries. At present, it confines itself, certainly in professedly socialist countries, to a rather narrow range of oil, mineral and marketing activities, combined on occasion with promises of future wonders that have a rather low cash value. Government-sponsored capital movements have, accordingly, taken the place of private capital movements. Whether good or bad, this is the modern form of capital movement. It is here to stay, and must now be regarded as perfectly normal and natural.

"At the same time, since the second World War, the richer countries, in one of the rare improvements in the human conscience, have come to feel some responsibility for helping the poorer lands. The motivations are complex. Arcane strategic calculations are combined with a sense of uneasiness and even guilt over the great and growing difference in affluence. But I think it possible to conclude that kindness and compassion are not wholly absent. If there has been an improvement in the human conscience, it should obviously be welcomed, encouraged, cherished and used. So both government loans and government grants should be considered a normal aspect of modern international relations. If the Indian Government by some false calculation or some misplaced morality fails to exploit them fully, it does a disservice to its own people, to other needful countries and perhaps even to the souls of those who are impelled to provide the assistance.

Capital Imports

"In the past, it was not the growing burden of debt and not the burden of transfers on the balance of payments which brought an end of capital imports. It was the increase of wealth and well-being. Speaking very broadly, increased well-being meant a declining urgency of consumption, and increase in savings. More domestic resources were thus available for investment. Presently some became available for export. Obviously, if this historical criterion of when there is an end to borrowing is taken as a guide, India will be in no such happy position by the end of the next plan. Consumption will still be meagre. Savings will still be relatively small. Capital imports, if less irreplaceable than before, will still be capable of making a major contribution to growth. Their hands should not now be tied by a policy which seems to exclude this opportunity. Nor should present policies have the effect of making such future borrowing seem an admission of failure or a miscarriage of plans. For all these reasons, the emphasis in current discussion on eliminating capital imports by the end of the third plan is wrong.

"The effort to make India independent of foreign assistance needs to be distinguished from the effort to reduce dependence on imported capital goods. The latter is a natural and desirable consequence of industrial development. It is assisted by measures which ensure balanced growth. And once India has engineering, machinery, electrical and similar industries, there is a greater certainty that growth can continue in the absence of capital imports. But achieving this stage does not mean that capital imports contribute less to growth. It is merely that they are no longer imperative. Depending on circumstances, they will contribute less, as much or more than before. There is no rule.

Value of Big Plans

"A plan is not only a projection of intentions and an assurance of internal consistency in what is attempted. It is also a goal. By its existence, it stimulates effort and acts as a lodestone to accomplishment. This effect of the plan on domestic energies is well recognised. The larger the goals, the larger the effort in mobilising resources and in getting them used. Taxes are increased and consumption postponed only when there is a need to do so. A big plan creates the need. Democracy being what it is in India and elsewhere, we can be sure that a plan that produces no crisis is a plan that is too small. The crisis brings the required effort.

"The same considerations hold about foreign resources. In the case of the United States, the amount of foreign aid provided is not based on a refined calculation of what as a people we can forgo from domestic consumption, or what taxes we can pay, or on what spending we can afford without inflation. These matters are all raised in the foreign aid debates, but for their orchestral not their economic effect. (In the recent recession years, more foreign aid might have meant higher domestic consumption, except that the amounts involved are not large enough to have a recognisable effect on the total U.S. economy.) As far as any historical and arbitrary figure can be rationalised, the amount of foreign assistance voted by the U.S.A. is a consequence of the size of the request and the urgency of the need. But both the size of the request and the urgency of the need are related to the size of the plan. If the second five year plan had been smaller, the ensuing crisis would have been milder, the requests for aid would have been smaller and the pace of development would have been slower in a country where to many people it must already seem terribly slow. As it was in the last plan, so it will be in the next. The amount of the aid will depend on the size of the crisis. The U.S. Congress awards no prizes for modestly-conceived and neatly-executed plans. Neither do other governments for whose increasing participation we must hope.

"In a few countries—Israel and Yugoslavia are two—there has been increasing recognition, at least by individuals, of the necessity and the virtue of a large balance of payments deficit for a long time to come. Anything else means that opportunities for growth are being traded for the barren applause of those who mistake fiscal respectability for economic progress. I would hope that an increasing number of Indians would also take a rational view of these matters. And such a view should not be concealed by double talk—by coupling defence of capital imports today with resounding promises of balance tomorrow. People in both the receiving and the providing countries need education in these matters. Moreover, for all expedient arguments, there is a day of reckoning. Aid should not be defended today by arguments that will cause difficulty and misunderstanding a few years hence. Even the basic strategy of the plan which is that large size makes for large effort at home and establishes the basis for larger claims on foreign resources should not be concealed. This will trouble those who advise small plans, the cautious avoidance of crisis and small effort. But these men are intended by nature to be troubled."

Indian Economic Organisation

As for the rationale of Indian economic organisation, Professor Galbraith says: "Returning to India after an absence of three years, I am impressed by the progress in many directions. I must confess I am also impressed by the lack of progress in working out a rationale of Indian economic institutions. This seems to me the most urgent problem that India now faces. This note is more to state the problem than to suggest solutions, although I have a few solutions to suggest. The time has come when India must seriously consider the pattern and shape of her economic institutions. Matters that are now being regarded traditionally and piecemeal must, if this is possible, be viewed pragmatically and as a whole. Let me illustrate. The basic division in Indian economic institutions is between the public and private sectors. This distinction is commonplace in everyday discussion, as is the question of what industries and activities should be in the public sector. There is also a good deal of debate over co-operatives, small industries and other such issues. But there is very little public discussion of the organisation of the public sector. The decisive question is nationalisation. Once in public hands, things will work out. The real issue, to which the most attention is paid, is how to scrape together resources to establish or expand industries, especially in the public sector, and what the priorities should be. I venture the view that the public sector has reached the point where its organisation requires a great deal of attention. India has a kind of post office socialism which is out of date and which is working far less well than it should and must. Even a fairly brief stay at the actual sites of the new steel mills reveals numerous faults and further difficulties are on the way. Competent executives are frustrated and angry over the centralisation of purchasing, personnel and financial decisions in New Delhi. These delays are a source of discouragement to the younger engineering and technical personnel who should be showing great enthusiasm. The result is poor morale where it should be high.

"Moreover, people in the field feel no responsibility for the next steps in the development, i.e., for the enlargement of these plants. Nor is there much concern over how the present ones, when they come in, can be operated at low cost and with satisfactory earnings. Expansion is a matter for New Delhi. Presumably, the foreign engineers will be called in again. Nor is the economics of

plant operation a local question, although success or failure will be decided locally.

Earning and Investment in State Concerns

"The problem of earnings and investment in the public sector is especially urgent. Until now, the most difficult problem in Indian planning has been where to get resources for investment. In a competently guided country like India—as distinct from most Middle Eastern or Latin American countries—this, not administrative capacity, is the bottleneck. Everything turns, or seems to turn, on what can be mobilised in taxes and voluntary savings at home and what can be obtained in loans and grants from abroad.

"Obviously, a prime aim of India must be to plan its way out of reliance on such uncertain and exiguous sources of domestic savings. (Foreign resources present a somewhat different problem.) To give people income and then remove it by taxation, inflation or appeals to thrift is an inefficient and self-limiting procedure. In both the capitalist and the communist countries, investment is in very large measure from the earnings of the industrial enterprises. These accumulate a surplus which becomes available either for their own expansion or elsewhere. The enterprise thus assumes responsibility for both the technical side of its own growth and improvement and also for getting the requisite resources.

"Something very like this must happen in India as all Indian economists recognise. Industrial plants must take on their full job which is to be efficient producers and to accumulate the surpluses which will provide for future expansion. It is very important that these surpluses be immediately identified with such further expansion. Otherwise they may become the target of workers in the industry who can easily be persuaded that they have a privileged claim on them, and consumers may also insist on low prices as in the present case of rail passenger travel. The result will be small surplus (or none) and hence no resources from this source. That I have called post office socialism—public ownership that contents itself with avoidance of loss or a modest profit which it returns to the treasury—will inevitably prove a stagnant form of economic organisation.

"I now come to another and somewhat related point. The proper organisation of the great establishments is not the only problem of the public sector. There is also the task of generating effort and enthusiasm in small activities—those of the villages, extension blocks, cities and perhaps also the States. The need for this is well recognised and is, indeed, one of the recurring themes in Indian discussion. The best planning provides people with an opportunity for doing what is beyond the mind and even the imagination of the planners.

"But the things that arise here in the public sector—expanding local control over local public finances, the sponsorship and development of local industries, the organisation of volunteer labour effort, of co-operatives, the provision for a period of rural service by university graduates—have little relation to the problems of organising steel production or fertiliser manufacturing. They require a different organisation and, to a considerable extent, they call for a different type of mind. This type of public activity and enterprise will be blighted if it is too closely identified with ordinary large-scale industrial development.

Three Public Sectors

"We may think, indeed, not of one *public* sector but three. One sector is concerned with bringing totally new industries into existence. This has been the important sector so far—it has been creating such industries as electrical generation, fertilisers, iron and steel. The second sector, an outgrowth of the above, is concerned with the operation, expansion and regeneration of the existing industries and with providing capital for the establishment of new industries. Finally, there is the wholly different sector which seeks to develop local responsibility and the release of local energies. By way of making this more explicit, let me suggest in summary form, without extensive argument, what each sector involves. I hope this will not be taken as any sort of final suggestion but rather as a basis for discussion.

"(1) The three parts of the public sector may be denoted as follows: sector A—initiation; sector B—operation, expansion and financing; and sector C—spontaneous development.

"(2) The *initiation* sector will be concerned with the launching of *entirely* new industries. This, as in the past, will be a ministerial function. However, this does not preclude the granting of more autonomy of effort than at present to companies developing new industries. And existing public firms should often be called upon to foster and develop new ones. Still initiation is a distinct function. It calls for decision as to what and where, and in the early stages of creation of an industry, considerations of efficiency and earnings are not vital. It is getting things started which counts. This stage of initiation has parincipally characterised the industrial public sector in India up to this time. However, a new phase is rapidly approaching.

Selection of Managers

"(3) The *operation, expansion* and *financing* sector embraces those industries which are now fairly launched. While in the initiation sector, a considerable measure of ministerial initiative and supervision may be necessary, in the *operation, expansion* and *financing* sector, ministerial supervision and intervention must shrink to a minimum. Civil service decision-making is inevitably and properly slow and deliberate and demanding in quality. Operating decisions must be prompt and they need not always be right, for most such decisions are reversible. So ministries have as their principal function selection of good managers supported by competent (though not powerful) boards and the provision of firm but workable rules by which the public enterprises shall live. (Covering, in particular, recruitment and labour relations, accounting and financial procedures and procurement policies. While the rules should effectively exclude dishonesty and favouritism, it should be remembered that excessive precautions can be very costly. Rules should be enforced not by advance clearance but by post-audit.) Beyond this, ministries must hold the companies responsible for results. To this end, officials should never be members of the boards. If they are, the autonomy of the enterprise will almost certainly be lost as the board becomes a link in the civil service hierarchy. Parliamentarians must have clearly in mind that when they question individual decisions of companies, they force ministries to protect themselves by asking for advance knowledge and approval of all decisions. This destroys the autonomy and hence the effectiveness of the public enterprise. And again, it must be stressed, the public enterprise must be free even to make mistakes, for these are inevitable in efficiently rapid decision-making.

"(4) The success of the *operation, expansion* and *financing* sector will be measured broadly by the efficiency of its operations—its ability to organise ample production at low cost and to sell at remunerative prices. (Control of prices is a separate chapter. To the largest possible extent, they should also be under the control of the enterprise. Then prices will not be an excuse for low earnings. This decentralisation of price-making has been a major accomplishment of recent Yugoslav experience. However, there will be cases, electricity and doubtless steel are examples, where central or group price setting are inescapable.) *This means that* there will be earnings—profits—*and these are the most important test of* the effectiveness of public enterprise. (As a measure of performance, Russia attaches about the same importance to profits as the U.S.A.) Production is not the only task. The existing concern is also the logical agency to undertake expansion in its own line and even to bring into existence related industries. When it is efficiently organised for operation, it will usually be efficiently organised for expansion. *In any case, it will be* more effective for this than a wholly new, inexperienced and untested organisation.

Financing Function

"(5) Expansion and operation in this sector should be tied together by the financing function. When a firm is given an expansion target, it should be asked to prepare a plan for financing it. This plan would have the first claim on earning. It would come to the Government only for what would not be supplied from earnings. If the expansion schedule does not absorb all the planned earnings, these should be used to repay capital and thus become available for investment in other industries. A public development bank is a logical part of this sector.

"(6) These accounting procedures, which incidentally are also broadly common to capitalist and socialist countries, have the great virtue of keeping the essential character of the enterprises and their tasks in the public view. Thus if the enterprise is obliged to use its earnings for the planned expansion rather than return them to the Treasury, their use for development will be clear to workers and consumers. They will be less likely to assert a privileged claim on the assumption that they are profits in the old sense. It will be seen that excessive wage or salary claims or indeed any waste—is at cost to the nation's development.

"(7) Time does not allow me to comment on the *spontaneous development* sector which I think has great possibilities. Development is not confined to the great industrial enterprises. As a growing body of opinion in India clearly realises, much must be done—always speaking of the public sector—in releasing the energies and efforts of local bodies and organisations. Community development is an important beginning, but I hazard the guess that opportunities here have scarcely been touched.

Socialists Damage Socialism

"(8) These are hurried comments. As I have observed, they are intended more to provoke decision, not answer questions. I have assumed that India has made a firm decision in favour of a public sector. But this decision is the beginning, not the end, of the discussion. In the old days, the principal enemy of public enterprise was, no doubt, those who disapproved of socialism. Now it is socialists themselves. For it is socialists who refuse to consider seriously the peculiar requirements of the modern productive enterprise, whether public or private; who decline to give it the autonomy it must have; who destroy it by meticulously passing on its decisions and thus forcing upon it an intolerable and unworkable centralisation; who decline to see that the organisation of public enterprises must keep pace with new conditions and new tasks; who are careless about the standards to which management of the enterprises must be held; and who, on occasion, encourage workers and consumers to appropriate the surplus on which expansion and growth depend and without which there will be stagnation. Above all, it is socialists who are responsible for the paralysing belief that success is a matter of faith, not work.

"In many parts of the world, including India, there is in fact no real alternative to extensive public enterprise. And while public enterprise is often successful, the record is highly uneven. It is sufficiently imperfect so that no one concerned with the success of economic development can take it for granted."

The binding choli

She's busy from morn till dusk, every single day. And added to the seemingly endless daily chores is the constant nagging discomfort of her clothes. Her movements are restricted by a newly-made choli which has shrunk after washing!

If only her friendly neighbour would tell her to always look for the label 'Sanforized' on every yard of cotton cloth she buys.

Look for

'SANFORIZED' REG'D TRADE MARK

on the label

and your clothes will never shrink out of fit!

Issued by Cluett, Peabody & Co. Inc., (Incorporated in the U.S.A. with limited liability) proprietors of the Registered Trade Mark 'Sanforized'. The use of the trade mark 'Sanforized' is permitted only on fabrics that meet this Company's rigid anti-shrinkage requirements.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay-2

SAN.58.18

Aid for Coal Industry

Substantial foreign assistance has been offered to India to develop her coal industry during the third plan period. The countries offering aid are the U.K., the U.S.A., West Germany and France. This follows the visits of coal experts from these countries. The U.K. sent an expert from its National Coal Board, who has submitted to the Indian Government a detailed report on the working of the coal industry, particularly in the public sector. The U.S.A., through the Technical Co-operation Mission, sent a similar team, which has made two reports. Neither the German coal expert, Mr. Graf, nor the French team has submitted any report. The British National Coal Board has offered to develop three undergrounds deep coal mines, while the Americans have offered to develop some open-cast mines. The Germans have offered to put up and maintain a workshop for coalmining equipment. The French offer is largely for technical assistance. Ten Indian engineers have already left for France for technical training.

National Development Council Meeting

The next meeting of the National Development Council will be held here on 14th and 15th January. The Prime Minister will preside. This meeting will finalise the third five year plan. As a result of the discussions the Planning Commission had with States' representatives, the plans have been revised and financially upgraded by Rs. 300 crores. Of this, the States have undertaken to find Rs. 200 crores, the balance being a further addition to the Centre's contribution. Financial experts of the Planning Commission are not disappointed with the States' efforts for raising additional resources during the second five year plan during which, it is claimed, they were able to raise Rs. 233 crores, compared with the target of Rs. 225 crores laid down for them. It is, however, admitted that the recommendation of the second Finance Commission has benefited various States in varying ways, and unplanned expenditure in some cases has gone up on which the additional resources have had to be used. The net result is that the gap originally left out in the second plan has largely remained unbridged.

The road outlay, it may be added, is being stepped up by at least Rs. 100 crores, in addition to Rs. 120 crores earmarked for the border strategic roads. The draft did not include the outlay on the Centre's building programme. There will be more funds provided for the rehabilitation of displaced persons. A distinction is made between schemes in the State plans and those sponsored by the Centre. The second plan outlay on the Centrally-sponsored schemes is Rs. 280 crores. It is now proposed to streamline the plan by transferring such schemes to the States. It is estimated that by this process, the Central outlay on its sponsored schemes would be reduced to Rs. 100 crores or Rs. 120 crores in the third plan period. It may, however, be added that it is the Centrally-sponsored schemes which have inflated beyond recognition such Ministries as Education, Cultural Affairs, Community Development, Food and Agriculture, and Health. It is too early to say how the Planning Commission would be able to resist the pressure of such Ministries dealing with subjects which were transferred to the States in 1921. The final picture, however, will only emerge from the forthcoming meeting of the National Development Council, scheduled to be held after the annual session of the Congress. The States, which have been urging bigger plans for themeselves, will thus have two opportunities for lobbying.

Indo-U.K. Negotiations on Tax Pact

The negotiations between the Governments of India and the U.K. on the question of evolving an Indo-British agreement for the avoidance of double taxation, have been inconclusive. It has not yet been possible to reach an agreement on all points.

Foreign Exchange Requirements

Without taking into account receipts from foreign aid negotiated during the year, the net foreign exchange requirements for the last year of the second five year plan are estimated at Rs. 170 crores. The total foreign exchange requirements for the third five year plan are estimated at Rs. 2,600 crores (excluding food imports under the U.S. P.L. 480 agreement).

Repayment of Interest on Foreign Loans

The amount of interest paid in foreign currency during 1959-60 on external loans repayable by the Indian Government was approximately Rs. 13.03 crores. In addition, a sum of about Rs. 4.21 crores has been paid towards interest in foreign currency during the same period by public sector organisations and private sector agencies for foreign loans repayable by those bodies.

Exploiting Pyrites Ores

It is proposed to set up a plant in Amjore, in Shahabad district of Bihar, for the exploitation of pyrites ores, large deposits of which have been located in that area, and for the production of elemental sulphur from them. For this purpose, a subsidiary Company under the name and style of the Pyrites and Chemicals Development Company (Private) Limited, has been set up with an authorised capital of Rs. 5 crores by the National Industrial Development Corporation Ltd (a Government of India undertaking). The shares in the subsidiary Company are wholly owned by the National Industrial Development Corporation.

Demand for Cement

The present demand for cement is estimated at about 950,000 metric tons a month, compared with the present availability of about 700,000 metric tons a month. In order to obtain the maximum production with the existing plant and machinery in cement factories, steps are being taken to ensure that the factories are adequately supplied with coal and that the cement produced is moved expeditiously. The annual installed capacity, which at present stands at 8.7 million tons, is expected to rise to 9.5 million tons by the end of 1960-61, 10.2 million tons by 1961-62, and the capacity already licensed for implementation comes to 12.5 million tons by 1963-64. The approved capacity so far comes to 15.6 million tons, but the balance of 3.1 million tons is yet to be considered for capital goods and plant. The target capacity fixed for the third plan is 15 million tons. It is hoped that plant and machinery for the balance capacity of 3.1 million tons will be approved soon. If necessary, the target will also be revised upwards.

Boot-making in Public Sector

The Central Government is setting up a boot manufacturing plant at an ordnance factory, the plant and equipment for which is being obtained from Kovo of Czechoslovakia by the State Trading Corporation. According to the agreement with Kovo, the firm has undertaken to ship the boot plant by the end of the year, the cost being Rs. 2,92,018. The boot plant is being set up at the harness and sadlery factory, Kanpur. It is expected to go into production by the middle of 1961.

Price for Fertilisers

It has been decided that as long as the Central fertiliser pool continues, the production of private factories will be purchased at a price which is paid for a similar type of product to similarly situated public sector factories.

U.K. Imports of Sarees Rise

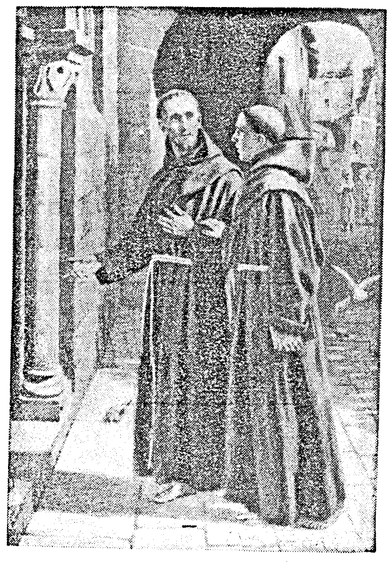
There has been a substantial increase in the export of cotton *sarees* from India to the U.K. during the first nine months of 1960, compared with the corresponding period of 1959. Some 10,000 million yards of *sarees* worth Rs. 10,000 were exported to the U.K. during 1959. Besides the U.K., Indian *sarees* have found markets in Ceylon, Burma, Afghanistan, Thailand, Saudi Arabia, East Africa, Singapore, the Sudan and the U.S.A.

The Government is now negotiating with the P. and O. group of companies to obtain a further reduction in the sale price of the Garden Reach Workshops and the Mazagon Docks Ltd on the basis of the figures given in the balance-sheet as on 31st March, 1960.

Dutch Port Expert in India

The managing director of the port of Rotterdam, Mr. Posthuma, has come to India on a six-week assignment under the auspices of the U. N. Technical Assistance Board to advise the Indian Government on the following problems: (i) the project for establishing a subsidiary port in the Calcutta region, and (ii) the dock modernisation scheme of the Bombay Port Trust and other related schemes.

Not by Words Alone...



The story is told of St. Francis of Assisi, that he once stepped down into the cloisters of his monastery, and laying his hand on the shoulder of a young monk, said, "Brother, let us go down into the town and preach".

The venerable father and the young monk set out together, conversing as they went. They wandered down the principal streets, and wound their way through alleys and lanes, and even to the outskirts of the town and the village beyond, until they found themselves back at the monastery again.

Then enquired the young monk, "Father, when shall we begin to preach?"

And the father looked kindly down upon his son and said, "My child, we have been preaching: we were preaching while we were walking. We have been seen....looked at; our behaviour has been remarked, and so we have delivered a morning sermon. AH! MY SON, IT IS OF NO USE THAT WE WALK ANYWHERE TO PREACH UNLESS WE PREACH AS WE WALK".

YES ... it is no use that we walk anywhere to preach unless we preach as we walk ..... In building the India of our dreams ... there is little room for preaching by mere words .. what are needed are DEEDS ... And DEEDS include higher production of some ESSENTIAL commodities like

CEMENT ... THE GREAT MODERN MATERIAL OF BUILDING CONSTRUCTION ....

In 1952, we had placed at the Nation's disposal over 1,32,000 Tons of Cement.
In 1954, we had produced over 2,02,000 Tons of Cement.
In 1958, we produced nearly 3,50,000 Tons of Cement.

This year .... in 1960 ....
We expect to place at the nation's disposal over 3,60,000 Tons of Cement

BECAUSE INDIA NEEDS MILLIONS of TONS of CEMENT ...

for Building the richer and prosperous India of our dreams ...

ORISSA CEMENT LTD ... Rajgangpur ... (Orissa)

A National Enterprise in Nation's Service

The U.S. authorities have offered $30 million from the Development Loan Fund for the import of equipment and $28 million from P.L. 480 funds for meeting rupee expenditure, to finance the entire cost of the fertiliser plant to be set up in Trombay. The potential production of the fertiliser factory will be 90,000 tons of fixed nitrogen, to be produced partly in the form of urea and partly as a mixed fertiliser containing both nitrogen and phosphorus.

Internal Consumption of Tea Rises

The following table shows the estimated annual consumption of tea in India during the past five years:

Year	Estimated consumption in India (in million lbs)
1954-55	190.7
1955-56	203.7
1956-57	216.8
1957-58	229.8
1958-59	242.8
1959-60	254.0 (estimated)

Proposal for New Newsprint Factory

The proposal received for setting up a Rs. 10-crore factory for manufacturing newsprint from sugarcane bagasse from Sahu Jain Ltd in Maharashtra State has been approved in principle, but the final licence under the Industries (Development and Regulation) Act, 1951, has not yet been issued, it was stated in the Lok Sabha.

Railway Development in Third Plan

Inaugurating the meeting of the reconstituted National Railway Users Consultative Council, the Railway Minister said that it is proposed to equip the railways with diesel and electric power to the extent of about 70 percent of the additional needs of freight traffic during the third plan. Steam traction will, however, continue for all other services. Complete electrification of about 1,100 miles, including those which are now under execution, and doubling of about 1,600 miles of track are also contemplated. Other measures for improving line capacity will include remodelling of yards, opening of new crossing stations, additional loops, introduction of centralised traffic control, automatic signalling, etcetera, the Railway Minister said.

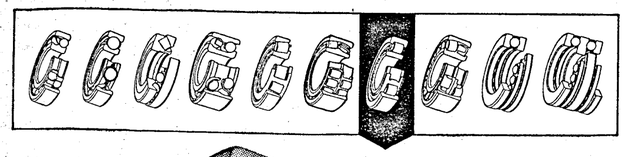
New Haulage Gears for Coal Mines

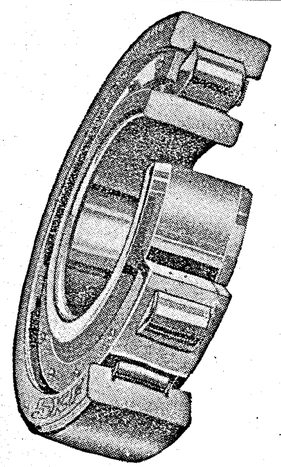
Some 13 haulage gears are under construction for Indian coal mines by the Carron Company of Falkirk, Scotland. They are 100 h.p. spur-geared, single-drum haulage machines, to be delivered to Singareni Collieries early in the new year at a cost of £4,000 each.

Worsted Yarns for Woollen Mills

Mr. Manubhai Shah made the following statement in the Lok Sabha last week concerning the difficulties faced by the woollen mills in northern India: "The different sectors of the woollen industry had been facing some difficulty in obtaining their requirements of various types of worsted yarns. The hosiery industry, in particular, was having considerable difficulty in this matter. The question of taking steps to ensure a balanced supply of the different varieties of yarn was considered at length by the Government. In order to ensure this, it was decided that there should be some control on the production of different types of yarn, so that no sector of the industry would be put to undue hardship caused by want of yarn. Therefore, after examining the pattern of production of different types of yarn in the preceding years, and having regard to the requirements of the various sectors of the industry, it was decided that every manufacturer of worsted yarns should produce weaving, hosiery and knitting yarn in the proportion of 47½ percent, 32½ percent and 20 percent, respectively. The Textile Commissioner issued an order under the Woollen Yarn (Production and Distribution Control) Order, 1960, directing manufacturers of worsted yarns to follow this pattern of production from 1st October, 1960. It is expected that this will ensure a reasonable supply of each type of yarn required by the industry. Representations have been received from a section of the industry, particularly the composite mils, that this pattern of production will adversely affect their working, as all the mills may not be equipped with the types of machinery required for producing the different types of yarn and also because this pattern of production will cause difficulties to composite mills which depend on their own production of yarn for working their weaving units, and will create some unbalance in the different sections of the mills. While it may be true that in some cases there may be a real difficulty, it is also probable that some mills are averse to following the prescribed pattern of production, as this would stand in the way of their producing a greater quantity of particular types of yarn which yield a larger profit. The Textile Commissioner has been asked to examine the case of each individual mill, and on the basis of the capacity of the mill and its requirements of yarn for its own weaving section, if any, to allow the mill to vary the pattern of production to the extent necessary. It is significant to note that a large section of the industry has welcomed the prescribed pattern of production."

SKF *offer the widest selection of bearings*





Illustrated here is the **SKF** CYLINDRICAL ROLLER BEARING, one of the ten variants of the four basic types of rolling bearing manufactured by **SKF**. The cylindrical roller bearing has a low coefficient of friction and is therefore suitable for shafts operating at high speeds.

LONDON INSURANCE LETTER

INDEMNIFYING FILM PRODUCERS

ONE cannot recall another month when the London insurance market's interest has been focussed on a film. "Film producer's indemnity" is a familiar form of insurance, in which some Lloyd's underwriters specialise, and it has recently involved a number of considerable claims each amounting to hundreds of thousands of pounds—notably about £600,000 when Mr. Tyrone Power died in Spain while *Solomon and Sheba* was being produced there about two years ago. But *Cleopatra* is an exceptional case, not only because it is a very big project, whose original budget of $5 million has been nearly doubled by the illness of its star, Miss Elizabeth Taylor, but also because the insurers have disputed their liability to the Company concerned, Twentieth-Century Fox. Total insurance placed in the British market in connection with this picture is nearly $7.2 million—more than £2½ million; the premiums amounted to $400,000. The risks involved in filming in Britain in this particularly wet year were more than normal and, though not much of the work had to be done outside, the weather caused delays. Then Miss Taylor's illness supervened, and production was suspended at a stage where the potential loss was already rather more than the original budget. The insurers, apparently, were not satisfied with Miss Taylor's declaration on the state of her health, which, they considered, subsequent events did not justify. This is, obviously, a somewhat risky kind of insurance. The weather is not always relevant, and insurance against strikes is not available, but the death or illness of a star performer is a serious possibility. The problems of *Cleopatra* have raised the question weather a premium of approximately 5 percent of production costs is adequate.

Cover for Assault

Another specialised kind of insurance which has attracted attention recently is cover against the risk of assault, particularly in connection with money and securities. A criminal with some experience in the matter is reported as saying that robbing a British bank is an easy way to get money. Less-experienced youths have committed murder in the process. Insurance companies are not satisfied with the banks' security and, naturally, they watch with approval the development of organisations whose function is to provide adequate security for money in transit. Many industrial and commercial firms have to arrange transit of substantial sums of money, and the number of assaults and robberies has noticeably increased. Insurance against assault may be effected as an adjunct to insurance of the money that may be the object of assault, or personal-accident policies may be written to cover relevant employees or all members of a firm's personnel. Experience shows that the range of risk extends far beyond the messengers and others who are most obviously likely to be involved with money in an exposed position, and schemes covering all employees of a firm are now favoured. The benefit, in case of injury or death in an attack, is not necessarily the same for all personnel in a scheme covering all employees: it may be related to the individual's earnings. Naturally, spreading the risk over the whole staff reduces the premium, *per capita*, in relation to the benefits.

Ford and Investment Funds

The offer by U.S. Ford for the minority interest in U.K. Ford would have involved the insurance companies indirectly even if Prudential Assurance Company had not been the principal holder of the minority stock. If more than £100 million of "new money" was coming to the market, it was argued, prices of many stocks and shares must rise. (Soon, however, industrials fell heavily, as the trading prospect became darker.) But it is not easy to replace nearly half a million units of a major stock like Ford's, and even for the giant Prudential, an upheaval of that order is not insignificant. A special responsibility devolves on the financial institutions in such a case. They must decide if the price offered is fair, and lead the opposition if they feel the offer should be opposed. It is, indeed, more and more difficult for the insurance companies to remain aloof from problems of management and policy in industry and to regard their investments simply as revenue-earning assets. If an industrial company in which an insurance company has an interest, simply as a shareholder, reports unsatisfactory results, the insurance company may well feel an obligation to guide and focus the critics and to elicit an explanation of the company's performance. To some orthodox minds, such activity seems too near to intervention in management. The broader problem at present is the economic trend. Insurance companies must not be influenced by day-to-day movements in the stock market; yet they must not ignore short-term fluctuations, whereby they can buy shares at moderate prices—if they are willing to buy them at all. At present opinion is divided. Some institutions feel that the trend of production and profits is decidedly downwards, and that incoming funds should not be committed to ordinary shares until their prices are lower; others can foresee no significant decline in ordinary shares and are reluctant to increase the proportion of investments in fixed-income stocks. But there is no doubt that the institutions' withholding funds from ordinary shares has been an important factor in the recent decline in their prices.

Jute

UPCOUNTRY BUYING LIFTS RAW JUTE PRICES

INDIAN GOVERNMENT ORDERS PUSH UP SACKING

RAW jute continues to create problems not only for the industry but also for the markets in general. Fibre prices, after showing signs of falling, have again hardened and returned to the Rs. 50 level. The reasons are complex and many are inclined to blame the mills—or those with agencies—for the rise. Upcountry agencies attached to mills are working at full pressure and their demand far exceeds the supply of jute. In fact, over the past week, imports in most upcountry agencies have fallen considerably, and the steady demand has forced prices out of parity with market quotations in Calcutta. The notable exceptions have been the mesta areas. Supplies of mesta have shown a sharp increase and mills have taken more interest, buying fair quantities. Prices have also advanced in sympathy with other markets, but the extent of the advance is not as great as in the Assam and Northern white agencies.

Stockists Hold on

Many believe that a large quantity of jute is still being strongly held by stockists. At present, they are not in need of money, and the shortage will last only as long as their financial commitments can be met without liquidating their stocks. Enquiries show that because of the prevalent belief among the upcountry operators that jute prices will rise further, everyone in the districts, from the grower to the baler, is holding fibre. It may seem strange that middlemen especially should hold stocks at these high prices, but their holding power has increased greatly as a result of the higher prices obtained for what has already been sold. Unlike the Calcutta sellers, who were badly hit by the rapid rise in raw jute prices, upcountry growers sold very little jute at the low rates. The excellent paddy crop that is now being harvested further strengthens their position. The general view in the villages, therefore, is that having done very well out of what has been sold, they will now await further developments. Buyers are confronted with a certain complacency from traders, which gives the impression (emphasised by the recent drop in imports in nearly all agencies) that they have no jute left. Hence the reports that supplies remaining with the grower are small.

A further bullish factor has been the publication of the raw jute arrival figures for November. Although the arrivals were slightly higher than in October, they were the lowest for the month of November since 1953. Furthermore, the total for the period from July to November 1960 is lower than for a similar period in any other season. Arrivals are now 478,000 bales below the estimated consumption for the period from July to November, which deficit is far greater than in any other season. At this time of year, arrivals are normally coming up to the level of estimated consumption, and on one or two occasions have actually passed it. Every season, by the end of December, the estimated consumption has always been surpassed by the arrivals; but this year, unless an all-time record is created by the December arrivals, this is impossible. It is thought that it will be January or February before arrivals overtake consumption.

Building Mill Stocks

If that is the case, the mills will have very little time to build up stocks for the next season. Consequently, the interim period between this season and the next may be an even more anxious one than the mills have just been through. It was said at the beginning of the current season that it would take the industry two years to recover from the handicaps created by the short crop of 1960-61, and it looks as if this estimate may be true. At present, it does not appear as if the mills will be able to increase production in the near future as they had hoped to do, and this does not augur well for the future of jute goods. Unless production is increased, there is little likelihood of goods prices falling, and unless jute goods become considerably cheaper, the battle against substitutes will be lost.

The fact that burlap consumption in the U.S.A. last month showed a welcome rise should not be construed as a bullish factor, which is what the market has done. Each rise in price is an incentive for overseas consumers to turn to other forms of packaging, and current interest may be only temporary until substitutes can be obtained in sufficient quantities. The Calcutta markets are so sensitive just now, however—and this applies equally to raw jute as to gunnies—that the slightest interest provokes an exaggerated reaction. Just how sensitive the market is can be gauged from the fact that the first Indian Government tender for only 2,000 tons of B Twills and some even smaller interest from Australia in woolpacks were instrumental in pushing up goods prices by over Re. 1. There has been very little genuine overseas interest in hessians, but apart from a rise in sympathy with heavy goods, local shipper covering against short shipments caused this section to become steadier. At the close, a further Indian Government order has pushed up goods prices to fresh high levels.

Arrivals of Raw Jute

During November 1960, arrivals of raw jute at Calcutta and mill stations amounted to 653,200 bales, made up of 604,200 bales from India and 49,000 bales from Pakistan. The total was 50,450 bales more than that for the previous month, but 130,000 bales lower than that for November 1959. Arrivals from India increased by 60,100 bales over the previous month, but those from Pakistan dropped by 9,650 bales. Total arrivals for the period from July to November 1960 now amount to 2,065,600 bales, being 1,843,550 bales from India and 222,050 bales from Pakistan. They are 251,200 bales less than during the corresponding period of last year, arrivals from India being 374,100 bales lower, but those from Pakistan showing an improvement of 122,900 bales. Raw jute arrivals during the current season are now 477,900 bales below the estimated raw jute consumption for the same period.

THE JUTE MARKETS

Manufactured Goods: The market was quiet at the opening last Thursday and quotations for both sacking and hessians fell. B Twills were Re. 1 lower at Rs. 172.50 for December shipment, and Rs. 163 for January-March shipment, while 40in. 10oz. dropped by 25nP to Rs. 54 for the near position and Rs. 53.75 for forward shipment. During the day, small business in Australian woolpacks and a small Government of India tender for B Twills excited the market. By Friday morning, sacking showed a rise of Rs. 1.50. Local shipper covering helped hessians and the previous day's losses were recovered. The rise was short-lived, however, and mill selling pressure, combined with the fact that there were no buyers, caused a setback. By the week-end, rates in all sections were back to those ruling at the opening. Small enquiries were received from the Sudan and the Middle East. The favourable burlap stock and consumption figures from the U.S.A. created a stronger undertone, which was reflected in small advances after the week-end, but once again very little business passed. On Tuesday, due to the *hartal* called in protest over the Berubari issue, all markets were closed, and no business was transacted.

At the close, the market was very steady due to the placing of a further Government order for heavy goods, and rates advanced rapidly.

Opening quotations on Wednesday morning were as follows:

	December	January	February	March
40in. 7½oz.	42.65	41.65	41.25	41.00
40in. 8oz.	45.50	44.50	44.00	43.75
40in. 10oz.	55.25	55.15	55.00	54.75
B Twills	180.00	174.00	170.00	167.00
Heavy Cees (Plain)	175.00	172.00	170.00	167.00
A Twills	208.50	208.00	205.00	202.00
Liverpools	196.00	193.00	194.00	191.00
Cornsacks	175.00	176.00	174.00	171.00

Raw Jute: The Calcutta raw jute market opened on a steady note. Reports of smaller imports and increased buying activity upcountry caused a further rise in prices in the mofussil, so there was no parity between upcountry and Calcutta quotations. There was also almost daily interest in Calcutta and small business was reported at rising prices. The interest seemed to centre on mesta, since imports of this type of fibre began to increase, and price advances were smaller than for other varieties. Pakistani cuttings again came in for some attention as the remainder of various licences was taken up or purchases made against cancelled contracts at lower rates. The prices paid varied considerably, and cuttings ruled firmer than for some time. Many mills had still to take up their allocation of Pakistani cuttings, and as most of the licences expired at the end of the year, they were up for revalidation. Assam jute opened at Rs. 48.50 a maund, but thereafter rates advanced by 50nP a day on account of the steadier upcountry markets and the limited mill interest, until on Monday morning they reached Rs. 50. Even at this price, sellers were reserved and only small lots were put on offer. Tuesday was a *hartal* when all markets were closed and no business was transacted. The Cossipore markets ruled steady throughout the week, with prices advancing daily. Imports were lower than in the previous week.

Business was reported in Assam and Northern jute at Rs. 50.50 to Rs. 49.50 for one month's shipment and ready bills of lading. Daissee-Tossa was done at Rs. 50.50 to Rs. 51. Various grades of mesta were bought and prices were based on Rs. 46.50 for Daissee, Desal and Northern and Rs. 45.50 for jungli mesta. Pakistani cuttings were reported at Rs. 205 to Rs. 215 a bale.

Opening quotations on Wednesday morning were as follows:

	Landed at Mills (Basis Bottoms) Rs. a 100 kilos	Rs. a md	Shipment
Assam	136.75	51.00	Dec.-Jan.
Northern	134.00	50.00	"
Purnea Desal	132.50	49.50	"
Daissee Selected	140.75	52.50	"
Assam Tossa	139.25	52.00	"
Mesta:			
Assam-Northern	130.00	48.50	"
Desal-Daissee	130.00	48.50	"
Jungli	127.25	47.50	"
Pakistani Cuttings N. C.	225 a bale		

U.S. BURLAP CONSUMPTION AND STOCKS

U.S. burlap consumption in November was somewhat better than during October, but it was 8 million yards below November 1959. At 72 million yards, 53 million yards represent bag cut-up and 19 million yards were piecegoods deliveries for industrial purposes. U.S. burlap in stock and afloat at the end of November increased sharply as pipelines started filling up, following the low point reached in October. At 255 million yards, 127 million yards were spots and 128 million yards were afloats. Appearing below are two tables which include the November figures—(1) based on member reports to the Textile Bag Manufacturers Association and the Burlap and Jute Association and (2) projected to represent the estimated consumption and stocks for the entire industry:

	U.S. burlap consumption (as reported to T.B.M.A.) (Million yards) 1960	1959	U.S. burlap consumption (estimated industry total) (Million yards) 1960	1959
Jan.	58	64	71	75
Feb.	61	61	75	70
Mar.	75	72	81	83
April	66	63	82	74
May	67	60	74	71
June	65	71	71	81
July	54	61	59	69
Aug.	63	58	67	65
Sept.	71	70	76	80
Oct.	63	61	67	69
Nov.	65	66	72	80
Total	708	707	785	817
Mo. Av.	64	64	71	74
Dec.		66		80
Total		773		897
Mo. Av.		64		75

THE FOREIGN JUTE MARKETS

YARN AND CLOTH PRICES REDUCED

(FROM OUR DUNDEE CORRESPONDENT)

THE decline in raw jute prices is still very slow. Buyers are likely to postpone their purchases until they are compelled to. Some amount of business has been transacted, but the quantities bought are small and for essential needs. If fibre values decline more rapidly—and they have a long way to go before returning to more normal levels—there will be more active conditions in all branches of the industry. There has been a good deal of doubt about the way jute prices will go, but it appears more or less certain that they will not move upwards now.

In Dundee, it is usual for buyers at this time of year to purchase more freely, but conditions up to now have not been quieter, and spinners and manufacturers are being forced to stop machinery and also work short time. The situation is gradually growing worse. The curtailment of production will have to be extended in the majority of spinning and weaving establishments.

Raw jute prices widely fluctuated last week, and a wide difference existed for all grades. Some

Jute packs a world of goods

Australian wool, Burmese rice, Cuban sugar, Egyptian cotton, Canadian wheat, Chilean nitrate...these are only a few of the commodities that travel to the markets of the world packed in jute cloth. By providing the cheapest heavy-duty packaging material known, jute plays an important part in international trade.

India produces 55% of the world's jute goods. The Indian jute industry provides employment to millions of farmers, traders and mill-workers in the country...earns on an average about Rs. 115 crores annually in foreign exchange.
Jute serves India in many ways, strengthens her economy.

Issued by the **Indian Jute Mills Association**
Royal Exchange, Calcutta.

IWT IJM 4291

cheap rates were accepted for secured parcels afloat and also for shipment, such as £165 done for Mill Lightnings, against £173 quoted. The E.P.C. rate was £178 15s recently. Mill Firsts were quoted at £182, Mill Hearts at £169, and Grade Hearts £166, while Grade Tossa-2/3 is offered at £173, fours at £168 and Continental Tossa-2/3 from £166, also crack marks of Daissee-2/3 at £173 and grade at £165, December-January, c.i.f. U.K.-Continent.

Calcutta goods weakened to 81s 3d for 40in. 10oz. and 64s for 7½oz., December, 81s and 61s 9d January-March and 80s 3d and 61s April-June, with B Twills 260s 9d, 245s 6d and 242s 6d for the respective positions of shipment, all f.o.b., Calcutta. Prices for jute yarns and cloth were reduced by £10 a ton on 9th December and again by £5 a ton on 14th December. For 8 lbs cops, the rate came down to 23.46d a lb and for 8 lbs warp to 24.60d, then further reduced to 22.88d and 24.03d a lb, respectively, while 3 ply 8 lbs twist is down to 25.95d from 27.67d a lb. Hessian cloth rates came down from 19.81d to 19.05d and to 18.67d for 40in. 10oz. and from 16.55d to 15.94d and to 15.64d a yard.

THE PAKISTANI JUTE MARKETS

FURTHER FALL IN FIBRE

(FROM OUR EAST PAKISTAN CORRESPONDENT)

DURING the past week, loose jute prices even in the interior showed a downward tendency. This, however, did not develop into panic selling, and business was limited. It is probable that the quite substantial drop in loose jute prices may be due to the fact that the speculative middlemen who bought at the first drop expecting the market to rise, had limited holding power and, therefore, disposed of their stocks. A firmer undertone in the interior developed towards the end of the week, and reports of wet jute were once again received. The local pucca bale market continued to be inactive with a few transactions in cuttings at widely varying prices. It was interesting to note that there was a premium for forward cuttings. Prices continued to fall overseas, where business was reported at £170 a bale for afloat jute Export Firsts, as against the E.P.C. price of £178. It was also reported that shipment business in small quantities was being done at about £170 a bale for Export Lightnings.

One or two balers in the Narayanganj market made good sales mainly to the mills some weeks ago. They have covered insistently but quietly, and were probably responsible for the fact that prices did not drop even more.

It has been reported that the Russians have quietly bought 4,000 tons of raw jute. The market has not so far reacted to the news. It is possible that the business was done some time ago and has been reported only after the sellers covered. If reports about this purchase are correct, the total sales to Russia and China will amount to about 50,000 bales.

It is estimated in the local market that approximately 3.3 million bales of raw jute have come into the market including 650,000 bales consumed by mills between July and November, 250,000 bales representing two months' stocks lying with mills, and 1.45 million bales exported overseas and to India.

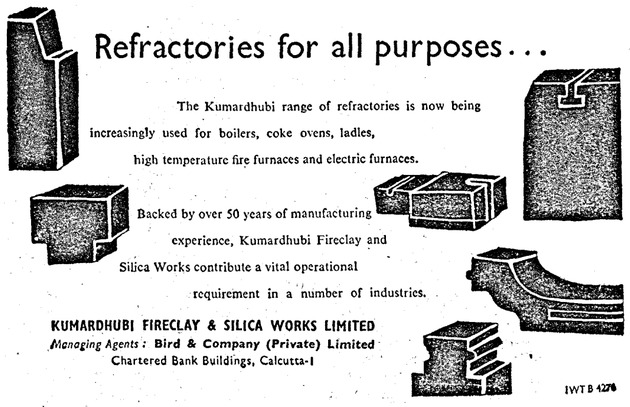
Since the E.P.C. registrations amount to a little over 2 million bales and since the overall position is long, it may be assumed that the difference between E.P.C. registrations and shipments is lying in the hands of balers, which may be a further 600,000 bales. This will bring the total to 2.9 million bales. To this may be added a further 400,000 bales representing jute in the hands of balers, at present unsold, jute in transit from balers to mills against forward contracts and for consumption by cottage industries. Assuming that reports are correct that about 33 percent of the crop still remains in the hands of the growers, it means that a further 1.65 million bales are to be received, which will make a total 4.95 million or 5 million bales.

As reported last week, the freight rates to South and east Africa for raw jute and gunnies have been reduced by approximately 57s a freight ton, which, added to the cheaper raw jute prices, will undoubtedly be of help to buyers in those countries and may well receive a healthy interest for all concerned.

U.K. CREDIT FOR PAKISTANI JUTE MILL ANNOUNCED

Britain's Commonwealth Development Finance Company has announced that it is to offer £375,000 towards the total cost of £720,000 of the expansion programme by the Star Jute Mills Ltd in Khulna in East Pakistan. The mill—described as one of the most modern in Asia—commenced production two years ago, working with 180 looms. The expansion programme is designed to raise the number of looms to 502 to increase annual production from 6,700 tons in 1959-60 to 17,000 tons by 1962-63. The Commonwealth Development and Finance Company says that it will provide the money "partly in the form of equity and partly in sterling debenture stock." N.A.F.E.N.

Refractories for all purposes...



The Kumardhubi range of refractories is now being increasingly used for boilers, coke ovens, ladles, high temperature fire furnaces and electric furnaces.

Backed by over 50 years of manufacturing experience, Kumardhubi Fireclay and Silica Works contribute a vital operational requirement in a number of industries.

BRITISH TEXTILE REVIEW

CLOTH EXPORT PACTS CRITICISED

AT the annual conference of the U.K. Cotton Board in October, Lord Rochdale, chairman, said that the cotton industry's policy for re-equipment would necessarily be based on the assumption that the problem of cheap imports from the Asian countries of the Commonwealth would be solved, satisfactorily and permanently. When he arrived in Hongkong on a private visit at the end of November, he was greeted by firm opposition to the export-limitation agreement, expressed in a joint statement by the chairmen of the Hongkong Cotton Spinners Association and of the Federation of Hongkong Cotton Weavers. The essence of the Hongkong industry's criticism of the current agreement, extending from the beginning of February 1959 to the end of January 1962, is that supplies from other sources have not been similarly restricted, and that restrictions are not really needed anyway. That Lancashire's trade has been much better than it foresaw is no cause for grievance, only a practical reason—from Hongkong's point of view—for letting the principle of "voluntary" restriction of exports lapse after the term of the current agreement. But the increase in the U.K.'s imports from other sources is resented as a matter of principle.

Exact comparison between the agreement with Hongkong and those with India and Pakistan is impossible, because the Hongkong agreement began earlier and will end earlier than the others; but it is difficult to believe that the colony feels serious resentment against the other Commonwealth exporters, whose agreements (as Lord Rochdale pointed out) were generally on the same basis as Hongkong's. The colony's objection to the increase in U.K. imports from Europe and (in a different category of goods) the United States is easier to understand. These imports, unlike the Commonwealth's, are subject to import duties, but they are not subject to quantitative restriction, either "voluntary' or compulsory. Besides, European suppliers—mainly France, Belgium, Holland, Austria, Spain (whose percentage increase in exports to the U.K. has been phenomenal)—non-traditional suppliers such as Egypt and Russia have been sharing the U.K. market in grey cloth, and the colony has had to refuse orders which other suppliers have been free to accept. In consequence, Hongkong's share of the U.K. import market diminished from 34 percent in 1958 to only 14 percent in the first half of 1960.

It appears from some remarks by Lord Rochdale that the re-export potential of the import trade is being emphasised as a possible solution of the problem. The U.K. Cotton Board's chairman acknowledged the increase in imports of cloth piecegoods from countries outside the Commonwealth (adding that it was "a source of serious concern" equally to Lancashire); but he pointed out that in 1959 as much as 90 percent of all these imports was re-exported, and he suggested that Hongkong had not used to full advantage the concession whereby piecegoods for re-export were exempt from the quota. The emphasis on re-exports from the U.K. could have important repercussions in the international trade in cotton textiles.

Unfortunate Timing

It can now be seen that the scheme to eliminate redundant capacity was inopportunely timed, for demand was certainly strong enough to keep more spindles and looms employed, and the pressure to import would have been less if the domestic output had been greater. An industry of diminished size has maintained its output surprisingly well, but the effects of the contraction in the physical capacity of the industry are apparent in the figures covering the first half-year after the final rate for scrapping looms—the end of March last; production of cloth in April-September this year was 612 million yards, against 655 million yards in the same period of last year.

Addressing the Cotton Board conference in October, Mr. Reginald Maudling, President of the U.K. Board of Trade, remarked that the scrapping phase in spinning, doubling and weaving was completed and that the re-equipment phase was making good progress. Lord Rochdale added his advice that firms should not defer re-equipment because of uncertainty about imports from Asia. The chairman's report on the reorganisation schemes for the finishing sections was, however, rather cautious, and it was subsequently announced that the period in which firms intending to participate in these schemes had to notify the Board of their intentions had been extended from the end of October to the end of January.

Versatility and Growth

Likewise in the man-made fibre industry, lack of capacity, rather than of demand, has governed output this year, and in this industry big plans are in hand to increase capacity, including a project by Imperial Chemical Industries for a new Terylene plant in northern Ireland. It is not lack of demand but lowering of costs—a result of increasing output—that brings prices down, as in the case of two of Courtaulds' speciality viscose staples, M. 95 and strong fibre, whose prices were cut recently. Such moves are steadily strengthening the competitive position of man-made fibres: at the same time, they put a keener edge on competition between one man-made fibre and another.

However, the principal factor in the growth of this trade, as a proportion of the total trade in fibres, is versatility. A remarkable variety of effects in apparel goods is being achieved by varying the use of Terylene, for instance. Combinations of filament weft and spun warp, and of filament warp and spun weft, already well established in the use of rayon, are now being used for Terylene and other synthetics; varieties of spun-weft yarn add to the varieties of cloth. Until recently, nylon and Terylene were not directly competitive, as nylon was used mostly on its own and Terylene was used mostly in blends with cotton or wool; but the development of bulked filament yarns, both nylon and Terylene, has brought both fibres into the range of knitwear, in competition with wool. Rayon, with the aid of research, has adapted itself to new uses and consolidated its position in old ones; it is expected to reassert itself strongly as a dressgoods fabric in the coming months. The acrylic fibres, which hold the smallest share of the market at present, are developing most rapidly; and these are the fibres which most directly challenge wool.

MIDDLE CLASS COST OF LIVING INDEX NUMBER FOR CALCUTTA

(Base: August 1939)

THE Middle Class Cost of Living Indices, by groups, have now been brought up to November 1960. As compared with October, the November Index for Food shows a drop of 6 points, while that for Miscellaneous indicates a rise of 2 points. The Indices for Clothing and Fuel and Lighting remain unchanged at 579 and 289 points, respectively.

Combining all the factors, the Middle Class Cost of Living Index for Calcutta shows that the cost of living declined by 3 points during November 1960.

SLIGHT RISE IN WHOLESALE PRICE INDEX

THE official wholesale price index (base: year ended March 1953=100) worked out to 125.4 during the week ended 3rd December, 1960, against 125.3 for the previous week. The index was lower by 1.0 percent when compared with the corresponding week of the previous month, but was higher by 6.2 percent than that of a year ago. The prices of oranges in Madras and potatoes (−14% each) and wheat in Bombay (−8%), jowar in Ujjain and Rohtak (−7% each), eggs in Madras, tea and black pepper (−6% each), rice in Jaynagar (−5%), bajra, bananas, cashewnuts and gur (−4% each), groundnut oil (−3%), mung, urad and ghee (−2% each) and maize, ragi, gram, gingelly oil, coconut oil, fish and cardamoms (−1% each) witnessed a fall, while those of oranges in Shillong (+15%), milk (+11%), onions (+8%) and rice in Nagpur (+8%), in Nowgarh (+6%) and in Nizamabad (+5%), wheat in Danduka, jowar in Nagpur and eggs in Calcutta (+6% each) and mustard oil (+1%) recorded an advance, and the index for Food Articles receded by 0.3 percent to 119.0, compared with 119.3 for the earlier week. The index for Tobacco declined by 1.9 percent to 111.2 due to a fall in the prices of raw tobacco (−2%). The Fuel, Power, Light and Lubricants group index worked out to 120.3, against 120.2 for the earlier week. The price of castor oil (+1%) was marked up. Higher prices of raw hides (+12%), lac (+6%), raw jute (+5%) and castorseed, copra and raw skins (+2% each) raised the index for Industrial Raw Materials by 0.8 percent to 147.7, compared with 146.6 for the earlier week. The prices of tanning materials (−4% each), raw silk and gingellyseed (−3% each), groundnuts, linseed (−2% each), raw cotton and rapeseed (−1% each), however, showed a fall. The prices of tin (−18%), copper (−2%) and zinc and brass (−1% each) witnessed a fall, while those of linseed oil (−1%) showed a rise, and the index for Intermediate Products worked out to 131.9, compared with 132.0 for the earlier week. The index for Finished Products advanced by 0.3 percent to 125.1 when compared with 124.7 (revised) for the previous week due to a rise in the price of jute manufactures (+2%). The prices of general chemicals (−1%) were, however, marked down.

INDEX NUMBERS BY GROUPS AND SUB-GROUPS

(Base: 1952-53=100)

Groups and Sub-Groups	Week Ended 3-12-60	26-11-60	5-12-59

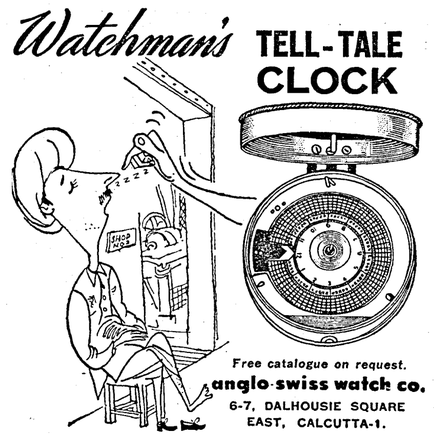
NO FURTHER PROTECTION FOR PLYWOOD AND TEA CHESTS

THE Tariff Commission in its report on the question of protection to the plywood and tea chests industry has recommended that protection to the industry "manufacturing plywood including plywood panels for tea chests and battens for tea chests" sould not be continued beyond 31st December, 1960. If, however, import control is substantially relaxed in future and imports of foreign plywood constitute a threat to the industry, domestic producers may apply for a reconsideration of their case. Secondly, satisfactory arrangement for prompt prophylactic treatment of timber after felling should be made in all cases where there is an interval between the felling of logs and their delivery at the mill site. Until the Forest Research Institute announces the results of its investigations in this behalf, the Andaman and the Kerala Forest Departments should at least apply bituminous paint to the buttends to prevent heart rot, etcetera. As wastages of timer supplied by P. C. Roy and Company, are reported to be extraordinarily high, the Company should also be asked to take adequate measures for the proper preservation of its timber. The Government has accepted the first recommendation. Necessary legislation will be undertaken in due course to deprotect the industry with effect from 1st January, 1961. The attention of the industry has been drawn to latter part of this recommendation. The Government has taken note of the other recommendation and steps, says an official announcement, will be taken to implement it as far as possible.

Domestic Demand

The domestic demand for plywood tea chests is estimated at 6.48 million sets (standard size 19in. x 19in. x 24in.) for 1960, 6.67 million sets for 1961 and 6.90 million sets for 1962. The domestic demand for all types of commercial plywood is estimated at 60 million square feet for 1960, 70 million square feet for 1961 and 80 million square feet for 1962.



Engineering and Transport

FIXING NEW SELLING PRICES FOR FERRO-SILICON

PLEA OF RISING COST BY PRODUCER

OPENING the public enquiry into the question of revising the selling prices of ferro-silicon held recently in Bombay, the chairman of the Tariff Commission, Mr. K. R. P. Aiyangar, said that in 1949, the Tariff Board, while recommending continued protection to this industry, also recommended that ceiling prices of different grades of ferro-silicon should be fixed. These recommendations were accepted by the Government, and ceiling prices for different grades of ferro-silicon were fixed at the levels of the fair selling prices estimated by the Board. In its enquiry report on protection to the industry in 1953, the Tariff Commission again reviewed the price structure and on its recommendation, ceiling prices (f.o.r. Bhadravati) were fixed as follows:

Grade	Rs. a ton Lump	Powder
75/80 percent ...	890	845
70/75 percent ...	820	779
60/70 percent ...	663	630
40/50 percent ...	466	443

Excess Demand

As the demand for ferro-silicon in the country is considerably in excess of internal production, the above ceiling prices became, in effect, the actual selling prices of indigenous ferro-silicon. During 1959, the Mysore Iron and Steel Works, Bhadravati, represented to the Central Government that its manufacturing cost had increased, particularly due to the increase in the rate charged for power by the Mysore State Electricty Board and requested that the present prices be suitably raised. The Government considers that a fresh examination of production cost should be undertaken and has, therefore, referred the question to the Commission.

The Mysore Iron and Steel Works is the only producer of ferro-silicon in the country, employing two 1,500 kVA and one 9000 kVA furnaces. The annual rated capacity of these furnaces for 70 percent to 75 percent grade of ferro-silicon was assessed by the Commission during the last enquiry in 1953 at 5,570 tons. Although no additional furnace has been installed since 1953, substantially higher production has in fact been obtained from these furnaces during the last two to three years. The producer has plans for installing two 12,000 kVA furnaces, expanding its capacity by 15,000 tons a year by 1962.

At the time of the last enquiry in 1953, the production of ferro-silicon was from the 9,000 kVA furnace only. The smaller 1,500 kVA furnaces were not in operation. Subsequently, the latter furnaces, which were located in Mysore, were dismantled and transferred to Bhadravati. One of them began production at the new site in April 1956, and the other in April 1957. The production of ferro-silicon of all grades rose from 3,808 tons in 1953 to 4,417 tons in 1954 and 5,184 tons in 1955. There was a slight decline during 1956 and 1957, production being 4,523 tons in 1956 and 4,621 tons in 1957. From 1958 onwards, production again went up, being 5,675 tons in 1958, 7,203 tons in 1959 and 3,123 tons in the first six months of 1960. Besides this unit, two new units with a total rated annual capacity of 12,200 tons, it is proposed, will be set up in Orissa. The draft third five year plan visualises a target capacity of 40,000 tons of ferro-silicon.

At the time of the last enquiry in 1953, the Commission estimated annual domestic demand at 4,500 tons for the period from 1954 to 1956. Estimates have now been received both of current domestic demand as well as of future, from different parties. The Iron and Steel Controller furnished requirements of main steel producers, electric furnace owners, railways and ordnance factories which constitute the bulk of the demand excluding iron foundries while the Development Wing has supplied estimates of the demand of iron foundries. Main steel producers who are also the main consumers have given estimates of their own requirements. From the total figures of demand furnished by the Iron and Steel Controller and the Development Wing, it appears that the current demand is about 13,720 tons whereas the Mysore Iron and Steel Works has estimated it to be 7,755 tons. Similarly, the figures of future estimates as reported to the Commission by the Iron and Steel Controller (including the figures of Development Wing) and the Mysore Iron and Steel Works are 15,387 tons and 10,236 tons, respectively, for 1961 and 16,717 tons and 15,157 tons, respectively, for 1962. On the basis of sales and imports during the first six months of 1960, it appears that the annual domestic demand during 1960 would be about 9,000 tons.

Principal Raw Materials

The principal raw materials used in the manufacture of ferro-silicon are quartz, M.S. turnings and borings and charcoal. All these are available locally. Besides, certain consumable stores and a large quantity of power are required for operating the furnaces. The producer has complained about the quality of soderberg paste obtained by it indigenously. The quality of indigenous product has been reported to be generally satisfactory by most of the consumers. The producer has informed that it is following the appropriate I.S. specification for the manufacture of ferro-silicon. Some of the consumers have, however, observed that the percentage of fines is excessive in the product supplied to them. In its enquiry in 1953, the Commission recommended ceiling prices of ferro-silicon of different grades. These prices have been maintained by the producer until 30th June, 1959. In some cases, it has been obtaining a deposit of Rs. 81 a ton on all grades of ferro-silicon since 1st July, 1959, and in some cases, it has notified that supplementary bills would be submitted after the Government has approved the price increase.

Comparative Prices

In order to have a comparative idea of the price of indigenous article with the imported product, prices of imported ferro-silicon of certain grades have been obtained from some of the consumers and the State Trading Corporation.

The producer has asked for an increase in the existing selling prices because the production cost has gone up considerably since 1953, due to increases in the raw material costs, power rates and labour charges. The Cost Accounts Officer has examined the figures.

Ferro-silicon is widely employed in metallurgy for finishing carbon steels and for producing alloy steels with special mechanical and physical properties. The production of steel, which is the most vital industrial material, is expected to increase from 2.6 million tons in 1960-61 to 6.9 million tons in 1965-63. Ferro-silicon will thus be required in ever-increasing quantites. Although all the raw materials required for the manufacture of ferro-silicon are indigenously available, its production has lagged behind demand, necessitating imports.

MANGANESE ORE EXPORTS TO CZECHOSLOVAKIA RISE

India exported 26,000 tons of manganese ore to Czechoslovakia in the first six months of 1960, compared with 21,000 tons in the whole of 1959, according to official sources. In 1958, the quantity exported was 23,000 tons.—N.A.F.E.N.

ANOTHER VENTURE OF PHILIPS INDIA

Philips India Ltd has acquired from the Official Liquidator to Calcutta High Court, the land, buildings, plant and machinery in Bombay previously owned by the Osler Electric Lamp Manufacturing Co. Ltd (in liquidation). The old Osler factory was closed down in April 1958, and thereafter, compulsorily wound up early in 1959 under the orders of Calcutta High Court. The immediate task of Philips India Ltd will be to overhaul the existing plant and machinery lying idle for a considerable period. Every effort will be made to start production by the middle of next year.

EXPORTS OF CASHEW KERNELS RISE

PROCESSORS TRYING TO FORM NEW SYNDICATE

(FROM OUR SOUTH INDIAN CORRESPONDENT)

NEW African cashew crop has started coming in, although no firm estimate of its size is yet available. Processors in Quilon are, however, inclined to believe that the new crop is not likely to fall short of last season's 100,000 and odd tons. The availability of African nuts will enable processing factories in Kerala, which have suspended work, to restart processing soon. Most of the cashew factories in the State used to stop processing from October for want of raw nuts. Kerala has about 175 cashew factories—most of them concentrated in the Quilon area—which provide employment for over 50,000 workers. The new Indian crop will not be available to the factories before three or four-months. If weather conditions are favourable, India is expected to produce about 65,000 tons of cashewnuts next season. Besides, she is likely to have a larger production of processed cashew kernels this year. Export figures indicate that she is exporting more than she did last year. The latest available official figures are for the period January to August. During this period, 27,570 tons of cashew kernels worth Rs. 13.9 crores went out of India, compared with 26,652 tons worth Rs. 10.6 crores during the same period in 1959. The United States, as usual, was the largest buyer, having taken 16,654 tons worth over Rs 8 crores. India exported 37,569 tons of cashew kernels worth Rs. 15 crores last year. She could earn another Rs. 40 lakhs from the export of cashew shell oil amounting to 4,889 tons. Raw nut imports from Africa amounted to 90,318 tons in 1959. Those during the period January to August 1960, amounted to 67,311 tons, compared with 57,275 tons during the same period of last year.

Encouraging Outlook

Cashew kernels had a comparatively dearer market this year, the lowest and the highest prices being 50 and 60 (U.S.) cents a lb. The current price for the commodity is 55 cents. The immediate outlook for the commodity is sufficiently encouraging, according to processors. The latter are trying to obtain raw nuts at reasonable prices by constituting a syndicate for the purpose of purchasing and making equitable distribution of imported nuts. If the efforts of the newly constituted syndicate succeed, factory owners will get their raw material regularly and at reasonable prices. The crop position is also better. Foreign enquiries are expected to maintain at least this year's level, so processors expect an all-round stability in the market next year.

World Coffee Prices Fall

Brazil recently sold to an American roaster firm a substantial quantity of coffee from her old stocks. This deal which was completed at a time when the International Agreement on Coffee Exports was being finalised, has had a demoralising effect on the world market, according to trade reports. The declining tendency in the world price for the commodity has been aggravated due to the shifting of a substantial share of Brazil's surplus to the American market. Its reaction on the world market, it is stated, was definitely unhealthy.

The world coffee crop for the 1960-61 season is expected to fall on account of the anticipated shortage in the Brazilian output. The latest estimate put the latter at 33 million bags and 25 million bags for exports, against last season's 43.5 million bags and 36.5 million bags, respectively. Drought is reported to be largely responsible for the sharp fall in Brazilian production. Even at this lower output, several million bags will be left over to be added on to the existing carryover stock. Although the producing countries are making continuous efforts to enlarge and spread their markets, any increase in world consumption over and above the normal rise in population may not be sufficient to absorb the increasing output. This apart, the price structure will depend upon the ability of producing countries to overcome competition and to regulate markets. But the deterioration in the supply-demand position will make price stabilisation efforts increasingly difficult in future.

Promotional Efforts

With a carryover stock amounting to over 20,000 tons and the new coffee crop definitely larger than last season's, India is facing a desperate situation at present. Leaders of the coffee-growing industry fear that the Coffee Board will not be able to maintain the growers' return at the present level. The malady for coffee plants, reported from Mysore (the largest coffee growing State), makes the industry's position still worse. Against this background, the Board's efforts to popularise coffee consumption are commendable. But its promotional activities mainly aim to expand the market for Robusta coffee in India. It has a very poor market abroad, so it is necessary to expand the internal market. The Coffee Board's decision to enhance the commission for Robusta coffee powder dealers from 6¼ percent to 10 percent and to remove all restrictions on its sale is welcome.

Recommendation of Tariff Body Resented

The recommendation of the Tariff Commission to exempt the depreciation allowance in the price structure of natural rubber for the purpose of calculating agricultural income tax has displeased the rubber growers. The U.P.A.S.I. has decided to take up the matter with the State Governments shortly.

CEYLON TEA EXPORTS RISE

Although tea exports from Ceylon declined to 34.61 million lbs in September 1960, from 39.14 million lbs in the corresponding month of last year, total exports in the first nine months of the current year increased to 316.26 million lbs from 278.86 million lbs in the corresponding period of last year. With the exception of Egypt, which took only 800,180 lbs in January-September 1960, against 7.28 million lbs in the same period of last year, exports to all destinations showed a marked improvement, with the U.K. increasing her offtake to 116.72 million lbs from 102.26 million lbs and the Continental countries raising theirs to 13.62 million lbs from 10.03 million lbs. Tea exports to the U.S.A. and Canada also increased from 34.94 million lbs and 11.38 million lbs in January-September 1959, to 37.74 million lbs and 13.23 million lbs, respectively, in the first nine months of the current year. Similarly, exports to Australia and New Zealand increased from 29.13 million lbs and 10.89 million lbs to 35.67 million lbs and 11.79 million lbs, respectively. Africa increased her offtake of Ceylonese tea to 28.74 million lbs in January-September 1960 from 24.69 million lbs in the corresponding period of 1959 as did the other countries to 57.95 million lbs from 48.24 million lbs. —N.A.F.E.N.

COCHIN TEA SALES

At Dust Sale T, 269,000 kilograms of tea were on offer. There was a good general demand, but the market was irregularly up to 10nP easier.

At Sale No. 49, 700,000 kilograms of tea were on offer. There was a useful demand at lower rates. Low mediums and mediums were 10nP to 20nP easier. Good mediums were up to 20nP below last valuation while high-growns were neglected. Clean leaf fannings were steady and whole leafs easier.

NORTH INDIAN TEA CROP REPORTS

The following summary of crop and weather telegrams has been received from different districts for November 1960:

Upper Assam: Outturn normal to good but poor in Dibrugarh; outturn todate in Nahorkatiya is about level with last year but elsewhere it is poor; the cold weather has set in and the season is practically closed.

Central Assam: Outturn poor; rain badly wanted in Nazira and Moran but in Golaghat weather conditions are satisfactory; despatch of crop from Moran is delayed by rivers drying up; the cold weather has set in and the season is practically closed.

Lower Assam: Outturn about normal but poor in Tezpur and Nowgong; weather abnormally dry; the cold weather has set in and the season is practically closed.

North Cachar: Outturn about normal; that todate is considerably below last year; blight is not so severe; rainfall is much below normal for the season todate; the cold weather has set in and the season will close about the normal time.

South Cachar: Outturn poor; that todate is considerably below last year; helopeltis severe in Chutlabheel but is lifting in most districts; the cold weather has set in and the season has practically closed.

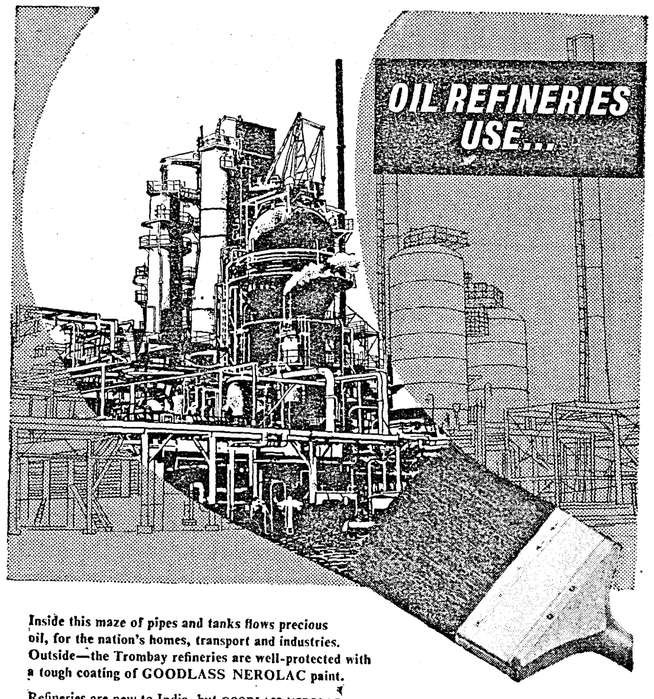
Eastern Dooars: Outturn poor; that todate is considerably below last year; rain badly wanted; the cold weather has set in and the season is practically closed.

Central Dooars: Outturn about normal; weather seasonable; the outturn todate is slightly over last year; the cold weather has set in and the season is practically closed.

Western Dooars: Outturn about normal; the cold weather has set in and the season is practically closed.

Darjeeling: Outturn about normal; the cold weather has set in and the season is closed.

Terai: Crop about normal; weather seasonable; some helopeltis; season likely to close early.



Inside this maze of pipes and tanks flows precious oil, for the nation's homes, transport and industries. Outside—the Trombay refineries are well-protected with a tough coating of GOODLASS NEROLAC paint.

Refineries are new to India, but GOODLASS NEROLAC have twenty-five years' manufacturing experience in India, backed by a century of technical and scientific development of methods and products.

GOODLASS NEROLAC—the Paint Specialists—supply all types of paints...each one specially manufactured to provide the best protection for every type of industry.

India's leading manufacturers of industrial paints and finishes

GOODLASS NEROLAC PAINTS

GOODLASS NEROLAC PAINTS Private Limited, Forbes Building, Home Street, Bombay 1
Agents: Balmer Lawrie & Co. Ltd., 21 Netaji Subhas Road, Calcutta.

"CAPITAL" STOCKS AND SHARES INDEX*

The *Capital* Stocks and Shares Index (Base : 1939) has now been brought up to November 1960. As compared with October, the November index for Government securities shows a rise of 0.1 point, while that for preference shares indicates a drop of 0.5 points.

There were increases in banks 7.9 points, coals 7.1 points, minings and oils 1.5 points, cements 1.9 points, engineerings 1.7 points, papers 38.4 points, sugars 3.4 points and miscellaneous 2.1 points, while decreases occurred in cottons 2.0 points, jutes 17.0 points and teas 0.8 points.

Correlating all the factors, the *Capital* variable yield securities index advanced by 3.6 points during November 1960.

	Index of Govt. Securities	Index of Preference Shares	Variable-Yield Securities. Banks	Cotton Mills	Coals	Jute Mills	Mining and Oil	Cement Lime etc	Engg. and Metal Works	Tea Shares	Paper Mills	Sugar Shares	Others	Combined Index.

THE IMPORTANCE OF BRAND NAMES

By Sripati Ranganadha

A BRAND is a name or a symbol or any other receptive form of identification of a specific product or service. The essential feature of a commodity or service, at the outset, lies in its identity. It is the brand that builds up the reputation of a concern, controls the marketing operations, stabilises sales, and eventually, perhaps leads to maximum profits. It is no wonder that the product researchers have to take every precaution to ensure that the proposed brand of a product is not mistaken for that of another. Therefore, they make every effort to see that the product has a name which is easy to pronounce since that promotes selling by suggesting the origin and quality of the product.

When a brand attains its goodwill, the product can almost maintain the same volume of trade for a fairly long period with relatively little or negligible selling costs. Experience has shown that the vast majority of consumers have fallen willing "victims" to brand products which are in the public eye. In the modern economy, every commodity has a brand name of its own. Only a few buyers normally have the time, interest and knowledge of the various goods sold. The majority of them usually follow in the footsteps of others who are socially acceptable and supposed to be in the know of things. They seldom exercise the right of the "consumer's sovereignty". The manufacturers naturally cash in on this tendency of the buying public and to exploit it fully.

Further, these manufacturers expect many more economic advantages from their established and well-known brands. These brands, in general, simplify sales programme, facilitate repeat orders, secure greater price stability, afford greater profits accruing from reduced prices, safeguard against imitation or substitution and tend to build up consumer acceptance; and they are naturally preferred by the majority of middle men.

The desired success of promoting sales depends on the policy pursued and the decisions taken by product research personnel who are naturally well acquainted with the other competitive brands and their means of distribution. The standardisation and streamlining of the mass output of products requires the use of significant designations. The existence of close identity or substitution of products and services may lead to undesirable consequences, for both rival manufacturers and consumers. Therefore, the brand which is legally known as the trademark of a product provides a safeguard against such a confusion.

Private and National Products

Brands are usually of two kinds. One is "national", in the sense that the name is given to a particular commodity or service by a single manufacturer or producer. The second type is called "private", which is the name given by middle men to certain products supplied by smaller manufacturers who cannot compete with "national" goods. The very choice of brands—national or private—suggests the extent to which the manufacturers are prepared to incur distribution costs. Each type of brand, in fact, has its own limitations. The right appraisal of the proposed product and market conditions lies in the ability and far-sightedness of the researchers. The producers, in general, may be classified as those who prefer to market their commodities with an eye on long-standing prestige, goodwill and responsibility for the quality of the product and those who aim at quick sales and quick returns.

It must be pointed out, however, that the above generalisation is sometimes misleading. In point of fact, both these producers strive for financial profits, but their means of attaining them differ. The former marketing a national brand have to spend a good deal of time, effort and money to build up the reputation of the product or service, whereas the latter, content with a private brand, have relatively less expenditure on sales promotion and compete with the former through middle men-distributors. The private brand of a nationally known concern is better placed in terms of price and distribution costs than the national brand of a manufacturer. It has been estimated in the U.S.A. that the costs of marketing a national brand product are nearly double that of the private one.

Well-known and established concerns which sell private brands, can change their suppliers, as they can sell a similar product of a different manufacturer or supplier under a different name. Originally, the idea of a private brand came into being due to certain manufacturers not having enough capital to launch their product or service on a national scale. Hence they had to rely on reputed middle men who could buy the small manufacturer's less known products and sell them under a given name. Unless these middle men order large quantities of their products and spend appreciable sums of money for promotional campaign, the manufacturers with a small capital would be at a competitive disadvantage, compared with national brand producers.

If the manufacturers depend entirely on middle men, the latter will have to finance substantially in advance to set their enterprise in motion. There should be, therefore, a long-term contract between them so that the manufacturers are in a position to bring out their products over a period of years. Few middle men of repute will ever concede to these apparently reasonable terms because considerable financial outlay and executive effort will be needed to popularise and publicise a private brand. Further, they will hesitate to assume the responsibility for quality.

In the light of these mutual limitations, middle men always look for a better and improved product for their customers with less financial commitment. The private brand manufacturers, on the contrary, may not look on a particular concern as the only means of distribution of their product for ever. This disharmony between the two—the manufacturer and the middle men—has given rise to a kind of dual producer who turns out a part of his sales under a private brand and the rest of it under a national brand. An dentical product sells for more under a national brand and for less as a private brand, in spite of the fact that the product (whether sold as a national brand or a private one) is brought out by the same manufacturer and costs him the same. Thus in the present-day economy can be seen a competition between the national and private brands of one and the same product, which makes an interesting study in sales potential.

Wholesalers and Manufacturers

Several wholesalers often join together and ask the manufacturers to produce a particular product under a single name to be marketed by them. This is no doubt unusual because it is difficult to induce different manufacturers to put out a product under one single name without their own individual and particular marks of identification. Products of this nature without quality and service differentiation and without price discrimination also appear to be rather common in an advanced economy.

The reputation of a brand calls for another innovation. A brand with a goodwill lends dignity to its by-products. If a particular commodity attains popularity in the market, the manufacturers prefer to use the same brand name for allied types of goods. For instance, if a soap has an attractive brand, the same is used to popularise all its related products such as tooth-paste, cream, face powder, lipstick and other cosmetics. Sometimes the same popular brand is used for entirely unrelated commodities such as table fan, sewing machine, record player, typewriter, etcetera. This is usually referred to as family (blanket) brand. For goods of an unrelated family brand the trade channel will necessarily vary. For example, a middle man of a specified field will entertain the only commodity of his interest from the family brand. The other products have to seek different concerns for making their way into the market.

Consumer Movement

Moreover, certain brands call for quality differentials to aid the consumer movement. The purpose of the movement, which dates back to 1920, is to help consumers in their choice of a product or service. This movement has been organised by the continuous and concerted effort of organisations such as trade unions, consumers' co-operative societies, business bureaux, magazines, professional enterprises, etcetera. A single brand of a concern can be drawn into many standards which differ in shape, size, package, colour and price. Advertisements proclaim that these standards differ markedly in quality from one another. This product differentiation is generally referred to as grade labelling. This is designated in the United States by an organisation called Production and Marketing Administration (P.M.A.), which was set up in July 1931. If it is so desired, each product may afford to have its own creative specification of labelling without the interference of P.M.A. After inspection, P.M.A. certifies the quality and assigns the grades of the products without any bias. These grades offer confidence

to the manufacturers and facilitate ready acceptance by consumers.

Colour Label

Sometimes it is not easy to distinguish between the qualities of a product whose labelling are ascribed in colours. Most often price differentials of such labels may not give the clue to the qualities of the product either. The content of different labels may be the same, but the get-up may be different, and naturally, there is bound to be a price difference which does not suggest the quality of the product. Advertisements tend to differentiate the colour of the label to suit consumer tastes. There is no point of superior qualities here. One quality of a label pigment is as good as the other of the same concern, but the tastes of consumers vary. Sometimes it is also difficult to differentiate the epithets describing the qualities of competitive products and services such as fine, de-luxe, premium, excellent, top, etcetera. Although one can attempt to draw a comparison between the so-called superfine and fine and special de-luxe and de-luxe and so on, one is aware that these trite usages are often very misleading.

Indian Standards Institution

In India, the National Bureau of Standards, popularly known as the Indian Standards Institution (I.S.I), is helping to minimise some of these deliberately confusing quality myths. It goes into the merits of the product individually by the quality control method and offers permission to use I.S.I. marks for the products. The Indian Standards Institution ensures and assumes responsibility for the quality of the product.

GOOD GENERAL DEMAND AT TEA EXPORT SALE

MIXED TREND IN PRICES

AT Sale No. 24, held on 19th December, the offerings at the Export auction amounted to 73,760 packages. There was a good general demand for all descriptions except medium Assam B.O.P.'s, which were the weakest feature of the sale. The very best C.T.C. descriptions received good support, but were irregularly easier by 20nP and up to 40nP. The better medium C.T.C. teas eased by about 20nP, but the poorest and more fibrous sorts, although irregular, were sometimes much dearer. Medium Assam O.Fgs. declined by 10nP to 20nP while similar B.P.'s were slightly easier and Fannings in this category were irregular and sometimes easier, although the poorer types of both descriptions were often dearer. Teas for price, plain brokens and Fannings were well supported and were generally firm, Fannings being occasionally dearer. Legg-cut descriptions and whole-leaf grades received satisfactory support and were generally steady. The brighter Darjeelings once again came in for satisfactory enquiry, while the poorer types were irregular and easier. There was only a limited quantity of tippy teas on offer and these were also irregularly easier.

FREIGHT RATES RISE

HIGHER rates in a number of trades in the freight markets were more readily conceded in the latest exchanges, and with a continuous shrinking in the volume of laid-up tonnage, owners are now showing greater inclination to hold back. Significantly, many charterers are anxious to conclude forward bookings at current levels. Grain from Pacific Coast to India paid a further 2s 6d at 66s 3d a ton to East Coast India. The high rate of 60s f.i.o.t. was conceded for iron ore from Mangalore-Belekeri to Hamburg for a spot ship and Laurenco Marques-Colombo coal was done at 50s f.i.o.t. Very sharp increases in rates from the River Plate to the Continent have been noted in the last two weeks, and rates are now ruling 16s 3d a ton higher. The ore rate from Mormugao has jumped 10s a ton to 50s for Continental destinations and scrap cargoes to Japan from America have gone up several thousand dollars on a lump-sum basis. Many experts now hold the view that the depression for dry cargo ships would be over were it not for the employment of some 1¼ million tons of tankers in the grain trades. The volume of unemployed dry cargo vessels at the end of November stood at only 2 percent of the world fleet and of this tonnage, it is reckoned only a further 500,000 tons or one-third could be economically put back in service.

The first vessel to lighten grain at Haldia Anchorage this year has just arrived and her progress in discharging will be watched keenly by shipping interests.

In the liner trades, cargo movement is still slow and the continued high prices in the jute industry have reduced exports of goods to a low point. Tea is still going forward in fair quantities and better deliveries of ores by the railways have improved the despatch of this commodity.

HIDES AND SKINS QUIET

The market was quietly steady. Stocks of hides were higher but those of skins were less than in the previous week.

Bazaar Sales

(Between 13th December and 19th December, 1960)

Cowhides: Wet salted (Ord.) 16,000 pcs. on the basis of Rs. 9.25 and Rs. 13 to Rs. 15.50; Wet salted (Slaughtered) 18,600 pcs. on the basis of Rs. 11 to Rs. 14 and Rs. 17 to Rs. 30; Wet salted (Ord.) 5,000 pcs. on the basis of 94nP a lb.

Bazaar Stocks

(19th December, 1960)

Cowhides: Wet salted 93,500 pcs.

Goatskins: Wet salted (Daissee, Kustia, Killed) 13,000 pcs.; Assam-Dinajpur 60,000 pcs.; Muzafferpore-Patna-Pakur-Purneah-Kissenganj 210,000 pcs.

COMPANY AND PUBLIC NOTICES

NEW CENTRAL JUTE MILLS CO. LTD.

NOTICE is hereby given that the Annual General Meeting of the Shareholders of the Company will be held on Wednesday, the 18th January, 1961 at 12 noon at the Registered Office of the Company at 11, Clive Row, Calcutta to transact the following business:—

1. To receive and adopt the Directors' Report and the audited Accounts of the Company for the year ended 31st March, 1960.
2. To declare dividends.
3. To elect a Director in place of Shri. A. K. Jain who retires by rotation but, being eligible, offers himself for re-election.

(To be proposed as Special Resolution under section 261 of the Companies Act)

4. To appoint Auditors for the current year and to fix their remuneration. The retiring Auditors Messrs. N. C. Jain & Co., Chartered Accountants, being eligible, offer themselves for re-appointment.

As Special Business:

1. To consider and pass the following resolution with or without modification, which will be proposed as a Special Resolution:—

   "RESOLVED that the regulations contained in the printed documents submitted to this meeting and for the purpose of identification subscribed by the Chairman thereof be and the same are hereby approved and that such regulations be and they are hereby adopted as the Articles of Association of the Company in substitution for and to the exclusion of all existing Articles thereof."

2. To consider and pass the following Resolution which will be proposed as Special Resolution':—

   "RESOLVED that Shri. A. K. Jain, Managing Director and Associate of Messrs. Sahu Jain Limited, the Managing Agents of the Company, be and is hereby appointed a Director of the Company liable to retire by rotation u/s 261 of the Companies Act, 1956."

3. To consider and pass the following resolution with or without modification, which will be proposed as an Ordinary Resolution:—

   "RESOLVED that the appointment of Messrs. Ashoka Marketing Ltd. as sole selling agents of the Company for the sale of Soda Ash, Ammonium Chloride Fertiliser, Muriate Ammonia and Anhydrous Ammonia Gas for the whole of India, on the terms and conditions enumerated in the Agreement, submitted to this meeting and already approved by the Board of Directors of the Company be and is hereby approved and confirmed."

Share Transfer Book of the Company will remain closed from 4th January, 1961 to 18th January, 1961, both days inclusive.

N.B. A member entitled to attend and vote at the meeting of the Company is entitled to appoint another person as his proxy to attend and vote instead of himself and the proxy need not be a member.

For NEW CENTRAL JUTE MILLS CO. LIMITED,
For SAHU JAIN LIMITED,
A. K. JAIN,
Managing Director,
Managing Agents.

Dated Calcutta
The 17th December, 1960.

Explanatory Note to Resolution No. 1.: The Articles of Association of the Company were in accordance with the provisions of the old Companies Act. In view of the changes effected by new Companies Act, it is considered desirable by your Directors to adopt a new set of Articles for the Company in order to bring them in conformity with the provisions of the present Companies Act. The consent of the Shareholders is sought to the proposed resolution as above.

Explanatory Note to Resolution No. 2.: Shri A. K. Jain who was elected as Director of the Company by Special Resolution of the Shareholders passed in the Annual General Meeting held on 31st July, 1958 now retires by rotation being an Associate of the Managing Agents of the Company. His election requires the consent of the shareholders by way of Special resolution, as required u/s 261 of the Companies Act. Shri S. P. Jain, Chairman of Sahu Jain Ltd. is father of Shri A. K. Jain and Shri A. P. Jain, Director of Sahu Jain Ltd.

Explanatory Note to Resolution No. 3.: Messrs. Ashoka Marketing Limited have been dealing with chemicals and have got organisation well established in different places in the country. It has been considered expedient that the Company should avail of the sale organisation of Ashoka Marketing Limited. The Board of Directors of the Company has approved the appointment of Messrs. Ashoka Marketing Limited as Company's Sole Selling Agents for the sale of Soda Ash, Ammonium Chloride Fertiliser, Muriate Anhydrous Ammonia Gas for the whole of India for a period of 5 years with effect from 1st September, 1960 on a commission of Rs. 7/50nP per tonne on Soda Ash and 2½% on the sale of other products (excluding Ammonium Chloride Fertiliser) and on the terms and conditions contained in the relevant agreement. A copy of this Agreement is available for inspection to the members on all working days during business hours at the Registered Office of the Company and the same will be placed before the Shareholders at the above meeting. The Appointment as Sole Selling Agents requires approval of the shareholders u/s 294 of the Companies Act, 1956.

The Managing Agents and the Directors of the Company have no interest in the said arrangement or agreement.

SHAW WALLACE & COMPANY LIMITED

Dividend on Preference Shares

THE Directors have declared a Second Interim Dividend of 3%, subject to deduction of Tax under Section 18(3)(D) of the Income Tax Act, 1922, on the Company's Preference Shares in respect of the year 1960, payable to Members whose names appear in the Preference Share Register on the 16th January, 1961. Warrants will be posted on or after that date to the addresses or in accordance with the instructions, recorded in the Company's books.

The Transfer Register of the Preference Shares will be closed from the 9th to the 16th January, 1961, both days inclusive.

Adjustments, if any, in the dividend as declared will be made on enactment of the Preference Shares (Regulation of Dividends) Bill, 1930.

By Order of the Board,
SHAW WALLACE & COMPANY LIMITED,
D. A. HOUGHTON,
Calcutta Director & Secretary.

4, Bankshall Street,
Calcutta-1.
16th December, 1960.

Ltd—20nP per share, subject to tax.

LINSEED FIRM

The market was firm due to a shortage of supplies from upcountry centres. Crushers showed keen interest for ready and forward deliveries, but sellers were scarce. The oil market was firm and stocks with millers were very small. Local buyers were in the market daily at prevailing rates as groundnut and mustard oil prices were high, but business passed on a small scale. Sellers were reserved. The oilcake market was steady due to local demand. The latest quotation is as follows: ready Rs. 27.37 a maund.

SHELLAC STEADY

During the week ended 21st December, the tone of the market was steady. The range of quotations was as follows:

Standard pure button-lac	Rs 90 buyers; 94 sellers.
Lemon No. 1 shellac	Rs 94, 93 buyers; 96 sellers.
Lemon No. 2 shellac	Rs. 83 buyers; 90, 91 sellers.
F.O. Superfine shellac	Rs. 83 buyers; 85, 86 sellers.
Standard One shellac	Rs. 80 buyers; 82, 83, 82 sellers.
T. N. Pure shellac	Rs 72, 73 buyers; 75, 76 sellers.
Golden Kusmi seedlac	Rs. 100 sellers.
Golden Kusmi seedlac (New Crop)	Rs. 104 buyers; 106, 108 sellers.
No. 1 Kusmi seedlac	Rs. 85 sellers.
No. 2 Kusmi seedlac	Rs 72, 70 sellers.
Golden Bysacky seed-lac	Rs 75, 76, 75 buyers; 77, 78 sellers.
One B seedlac	Rs 73, 74 buyers; 75 sellers.
Two B seedlac	Rs 63 64, 63 buyers; 65 sellers.
Manbhum Fine seed-lac	Rs 71, 72 buyers, 73, 72, 74 sellers.
Fine Bysacky seedlac	Rs. 64, 65 buyers; 65, 66 sellers.
Genuine Bysacky seedlac	Rs 58 buyers; 60 sellers.

Shipments during December until the 16th were 13,863 packages.

U.K. STILL LEADS THE WORLD IN TEA CONSUMPTION

Britain is still the greatest nation of tea-drinkers in the world, according to figures given in a review, *Plantation Crops*, just published by the Commonwealth Economic Committee in London. Coffee-drinking is on the increase in Britain, but the popularity of cocoa as a hot beverage is declining, the review says. In 1959, the average Briton consumed 9.6 lbs of tea and 1.8 lbs of coffee. New high levels of world production of tea, coffee, cocoa, and rubber were recorded in 1959-60, but sugar production fell below the record figure for the previous year. Commonwealth countries ship more than four-fifths of the tea entering world markets, and about one-half of the world's cocoa and rubber. The United States and Britain are the largest importers of many plantation crops from the Commonwealth. The U.S. market for rubber, cocoa, tea, and spices from the Commonwealth showed a welcome recovery in 1959.

A tradition extended...

With the merger on 1st January 1961 of the Eastern business of Lloyds Bank Limited with National and Grindlays Bank Limited a momentous step will be taken. This pooling of resources will help both Lloyds and National and Grindlays to offer better and wider services to their constituents. Lloyds, who will hold shares and be represented on the Board of National and Grindlays, will continue, through this association, to maintain a close interest in the banking business of all territories where they have established strong ties.

National and Grindlays Bank—one of the oldest of the Exchange Banks—have throughout had the same ideal as Lloyds: rendering first class service. The merger is therefore between two Banks similar in outlook, in tradition and in achievement. To maintain what both Banks consider is so essential—the personal touch—you will find Lloyds Branches after the merger manned by the same personnel, ready as usual to give the efficient, expert and helpful advice which their constituents have been accustomed to receiving.

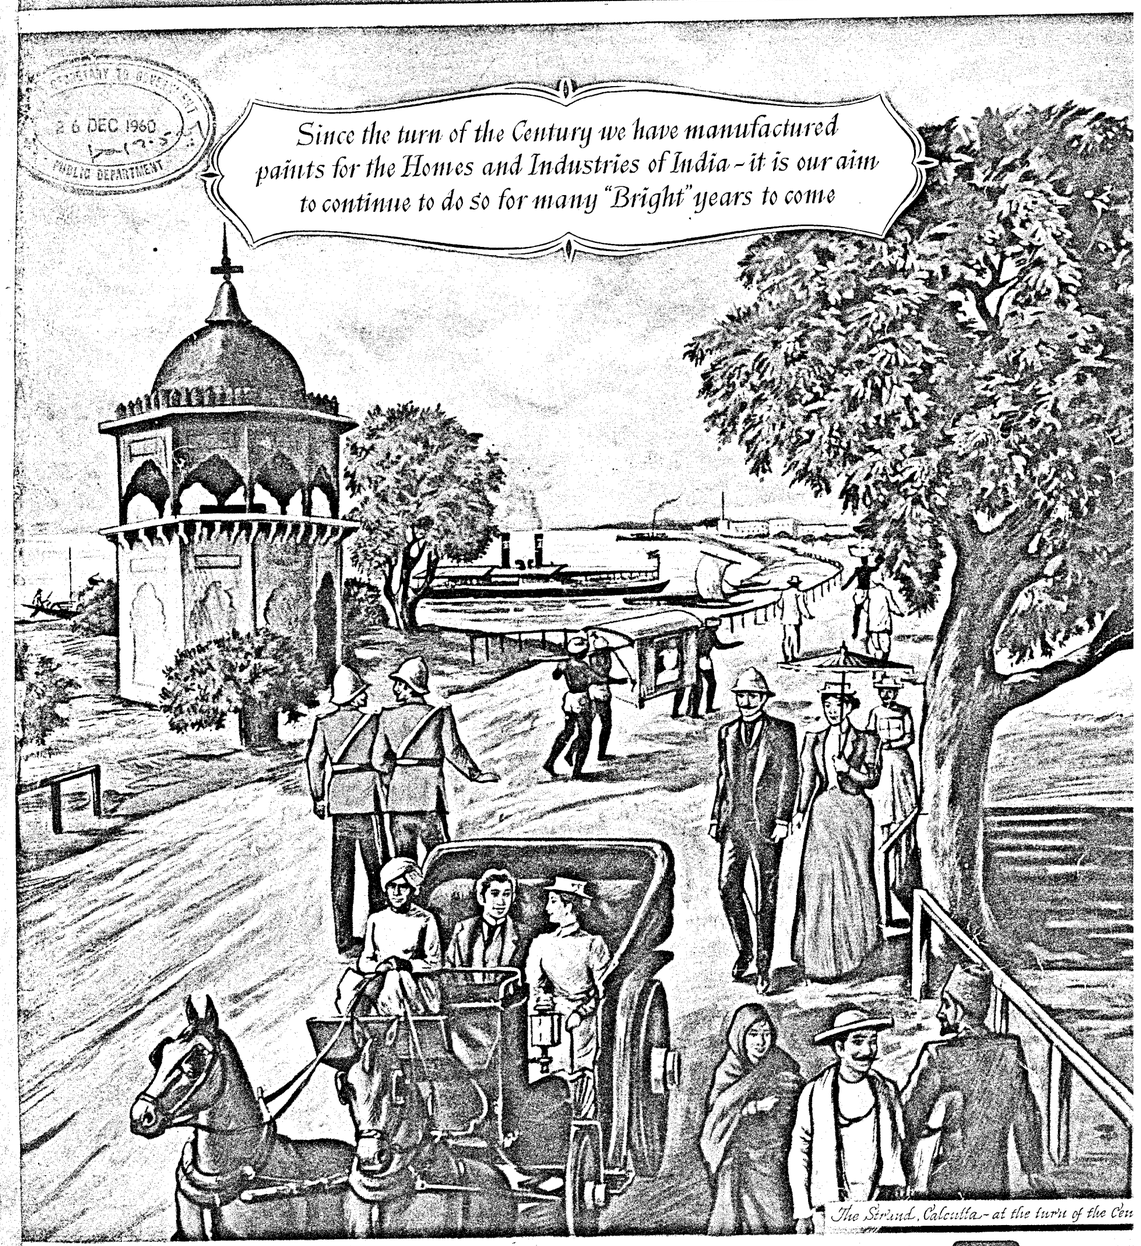
ANNUAL REVIEW OF TRADE, COMMERCE AND INDUSTRY

CAPITAL

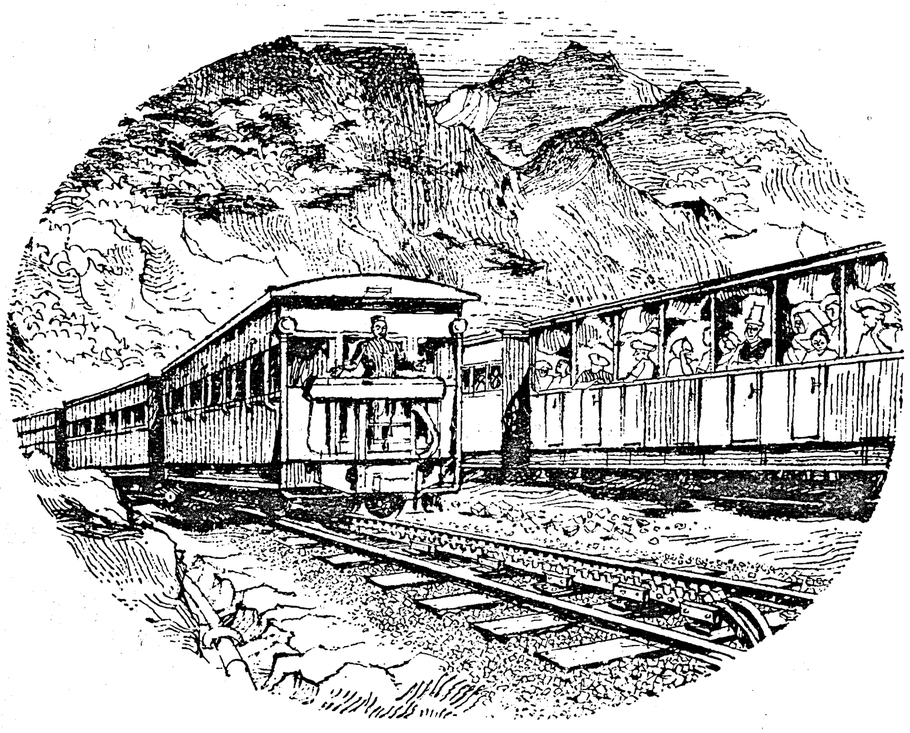
Rs. 5 PER COPY DECEMBER 1960 REGD. No. C2



High up in the Nilgiris

Few railway routes in India had a more chequered beginning than the 28½ mile link between Mettupalayam a Ootacamund located at an altitude of 7500 ft. in the Nilgi

Though first proposed in 1854, work on the railway was not started until 1891. The construction was completed by the Government in 1908 after two private Companies had gone into liquidation. The laying of the railway involved no less than 16 tunnels, totalling over three-fifths of a mile in length and large number of bridges some with spans upto 100 ft. The ascent at places is so steep that rack bars had to be provided between the track rails to serve as a form of ladder up which the engine climbs.



GKW

Today, Indian Railways carry annually over 13.2 crore tons of goods—mainly food products and raw materials; and since 1922 we have been closely associated with the manufacture of Railway Track and Signal Fittings in India.

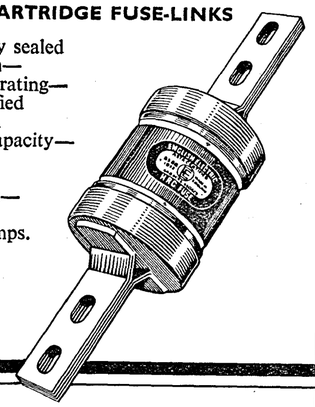
'ENGLISH ELECTRIC'

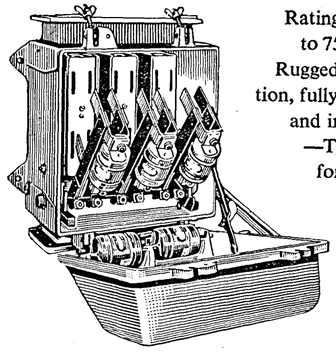
HIGH RUPTURING CAPACITY HEAVY DUTY FUSEGEAR

H. R. C. CARTRIDGE FUSE-LINKS

Hermetically sealed construction—Non-deteriorating—ASTA certified for 35 MVA rupturing capacity—Visible indication of operation—Ratings up to 300 amps.



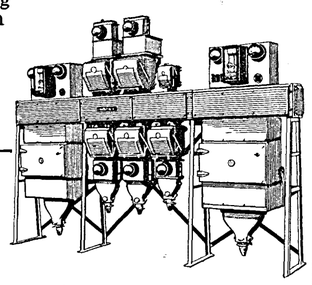
COMBINATION FUSE-SWITCHES



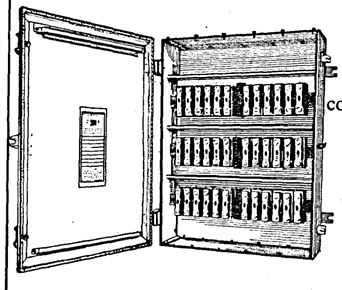
Ratings from 30 to 750 amps—Rugged construction, fully shrouded and interlocked—Type tested for 35 MVA rupturing capacity.

COMBINATION FUSE-SWITCHBOARDS

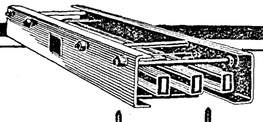
Incorporating Combination Fuse-Switches upto 750 amps—Robust and compact construction—Readily modified and extended—Type tested for 35 MVA rupturing capacity.



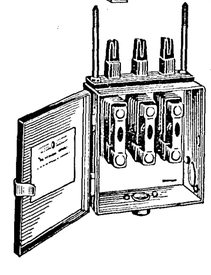
DISTRIBUTION FUSE-BOARDS



Robust, dust and moisture proof construction—Type tested for 35 MVA rupturing capacity—Ratings from 15 to 100 amps.



Flexibility of power distribution—Can be installed without disturbing existing layout or production—Avoids chasing of floors for ducting—Approved by Fire Insurance Authorities.



OVERHEAD BUSBAR EQUIPMENT

A complete range of distribution equipment manufactured at the Madras Works of The English Electric Company of India (Private) Ltd.

OIL —*lifeblood of industrial civilisation*

Oil means easier life—for oil powers and lubricates machines, planes, ships, trains and trucks, easing the burden of man.

Oil means brighter evenings—for oil keeps giant electric turbines and generators running, and also feeds the lantern of the villager.

Oil means more food—for oil powers tractors which give more food from less land.

Oil means healthier life—for petroleum insecticides destroy germ-carrying insects, adding more years to man's life.

Oil means diffusion of knowledge—for oil lubricates printing presses and makes printing inks, making communication of ideas easier.

Oil means all this—and a great deal more!

Oil is playing a major part in India's march towards economic expansion. Through its major operations—refining, marketing and exploring for oil—Stanvac is participating in the country's efforts.

TRUSTED NAMES

... mean a lot to the nation at this stage, when vast plans are going full speed ahead. Our range of trusted names reaches into every field of the country's planning. We supply the nation with reliable machines—machines that not only do the job, but do it to perfection—from reputed manufacturers, each a master in his line.

From well known manufacturers in the U.K., U.S.A., Australia, the Continent and India we bring you a complete range of machines and equipment for all the Industries.

TOWARDS ACHIEVEMENT

In three brief years a wilderness of swamp and paddy fields has been transformed into the giant steelworks at Durgapur. This remarkable achievement has been made possible by ISCON—a consortium of thirteen leading British firms who are responsible together for the construction of the steelworks. When completed, the steelworks will have a capacity for one million ingot tons of steel and a wide range of end products for the industrial markets of India.

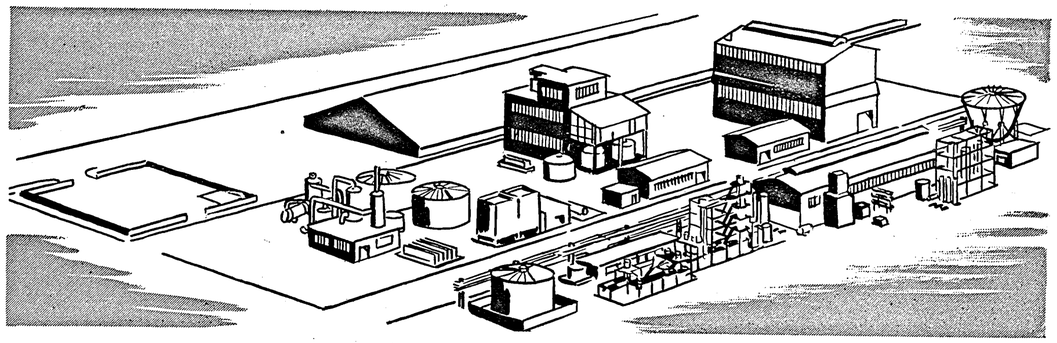
CHEMICALS FOR INDUSTRY



Simon-Carves, in India since 1935, accept contracts for designing and building plants for Sulphuric Acid and Oleum production, Roasting of pyrites and other sulphide ores, Saltcake and Hydrochloric acid, Electrolytic soda and Chlorine, Coal carbonisation and by-product recovery, Ammonia synthesis by the Ammonia Casale process and production of Nitrogenous, Phosphatic and complete fertilisers.

Simon-Carves are currently executing a contract from East India Distilleries & Sugar Factories Ltd., to build a complete compound fertiliser factory in Ennore near Madras. The factory will go into production about the middle of 1962.

The contract includes the design and supply of the equipment, the civil engineering work and the erection and commissioning of the plant which will produce approximately 51,000 tons a year of compound fertilisers based on ammonium phosphate. The factory will include an ammonia synthesis plant, sulphuric and phosphoric acid plants and raw material and product storage and handling equipment.

INDIA'S TAKE-OFF PROBLEM

The name of Dr. Vera Anstey, of the London School of Economics, requires no introduction to readers in India. Dr. Anstey's interest in this country dates back from her period of residence here between 1914 and 1920; her two books on India, "The Trade of the Indian Ocean", and "The Economic Development of India", were published in 1929. Her contact with Indian affairs was maintained during the period she was Sir Ernest Cassel Reader in Commerce at the University of London, and her influence on the development of economic thinking in this country, through the many Indian students who came into contact with her during the many years she has been associated with the London School of Economics, must be considerable. In this article, she outlines the reasons why planning is necessary to take India through a more-than-normally-difficult take-off phase, but must nevertheless be appropriate to Indian conditions and not lose sight of the primary needs of food, shelter, employment and incentive. Dr. Anstey makes a special point of advising against further extravagantly expensive prestige projects when the need is for rapid development to overtake population growth.

By

VERA ANSTEY

"DEVELOPMENT is now consciously part of national and international policies in pursuit of world peace and prosperity, by bridging the gap between the world's rich and poor, without political tutelage." (*The Economist*, 17th September, 1960). The transition from one five year plan to the next is always a period of heart searching, and may be of heart burning. The question is whether there is cause for serious disillusionment and disheartenment because India's draft third five year plan, which includes a review of the progress made during the second plan period, reveals some setbacks, and stresses the need for greater efforts, an increased scale of planning and investment, and substantially more foreign financial aid.

Some of the major disappointments and reasons for unease may be summarised as follows. Firstly, the draft plan admits that the attainment of take-off to self-sustained development is still some one to two decades ahead, while the long promised achievement of self-sufficiency in foodgrains is again deferred, and reappears as one of the main objectives of the third plan. Secondly, it is estimated that whereas the second plan—which had adopted the very modest target of providing employment for the annual addition to the working force, without relieving the backlog of unemployment and under-employment—has in fact created only some 6½ million additional jobs instead of the estimated 8 million required outside agriculture. Hence unemployment and under-employment are likely to have actually increased during the second plan. Thirdly, recent estimates of population growth reveal a rate much in excess of that indicated in the second plan. This must increase unemployment as well as population pressure in general. Fourthly, the present efforts to secure additional foreign capital to complete the second plan, and the greatly enhanced target in this respect set for the third plan, show that India's balance of payments problem tends to become more than ever critical. This has given rise in some quarters to the fear that, if forthcoming, such capital would simply go down an open drain.

Understanding the Problem

The contentions in this article are that, despite these disappointments, there is no need to be disheartened if the nature of India's problem of take-off is fully understood, if the happily flexible third plan is suitably adjusted, and if generous foreign assistance is forthcoming. But these are big "ifs"! Much has recently been written about "take-off" and "self-sustained development". "Take-off" refers to the critical transition from a stage of preparatory reforms to that of self-sustained development. The latter phrase refers to a situation in which the rate of domestic saving and investment is sufficient, and so utilised, as to induce a cumulative increase in national income, exceeding the rate of population growth. This is not to say that foreign capital will then no longer be required and welcomed, but that it can be attracted and remunerated in accordance with ordinary commercial principles. The draft plan states (p.10) that the "objective of securing viability on external account within a period of 10 years or so" is being given high priority. Another objective of Indian planning is "socialisation", although the greater the emphasis laid thereon, the longer the period required to attain external viability is likely to be. But once such viability has been secured, the fears that further financial aid will simply go down the drain would be removed. Hence attainment of the requisite rate of national income and viability on external account may be taken as the main criteria of having reached self-sustaining development.

The chances of attaining take-off within "ten years or so" may be clarified by analysing what take-off involves under the special conditions prevailing in India, and in similarly situated under-developed countries.

India's Case

The problem of take-off is not the same for under-developed countries of all types, or for some under-developed economies, as it was for countries which are now advanced. No systematic attempt has yet been made to classify types of under-development, but their varied economic and social characteristics are universally acknowledged. For my purpose, it suffices to indicate certain outstanding Indian social and economic features which render the problem of take-off different in kind, rather than in degree, from that which formerly faced the advanced countries, and which now faces other types of backward economies. It will then be argued that these features necessitate governmental planning; that such planning must be appropriate (and not a mere imitation of measures and policies adopted successfully elsewhere); and that success will be difficult (if not impossible) to achieve without very substantial foreign financial assistance.

A few of the relevant social and economic features may be briefly mentioned, as follows. In the past, India has received strong economic stimuli—including close personal contacts and extensive trade with the West, substantial foreign capital and entrepreneurship, and the establishment of potential growing-points (industrial and commercial, together with mining and plantation centres), preceded or accompanied by the construction of public utilities—which elsewhere have led, *via* the normal economic mechanisms (*e.g.*, relative price, cost and profit movements) to the extension of modernisation throughout the economy and to self-sustained development. No such results have occurred in India, for various reasons, the foremost of which is the rapid rate of population growth, coming, as it does, on the top of high population density. Instead of modern technologies and techniques gradually extending throughout the country, accompanied by monetisation, only certain limited economic classes and sectors have significantly improved their economic conditions and standards. The poverty-stricken masses have responded to the increased output and availability of foodstuffs and other necessities simply by maintaining ever-increasing numbers at approximately the same standard of life. Thus the Indian economy has "grown", rather than "developed", mainly by the expansion of existing types and methods of production, counterbalanced by population growth, so that among the bulk of the people there has been no *per capita* increase in productive equipment, efficiency, output, or power to save and invest.

It was hoped that independence would remove the former obstacles to widespread progress, which were attributed to alien rule. But although independence has paved the way in some respects, especially by social reforms—forbidden ground for the British Government—in fact the obstacles have proved deep-rooted. The "normal economic mechanisms" have not sufficed to induce modernisation among the masses. This failure has been attributed by some authorities to inelasticity of supply, by others to market (or demand) inelasticity. Probably there has been inelasticity in both respects. The central problem is to engender belief in the possibility of economic improvement and in the power of self-help among the masses. It is here that planning has so far proved most disappointing. Active participation and enthusiasm have not been aroused.

Population Growth

The present, ever-increasing rate of population growth is due to the continuous decline (especially since 1921) in the death-rate, promoted by the introduction of public health and medical measures, famine, relief and prevention, and increased availability of the necessities of life, without any significant decline in the birth-rate. This was not the situation in the now advanced countries at the time of their "industrial revolutions". This historical argument, together with the immensity of the population problem alone, suggest that to rely solely upon the working of normal economic mechanisms will not suffice to induce take-off in

....A plan for progress

PROGRESSION means new products, new methods, new ways to meet modern demand of industry. It means expansion. Expansion means opportunity—opportunity for our technicians to express their special talents and skills, opportunity for the masses to find an employment in the new factories and business.

THE BEHAR FIRE BRICKS & POTTERIES LTD. are continuing their expansion rapidly and extensively in pace with the general development of the Country. Begining with a small plant at MUGMA (Bihar) nearly 40 years ago the Company today has a fairly large plant producing FIRECLAY REFRACTORIES of all shapes and description.

A NEW UNIT OF SILICA PLANT has been completed and is producing ***dependable*** 'BEHAR' Brand SILICA REFRACTORIES saving valuable Foreign Exchange for the Country and generating considerable new employment.

THE BEHAR FIREBRICKS & POTTERIES LIMITED.

ıdia. A different approach must be adopted, and as been adopted, in the five year plans.

Many other features aggravate the problem, or instance, the scarcity of land, compared with ıe continued predominant dependence upon griculture—the latter being a sign rather than a ause of poverty and under-development. This, ı its turn, involves, with population growth, a arge surplus of unskilled rural labour. Then ıere has been and still is a substantial "import eak", accounting partially for the failure of ıodernisation to spread throughout the economy. 'hat is, the additional incomes generated in the ıodernised sectors have given rise to a relatively arge demand for imports in comparison with omestic products. Under British rule, this was ggravated by the export of profits and part of he earnings of Europeans, although a not unmportant share of these earnings was ploughed ack in India. But even today the prosperous lasses—as far as is permitted—import luxuries ıot produced in India, and travel abroad, etcetera, vhile the import-content of public and private nvestment remains very high.

All this (together with many other features vhich cannot be discussed here) means that the ask of take-off in India necessitates not a coninuous, gradual, process of economic expansion, ut a leap forward of critical size, sufficient to urpass the rate of population growth, and to ngender increased earnings, savings (which must e mobilised) and investment—in personal as well as material equipment—in all sectors, in order to nable the economy as a whole to cross the chasm etween the stage of preparation for take-off, and ı condition of cumulative, self-sustained development. This necessitates both large-scale planning, nd substantial foreign financial assistance.

Foreign Assistance

To take the latter point first, the need for speed (so that population growth does not overtake increased national output) and the fact that inadequate domestic capital for investment is of the very essence of the problem, necessitate temporarily unrequited capital imports during the take-off phase. Otherwise the critical size of the investment needed, if it is to be achieved, will result in resort to substantial deficit financing, the evils of which were so clearly expounded by Professor Bauer in *Capital's* last Annual Review (December 1959). The chief burden of deficit financing would fall on the poorest classes, and hence would prevent progress from spreading throughout the economy.

Turning to governmental planning, it is not to be assumed either that there should be rapid direct encroachment upon the private sector, or that the receipt of capital imports should involve relaxation of the efforts to step up domestic saving. Nor need continued dependence upon the private sector, and policies designed to promote domestic saving and investment, seriously conflict. The Indian plans recognise that there are limitations upon the size and rate of expansion of the public sector, and the need to rely upon the private sector for enterprise and initiative. But the latter will not be forthcoming if incentives are unduly curtailed—a point to be discussed further below. Many authorities have pointed out that reforms in fiscal and allied policies could enhance domestic savings by methods which in many cases would promote rather than hinder increased output and investment in the private sector. Under Indian conditions, which involve great difficulties in securing ever-increasing numbers of incorruptible, trained and experienced managerial and executive officials, it is better to stimulate private enterprise by suitable incentives to promote undertakings compatible with the plans, than for the Government itself to undertake far-reaching entrepreneurial functions. Incidentally, it should not be forgotten that the size of the public sector and control over the private sector are less in India than in many "unplanned" economies. There are other well-known arguments for governmental planning—such as that many projects designed to promote future productive capacities require so much capital, and entail such a long period before returns are received, that they are beyond the reach of private entrepreneurs—but these need not detain us here.

Special Nature

The conclusion is that it is the special nature of the take-off required in India that makes planning essential, in order to secure the best allocation of scarce resources (including the choice of techniques as well as of projects), especially as between the increased production of consumers' goods and services and the provision of more employment, on the one hand, and investment in modern types of capital-intensive projects designed to increase future productive capacity, on the other hand. In addition, it is only the Government that can introduce social and institutional reforms which are a necessary preliminary to material advance. Only the Government can check luxurious consumption and unnecessary foreign imports. Only with wise planning will the economy "develop" rather than merely expand.

Scale of Planning

So much has to be done, and done quickly, that an enlarged scale is essential for the third plan. It does not necessarily follow that the exact scale envisaged in the draft third plan, let alone the detailed policies recommended, are the best. What is necessary is that the results secured provide a period during which not only does the increase in national income outstrip population growth, but also that the standard of life and education can rise sufficiently to enable family planning to take firm roots. Many criticisms may be made of the draft plan. Here attention can merely be drawn to certain principles and policies which, if stressed, extended, or more fully implemented, might reduce capital requirements, alleviate the balance of payments problem, and set India more quickly and firmly on the path of development.

High priority should be given to the completion and full implementation of preparatory institutional reforms, some of which have been left in a state of suspended animation. In particular, the land reforms (which, initially, actually injured certain classes of cultivators who particularly required assistance) have not yet resulted in the anticipated stimulus to improved output cultivation which was a primary objective. Next, it is essential to provide for full utilisation of capacity already, or about to be, installed by, for instance, multi-purpose and other irrigation and hydro-electric projects.

On the other hand, the initiation of further extravagantly costly "prestige" projects of long gestation should be avoided. These freeze much capital—often foreign capital—and usually also have a high import content. The nuclear power stations are a striking case, especially as they are everywhere in an experimental stage and are, therefore, likely to become obsolescent quickly. More efficient and less costly plant and techniques will soon be evolved and are well worth waiting for—especially as existing power-capacity has not yet been fully utilised. This is not to condemn all large-secale projects with high capital intensity. Each case requires individual technical and economic analysis. For instance, the high expenditure on iron and steel plants during the second plan has been criticised by some authorities, while others have estimated that if the three main plants had been constructed five years earlier, the saving in foreign exchange would have exceeded their total capital cost. But the iron and steel industry is a very special case. The Indian industry is an outstanding example of a protected infant industry that has grown up. There is an existing domestic market for its products, and there are great potentialities for export.

Use of Incentives

Then again, much more should be done to extend and reinforce throughout the economy both monetisation and the closely related power of the normal economic mechanisms. Thus far, greater use should be made of economic incentives and disincentives in all sectors. For instance, the present crippling direct taxes on companies and more prosperous individuals not only impose a strong disincentive to enterprise, but also divert energy and effort from nation-building projects to the devising of methods of evasion and avoidance. Both government revenue and public morale might be enhanced by a reduction in tax rates accompanied by stricter enforcement. This would promote, rather than diminish, social justice. Incentives might, perhaps, be introduced into the community and extension projects, which appear so far to have failed to provoke the enthusiasm and spirit of self-help necessary for real success. Highly intensive pilot projects might be given priority, and the establishment of a new pilot project in a particular area might be made to depend upon the attainment of stated targets by a normal community project. This might stimulate the desire to keep up with the Joneses! As it is, it is to be feared that the proposed increased expenditure upon these projects, and also upon the mass extension of co-operative societies (irrespective of the maintenance or instillation of co-operative principles) may be wasted and prove self-defeating.

Perhaps most important of all is to hasten the adoption of well known, but insufficiently practised, improved methods of cultivation. Criticism of the draft plan's small percentage allocation to agriculture is widespread. The last point for mention here is that the creation of greater employment opportunities has not been given the great prominence that it deserves. The problem demands more systematic analysis. This is easier said than done but two points may be made. First, that the standard of life of a poverty-stricken family would be raised far more by giving employment to one more member, than by providing higher wages or earnings for those already at work. Second, that to promote medium-sized, not highly mechanised industries with short gestation periods would both increase output *per capita* more, and increase it more rapidly, than investment in highly capitalised industries (such as oil refineries) whose employment potentialities are small. No assistance should, however, be given to an extension of existing inefficient industries with primitive techniques.

Conclusion

The conclusion to be drawn from the above analysis is that India, like some other, but not all, under-developed countries, is faced by a particularly difficult problem of take-off, which is no however, insoluble if wise policies are pursued It must not be overlooked that under-developed countries have today certain advantages not possessed in the past: *i.e.*, they can adopt or adapt many technological and technical improvements created in advanced countries. From these they should select those most suited to their own circumstances and needs. Thus innovations can be secured without the need to invent. But they should not imitate their exemplars blindly. They must select appropriately. If this is not done here India will find herself still with a small, prosperous modernised sector, while the bulk of the population—as in the past—although larger in numbers, will remain on, or near, the margin of subsistence.

THE ECONOMICS OF INDIAN EDUCATION

OXBRIDGE MODIFIED : THE BUGBEAR OF LITERACY

By

NEIL McINNES

THERE are some social institutions which one does not have to bother criticising because they criticise themselves. That is to say, they show all their inadequacies by simply breaking down before our eyes. What is called, too moderately, the "crisis" in Indian education is an example of such a breakdown, of the total failure of an institution to satisfy *anybody* or to serve adequately *any* of the purposes to which one could imagine it being put. No matter whether you think the aim of education is to introduce universal literacy or to form a restricted *élite*, to promote culture or to cater to industry, to liberate the spirit or to inculcate docility, to give graduates a meal-ticket or to provide quiet, soft jobs for dons—on any of these counts, the present Indian educational system just is not working. The Directive Principle of the Constitution concerning universal compulsory education has not been implemented, and although the later date of 1966 is now optimistically promised for the entry of all children between six and 11 into elementary schools, one must remain sceptical about the performance of certain States, including West Bengal. Besides, in those pockets where the Directive Principle is officially counted as realised, the facts are reported to be rather different : schooling is often neither universal, nor compulsory, nor even free.

At the other end of the educational ladder, in the universities, matters are worse. There are now 40 in the country and the number of undergraduates has been quadrupled since 1947-48 to around one million in the current academic year. Yet these institutes sometimes seem to be so many machines for generating among students great expectations which the Indian economy cannot meet. Business, industry and administration cannot find the men they want, and yet there are unemployed graduates (occasional suicides symbolise the plight of thousands of men), while India probably has more expatriate graduates than any other politically stable nation. The deterioration of academic standards is admitted on all hands : it was proven in the case of Banaras by official enquiry, and is plausibly alleged to have attained scandalous proportions in Calcutta and Lucknow. All teachers and most students are grievously discontented—the latter mutinously so, until the problem of "student indiscipline" no longer evokes merely the clucking of moralists but repressive police action.

Student Indiscipline

The lazy habit of attributing this sort of institutional breakdown to the moral defects of the main sufferers has been exemplified exactly in the matter of this "student indiscipline". One has had for years to listen to sententious elders proclaiming, on the occasion of each new outburst of undergraduate discontent, "What these young devils need is etcetera, etcetera." Now this moralising has been officially countenanced. We have had a report from a Committee on Religious and Moral Instruction this year which recommended the teaching of "moral and spiritual values" to the unhappy victims of an unsuitable educational system, precisely as English hypocrites used to urge the "moral uplift" of riotous factory hands. The other familiar suggestion on what to do with striking workers—"put 'em in the Army, that 'll make men of 'em"—has not been neglected as a cure of student indiscipline. The National Service Committee this year recommended conscription for periods of nine to 12 months with the supposed object of "inculcating in students the values of discipline, social service, dignity of manual labour and dedication to the country". To its discredit, the Central Advisory Board of Education deigned to treat this radically anti-educational proposition seriously, instead of stigmatising it for what it was : the proposal to replace a bad educational system, not with a better one, but with the opposite of education—compulsion and indoctrination. It was disappointing to see that at the West Bengal College and University Teachers Conference in Calcutta in September, the same moralising approach was endorsed by academics, who spoke of "infusing" into a system, whose vices they admit, "a robust ethical purpose".

The collapse of Indian education is of quite a different nature to the educational crises seen in other countries. In the United States, the need of extensive reorganisation has been felt since Russian superiority in many technical branches became clear. In Britain, an antiquated but glorious educational tradition has had to be modernised to suit the new class structure and advancing industry. In France, a system framed by Napoleon and the Jesuits has had to be brought up to date just when it is submitted to the strain of a rising juvenile population. These situations are, if the newspapers have left any meaning in the word, "crises". The Indian position, on the other hand, is something nearer dissolution. The educational system is out of gear with the nation's social and economic development, so that some of its cogs are grinding and clashing while others are turning in the void. Student violence and the intrusion of political parties into places of learning are symptoms of this, not the causes ; while to blame, as some academics do, the "disorganisation of all Indian society" is to be like the soldier who claimed to be the only man in step.

Breakdown of System

The breakdown of the system is not surprising because it is a bastard compromise whose insufficiencies could be disregarded only as long as the demand for education was limited and as long as Indian society was fairly stable. During that period, the system produced, because of its very weaknesses a type of man who was temporarily useful. He was the restless, loquacious and courageous idealist, who had a rôle in the political struggle for national independence, but who has a much smaller part to play in the new polity. The main elements in this compromise are an ancient, traditional style of learning based on memorisation of texts enjoying great prestige and on intimate relations between master and pupil ; an imported, foreign system, copied from the British universities, heavily biassed towards literature and philosophy, and neglecting both the native tradition and modern technology ; and, thirdly, the new Indian universities which by foreign (and, therefore irrelevant) criteria are perhaps of lower standard, but which also pay little attention to modern science and technology. To this mixture has been added in very recent years, on the one hand, a string of technological institutes which have no connection with the older system, and on the other hand, a drive for universal literacy which is completely unconnected with the higher education in that the village child who begins to master the first letters has not, unlike his British or French compeers, set his foot on a ladder that leads, given ability, to the highest rungs of the system.

Put under pressure, this system—or rather this lack of system, this congeries of unco-ordinated efforts—has caved in. One had no right to expect anything else. In what follows, we shall criticise it and suggest measures of unification, always from the point of view of co-ordinating Indian education with the nation's economy. However one-eyed this economic approach may seem, there is no need to apologise for it. Naturally, there is much more to be said about education besides its economic function, its costs and returns. The cultivation of men's minds is never simply an "investment in human capital". It is also, in the highest sense, a consumer good, one of the things men want. But they will not get it unless the institutions that dispense it have some sort of economic foundation. No matter how unworldly, non-utilitarian or "intellectual" certain famous systems of education may have appeared, they fitted in with the economy of their day, *i.e.*, they met a demand for idle literati financed by the resources of the Catholic Church or the publishing business or imperialist administration. You can produce a string of Aquinases, Sartres and John Stuart Mills if there is the effective demand for their output. If there is not, you cannot. The aim of education is not merely to satisfy effective economic demand, but until it does that first, it cannot go on to do anything else.

Irrational Projects

My argument is that both the main lines of Indian education—the multiplication of British-style universities at the top, and the drive for universal literacy at the bottom—are economically irrational. Both lead to waste, waste of men and waste of money, and neither can justify the great hopes that are placed in them as long-term investments. Equally serious, the lack of co-ordination between these two lines of effort would lead to waste even if each was successful in its separate sphere, which they are not. That is to say, even if the universities were functioning happily and if the campaign against analphabetism were gradually progressing, India would still have a disjointed educational system unsuited to her evident needs. What is required to replace this is a coherent educational plan that is less ambitious quantitatively at the bottom (*i.e.*, as to the spread of literacy) and less ambitious qualitatively at the top (*i.e.*, as to the formation of cultivated mandarins), but which constitutes an organic whole related to the targets and forecasts of economic development. The desperate belief that, since learning and literacy are admitted to be good things, any effort to spread them, however haphazard, must pay off in the long run is an irrational attitude unworthy both of academics and economists.

Take first the spread of literacy. I admit to sharing the common prejudice that this is a good thing, that a man who can read a little is a better man than one who cannot, and that a situation where 10,000,001 men can read and write is a better situation than one where only 10,000,000 can do so. No doubt these are mere prejudices and they have been criticised as such, with Indian conditions in mind, by Ananda Coomaraswamy in his excellent book *The Bugbear of Literacy*. At all events, they are no adequate foundation for a national educational policy, and in practice, they are invariably backed up by an appeal to the economic returns of literacy considered as an investment by the nation in its human capital. Such economic arguments are in reality dubious, and the advocates of universal literacy would do better to restrict themselves to defence of literacy as a consumer good—except that it is questionable whether the sort of campaign India can afford produces even that.

Consecutive Courses

It is agreed, not only by economists but by educationalists, that anything less than four years' consecutive schooling is useless. It produces no economic returns and leaves no permanent impress on the mind. A sketchy and patchy primary education offered to millions is a pure waste of money and manpower, diverting resources that are better used elsewhere (not just teachers but children themselves, who perform many economic functions in poor rural economies). Even a full four years' solid schooling is terribly insufficient, doing little more than alienating children from one way of life without giving them entry into another. Reluctant as we may be to accept the fact, the truth is that learning is not beneficial in small doses. There is a bare minimum below which it has no useful effect, and so it is preferable to give that minimum to a smaller number of children rather than waste energies by scattering them. It is notable that Professor Arthur Lewis used to be an ardent advocate of literacy, writing in his *Theory of Economic Growth*, "The first objective must be the introduction of universal primary education". But after a spell in Ghana as adviser to the Government, he now places much more store by the extension of secondary education which concerns, naturally, a much smaller number of children.

The usual Indian target is indeed this absolute minimum of four years. The Bihar Government, for example, aims to school all those between six and 11 during the third plan. But it must be realised that a target of four years means in practice much less for most children for these three reasons —absenteeism, repeating of classes and desertion before completion of the course. Absenteeism is commonly about 50 percent in village schools, especially in the seasons of major work in the fields. The other two factors show up in the circumstance that the first-year class is always much bigger than the later classes, because it is full of failures repeating a course and of young hopefuls who will never complete the cycle. In some regions, only 12 percent to 16 percent of those who enter the lowest class finish the highest class, and

17-18.5 KNOT VESSELS GIVING A THIRTY DAY VOYAGE TO U.S.A.

These vessels have Refrigerated Cargo Space, Tanks for Bulk Oil and carry a limited number of passengers in Airconditioned Comfort.

For full particulars apply to :

F. W. HEILGERS & CO. (PRIVATE) LTD.

Chartered Bank Buildings, CALCUTTA.

Telephone : 22-2351 (18 Lines). Telegrams : HEILGERS. Calcutta.

only half of them actually pass the final examination, if any is held. Thus the bare minimum amount of education is received by a minority even when it is theoretically compulsory for all. In these conditions, at least half the effort made in primary schooling is wasted.

Now, there are remedies for these ills and it is urgent that they be applied. But it is improbable that they can be, as long as the goal is *universal* primary education, because they would require money and organisation, and the burden of supplying the present inadequate schooling is already insupportable. This year, in all the countries of Asia excluding China, 60 million children are receiving, *theoretically*, primary education, and this is costing governments $6 a head. Numbers will grow, according to optimistic plans, to 90 million in 1965 and 220 million in 1980, and meantime, the cost *per capita* will rise from $6 to $10, and then to $20. Thus the cost of an inadequate primary education for all will be multiplied by ten in the next two decades; in reality, this far exceeds the present or foreseeable financial resources of Asian Governments, including India. However inconsistent it may be with democratic shibboleths, there is a plain need to concentrate on a smaller number of children, both for economic and educational reasons. Such selectiveness is undemocratic only if the grounds of selection reinforce vested privilege, which they need not. With a smaller number of candidates for literacy, it would then be possible to apply some of the following antidotes to absenteeism and desertion.

The Rhodesian Example

The main reasons for insufficient attendance at classes are the discouragement of pupils and the negligence of parents. To meet the first, a remedy already applied in Rhodesia is to promote all pupils to the next class if they have put in the required hours of attendance, regardless of their performance in examinations or other tests. Outrageous as this will seem to educators trained in the western examination-geared system, more learning gets put about if children are not discouraged by official failures. It is better, on pedagogical grounds, to have all willing children muddle through a full course than to let through a minority and discourage the others till they give up. In Rhodesia, the percentage of desertions between the first and fourth year fell from 20 to 1 when this system was applied. If the goal really is to teach as many as possible, this is a praiseworthy result.

It is more important to get at parents. Probably the best way to do this in India is to give free lunches at school. No better use, surely, could be found for the agricultural surpluses placed at India's disposal by the United States, and occasionally by other countries. Certainly, there is no way of using those gifts that would appeal more to the donors, and thus make further calls on their generosity. The idea of providing a free meal to struggling illiterates would have an irresistible attraction to many nations better off than India. If the organisation of such a campaign be called begging, then it is the most honourable form begging can take.

In general, it is vital to interest parents in the school if satisfactory attendance is to be maintained. No doubt the ideal way to do this (although it would not be practicable if the aim remained universal education) would be to associate the teaching of children with adult education for their parents. The two campaigns should go on concurrently, and in the same places. When all the known ways of bringing parents to the school have been tried, it might serve to take the school to the parents. Instead of teaching to empty classes at sowing and harvest time, the school should be shut down altogether and classes moved out, still as some sort of group, into the fields to help the community. This seems an acceptable approximation to the Chinese idea of work-schools where time is divided equally between lessons and productive labour.

Reorientating Indian System

It scarcely needs to be added that in India, with her dangerous and growing food deficit, education right from the first steps should have an agricultural bias and should be the vehicle for the spread of improved techniques of cultivation. Whatever the grammarians say, the first word children learn to spell out should be not "cat" but "fertiliser." This is simply the application at the lowest level of the principle that should govern all Indian education. When a child or youth quits the school or college at the end of any phase of education, from the lowest to the highest, he should be equipped not for the next stage in the educational process so much as for a job that actually exists in the economy at that moment. Education is not a tunnel which leads to a doctorate of philosophy, but a road which branches out at regular intervals into the heart of the nation's economic life

Until such time as primary education is geared to specific productive tasks, it is a fallacy, or at least an exaggeration, to believe that universal literacy is the sure road to economic progress. It is a truism that there is a correlation between a nation's economic development and its educational level and it is obvious that education begins with literacy. But that does not prove that every increase in literacy leads, even remotely, to some increase in productivity. The Philippines today boasts just about the highest literacy rate of any under-developed country, but its economic development is not correspondingly advanced. Most of the modern industries found in Asia were built and run with illiterate labour; western and, in the first instance, British, industrialism was built when ignorance and literal analphabetism were general; and many of the most productive workers and artisans in India today no more know how to read and write than the men who constructed and adorned Notre Dame 750 years ago. Indian economic progress certainly requires more people with advanced scientific training and very, very many more with suitable secondary education. But it is impossible to show that it requires millions more with the ability to read and write.

Education and Productivity

The Russian academician, Stroumilin, tried in 1922 to calculate the rises in productivity to be expected with each stage of education, and claimed to find that four years' primary school boosted work efficiency by 43 percent, secondary schooling by 108 percent and university or college training by 300 percent. He ended with the neat calculation that 3,000 million roubles invested in public instruction would yield 70,000 million roubles of extra production after several years. Leaving aside the absurd pretence at mathematical accuracy, the general idea here is beyond question, that increased education of the right sort in the right number of people available at the right moment means increased production. It is known, for example, that the increase in U.S. production between 1899 and 1953 was three times the increase in the economic factors, land, capital and labour. That is, only one-third of the increased wealth came from the classic economic factors and the remaining two-thirds came from intellectual factors such as superior co-ordination, technological progress, better organised business and markets and, finally, a higher education level. It is hard to say how much of this was due to better education, but it is likely that most of what was so due was the consequence of, not wider literacy, but more general *superior* education. It is conceivable that India could achieve similar results by multiplying the number of her engineers, agronomists and accountants (and diminishing the percentage of lawyers, etcetera), while the percentage of illiterates in the whole population remained stable.

It might be replied that while superior education for a limited number is certainly more productive, a gradual expansion in literacy must also be beneficial, provided a nation can carry on both efforts at once. Now, it is sure that if India could promote literacy from 20 percent to 90 percent in a few years, the results would be evident and considerable for the economy. But it is also true that (and this is what is really happening) small and gradual increases—from 20 percent to 30 percent and then 40 percent—produce no noticeable effect on productivity whatsoever. Until it reaches the point where, as Hegel would have said, quantitative change suddenly becomes qualitative change, the spread of instruction has no other consequences than to increase consumption without a corresponding increase in productive resources and to disrupt the labour market by creating a supply of rudimentary talent for which there is no present use.

Minimum Useful Schooling

None of the foregoing, I repeat, is a denigration of literacy as a cultural good. But it has emerged that there are two minima below which elementary instruction produces no useful returns: a minimum amount of schooling for the individual, which is more than he is receiving in the current drive against illiteracy, and a minimum number of literates in the population as a whole, and this figure is nowhere in sight for India yet. Only a plan which has the prospect of attaining *both* these minima within a reasonable space of time is an economically rational plan for education (although still not necessarily the *best* plan). A plan which does not have that dual prospect—and the current Indian campaign seems to be in that case—remains a mere humanitarian gesture incapable of economic justification. To it should be preferred a system of elementary instruction aiming to give adequate rudimentary training to a smaller number, of whom a majority should thus be equipped for immediately productive tasks and the rest taken up directly into the next layer of the educational system. Instead of hoping to be able to say one distant day to tens of millions of children, "There now you can read, and hereafter God help you", it would be more reasonable to say to a smaller number within a few years, "All of you have learned something immediately applicable in Indian farming and some of you have earned entry into secondary schools that are ready to take you".

Different Economy

Naturally, once we have decided to consider education in relation to the economy, Gandhi's "basic education" must be ruled out—not because we think little of it, but simply because the Government of independent India has chosen to build a totally different sort of economy to the one the Mahatma had in view. There would be much to say about the idea of knitting the school into village life, training head, hand and heart together and teaching children a spirit of independence by showing them the vanity of many industrial goods, be they British or not. But once the nation has resolved to build its life on steel mills rather than spinning wheels, all that becomes irrelevant. The periodic accumulation of a mass of tangled thread by amateur spinners is an act of piety towards a tradition which, one hopes, will never die (for one day the Indian people will have to grope their way back to Gandhian simplicity after they have become as rich and as unhappy as the Americans). But meantime, it constitutes no part of the nation's educational system.

To return abruptly from these philosophical considerations to the bare economics of education: it costs ten times as much to put a student through the three cycles—primary, secondary and superior —as to give four years' primary schooling to one child. Thus for the same cost, you can have ten literates or one person with a higher education. Which is the "better" investment? If the person with the higher education is an expert in Persian prosody, and if the ten literates are scattered in the various States that have been serious about elementary education while neighbouring States have done less, then no doubt both are equally sterile as investments, however admirable they may be on cultural grounds. Democratic prejudice would still incline us to choose the ten literates, and that choice is reinforced by the economic circumstance that the initial capital outlay is smaller: the only costs in elementary education are buildings and teachers, staff costs are 70 percent to 80 percent of recurring charges, and thus there is the possibility of employing a large number of persons with a minimum capital, and such possibilities are rare in developing economies. Complete this picture with the excessive hopes that are placed in education as an investment, and the enthusiasm for universal primary schooling explains itself.

Education as Investment

In fact, education, considered as an investment, is much slower to mature and fructify than any other capital outlay. That is why economic plans are so seldom accompanied by national educational plans. Their useful spans are of unequal length, an educational plan requiring foresight over at least a decade, whereas economic plans look only three or five years ahead. Still, some comparison is possible between the waiting times, before returns appear, of universal primary and restricted advanced training. To ensure that one advanced student, who is being compared with ten literates, begins to "pay off" for the economy at the end of a 12-year training, it is necessary only to see that he is trained in something for which there will be an effective demand in 12 years' time according to the economic plans. That should not be too difficult, given the smaller number of people involved, and if this phasing is assured, a graduate can pay immense dividends on the investment required to form him. On the contrary, the conditions for an economic return on generalised literacy are much harder to guarantee. One of them, a sufficiently wide spread of elementary instruction (approaching 80 percent or 90 percent of the population) is scarcely being considered in India, where one sees one State pressing ahead with primary schooling while the next State lags. The other, a really adequate amount of instruction for each individual, is probably being assured to a minority of those supposedly affected by literacy drives.

Our ten-or-one dilemma is, of course, hypothetical. In practice, it is a question of emphasis and a search for the optimal distribution of energies. One is not required to come down decisively for or against primary education for all, but one must consider various optima. What is the optimal quantum of real elementary instruction which will change a child's capacities? It is surely something longer than the bare minimum of four years which in the event works out at much less for many children sent to school. What is the widest *feasible* distribution of this quantum of instruction among the whole population, granted that the optimum of 100 percent is not feasible, either

she travelled 900 miles... ALONE!

THIS charming girl of five had just spent her holidays with Grandma in Bombay. But it was time to return to her parents—and school—in Delhi. With whom would she travel? Nobody could accompany her... and think of the extra expense involved!

So they sent her by IAC. It is only by air that the young can travel alone with ease and comfort. The moment your child is taken charge of and put on board to the time she is handed over at the destination, her every want is attended to by well trained hostesses. And while she wings her way in comfort you are free of worry knowing that she is in good hands.

YOU ARE IN GOOD HANDS

TATA INDUSTRIES PRIVATE LIMITED

financially or humanly? To answer that question, one would need to consider primary education on a national basis, instead of leaving discordant initiatives to the various States. One would need, secondly, to relate the content of that instruction to the work that most recipients will actually do when they have finished it, *i.e.*, to the agricultural plan. One would need finally to relate it to the plan for secondary education, to which the minority would then pass. In turn the volume of secondary education would be determined by two things: the jobs actually awaiting young people when they have finished it (for I have said that at the end of any phase of education a youth must be equipped for a job that already exists), and the requirements of the tertiary institutions, whose objectives should in some measure be dictated by the industrial plan. To this, one extra condition should be added. It is that everyone who has finished his secondary education should be capable of being trained in a short time, and according to a prepared formula, for work as a teacher.

Training of Teachers

This last condition is important, for it means that the secondary school system doubles back and supports primary education instead of looking forward exclusively to the universities and technical institutes. It is the crucial point of all educational reform, which must begin with the training of teachers. It is no use changing methods, textbooks, the syllabus, examination rules, or introducing audio-visual aids or a new "spirit" in education, if the teachers who are to use those techniques have not been previously and expressly trained in them. No effort should be spared (and pedagogical science now has many useful suggestions in the matter) to prepare a compressed course in teaching, adapted to Indian conditions, which can be offered all students at the end of their secondary education.

In sum, by being put on a narrower base, the educational system could be made to impart economically useful information from the start, it could be made more coherent internally, and it could fit in at most points with the nation's economic plan. For these purposes, however, it seems inescapable that there must be a national educational plan instead of a congeries of disparate efforts. Only then can the questions of geographical spread, cohesion between the various levels of education, and co-ordination with national economic life be rationally treated. A useful part of this central organisation would be an Education Bank, empowered to raise funds from the Union and State Budgets, from abroad, and from its own borrowing among the public, and to make loans guaranteed by mortgages on school building sites.

Failings of Universities

The critique of the top level of Indian education, the universities, may be conducted more summarily, because their inadequacies are evident and beyond contest. Although they have in the past century produced much human material of inestimable value, the fact stands that they are a foreign importation (of which the original model has since been much reformed whereas the copy has not) which has never been fully integrated into the Indian economy. They have, however, produced an *élite* which, until lately at least, was often of comparable value to the academic class in other countries and which is sincerely and passionately attached to the highest ideals of advanced education. For that reason, this *élite* resists all suggestions of cheapening, hastening and streamlining tertiary education in India (and especially when such suggestions come from a foreigner) as attempts to fob off on this nation some contemptible substitute for the higher learning. The educated patriot naturally considers as insulting the implication that Oxford, Harvard and the Sorbonne are for those that can afford them, but a backward country must be content with slighter ambitions. Moreover, he has been taught—this is an integral part of the humanist tradition in the western education he has received—that the higher education is always exposed to attack from practical-minded authorities and materialist business men who seek to subvert its disinterested ideals for their own profit. And indeed it is true that when business men complain that the university is giving them too few engineers or whatever, they often mean that they cannot get enough at the low price they are offering. In business, you do not complain of a shortage of jute without trying to pay more for it, whereas some people blame the university for not increasing the supply of a rare commodity at constant prices.

The upshot is that the academics are frequently the most reactionary opponents of reforms that would integrate tertiary education into the economy—at the cost of "lowering standards". Yet standards, judged exactly by the academics' criteria, have slumped during the current effort to multiply Oxbridges in an economy that cannot support them. How much culture is being instilled into students who mug up cribs to pass examinations which, they themselves realise, are not going to guarantee them a dignified life? The deterioration of standards is already certain and is being hastened by the fact that justifiably discontented students and their parents absurdly imagine that matters will be improved if standards are lowered further. In these circumstances, no suggestion for an alternative form of university studies, better designed to meet the needs of the day, can be rejected on the mere grounds that it would imply "lower standards". The attempt to attain "ideal" (in fact 19th-century British) standards could be continued in one or two specially selected universities, to which admission was open to students from all over India, but only if they demonstrated genuinely high scholarly capacities such as would get a British youth into Oxford or Cambridge. These students should then be offered really adequate financial assistance and a traditional collegiate life. All the other universities should then be totally reorganised to provide, for the most part, compressed courses aimed at filling known and foreseeable manpower needs while giving students and parents the satisfaction of putting two capital letters after the family name. A similar situation already exists in the United States, where not every so-called university tries to be Harvard or Yale; the scorn with which some academics speak of these second-rate institutions is quite unbecoming, for at least their graduates and diploma-holders get jobs and if, as report has it, [illegible] of them offer a diploma in janitorship you may depend that is because there is a demand for janitors.

Effective Demand

It is uneconomic, unreasonable and immoral to encourage young people to believe that there exists an effective demand for certain accomplishments, when, in fact, there exists nothing more nourishing than conventional respect. It is impolitic to send out several hundred thousand young men a year with economic expectations that the country cannot meet for years to come. The consequences are familiar: immense intellectual unemployment which has a demoralising effect not only on the sufferers but also on the students who can see it coming, an excess of graduates in non-essential professions such as law, and an emigration of the most highly qualified who seek their market price abroad. Even where talented graduates find employment that satisfies them personally, it is often employment of a sort that is not best from the national point of view. I refer, of course, to the pressure from the best graduates to get into that small sector of modern business which is not integrated into the national economy and which works mainly for export. A successful Indianisation campaign looked after that for two or three years, but what will happen when that sector is fully Indianised? Indeed, all the ills just mentioned are going to become more pronounced in the years ahead as the supply of unemployable graduates swells.

False Trail

The university system is today on such a completely false trail that if the number of universities were to be doubled, the damage they are doing would be doubled too. That is to say, it is not a question of overcrowding, under-equipment, inadequate financial resources or economic stress; it is a question of supplying the wrong sort of education—wrong, that is, from the economic point of view I have adopted throughout. Academics who would resent the application of this economic point of view to their hallowed system should be reminded that current policy really derives from an unconscious economic calculation, more specifically from the recognition of a difference in costs: it is financially easier to multiply Oxbridge-style universities than it is to expand the economy to support them and their products. Everyone wants India to have the prestige and the satisfaction of both an advanced economy and an advanced educational system. It is infinitely harder to have the first than the second, because it is incomparably easier to educate one million youths to degree level than to build the economy that could employ them. By choosing to do the easier thing first, one chases illusory satisfactions and stores up trouble, because one forgets the first aim of education (although not its sole or "ultimate" aim): to equip young people to earn a living in some nook of their own society, whether that be a sleepy sinecure in the India Office, in a monastery, in a Left Bank art magazine, or in an engineering works.

THE UNEVEN PROGRESS OF INDIAN AGRICULTURE

ADMINISTRATIVE AND ORGANISATIONAL FAILURES

By

ASOKA MEHTA

BETWEEN 1951 and 1961, India's population is expected to increase by 70 million, that is, by almost 20 percent. Over the same period, her food production is expected to go up by 35 percent. The food position, however, will not ease. The reasons are obvious. The situation was difficult in 1951, and with the surge of economic development, it is on the food front that unappeased hunger presses with insistent demand. The inadequacy of resources made deficit spending a useful tool of development. Without it, some of the benefits that have come to the people would not have been realised. Power-generating capacity will increase by 68 percent in the second plan period; backward States like Assam, Orissa and Rajasthan will register large advances—200 percent, 1,236 percent and 138 percent, respectively. During the same period, extension of primary education will be 15.1 percent, wherein the gains of Kashmir, Rajasthan and Bihar will be 59.5 percent, 49.6 percent and 36.4 percent, respectively. Likewise, the pattern of the plans, with its emphasis on heavy industry, generates money demand without providing a corresponding flow of consumable goods in the markets. This very pattern, however, will reduce the country's dependence on imports for future development and impart a strong impulse for economic transformation. The choices which have been made, whether wise or not, have helped release a continuing demand for foodgrains among the people.

Political Awakening

Independence and democracy spell political awakening. Its impact is felt mainly by foodgrains and primary education. In coming years, the impact will become sophisticated. The millions who in the past lived on roots and inferior grains now ask for better food. The demand is not only for more food, but for grains that "the elders and betters" are wont to consume. The food habits of the people are the first to feel the full weight of political and economic changes. The question arises whether adequate awareness of these repercussions was shown by the planners. In this context, it is necessary to review State outlays under the second plan:

Table 1

	1956-57 (Actuals)	1960-61 (Plan)	Percentage increase
	(Rs. crores)		
Agricultural and community develcpment	59	142	141
Irrigation and power	144	179	24
Industry, including village and small-scale	14	25	77
Transport and communications	29	35	22
Social services	51	131	200

Whatever one may think of the initial allocations, the step-up in expenditure has been the highest in agriculture and social services—that is, in the provision of food and education.

What has been the nature and extent of the increase in agricultural production? The following table brings together the available data:

Table 2

INDEX NUMBERS OF AGRICULTURAL PRODUCTION

(Agricultural year 1949-50 equals 100)

Commodity	1950-51	1956-57	1957-58	1958-59	1959-60
Rice	87.9	119.1	104.8	127.6	123.3
Wheat	101.1	141.6	116.5	147.1	146.5
All cereals	90.3	119.9	108.6	129.3	125.3
Foodgrains (cereals and pulses)	105.9	130.0	127.8	130.1	124.3
Crops other than foodgrains	105.9	130.0	127.8	136.7	133.1
All commodities	95.6	123.6	114.6	132.3	127.2

Uneven Progress

These all-India figures hide diversities and divergences among the States. The progress of production in different States presents an extraordinarily uneven picture:

Table 3

PRODUCTION OF FOODGRAINS

(000 tons)

State	1949-50	1951-52	1955-56	1958-59	1959-60
Andhra Pradesh	4,393	4,099	5,536	6,364	6,296
Assam	1,789	1,447	1,709	1,800	1,799
Bihar	5,910	3,872	5,184	6,730	5,800
Bombay	6,734	5,623	7,255	8,928	7,507
Jammu and Kashmir	337	382	474	549	487
Kerala	710	728	887	965	1.055
Madhya Pradesh	5,749	4,747	7,617	9,285	9,035
Madras	3,088	2,887	4,538	4,925	5,096
Mysore	2,478	2,524	3,783	3,717	3,627
Orissa	2,184	2,133	2,463	2,452	2,447
Punjab	3,437	3,256	4,785	6,078	5,367
Rajasthan	1,127	1,553	4,175	5,093	4,726
Uttar Pradesh	11,157	11,611	11,886	13,399	13,182
West Bengal	4,423	4,712	4,973	4,526	4,615
All-India	54,048	50,022	65,794	75,503	71,750

It is obvious that three States—Assam, Orissa and West Bengal—have registered hardly any increase over a decade. The production there has been stagnant. Bihar, with sharp fluctuations, has failed to show any upward trend. Rajasthan's figures remain the subject of controversy among economists and statisticians, and may be kept aside. Even then, there are five States—Andhra Pradesh, Madhya Pradesh, Madras, Mysore and Punjab—which have steadily increased their production, and seasonal fluctuations notwithstanding, the upward trend is unmistakable; over a decade, the increase has been 50 percent or more. The picture comes into sharper focus and gains clarity when the fluctuations from year to year are noted. The following States have a common base (1949-50 equals 100):

Table 4

INDEX OF AGRICULTURAL PRODUCTION

State	1950-51	1951-52	1952-53	1953-54	1954-55	1955-56	1956-57	1957-58	1958-59	Average annual rate of change
Andhra Pradesh	105	104	101	122	126	127	134	130	140	4.62
Assam	92	95	101	99	101	103	106	104	108	1.35
Bihar	72	80	98	102	76	91	96	—	—	0.78
Madras	100	107	95	113	128	127	133	138	—	5.40

Seasonal Fluctuations

Similar figures for Mysore and Uttar Pradesh, although with a different base year, show the annual rates of change to be 6.22 percent and 1.93 percent, respectively. The average annual rate of change for India as a whole works out to 3.58 percent, against 9.6 percent claimed by China. Considering that the population in this country is growing at the rate of 2 percent a year, the production was low in the early postwar years and the tempo of development is increasing, a rate of increase of less than 5 percent is dangerous. The performance in Madras, Mysore, Punjab and Andhra Pradesh shows that it is possible to achieve—and maintain—an average annual rate of growth of 5 percent in agricultural production. The growth is rarely steady, and it is generally by jumps. But usually when a jump is taken, a new base of production emerges, around which seasonal fluctuations occur. Half a dozen States in India have failed to organise such a jump, and have let their agriculture stagnate.

The five States where production has shown a steady rise are not those which have been given larger or special allocations for agriculture. They include States where special irrigation facilities have been developed, but the laggard States also include regions where large irrigation potentials have been created. In the search for causes, one is driven to the conclusion that the failure has been administrative and organisational. The following table shows the potential (gross) from continuing major and medium irrigation schemes of the first and second five year plans (in thousand acres):

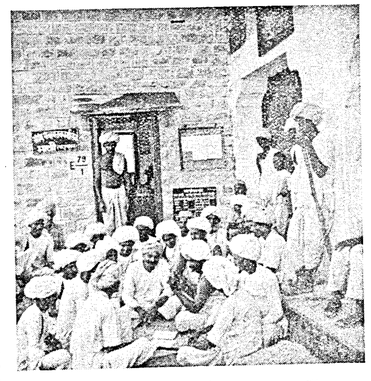
Table 5

State	End of first plan		End of second plan	End of third plan
Andhra Pradesh	191		830	2.035
Assam	—		—	—
Bihar	308		915	2,840
Bombay	157	Gujarat	725	2,150
		Maharashtra	275	1,250
Jammu and Kashmir	5		20	110
Kerala	230		370	540
Madhya Pradesh	10		80	1,360
Madras	183		275	1,250
Mysore	119		780	1,470
Orissa	—		1,000	2,385
Punjab	3,134		3,640	4,330
Rajasthan	510		965	2,375
Uttar Pradesh	1,210		2,375	3,975
West Bengal	394		1,700	2,685
Total	6,451		14,220	28,325

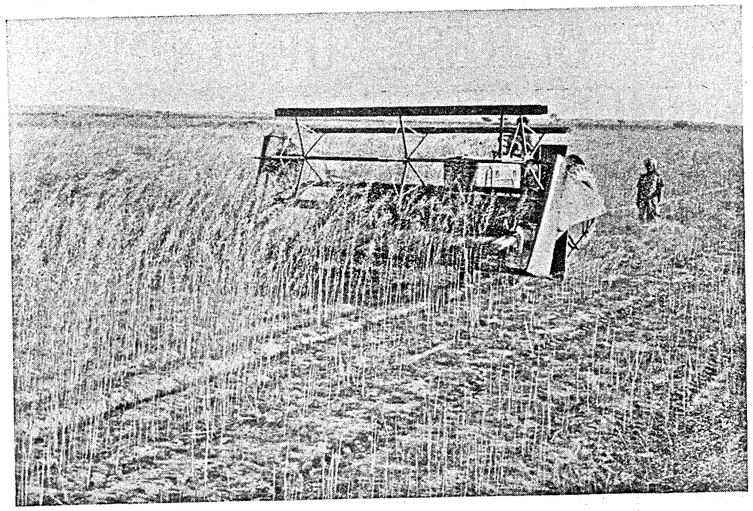
Irrigation Potential

It will be seen that the tempo of growth of the irrigation potential is to be maintained. After each plan, it gets doubled. The advantages will increasingly be flowing to what have so far been the stagnant States. But unless their style of work is changed, the potential will remain unused. Mr. Liao Lu-yen, Chinese Minister of Agriculture, recently gave the example that it is not difficult to build ten cotton textile mills with 100,000 spindles each, but to supply them with raw cotton, the acreage would have to be extended by 10 million mow on the basis of current yields. "This will not be so easy to do", wrote the Minister in *Hung-Chi*.

Industrial production is relatively easy to expand; its technology provides, as it were, the needed style of work. In agriculture, in Indian conditions, production becomes a function of the style of work. It is necessary, therefore, to look into the administrative and organisational weaknesses of the stagnant States. This does not mean that there are not other factors and forces to be



A panchayat meeting in a Rajasthan village



A wind-rower harvesting mustard on a mechanised farm

reckoned with, but it is useful to isolate certain areas of operation. A competent commission on agriculture, through evidence publicly taken, can help elucidate the issues involved and educate public opinion.

Planning Commission Study

A recent study paper of the Planning Commission came to the following significant conclusion: "States which have fared well in agricultural production have generally achieved a larger measure of advance in other directions as well." Success on the food front implies a certain tightening of the administrative and organisational network. Such tightening is essential for achievement in any sphere of development. Men in power, as elsewhere, grow old and get into a rut. These ruts need to be changed, the style and the rhythm of the work altered. Such retooling has to be done if the plans are to pick up momentum. The Chinese Minister quoted earlier stated recently that "the amount of grain to be supplied to urban areas in 1960 is estimated to be 100 percent more than in 1953." For India too, this problem is pressing; between 1951 and 1961, urban requirements of foodgrains will increase by 60 percent or 70 percent. A part of the increase, it seems, is at present met by rising imports.

Table 6

IMPORTS

(000 tons)

Cereals	1957	1958	1959	1960 (Jan.-Aug.)
Rice	736	390	290	586
Wheat	2,852	2,674	3,497	2,807
Others	—	110	20	18
Total	3,588	3,174	3,807	3,411

Internal procurement showed some improvement at one time, but a decline has set in now. Bihar gave up procurement in May 1959, and West Bengal in June 1959. Madras has not procured rice during the current season and Uttar Pradesh gave up purchases of wheat in August 1960. The pace of procurement has been as follows:

Table 7

PROCUREMENT

(000 tons)

	1957	1958	1959	1960 (Jan.-Aug.)
Rice	200	558	1,532	638
Wheat	—	—	263	344
Others	90	19	37	—
Total	290	577	1,832	982

The Indo-U.S. agreement for importing 16 million tons of wheat and one million tons of rice in the next four years having been signed in May 1960, procurement efforts have characteristically slackened. If the production of foodgrains is adequate, one need not worry very much about procurement. But if production lags behind, with growing urbanisation, imports will not solve procurement problems. If the country evades its production responsibilities, it will soon be impaled by procurement difficulties. This dilemma of the food situation cannot be avoided.

DEVELOPMENT OF THE OVERSEAS COMMUNICATIONS SERVICES

EXPANSION HAMPERED BY FOREIGN EXCHANGE DIFFICULTIES

By

M. M. PHILIP

Secretary, Ministry of Transport and Communications, Government of India

TELEGRAPH, telephone and radio communications are handled by two Departments—by the Posts and Telegraphs inside the country and by the Overseas Communications Service outside it. India was first connected with the overseas countries by cable in 1870, when the Bombay-London cable telegraph service was inaugurated. This was the only link with the outside world for a long time, and until the radio developed, all international communications were through cables. (At present, there are 350,000 miles of submarine cables laid in the beds of oceans.) Communication by radio developed in the earlier portion of the century. By 1927, the Indian Radio Telegraph Company came into existence, with a wireless telegraph service between India and the U.K. This was a rival company to the old cable concern and in 1932, a merger took place between the two. The Indian Radio and Telegraph Company was re-named as the Indian Radio and Cable Communications Company Ltd, which operated both cable and wireless services to and through India. The traffic to the neighbouring countries like Ceylon and Pakistan is handled by the Posts and Telegraphs, but the outside link was entirely maintained by the Indian Radio and Cable Communications Company until 1947 when the Central Government nationalised the service. This was the only outlet to London. After nationalisation, more links were established and these were gradually increased both by wireless telegraphy and radio telephony.

Four Gateway Centres

The Overseas Communications Service has four gateway centres for handling international communications, namely, Bombay, Calcutta, New Delhi and Madras. The Bombay centre has its transmitting station in Kirkee, receiving station in Dhond and the Central Traffic Office in Bombay. The transmitting and receiving stations as well as the central traffic office are interlinked by land-line v.f. telegraph system. The Calcutta centre has its transmitting station in Halisahar and receiving station in Hatkanda, which are about 30 and 36 miles, respectively, from the central traffic office in Dalhousie Square, Calcutta. The New Delhi centre has its new transmitting station in Kalkaji with expanded facilities for external telecommunications by radio-telegraph, radio-telephone and radio-photo services. This station was formally opened on 6th February, 1958. The new receiving station at Chattarpur has commenced operating since 24th January, 1959. The central traffic office is now located in Parliament Street. The Madras centre was so far a submarine cable station, but from this year, it has a radio centre also, with its transmitting station in Korattur and receiving station in Padianellur connected to the central traffic office in the General Post Office, Madras.

For the transmission of messages both by wireless and by cable, overseas telegraph facilities are provided *via* the international submarine cable and radio telegraph network to which India is linked. The cable chains are: (a) Bombay-Aden-Alexandria-Malta-Gibralter-London, (b) Bombay-Aden-Mombasa-Zanzibar-Sychellas and (c) Madras-Penang-Singapore-East Asia.

Direct Services

Direct wireless telegraph services have been established between India and the following 23 countries: (1) Afghanistan, (2) Australia, (3) Burma, (4) China (Shanghai and Peking), (5) Egypt, (6) France, (7) Hanoi, (8) Indonesia, (9) Iran, (10) Iraq, (11) Italy, (12) Japan, (13) the Philippines, (14) Poland, (15) Rumania, (16) Saigon, (17) Switzerland, (18) Thailand, (19) United Kingdom (three outlets—from Bombay, New Delhi and Calcutta), (20) Russia, (21) U.S.A. (two circuits *via* Mackay and *via* R.C.A.), (22) West Germany and (23) Yugoslavia.

Direct radio-telephone services have also been established between India and the following countries: (1) Aden, (2) Australia, (3) Bahrain, (4) Burma, (5) China, (6) East Africa, (7) Egypt, (8) Ethiopia, (9) France, (10) Hongkong, (11) Indonesia, (12) Iran, (13) Iraq, (14) Italy, (15) Japan (two outlets), (16) Malaya, (17) Poland, (18) Saudi Arabia, (19) South Viet-nam, (20) Switzerland, (21) United Kingdam (three outlets), (22) Russia and (23) West Germany.

Apart from these direct services, radio telephone services *via* the international network are available to 53 other countries. Ships at sea also make use of the radio telephone service and about 40 ships are using this convenience. Overseas Communications Service provides multi-address news-transmissions by radio telegraph on behalf of the Ministry of External Affairs to the Indian consular posts abroad.

Another service is what is called radio photo service, which is now available between India and the following nine countries: (1) China, (2) France, (3) Italy, (4) Japan (two circuits), (5) Poland, (6) U.K. (and other destinations *via* London) (three circuits), (7) U.S.A., (8) Russia and (9) West Germany.

In addition to this direct radio photo service, switched radio photo service is available *via* London to 17 other countries. Practically all the expansion schemes were planned and executed by the Indian personnel in the Overseas Communications Service.

Handicaps in Expansion

Most of the equipment necessary for expanding the services have to be acquired from foreign countries, and that has been a real handicap due to the shortage of foreign exchange, but once the channels are established, these services are very paying. India has developed so rapidly in communications that she has left behind the old morse system of telegraphy. Present operations are all by teleprinters. In the recent past, teleprinter messages received at the Overseas Communications Service office had to be transmitted to the addressees in the interior of the country either by telegram or by hand. Now they are contemplating the establishment of teleprinter exchanges in selected places. This would mean that the message typed out on the teletypewriter at the issuing office will be available for the party at the receiving end immediately, or it will be waiting for him on the teleprinter in his office.

At present, there is a heavy shortage of teleprinters, but a new teleprinter factory is being set up, and within two or three years, it is expected that immediate demands would be met. But the rate at which the demand is growing, it is not likely that the existing arrears can be cleared in full. Now that the teleprinter service has been in operation, the Overseas Communication Service has been leasing out channels to private consumers for a fixed annual rental. This means that the user can have a teletypewriter in his office in India permanently connected with a teletypewriter in his head office permitting direct and instantaneous exchange of communications. The services are particularly in demand with the airlines. Today the Overseas Communication Service has 10 such leased channels operating with foreign countries. The demand is still growing.

Economics of Cable Communication

In spite of the development in radio linking, the more advanced countries are still going in for cables because these can take more traffic. Recently, a new cable was laid across the Atlantic and there is a proposal to lay one more. The cables can also be used for transmission of television programmes from one country to another. There is a proposal to have a cable through the Indian Ocean which is still being considered by the Commonwealth Telecommunication Board. These cable-laying programmes are very expensive, but it seems that the economics of overseas communication justify expenditure on this account by countries who can invest in this. One of the major sources of profit in international communication is the income from traffic which transits the different operating stations, and many of these investing countries hope to get the trans-atlantic traffic by speedier and surer transmission by cable. In future, India will have to see that she also gets a good share of the international traffic and for this, she has got to be up-to-date along with other countries. As a member of the Commonwealth Telecommunication Board, this country is able to watch the latest developments and judge how best she can adjust herself to the changing requirements. Direct linking is certainly good up to a point especially where mutual interests justify it, but the existence of idle channels is obviously unprofitable. At present, India has not got enough channels to meet all the demands. The Communications Department has got to expand rapidly.

E 546

FISCAL PROSPECTS FOR THE THIRD PLAN

THE GROWING IMPORTANCE OF EXCISE DUTIES AS SOURCE OF CENTRAL REVENUE

By

H. L. DEY

IN the draft outline of the third plan, the total outlay in the public sector has been set at Rs. 7,250 crores, of which Rs. 1,050 crores would be current outlay and Rs. 6,200 crores would be investment. As at the latest revision (June 1960), the corresponding figures in the second plan were Rs. 4,600 crores for the total outlay, of which Rs. 950 crores were for current outlay and Rs. 3,650 crores for investment. The expected investment in the private sector is put at Rs. 4,000 crores in the next plan, compared with Rs. 3,100 crores in the second. These figures may be set out as follows :

(Figures in Rs. crores)

	Public sector			Private sector investment	Total investment
	Plan outlay	Current outlay	Investment		
Second plan	4,600	950	3,650	3,100	6,750
Third plan	7,250	1,050	6,200	4,000	10,200

It would be noted that in the third plan as compared with the second, it is proposed to step up the total investment by 51 percent and the public sector investment by as much as 70 percent. The corresponding increase in the private sector investment would be no more than 29 percent. It is also significant of the current trend of planning policy that, as between the second and third plans, the relative share of the public sector in the total investment rises from 54 percent to 61 percent, whereas that of the private sector declines from 46 percent to 39 percent. This changing pattern of investment is in line with the oft-declared policy that the relative rôle of the public sector would become progressively dominant with each successive plan.

The question of how far this order of priorities, as indicated by the relative allocation of investment between the public and private sectors, is consistent with the availability of resources currently and/or prospectively, and how far it is compatible with the requirements of stability and orderliness which are so essential to the success of long-term development programmes, can be answered, in the main, by a realistic appraisal of the resources position as visualised in the plan.

Estimate of Resources

The estimate of resources in the third plan is set out in the following figures. The corresponding figures for the second plan are also given side by side :

Table I

FINANCIAL RESOURCES

(Figures in Rs. crores)

Items	Original figures of the second plan	Revised figures of the second plan	Third plan
1. Balance from revenues on the basis of existing taxation	350	(—)100	350
2. Contribution of the railways on the existing basis	150	150*	150
3. Surplus of other public enterprises on the existing basis	..	**	440
4. Loans from the public	700	800	850
5. Small savings	500	380	550
6. Provident funds, betterment levies, steel equalisation fund and miscellaneous capital receipts	250	213	510
7. Additional taxation, including measures to increase the surpluses of public enterprises	450	1,000	1,650
8. Budgetary receipts corresponding to external assistance	800	982	2,200
9. Deficit financing	1,200	1,175	550
10. Total	4,400	4,600	7,250
The gap to be covered by additional measures to raise domestic resources	400		
Grand total	4,800		

* Inclusive of increased fares and freights.
** Included in (1) above.

It will be seen from the figures that the actual financial performance in the second plan has been more or less up to the mark under items 4 and 5 together (public loans and small savings), item 8 (budgetary receipts corresponding to external assistance) and item 9 (deficit financing). The performance of the plan under item 7, namely, additional taxation, was truly remarkable. Whereas the original taget for additional taxation was Rs. 450 crores, the amount actually raised from this source was Rs. 1,000 crores, being more than double the target originally set. The taxes which have contributed substantially to bring about this result are Union excise duties and the corporation tax. Another good source of revenue has been the currency and mint. Of the new taxes, the wealth tax has produced a significant amount. But it is necessary to observe that two other new taxes, namely, the expenditure tax and the gift tax, about which there has been a fierce controversy, have yielded poor revenues, the contribution of each being less than Rs. 1 crore a year. As for the remaining items of financial resources, the performance of the second plan was unsatisfactory or disappointing. Thus, under item 1 (balance from revenues on the basis of existing taxation), the result over the five-year period was a shortfall of Rs. 100 crores, instead of a surplus balance of Rs. 350 crores. The net position thus is a deterioration to the extent of Rs. 450 crores. This negative result was produced largely by the combination of a decrease in the yield of some of the traditional revenue producers, such as Customs, and an increase in non-plan expenditure such as direct demands on revenue, debt services, civil administration, miscellaneous, defence, etcetera.

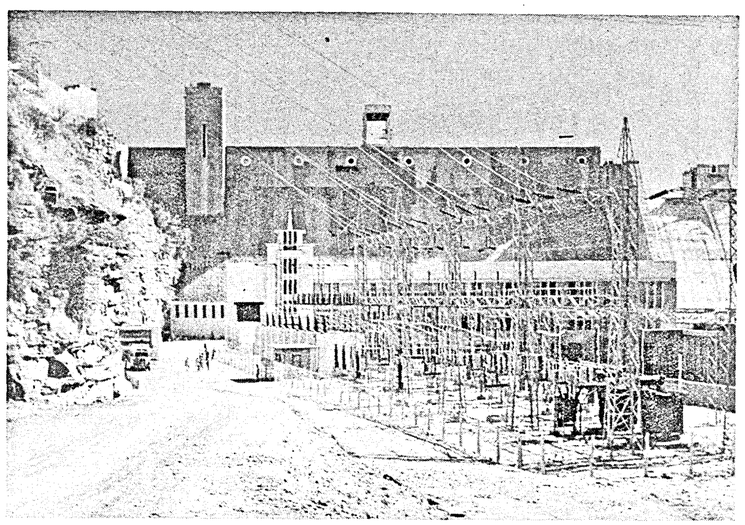
Decline in Customs Revenue

Customs revenue, which had been the most productive among the taxes until the closing year of the second plan, has been steadily declining in recent years, partly due to a net decrease in import duties because of severe restrictions on consumer goods imports, and partly due to a fall in export duties caused by a liberalisation of export policy through a substantial reduction or abolition of export duties on many articles of export. The losses in revenue from some of the traditional taxes were sought to be made up by enhancing the rates on selected items of the old and the new taxes, and also by extending the coverage of some of the new levies. Thus, the coverage for the Union excise duty has been steadily extended so as to include the products of expanding industries or articles of growing use in connection with development or rise in consumption standards, that is, motor spirit, kerosene, sugar (very substantial increase), matches, tobacco (very substantial), cement, soap, paints and varnishes, vegetable non-essential oils, refined diesel oil (substantial), rayon and synthetic fibres and yarn, cotton textiles, etcetera.

It is significant of the rôle of Union excise duties in developing the tax resources that, to the total increase of revenues by Rs. 416 crores over the second plan period, they contributed as much as Rs. 234 crores, or almost 60 percent of the total increase. And there can be no doubt that, in view of the huge numbers of people to be dealt with and having regard to the pattern of income distribution, the wide dispersal of the population and the illiteracy of the majority, and lack of proper costing and accounting except in the limited area of organised industry, trade and transport, the excise duties must continue to play a dominant rôle in India's expanding tax system in the years to come.

Rise in Non-plan Expenditure

In spite of the tremendous step-up of the taxation efforts of the Government and their successful outcome, the fact remains that the fast-growing tax revenues failed to catch up with the still faster growth of non-plan expenditure. Thus, over the second plan period, while the Central Government's revenues increased by Rs. 405 crores to Rs. 920 crores, or by some 82 percent, its expenditure increased by Rs. 516 crores to Rs. 980 crores, or by as much as 111 percent. Consequently, far from the existing level of taxation being sufficient to leave a surplus after covering the non-plan expenditure, as had been visualised in the second plan, even a much higher and more extended tax system proved inadequate for the rapidly growing expenditure. And since the growth of a democratic welfare State implies rapidly rising expenditure on various social services which, incidentally, do not yield any direct revenues, and also because of the inevitability of continuous and substantial increases in defence expenditure due to the increasing costliness of modern defence weapons and in the specific context of current Sino-Indian relations, it would be unrealistic to expect that the existing taxes, although their yield would no doubt expand with the growth of national income, production and consumption, would be able to produce a surplus of the order of Rs. 350 crores, as estimated in the third plan. On the contrary, it is more than likely that the gap, which was of the order of Rs. 100 crores over the



The power-house and switchyard of the Gandhi Sagar dam in Madhya Pradesh

second plan period, would be substantially larger over the third plan period.

It would be thus seen that, in estimating the balance that would be available from revenues on the basis of the existing taxation, the planning authorities have been rather over-optimistic and, therefore, unrealistic. The same lack of objectivity also appears to have influenced their estimates of resources under some of the remaining items. Thus, for instance, there would not appear to be any justification at all for the expectation that the public enterprises other than the railways would produce a net surplus of Rs. 440 crores, of which Rs. 300 crores are to be obtained from Central Government enterprises (iron and steel, fertilisers, oil extraction and refinery, posts and telegraphs) and Rs. 140 crores from the enterprises of State Governments (electricity boards, transport undertakings, etcetera). As for the basis of these estimates, the draft outline states: "The estimates have been made on certain broad assumptions and are, therefore, very rough. It is proposed to examine them in greater detail in consultation with the Central Ministries and the State Governments before the plan is finalised."

No Firm Basis for Estimates

This would clearly indicate that the authorities concerned have no firm basis for arriving at these estimates and that, therefore, it is quite uncertain as to what the figures are likely eventually to turn out to be. Such estimates are likely to be completely upset by increases in basic costs, such as railway freight, wages, coal, raw materials, etcetera, on the one hand, and by the appearance of bottlenecks in the supply or movement of any of the factors or by higher cost of money or by deficiencies in management or by major industrial disputes, resulting in lowering the level of productivity in one or more major enterprises, on the other. Therefore, here, too, it is highly improbable that the goal set can be reached. It would also follow that this source cannot possibly make a further contribution towards the plan expenditure, as visualised under item 7 (additional taxation, including measurers to increase the surpluses of public enterprises). Quite apart from the difficulties of cost control and efficient management, it is well to remember that since public enterprises are mainly concerned with the production or supply of basic commodities or services, there is a somewhat rigid limit to the enhancement of prices or charges which may be fixed for them. An objective examination of the available evidence concerning item 8 (budgetary resources corresponding to external assistance) would also lead us to the conclusion that the estimate for the expected foreign assistance is much too high. Eventually, the amount of foreign assistance available to us is likely to prove substantially smaller than this estimate.

On the basis of the analysis given above, it would follow that if the target of outlay amounting to Rs. 7,250 crores is to be reached, much bigger rôles would have to be filled by (a) additional taxation and (b) deficit financing. It would be a safe prediction that deficit financing would have to go much further than the proposed Rs. 550 crores. It needs also to be stated that if the planned increase of national income by 25 percent and the corresponding increases in employment, production and consumption are achieved, involving a higher tempo of activities, the economy would be capable of absorbing a much larger injection of money than is indicated by deficit financing of the order of Rs. 550 crores.

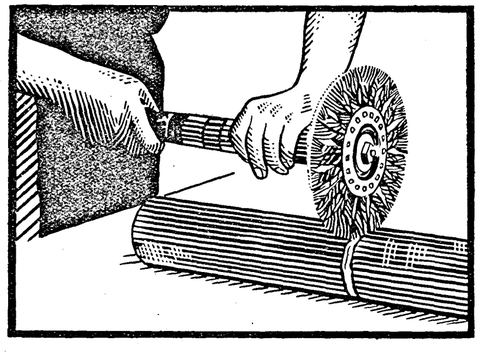
Likely Alternatives

Since the resources available under items 1, 3 and 8, are likely to be much smaller than the estimates given in the draft outline, it would follow that the Government would be likely to be faced with the alternatives of either substantially raising the taxation or substantially cutting the outlay, or both. For business as well as political reasons, it would be unwise or impracticable to cut the outlay very substantially. Consequently, there would be the inescapable necessity of raising more resources through taxation than what is proposed in the draft outline. Again, for administrative and other practical reasons, such additional taxation must for the most part be indirect taxation. The additional resources required to be raised through taxation may well be of the order of Rs. 2,000 crores. This, however, would call for a strenuous search for a strictly selective list of commodities, the taxation of which would satisfy the tests of productivity, economy of collection, etcetera. It would also be necessary to make a drastic overhaul of the machinery for the administration of commodity taxes, and, particularly, the Union excise duties. It is significant that the Central Government has just appointed a committee under the chairmanship of Mr. A. K. Chanda, former Comptroller and Auditor-General, to go into this question. It is believed that if the commodities to be taxed are wisely selected and the tax administration machinery is suitably reconstructed so as to be made fool-proof and knave-proof, the Union excise duties would be able to fill an even much bigger rôle in the Indian tax system than they have done in the recent past. These comments would also be applicable to the indirect taxes levied by the States, such as sales taxes, entertainment tax, electricity duties, etcetera.

Need for Realistic Approach

In conclusion, it is important to point out that even though the lion's share of capital formation in the second plan has been allocated to the public sector, actually the major contribution towards fulfilling the resource targets will be made by the private sector through loans and taxes and, particularly, the excise duties and sales taxes on commodities and services. It follows that if definite, continuous and rapid progress is to be made towards the take-off stage, it would be just, appropriate and sensible to allocate capital formation between the public and private sectors, not on the basis of mere ideological impulses which do not fit the present-day complex and fast-changing socio-economic conditions and international political set-up, but according to the relative capacities of the two sectors to step up national income, savings and capital formation. This has been clearly indicated by their respective achievements in the second plan.

BRUSH



'SCCO'

These bruches are invaluable for buffing and cleaning exceptionally severe scaling or rust from structural work, also specially adapted for weld cleaning, and other tough scaling propositions and rough Castings. "TWISTKNOTS" may be operated at considerably higher speeds than ordinary wire wheels and a comparatively light pressure increases both the efficiency and life of the brush in addition to lightening the work of the operator.

THE RIGHT TO STRIKE IN PUBLIC ENTERPRISES

ISSUES ARISING FROM GOVERNMENT ACTION AGAINST CENTRAL EMPLOYEES

By

Dr. N. DAS

THE problem of industrial relations in the public sector has become acute and insistent as a result of the Central Government employees' strike which started on 11th July, 1960, and continued until it was called off unconditionally on 16th July. Although it affected all the key Government departments and establishments, only about 11 percent of the 2.2 million Government employees participated in it, with the result that—in spite of the wide coverage—the normal life of the community was hardly affected. It has, however, raised the issue whether industrial relations in the public sector should be regulated in a manner different from what is being done in the private sector. The strike has given a rude shock to conventional thinking on the subject. The eighteenth session of the Indian Labour Conference, which was convened on 24th and 25th September this year to discuss as many as six subjects, devoted its entire time to considering only one item—an appraisal of the strike and the measures which should be adopted to prevent its recurrence. Mr. Gulzarilal Nanda, Central Labour Minister, said in his opening address at this conference: "In any circumstances, in any country, such a development might have created a grave threat to economic and political stability. In the prevailing conditions in our country, the terrible hazards to which the Indian community was exposed must be obvious to every citizen. It has, therefore, to be the first care of the Indian nation that it should not be faced with such a crisis again."

Joint Negotiating Machinery

The remedies which it is proposed to apply were indicated by Central Government spokesmen during the debates in Parliament in August 1960 and were repeated by Mr. Nanda at the eighteenth session of the Indian Labour Conference. It was stated that there should be some restriction on the right of Government employees to go on strike. At the same time, the Government will set up joint negotiating machinery at various levels in those departments or organisations where strikes will be prohibited. In other words, employees will have an adequate forum for the redress of their grievances. The Government will also be prepared, Mr. Nanda said, to submit unresolved disputes between itself and its own employees to arbitration if the joint negotiating machinery is unable to reach a settlement.

The suggestion that there should be some restriction on the right of certain categories of employees to go on strike, was opposed by most workers' organisations. It was argued that this would mean an encroachment on the fundamental right of workers to organise and bargain collectively. The argument, however, overlooks two important facts. The first is that the Government has a special responsibility to the community; it must take certain preventive measures to ensure national security and the vital interests of the economy. Secondly, such restriction is not unknown in many democratic countries; for example, strikes in public services are prohibited by law in Switzerland, Canada, Japan and Australia.

No General Ban

Mr. Nanda said in his reply to the debate that the Government does not propose to impose a general ban on the workers' right to strike. Even in the public sector, strikes will be prohibited only in the civil departments of the Government and in certain essential services like the railways and the posts and telegraphs. Workers will continue to enjoy the right to strike in public sector commercial and industrial undertakings just as they do in the private sector. Moreover, even when restrictions are placed on the right of certain categories of public employees to strike, the Government will set up joint negotiating machinery at various levels and there will be provision for the settlement of disputes by arbitration if the joint machinery fails to resolve them.

The real issue, however, transcends the question of the right to strike. It is often alleged that, when the Government comes down heavily on employers in the private sector for their alleged acts of omission and commission, it winks at similar acts when these take place in public undertakings. Workers' representatives have complained time and again at meetings of the tripartite Industrial Labour Conference and the Standing Labour Committee that the Government has one yardstick for private sector employers and a totally different one for itself as an employer. They have pointed out, for example, that the "code for discipline in industry" has not been accepted by all the managements in public sector undertakings; and that while the Government swears by voluntary arbitration as far as industrial disputes in private enterprises are concerned, it fights shy of the technique when confronted with a dispute between itself and its own employees. Labour representatives also point out that while the Government urges employers in the private sector to give an annual bonus to their workers, it does not do the same for its own workers.

A Few Lapses

The Government has been guilty of quite a few lapses which are borne out by statements made by its own officers. According to the Labour Officer of the Government of Orissa, the management of the Rourkela steel plant had not adopted certain essential protective and welfare measures for its workers, although they were considered essential for any industrial undertaking of its type. For example, the prescribed limit on working hours was not observed, weekly holidays were not granted nor overtime paid, and women were made to work in night-shifts in utter disregard of the mandatory provisions of the Factories Act. The same state of affairs prevailed for a considerable time at the Bhilai steel plant in Madhya Pradesh, so at one time the Central Ministry of Labour and Employment seriously thought of setting up a committee to enquire into the matter. The idea was, however, abandoned, presumably because the Government did not like to wash its dirty linen in public.

On the other hand, it will be unfair to say that workers in public undertakings in India have lesser amenities and more difficult working conditions than those in private enterprises. Because of the direct pressure they can bring to bear upon the Government, workers in some of these undertakings (the notable examples are the Sindri Fertilisers, the Chittaranjan Locomotive Works, the Hindusthan Cable Co. Ltd, and the undertakings in the Bangalore and Damodar Valley areas) enjoy housing and other benefits which are far ahead of those in some private factories and establishments.

Meaningless Comparisons

Such comparisons are, however, meaningless. There are many private enterprises, the managements of which can boast of very advanced and intelligent labour practices and welfare measures. So the Government is no more a model employer than some of the enterprising units in the private sector. Unfortunately, the acts of omission and commission in the latter receive an unusual degree of publicity—largely at the instance of the Government—while every effort is made by those in authority to play down similar lapses in the public sector. This sometimes places the Central Ministry of Labour and Employment in a most uncomfortable position. Charged with the maintenance of a high standard of working conditions and healthy labour relations in all sectors of the economy, it is often assailed (and quite rightly so) by both labour leaders and employers in the private sector for its alleged weakness in dealing with the recalcitrant managements of public undertakings.

If one looks at the situation objectively, one must agree that there is no case for giving special privileges to comparatively small bodies of workers, just because they happen to have found employment in public undertakings, when similar privileges cannot be granted to their compatriots employed elsewhere in the factory and the field. Such concessions raise production costs in an enterprise which can be justified on grounds neither of equity nor of contribution to the national well-being. It is the consumer who pays, through higher prices. Thus "welfare" in one part of the economy causes harm elsewhere. The ultimate effect is to retard economic development, since resources which could have been mobilised for capital formation, are in fact consumed by workers.

Public Service

Commenting on the situation in the United Kingdom, two distinguished economists have urged workers in nationalised industries to work "in a true spirit of public service". Nationalisation cannot succeed without it; nor can democratic socialism prove to be a superior conception of economic or social life. If the vast industrial forces which work in the public corporation merely seek to exploit their position to the full, the future will be grim and joyless indeed.

Unfortunately, human nature being what it is, it will take a long time before the ideal is achieved. The eternal conflict between the particular interests of labour and the general interests of the community does not lend itself to easy solution even under nationalisation, especially when workers feel that they are not getting a fair deal. Perhaps, trade unions are largely influenced in their outlook and practices by the capitalism which produced them. Workers in public undertakings may not, therefore, easily abandon their defensive and negative attitude and display the qualities of constructive leadership, understanding and co-operation.

In the ultimate analysis, the problems of industrial relations in public sector undertakings are not materially different from those in similar undertakings in the private sector. Yet, when private undertakings were nationalised or new undertakings were set up in the public sector in India, the hope was expressed that the very act of public ownership would usher in a new era of industrial relations. But it is clear that such hopes cannot be realised. There is no magic in the words "public sector", and mere extension of it does not provide an answer to the problems of entrepreneurship, production or a fair deal for workers. The same economic and social laws apply to the private as well as the public sector, so the same approach is necessary for tackling the problems of both.

INDUSTRIAL **IBCON** CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT:— PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL • STORES ORGANISATION AND CONTROL
FUEL AND STEAM UTILISATION • RAW MATERIALS CONTROL • QUALITY CONTROL • TRANSPORT
MECHANICAL HANDLING • OPERATIONAL RESEARCH • VALUATION OF PLANT AND BUILDINGS

ON LABOUR:— METHOD AND WORK STUDY • JOB EVALUATION • INCENTIVES • PERFORMANCE CONTROL • WAGE STRUCTURES
TIMEKEEPING SYSTEMS • PERSONNEL RECORDS • HUMAN RELATIONS • COMMUNICATION

IN OFFICES:— MANAGEMENT CONTROLS • MANAGEMENT ORGANISATION : EXECUTIVE AND CLERICAL • WORK MEASUREMENT
INCENTIVES • BUDGETARY CONTROLS • LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND:— THE SETTING UP AND TRAINING OF THE CLIENT'S OWN INDUSTRIAL ENGINEERING DEPARTMENT
MARKET RESEARCH • PLANNING FOR MODERNISATION AND EXPANSION OF INDUSTRIES
TECHNOLOGICAL STUDIES IN RAW MATERIALS, PROCESS AND PLANT PERFORMANCE

Factors Determining Good Labour Relations

Exaggerated Concepts Of Industrial Democracy Impede Progress

By

MARY SUR

THE Ministry of Labour's report for 1959 snowed that only 5.6 million man-days were lost through work stoppages in 1959, compared with 7.8 million in the preceding year. For the first half of 1960, the man-days lost were 2.8 million, against 3.2 million in the corresponding period of 1959 and 4.7 million in 1958. Quoting these figures at the eighteenth session of the Indian Labour Conference in September 1960, the Central Labour Minister declared that strikes and lock-outs had been "steadily and slowly abating since the adoption of the code of discipline", and concluded that "in spite of murmurs and protests from all directions, the performance all round has been improving." It is not enough to study the returns of man-days lost through stoppages in industry to obtain a true picture of the trend in labour relations. A strike in a very large concern may unduly inflate the annual figures. The figures for 1960, for instance, will be much inflated if they include the strike of Central Government employees in July last. Moreover, figures of stoppages take no account of the effect on productivity of bad relationships which result in frequent agitation and heated controversy, or sullen discontent and go-slow tactics. This atmosphere can reduce efficiency and lower output without actually bringing about a stoppage of work. For a true picture of industrial relations, therefore, one needs a much broader view than that given by statistics, and has also to see what is happening in industrial courts. Besides it is necessary to study alternative machinery for the settlement of disputes. One has to consider the cumulative effect of the Central Labour Minister's policy of establishing "codes and norms", and of the continuous propaganda in favour of joint consultation and mutual negotiation of differences.

Many Experiments

In the last decade, there have been many experiments in the field of industrial relations. Many new ideas have been thrown into the pool, and looking back, one finds that most of them have emanated from the Central Ministry of Labour. The first step of the independent Government was to strengthen and develop machinery for conciliation and for compulsory adjudication of disputes. At the same time, however, stress was laid on the importance of joint consultation through legislation for works committees. Subsequently, it was the Government which tried to persuade both sides in industry to give up their addiction to litigation and to encourage the voluntary settlement of disputes. It was the Government which helped spread the idea of workers' participation in management and voluntary arbitration, and which sponsored the productivity campaign. Since these ideas were like seeds scattered from above, one should study the extent to which they have taken root in industry. In more slowly-developing industrial societies, usually such ideas have made their way upward. They have been based on the experiments of individual pioneers or research workers in industry, whose work has gradually become known and has influenced others. The Government sometimes has stepped in later to bring the laggards into line. In India, on the other hand, industrial development has been so rapid that there has been no opportunity for the slow growth of ideas. The Government has had to force the pace, and there is always the danger that, as a result, people will pay lip-service to the new ideas without fully understanding their implications.

Before considering the impact of the ideas on industrial relations, it is necessary to have a look at the machinery of compulsory arbitration. Although strikes may be fewer, there is no indication that the number of disputes has decreased. References to adjudication still keep labour courts and tribunals busy, but there is some evidence that companies and unions which in the early days of the Industrial Disputes Act tended to rush to the courts settling all their labour problems, have now become weary of the processes of litigation and are making a much more genuine effort to settle differences by negotiation. In this, they are receiving considerable help from the labour advisers of the various employers' associations, who often act as voluntary conciliators and help settle cases without the intervention of the official conciliation service. In some companies, on the other hand, reference to adjudication has become almost a habit, and their labour departments have become largely legal departments, reflecting the legalistic approach of the management, and leaving little time for constructive work.

Overemphasis on Litigation

The overemphasis on litigation is shown clearly by the number of appeals rejected by the Supreme Court—an august body which was never intended to spend its time on petty industrial cases—but which with the abolition of the Labour Appellate Tribunal, had to take over industrial appeals. The Ministry of Labour's report for 1959 gave figures for the period 1955-59 which showed that over 53 percent of appeals filed were dismissed by the Supreme Court at the preliminary stage. Of the 549 appeals filed, about 30 percent were made by workmen and the rest by employers. Of the cases decided by the Supreme Court, 63 percent of employers' appeals and 96 percent of the workmen's appeals were unsuccessful. There could not be clearer proof of the flimsy nature of many of the appeals and of the fact that the Supreme Court's time is being wasted in the majority of cases. This is not a good sign. As for the subjects raised on appeal, 47 percent related to termination of service, 30 percent to wages and dearness allowance, and 20 percent to bonus.

In spite of a good deal of time wasted, it must be conceded that an appeal court is absolutely necessary, especially when ideas about industrial relations and management's prerogatives are in a fluid state. The Supreme Court has performed an extremely important function in clarifying certain new concepts. Principles of "social justice" have replaced the so-called "law of master and servant." Principles of "natural justice" have been applied to disciplinary action. But the new terms—being somewhat vague—came to be used too loosely in the courts, and the Supreme Court has had to step in to guide and correct. Now one at least has a fairly clear set of guiding principles on such questions as discipline, discharge, dismissal, retrenchment, conditions of service and retiring terms. Some of them have elaborated or clarified the law; others have broken new ground in the search for "social justice".

One difficulty about industrial adjudication is that resort to a court of law suggests that the dispute is a question of right and wrong, and that the judge will decide which party has right on his side. This may be so in certain cases, such as alleged victimisation, unfair labour practices and wrongful dismissal, but at least half of the industrial references relate to economic questions such as wage fixation or bonus claims, and in giving its award in these cases a court exercises an arbitral and not a judicial function. When he has before him a claim for increased pay, the industrial judge has not merely to consider the law and the facts of the case but concepts such as "social justice," "fair wages", and variable factors such as the cost of living, the capacity of the company to pay, and the influence of an increase in wages on the industry or the locality generally. These are questions which are better settled by other than judicial methods.

Bonus Appeals

The arbitral nature of adjudication is most clearly seen in bonus cases. One has only to study the great number of bonus appeals to realise that the so-called "Bombay formula" is so full of legal loopholes that it does not deserve so scientific a name. In fact, it may be said to have raised more problems than it has solved and to have been an excuse for endless adjudication and appeals. It has really settled nothing except the lines on which management and unions can wrangle over the calculation of the "available surplus", of "rehabilitation" and so on. And when a figure for the "available surplus" is at length arrived at by the judge after much disputation and calculation by the parties, the proportion which should go to the payment of bonus remains a variable to be decided by the judge.

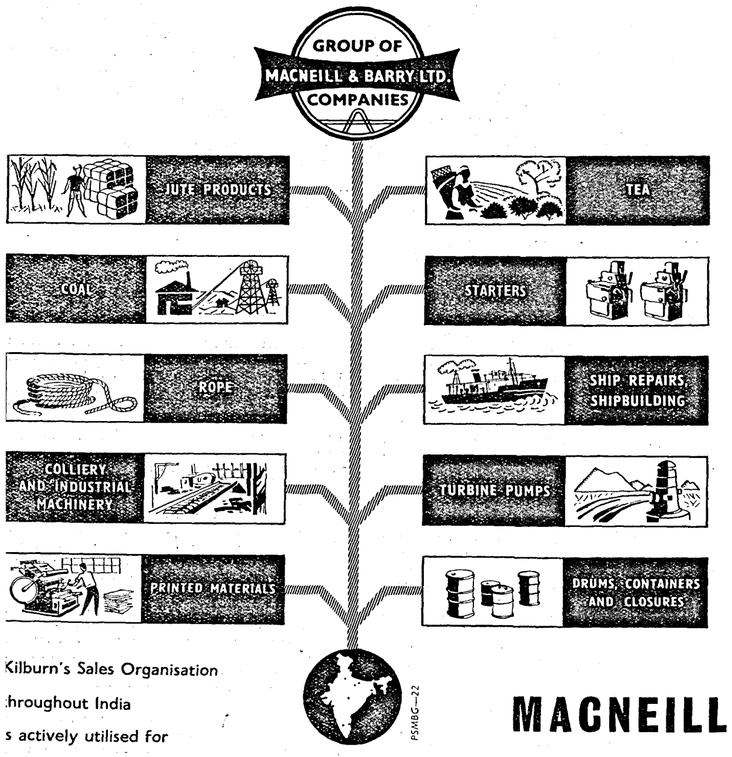
The Government has now set up a special commission to enquire into the subject of bonus. It is presented with a nice problem. It can hardly scrap all the decisions of courts and start again from rock bottom without inviting a host of new disputes. It might with advantage decide what proportion of the "available surplus" should be ploughed back into the business or be devoted to price reduction. There is a real danger in all the discussion on bonus that what Peter Drucker calls "the costs of staying in business" may be neglected. In Yugoslavia, for instance, it is laid down that 28 percent of the surplus profit of an undertaking must go back into the business, and the workers' council may then decide how much of the remainder should be given as bonus or be devoted to housing and other amenities, subject to the approval of the trade union and the communal people's committee.

If bonus could be removed from the sphere of adjudication and be settled by negotiation in line with certain basic principles, it would be a great step forward. Unfortunately, the tussle over bonus has become an annual event in many companies, and August and September are referred to as the "bonus season". Yet there are a number of alternatives to the "Bombay formula" which have been written into agreements. Some give an agreed percentage of profit as bonus; some link it with the dividend to shareholders; and some work on average prosperity over several years. The most effective bonus scheme is that which is linked with production. In spite of the advantage of making an agreement which will avoid an annual struggle over bonus, there is still insufficient mutual confidence to settle bonus claims in this way except in a comparatively small number of concerns.

Wage Boards

An alternative method of resolving disputes over remuneration is through wage boards. Under the Minimum Wages Act, wage boards were originally introduced to settle minimum wages in those industries where labour was unorganised and weak, but the principle has now been applied to the settlement of wage disputes in an industry. If the employers' association and the trade unions agree, then the whole question of wage fixing—and bonus also in some cases—is referred to a board consisting generally of two members representing the employers, two representing the trade unions, two independent members (generally one Member of Parliament and one professor) with a well-known public figure as chairman. This body is required to determine what categories of employees should be brought within the scope of wage fixing, and to work out a wage structure based on the principles of fair wages as set out in the report of the Committee on Fair Wages. The first wage board to present its recommendations was the one for working journalists. Wage boards for the cement and cotton textile industries completed their reports in 1960, and the Sugar Wage Board's report is being considered by the Government at the time of writing. Wage boards have also been constituted for the jute industry and for plantations. In fact, the demand for this new machinery from trade unions has increased in the last two years.

The machinery of the wage board is not necessarily any more rapid than the processes of adjudication, although it has been welcomed as an alternative to labour courts. In the cotton textile industry, three years elapsed between the setting



Macneills have been associated with India's commercial and industrial development for almost a century, and with the growth of the country's economy, Macneills' services to commerce and industry have grown.

Macneills today are owners and managers of an important group of companies engaged in the manufacture or sale of Mining and Industrial Machinery, Turbine Pumps, Starters and Switchgear. Ropes, Jute Products, Drums, Containers and Closures and other Light Industrial Products for the home market and for export.

They are important producers of Coal and Tea and also operate the largest system of inland water transport in Asia which maintains its own Shipbuilding and Repair Yard on the river Hooghly.

Kilburn's Sales Organisation throughout India is actively utilised for the Group's Products.

up of the wage board and the acceptance of its recommendations by the Government. But there is the advantage that the board's discussions are conducted in a very different atmosphere from the heat of controversy which accompanies an industrial court case. Witnesses are heard, but in a fact-finding spirit, without the cross-examination of counsel, and the members of the board reach their conclusions in discussions which are problem-solving rather than judicial. The principle of wage-fixing by wage boards has, therefore, much to recommend it.

Main Problem

The main problem with this new machinery is the implementation of the wage board's report. It has no legal sanction for its findings, but since it is constituted to represent both sides of industry its recommendations should be acceptable to both. The Seventeenth session of the Indian Labour Conference proposed that wage boards should be put on a statutory footing so that their awards would be enforceable, but the Standing Labour Committee declared that this would not be in keeping with the Government's policy of encouraging voluntary settlement of disputes, and that unanimous decisions of wage boards should be implemented by the parties themselves. While this is obviously the correct line, the Government has not ruled out the possibility of giving legal sanction to wage board reports. The implementation of the Wage Boards' recommendations in the cement and textile industries proved a severe test for the new machinery. The Central Labour Minister, speaking at the eighteenth session of the Indian Labour Conference in 1960, commented on the position as follows: "In view of the broad-based composition of these boards and the fact that their recommendations were of a unanimous character, I was totally unprepared for the nerve-racking struggle which ensued to secure the acceptance and implementation of these recommendations. The resistance was wholly undesirable and unnecessary and brought to light the gaps in the authority exercised by organisations of employers."

One of the difficulties encountered in the cotton textile industry was the varying outlook in different regions and in large and small units in the industry. While in theory standardisation of wage rates is desirable, it may not always be practicable at the present stage, and more attention will have to be paid to those variations by wage boards in future. Will wage boards help to evolve a national wage policy, and is such a policy possible? Although their terms of reference were the same, it is significant that the Cement and Textile Wage Boards disagreed in their approach to the "need-based minimum wage" recommended by the fifteenth Indian Labour Conference. While the Cement Wage Board accepted this recommendation and based its wage structure on it, the Textile Wage Board felt that the introduction of a need-based minimum wage would be "a leap forward of a character that the industry would not be able to support," so it contented itself with flat wage increases.

Need-based Minimum Wage

The I.L.C. recommendation of a "need-based minimum wage" was obviously a little premature. Although it was a tripartite decision, the Government has already, in effect, resiled from it. Workers naturally made it the basis of their demands before the Central Government Pay Commission and in the State Bank dispute. While the Central Labour Minister had once said that the decisions of the I.L.C. were "morally binding", the Central Finance Minister bluntly declared that the Government was justified in rejecting the minimum suggested, as it had not been formally considered or approved by the Cabinet. This raised a first point about decisions of tripartite bodies, and a formula has had to be devised lest representatives of the Central Labour Ministry should be thought to be in a position to commit the Government by views expressed at these conferences. It has, therefore, been suggested that decisions of the I.L.C. should be divided into two categories—those in the nature of mere recommendations and those binding on the participants. At the last conference, Mr. Nanda made it clear that while the Government should not do something repugnant to the conclusions of a tripartite conference, it was ultimately responsible to Parliament, and in the interests of national security and the economy of the country, it would be justified in exercising its "inalienable right" to take appropriate steps in a particular situation. This was the justification for not applying the "need-based minimum wage" in Government service. It seems, however, that the Government expects the private sector to follow the formula as far as possible.

This brings out clearly the distinction between the Government in the Central Ministry of Labour and the Government as an employer in the several Ministries in control of the public sector and essential services. Since the public sector is growing every year, this dual attitude has unfortunate consequences, only too well illustrated in the strike of Government employees in July last. It is true that the Government has special responsibility, particularly at this critical juncture in its planning, but it is, to say the least, misleading to labour if the Government through the Central Ministry of Labour adheres to principles of policy formulated at tripartite conferences, when they cannot be applied within the public sector. So it should be made clear which decisions of the Indian Labour Conference are considered as binding on the participants, and which are in the nature of recommendations only. The Government now has to recognise that whether employees work in the private or the public sector, the same problems of labour relations arise. Those who work under the Government do not thereby become so patriotic as to give up the claims being made by their contemporaries in private employment. In the U.K. also, it was soon found by experience that nationalisation was no solution to labour problems, and that whether the employer was ultimately a board of directors or the Government, it seemed an equally distant and depersonalised authority to the average workman.

Strike of Central Government Employees

A study of the dispute which led to the strike of Central Government employees in July 1960 shows that it followed a path well known to the private sector. Demands were pitched high and claims based on the principles enunciated by the Indian Labour Conference. The Prime Minister refused to meet the Joint Council of Action unless its demands were modified. A similar stand was taken by the Central Finance Minister in the State Bank dispute. But to private industry it seemed merely normal tactics that demands should be high. Expectation was not necessarily so high. Labour Commissioners are always explaining to private employers that, if negotiations are started in a spirit of mutual accommodation, demands will be modified and eventually some *via media* will be found. However, the Labour Commissioners' long experience does not seem to have been called in to assist in this dispute.

Throughout the dispute, the emphasis was on the question of minimum pay and dearness allowance—naturally the most important issue—but much less attention was given to certain genuine grievances, which surely operated to bring the more moderate employees out in support of the strike policy. In a large number of cases, the Government's implementation of the Pay Commission's report resulted in employees actually receiving less cash in hand on pay day, although they would ultimately receive more on retirement. The private employer has long ago discovered that it is unwise to reduce cash receipts, whatever the alternative advantages offered. Another lesson the private employer has learnt by experience is that he cannot increase hours of work for any reason without substantial compensation. Yet the Government did just this over Saturday working. Moreover, the decision on Saturday working went beyond the recommendations of the Pay Commission, although the Government was all along referring to the report as if it were an arbitrator's award and should be accepted as such by the employees.

The strike failed, as it was bound to once the Government took firm action, but it has provided some important lessons, and has already produced some tangible results. It has proved to workers the folly of strikes in essential services vital to the national economy. The fact that the strike was illegal made the Government indignant, and it is to be hoped that it will, therefore, be firmer in future in its attitude to illegal strikes in the private sector. The strike, moreover, has shown the Government that the public sector must be brought more into line with the private sector in the matter of labour policy. That joint consultation is now to be established at the various levels of Government service through a three-tier system of Whitley Councils is an important step forward, and may even help foster further joint consultation in private industry. Machinery for compulsory arbitration as a final resort if negotiation fails, has now been promised in the form of a panel of three arbitrators, one to be chosen by the Government, one by the employees concerned, and the third jointly by the first two. This seems a sound device, and may also help encourage the use of arbitration in the private sector.

Compulsory or Voluntary Arbitration

Arbitration as an alternative to adjudication has suddenly become one of the demands of national trade unions. The idea was first mooted publicly by the Central Labour Minister, but reactions then were not very favourable. Most people felt that the idea was too advanced, and that industry had become too wedded to the method of adjudication. Yet there were constant complaints about adjudication. The former Central Labour Minister, Mr. V. V. Giri, had gone so far as to label it "public enemy No. 1" of good industrial relations. The present Central Labour Minister has consistently appealed for alternative methods of settling disputes. At one stage, he even suggested an experiment to meet halfway those who wished to abolish the labour courts and tribunals. He offered a six-month truce during which no cases would be referred to adjudication, but none of the national bodies—neither the employers' associations nor the trade unions—would take up the challenge, and the State Labour Ministers also voted solidly against the proposal. It is clear, therefore, that whatever may be said for propaganda purposes, everyone is afraid to abandon the final resort to compulsory adjudication. Employers are afraid of an increase in strikes, workers of the machinations of unscrupulous employers and Labour Departments of the breakdown of law and order in their States. A sad commentary, perhaps, but undoubtedly an accurate assessment of the present situation.

Meanwhile, although the idea received little support when first made by the Central Labour Minister, voluntary arbitration has been demanded by various national trade unions, and in particular by the I.N.T.U.C. One cannot, however, escape the feeling that it has been taken up as a new slogan with little appreciation of its implications, and that most workers see it only as a welcome alternative to the lengthy and costly processes of the law. Mr. G. Ramanujam, I.N.T.U.C. president, speaking at the 1960 conference complained that "the delay experienced in the settling of disputes is still the main cause of labour's legitimate discontent". He suggested that the Government should "blacklist" employers and unions who do not accept voluntary arbitration. Others have also suggested that industry should be "forced" to accept voluntary arbitration, without seeing the obvious contradiction involved. Voluntary arbitration cannot be treated merely as an alternative to adjudication. It is a civilised form of settling differences, involving a high degree of confidence in the chosen arbitrator and prior agreement by both parties to accept without question the arbitrator's ruling. Therefore, it is necessary not only to have arbitrators who can command such confidence, but also trade unions which can discipline their rank and file in the acceptance of an award. The Government is now engaged in compiling a list of suitable arbitrators, but it is none too easy a task.

Negotiation and Agreement

The only real alternative to compulsory arbitration is settlement by negotiation and agreement. Some years ago, the more forward-looking companies began to make long-term agreements with their recognised unions covering quite a wide range of subjects, such as pay and working conditions, joint consultation and the handling of grievances. This seemed a very hopeful trend, but it has not spread to any really appreciable extent. Those who had made these collective agreements have in most cases renewed them or made fresh agreements on the expiry of the contract, but other more recent agreements seem to be mainly settlements reached during conciliation on particular demands, such as bonus, rather than on general working conditions and relationship within the company. But it is encouraging that many more disputes are now being settled by agreement than in the past. In West Bengal, for instance, about 40 percent of the cases referred to the Labour Commissioner are settled by tripartite agreement—that is, in conciliation proceedings—and of the remainder, about half are settled outside by bipartite agreements. The conciliation officers are increasingly sending the parties back to work out solutions for themselves, with perhaps a little advice to start them on the right lines. In this process, the labour advisers attached to many of the employers' associations are also helping. Overall, the number of disputes and the number of references to conciliation may not be decreasing, but many of them relate to small concerns or new enterprises which are not so conversant with modern methods of management. Many of the older concerns are now solving their problems fairly successfully by negotiation. There remain, of course, whole areas of industry where negotiation is not possible because there are rival unions, or the unions are not recognised by employers. Even so, sometimes indirect negotiation through employers' associations has solved problems without according formal recognition to the union.

Joint Consultation

The Industrial Disputes Act, 1947, envisaged joint works committees as part of the machinery of industrial relations. The idea at that time seemed to be that discussion in works committees might help settle disputes and promote good relations between employers and workmen. To the unions, this seemed to be usurping their function, with the result that they were at first rather suspicious of works committees. Later, however,

they decided to give support to this form of joint consultation. Although the Government can insist on the setting up of works committees, progress in this direction has been uneven. Works committees are working well in some companies; in others, either management or workers' representatives, or both, show little interest or initiative, and some committees have died of inanition. Those that work best usually restrict themselves to domestic matters of general concern to workers, and avoid questions which might impinge on the trade union sphere of activity. One or two have gone further, particularly where organised labour is weak or divided, and the works committee has become the only possible channel of communication between management and workers. On the whole, the committees jog along without conspicuous success or failure.

Labour Participation in Management

It was the Central Labour Minister who took the initiative in a further experiment in associating labour with management through joint management councils. The plan approved by the Indian Labour Conference in 1958 was to start these councils in 50 undertakings, including some in the public sector. Actually only 24 are so far functioning. Although a seminar of representatives of these units, convened in March 1960, showed that some significant results had been achieved, as the Labour Minister said, "progress in quantitative terms has been meagre." This he ascribed to the "insufficient enthusiasm for the new approach both among the ranks of employers and the organisations of workers," and added that the latter were thereby missing a "most valuable opportunity for an advance towards the larger aims of the labour movement." To the employers, he said that the private sector "has to meet the challenge that it should justify its existence in a socialist pattern by acquiring new attributes and assimilating itself as a part of the new social order".

As in the case of voluntary arbitration, labour participation in management is a very advanced concept which depends on a high degree of mutual confidence between management and labour. It is probably true to say that joint management councils will only succeed in those undertakings where a sound relationship has *already* been built up. Except, perhaps, as an ideal, labour participation in management is not at this stage likely to contribute much to industrial relations. To set up joint management councils where good relationship has not already been established is like building a grand superstructure on weak foundations. The real line of progress lies, therefore, in strengthening the foundations. It is here that the Central Labour Minister's policy of evolving "codes and norms" is—in spite of much initial scepticism—gradually beginning to bear fruit.

The Code of Discipline

The "code of discipline in industry" was first drafted at the fifteenth session of the Indian Labour Conference in 1957, and was eventually ratified by the principal national associations of employers and trade unions. It is never easy to draw up on paper a code of conduct, and the code of discipline, even in its final form, is not very precise. But it does provide a set of general principles for the conduct of industrial relations. Frequent reference to adjudication and the drafting of standing orders has tended to make both employers and trade unions too legalistic in their approach to any problem. When either side raises a point, the other is inclined to say "it is not legal", or "it is not in the standing orders"; and labour officers find themselves engaged to a large extent in legal interpretation.

In so far as the code provides a moral, rather than a legalistic, approach to problems of industrial relations, it is a move in the right direction. It has, for instance, given conciliation officers a yardstick by which to judge the actions of management and workers. Labour commissioners and their staff have ho legal sanction behind them, and they have to work through explanation and persuasion. The code, however, has given them a moral sanction which is proving quite effective. Before, it made little effect on a union if the conciliation officer pointed out that it had indulged in an illegal strike, for the union as well as the officer knew that in the final resort only an industrial court had jurisdiction to decide if a strike was legal or illegal. Now the conciliation officer can point out that the action taken is not in accordance with the code by which the union is bound. Similarly, when an employer takes unilateral action, it can be explained to him that he is breaking one of the clauses of the code to which his association is a signatory.

A step towards reducing litigation, suggested in the code, is the screening of appeal cases, in order to curb the tendency of parties to a dispute to approach higher courts indiscriminately. Central organisations of employers and workers have been persuaded to set up machinery for screening cases of appeal filed by their members, and this has resulted in some cases being withdrawn. Summing up the progress made since the introduction of the code, the Central Labour Minister said: "It is still my faith that as we proceed more and more firmly on the basis of voluntarily accepted obligations, and the influence of conventions grows, the occasions for the Government to have recourse to the penal provisions of law will diminish progressively."

Implementation Machinery

In a somewhat similar way, pressure is being brought to bear on those who do not implement labour laws, awards and agreements. There used to be many general allegations made publicly that awards were not being implemented. Now all such complaints are referred to implementation machinery working in each State under the guidance of the Central Evaluation and Implementation Division of the Ministry of Labour, started in 1958. Through this machinery, a check is made on the progress of implementation and all complaints of non-implementation are investigated. In many States, there are tripartite implementation committees which meet regularly, discuss complaints and take action. Their work is carried on behind the scenes, without the glare of publicity. They establish the facts and this itself has a moderating influence.

In conclusion, one may say there is evidence that in various directions progress is being made. Industrial relations are certainly not stagnant. There is much frustration on both sides of industry, and to those engaged in the day-to-day work of management there seems to be an unending vista of problems and disputes. This is largely because the peace of industrial development has been so forced that it is difficult to take a long-term view. There is, for instance, much dissatisfaction with the slow processes of industrial courts, but taking a wider view one can see that adjudication has produced useful results. Through it standards have been worked out for the "socialistic pattern of society", and one now has a clear framework for the new system of "social justice".

Dissatisfaction with compulsory arbitration has brought about interest in new forms of settlement, so recent years have seen considerable experiments on wage boards, joint consultation, collective bargaining, labour participation in management and voluntary arbitration. The new ideas have often not been fully understood, and there is little realisation yet of the true import of the voluntary principle as applied to industrial relations. Results are not, therefore, always up to expectations, and there are disappointments, but these experiments have at least shown the weak links in the new machinery, and above all the need for further education of both management and workers.

Industrial Democracy

Some of the ideas adopted as slogans are too advanced at present. The country cannot be said to be ready for voluntary arbitration or labour participation in management to any appreciable extent. These are advanced forms of industrial democracy which depend for their success on existing sound relationships within the organisation. They cannot themselves build the foundations for good relationship, which require much laborious spadework. One cannot, therefore, expect more of these particular experiments than to keep the minds of people alert to their possibility. The Central Labour Minister's policy of "codes and norms" is beginning to bear fruit. It is still too early to indicate its positive results, but it is certainly helping to strengthen the voluntary settlement of disputes. It can only be a gradual method, but it is probably more sure in the end than the more spectacular experiments.

One of the weaknesses of the present system is that there are still areas of industry where trade unions are not recognised and where the voluntary principle cannot, therefore, be applied. The failure to build up strong national or industrial unions, the dependence of unions on outside leadership and political parties, the multiplicity of rival unions—all these are problems too well known to need further stressing. One is, unfortunately, no nearer to a solution. The legalistic approach to all labour problems is still predominant, and has the unfortunate effect of "depersonalising" relationships. Management needs to be more human and more personal in its methods, since the legalistic approach always becomes a negative one. A more positive and constructive approach is the best contribution that management can make towards better industrial relations.

Eyes alight with joy, the happy group crowd around the balloon man. One, two and up they go, the gaily coloured balloons. What magic holds them aloft? "Gas, a magic gas", replies the wise balloon man.

Years later these children as adults, following different professions, will again marvel at the power of another gas—Oxygen, which serves our industries, sustains the jet pilot and gives relief to the sick.

But from where does it come this 'miracle gas'—Oxygen? It comes out of thin air and has been manufactured by Indian Oxygen for the past twentyfive years.

HASTINGS STREET

A House of Memories

No liveried footmen or blazing chandeliers remain to proclaim the grandeur and gaiety that once pervaded the large red brick mansion that still stands in Calcutta's Hastings Street and which Warren Hastings, India's first Governor-General, built for his charming wife as her town house. For many years this fine residence was the scene of glittering assemblies and balls, the entrée to which was considered a high social privilege.

In 1827, No. 7 was acquired for the purpose of its business by the old established engineering firm of Burn & Company which occupied it for almost a century. By reason of its expanding business, Burn & Company found this historic building with its cobbled carriage drive and spacious rooms too small, and in 1925, the Company was forced to sever its link with this house of memories and moved to larger premises in Clive Street, where it joined hands with Martin & Co.

Today, the activities of Martin Burn Ltd. cover a wide range of engineering interests including those brought to it by the renowned firm of Burn & Company all of which are vital to the rapid development of India's industrialisation.

Developing Co-operatives under the Third Plan

More Resources Needed to Strengthen Credit Societies

By

G. M. LAUD

A DECADE of economic planning has witnessed growing emphasis on co-operation with a view to raising production and improving the economic condition of the masses. This is as it should be, because as early as the 'thirties, the Royal Commission on Agriculture plainly stated that "in co-operation lies the best hope of India." Since then its potentialities have been emphasised by various committees and its importance has been recognised in the two plans. The first five year plan acknowledged co-operation as an "instrument of planned economic action in democracy" combining initiative, mutual benefit and social purpose. The second plan considered the importance of economic development on democratic lines, more so in a socialistic pattern of society, and declared that the building of a co-operative sector was one of the central aims of national policy. The allocation for community development and co-operation under the third plan has been raised from 4.6 percent of the outlay in the public sector during 1956-61 to 5.5 percent in the following quinquennium. At the same time, the draft outline of the third plan points out that "the allocations proposed at present are necessarily provisional. They are included to assist the Central and State Governments in undertaking detailed studies of their programmes and projects."

Cautious Approach

This cautious approach has been prompted by the realisation that adequate preparedness for the organisational tasks involved is essential. And what are these tasks? The authors of the draft outline explain: "The village *panchayat* and the co-operative and the national extension agency should ensure that each family has an integrated plan for the use of approved seeds, fertilisers and organic and green manures on its holding and that every family is assisted with short-term credit in money or kind or both for this plan." The community development agencies are expected to organise the supplies, services and technical assistance needed by farmers. The evaluation reports have shown the shortcomings of the extension agency. It is not the purpose of this article to rewrite the prescription for strengthening it. What is pertinent to note is that even if the agency is strengthened, it cannot function effectively unless adequate supplies are assured. So the programme for augmenting production of improved seeds and fertilisers assumes significance. At present, shortages are chronic and prices uneconomic.

The draft outline has warned that "without a village production plan, it will not be possible for extension workers to reach all the farmers in the village or to mobilise effectively the efforts of the local community. True, to quote the same source, "from the beginning of the second plan, much stress has been placed on the preparation of village production plans," but the Committee on Co-operative Credit, presided over by Mr. V. L. Mehta, did not find any such plan operating in any village even during 1959-60. It is, however, felt by planners that the *panchayat* is in the best position to visualise the village production plan as a whole and, in particular, to arrange for the execution of programmes requiring effort on the part of the entire village community or of groups of beneficiaries.

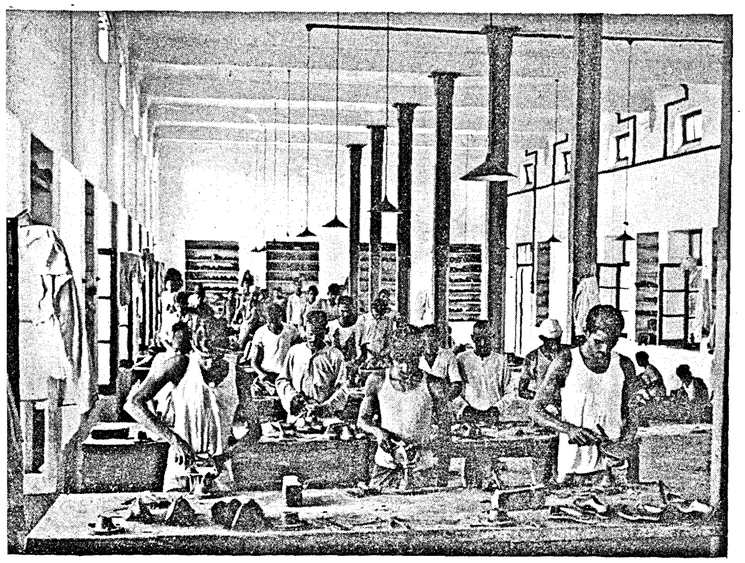
Village Production Programme

Whether this expectation will materialise or not only the future will show. The past does not indicate that the future will be promising. Yet the third plan has pinned its faith in co-operatives and *panchayats* as the primary agencies for executing the community development programme for which the village production programme is the foundation. The draft outline, however, makes it clear that the primary functions of the village co-operatives are the provision of short-term and medium-term credit, the supply of agricultural and other production requirements and the marketing of agricultural produce. It follows from this that each village must have a production plan, the *panchayat* must be capable of executing it and the national extension agency must be enabled to provide supplies, services and technical assistance before co-operatives play their rôle effectively. The problem of co-operatives is one of strengthening all the rural agencies and creating conditions in which they can operate successfully.

During the first plan period, official policy was influenced by the recommendations of the Agricultural Finance Sub-Committee of the Policy Committee on Agriculture and the Co-operative Planning Committee, the ideal of creating a welfare State and the radical change in the conceptions of Governmental functions. The second plan, on the other hand, was influenced by the recommendations of the Rural Credit Survey Committee designed to strengthen rural co-operative credit; to promote the welfare of the weaker classes, *i.e.*, the medium and small cultivator, the agricultural labourer, and the village handicraftsman and to build up co-operation "which joins together in a common purpose the united strength of the Indian village with the united strength of the Indian State." Unfortunately, only some of the recommendations were implemented and yet their implementation stimulated co-operative activity. For evaluating the progress, the latest available data relate to 1958-59. The year is significant because in the midst of it, there was a change in the Government's policy. The progress achieved during the period is summarised below:

PROGRESS OF AGRICULTURAL CO-OPERATIVE CREDIT

	First-Plan 1950-51 Actual	Target	Second Plan Achievement (1958-59)	Target (1960-61)	Achievement (1958-59)
Number of agricultural credit societies	115,462		159,939		182,905
Membership of societies (in lakhs)	51.54		77.91	150	119.01
Loans (in crores)	22.90	125	49.62	200	125.50
Average loan a member (Rs.)	44		64	100	106
Percentage of overdues to outstandings	33		25		14.3
Value of goods sold (in crores of rupees)	19.30		8.81		18.70
Long-term loan outstandings (in crores of rupees)	6.54		13.80		22.24
Long-term loans made (in crores of rupees)	1.65	5	2.78		5.89

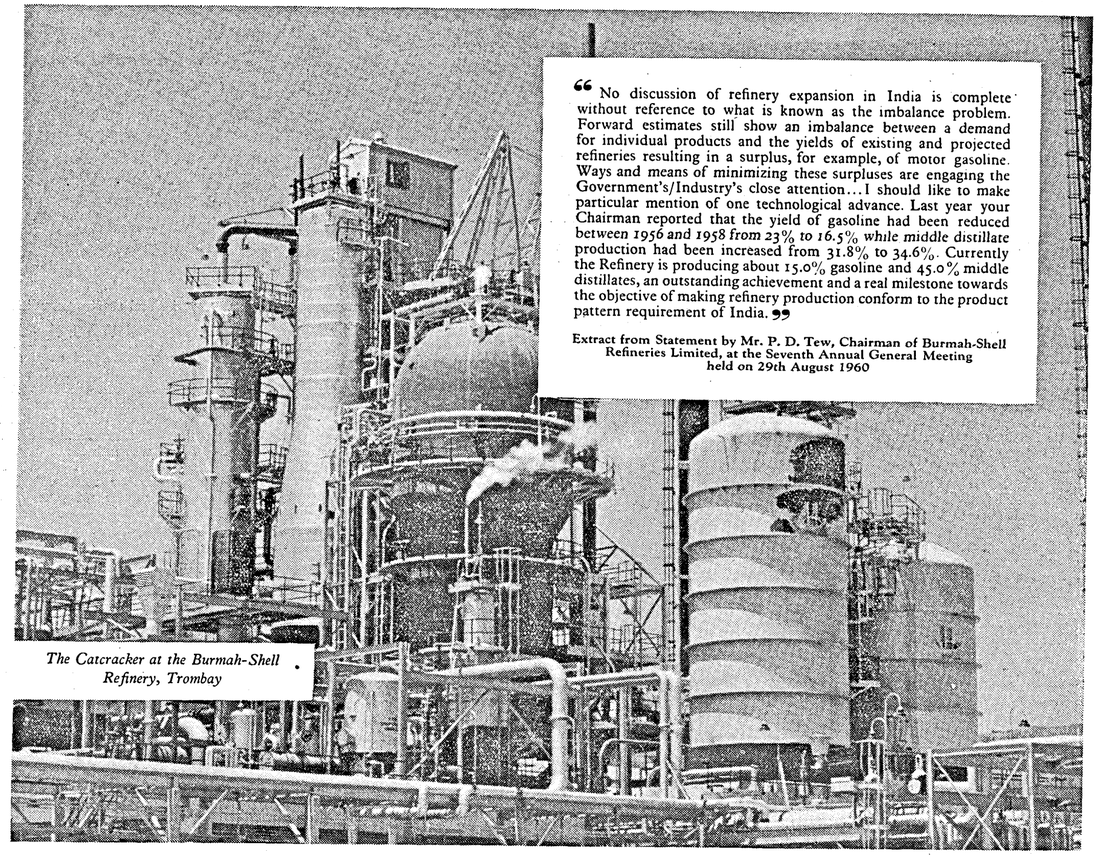


A small-scale unit where shoes are manufactured

Three features prominently stand out. The pace of expansion has been accelerated under the second plan; its most significant feature is that the average loan, short and medium-term, which had been raised by roughly 50 percent during 1951-58 shot up by 66 percent in the following three years and has outstripped the targets fixed for 1960-61 and the proportion of overdues has progressively declined. How much of the expansion under short- and medium-term credit is to be attributed to the inability of long-term credit to respond to the target and to what extent it has indirectly helped in reducing the ratio of overdues may not be known; but the element of these two factors cannot be ignored. Their aggregate sales have shown hardly any improvement which means that the expansion of credit has not been accompanied by the growth of multipurpose activity, *i.e.*, the supply of credit in kind and the marketing of crops. During 1958-59, the sales by State, central and primary marketing societies and agricultural credit societies totalled Rs. 83.83 crores. If an allowance were to be made for duplication of work by the intermediate agencies, the aggregate sales would not exceed Rs. 40 crores, out of which not more than a half might represent the sale of agricultural produce—the balance being the supply of agricultural requisites to the farmer. The crop loan system on which the second plan had relied for the expansion of credit and agricultural production has not made the desired progress.

Regional Disparity

The position becomes still more disturbing on account of the regional disparity in the strength



"No discussion of refinery expansion in India is complete without reference to what is known as the imbalance problem. Forward estimates still show an imbalance between a demand for individual products and the yields of existing and projected refineries resulting in a surplus, for example, of motor gasoline. Ways and means of minimizing these surpluses are engaging the Government's/Industry's close attention... I should like to make particular mention of one technological advance. Last year your Chairman reported that the yield of gasoline had been reduced between 1956 and 1958 from 23% to 16.5% while middle distillate production had been increased from 31.8% to 34.6%. Currently the Refinery is producing about 15.0% gasoline and 45.0% middle distillates, an outstanding achievement and a real milestone towards the objective of making refinery production conform to the product pattern requirement of India."

Extract from Statement by Mr. P. D. Tew, Chairman of Burmah-Shell Refineries Limited, at the Seventh Annual General Meeting held on 29th August 1960

of agricultural primary societies as on 30th June, 1959. Twenty-eight percent of the working capital of agricultural primaries was located in Bombay State, comprising Maharashtra and Gujarat, and Andhra, Madras and Mysore States together claimed the same share. The remaining 44 percent was located in States having 68 percent of the rural population in the country. Qualitatively, only 24,257 societies, *i.e.*, 14 percent of the total were good being in "A" and "B" audit class, while a little over half were in "C" class, *i.e.*, not bad. The statewise analysis showed that out of 24,257 societies enjoying "A" and "B" audit class, 14,177 were in five States, *i.e.*, Maharashtra, Gujarat, Andhra, Madras and Mysore. The only redeeming feature of the development during 1951-59 was that the average size grew during the period. The average membership a society rose from 45 in 1950-51 to 65 in 1958-59 and the paid-up capital doubled from Rs. 1,000 to Rs. 2,000. But the reserves and other funds remained unchanged at Rs. 1,000 and deposits halved to Rs. 1,000 a society. Consequently, whereas lendings a socieay rose from Rs. 2,000 to Rs. 7,000, borrowings increased from Rs. 1,000 to Rs. 6,000. To support the increased borrowings of this magnitude, the central co-operative banks had to borrow on average Rs. 19.89 lakhs in 1958-59, compared with only Rs. 1.93 lakhs in 1950-51.

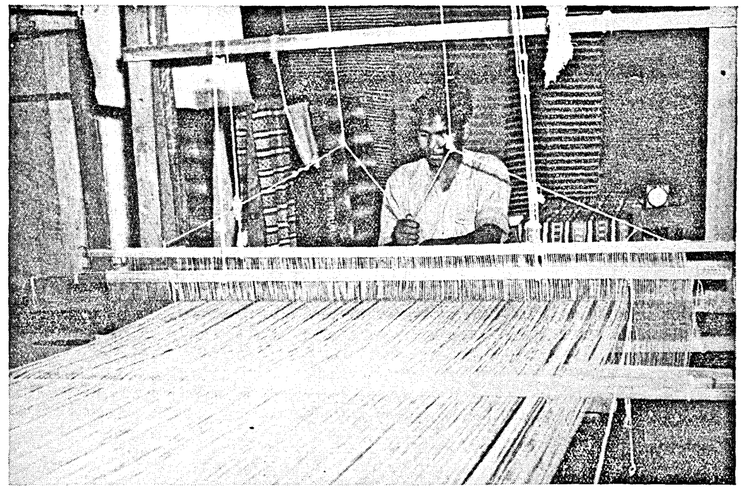
The National Development Council declared on 9th November, 1958, that co-operatives should be organised on the basis of the village community as the primary unit and that the responsibility and initiative for social and economic development at the village level should be fixed on village co-operatives and *panchayats*. It raised the target of membership of agricultural primaries under the second plan from 15 million to 20 million and expressed the hope that all the rural families could be served by co-operation before the end of the third plan period. Since then the energies of co-operators, official and non-official, have been concentrated on stemming the tide. The Working Group feared that the partnership between a village co-operative (*i.e.*, a business organisation and a *panchayat)* and administrative organisation, may not be competent to handle democratic functions. It also felt that the achievement of the targets would demand a vast army of persons and pleaded for ensuring that the large-scale expansion would not prove unsound. Its report was discussed by the National Development Council and on the latter's recommendations, the Government of India reached some decisions on 11th May, 1959.

The decisions—officially described as "broad indications of the policy"—watered down the earlier conception on the size of the primary rural co-operative, abolished the State partnership in the share capital of the primaries and shifted the emphasis from partnership between the co-operative and the *panchayat* to co-ordination between them. The State Ministers' Conference held in Mysore after two months entrusted the problem of adequate finance and State participation at the primary level to an expert committee presided over by Mr. V. L. Mehta. It emphasised the obligations of co-operatives towards the weaker section and urged the provision of credit against the security of crops being linked to specific production programmes and agricultural co-operative marketing.

Broad Indications

What this has meant to the expansion of co-operation after June 1959 is not known because of the dearth of statistics. But some broad indications are available from the draft outline of the third plan and other papers. It is hoped that by the end of 1960-61, the country will have 200,000 agricultural primary societies with a membership of 17 million, compared with the original target of 15 million and the revised target of 20 million and the short-term and medium-term credit provided by them around Rs. 190 crores, against Rs. 200 crores expected to be provided for 15 million members. The second plan has witnessed a substantial measure of expansion on the credit front, but the hope of loans being granted on the basis of production programmes and anticipated crops—produce being collected by agricultural primaries for sale through marketing co-operatives and the marketing societies being well developed as an organisation for selling the produce—has not materialised. As a result, in many States, development has not taken place on the right lines even in relation to credit. The draft outline of the third plan confesses that the eastern zone is particularly weak. The fact is that the system of granting loans on anticipated crops has not been introduced in most of the States; there has hardly been any linking of credit to marketing or agricultural production and co-operative economic activity—especially processing and marketing—has not made any impact on the rural economy.

Viewed against this background, the targets for credit fixed under the third five year plan appear to be highly optimistic and present organisational and administrative problems of a magnitude bigger than those of the second plan. True, the 1956-61 targets will be achieved by and large, but they will not have a sound support at the base. As such, it is necessary to proceed cautiously with the further expansion of credit. Priority has to be given to rectification and rehabilitation of the co-operative structure and the consolidation of gains. The authors of the draft outline are aware of this and have, therefore, chosen to describe the targets as "illustrative," but judging from the experience of the past, one has reasons to fear that the official enthusiasm will be whipped up by political pressures for adding 50,000 new agricultural co-operatives and raising the membership from the estimated level of 17 million at the close of 1960-61 to 40 million at the end of 1965-66 in order to ensure that 74 percent, against 33 percent of the agricultural population, is covered by agricultural credit co-operatives. And once this process is set in motion, its logical corollary of expanded credit will begin to operate. And all this without proper co-ordination of credit with agricultural production plans, marketing and processing as also administration and supervision. On the other hand, if credit expansion is resisted, the movement and the State will be brought into disrepute and rural unrest will thrive.



A weaver at work in a small-scale industrial training centre in Bihar

Evaluation of Progress

The broad indications of the action to be followed in promoting co-operatives were conveyed to the State Governments by the Central Ministry of Community Development and Co-operation in May 1959, and the schemes were accordingly formulated for 1960-61. An evaluation of the progress of the schemes will be highly stimulating. Broadly, it may be stated that no tangible effort has been made to attract honorary workers and leaders "with enthusiasm, ability and integrity" to the movement in "much larger numbers, the training programme has not kept pace with the expansion needs for reasons beyond the control of those in charge, the pattern of supervision is still being debated, the departmental staff is being strengthened quantitatively but the strength has deteriorated qualitatively; and the ideal of simplifying the co-operative and procedure has remained a distant goal even in the co-operatively well developed States". It is officially estimated that roughly 50 percent of "C" class societies and all "D" and "E" class societies will have to be revitalised. In quantitative terms, this would involve the reorganisation and revitalisation of roughly 75.000 societies. Are the State Co-operative Departments and non-official agencies equipped for this task under the third plan?

Even assuming that all the bottlenecks detailed earlier are removed, the problem of financial resources will present difficulties. This was examined in detail by an expert committee, and its recommendations do not suggest a departure from sound banking principles and the present pattern of the structure for which the Reserve Bank is the lender in the last resort. From the available data, it is noticed that the expansion of credit has been accompanied by a more substantial increase in the

"We believe...

that Free Enterprise is your enterprise and contributes to your prosperity. It is the lifebreath of a free society. It is not a creed; it is a way of life which all who cherish freedom must safeguard.

"WE BELIEVE that democracy is an essential element in the Indian way of life. Free Enterprise is an integral part of it and as such it should be permitted to play its legitimate role in our national life.

"We BELIEVE that the beginning of intelligent living is the beginning of Free Enterprise. It is not something new: it is as old as man. The man who first discovered fire was a Free Enterpriser as also the man who invented the locomotive. Today, the man who builds up industries is a Free Enterpriser; so also is the small trader.

"We BELIEVE that in the circumstances prevailing in our country today, there is ample room for State enterprise to function alongside of Free Enterprise in the service of the people. Monopoly of any kind, whether State or Private, is undesirable.

"We BELIEVE that Free Enterprise must have clean hands. We realise that within its fold, as in that of every system, there are black sheep, and it will be our constant endeavour to develop and foster healthy traditions within Free Enterprise."

Extracts from the Manifesto of the Forum of Free Enterprise.

The Forum of Free Enterprise is a non-political and non-partisan organisation. The Forum disseminates authoritative information to educate public opinion. It brings to public notice the achievements of Free Enterprise in this country, and the manner in which it can make its contribution to the economic development of India in order to raise the standard of living. All those who believe in the values of voluntary enterprise and democracy, whether they be in service, profession, agriculture, trade or industry, are invited to become members. Annual Membership is Rs. 10/-; Student Associateship is Rs. 2/-.

borrowings from the higher financing agency as the following table shows:

TRENDS OF LENDING AND BORROWING

	1950-51	1955-56	1958-59
Outstandings of agricultural primaries	29.13	59.84	135.00
Borrowings of agricultural primaries	19.21	42.80	109.32
Percentage of 2 to 1	65.9	71.5	80.9
Outstandings of C.F.A.S.	34.14	54.34	130.83
Borrowings (other than deposits) of C.F.A.S.	9.01	21.60	84.90
Percentage of 5 to 4	26.4	39.9	64.9
Outstandings of apex banks	17.90	34.77	101.22
Borrowings (other than deposits) of apex banks	8.54	19.02	76.68
Percentage of 8 to 7	47.7	54.9	75.7

It will be noticed that the dependence on borrowings at each stage has been growing faster than the expansion of lending operations. From the latest returns of the State co-operative banks, it is seen that their borrowings on 30th September, 1960, represented 85 percent of the outstandings. At a time when the lendings to the ultimate borrower by agricultural primaries amount to Rs. 175 crores, the borrowings of the State co-operative banks have amounted to Rs. 106 crores. One can, therefore, well imagine the position in this behalf if the targets of Rs. 400 crores under short-term credit and Rs. 160 crores under medium-term credit were to be achieved. True, the planners expect that 25 percent of the resources needed should be raised by the primary societies and 25 percent by the central financing agencies leaving the balance to be provided by the apex banks; but is the expectation based on a realistic appraisal of the situation? The answer is negative. Unless steps for augmenting the deposit resources are taken at all the three levels, there is every possibility of co-operative institutions being reduced under the third plan to mere intermediaries for passing the Reserve Bank credit—a position which will be unhealthy both for co-operatives and the Reserve Bank.

Calculations of Planners

The problem before the co-operatives is how to turn into reality the planners' calculations without adversely affecting the monetary system. One of the methods urged to conserve the resources is to entrust the financing of marketing and processing co-operatives to the State Bank of India. Apart from the fact that the diversion of the more remunerative sources of business will curb the earning capacity of the co-operative credit structure and its ability to carry risks of agricultural credit, it is to be wondered whether the State Bank of India can have the necessary deposit resources after meeting the credit needs of its normal clientele, including the growing number of industrial undertakings in the public sector. Because the State Bank of India has idle resources at present, the long-term problem of its resources does not seem to have received sufficient attention.

The borrowing capacity of institutions operating at the primary, intermediate and State levels is determined in terms of the multiple of their owned funds. In actual practice, the borrower contributes to their share capital in proportion to his borrowings. This process has led to overcapitation and to the cost of borrowed funds being indirectly pushed up. Under the circumstances, co-operative credit may have to compete with the village *sowcar* at least in well-developed States, while in other States, it is liable to suffer from the lack of the nucleus at the capital base with the result that the process of institutionalising rural credit may be slowed down. If this danger is to be avoided, planning for expansion of rural credit has to be based not only on production plans but it has to be firmly linked to resources and conditions in order to ensure the successful functioning of co-operative credit institutions on sound banking lines. The main theme of the Expert Committee on Co-operative Credit reiterates the more important recommendations of the Rural Credit Survey Committee which are yet to be implemented, but for the politician and his voter, the borrower, discipline, sound banking principles, efficient management and internal strength are words to be preached only and not to be practised.

It is not too late to face facts and adjust co-operative practices with the full knowledge that the co-operative movement must maximise its effort to tap savings and must retain the surplus funds for its own use. This presents a dilemma. To the extent it is enabled to tap savings, the interest of the national savings campaign will suffer. Similarly, if the latter position is accepted, the support to Government securities will dwindle. The latter problem would further worsen if the target of long-term co-operative credit at Rs. 150 crores were to be taken into account because the required funds can be raised by land mortgage banks only if institutional investors like the Life Insurance Corporation and banking companies are persuaded to subscribe to their debentures liberally. A rethinking on the monetary policy in the light of the targets is, therefore, necessary. It will have to be more dynamic than what is reflected in the recommendations of the Expert Committee on Co-operative Credit which has pleaded for moderate liberalisation of the refinancing facilities made available by the Reserve Bank and for diverting a part of the P.L. 480 rupee counterpart funds.

Mobilising Deposit Resources

Finally, it needs to be emphasised that the mobilisation of deposit resources is a problem of investors' confidence in co-operative credit institutions. A Government guarantee is a poor substitute for sound banking policies and practices, and directions from officials not knowing the technique of credit mechanism and supervision of borrowers by their federal societies controlled by borrowers' representatives cannot replace trained bankers required for managing these institutions handling public funds. These aspects of the co-operative development programme were emphasised by the Rural Credit Survey Committee five year ago. Its major recommendations have been pigeonholed, and co-operation is being made to serve the small cultivator and the artisan without having the requisite tools at its disposal. It is not enough to recognise the potentialities of co-operation; what is needed is the assistance to overcome its deficiencies. While providing it, the Government should assure the co-operatives that they will not be told to do more than they can without inflicting any injury on themselves. It is an accepted fact that the country has to build up co-operation as a strong ally of democratic government ever responsive to the national effort for economic development but it cannot forget that co-operatives are essentially business institutions. The tentative targets fixed under the third plan, therefore, present a challenge and an opportunity to them as well as their partner, the State. It is to be hoped that the pace of co-operative development will be regulated by the resources in men, money and organisation at the disposal of the partners during the next five years.

Retirement of Directors by Rotation

Interpretations of the Company Law Differ

By

S. GUPTA

THERE is evidently some confusion in the minds of company executives and their legal advisers about the correct interpretation of many of the provisions of the Companies Act, 1956, especially those contained in Sections 256 and 262. The former Section deals with the ascertainment of directors retiring by rotation and filling of the resultant vacancies, and the latter with the filling of casual vacancies among directors. The main reason for this confusion is the poor drafting of the Act, in which the language used in some Sections contradicts certain basic principles laid down in other Sections of the Act. While some of these seeming contradictions will, in course of time, be reconciled by judicial decisions or by legislative action, there are others which are unlikely to be taken to the law courts in the near future. The main topic of this article is the filling of casual vacancies. With this matter is inseparably linked up the tenure of a director appointed to fill up such a vacancy and the normal term of office of a director liable to retirement by rotation.

Public Company

In a public company, Messrs A.B.C. Ltd, there are eight directors, of which two, viz., K1 and K2, are appointed by the managing agents in terms of the articles of the company. There are six directors, whose period of office, in terms of Section 255 (1), is liable to determination by retirement of directors by rotation. Of these six directors, A and B were appointed by the company at the annual general meeting held in December 1957, C and D in December 1958, and E and F in December 1959. B resigned in January 1960, and in his place B1 was appointed to the casual vacancy in February 1960. E resigned in February 1960 and his place has not yet been filled up at the time when the question of the next annual general meeting, to be held in December 1960, is being considered. In this connection, the following questions arise: (a) how many directors retire by rotation; and (b) who are those directors? On the answers to these two questions, there is a wide diversity of opinion.

One group of people, basing their opinion on the literal interpretation of sub-section (1) of Section 256, argue that the total number of rotational directors for the time being, as at a date immediately before the December 1960 annual general meeting, is only four. E, they argue, having already resigned, cannot retire at the 1960 annual general meeting, and B1 cannot retire by rotation but merely vacates his office on the expiry of his term of office, pursuant to Section 262(2). There are, therefore, they argue, only four rotational directors, and the nearest number to one-third of four, i.e., one director only will retire; that director will be A, who has been longest in office.

Second Group

A second group of people basing their opinion on the general pattern followed in the relevant provisions of the Act relating to the appointment, vacation and termination of the office of directors, argue that, at the material date, the total strength of directors who are liable to retire by rotation is six (notwithstanding that B had resigned earlier and his place was filled by the directors by appointing B1, and notwithstanding that E's office remains vacant); that two (i.e., one-third of six) directors have to retire by rotation; and that those two directors are A and B1 for B.

Standing somewhere between the first and second group (much nearer to the second than the first) is a third group of people who agree with the second group to the extent of holding that A and B1 should retire in 1960, for the reason that the offices of these two directors fall due to be determined in 1960, by rotation. It is, however, argued that, if E's office is not filled up by the board, pursuant to Section 262(1), before the 1960 annual general meeting, this office will be extinguished and the directors will not have the power to fill the casual vacancy after that annual general meeting.

Normal Term of Office

The opinions expressed by the three groups need to be examined in the light of the provisions of Chapter II of the Companies Act, 1956. It is necessary to ascertain in the first instance how and when the normal term of office of B or E will expire. Section 262 asserts that B has a normal term of office and that B1's term of office will be co-extensive with B's term. In order to ascertain what that term is, one has to fall back on the provisions of Section 256 of the Act and examine the general pattern set out in Sections 255 and 256 concerning the composition of a board of directors, their method of appointment and the determination of their period of office by rotation. For facility of reference, relevant extracts of these Sections are given below:

255 (1)—"Not less than two-thirds of the total number of directors of a public company ..., shall:

(a) be persons whose period of office is liable to determination by retirement of directors by rotation; and

(b) save as otherwise expressly provided in this Act, be appointed by the company in general meeting."

256 (1)—"... and at every subsequent annual general meeting, one-third of such of the directors for the time being as are liable to retire by rotation, or if their number is not three or a multiple of three, then the number nearest to one-third, shall retire from office."

256 (2)—"The directors to retire by rotation at every annual general meeting shall be those who have been longest in office since their last appointment. . . ."

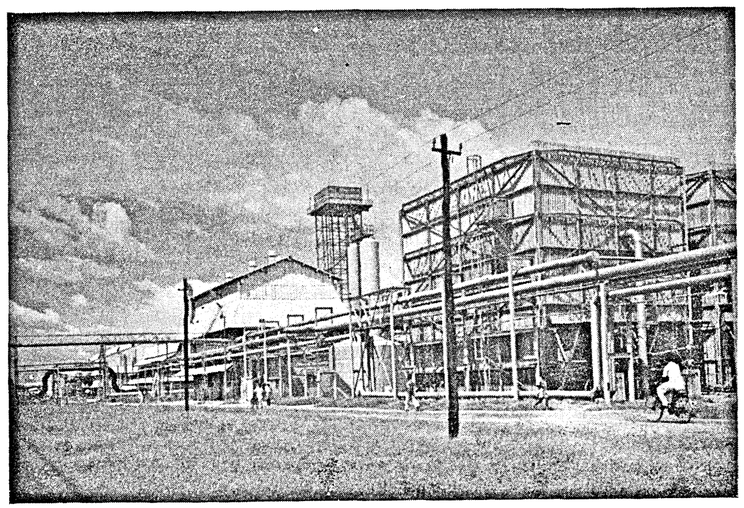
Retiring by Rotation

Briefly, the principles laid down above are as follows. At least two-thirds of the total number of directors of a public company must be such directors whose period of office is liable to determination by rotation (Section 255). One-third of such "rotational" directors must retire at every annual general meeting [Section 256 (1)]. The directors so to retire by rotation will be those that have been longest in office since their last appointment [Section 256 (2)]. While this general pattern is reasonably free from ambiguity, some of the words used in sub-sections (1) and (2) of Section 256 have given rise to considerable diversity of opinion. For instance, the first group (referred to earlier) interprets the words "one-third of such of the directors *for the time being* as are liable to retire by rotation" as meaning one-third of those directors actually holding the office of a rotational director immediately before the next annual general meeting. They further take the word "directors" in sub-section (2) to mean the persons actually holding the office of a director and argue that it is the persons who held the office longest since their last appointment that are due to retire and there can be no question of retirement of the office of a director which is vacant.

The objection to the above literal interpretation is that it ignores the basic principle that every director appointed by the company in general meeting has a term of office, and that the period of his office is determined by the application of the principle of retirement of directors by rotation, and not by death or resignation of the person originally appointed by the company, nor by the vacation of his office by removal, disqualification or any other reason. The person appointed may resign or vacate the office, but the office remains, and this office can be filled up, as a casual vacancy, by the board of directors any time before the term of this office is determined by rotation, pursuant to sub-sections (1) and (2) of Section 256. This view is supported by the specific provisions of Section 262, and also by the further provisions made in: (1) Section 280(3), which states that when a director, having attained the age of 65 before the expiry of his normal term of office, is proposed for reappointment at the next annual general meeting, but fails to be reappointed, the vacancy may be filled as a casual vacancy. (2) Section 284(5) and (6), which lays down that if a director is removed from office by the company in general meeting and another director appointed in the former's place, the latter will hold office only for the remaining term of the former; further, that the vacancy can be filled up as a casual vacancy by the board of directors.

Premature Vacancy

Once it is conceded that every director appointed by the company in general meeting has a term of office and that any premature vacancy in the office of such director can be filled up as a casual vacancy, it is axiomatic that the office continues in spite of its premature vacation by death, retirement or removal. The term of office of a rotational director can be determined only by the application of the principle of rotation in terms of Section 256. If, on the expiry of the term of a director by rotation, a resolution is passed by the annual general meeting or its adjourned meeting that the vacancy shall not be filled in terms of Section 255 (4), or if the general meeting fails to make an appointment to the office of a director on the expiry of his term, then and then only is the office of a director, which had been created by the company in general meeting, extinguished. The total number of directors of a company may be increased or reduced by the company in general meeting. But unless such a change in the total number has been made, and unless the office of a rotational director has been extinguished in the manner indicated above, the total number of directors liable to retirement by rotation at any annual general meeting can be ascertained with



The double salt and urea plant at the Sindri fertiliser factory

reasonable certainty. These consist of the number of offices of rotational directors appointed by the annual general meetings (irrespective of whether some of these offices are vacant or not), excluding the office of any director that has been extinguished.

In the case of A.B.C. Ltd, the total number of "such directors for the time being as are liable to retire by rotation" is six and, therefore, two will retire at the annual general meeting in 1960. These two are A and B1 for B, whose term is determined by rotation. The terms of office of C and D will be determined in 1961 and of E and F in 1962, unless in the interval the number of rotational directors is increased by the appointment of an additional director or reduced by the extinction of the office of a director on the expiry of his term. If E resigned in February 1960, his term of office will be determined (barring any variation in the number of offices of rotational directors) in December 1962. During the intervening period, at any time, and as often as necessary, any vacancy or vacancies in E's office can be filled up as a casual vacancy.

Literal Interpretation

Reverting to the difficulty presented by the literal interpretation of the phrase [in sub-section (2) of Section 256] reading "the directors to retire by rotation at every annual general meeting shall be those who have been longest in office...", it has been demonstrated in the preceding discussion that, as the offices of directors are determined by rotation, there is no question of a person retiring by rotation as distinct from his office. This sub-section may be paraphrased somewhat on the following lines: The periods of office of those directors will fall to be determined by rotation at every annual general meeting that have been longest in duration since the relative appointments were last made by the company in general meeting.

It is of interest to note that the word "retire" has been used somewhat loosely throughout Chapter II of the Act. In Section 255 (1) (a) a rotational director is referred to as a person whose period of office is liable to determination by retirement of directors by rotation, and the word "retirement" has throughout Sections 256 and 257 been used in the context of retirement from the office of director by rotation, and not of a premature vacation of office. The same remarks also apply to Section 264. In sub-section (2) of Section 280, when, on attaining the age of 65 years a director is, subject to certain permissible relaxations, called upon to "vacate office", and not to "retire". But in sub-section (3), unfortunately, this desirable distinction between vacation of office and retirement has been lost sight of. It is, therefore, evident that in the Act the term "retire" has no precise and immutable meaning. The true meaning has to be inferred from the context in which it is used. There can be no reasonable doubt that, as mentioned before, the words "the directors to retire" in sub-section (2) of Section 256 refer to the determination of the office of directors by rotation and not merely to the vacation of office by persons actually holding the office of a director.

General Pattern

The position concerning the constitution of the board of directors of a public company, the application of the principle of retirement by rotation and filling up of casual vacancies may now be recapitulated. The general pattern arising from the foregoing discussion can be set out as follows:

(1) In default of and subject to any regulations in the articles of a public company, all the directors of a company shall be appointed by the company in general meeting.

(2) Not less than two-thirds of the total number of directors shall be appointed by the company in general meeting and shall be persons whose period of office is liable to determination by the retirement of directors by rotation.

(3) Of the total number of rotational directors, one-third shall retire at every annual general meeting so that the entire body of rotational directors are rotated or turned over at three successive annual general meetings, approximately in three years.

Office Remains

(4) When a general meeting appoints a person as a director, it creates the office of a director, and the term of this office will be determined by the rotation of one-third of the total number every year. If the person vacates the office by death, resignation, disqualification, removal or compulsory vacation in certain circumstances, such disqualification is personal and does not have the effect of extinguishing an office which was created by the company in general meeting. The person may vacate the office, but the office continues in being until the expiry of its allotted term. In calculating the total number of rotational directors for the purpose of Section 256 (1), any offices of rotational directors which are vacant (but have not been specifically extinguished by the company in general meeting) must be included. When the period of office of a rotational director is determined by rotation, this office must be referred to the annual general meeting to be filled up, and will count as one of the one-third of the total number of offices liable to determination by rotation. If that general meeting makes no appointment, or if the matter is not placed before the general meeting at all, the office is extinguished.

(5) If the office of a rotational director is vacated before its normal term, the casual vacancy can be filled at any time, and as often as necessary, in the interval between the vacation and the normal expiry of the term of office of the rotational director.

(6) The normal term of office of a rotational director is not disturbed by the vacation of office by the holder for any reason whatsoever. There may, however, be a slight variation in the frequency of rotation by an increase or decrease in the total number of rotational offices of directors specifically effected by the company in general meeting, or by the appointment of additional directors or by the failure to appoint a director in an office which is determined by rotation.

RAISING PLAN RESOURCES FROM THE RURAL SECTOR

THE PROBLEM OF DRAWING A SURPLUS OUT OF SUBSISTENCE FARMING

By
V. G. RAMAKRISHNA IYER

IT has been emphasised that without the mobilisation of resources from the rural sector, it is not possible to implement a third plan of Rs. 10,200 crores. The rural segment in an underdeveloped country like India may conceal large reserves of unused or under-used manpower, and to some extent of other resources also. But the problem of obtaining increased resources from the vast and unorganised rural areas is a difficult and complex one. As the bulk of the rural population is on the subsistence level, any increase in the tax burden or imposition of new taxes on them would reduce their already low level of consumption, and in a democratic country like India, it may have serious social and political repercussions. However, the need for greater resources to finance the plans and the increasing bias towards improvement of various agricultural services in the development programmes point to the necessity of devising ways and means for ensuring a larger contribution from the rural sector.

Development Finance

The importance of agricultural taxation as a source of development finance in a developing country arises from a number of factors. The major portion of the national income originates from the agricultural sector (contributing more than 50 percent of the national income in India), so this sector must bear a large share in financing economic development. In such a country, there might exist a large non-monetary sector which may not be reached through the medium of income and commodity taxation. Thus, the tax potential existing in this sector can be used for development finance only through the taxation of agriculture. Further, the rise in agricultural output associated with the implementation of a development plan must be prevented from being consumed by the farm population, and should be siphoned off for financing further development.

As a matter of fact, taxation of agriculture for economic development is not a new experiment. It has its historical parallels in Japan in the late nineteenth century and in Russia and China in recent times. Japan kept up a stiff land tax which was responsible for the rapid pace of economic development. The Russian and Chinese experiments have been inspired by a similar idea. It is not suggested, however, that an underdeveloped country like India should collectivise farms for the mobilisation of agricultural resources. Most of the underdeveloped countries function in an environment of freedom. Thus, unlike the Russian and Chinese examples, the aim should be agricultural taxation and not confiscation.

Tax Potential

During the first and the second five year plans, this aspect of the problem has not been given the attention it deserves by the Planning Commission. The Commission, while formulating the first five year plan, was rather sceptical about the tax potential of the agricultural sector. But the trend of land revenue in India has been going progressively downwards, accounting at present for only 8 percent of the total revenue. The Taxation Enquiry Commission observed that the incidence of taxation in the urban areas is higher than in the rural areas. In *Socialist Society*, Mr. William Lockwood says that "the degree to which Indian agriculture escapes taxation is most serious and it cannot be taxed directly by the Constitution. Its indirect taxes are much lighter than what city people pay. The land tax has deteriorated over a century to the point where it captures only 1¼ percent of the valued farm output. As a matter of fact, the States in India raised only 35 percent of the revenue increases they were asked to provide to finance the first five year plan. By contrast, we can recall the burden carried by the Japanese farmers in the early decades of industrialisation and the still heavier burden on Russian agriculture to pay for industrialisation. This rural tax issue, together with lagging reforms in land tenure and in village governments, epitomises the problem of persuasion". So the problem in India is to break through the rigidity characterising the tax structure.

The *per capita* income of the agriculturists in India is very low. The slow pace of economic development has been responsible for the low level of income. The Rural Banking Enquiry Committee's report pointed out that the surplus left with the agriculturists who constitute the bulk of the population, is very small even in normal years. But to assume that the rural sector has no contribution to make is to ignore certain fundamental facts. Agriculture has had to suffer a hierarchy of intermediaries who have made no contribution to production, but who have relied for their living on the efforts of a few productive workers. A large number of workers are still under-employed and are being virtually supported by the savings of the productive few. If the intermediaries and the under-employed workers are removed to some other undertakings, it will be possible to draw on the savings of the productive workers to finance labour-intensive development projects. It must be borne in mind that even after supporting a vast army of under-employed workers and intermediaries, some surplus is still left with the agriculturists which is usually invested in the purchase of land, in acquiring additional livestock and in the extension of commercial crops and plantations. Unfortunately, much to the detriment of the national economy, a large part of the savings is invested in the purchase of gold and ornaments. The enormity of the problem may be imagined from the decision of the Central Government to put an embargo on the import of gold and silver on private account in 1947. One of the objectives underlying this decision was to divert the rural savings from unproductive investment in precious metals to more productive channels of economic development. From all this, it is clear that there is some surplus left with the agriculturists which can be tapped in financing the third plan.

Agricultural Income

In 1931-32, agricultural income was 52.8 percent of the national income of Rs. 1,689 crores. In 1947-48, with the increase in national income to Rs. 4,932 crores, the agricultural income rose to Rs. 2,660 crores, thus constituting 56.2 percent of the total national income, *i.e.*, an increase of about 4 percent. For the post-independence period, the share of agriculture and allied industries has ranged from 51 percent in 1950 to 45 percent in 1958. Thus the share of agriculture in the national output has gone down since independence. One important reason for the diminishing agricultural output is the growing acuteness of under-employment. Against this, the Census figures show that the percentage of population dependent on agriculture rose from 69.1 in 1901 to 75.5 in 1921, and dropped subsequently to 67 in 1931, before rising again to 69.8 in 1951. Thus it is clear that during the last few decades, the percentage of population dependent on agriculture has been declining. As a result, agricultural output is sure to increase with the diversion of surplus population from agriculture and its reorganisation on the co-operative basis. The resultant increased food surplus should, therefore, be tapped for economic development; otherwise, it may get absorbed in increased consumption.

Rural Development Programmes

Further, the economic position of the agriculturists has definitely improved because of the various rural development programmes executed during the second plan, as a result of which there will be much scope for rural taxation. On the basis of the position in the second plan, it would be reasonable to assume that the "rural content" of the next plan, *i.e.*, outlay on schemes of direct benefit to the rural population, may be roughly one-third of the total plan outlay, because agriculture and allied activities will continue to be given first priority. The total outlay of the third plan in the public sector may be nearly Rs. 7,500 crores. So the rural content of the third plan may be about one-third, or Rs. 2,500 crores. During the second plan, schemes suitable for execution by rural communities themselves amounted to about Rs. 500 crores. It can, therefore, be said that such schemes in the third plan would amount to Rs. 1,000 crores and it is for these schemes that the rural manpower and other resources can be mobilised.

For this, it is necessary to have, in the first place, some idea about the incomes from which the additional tax revenue was drawn during the past and the kind of things for which demand is likely to have been affected by taxation. A preliminary analysis of the available data suggests that the increases in the revenues since 1952-53 have come from the urban sector rather than the rural sector, and that while taxation has probably absorbed nearly 40 percent of the increase in incomes in the urban sector, the share of the Government in the increased income of the rural sector has been perhaps not more than about 14 percent to 15 percent.

Estimates of Resources

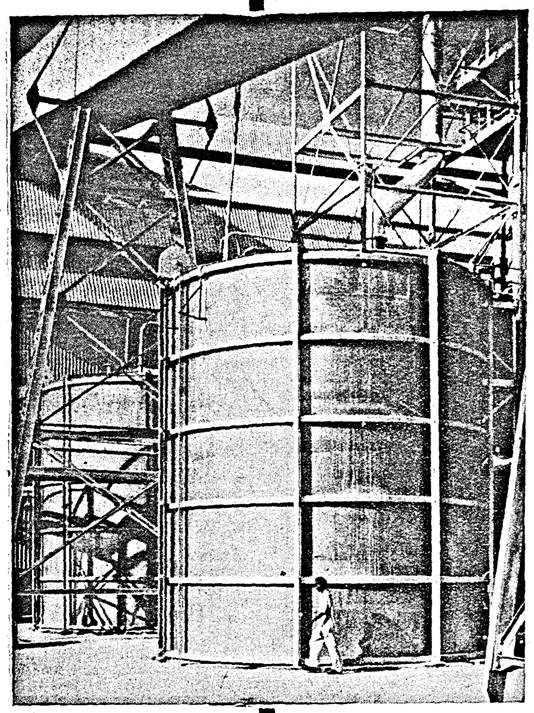
Based on these, in the estimates of the resources of the third plan, a tax on agricultural production to the tune of 8 percent of the total value, namely, Rs. 6,000 crores, *i.e.*, Rs. 480 crores a year and, therefore, Rs. 2,400 crores, is anticipated. This taxation is to take the form of a tax of Rs. 35 an acre on 65 million to 85 million acres of irrigated land and Rs. 15 an acre on 200 million acres of dry land. Trade in foodgrains, it is expected, will yield a profit of Rs. 850 crores. It must be noted in this connection that raising additional tax revenue from the rural sector will definitely impinge on consumption at the margin. It will also involve many difficulties, particularly the appropriation through rent, interest and trading profits. But pending such action that will reduce the exploitation which goes on in those ways, it is possible to think of measures which will not only raise resources within the existing framework, but also introduce an element of progressive taxation in a sector where it is almost absent. It is important not only to raise additional revenue from the rural sector, and increase the progressiveness of taxation, but also to take care at the same time that both can be done without affecting adversely the incentive in this sector to produce or market more.

Possible Measures

In order to achieve this objective, the following measures are suggested: (1) enhancement of land revenue over five acres; (2) a tax on agricultural rent (deducted at source from tenants, the incidence of which falls on the rent-receivers) one-tenth of the gross produce of the tenants; (3) a surcharge on holdings above five acres under commercial crops, with adjustment, of course, for different kinds of commercial crops.

From the above measures, it may appear that a large amount of resources can be derived by enhancing the land revenue. For land revenue over a long period has not been responsive to agricultural prices and incomes, and hence there is sufficient justification for introducing changes in it. In India, as the tax system now is, rural households with incomes of Rs. 600 to Rs. 1,200 a year are called on to pay approximately 3 percent of their income as tax. Further, it is possible to raise resources if agriculturists are told what will be done with the revenue thus raised. In all probability, the revenue raised by doubling land revenue and other measures can be ploughed back into the rural sector. Inevitably, therefore, the expenditure will be on items which will have a large employment potential, and if the incomes accruing to the lower income households on this account are all considered, then the net effect will be a redistribution in their favour.

Besides, the purpose behind the measures needs to be considered. The purpose is essentially to tap the higher incomes in the rural sector and make taxation more progressive. The best method of increasing the progressiveness of taxation in this sector and simultaneously raising



APV SERVES THE CHEMICAL NDUSTRY

APV offers to the Chemical Industry its unrivalled experience in fabrication of plants in stainles steel and principal non-ferrous metals. APV engineers specialise in the design, manufacture and installation of complete process plants including all auxiliary equipment. Superfine APV workmanship is responsible for the installation of many novel types of process plants, some of which enjoy a world-side reputation.

In India APV has a modern workshop at Dum Dum where a wide variety of highly skilled work is performed under the closest technical supervision.

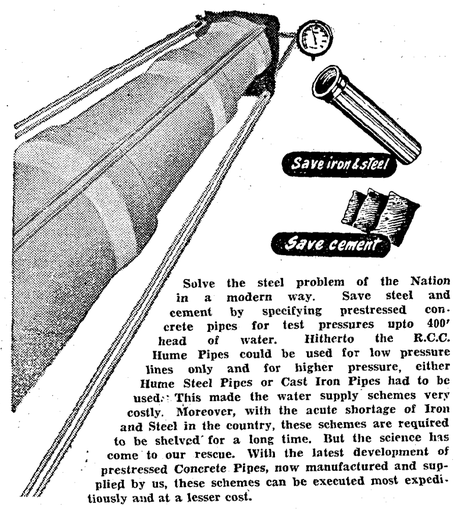
Use prestressed concrete pipes



Solve the steel problem of the Nation in a modern way. Save steel and cement by specifying prestressed concrete pipes for test pressures upto 400' head of water. Hitherto the R.C.C. Hume Pipes could be used for low pressure lines only and for higher pressure, either Hume Steel Pipes or Cast Iron Pipes had to be used. This made the water supply schemes very costly. Moreover, with the acute shortage of Iron and Steel in the country, these schemes are required to be shelved for a long time. But the science has come to our rescue. With the latest development of prestressed Concrete Pipes, now manufactured and supplied by us, these schemes can be executed most expeditiously and at a lesser cost.

Our Prestressed Concrete Pipes now fill a big gap in Engineering requirements. The range in both pressures and diameters offered means a saving to the Engineer in his projects and a saving to the Nation in both Steel & Cement.

more revenue is probably to make land revenue itself more progressive. Instead of a uniform doubling of land revenue on holdings above five acres, a 25 percent or 50 percent increase on holdings of between five and ten acres, a 100 percent increase on those of between 10 acres and 15 acres, and a 200 percent increase on still larger holdings, may be considered.

As a matter of fact, there is a considerable amount of concentration of income and property in the rural sector. This is highlighted from the results of the National Sample Survey reports on land holdings in recent times. With this kind of distribution of land and income, a progressive system of land revenue should be able to yield considerable revenue, apart from reducing the inequalities of income in this sector. The only problem lies in devising a scheme, which will not induce evasion of taxation through the division of the same family. Already this has happened on a wide scale on account of the proposed ceilings on land holdings, and so inevitably one has to concentrate mainly on the holdings in the range of five to 30 acres. It is obviously important that the degree of progression introduced in land revenue is not so great as to induce holdings of, say, 20 acres to 30 acres being broken into still smaller ones.

Practical Difficulties

Although there is a case for increasing rural taxation with a view to implementing the third plan, it is necessary to consider the practical difficulties in any attempt to increase rural taxation. An attempt to enhance rural taxation involves a careful consideration of the present position of the land revenue. This scheme of taxation is based on the assumption that agricultural prices have risen sharply, but land revenue has remained at 1930 levels. This suggestion does not take into consideration the rise in the cost of cultivation, the effects of tenancy legislation cutting into the landlord's share and the seasonal vagaries which might decimate yields. In a period when agriculture has to be encouraged by providing incentives for increased production, whether such heavy taxation on the rural sector will not stultify the major objective of food production is to be critically examined. Demands are being considered on the one hand to supply irrigation waters free of charge from the multipurpose projects on which millions have been and are being spent; on the other, a rosy picture is painted that the agricultural section will contribute as much as Rs. 2,700 crores towards the financing of the third plan. How much of the *taccavi* loans have been repaid needs also to be considered. Land reforms such as the imposition of ceilings on holdings with a view to providing land for the landless, entail expenditure in the shape of compensation. The problem of realising the value of land to be distributed to the landless also has to be faced. Thus the proposal, although attractive, is very hard to implement.

The proposal is also based on unrealistic assumptions. If the contribution of the rural areas to the national income is in the neighbourhood of 50 percent, it should be noted that the people living in these areas constitute about 80 percent of the population. With one-half of the contribution to the national pool that these four-fifths of the Indian population make, it is assumed that more should be obtained out of them for financing programmes of national development. Another point that has to be noted is the contribution made by a number of individuals whose unit of operation is generally small and hence whose taxable capacity limited. This applies both to those engaged in agriculture and industries allied to it. To call on persons, who are referred to as not being in a position to have even one square meal a day, to contribute by way of further taxation, represents an approach to the problem of resources which ignores the basic facts of the rural economy.

Rural Development Programmes

As for the "rural content" of the plan, the question that arises is what is the portion which is going to benefit the masses. According to the second plan, out of an aggregate outlay of Rs. 4,800 crores, the items which directly benefit the rural areas are agriculture, village and cottage industries, of which, again, the expenditure on small-scale industries might not directly benefit the rural areas. To this can be added national extension and community development, quite a considerable portion of which, however, represents the cost of staff recruited in urban areas. Irrigation and flood control contribute to some extent. On all these items, the aggregate outlay would be roughly one-quarter of the expenditure in the public sector. Even then, it cannot be said that the rural areas stand to benefit to a larger degree than their contribution to the national income merits, apart altogether from the fact that their need for development expenditure, social services and amenities is admittedly very low.

Yet another aspect needs to be emphasised. It is that incomes in the rural areas are distinctly lower than in urban areas, the proportion between the average incomes being 3 : 7 approximately. The agricultural labourer gets only one-tenth of what the industrial worker gets. The rural economy being what it is, the scope for securing an increase in rural income by organised pressure is, therefore, limited. The main factors responsible for the low income of the rural people are the growing population pressure and the decay of rural industries. Since the bulk of the rural poulation has a low standard of living, with the level of consumer expenditure barely half a rupee a day, the scope for securing substantial resources by means of additional taxation is strictly limited.

Limited Scope for Raising Land Revenue

As for land revenue, whether it can be increased to the extent visualised is somewhat uncertain. The present incidence of land revenue works out to only 1.5 percent of the valued farm output in a year. But if land revenue is to be increased to the point of yielding Rs. 570 crores a year during the third plan period, about 9 percent to 10 percent of the valued farm output will have to be taxed annually by the State. By all accounts, this seems to be an impracticable proposition at the present time in view of the serious political factors in the rural situation. A former Finance Minister, Mr. C. D. Deshmukh, has also expressed the opinion that "the Government should have the political courage to impose some restraint on the consumption of the 90 percent of the population which does not pay income tax". The amount of political courage which will be required on the part of the Government to increase land taxation by seven to eight times will be beyond its capacity. It is, of course, theoretically conceivable that a large surplus can be squeezed out of agriculture if State trading in foodgrains and co-operative organisations are introduced on a countrywide scale. In the case of State trading, the probability is that no substantial surplus may be mobilised because of the certainty of the two contrary pulls—one from the producers for higher procurement prices and the other from the consumers for lower issue prices. Again, if joint co-operative farming can be organised on a countrywide scale, it will be theoretically possible to tax a larger proportion of the agricultural produce than at present; this can be done on the plausible ground that in a co-operative set-up, production would increase substantially. But any such development cannot be postulated with certainty because the kind of co-operative organisation which is visualised will not be accompanied by that amount of compulsion which has been possible in China. It may even be that co-operatives, instead of yielding more surplus for the State, may actually draw in more State investments by way of aids and credits. The fear has rightly been expressed that State trading in foodgrains might easily involve losses and subsidies, and that co-operatives might easily become an agency for drawing more and more public funds into agriculture.

Fragmentation of Holdings

The introduction of progressive land revenue will result in widening the difference between the existing and the proposed tax. As such, it will be a strong incentive for the subdivision of holdings, especially when there is no check on such subdivision because of coparcenary rights. The scope for subdivision is also large because the size of the agricultural family is closely related to that of the holdings. Even if it is agreed that conditions of cultivation do not allow for any large-scale subdivision of the operational farm, the imposition of the progressive land tax is bound to result in large-scale subdivision of ownership holdings—thus defeating the purpose of the measure which is to be correlated to the ownership of holdings. Furthermore, land revenue is a charge on a unit of land, independent of the size of the holding. Any introduction of progressiveness should be related to the productivity of the unit, *i.e.*, an acre. It is true that the productivity of the unit will be taken into consideration while fixing land revenue. However, the existing relationship between productivity and land revenue is not as fair as it ought to be. Secondly, there have been large shifts in productivity on account of the supply of fertilisers, extension of irrigation facilities, etcetera. Hence land revenue may not be a sound basis of rural taxation.

As for the tax on agricultural rent, it is also sometimes described as unfair because it amounts to discriminatory taxation of one particular type of income. It is a banality that all lands which are not submarginal yield rent. Why, then, should the income which flows to a person as rent be subject to an additional tax, not applicable to the income which flows as rent to the owner-cultivator. Apart from the administrative difficulty of collecting this tax from about a crore of households leasing out lands, there is no method of ensuring that the incidence of this tax will not be shifted to the tenants whose bargaining position in the present day set-up is extremely weak. It has been observed in recent times that large areas which are actually tenant-cultivated are being shown as owner-cultivated or cultivated by labour. Also, if the financial requirements of the third plan are kept in view, it is fruitless to impose a tax on a source which is fast depleting and may be completely wiped out in course of time. A tax on rent without reference to the income of the rent-receivers involves injustice as no concession is being given in the case of very low-income rent-receivers. Further, a tax which falls heavily on low-income rent receivers may also meet with serious resistance.

Taxing Commercial Crops

As for the tax on commercial crops, it will cause major shifts in the area sown to different crops. In recent times, the total acreage under commercial crops in India has gone up, as a result of which foodgrain prices are rising faster than those of commercial crops. It is also possible that the effect of an additional levy on land under commercial crops may cause shifts at the margin in the case of some crops which are important from the point of view of foreign exchange. Therefore, in the context of relatively high foodgrain prices, any fresh disincentive by way of land tax on commercial crops might affect the area sown under these crops adversely.

An examination of the case for and against increasing rural taxation for the implementation of the third plan shows that the problem bristles with practical difficulties. In their anxiety to maintain the investment under the third plan at Rs. 10,200 crores, the planners should not be led away by a theoretical and dogmatic approach to the problem. What is urgently required is a realistic approach to the facts of the situation. It is now admitted that as the third plan involves larger resources, possibilities of increasing the rural contribution should be explored. But on that account, fanciful estimates of very large revenues being obtained by rural taxation should not be made. The *per capita* income of the rural sector is very low. During the past ten years of post-independence era, there have been only five years of agricultural prosperity. It is, therefore, unsafe to bank too much on increasing agricultural prosperity in the third plan. Plans of food production based on the monsoon are no plans at all.

SOCIAL ASPECTS AND IMPLICATIONS OF PLANNING

MAIN EMPHASIS SHOULD BE ON RAISING PRODUCTION

By

P. S. LOKANATHAN

Director-General, National Council of Applied Economic Research

INDIA'S struggle for freedom had an economic and social accent even more than the political. Independence came to be considered as a necessary condition for the removal of the grinding poverty of the masses and for lifting the backward sections of the community. The *charkha* and *khadi* were not only symbols of the self-respect of the nation, but had their roots in the social aspects of human life. Mahatma Gandhi felt that no person should remain idle and without work to do. That all the people should be employed in some occupation or other was, to him, equally a moral and social as well as an economic necessity. Similarly, the removal of untouchability, the breaking of traditional bonds and barriers, the need to bring up the less privileged sections of the community into line with the others were ends based on social values developed along with the fight for freedom.

Thus, when the Constitution of India came to be drawn up, it was not surprising that social and economic values should have found not only an expression but emphasis in some of its Articles. In this, India is not alone. Most of the under-developed countries, on account of the very nature of their struggle for independence, set down as objectives not only political independence but other goals like rapid economic progress, equality of opportunity, reduction in inequalities in the distribution of income and wealth, full employment, etcetera, and wrote into their Constitutions what have come to be regarded as the ideals of a welfare State. The significant difference, however, between the advanced countries and India, lies in the fact that the ideals of liberty, equality and fraternity, as well as those relating to the provision of minimum levels of social welfare and for ensuring justice and equality, were adopted in our country without the prior attainment of a fairly high standard of living and a reasonable degree of equality of opportunity, which the western countries had achieved before they became democratic. In the words of Mr. Nehru, "in Asia, political revolution came first, followed immediately by demands for social betterment, which could not easily be fulfilled because of economic backwardness and lack of resources."

Economic growth in India is thus taking place in the *régime* of a welfare State. Planning for growth and for the welfare State are considered as more or less the same thing. From a somewhat different point of view, one may say that the overriding social objective is the establishment of a welfare State and planning is an instrument for the attainment of this objective. This approach is not at all unjustified considering the many-sided and all-pervasive nature of the process of economic development.

Social and Economic Institutions

Economic growth consists of a whole complex of simultaneous and interdependent changes in the economic, social and institutional environment. The country's social and economic institutions which channel the economic resources and affect the motivations of human beings are clearly very important for economic growth. The pattern of growth in population and the investment made in maintaining and improving health, education and skills are also basic, since it is the human beings who are the carriers of and sharers in economic growth. Consequently, the social aspects and implications of planning for development are at least as important as the purely economic aspects. Economic planning has to be intimately concerned with extra-economic affairs—educational, social and cultural.

The grading of tobacco leaves

Wider Social Aspects

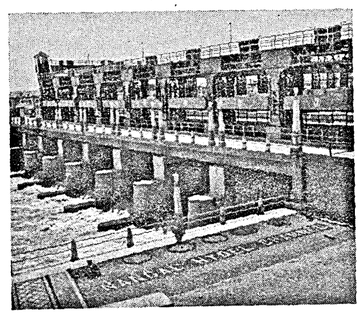
It is evident that the wider social aspects of developmental planning have to be brought into focus and their implications for economic growth should be analysed. Economic planning is done, not in a vacuum, but against a social and institutional environment which influences the process of development, and is in turn influenced and modified by it. Economic planning from this point of view is accompanied by a simultaneous process of social disintegration on the one hand, and social reintegration on the other. If the broad social objectives to be achieved are laid down, it follows that the pattern and policies of development adopted by a country should be such that the net result of the disintegration and reintegration is a social order in which these objectives, if not realised, are at least nearer realisation.

While the general conclusion indicated above is legitimate, it is necessary to bear in mind the obvious limitations and qualifications that modify it. The most important of these arise from the possibility of conflict between the economic and social objectives of developmental planning. One object of planning in under-developed areas is to secure a sustained and rapid rise both in national income and the prevailing standards of living. It is possible that the process of transition (*i.e.*, social disintegration and reintegration) leading to a more desirable society may hamper the attainment of this economic objective. For example, the objective of a rapid reduction of inequality in distribution may clash with the aim of a rapid increase in the volume of savings (and investment).

Such conflicts are likely to be particularly important in the short run. This is so because, while the social objectives summarised in the concept of the welfare State developed in the economically advanced countries after they had already achieved the economic objective of sustained growth in both national and *per capita* incomes, in India the attempt is to become a welfare State before achieving a reasonable minimum of economic development. No general rule can be laid down for the resolution of such conflicts. Each case has to be considered on its merits and some compromise worked out between the incompatible social and economic objectives. However, it may be said that, in the long run, social objectives, like equality, can have a significant welfare content in under-developed countries only if the standard of living is raised substantially and continues to rise. Equality in poverty is not likely to lead to a society that will ensure a full and rich life to its members. This basic fact has to be borne in mind by the planning authority while discovering a compromise in the short run between economic growth and social well-being.

Emotional Approach

The achievement of a compromise between the two sets of objectives is sometimes hampered by the emotional approach that is often adopted. Although the social ideals have been emphasised all along, their full implications, both short-term and long-term, especially in the economic sphere, have not been worked out. Consideration of these factors does not imply neglect of, or indifference to, the accepted social goals. It means a logical and analytical rather than an ideological approach to them. The attainment of the social objectives is conditioned by economic factors—the welfare State must have an economic base. If the base is weak and unbalanced, no stable social structure, however ideal, can be constructed on it.



The headgates of the Nangal hydel channel

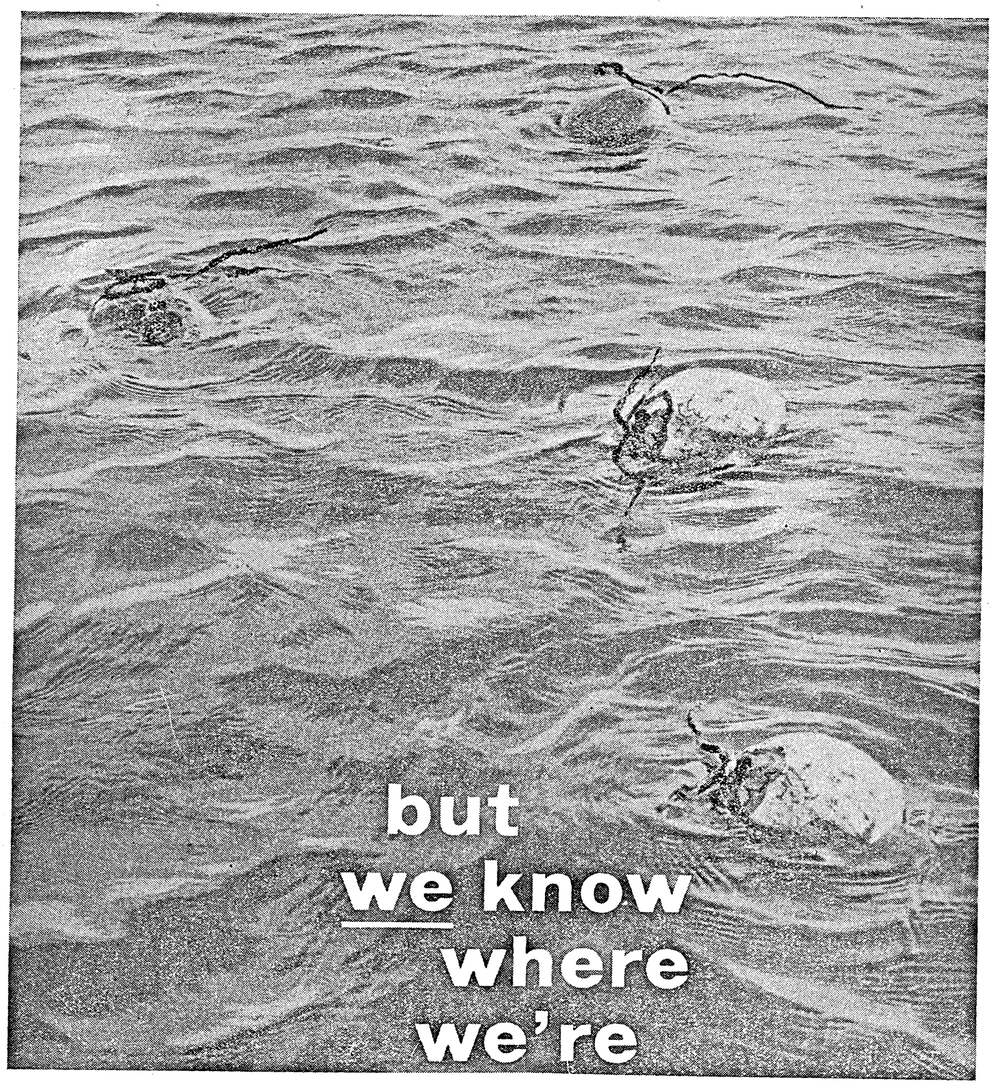
Social Objectives of Planning

The broad social objectives have been enumerated in the Directive Principles of State Policy, Part IV, of the Constitution. Article 38 lays down that "the State shall strive to promote the welfare of the people by securing and protecting as effectively as it may a social order in which justice, social, economic and political, shall inform all institutions of the national life". The directions in which social policy should be especially active are spelt out in the succeeding Articles. These emphasise the achievement of "an adequate means of livelihood" for all citizens, the prevention of "concentration of wealth and means of production to the common detriment" and the provision of "work ... education and ... public assistance in cases of unemployment, old age, sickness and disablement, and in other cases of undeserved want". The State "shall endeavour to secure, by suitable legislation or economic organisation or in any other way, to all workers, agricultural, industrial and otherwise, work, a living wage, conditions of work ensuring a decent standard of life and full enjoyment of leisure and social and cultural opportunities." The basic social objectives indicated by these Directive Principles, summed up in the phrase "socialist pattern of society," have been accepted by the country as the goal of economic policy. Economic planning is a means adopted for attaining these given ends. Consequently, the pattern and the policies of development in India are, from the start, influenced and shaped by the basic objectives that society has in view.

Balanced Emphasis

Since the first five year plan, there has been a balanced emphasis in India on the increase in production and employment on the one hand, and the achievement of economic equality and social justice on the other, and a recognition of the inter-relationship between the two objectives. "The elimination of poverty cannot obviously be achieved merely by redistributing existing wealth. Nor can a programme aiming only at raising production remove existing inequalities. The two have to be considered together; only a simultaneous advance along both these lines can create the conditions in which the community can put forth its best efforts for promoting development". (First Plan, chapter I, para 4).

Among the principal objectives of planning, as formulated in the second five year plan, are the following which have a substantial social content: (a) a large expansion of employment opportunities; and (b) reduction of inequalities in income and wealth and a more even distribution of economic power. In addition, the attainment of



going...

Sea and sky and sand...and fringing the shore the swaying palm trees. A scene of timeless beauty, and incidentally, one of nature's most efficient distribution set-ups.

The palm tree casts its fruit into the open sea to be carried away with the ebb tide, and to be washed up again on some distant shore, so that one day, there will be palm trees there, too.

DISTRIBUTION is *our* business too. But we at Voltas have this advantage over nature...*we* know where we're going! Nothing is left to chance. No matter where our customers are, they are certain of getting the goods and services they require.

Voltas have, over the years, built up a highly adaptable and trusted distribution system to move goods manufactured anywhere in the world, to anywhere in India.

Our stocks-sales-service-engineering organisation is nation-wide, and covers every important distribution and consumption centre. Voltas give you...

What is wanted • Where it's wanted • When it's wanted

Calcutta • Madras • New Delhi • Bangalore • Cochin • Ahmedabad • Secunderabad • Lucknow • Kanpur • Patna

JWT-VT-586 (a)

balanced regional growth and the improvement of the conditions of the less privileged classes have been accepted as other objectives. The pattern of investment in the second plan, and that proposed for the third plan, is designed to attain these objectives concomitantly with economic growth. How far can a balance between the two sets of objectives be achieved, and how are economic factors likely to affect the realisation of the social objectives? What policy measures may be considered that would lessen the area of conflict between social welfare and economic development? Such a study is likely to be profitable because, even though India is committed to the objective of a "socialist pattern of society" there is no fixed, fanatical, unalterable interpretation of the concept. "The socialist pattern of society is not to be regarded as some fixed or rigid pattern. It is not rooted in any doctrine or dogma." (Second Five Year Plan, chapter II, para 5). This gives a certain flexibility to Indian planning which allows modifications in the pattern of development, if considered necessary and desirable.

The Problem of Equality

The goal of social and economic equality has many facets. It involves not only a reduction of income differentials between individuals and classes, but also those between and within economic sectors in the rural and urban areas and geographical regions.

The disparity between rural and urban areas stems from the fundamental difference in the types of economic activities carried out in them. The differential in income levels largely reflects differences in productivity. However, to the extent to which roughly similar activities are carried on in both rural and urban locations (for instance, small industry), it is found that the productivity of rural workers is lower than that of their urban counterparts[1]. The process of economic development is bound to have important repercussions on the whole rural-urban economic structure.

The first impact is on the relative sizes of the two sectors of the economy. The normal pattern of economic growth involves a relative shift of population out of agriculture and primary production into secondary and tertiary activities. This implies a large increase in urbanisation, and an increase in the economic importance of urban areas relative to rural areas. This is not without its advantages. The smaller the percentage of the population required to produce food and raw materials, the greater would be the productivity and the *per capita* income in the rural sector. In the U.S.A., about 10 percent of the population supplies the food requirements of the entire country. In India, even though 70 percent of the total population is dependent on agriculture, there is shortage of food.

The objective should be to influence rural incomes by raising the productivity a worker in the rural areas. This can be done through policies directed along three lines. First, a suitable price policy should be developed with the aim of maintaining rural incomes *vis-à-vis* other incomes. Second, an attempt should be made to reduce prevailing under-employment and to provide fuller employment in rural areas. Third, measures should be taken to reduce the proportion and, if possible, the size of the population in agriculture.

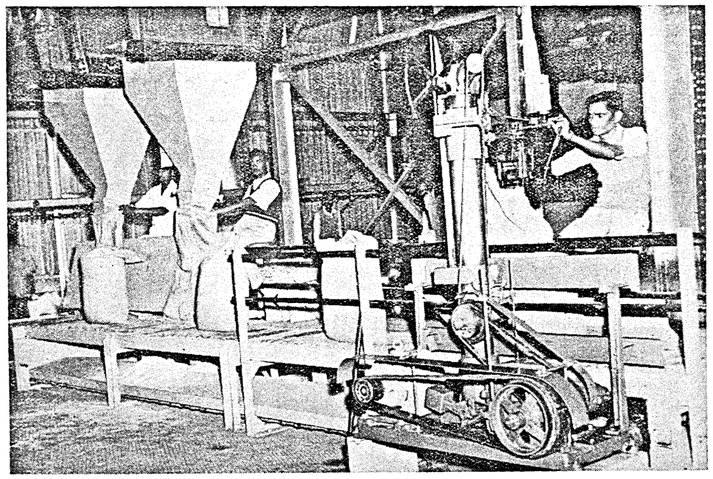
Price Policy

The terms of trade between agricultural commodities and manufactured goods are of primary importance in determining the trend of rural-urban disparities. Large increases in agricultural production may cause substantial price declines and worsen the terms of trade in relation to the manufactured output produced in urban areas. This would give the urban area the major share of the gain from agricultural development, and may also remove the incentive for farmers to work for continued increases in output. The possibility is indicated by the fact that the U.P. Bureau of Statistics index of agricultural parity (1948 equals 100) declined to 70.7 in the good harvest year 1955, and stood at 94.4 in 1959. To tackle this problem, it is necessary that the Government formulates a reasonable agricultural price policy, with special attention to the fixing of minimum prices for farmers, so that they may secure the just reward for their contribution to development. The need for maintaining a stable general price level should not be interpreted to mean a policy of low agricultural prices. In the interests of stabilising rural incomes and of maintaining them *vis-à-vis* other incomes, minimum price fixation in some form is necessary. On the basis of European and American experience, it is also likely to stimulate the growth of agricultural production.

Fuller Employment

The under-utilisation of rural manpower, indicated in the prevailing disguised unemployment and under-employment, is another necessary plank in any programme for raising rural incomes. Measures should be implemented with the twin object of providing employment to those willing to work and to raise agricultural production. Comprehensive works programmes along these lines have been suggested in the *Draft Outline of the Third Plan.* The main emphasis is on labour-intensive projects like drainage, land improvement, flood control, soil conservation and road development, requiring mainly unskilled and semi-skilled labour and leading to increased production and the creation of community assets.

[1] This is so even in developed countries.



Fertilisers being packed in bags at a fertiliser factory

The development of small-scale industries in rural areas is also suggested to reduce under-employment and to reduce the rural-urban income differential to the extent that it reflects the different types of economic activities carried on in the two areas. General considerations throw doubt on the feasibility of such development. Small-scale industries, in so far as they are ancillary to large industries, should be located near them. Also, small-scale industries are more dependent than even large-scale industries on the availability of economic and social overhead facilities like power and transport and skilled labour (to the extent that they are required). These overhead facilities are generally available in conjunction only in urban areas.

Industrial Estates

The recent experience with industrial estates also leads to a similar conclusion. Only those industrial estates which are located in or near centres of industry have been successful in promoting new small-scale industry. The crucial factor appears to have been the presence or absence of enough and suitable entrepreneurs to take advantage of the available opportunities and the facilities made available by the industrial estates. Under the circumstances, the emphasis on rural "industrial estates" may mean a slower rate of expansion of small-scale industry. Even if the rural industrial estates are successfully established, the small quantitative significance of the small-scale factory sector in the industrial scene makes it probable that no major impression will be made on the rural-urban disparity.

A bumper rice crop grown by using the Japanese method of cultivation

Higher Productivity

The success of all these measures in raising rural incomes would, however, in the final analysis depend largely on the relation between population (*i.e.*, manpower) growth and the increase in urban non-agricultural (mainly employment) opportunities, because this would determine the change in agricultural employment. Employment in agriculture is residual, the sector absorbing the surplus manpower in the economy. The reduction of the population engaged in agriculture, therefore, depends on the relationship between population growth and the pace of industrialisation. If population grows faster than employment opportunities are created in the non-agricultural sector, the proportion of those in agriculture is likely to increase. The productivity of labour in agriculture is, therefore, under the prevailing social and economic organisation, to some extent a dependent variable reflecting the supply of labour. If the aggregate demand for labour created by developmental planning over a period is larger than the increase in manpower during the period, there would be a tendency towards increase of productivity a worker in agriculture. If not, the surplus manpower would tend to depress agricultural (and therefore rural) productivity.[2]

Consequently, the net output a worker (employed, under-employed—disguised or otherwise) in agriculture can be tackled by direct measures only to a limited extent. The larger the volume of the expected increments in the labour force that can be siphoned off to non-agricultural activities, the less would be the under-employment in agriculture and the greater the impact of measures to increase per acre productivity on the output a worker, dependent on agriculture. Given a targeted rate of growth of agricultural and non-agricultural output, a larger transfer of workers to urban non-agricultural employment would imply a smaller gap than otherwise between rural and urban income levels. With economic development, increases in productivity are likely to occur in both urban and rural activities, especially if a suitable agricultural price policy is formulated and fuller employment provided in rural areas, and if population growth is not too large.

However, the proposed development of large-scale industrialisation, the population pressure on land apparent in most rural areas of the country, considered along with the fact that large-scale mechanised farming does not seem a practicable proposition in the foreseeable future, creates the likelihood of an increase in existing productivity (and, therefore, income) inequality existing between rural and urban areas. This possibility has to be considered by the planning authority because of the nature of development in the two sectors. The production (and productivity) in urban areas increases largely with the creation of fairly big units with large productive capacity in the various industries, and the establishment of conditions for their efficient working. Agricul-

[2] Agricultural production, however, would rise nonetheless.

The history of coal in India is lost in antiquity

The word 'Coal' is believed to have originated from the Sanskrit 'Kal' meaning black, and in ancient India, coal was known as the 'Burning Rock' and was believed to possess supernatural powers. However, it was not until 1774 that the first attempt was made to mine this mineral when John Sumner and Suetonius Grant Heatly discovered coal in Bengal and applied to Warren Hastings for permission to mine it. Enclosing a short but clear memorandum of their intentions and requests, the oldest document in history of the Coal Trade dated, Calcutta, 11th August 1774, may well be quoted as the initial impetus to the vital Coal Industry of today:

"Hon'ble Sir and Sirs,—I have the honour to present to you in the name of Mr. Suetonius Grant Heatly and myself, 'Proposals for working coal mines and selling coal in Bengal in consequence of our having discovered certain coal mines in Pachete and Birbhoom and I assure you, Gentlemen, that in case you will be pleased to grant us the indulgences we request that we will endeavour to prevent all disputes with the country people, and in general to render the execution of what we undertake, subservient to every good purpose the nature of work will admit.

I am, etc.
JOHN SUMNER
for Sumner and Heatly".

But it was only in 1814 that the Industry came to be established with the opening of the first mine at Raniganj in Bengal.

The Bengal Coal Co., Ltd., producers of quality coal since 1843, were the first of existing Coal Companies to be formed and their collieries can trace their decent right back to the first coal mines ever to be opened in India.

tural production, on the other hand, increases on account of the decisions and efforts of millions of cultivators spread over a large geographical area. Consequently, the implementation of the planned expansion of industrial production is relatively clear-cut and definite, and the hurdles in the way are fairly specific, while agricultural development faces more subtle and more pervasive problems.

If, on account of these factors, a steady growth in agricultural productivity is not achieved, a "dual" economy may emerge in the country[3] with an advanced and urban industrial sector coexisting with a backward and stagnant agriculture. This problem appears to be particularly important in the relatively under-developed areas of India which, on account of their wealth of natural resources, have emerged as areas suitable for the establishment of basic industries. Particular emphasis should be laid in such areas on the successful fulfilment of the programmes for agricultural development and special attention should be paid to measures to increase rural incomes and productivity, *e.g.*, the development of subsidiary activities like animal husbandry and poultry farming. Other measures that have been recommended to prevent the emergence of a "dual" economy are the revitalisation of village industries and the development of rural education and social welfare schemes.

Inequality Within the Rural Sector

The goal of reduction of inequality implies not only a reduction of disparities between rural and urban areas, but also within these areas. Measures have already been taken by the Government, the total effect of which is a reduction of economic and social disparities within the rural economy. The progress of land reforms, the increased security of tenures, and the proposed implementation of the legislation relating to ceilings on agricultural holdings, together with the expansion of irrigation in areas which formerly suffered from scarcity conditions, the programmes relating to the welfare of backward classes and the expansion of elementary education have raised the standard of living of some of the poorest people in the rural areas.

Notwithstanding these measures, it appears that tendencies towards the aggravation of existing inequalities are likely to accompany development. Within the rural sector must be distinguished various classes, *viz.*, large farmers, small farmers, agricultural labourers and the artisans, traders and other non-agriculturists. These categories are not clear-cut; an individual may belong to more than one class at the same time. The classification is useful, however, because the changes that accompany economic growth affect these classes in different ways and in varying degrees.

With the implementation of programmes of agricultural development, it appears that in spite of a rise in the absolute standards of living, there would be a tendency for economic inequality to increase and for the gap to widen. This follows from the structure of agriculture prevailing in the country. According to the rural credit survey, 58 percent of the cultivated areas are within 30 percent of the total number of agricultural holdings, and a large part of the nation's agricultural production comes from "large" cultivators. The major part of the marketed surplus of agricultural production originates in the medium and large holdings, although the larger farmers appear to sell a lower proportion of their total output.

If production increases proportionately on all holdings with agricultural development, then the fact that the major part of the marketed surplus comes from the larger holdings would tend to widen the absolute gap between the incomes on larger holdings and that from small holdings. As a large part of the crop marketed by small farmers is put on sale for meeting the immediate needs, and this would be reduced by the rise in production an acre, there may be a fall in the proportion of the total marketed surplus coming from small holdings. Therefore, even with a proportionate increase in production, the monetary incomes of large farmers would tend to increase more than those of small farmers. Fiscal measures should be taken to tap this potential source of revenue. This would also serve to check the tendency to inequality. With the increase in agricultural productivity that follows agricultural development, the capitalised value of agricultural land rises. The biggest increase in aggregate capitalised value naturally accrues to the large landholders.

Agricultural Marketing

A major factor influencing the distribution of rural benefits is the organisation of agricultural marketing. To the extent that the transaction in agricultural output is "distress" selling to creditors or traders, the gains of productivity do not accrue to the cultivator. From this point of view, the larger landholders appear to be in a more favourable position. The extension of co-operation in various spheres is already a part of national policy. This would keep in check the tendency towards increasing inequality in rural areas.

The existing hierarchy in the village interferes with the free flow of benefits from the measures already undertaken for rural development. The provision of irrigation facilities and fertilisers are major planks in the Government's programme for raising agricultural output. Because the larger farmers have the resources to construct channels and anicuts and to buy fertilisers, as well as the social power and position to secure priority in the receipt of these facilities (which are in short supply), the final effect of irrigation facilities and fertiliser supply is often an accentuation of the existing inequalities between small and large farmers.

Larger Holdings

As a result, the increase in agricultural production, instead of being uniformly distributed over a given area, may tend to concentrate on the larger holdings, and the forces leading to such concentration would be strengthened. Special attention, therefore, has to be paid to the equitable distribution of the benefits accruing from the facilities for increasing production that the Government is providing in rural areas. The measures for democratisation and the planned development of village self-government, which are proceeding particularly fast in some States like Rajasthan and Andhra Pradesh, are likely to be a useful device for equitably spreading the benefits of irrigation and similar developmental efforts. There is, however, the danger that the village *sarpanch* and other members of the *panchayat* may secure an inequitable share of these benefits. The fact that these offices are elective lessens, but does not remove, this possibility.

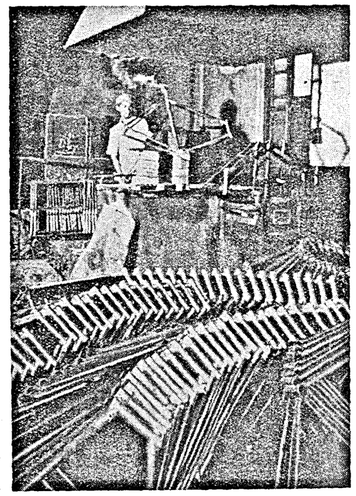
Another factor that may conceivably strengthen the forces tending to increase the inequality among cultivators is the fact revealed by the Farm Management Surveys in various States that the intensity of cultivation, in all senses, is greater in small holdings than in large holdings. A greater leeway, and, therefore, the possibility of obtaining greater proportionate increases in production, thus exists on the larger farms than on the smaller ones. The extent to which these possibilities can be exploited depends partly on the labour situation that is likely to prevail in rural areas. Larger farmers depend to a greater extent on hired labour. If conditions of scarcity prevail and agricultural wages rise sharply, it may be difficult to secure the maximum increase of output on the larger farms. This would mitigate the increase of inequality, but it may also slow down the growth of agricultural production.

Economic Condition

The economic condition of agricultural labourers *vis-à-vis* the cultivators is difficult to predict. To the extent that agricultural wages are steady at traditional levels, the benefits of increased productivity would not seep down to landless labourers, and only partly to agricultural labourers with landholdings. Opposing forces appear to be at work in this sphere. The increase of population, together with the already existing pressure on land, lead to an increase in the supply of wage labour in the agricultural sector. This is reinforced by the rise in the "desired" standard of living among the masses, which induces many not working at present to offer themselves for work. Opposed to this is the fact that with the spread of irrigation and intensive cultivation, and with the extension of the cultivated area, the requirements of labour in agriculture are likely to increase substantially in the future. The net result of these forces is not definite, but it appears likely that no sharp rise in agricultural wages is to be expected in the near future. The gains from increased productivity in agriculture are, therefore, likely to accrue to this "depressed" section of the rural population only to the extent that landless labourers secure land and other wage labourers have landholdings, and depending on the increase in the demand for labour in other fields, *e.g.*, construction.

The condition of the non-agricultural classes in rural areas is bound to be affected by economic development. With the increased agricultural production and rising farm incomes, there would be an increased demand for transport and trade facilities and for the artisan's production. At present, there is a large amount of under-employment in these classes, and this, with increased demand, would imply higher incomes, provided the number of persons engaged remains constant. Among other factors, this would depend on the creation of urban employment opportunities, and the rate of urbanisation, the increase of population and the absorption of labour in agriculture. As for artisans, another factor to be considered is the consumers' preference as between the produce of

[3] In spite of rising total agricultural production.



Bicycle frames being welded at a Bombay factory

urban and village industry. On the basis of these considerations, any major change in the economic condition of the rural non-agriculturists does not appear likely.

Inequalities Within the Urban Sector

In addition to entrepreneurs and capitalists engaged in secondary production and employing wage-earners in large-scale and small-scale units and also in transport, trade, professions, services and other tertiary activities, the urban sector has a class of salary-earners with more or less fixed incomes. Within this sector also it appears that the forces at work may enhance the existing inequalities. The boom conditions of expanding industrial activity lead to an increase in the volume of profits. Large-scale industrial expansion is often closely linked with the ploughing back of profits and the growth of industrial empires. The number of entrepreneurs does not, therefore, increase as fast as profits. This accentuates the inequality of distribution. The encouragement of small-scale industry, in so far as it provides an incentive to new entrepreneurs, is thus a countervailing force to the tendency of industrial concentration to increase during periods of rising profits and rapid expansion.

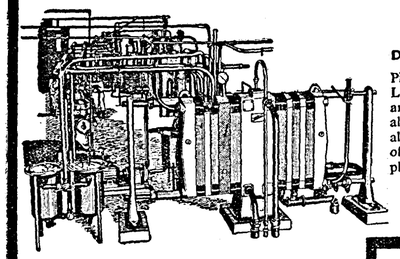
A second factor influencing the distribution of income in urban areas is the increasing productivity of labour in organised industry. According to the second plan, productivity a worker in large-scale industries may increase by about 4 percent a year. The distribution of the gains from this increase in productivity would influence existing inequality.[4] If organised labour is able to secure substantial increase in wages, the gap between the capitalists and industrial workers would be narrower. However, to the extent to which the gains from productivity do not accrue to the capitalist, he would lose the incentive to work for further increases in productivity, and industrial growth would be affected adversely. It is, therefore, necessary that some compromise formula for distribution of the gains from rising productivity should be worked out, bearing in mind the imperative need of the maximum increase in industrial output. As has been suggested in the article referred to above, in industries where the wage is below the minimum wage, the whole of the gain from productivity should be given to labour. Where the wage is between the minimum and the fair wage, the ratio of division between labour and management may be 4:1. Where the wage is at or above the fair wage level, the distribution may be on a 50:50 basis. The factors indicated above influence the distribution between labour and management in large-scale industry. However, the general pattern of urban inequality emerges only after a consideration of the relative position of the large urban tertiary sector.

Increase in Tertiary Activities

The proposed large-scale industrial development and the increase in secondary sector output and employment are likely to lead to an increase in tertiary activities. However, the growth of tertiary activities and the levels of tertiary incomes in urban areas would be influenced partly by the relationship between the likely increase in the urban working force and the increase in urban

[4] See "Sharing the Gains of Productivity" by P. S. Lokanathan Productivity. Vol. II, No. 1, October-November 1960.

IN SERVICE L&T LIES SUCCESS...



DAIRY & REFRIGERATION

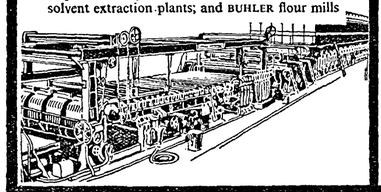
Pioneers in dairy engineering, L & T have helped to plan, and install 44 modern dairies all over India. Today, L & T also manufacture various items of dairy and refrigeration plant and equipment

EARTHMOVING & AGRICULTURAL EQUIPMENT

L & T have supplied to various projects earthmoving, land-clearing, excavation, logging and dredging machinery—CATERPILLAR Tractors, Bulldozers, Dumpers, Scrapers and Motor Graders; JOHN DEERE Wheeltype Tractors; HENSCHEL Locomotives; COLES Cranes; HYSTER Fork Lift Trucks; and PRIESTMAN excavators and dredgers

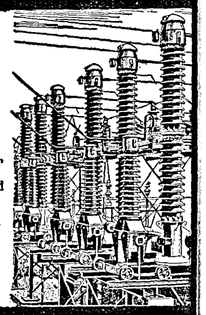
HEAVY PLANT

Paper machines manufactured by J. M. VOITH have been supplied to a number of Indian paper mills. Among other heavy plants supplied by L & T are NIRO Atomizer plants; CHEMIEBAU sulphuric acid plants; ROSE, DOWNS & THOMPSON solvent extraction plants; and BUHLER flour mills



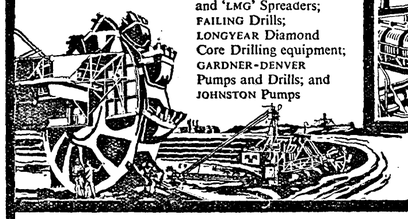
ELECTRICAL EQUIPMENT & SWITCHGEAR

L & T supply for hydro-electric and thermal power stations, substations and distribution installations, high quality electrical equipment manufactured by ESCHER WYSS, OERLIKON, HAEFELY and NORDEN; and LK Switchgear now manufactured by L & T at Powai



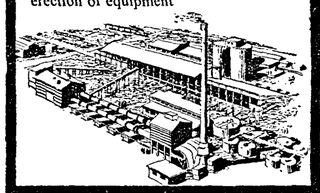
DRILLING & MINING

To the Neyveli Lignite Project, and other mining schemes, L & T have supplied 'LMG' Bucket Wheel Excavators and 'LMG' Spreaders; FAILING Drills; LONGYEAR Diamond Core Drilling equipment; GARDNER-DENVER Pumps and Drills; and JOHNSTON Pumps



CIVIL ENGINEERING

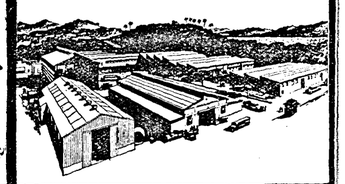
Engineering Construction Corporation Private Limited a fully owned subsidiary of L & T, has constructed a number of cement factories, notably the cement factory of India Cements Limited at Tinnevelly. L & T, together with ECC, undertakes to do "turn-key" jobs, including all design work, civil engineering and the supply and erection of equipment



MANUFACTURE

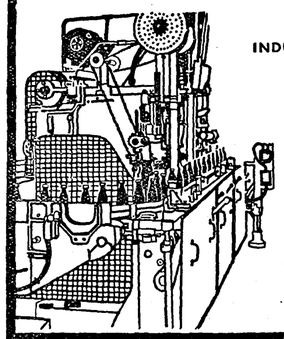
Products manufactured at L & T Powai Works

Dairy machinery and refrigeration equipment; solvent extraction plant; switchgear and motor starters; induced draught cooling towers, petrol dispensing and metering pumps; sheepfoot rollers and belt conveyors; stainless steel, copper and aluminium equipment for the chemical and dyestuff, drug, pharmaceutical and food-processing industries; and distilleries and breweries



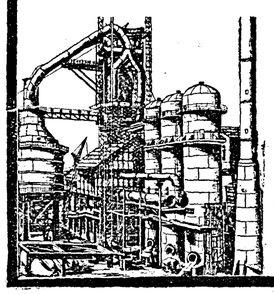
INDUSTRIAL APPLIANCES

Numerous industrial appliances are supplied by L & T. These include DIAF pharmaceutical machinery; MORGAN FAIREST labelling and tablet strip-packing machinery; DANFOSS automatic refrigeration controls; ELLIOTT, BRISTOL and GORDON process control instruments; DE WALT power saws; EUTECTIC welding alloys; and up-to-date bottling installations



ERECTION

At the Rourkela steel works, L & T have erected 3 Blast Furnaces, a 'Pig' Casting machine, and the Rolling Mill Buildings, involving a total of 63,000 tons of steel work. These are only the more recent of the erection contracts executed by L & T



SERVICING

IN SERVICE L&T LIES SUCCESS

When we coined this slogan, we intended to sum up in a few words our outlook upon the function we perform. We believe that in the world of commerce lasting success comes only to those who are willing and competent to give service, as well as goods, to their customers. By service we mean advice and assistance to those who have engineering problems. We maintain a staff of experts in all our Divisions. Every installation, every piece of equipment we supply is backed by a service organisation designed to keep it working at highest efficiency. Only thus have we a right to hold the position we have always striven to occupy.

secondary employment. The portion of the increment in the urban working force not absorbed in secondary activity would flow into the tertiary sector, depressing the income levels that would otherwise prevail there. The impression gathered in various States is that the rate of urbanisation is such that, given the expected increase in total population, and the likely creation of urban employment opportunities in industry, there would be a trend towards surplus manpower in urban areas which would be absorbed in the tertiary sector.

Given the targeted increase in industrial production, an increase in industrial productivity a worker would thus have two effects. The higher the rise in productivity in industry, the smaller the proportion of the increase in urban manpower that would be absorbed in secondary activities and the greater the excess that would flow to the tertiary setcor. Secondly, the greater the increase in industrial productivity, the larger the likely rise in industrial wages, considering the fact that industrial labour is well organised. Both these forces would increase the existing gap between income levels in organised industry and in service industries. However, an increase in productivity a worker is in the interests of economic growth. Thus, once again, the conflict between growth and equality has to be faced.

An increase in industrial productivity, while it has a detrimental effect on the tertiary sector in the manner indicated above, also has a favourable influence on the demand for the services of that sector. This is important because of the high income elasticity of demand for tertiary sector output. On the whole, the unfavourable effects are likely to over-weigh the favourable effects. According to a recent estimate, the wage levels of industry and organised labour are about four or five times the average urban wage. This differential is much larger than in other countries. The general measures that may be considered to resolve this conflict include the encouragement of small-scale industry. To the extent that the expansion of small industries absorbs excess urban manpower, the pressure on the tertiary sector would be reduced. The relative position of fixed-income groups is likely to be affected adversely by economic growth and the resulting rise in profit and wage incomes. This trend is particularly important in the case of the low-income salary classes.

The discussion hitherto has shown that, given the pattern and policies for development being followed in India, the immediate impact of development on the relative position of different groups and sectors in the economy is determined by: (1) autonomous forces and the nature of economic relationships that obtain, *e.g.*, population growths; (2) the response of the particular group to the challenge posed by the change going on, *e.g.*, the growth of entrepreneurship; and (3) the success of measures that can be taken by the Government to mitigate the social and economic burdens of the change.

The governing consideration in Government measures for alleviating the social "costs" of development should be the continuation of rapid economic growth. However, for a given rate of growth, the pattern of investment and such other policies should be adopted as would imply the least aggravation of inequality.

Reducing Inequalities

In considering measures for reducing inequality, the Government should bear two factors in mind. First, all inequalities are not the same. Inequalities that promote growth are socially less undesirable than inequalities that do not. Special attention should be directed to the reduction of the latter type of inequalities. For example, gross inequalities in consumption are more undesirable than inequalities in income (to the extent that these are reflected in a high rate of savings). A second factor influencing the nature of Government policy is the fact that India has a democratic society with a mixed economy. Private enterprise has a definite rôle to play in promoting development. The existing values of liberty and democracy should not be sacrificed at the altar of equality.

Fiscal measures have been adopted as a device against increasing inequality. The tax structure is aimed at controlling not only the concentration of income but also of wealth. Its effectiveness is reduced, however, by the absence of proper enforcement (evasion). The tax system as it exists, if vigorously enforced, imposes a virtual ceiling on the wealth held by individuals, as the sum of the income and wealth taxes above a certain level of wealth exceeds the income accruing from the weafth. The scope of fiscal policies is limited by their being particularly effective only in urban areas and by the necessity of their not affecting incentives. Other measures that are checking the tendencies towards an increase of inequality in industry are: (1) the decision of the Government to have more and more heavy industries in the public sector; and (2) legislative measures, like those under the company law, which put a limit on intercorporate investment and on the number of firms that may be under one management.

Another set of measures should aim at the reduction of under-employment and the provision of education, public health and other social welfare facilities. These measures are particularly important for tackling rural inequalities. As mentioned earlier, the Government has already outlined a scheme for ensuring fuller utilisation of rural manpower by carrying out public developmental works for various kinds in rural areas (*Draft Outline of Third Plan*, pp. 66-72). A large programme of general education and public health, especially, improvement of sanitation and water supplies and the control of communicable diseases has also been drawn up. The effect of these measures would be, somewhat to mitigate the likely tendencies towards increasing inequality indicated earlier.

Regional Disparities

The objective of equality of distribution requires, by implication, that the regional disparities in economic development existing at present be reduced. Some idea of the existing regional disparities is given by the following table showing *per capita* income and factory employment in some of the States:

State	Per capita income (Rs.)	Average Daily Factory Employment (000)
Assam		73
Andhra Pradesh	232	137
Punjab	296	68
Madras	229	338
Gujarat	286	319 (1957-58)
West Bengal	318	652
Maharashtra	298	650 (1957)
Madhya Pradesh (1956-57)	259	134
Orissa (1956-57)	211	21
Rajasthan	224	35
All-India	216	3,197

Note: Unless otherwise stated, income data is for 1955-56; and employment data is for 1955.

The second five year plan explicitly adopted the goal of balanced regional development. "In any comprehensive plan of development, it is axiomatic that the special needs of the less developed areas should receive due attention. The pattern of investment must be so devised as to lead to balanced regional development." This objective has also been stressed in the Industrial Policy Resolution of 1956. The National Development Council has agreed that, "within the resources available, every effort must be made to provide for balanced development in different parts of the country." (*Second Five Year Plan*, chapter II, paras 28, 29).

The first problem which arises in this connection is the interpretation that is to be put on the phrase "balanced regional development". From one point of view, it implies the uniform distribution of the planned investment among different regions of the country. From another point of view, regional balance requires a distribution of investment in such a manner that the regional rates of growth be equal, thus eliminating regional disparities of *growth rates* that have prevailed so far. Neither of these interpretations are consistent with the accepted social objective of reduction of prevailing inequalities. On the contrary, they would lead to a situation of increasing regional inequality. To diminish regional disparities, it is necessary that the backward regions should plan to have a higher rate of growth than the developed areas. Balanced regional development in the context of India's social goals can mean only this.

Distribution of Natural Resources

A number of complications, however, become apparent immediately an attempt is made to apply this interpretation to actual planning decisions. The first arises from the geographical distribution of natural resources, in the context of the pattern of development proposed for the country. Rapid industrialisation, with emphasis on the development of basic industries, is an avowed objective of all the plans. The efficient operation of much of large-scale industry often requires plants of a certain minimum size which must be established in a specified location, selected on economic grounds. Often basic industries like iron and steel are resource-oriented and have to develop near raw material deposits. Because of the large size of plant, initially at least, only a limited number of units can develop in a country. These factors severely limit the possibility of geographical dispersal of planned investment, on the basis of regional balance. To some extent, the objective of large-scale industrialisation, with emphasis on heavy industry, thus conflicts with the goal of regional balance. For example, the three new steel plants absorbed nearly 70 percent of the total investment in industrial projects in the public sector in the second plan, and had to be located purely on the basis of natural resource deposits. However, too much should not be made of such a limitation. Not all industries are closely tied to natural resources, and not all the planned investment is in large-scale industry. The importance of natural resources as a determinant of all industrial location should not be exaggerated. And investments in agriculture, small industries, transport and communications and social services, housing, etcetera, which are capable of being fairly free of geographical dispersal, make up the major part of the planned investment (71 percent of the total in the second plan).

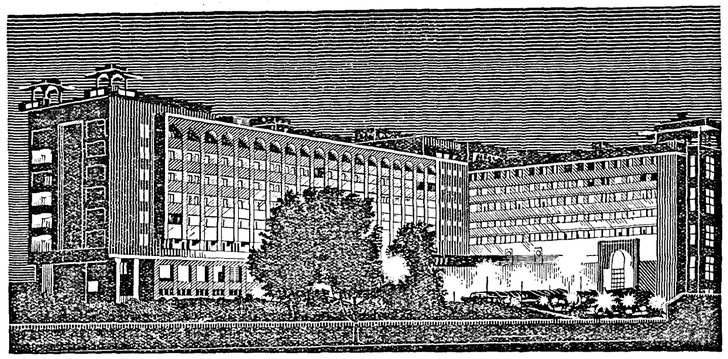
A second problem interfering with the attainment of regional balance is the possibility of conflict between this objective and that of rapid growth of national output. It has been stressed by various economists that there is a tendency for growth to be concentrated round a limited number of "growth points" or "growth poles". For example, the establishment of a steel plant at a particular place creates a nucleus of skilled labour, a ready supply of raw materials, and also provides transport and other social overhead facilities, which make the town particularly attractive for the location of other industries. The location in other distant areas of this secondary industrial development flowing from the steel plant would be uneconomic, and, if insisted upon, would slow down the rate of growth. Professor Hirschman has gone so far as to insist that, up to a point, "inter-regional inequality of growth is an inevitable concomitant and conditions of growth itself".[5] His conclusion is relevant mainly to large-scale industrialisation, particularly that of a basic character. However, it is not without relevance for agricultural development. In the interests of a rapid increase in agricultural production, it is desirable to concentrate investment in the most promising agricultural areas rather than to concentrate on raising productivity in the most backward areas. It is obvious that, to the extent the "backward areas" do not coincide with the "promising area", the pursuit of balanced regional development will reduce the rate of growth of agricultural production. The conflict between balance and growth is not easy to resolve. It may be emphasised again that rapid growth is the primary objective. It is in the process of achieving this objective that special measure should be adopted and attention should be paid to regional balance. Keeping this point in view, the choice of specially promising districts for intensive measures to increase production, as suggested in the third plan draft, is to be commended. The objective is to have a substantial increase in agricultural production.

One method of effecting a compromise between rapid growth with its requirement of economic allocation of resources and regional balance, would be to reserve a certain proportion of the total planned investment to be allocated with the aim of reducing regional inequalities, the remainder being allocated on purely economic considerations. Another method would be to let economic considerations determine the allocation of investment among various heads, but to invest relatively more in social overheads in backward areas which do not immediately show promise of rapid development.

A problem that has to be confronted in implementing this suggestion is how to distinguish backward areas. There is no unique criterion for determining the economic backwardness of an area. Promising general indices are the poverty of the people (as indicated by low *per capita* income and consumption) and an under-developed economic structure (indicated, for example, by the low percentage of poulation in secondary and tertiary activities, the low ratio of the urban-rural population and the lack of a transport network). The various measures mentioned need not give a clear indication of backwardness, especially as of two areas one may be relatively more backward on one index, and less backward on another. However, a rough demarcation of relatively backward regions can be made on the basis of *per capita* income levels. It so happens that a number of basic developments carried out in the second plan, specifically the steel plants, although located on economic considerations, have come up in relatively under-developed regions. Many of the large irrigation projects, *e.g.*, Hirakud, Nagarjunsagar and Chambal valley, are also located in agriculturally backward regions. The development "induced" by and linked to these projects

[5] *The Strategy of Economic Development*, page 184.

The Ashoka Hotel AT NEW DELHI



LIGHTING BY PHILIPS

Occupying an area of 20 acres, the Ashoka Hotel—the largest project of its kind in India—stands out as another shining example of Philips specialised lighting.

The lighting is so essentially a part of the whole conception that it presents an architectural masterpiece which belies the fact that it is achieved by artificial means.

Philips exclusive lighting consisting of lamps, fittings and accessories ensures ultimate economy through maximum illumination level at lowest running cost and gives longer, trouble-free performance. Philips' scientifically designed equipment is the result of experience, research and development to meet the ever-growing demands of better lighting. And hand-in-hand with Philips' unrivalled quality goes the invisible *plus* of Philips' international experience and know-how.

FREE: *For planned lighting, designed economically to suit your specific need—whether it is industrial, commercial or any other specialised application—consult Philips Lighting Service Bureau.*

PHILIPS quality lighting for ultimate economy

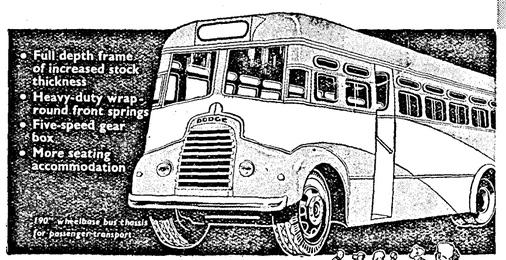
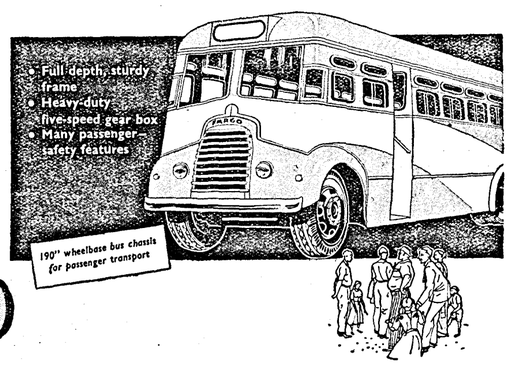
PHILIPS INDIA LIMITED

For safety, economy, endurance, there are no vehicles like DODGE AND FARGO





DIESEL BUSES

Progressively manufactured by THE PREMIER AUTOMOBILES LIMITED BOMBAY

FISTA'L PAL 27

would, therefore, be consistent with the furtherance of regional balance.

Growth Poles

Further, the conflict between growth and regional balance is progressively reduced as development proceeds. With the establishment of an efficient transport network, the rise in *per capita* income, the spread in skills and the widespread availability of electric power, the possibilities for a large number of "growth poles" would be created, especially as industries producing intermediate and consumer goods would become important. However, whether, even in the long run, regional disparities will be *completely* eliminated is doubtful. The natural and human resources of regions vary both in quantity and quality. These differences, although they can be modified, cannot disappear with time. This has led to the suggestion that instead of trying to raise income levels in resource-poor, thickly-populated regions, large-scale migration to resource-rich, low-population areas may be encouraged. In the context of the economic and social conditions prevailing in the country, it does not seem feasible to embark on such a programme on the requisite scale. Apart from the traditional immobility of the Indian masses, large-scale migration of unskilled labour will present vast organisational difficulties and will create stresses and strains that are socially and politically undesirable. Inter-regional mobility of technical personnel and of enterprise, however, can be encouraged as a method of reducing inequalities. The National Council of Applied Economic Research has recommended that migration boards should be established with a view to facilitating and organising migration within States and between the States, but it is necessary not to underestimate the difficult nature of the problem.

The Problem of Employment

Another social goal before the planners is the creation of more employment opportunities. The right to work and to a means of livelihood should be available to all citizens. The creation of widespread employment opportunities, apart from being important in itself, is related to the objective of reduction in inequality. If there are two patterns of development for attaining the same increase in *per capita* income, that pattern which creates more employment is likely to further more equitable distribution. Considering the prevailing backlog of disguised and open unemployment and under-employment, the rate at which the population is increasing and the magnitude and pattern of investment being undertaken in the country, it appears unlikely that conditions of full employment can be created within any short period. This fact increases the importance that should be given to measures to create the maximum employment opportunities without, of course, jeopardising the rate of economic growth.

The seventh Evaluation Report on Community Development indicates that the proportion of adult males and females offering themselves for wage employment in 20 development blocks has risen from 34 percent in 1954 to 41 percent in 1959-60. The reasons for this increase, however, are not clear. It might partly be the result of a rise in "income horizons" in the rural areas, and partly that of the decay of age-old prejudices and the changes in the position of various classes. That the latter of these may be important would appear from the fact that the largest proportionate, as well as absolute, increase in the percentage of people offering themselves for employment, is among the "non-cultivating owners". To the extent that there is an increase in the proportion of the labour force coming into the labour market, the employment problem will be intensified. The objective in the circumstances should be to avoid such policy measures as would accelerate the emergence of open unemployment and to create as much additional employment as possible, commensurate with the accepted growth targets.

As the major portion of under-employment of manpower resources is found in the rural areas, a large maintenance and construction and land improvement programme may be taken up in such areas, at the same time increasing the level of investment. Such a programme, however, would chiefly absorb unskilled workers and do little directly for the under-employment in village and cottage industries. Encouragement and support to these industries have been a part of the Government's policy for some time. However, it appears, that in spite of this, considerable slack is still present in them[6]. It follows that the rural unemployment problem cannot be eased by shifting people from cultivation to village industries.

One factor which would require to be considered in any appraisal of the employment problem is the likely behaviour of disguised unemployment. The existing social and institutional structure in rural areas has built into it a kind of unemployment insurance at the family level. Unemployment which would otherwise be open is disguised within the folds of the household enterprise. With economic growth and the consequent impact on prevailing ideas and institutions, there is the possibility that the disguised unemployed would be thrown on to the labour market and the immediacy of the problem would become greater.

Employment Policy

The employment policy of the Government should at least aim at absorbing the additions to the labour force so that the absolute volume of unemployment and under-employment does not swell. The difficulty of reducing the degree of prevailing unemployment (both disguised and open) creates the possibility that the rise in *per capita* incomes resulting from planning may have no immediate significance on the standards of living of the masses. The problem from this point of view is to find the means to bring some of the gains of economic development to these masses, even though they cannot be given enough jobs. Government expenditure on social services, chiefly public health and education, touches the life of all people, whether employed, unemployed or under-employed. The problem is how to finance sufficient expansion of these social services. It is necessary, in any case, to emphasise those social services that may contribute to economic growth. Social welfare expenditures, especially those on public health and sanitation, while obviously desirable, lead to a large spurt in the rate of population growth and create important long-run problems.

No short-term solution of the unemployment problem is thus possible. Until India is able to break through and transform the present traditional subsistence economy into a modern *dynamic economy*, the problem will continue to be difficult to eradicate. Investment, sufficiently labour-intensive to secure full employment in the short run, would only imply a sacrifice of rapid economic growth, and consequent long-run unemployment.

The policy of giving effect to the principle of "fair wages" in organised industries through the setting up of Wage Boards also throws into sharp relief the dilemma between economic and social goals. Workers press for a relatively high wage, sometimes without regard to the capacity of the industry to pay. This, of course, is a short-sighted policy which the trade unions will themselves find to be against their interest. But the more subtle danger is that labour is succeeding in its efforts to get a relatively high wage, because of the capacity of particular industries to pay, or because the burden is successfully passed on to the consumer, thanks to the protection enjoyed by the industry. This may really cause a net reduction in employment. In addition, the country's resources would not be efficiently used. Existing industries would tend to be protected at the expense of new industry which might otherwise have been set up.

Mica being cut to the required shapes near a mine

Social goals and objectives are undoubtedly as valid and justified as economic goals in India's planning, but there is a danger of under-estimating the difficulties and complexities involved in attaining those goals. The desire to share and distribute often becomes stronger than the capacity of the economy to fulfil it. Any hasty or unwise measures to speed up the social goals may result in injury to the entire community. The principles that may be laid down for action may be set out thus. Given two alternative production programmes, India should choose the one which will not aggravate existing inequalities. Secondly, the accent of national policy should be positive and constructive, and should aim at giving all help and facilities possible within the limits of available resources, without harming total production and total national output. Thirdly, the balancing element should be the provision of social overheads for the relatively weaker sectors of the country and relatively backward areas—but not curbing of growth.

U.K. PROVIDING MORE AID FOR OVERSEAS DEVELOPMENT

BETTER INVESTMENT CLIMATE NECESSARY

By HUBERT E. WOUTERS

FOR 300 years or more, Britain has helped accelerate the economic development of countries overseas by providing men, money, equipment and services. In some countries —notably those now in the Commonwealth—it has provided the basis of law and order and sound administration essential to the success of any development effort. All this has been of mutual advantage to Britain and the receiving country, and that is the aim of her overseas development activities today. The British were prominent among the explorers who pioneered the routes for the later traders, settlers, administrators and technicians, to whose numbers also Britain has always made a large contribution. Sir Humphrey Gilbert and Sir Walter Raleigh opened up the possibilities of the American continents; Captain Cook showed the way to Australia and New Zealand; *Mungo Park, Livingstone, Stanley,* Samuel Baker and other explorers and missionaries blazed the trails in Africa; and Captain Scott and Sir Ernest Shackleton did a great deal in charting Antarctica over the centuries. British settlement overseas, although it preceded 1815, especially in North America and the West Indies, reached its peak in the hundred years after that date. During this period, it is estimated, over 20 million people sailed from the United Kingdom for destinations beyond Europe. Of these, about 13 million went to the United States, some 4 million to Canada, about 1.5 million to Australia and New Zealand, while others found their way to Africa, Latin America and the Far East. Since 1918, there has been a slowing down, but even so between 1918 and 1939 more than a million people went from the United Kingdom overseas, while another 2 million did so between 1946 and 1959—mostly to Commonwealth countries.

Industrial Revolution

For well over a hundred years, Britain has been a major supplier of external finance for other countries. In the nineteenth century, the British economy—transformed by the industrial revolution —expanded rapidly, and the expansion was accompanied by a high rate of saving. Private individuals habitually set aside part of their growing wealth and invested it in undertakings which, it was expected, would bring in gain for themselves or for future generations. A large proportion of these private savings found their way overseas in a multiplicity of undertakings—railways, harbours, mines and municipalities—in nearly every part of the world. As these undertakings matured, they provided the British investors with a stream of dividend and interest payments which were mainly reinvested in the same or other enterprises overseas, so the total volume of capital invested overseas tended to rise steadily. On the whole, this investment in overseas economic progress brought substantial gains to British investors and to the United Kingdom as well as to the countries whose development was stimulated by the investment. However, various estimates made of the average yield on British overseas investments show that it has been no greater than if the money had been invested at home. U.K. investors suffered heavy capital losses (estimated to total about £5,000 million up to 1939) through unprofitable ventures or through defaults by foreign governments and local authorities. All over the world, there is striking visible evidence of British overseas enterprise, both past and present. It is to be seen in railways, roads, bridges, harbours, docks and airports; in dams, irrigation works and power-stations; in mines and oil installations; in factories, plant and machinery; and in numerous buildings.

Private Sources

Before the first World War, most of the funds for international investment came from private sources in this way. In the first ten years of the twentieth century, the countries whose people did most foreign investment were probably Britain, France and Germany. Investments from Britain were about double those from France and treble those from Germany. A large part of this investment was in countries where industrial development was already under way, where profits were good and the risks were least. About half was in Europe and North America. The underdeveloped countries got little. Much the same happened between the wars, with the world slump in the 'thirties leading to a shrinkage in the total amount of international investment. Loans for heavily populated and poor countries, such as China and India, were particularly scarce. War and threats of war slowed down international investment because they increased the risk of the money being lost. This happened after the last war. And, in addition, the countries of western Europe needed massive amounts of capital goods to rebuild shattered cities and industries. Once again little capital from private sources found its way to the poorer countries. Private investors overseas put a good deal of money into Britain after the war, but much more was invested abroad by British people and concerns. The United States has been the biggest provider of private capital. Americans, Britons and Swiss have between them been the source of most funds. Much of the American investment has been in Canada. Most of the British investment has been in other Commonwealth countries. Most of the rest was in South America or western Europe. But the rate in 1952—allowing for changes in the value of money—was only about half of what it was in the mid-1920s. Since 1952, there has been some increase, but measured against the need it is still small.

Basic Services

In the underdeveloped countries—which make up the huge area which stretches round the earth from Latin America, across Africa and through the Middle East to south and south-east Asia—the first requirement is for capital investment in such things as power, transport, water supply and housing. These basic services are necessary to make possible further steps towards increasing production and living standards. But this sort of development, often controlled by the governments of the countries concerned, is frequently not attractive to private investors. So new methods have been developed since the war to help the poorer countries get their development programmes moving; loans from one government to another, for example, or from international agencies such as the International Bank for Reconstruction and Development. The lion's share of this capital from public sources went to Europe after the war to repair war damage. Between 1945 and 1951, loans and gifts by the United States to Europe were three times as big as to all other countries. This was the period of Marshall Aid. But the balance has since been shifting towards the poorer countries. In the three years up to 1957, assistance to Europe was less than a third of that to the rest of the world.

With increasing prosperity, Britain has been able to step up her assistance to other countries. From 1949 to 1957, loans and grants going out to other governments from Britain were nearly £340 million more than those which came in. Since the Commonwealth Economic Conference in the autumn of 1958, Britain has lent the Government of India £28.5 million, Pakistan £10 million and the Sudan £5 million. She has also undertaken to give new loans from the Exchequer to the colonies, for which she has a special responsibility. Taking into account her own needs for capital investment—for industry, schools, housing and so on—and what other cuntries have done, Britain has made an impressive contribution to the development needs of other countries. It is worth examining in some detail what has happened in recent years.

Overseas Commitments

The importance of investment and assistance in the poorer countries of the world within the context of Britain's overseas commitments has been emphasised in the Government White Paper on Assistance from the United Kingdom for Overseas Development. This document shows that assistance from U.K. Government funds to less developed territories has risen from about £80 million in 1957-58 to nearly £140 million in 1959-60. Including private investment of about £100 million, about 1¼ percent of the national income is going to benefit the less developed countries. Since the war, the total amount devoted to those countries from U.K. sources in the form of private investment or Government assistance has amounted to some £2,500 million. This is a record which, in relation to national resources, can challenge comparison with that of any other country. The catalogue of such assistance should not, however, be read as an excuse in boasting and self-congratulation. Any such pretensions would be well and truly deflated by the following extract from the White Paper which sets the volume of aid and the relative wealth and affluence from which it came in the context of the abysmal poverty which it is endeavouring to remedy: "Malnutrition is the common lot of millions in the poorer countries of the world. Housing is frequently primitive, transport and communications are very limited, basic social services which we take for granted are almost non-existent. Two-thirds of the world's population live in countries which face problems like these. In India, for example, there are eight times as many people as in this country: their average income a head, about £25 a year, is one-sixteenth of ours. There is a growing determination in the poorer countries to rise out of poverty through economic development. They are making great efforts themselves, and the larger part of the money they are spending on capital development comes from their own resources. But additional resources, and in particular foreign exchange to buy plant and materials from abroad, are an essential supplement. There is a challenge to the advanced countries to help them to help themselves."

Private Investment

In assessing the part that Britain is playing in making economic help available to the less developed countries, it is necessary to stress, at the outset, the primary importance of private investment. On the information at present available, it is estimated that the total of private capital exports from Britain has averaged £300 million a year over the past seven years. This includes sums averaging £55 million a year which have been raised on the London market by the Governments of independent Commonwealth and colonial countries and by public corporations and companies. The total of £300 million does not include the net increase in commercial credits extended by British exporters to overseas importers. Much of this credit is guaranteed by the Export Credits Guarantee Department. It is of a short or medium-term character and is not, therefore, included in the estimates of overseas investment. Of the sum of £300 million a year, it is estimated that about £100 million a year has been invested in less developed areas. This would include the reinvestment of undistributed profits. The Government White Paper suggests that the figure of £100 million a year as the investment of British capital in these less developed countries "may be too low" an estimate. —

Profit and Safety

The importance of private investment makes it particularly incumbent on the borrowing nations to behave politically and economically in such a way as to ensure that this flow of capital will continue. Such investment is moved by a careful calculation of profit and safety. Whether it will continue to flow must, in large part, depend on the assurance the territories concerned can give that such capital will be profitably used. This problem was admirably stated by an executive director of the Bank of England, Mr. Maurice Parsons, in the course of a recent visit to African territories. He said that he found nobody who disapproved of this trend towards independence; but he stressed that if such independence were to go hand in hand with reasonable development, there must be good administration. If the standard of administration drops, he said, economic development will be impeded.

The creation of a good administrative machine is also one of the tasks which comes within the

scope of economic assistance and in particular of the assistance given direct from government to government. The total aid given from the U.K. Exchequer for overseas development is authorised by Parliament annually. The estimate for the financial yer 1959-60 is £138 million. The assistance takes the form of grants and loans, together with payments for technical assistance made directly with the receiving country. It can also take the form of contributions to international bodies working in this particular field.

Direct Bilateral Assistance

The direct bilateral assistance last year amounted to £118 million, of which the greater part was provided by loans of £60 million. Grants amounted to nearly £40 million and technical and emergency assistance accounted for another £18 million. In the sphere of education, the personal contribution of trained men and women—including the supply of teachers from the United Kingdom and the provision of facilities for training teachers and others from overseas—has been even more important than money. About 2,500 teachers from the United Kingdom leave annually to serve in Commonwealth countries, and some 500 in foreign countries, on interchange schemes. There are at present nearly 40,000 overseas students, most of them from the less developed countries of the Commonwealth, undergoing fulltime courses at universities, technical colleges, teacher-training institutions and other establishments in the United Kingdom. A small proportion of these students are financed directly by scholarships from the U.K. Government, but the British exchequer meets a large part of the cost of their education here in other ways.

Equally important is the technical assistance in the form of the provision of experts, advisory services and training facilities which is so often an essental adjunct to capital investment. Such assistance falls both within the realm of private and public investment. Many industrial firms, which have established subsidiaries overseas, have linked this with training projects as an integral part of their investment. They receive apprentices in the United Kingdom and train them to occupy leading positions in the administration of their overseas subsidiaries. The U.K. Government provides technical assistance for colonial territories through the Colonial Office and to the independent countries of the Commonwealth under arrangements made under the Colombo Plan.

Direct Advances

One of the most important channels through which direct Government financial assistance has recently been flowing is the Export Credits Guarantee Department, which, under Section 3 of the Act through which it operates, can depart from its traditional business of guaranteeing export credits and make direct advances to the recipient country. Such assistance is specifically related to contracts placed in Britain. Although "Section 3" loans are not confined to the Commonwealth, the substantial increase which has taken place in the last two years has resulted from the decision announced at the Montreal Commonwealth Economic Conference of 1958, to make increasing use of this procedure to provide for sound economic development in the independent Commonwealth countries which could not be financed in any other way. The total amount of Section 3 loans, since they were first instituted, has reached the figure of £125 million, of which about £30 million has still to be drawn upon.

In addition to the bilateral assistance of £118 million granted to overseas countries last year by the U.K. Government, a further £21 million was made available by way of multilateral assistance through contributions by the United Kingdom to international organisations. The most important of these is the International Bank for Reconstruction and Development, by far the largest of a number of international organisations concerned with economic development. The United Kingdom's subscription was originally $1,300 million, but it was increased last September to $2,600 million. In addition, the Bank has received private capital from the United Kingdom on three occasions through the issue of its bonds through the London market: £5 million in 1951, £5 million in 1954, and £10 million in 1959.

Among other channels through which overseas assistance is being provided is the International Finance Corporation. This is an affiliate of the International Bank, but whereas the latter concerns itself with loans made to or guaranteed by member-governments, the I.F.C. is concerned solely with investment in private enterprises. Its authorised capital is $100 million, of which the U.K. subscription of $14.4 million was paid in the financial year 1956-57. More ambitious, but yet to be launched, is the International Development Association, which will have an initial capital of $1,000 million and will be affiliated to the International Bank. Its main concern will be to make loans to needy countries on conditions which will be somewhat softer than the commercial terms exacted by the International Bank. In addition, the United Kingdom contributes to the U.N. programme of technical assistance and to such specialised agencies as the Food and Agriculture Organisation, which finances important technical and advisory work in the poorer countries.

Fair Share

There is no lack of channels through which investment and economic assistance can be provided in the less developed countries. In filling these with resources, Britain has so far done its fair share. "Fair" is here used in relation to what has been done by other countries that could and should have borne their part of this burden. It is more than probable that the total amount today given to the less developed countries will have to be increased and that, even though other donors will be stepping up their contributions, the absolute amount required from Britain will grow. This prospect emerges quite clearly from two recently published documents, the report of the "Group of Four" on the future of the Organisation for European Economic Co-operation and that of the three bankers, Sir Oliver Franks, Herr Abs and Mr. Sproul, on the future assistance which will have to be provided to enable India and Pakistan to complete their development programmes. The O.E.E.C. is to be remodelled as the Organisation for Economic Co-operation and Development. With the adhesion of the United States and Canada as full members, it will, according to this proposal, have to devote more of its efforts to the interests of the rest of the world, since its task of economic reconstruction in Europe has virtually been completed. There is no doubt that with the stimulus of the United States behind it, the new organisation will play an increasing rôle in mobilising the resources of the free world and making them available to the poorer countries.

Grants and Loans

The findings of the three bankers, published as a letter to Mr. Eugene Black, deal with the problem in more detailed and specific terms of the two countries which will claim a considerable part of this assistance. They also point most usefully to the duties of the recipient of assistance. The three bankers stress that, if the help which is to be given to the sub-continent is not ultimately to impose an intolerable strain on the balance of payments of the two countries, a substantial proportion of the aid will have to take the form of grants or loans not made on strictly commercial terms. This, they say, "will create problems and responsibilities for both the countries providing and the countries receiving aid." The latter must recognise that the aid providing countries will have to satisfy their legislators that the recipients' methods of handling their economic policies are realistic and that the aid provided is spent on the purposes for which it was intended.

In addition to all the humanitarian and political considerations, which are in themselves powerful enough, there are also good economic reasons why a country like the United Kingdom must continue to encourage the flow of investment and direct aid to the less developed countries overseas. The United Kingdom lives by international trade, and the opportunities for trade grow as customers abroad raise their living standards and increase their own industrial potential. One of the most striking developments in international trade in recent years is that it has been growing most rapidly between the industrial countries and not between them as a group and the primary producers as a group. Between 1952 and the first three-quarters of 1959 total exports of industrial countries to each other increased from a rate of $25,000 million a year to $40,000 million while their exports to primary producers rose from only $19,000 million a year to $23,000 million. Since 1955, U.K. exports to other manufacturing countries have increased by about two-fifths, while her exports to primary producers have been unchanged. In the trade in manufactures between advanced countries, capital goods tend to predominate, particularly where countries specialise in certain lines and maintain a high rate of technological change. But it is also true that the biggest expansion in trade in durable consumer goods in the 1950s was between the industrial nations who were making them.

Climate for Lending

Because self-interest is so compelling a force, it can be relied upon greatly to increase the flow of international capital—provided a climate more encouraging to lending were created and evidence were forthcoming of a growing reservoir of funds. As for the climate, there is no denying that this can only be improved by orthodox remedies. Backward countries will have to keep their finances in healthy condition, add diversity to their economies and strive for both increased production and productivity. The provision of capital calls for co-operation by givers as well as receivers and the latter should be willing to fall in with the reasonable requirements of the former. They should not deny lenders the prospects of adequate reward and ought to be receptive to funds for established undertakings as well as for new projects. In other words, they must not permit nationalism to blind them to the economic facts of the world in which they exist.

TABLE I

GROWTH OF U.K. GOVERNMENT ASSISTANCE

£ million

Year	Total
1951-52	61
1952-53	49
1953-54	52
1954-55	77
1955-56	83
1956-57	76
1957-58	81
1958-59	110
1959-60 (Estimate)	138

TABLE II

MAKE-UP OF U.K. GOVERNMENT ASSISTANCE*

£ million

	1957-58	1958-59	1959-60 (Estimate)
Bilateral assistance			
Grants	35.0	33.3	39.6
Loans	10.9	36.7	60.4
Technical assistance	4.1	4.4	5.2
Total	50.0	74.4	105.2
Emergency assistance	13.3	11.7	12.5
Total bilateral assistance	63.3	86.1	117.7
Multilateral assistance			
Disbursements from the U.K. subscription to I.B.R.D.	16.0	21.1	18.0
U.N. Expanded Programme of Technical Assistance (and U.N. Special Fund after 1959)	0.7	0.8	1.2
Subscriptions to U.N. agencies	1.4	1.5	1.5
Total multilateral assistance	18.1	23.4	20.7
Total economic assistance	81.4	109.5	138.4

* These categories and the sums involved differ from the presentation given in the White Papers on the U.K. balance of payments. These differences arise (a) because the balance of payments estimates do not make a precise distinction between economic assistance and other types of Government current expenditure, (b) because of timing (disbursements from exchequer funds are on a financial year basis), and (c) because some types of transactions included as exchequer aid do not enter into the balance of payments.

TABLE III

DISTRIBUTION OF U.K. BILATERAL ASSISTANCE

£ million

	1957-58	1958-59	1959-60 (Estimate)

Durgapur Thermal Power Station

Prestressed Concrete Plank Roofing was adopted for the Durgapur Thermal Power Station because of its lightness thus reducing the cost of the foundation and superstructure. It also made rapid construction possible.

A conventional cast-in-situ roof was ruled out because of the unusual height between roof and floor.

The roof area covered was 50,000 sq. ft. The job was completed in about twelve months.

An additional feature is thermal insulation with foam concrete blocks.

Significance of Economic Integration In Europe

The Possible Effects on Indian Trade

EUROPE'S economic integration and the efforts leading up to it bear but remotely on the problems of India's development. The compulsions of a tight foreign exchange position weigh heavily on this country. Apart from the traditional exports—ores, tea, vegetable oils, cotton and jute manufactures, hides and skins—there is not much India can sell to the advanced countries of the West. Even for these, the demand in Continental Europe is small, and the competition keen. The Central Commerce and Industries Minister, Mr. Lal Bahadur Shastri, commented recently on the trade deficit with the European Economic Community—West Germany, France, Holland, Italy, Belgium and Luxemburg. If they did not buy more from here, he said, India will be forced to cease buying from them. Since imports of capital goods from West Germany, particularly, have been possible because of credit facilities and deferred payment terms, the warning is unimpressive. This country is hardly in a position to insist that, unless the European Economic Community buys from her what it does not specifically need, she will cease to buy from it what she very much needs. Mr. Shastri may be convinced by this strange logic, but he can hardly hope to carry conviction to others.

Foreign Collaboration

The Central Government, however, has taken great pains to enlarge India's range of exportable

By

S. NATARAJAN

goods. It abandoned around 1958 its earlier insistence on Indian majority share-holding in joint-ventures with foreign concerns. In the pharmaceutical industry, Dumex has been allowed to operate a plant for the manufacture of tetracycline with 100 percent American capital; Nestle, manufacturing milk products and baby foods, has 90-percent foreign participation; Hoffman La Roche has over 85 percent Swiss investment; and Johnson and Johnson has 75 percent American capital. In engineering, there are several ventures with 60 percent to 75 percent foreign equity capital. A logical consequence is the Government's latest demand on foreign participants in joint-ventures to surrender or concede some export markets to manufacturing units in India. An inducement offered is the sanction of higher royalties on goods sold outside the country. Another attraction might well be the tax concessions to new industries.

What is the "export territory" which India can hope for due to such concessions from foreign concerns? One of the earliest agreements to define an "export territory" for the Indian product of a joint-venture was that between the Associated Cement Companies and the British firms of Vickers Ltd and Babcock and Wilcox Ltd which launched the A.V.B. Ltd. The capital in this venture was contributed by the Associated Cement Companies (49.8 percent), Vickers Ltd (24.9 percent), Babcock and Wilcox Ltd (24.9 percent), and four Indian companies (.1 percent each), so Indian majority holding was secured. The territory defined was in Africa, the Middle East and Asia, and the agreement provided for consultation with the two foreign firms on matters concerning the appointment of agents and the fixing of sales commission in the export territory. Many of the countries mentioned would perhaps not be purchasers for some time to come, but generally speaking the areas named were large, containing India's potential market for the export of industrial manufactures.

Main Interest

The main interest for foreign industrialists who undertake production in India is the Indian market, present and potential. Moreover, the margin of profit on sales in India is greater than on sales abroad—a deterrent to Indian industrialists themselves. Foreign firms which undertake production in India are well able to launch similar enterprises elsewhere if the market justifies the effort, and if it cannot be served by the main unit. The conceding of export territory in the circumstances offers little scope; it might be presumed too that the demand will generally begin to be met only after a reasonable part of the Indian demand has been catered for. But this kind of activity affords a useful field for co-operation between the advanced countries and the developing Indian economy. In a way, it might be described as a practical adaptation of the idealistic solution which requires that the advanced countries should agree to lose much of their share of the world market in cheap, simple manufactures to Asian industries and to allow more Asian goods into their own home markets. The persuasion of the advanced countries has not been easy in the past and will not be easy in the future. The long argument between Europe and America over trade and aid, the British textile industry's measures to guard against cheap imports, and the protectionist policy adopted by the U.K. for the Dundee jute industry by a mark-up of prices of imported jute products, indicate the attitude of advanced countries. On the other hand, the advantage of joint-ventures undertaking market exploration is that it ensures a bigger cake and a fair share in it for all concerned. European integration—although not necessary for this form of activity—should help it, even if it first results in the shrinking of the export territory for countries like India; and from such collaboration, it will undoubtedly be less difficult to proceed to mutual adjustments and concessions in a larger field without loss on either side.

The balance of trade between India and the European Economic Community is heavily against India. Excluding the U.K., with the European Free Trade Association—comprising Austria, Switzerland, Denmark, Norway, Sweden and Portugal—trade is negligible. The following table shows imports and exports for these regions with trade figures for the U.K. and the total trade for comparison:

(Figures in Rs. crores)

	U.K.		E.E.C.		E.F.T.A.		Total Trade	
	(a)	(b)	(a)	(b)	(a)	(b)	(a)	(b)
1956 ...	206	185	164	40	34	4	821	619
1957 ...	238	161	217	41	40	4	1,029	610
1958 ...	168	176	164	34	26	6	864	579
1959 ...	173	172	190	40	25	5	869	626

(a) Imports (b) Exports

What the countries of the Community and the Association buy from India are the commodities traditionally exported; even for these, the demand is limited and the competition keen. With the two groups apart, there is little reason for the Community to show any preference for Indian goods; and the E.F.T.A. countries, apart from the U.K., are negligible factors in India's foreign trade. The value of any wider integration—and this is the main reason for the present existence of the loosely-knit Association—lies in the participation of the U.K. in it.

Growing Strength

The growing strength of the European Economic Community has given rise to a sentiment in Britain in favour of integration. Although there are many obstacles, the sentiment cannot be ignored. It has inspired a comprehensive study of the economic problems of the Commonwealth and the effects on its different members if Britain joins Europe in a closer association. The results of the survey, which was carried out by the Economist Intelligence Unit, have been published in *The Commonwealth and Europe*. In the section on India, the Unit has devoted considerable attention to draft the third five year plan. On two important subjects, it is inclined to the view that what the Planning Commission hopes to accomplish in the next five years is more likely to be

» BECOCELL «

the supreme auto & industrial finish

A high class Nitro Cellulose finish for motor cars and steel furnitures. Also useful in other industries. Gives a brilliant finish that can easily be maintained for years.

Extremely fast and hard drying. Impervious to oil and petrol. Highly resistant to alkali and acids.

BECO CHEMICALS PRIVATE LTD.
P 40 PRINCEP STREET, CALCUTTA 13.

achieved in the next decade (production of foodgrains and export earnings). The draft plan envisages an annual average of Rs. 690 crores of export earnings during the next five years; the publication says that under the most favourable conditions, India's total export earnings will touch Rs. 690 crores only in 1966.

The reasons for the pessimistic outlook are the trade attractions of a large, protected and expanding domestic market, vigorous competition in India's traditional exports from other Commonwealth countries as well as from China and Japan, and the stage of industrial development which does not yet leave scope for large exports of industrial goods to competitive markets. It is interesting to note in this connection the views of an Indian industrialist, Mr. Shri Ram, who recently said that a concerted effort by the Government and the engineering industry could bring in Rs. 50 crores of export earnings in the engineering sector alone by 1966. His conditions, however, cover so wide a ground and call for such close cooperation and understanding between the Government and the private sector that in the prevailing circumstances they sound more like a warning than an expression of hope. As far as Europe is concerned, when Indians speak of exporting engineering goods, they think of the advanced countries of Europe as collaborators likely to help India to acquire new markets. This can conceivably add to the existing trade unbalance, not reduce it. India's dependence is on the traditional exports, which they have to be induced to take in exchange for imports of capital goods and industrial raw materials.

Traditional Exports

As far as traditional exports go, the European Economic Community by itself presents several problems. On account of its connection with Belgium and France, the overseas territories enjoy certain privileges in the Community which endanger the development of India's export trade. Besides, they have certain claims on financial assistance which reduce the limited amount of foreign aid available. The privileges are recognised by Customs concessions; the claims are met by a development fund which has so far been used for social purposes only, indirectly bearing on economic matters. Apart from the fund, it is only natural that private capital in the Community should flow to develop the industries of the overseas territories. The prospect of the U.K. participating in a wider integration gives rise to further apprehensions which are best expressed in the words of *The Commonwealth and Europe*: "Few Indian goods, other than jute textiles, are sufficiently competitive to maintain their footing in the U.K. market if they had to sell across a tariff on equal terms with China and Japan and meet duty-free competition from the Continent. If trade were not to be fairly severely damaged by a merger between Britain and the Six, India would have to have a duty-free quota for grey cloth sold to the U.K. and liberal quota treatment on the Continent for jute manufactures to offset the loss of trade with Britain in other goods."

If in cotton textiles, the quality and price of other manufactures offer keen competition, in tea the limited demand on the Continent (it is restricted to the Netherlands and north-west Germany) and the competition of cheap African tea are major obstacles to trade expansion. Any reduction in the prevailing average of 35 percent tariff on tea among the members of the Community will equally apply to tea from Ceylon and east Africa while any tariff on tea in the U.K. may well lead to a decline in demand. In vegetable oils, no increase in demand is anticipated as far as Europe is concerned, adjustments depending on Britain joining the Community favouring animal fats. In hides and skins, it is interesting to note that while India's total exports have risen from Rs. 7.5 crores in 1956-57 to Rs. 11.22 crores in 1959-60, she has faded out of the West German market where at one time she met 20 percent of the total demand.

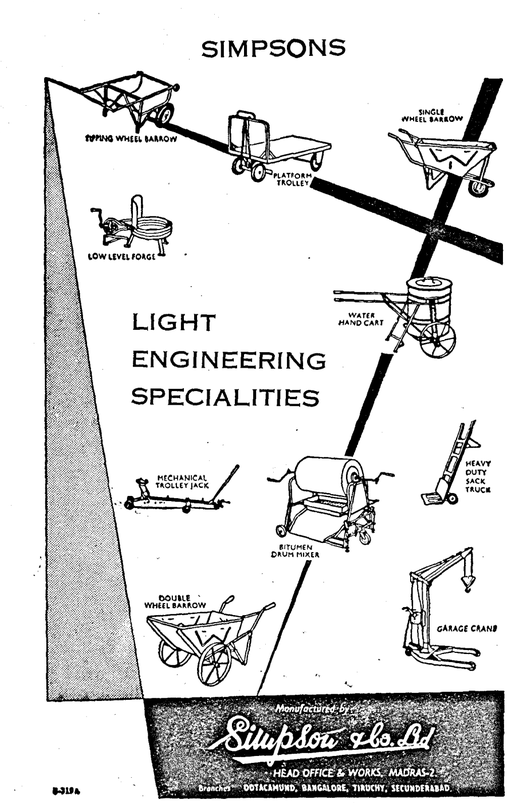
Commonwealth Trade

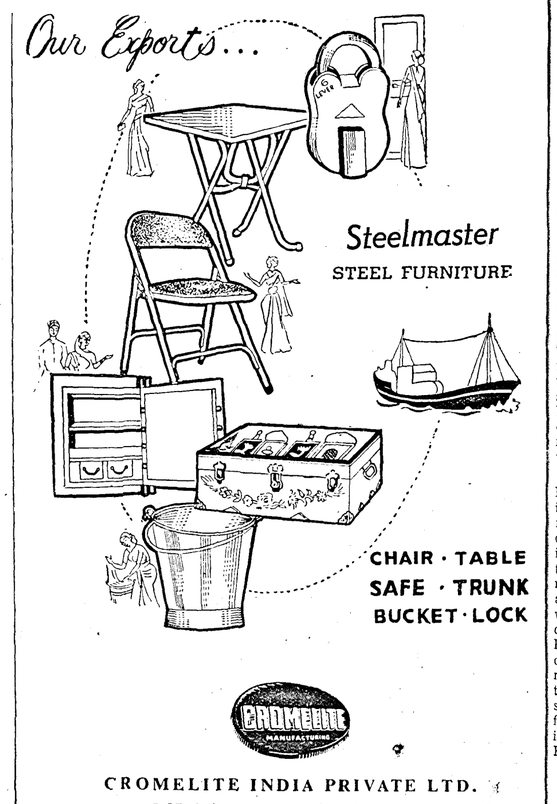
Influenced partly by the fact that the U.K. continues to be India's largest customer, some in India favour the strengthening of Commonwealth trade, as against Britain's participation in European integration. But India's import figures indicate a shift in the pattern of trade which cannot be ignored. There are several reasons for Britain's losses in India, such as the failure to extend credit and neglect of the Indian market. But it cannot be denied that a gradual change is coming over the traditional preference for British goods. Indian engineers and technicians no longer restrict their experience and education to the U.K., and this fact has an important bearing on the machinery and equipment preferred. Britain, no less than India, faces a competitive world. The former's fear of material loss if she stays away from developing conditions in Europe may well induce its leaders to overlook the disadvantages suffered by any of the less influential or persuasive members of the Commonwealth in deciding her future course of action. If *The Commonwealth and Europe* carries one message for India it is this: what India might lose out of European integration presses least on British minds. The fact that India has little to bargain for either with Britain or with the Community, has to be appreciated in order to effect the necessary adjustments to a situation over which she has no control.

Two recent developments, however, deserve attention. First, the independence or autonomy of many of the overseas territories of France and of the Belgian Congo has not affected their privileged position with the European Economic Community. This might serve as a precedent for Britain when she decides to join the latter herself. But it is unlikely to be of much help to the Asian members which have enjoyed over ten years of independence. Secondly, the independent States of Africa have claims to external assistance which cannot be overlooked, especially now that Russia has begun to take an interest in Africa. It is true that India's belief in her own special need for assistance is widely shared by the West. This is not, however, a matter that can be traded on for long. The repudiation of colonialism implies that no under-developed territory can be left to the responsibility of one country.

Two Impressions

Certain impressions need to be corrected. Outside India, it is apparently felt that India's protestations of interest in the export trade are not very serious. The Economist Intelligence Unit has discussed this point specifically. Business, it says, is satisfied with its opportunities in the home market, and the Government, although it does not say it in so many words, is well content with foreign aid. There seems to be some anxiety to remove this impression but how it will be done remains to be seen. There is a feeling in India that the Government pushes in the State Trading Corporation wherever it can. Trade as well as aid depend much on persuasion. Bad manners are contagious and ministerial bad manners particularly so





Association with European Common Market Brings Little Gain to Africa

No Danger of Discrimination Against Indian Exports

By

A SPECIAL CORRESPONDENT

IN spite of assurances and evidence to the contrary, the belief persists in many Asian and Latin American capitals that the association of certain African territories with the European Common Market entails serious discrimination in favour of one group of developing countries to the detriment of the rest. This discrimination is suspected to be dual: in trade, it means that tropical produce from those territories gains preferential access to the world's biggest importing unit, the European Common Market; and in aid, it means that those same territories have a prior, or even exclusive, claim on the west European capital surplus. Anxiety on this score has been the most important reaction of many developing countries, and not least India, to the progress of the Common Market, and it will be given full expression at the coming G.A.T.T. conference. Yet it is based on disregard of the facts. One wonders whether one does not see here the birth of a political "myth", *i.e.*, an emotionally coloured false belief held to in the face of contradictory evidence. Or, alternatively, whether certain capitals are not seeking an alibi in the "discrimination" theory for their disappointing performance in trading with, and borrowing from, Continental Europe.

Rome Treaty

Not that fears on this subject are entirely irrational. If one reads the Rome Treaty setting up the European Common Market quite literally and if one jumps to the conclusion that it is going to be translated into the facts word for word, then the possibility of discrimination emerges. In reality, this is not happening in any sphere: the treaty as implemented differs widely from the document signed in Rome several years ago, and it is facts, not intentions, which one is entitled to criticise. Yet even if the degree of association between Europe and Africa projected in the treaty were to be realised, several things would have to be borne in mind. The first is that all the tropical produce of the African associated territories could never meet western Europe's growing needs. If the Common Market bought every ton they had to offer, it would still have to trade extensively with the other producers. This is especially true if one takes quality, as well as quantity, into account: African grains and fibres are notoriously inferior to equivalent produce from some Asian and Latin American countries. Secondly, the only means the European Common Market has to give preference to African produce is by way of lower duties and bigger import quotas—but in practice, duties on raw materials and tropical produce are almost always low or nil, and quotas non-existent. So there was never much scope for trade discrimination in these goods, and what there was has been reduced by the return to freer trade. Lastly, the degree of association imagined by the authors of the Rome Treaty would probably not exceed, if it were realised, the cohesion of the British Commonwealth or, more exactly, the imperial preference system. In other words, the discrimination feared by countries such as India, Pakistan and Ceylon could not be worse than now suffered by raw material producers not belonging to the Commonwealth preference zone.

All of that supposes that the sections of the Rome Treaty dealing with association were fully implemented. In truth, that is not happening and remains quite improbable. First of all, it is too often forgotten that, while the African territories in question compete with a country like India in two or three products, they compete in just as many with European agriculture itself. Europe, after all, produces oilseeds, tobacco, sugar and many warm-climate fruits. Any attempt to give African countries freer access for all their produce to European markets will be, and is being, firmly opposed by powerful European interests much more effectively than outsiders could hope to do through G.A.T.T. Conversely, when those outsiders try to sell more in western Europe, they will find, for very many products, that the real obstacle is not Africa but the vested interests of protected European farmers.

Next, for those products which Europe cannot grow and where there is competition between the associated African States and other producers, an extensive diversion of buying orders from one zone to another is extremely difficult to effect, no matter how much tariffs and quotas are fiddled with. A wholesale change-over from one set of suppliers to another—such as is feared in some Asian capitals and such as may have been hoped for by some signatories of the Rome Treaty—is a figment of the imagination. Disregarding questions of quality and price (where it is certain that Africa will never have a notable advantage), where an industrialised country buys its raw materials depends to a large extent on where it sells its manufactures. West Germany, for example, is not going to stop buying coffee from Brazil and cocoa from Ghana at the risk of losing its markets for motor-cars and machines in those countries, for the sake of buying them from former French colonies in Africa of notably lower purchasing power—purchasing power, moreover, that is traditionally directed towards French goods rather than West German.

This point is crucial and concerns mainly West Germany. France already buys 60 percent to 70 percent of the exports of the African territories in question, without anyone complaining of discrimination. The damage that other developing countries fear could only come from a diversion of West German custom to those same territories. So little is this happening that West Germany is refusing to discriminate against her traditional raw material suppliers in favour of other Continental countries, let alone in favour of those countries' ex-colonies. For example, the European Common Market is currently shaken by a first-class row about German meat imports: France has a large meat surplus which West Germany—flouting at least the spirit of the Rome Treaty—refuses to buy because that will mean taking less meat from Denmark and Argentina. These two latter are countries which have very little secondary industry, and rely on West Germany for their machines, motor-cars, etcetera. Bonn declines to sacrifice those markets for manufactures even for the sake of a Common Market partner; the likelihood of her doing so for the sake of a mere "associate" is minimal. A country like India which has a large and unfavourable trade balance with West Germany (and for that matter with all the Common Market countries) has little to fear from a hypothetical diversion of trade.

Duty Reduction

Leaving the realm of fears for that of facts, one should examine what benefit the African-associated territories have so far drawn from the implementation of the Rome Treaty. The first duty reduction, of 10 percent, on 1st January, 1959, was extended by the Common Market nations to all members of G.A.T.T. and all nations enjoying the "most-favoured nation" clause, *i.e.*, to all the competitors of the African territories, who therefore gained just nothing. The second reduction, also of 10 percent, was similarly extended to all members of G.A.T.T., with the purely theoretical reservation that the new tariff on goods from outside the Common Market and associates could not be lower than the future common external tariff whereas new duties imposed inside that group could go below the external tariff. This reservation was theoretical because there is no case where goods from Africa are being imported into the European Common Market countries at duties lower than the common tariff while goods from outside are still paying that tariff.

On the other hand, West Germany decided to reduce her tariffs on *all* imports of such tropical produce as coffee and cocoa, from whatever source, to the level of the future common tariff. In other words, Bonn avoided the necessity of discriminating in favour of the associated territories by charging all suppliers lower duties. The African exporters thereby gained nothing in the way of favoured treatment, but all their competitors gained by meeting lower duties when they exported to West Germany. At least, they seemed to gain, because Bonn accompanied this reduction in import duties with an increase in excise duties on coffee, cocoa and tea which wiped out most of the effect of the lower tariffs. These excises are paid by produce from all sources, so once again Africa gained nothing. Quite the contrary, the excises are calculated not *ad valorem* but on weight, and since African produce is cheaper in price for the same weight, this was of advantage to producers of superior produce in Latin America and elsewhere. Far from gaining, the African producers of cheaper and inferior produce have lost. There is no way of preventing West Germany and eventually other Common Market countries from practising this subtle discrimination in reverse.

Liberalisation of Import Quotas

Anyhow, it needs to be recalled that import duties on many tropical products and raw materials were already nil in West Germany, Belgium, Holland and Luxemburg. So the stage-by-stage reduction of duties is meaningless here, and benefits nobody. The same applies to the liberalisation of import quotas; many tropical products were already entry-free, so a discriminatory increase in quotas is without effect—and in any case the increase has not been discriminatory but has been extended to many countries outside the European Common Market. Yet it must not be forgotten that the contract of association between the Common Market and its associates is reciprocal: for every concession the Continent makes to Africa, the African territories have to make a reciprocal concession. Thus, in return for "concessions" which, one has seen, are purely illusory, the African countries have had to concede the Continent lower duties and bigger quotas for imports of manufactures. India has not had to grant West Germany or Italy freer access to this country for their manufactures, but the African territories have had to do so. Admittedly, West Germany and Italy have thereby gained very little because the African territories are not big importers of manufactures. The main difference has been that instead of granting import licences valid for France or Belgium only, they have issued slightly larger licences valid for all the Continent. This scarcely represents a sacrifice on their part (because their suppliers in France and Belgium, faced with competition, have had to cut prices), but one can well understand that some African leaders consider that the "reciprocal" exchange of

benefits has in reality been all one way, and not to their advantage.

In brief, the first steps towards the European Common Market have produced no discrimination in favour of the associated territories, to the detriment of other developing countries. So alarmist critics of the association project must be thinking of the final stage when the Common Market will be fully realised. At that time, in theory, the Common Market will be surrounded by a unified external tariff, which goods imported from India, for example, will have to pay, whereas the same goods imported from Africa will pay lower duties and eventually none at all. Now, to assess the impact of that future situation on Indian exports to western Europe, one will need to know the level of the common external tariff in order to see what benefit Africa will enjoy in those cases where she exports identical produce of equal quality to western Europe. The first point to emerge is that for many raw materials, the external tariff will be zero or negligible, so that the African territories' advantage will be likewise. The second point is that the common tariff—where it exists—will be a compromise figure and thus represent an *opening up* of markets in the formerly high-tariff countries—Italy and France. Since these countries are substantial consumers of tropical produce, and since they have lately abolished the quota system, the reduction of their tariffs to the average level can be a significant advantage. That certain African territories will still have an advantage over exporters not associated with the Common Market will be much less important than the circumstance that the absolute amount of this duty difference will have been greatly reduced in these markets which were, till lately, virtually closed to imports from outside Africa.

Common External Tariff

Naturally, for the same reason—that the common external tariff will be a compromise figure—duties charged on the entry of certain Indian products into the low-tariff countries, such as West Germany and Holland, will be increased. But that is precisely why these countries are opposing the erection of the common external tariff at the end of this year. First, they have received permission from their partners to raise their tariffs to the common level very slowly, and it is clear that they are going to make every increase the occasion for a delaying-action engagement. Secondly, even before the common tariff has come into existence, they have got their partners to agree to reduce it by 20 percent. Thus Indian exports to a high-tariff Continental country will henceforth encounter duties which have slumped to the average European level and then 20 percent below that, while exports to a low-tariff country will encounter duties that will rise, if at all, only slowly and then never to within 20 percent of the old average. So the net effect of the change will be that the six-nation region taken as a whole will be more open to Indian goods than before, while the absolute amount of preference which competitive African goods enjoyed will have been reduced.

What this will mean in terms of rupees to Indian exports is something to calculate for each case, remembering that the list of products involved is extremely small. Meantime, one can understand that the Africans regard the proposal to reduce the external tariff as a betrayal of the original promise to give them substantial trade advantages in western Europe. It is quite possible that there will be isolated cases where certain Indian interests might be jeopardised by what is left of the association project. But that is a matter to take up with precise figures in hand, rather than with general complaints about trade discrimination, for this notion has been progressively emptied of content.

Discrimination in Aid

So much for discrimination in trade. Discrimination in aid may be more briefly dealt with because it has never been a serious issue. It has always been clear that a country which puts up an attractive project and exercises the customary political pressure is not going to find itself neglected by, say, West German lenders for the sole reason that one of France's ex-colonies also needs capital. The European Common Market did indeed set up a special fund to provide capital to these latter, but it has been hard put to find a use for its money. At the rate things are going, the trial period of five years (for the whole association project is simply on trial until the end of 1962) will run out without one-quarter of the sums available having been invested in the African territories. There are many reasons why West German aid to developing countries has not been more generous, but the association scheme is not one of them.

Moreover, at the end of the trial period (at the latest) all the African territories will have to renegotiate their connection with the Common Market and since most of them have achieved national independence since they were press-ganged into "association", they will want to alter the nature of that connection. If they choose to remain linked with the Common Market (some, such as Guinea, will simply drift away), but decide to opt for some other status than "association"—a status that recalls their recent colonial past—then they will have to renounce the right to draw on the Common Market's development fund. That fund is, in the terms of the Rome Treaty, open only to "associates" as these were defined when all the associates in question were European colonies. If they demand some other status, then they will have no more claim on west European capital surpluses than countries like Greece and Turkey, which are negotiating a special connection with the Common Market in return for allowing freer entry of manufactures from that region.

Concept of Association

More generally, the whole concept of association between the six nations of western Europe and certain African territories will have to be redefined within the next two years. The one certainty is that nothing will be left of it save what the Africans, who have meanwhile become sovereign, wish to accept freely. And in return for whatever arrangement they consent to make with western Europe, they will get nothing that the Germans do not wish to grant—and the Germans feel much freer today than in 1956-57, when France refused to go ahead with the Common Market unless West Germany agreed to help her colonies. Speculation about potential discrimination in favour of Africa to the detriment of other developing regions must be based on those two facts, not on extrapolations from the wording of the Rome Treaty.

It is ironical that the strongest argument that will be urged in western Europe and in Africa for retaining some discriminatory content in the status of "association" is this: whatever the limitations of the Euro-African trade club, it should not be disbanded until Britain and the Commonwealth have given up the remnants of imperial preference. In other words, the main motive for the association of certain African countries with the European Common Market—association which some people in this country profess to find dangerous and unfair—is envy of the benefits that India and other Commonwealth countries enjoy inside the imperial preference system.

ROLE OF E.F.T.A. IN REDUCING TARIFFS

MARKETS FOR U.K. INDUSTRIES LIKELY TO EXPAND

By

OUR LONDON CORRESPONDENT

BRITAIN'S well-being has depended since the first industrial revolution on exports, and their importance has increased with the size of the population and the growing use of imported raw materials. For a variety of reasons, these exports, at times, have failed to provide the purchasing power the country needs in the world market. But over the past few years, the U.K. has enjoyed rising prosperity, thanks to favourable international conditions and a shrewd domestic policy. As a result of this, Britain has succeeded in (a) maintaining a high rate of production and full employment without too many bottlenecks; (b) switching production rapidly to accommodate changing demand; (c) opening up new markets to replace inevitable losses elsewhere; and (d) building up an economy which, although still subject to setbacks due to unfavourable developments, is sufficiently strong to take full advantage of any which happen to be favourable. The restraints and restrictions of the last two years have had the effect of leaving Britain in a good position to make the most of the opportunities which may lie in the future.

Risks of Exclusion

Both Canada and the U.S.A. have been quick to see the potential expansion of sales arising from the bigger markets of the new groupings in Europe and also the risks of exclusion. As far as Britain is concerned, some of the good recovery in trade with European Common Market countries—particularly with West Germany—duing 1959 may prove temporary. Already there is much concern over the ultimate effects of Common Market tariffs against some U.K. products in the countries with relatively low tariffs, especially in Germany, Holland and Belgium, where the prices of some British goods have had a slender margin of advantage. Against this must be set the benefits to be gained from Britain's participation in the "outer seven" European Free Trade Area. Although these are considerable, the United Kingdom's best hope obviously lies in the emergence of freer trade throughout Europe as a whole; at present, this seems to be a matter of negotiating from a relatively weak position in order to arrive at a compromise before present trading patterns are irrevocably changed. Although the outlook is unsettled, Britain's exports to Europe should still share in the general growth of business. But first, what is this area and what does it hope to achieve?

Spectacular Growth

The spectacular growth of trade in western Europe since the foundation of the O.E.E.C. in 1948 shows how much can be achieved through economic co-operation. To this development, "liberalisation"—the joint removal of quantitative restrictions on trade—has made a major contribution. It has proved possible because—to quote an O.E.E.C. report—there has been a common understanding among all countries that the freeing of trade is a powerful means of stimulating productivity and raising the standards of living in member-countries. The success of the move towards freer trade depended also on an adequate system of multilateral payments—an objective effectively achieved through the European Payments Union. Because the system effectively embraced the whole of the sterling, franc and guilder areas and also because of subsequent agreements between certain members of the Union and other countries—notably in South America—the growing payments freedom in Europe was extended overseas. During this period, national economic policies in western Europe came to be determined, as never before, with knowledge and consideration of the policies of fellow-members of the Organisation. This circumstance cannot but leave its mark as new tasks are tackled, including the present pioneering work for a planned demolition of the other main prewar barrier to trade, namely, tariffs. Although in early discussions of the Marshall Plan, the Brussels Customs Co-operation Group was set up—producing incidentally the Brussels Nomenclature, basic to all later studies of tariff reduction—the O.E.E.C. itself was not able to give much attention to the tariff problem before 1956. In the spring of that year, the low tariff countries —Belgium, Denmark, Luxembourg, the Netherlands, Norway, Sweden and Switzerland—moved for a reduction of tariffs on goods marketed mainly in Europe.

New Approach

A new approach towards the dismantling of tariffs arose from the desire of six O.E.E.C. members to make more rapid progress. The six were France, West Germany, Italy, Belgium, the Netherlands and Luxembourg, countries which first joined together to form the European Coal and Steel Community. In Messina in 1955, they approved the objective of a common market, and in March 1957, enacted the Treaty of Rome to establish the European Economic Community. The object of "the Six" was to abolish tariffs between them in ten to 15 years, establish a common tariff with the outside world, and to promote a close association in economic and social matters. In the broadest sense, this was seen by the Six as part of the growth towards European unity. In this spirit, the O.E.E.C. sought in 1957 and 1958 to establish a framework in which all its members could associate with the Community. The main proposal was for a "Europe-wide free trade area" which would abolish trade barriers between its members but leave them free to choose their own Customs tariff and trade policy outside. The suggestion—explored intensively within the O.E.E.C.—was that the E.E.C. should be complemented by a wider "free trade area", which could embrace all the O.E.E.C. countries, both those able to accept its full obligations and those for whom special arrangements would have to be made.

Low-tariff Countries

The need to look for such a solution was dictated by the special circumstances of particular countries. The Scandinavians and Switzerland, for example, are traditionally low tariff countries and their economies have developed by being wide open to the outside world. For them, joining a Customs union would have meant putting up their tariffs in opposition to their normal liberal trade policy and against the interests of suppliers all over the world; and it would have threatened the large part of their income which is derived from international trade. For the United Kingdom, membership would have been incompatible with its relations in the Commonwealth and its other worldwide financial and commercial functions. Moreover, the strongly political aspiration and the supra-national character of the E.E.C. made membership incompatible with the policies of neutrality of some E.E.T.A. members. So the proposal for a European Free Trade Area embracing both the E.E.C. and the other members of the O.E.E.C. was not found acceptable by all parties, in spite of 18 months of intensive study on a multilateral basis. To preserve the momentum towards trade freedom, and to avoid returning to a pattern of bilateral arrangements, the seven O.E.E.C. countries with the most clearly defined common position were able to move on, nevertheless, to establish a free trade association among themselves—the E.F.T.A.—which, while still holding out a hand towards the E.E.C., has begun to confer the advantage of trade freedom on their own 90 million inhabitants.

In founding the E.F.T.A., the seven countries which met in Stockholm have given a clear demonstration of their continuing faith in the multilateral approach which has been the O.E.E.C.'s outstanding contribution to international economic behaviour. The E.F.T.A. has no aims for political unification of the seven member-countries. It allows for a wide variety of membership; and in spite of some wide differences of population and economic strength, all members have the same voting powers at the conference table. Internally, it is hoped that the direct effect of this association will be to strengthen the economies of the members by promoting expansion of economic activity, full employment, rising standards of living and financial stability. Externally, it will offer opportunities for world trade expansion. The most important step is that member-States will progressively abolish their tariffs on imports of goods originating in the area, starting with the reduction of 20 percent made on 1st July, 1960. The process will be completed not later than 1st January, 1970, by means of 10 percent reductions on 1st January, 1962, 1st July, 1963, 1st January, 1965, and on 1st January of each year after that up to 1st January, 1970. This timetable is designed to enable the seven countries to eliminate their tariffs in step with the E.E.C. countries, and there is provision for revision if it should become desirable. Members undertake to abolish quantitative restrictions on imports of goods from the area at the latest by the end of ten years, and for that purpose will increase their import quotas by at least 20 percent each year. But this will not detract from the wider obligations of members on import restrictions, and it is no part of the intention of the seven countries to use quotas to create a preferential system between them.

Origin Rules

Member-countries are free to retain or change the differing level of their tariffs against countries outside the area. Thus there will be no common external tariff of the group. This means that "origin rules" have had to be worked out, to distinguish between the products of member-countries which enjoy the benefits of tariff removal, and products of other countries. These rules require a percentage of the value of the goods to be added in the area, or the fulfilment of certain processes within the area to enable goods to qualify for E.F.T.A. treatment. In addition, there is an extensive list of basic materials which will count as being of area origin when incorporated in manufactured goods, whatever may have been their original source. This means that there will be no pressure on manufacturers to use raw materials produced within the area rather than those imported from outside. There are also rules designed to secure fair conditions of competition, for example, on Government aids (including export aids), on restrictive practices, on dumping, and on freedom of establishment. A general escape clause allows a member-State to take certain temporary protective measures in cases of serious difficulty for a particular sector of industry, resulting from the removal of tariffs and quotas, or where necessary to safeguard the balance of payments. There are arrangements on agriculture and fish having regard to the special considerations and conditions relating to these. These arrangements are designed to facilitate the expansion of trade which will provide reasonable reciprocity to member-countries whose economies depend, to a great extent, on exports of these products.

Fair Competition

The convention drawn up by E.F.T.A. is, therefore, a practical instrument, containing the minimum necessary rules for the progressive removal of trade barriers in conditions of fair competition. Though firm, it is fiexible. Its operation will be supervised by a council, but the E.F.T.A. sets out with the least possible constitutional and official apparatus. It does not envisage the establishment of a substantial central organ or secretariat, relying rather on the spirit of co-operation already existing between its members and on the resources already available in the O.E.E.C. The convention of the Seven is liberal and outward-looking in its character, and it is their conviction that it will be in the best interests of Europe that a wider agreement should be characterised by the same features. But there is no imprint of perfectionism on this convention. It allows for the improvements which should be suggested with the accumulation of experience. Its main provisions are flexible and can be adapted easily to the needs of a wider European association. History and

National Rayon
spins yarn from the bounty of nature

Fashionable fabrics at a low cost—that is the promise of Nature's bounty when spun into Rayon by NRC.

There is bounty of another sort as well: Rayon makes subsidiary chemicals which are vital to many diverse industries; it provides full-time employment to 500,000 workers; affords invaluable training and experience to chemical engineers and technicians, and conserves India's foreign exchange.

This bounty is truly a gift well-timed for this country.

geography have made the seven E.F.T.A. countries into—above all else—trading communities. Long coastlines made five of them maritime pioneers, and the central position of the other two on the trade routes of Europe made them important commercial centres since early times. Of the trade of the Seven today, four characteristics are outstanding. First, they rely to a great extent on the division of labour between countries, and their total international trade is, therefore, substantial. Secondly, a great deal of this trade is reciprocal: they send 18 percent of their exports to each other and get 16 percent of their imports in return. Thirdly, they are an integral part of the trading network of western Europe as a whole and do something like a quarter of their total trade in both directions with the E.E.C. countries. Finally, they have extensive trading connections with the rest of the world, with which—in spite of the closeness of European links—they do three-fifths of their foreign business. Among the seven are nations with some of the highest living standards outside North America; and it is these high living standards which make them some of the world's most desirable markets.

Broad Contrast

There is a broad contrast between the United Kingdom, which is predominantly an importer of food and materials (three-quarters of total imports) and the other six E.F.T.A. countries, which are predominantly importers of manufactures (ranging from just under three-fifths to nearly three-quarters of their national imports). While most of them are, in different spheres, among the leaders of western manufacturing techniques, their individual economies are not sufficiently diversified to satisfy anything like all their own requirements. This complementary aspect of their economies is one of their strongest links. Three-fifths of Denmark's exports, for example, are agricultural, and nearly two-fifths of her agricultural exports help meet the industrial needs of the United Kingdom. In return, the Danes get over a fifth of their imported supplies from the U.K. In 1958, the value of the imports of E.F.T.A. countries from each other was about $3,000 million. About one-third of the total imports of the Scandinavians came from within the E.F.T.A. area: the U.K. imported over $850 million from the Scandinavians.

Foreign trade, in fact, plays a greater part in the affairs of the E.F.T.A. group than in the E.E.C. This, and the link between trade and living standards, is illustrated rather dramatically by three figures. Whereas the population of the E.F.T.A. group is little more than half that of the E.E.C., its combined national income is about two-thirds, and its combined imports and exports three-quarters. Switzerland and Austria have particularly strong trading ties with their Continental neighbours, drawing more than half their imports from E.E.C. countries. All the E.F.T.A. group looks in varying degree to the industrial centres of the E.E.C. for some of their manufactured imports: in fact, some 45 percent of their supplies under this head come from the Six. Portugal, Norway, Sweden, Denmark and Switzerland buy *more from* the E.E.C. countries as a whole than they sell to them. Federal Germany has a particular dependence on markets among the Seven, where she sells more of her manufactures (27 percent of the total in 1957) than she does among her E.E.C. partners (24 percent).

The Seven also have important markets and suppliers in other parts of the world. Swiss watches and precision machinery, Portuguese cork and wines, Scandinavian paper and fish products, Austrian instruments and fashion goods, are marketed outside Europe on much the same scale as within. In return, most of their imported food and raw materials come from outside western Europe, together with some important manufactures. The United Kingdom takes more than a third of her imports from the sterling area, where it markets two-fifths of her exports, and now looks to the United States as its biggest single market. As dependent on international trade as any group of nations anywhere in the world—and far more dependent than most—the seven E.F.T.A. associates are no defenders of the *status quo*. They desire as resolutely and intensely as their friends in the E.E.C. to take a further move forward in European economic integration; and by moving parallel to the E.E.C. they hope to facilitate co-operation with the E.E.C. in a wider O.E.E.C. framework in the interests of a further growth in world trade.

Enlarged Home Market

Like any free trade area, the E.F.T.A. will confer upon member-countries all the advantages of an enlarged home market, further developments in the division of labour, and a more efficient allocation of resources. Increasing activity is likely to add moreover to the demand for imports

E. F. T. A. and E. E. C: HOW NATIONAL OUTPUTS ARE MADE UP

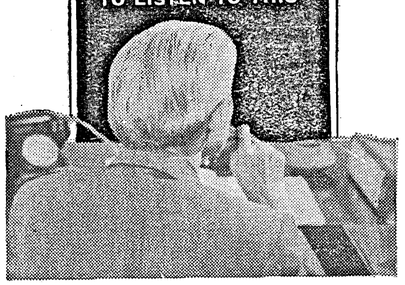
TOP MANAGEMENT WILL WISH TO LISTEN TO THIS



All over the world, Insurance protection for employees while in service and satisfactory benefits on retirement have become accepted features of sound business management. Life Insurance and retirement incomes are indeed being regarded as a primary need as essential as food, clothing and shelter.

Progressive employers in our country are realising that the introduction of such employee benefits results in improved employer-employee relations, higher efficiency and increased production. An ever increasing number of prudent employers are adopting the Group Insurance and Superannuation Schemes—employee Insurance and retirement schemes streamlined and perfected by the Life Insurance Corporation of India.

Today top management wants to know what exactly these Schemes can do for them, what the financial implications are likely to be and what precisely is the nature and scope of the benefits offered. Broadly, the Schemes fall into two categories.

Group Insurance Scheme: offers low cost Life Insurance coverage on a Group basis to employees and gives real security to their dependants.

Superannuation Scheme: provides a source of steady and life-long pension to employees after their retirement (with or without Life Insurance cover).

Some features common to both Schemes are :

1 They can be instituted without any extra cost to the employer

2 Employers' contributions to such Schemes are allowed as normal business expenses for the purpose of income-tax

3 Most of administrative work with regard to these Schemes is done by the Life Insurance Corporation of India.

Special features of Group Schemes :

1 For groups of prescribed size, attractive reduction in premium rate is allowed

2 All the members are covered under a single Master Policy

3 Flexibility—the benefits can increase from year to year.

The Group and Superannuation Schemes create a new atmosphere of employee loyalty and a sense of gratitude. They operate like a voluntarily organised Social Security Insurance in miniature.

Please let our Group Representative come and explain the details to you without any obligation whatsoever.

There is no substitute for LIFE INSURANCE

MORE FOREIGN EXCHANGE FOR THE NATIONAL PLAN

Extensive international trade is essential for the development of national economy. A country's foreign trade largely depends on efficient banking service.
With a network of correspondents at all important trade centres of the world the **United Bank** is equipped to render adequate service and give expert guidance in matters of foreign trade.

United Bank of India Ltd.

HEAD OFFICE: 4, CLIVE GHAT STREET, CALCUTTA-1

Foreign Agents and Correspondents in:—

U.K., U.S.A., Australia, Canada, France, Belgium, Holland, Germany, Norway, Sweden, Switzerland, Italy, Japan etc.

from all sources, and the outward-looking character of the arrangements will allow outside countries also to share in the benefits. The prospect for business is good. For many export industries —and potential export industries—freer trade will provide the essential conditions for expansion, and as the plan comes into effect, there will certainly be readaptations to take advantage of them. These will reinforce the process of growth in changing conditions, which is a necessary feature of industry in the age of technology and the rapid development of overseas markets.

It is notable that industry itself in the E.F.T.A. countries was pressing for some such development in April 1958. In a joint statement, issued by the industrial federations and employers' organisations of Austria, Denmark, Norway, Sweden, Switzerland and the United Kingdom, it was said: "Our motive in coming together was to see whether, from the point of view of industry, agreement could be reached, between us on the principal features of a free trade area, and we report with satisfaction that such agreement has proved possible...Within the framework of existing international obligations, a free trade area should have as its objectives (i) to encourage a freer and wider international exchange of commodities, goods and services, not only in western Europe but with the rest of the world; (ii) to promote the widest possible system of multilateral trade and payments; (iii) to stimulate the emergence of a rational structure of production in western Europe; and (iv) to promote conditions favourable to a high and stable level of employment". In August 1959, representatives of trade union centres from Austria, Denmark, Norway, Sweden, Switzerland and the United Kingdom, also considered the E.F.T.A. plan. They welcomed it and attached the greatest importance to the reference to full employment, increased productivity, and the rational use of resources, and underlined the declaration of a need for sustained expansion of economic activity in each member-country.

A Great Challenge

In September 1959, the president of the Federation of British Industries, Mr. W. H. McFadzean, declared: "There is certainly plenty of scope for a further increase in the exports of many of our goods, and a great challenge to our exporters to do so, particularly from the machinery, vehicle and metal-working industries, chemicals and a wide range of textiles." But he went on to say: "I feel that it would be quite wrong if we were to look at the new association and the advantages it offers solely in terms of the favourable treatment which we shall, incidentally, be giving one another. We must always keep right in the forefront of our minds the other great objective...the formation of a bridge with the Six."

Suppliers from all over the world have a stake in seeing this market grow. In relation to national income, there is probably no other area so dependent on imports. Whereas imports form 3 percent of U.S. national income, for the United Kingdom the figure is 16 percent and for the Continental E.F.T.A. countries it is still higher at 25 percent. As importers, the seven countries together are nearly one-and-a-third times as important as the American market. This is an area of high industrial development and progressive living standards; and the demand for capital and consumer goods, already high, is likely to intensify as the E.F.T.A. plan matures.

Britain and E.F.T.A.

So much for a general background to E.F.T.A. How will it affect British firms and their trading prospects in Europe? Since the other members of the Association include some of the most prosperous States in western Europe, it is obvious that there are big opportunities for increasing trade between the Seven. All the indications are that British industry should do very well in taking advantage of these opportunities; Britain is the only large country in the group, and the only country possessing a manufacturing capacity capable of producing the greater part of the full range of modern industrial output. Nevertheless, the industries of several of the other members, while not as wide-ranging as those of Britain, are highly efficient. This means that several U.K. industries can expect sharp competition from the Seven. This is likely because the British tariff is relatively high, which means that most U.K. industries have in the past enjoyed much more substantial portection from foreign competition than have the majority of industries in other members of the Seven. As far as the effects of the Association on the trade of its members are concerned, three things stand out. The first is that there will be substantial new opportunities for British exporters, mainly at the expense of Germany. It looks as if the Association will not create a great deal of new international trade, but that it will divert a considerable amount of the imports of the other members, notably, Scandinavia and Switzerland, to British sources of supply away from other countries, notably, Germany. The second thing is that it would be unwise to exaggerate the prospective amount of this trade diversion, because the typical level of Scandinavian and Swiss tariffs is already quite low. For example, most machinery going into Sweden, Denmark and Switzerland pays less than 10 percent as duty. Lastly, it seems quite likely that some British industries will feel the squeeze—including perhaps some that are not expecting it. The reasons for this are that the typical U.K., tariff on manufactures is quite high, the British average being around 17 percent. All the same, the European Free Trade Association will provide considerable opportunities for efficient British industries, even though it is far from being a full or an ideal solution to Europe's trading problems.

In all discussions of the "Six," the "Seven" and more hypothetical trade groupings in Europe, there has been no certainty about each country's net loss or gain under an altered tariff system. It is easy enough to speak of new opportunities and competition, but much more difficult to predict exactly where they will arise. Now, however, P.E.P. which last year listed the present and ultimate tariffs and the trade volumes of the European Common Market and E.F.T.A. countries, has followed this up by a detailed study of the likely shifts in Europe's trading pattern when the new tariff structures have taken shape. The paper, originally prepared for an international meeting of research groups early this year, is now published with the title *Trade Diversion in Western Europe* (P.F.P. 5s). The survey does not attempt the obviously impossible task of precisely assessing each country's balance of advantage under the new arrangements. There are clearly too many imponderables, such as varying degrees of new enterprise, the uncertain force of tradition, and the influence of outside nations, for this to be possible. The principal conclusion is that as the west European nations import manufactured goods chiefly from each other, the Common Market and E.F.T.A. groups will themselves feel the main impact of diversions of trade in manufactures, while countries outside the area

will be most affected by any diversion of Common Market and E.F.T.A. imports of manufactures.

Division of Sales

Since both groups' tariffs are low or non-existent on most raw materials, this is where present suppliers are likely to be least affected. But the ultimate Common Market tariff on wood-pulp may affect Swedish suppliers, while Canada and Norway may suffer from its duty on aluminium. In foodstuffs, the French and other overseas territories of the Common Market may gain some ground over Latin-American and African suppliers of coffee and cocoa, but Commonwealth dairy and meat sales are unlikely to be much hurt by E.F.T.A. arrangements. On the vital question of trade in manufactures, the survey forecasts considerable diversion of sales, mostly leading to a greater supply of needs within each European group. This concentration may be quite marked for machinery, but E.F.T.A.'s larger machinery imports from the "Six" are likely to fall and there should be clear opportunities in this field for increased British sales to E.F.T.A. nations. In chemicals, it is suggested that sales to the European Common Market will be discouraged by the final tariff, while gains in British sales to E.F.T.A. will be small except in plastics. In cotton and synthetic textiles, clothing and footwear, however, E.F.T.A. should gain in the Common Market, although losing in woollen goods. In the field of motor-cars, the survey records that some Scandinavian countries which are not producers impose revenue duties which may not be removed under the E.F.T.A. system. This might restrict the substitution of British for Continental sales to Scandinavia, although there should be some opportunities here.

Another general survey of the subject has recently been undertaken by the Economist Intelligence Unit under the sponsorship of Britain in Europe Ltd, and has been published by the former under the title *The Commonwealth and Europe* (Price 42s). In view of the concern voiced at the meeting of Commonwealth Finance Ministers at the prospects of the U.K.'s involvement in European economic unity, it is interesting to find from this massive and valuable study of Commonwealth and European trade that the Unit has come to the conclusion that Britain could seek closer relations with the Six Common Market countries without violating the principles of the Common Market or harming Commonwealth trade. The authors point out that almost all raw materials from the Commonwealth already enter the Six and Britain duty-free. If anything, the creation of the Common Market in Europe will increase the demand for raw materials, which form a high proportion of total imports from Commonwealth countries. The main problem—if Britain adopts the common external tariffs of the Six—will be over the import of temperate agricultural produce, tropical foodstuffs and Commonwealth manufactures, especially cheap Asian goods. But these, the study concludes, can be solved to the advantage of the Six, the Seven (European Free Trade Area) and the Commonwealth.

Main Criterion

The main criterion for Britain will be "that imports from the low-cost Commonwealth producers to Europe, as a whole, should not decline as a result of European integration, and should, indeed, be given a chance to expand as consumption rises." As for tropical foodstuffs, the study argues that Britain should be able to persuade her European partners to modify their protective system. In particular, she could improve export prospects for Nigeria and Ghana, who are at present threatened by the preferences which the Common Market countries extend to their overseas territories. Finally, a merger between Britain (with other members of the Seven) and the Six should strengthen Britain's hand in advocating low tariffs on manufactured goods and enlarged quotas for the whole European market. With these tariff arrangements, which should be acceptable to both the two European trading groups and the Commonwealth, "no obstacle of an economic or commercial nature remains to prevent Britain, with its E.F.T.A. partners, from merging with the Six."

Probable Effects

While the general overall picture of British economic co-operation with Europe appears to be favourable, it is obvious that each industry must naturally examine the problem from its own standpoint. So far, only the probable effects of E.F.T.A. on the U.K. engineering industry appear to have been examined in any detail. Imports of engineering products by Continental members of the E.F.T.A. are large by any standards; and between 1956 and 1958 they increased by a quarter. In 1958, they were worth £754 million, nearly £130 million more than imports of the same goods by the U.S.A. and the U.K. combined, and nearly three-quarters as much as imports by Common Market countries. Of Continental members of the E.F.T.A., Sweden and Switzerland are easily the largest exporters of engineering products. In 1958, Sweden supplied 9 percent of the area's imports and Switzerland 2½ percent. The great bulk of other supplies came from the Common Market (mainly West Germany), the U.K. and the U.S.A. Between 1956 and 1958, the Common Market's share of the total increased from 52 percent to 57 percent, while the United Kingdom's share fell from 19 to 15 percent and the U.S.A.'s share from 12 percent to 9 percent. West Germany increased its share from 40 percent to 43 percent and other European Common Market countries from 11 percent to 14 percent. A closer look at the United Kingdom's performance shows that her total sales amounted to £114 million in both 1956 and 1958. A fall in sales to Norway offset increases elsewhere:

IMPORTS OF MACHINERY AND TRANSPORT EQUIPMENT

	1956			1958		
	£ million	of which, from the U.K. £ million	Percent	£ million	of which, from the U.K. £ million	Percent
Portugal	34	9	27	45	10	23
Denmark	78	19	24	94	20	21
Sweden	169	38	22	216	39	18
Norway	143	34	23	193	28	14
Switzerland	106	11	11	110	12	11
Austria	71	4	5	97	5	6
Total	601	114	19	754	114	15

The table shows that in 1958 Britain supplied well over half the area's imports of tractors. At the other extreme, her share of the machine tool market, in which West Germany held the dominant place, was a mere 7 percent. She fared quite well in the market for boilers and steam and internal combustion engines (28 percent of the total), commercial vehicles (20 percent), textile machinery (18 percent) and mechanical handling, construction and mining machinery (16 percent). Motor-cars and electric machinery and appliances accounted for nearly a third of the area's imports of engineering products. The United Kingdom supplied only 14 percent of the market for motor-cars, 13 percent of the market for electric machinery and appliances.

Important Changes

On 1st July, members of the E.F.T.A. introduced two important changes: (1) import duties (other than revenue duties) on goods eligible for Area tariff treatment were cut by 20 percent. (2) Bilateral quotas for E.F.T.A. countries were "globalised" (that is, added together and opened to all) and increased by 20 percent. Where quotas are nil or negligible, the basic quota is set at a reasonable figure and increased by 20 percent. Members' present tariffs on engineering products are complex, particularly in the cases of Switzerland and Portugal, and cannot be adequately summarised. On the whole, rates are the highest in Austria and the lowest in Switzerland and Denmark; Norway and Sweden come between the extremes. Portuguese rates vary greatly, and tend to be high on consumer goods. Swiss and Norwegian rates for motor-vehicles include a revenue element as the table at the top of this page shows.

Since most imports are already free from quantitative restrictions, the quota increases will affect the market less than the tariff reductions. For example, among engineering products, Switzerland restricts only motor-vehicles; Swiss quotas are nominal in the case of motor-cars, but very restrictive for commercial vehicles. Sweden has a generous bilateral quota for U.K. motor-cars and light commercial vehicles, and quotas are not onerous in Denmark and Norway. Portuguese restrictions include quotas on motor-vehicles and other consumer durables. Austria restricts a wide range of products, and here the U.K.'s competitive position should improve considerably.

As the E.F.T.A. gets under way, there should be increasing opportunities to sell British engineering products. From 1st July, U.K. goods have begun to benefit from Area treatment. Although the initial tariff cuts represent only a small proportion of the present selling price in low-tariff countries, even there buyers get an increased advantage from importing British goods. This should be of interest particularly to cost-conscious importers of components and other industrial products. Moreover, goodwill between E.F.T.A. countries is itself awakening interest in mutual trade. These opportunities can be exploited, however, only through a strong sales effort in E.F.T.A. countries. Britain's failure to expand sales between 1956 and 1958 suggests that much attention needs to be given to organisation and advertising. But, in this large and rapidly growing market, the rewards for enterprise should be great.

Methods of Estimating National Income in India

The Difficulties of Accurate Calculation

By S. KESAVA IYENGAR

THE national income concept originated in England about 300 years ago, but appreciable progress in computation, analysis and interpretation has been achieved during the last 30 years. As a U.N. publication has said: "An examination of the origins of national income estimating, its evolution from rather crude beginnings to a fairly advanced analytical tool and planning aid, its present structure and uses, and the possibilities for its further improvement, must be rewarding to anyone concerned with the future of economic analysis and measurement." Among the pioneer researchers were Bowley, Stamp and Keynes (Britain), Simon Kuznets (U.S.A.) and Rao, Shirras, Mukherji and Ghosh (India). The second World War stimulated income studies. But even by now, not much advance has been made, although the ground covered so far has not been unsatisfactory.

Inherent Difficulties

There are numerous inherent difficulties, more in underdeveloped areas. The contribution by factors like climate, tradition and philosophy of life to net national well-being, has yet to be estimated even approximately. While these non-economic factors closely influence the economy, there are numerous loopholes in national income estimates on account of the extent to which money economy operates, and the proportion of utilised to unutilised goods and services. It is said that monkeys in India eat away food sufficient for 20 million people annually. During the season, thousands of rural families live entirely on *sithaphal* and jack fruit. Some recent sample surveys have shown that disguised unemployment in urban areas is much higher than is usually guessed. Value is attributed to sand and limestone after carting, but the quantities available but not used are worth hundreds of crores. There is no relation between price and calorific value: during season, a basket of *sithaphal* sells at 8 annas, while rice sells at 12 annas a seer with much less calorific content. Internal purchasing power parities often differ from exchange rates, and international equations suffer from this handicap. A further hurdle is the adoption of different techniques in different countries, and by different agencies in the same country (as for instance, by N.S.S., I.C.A.R., I.S.I., R.B.I and C.S.O), which inevitably lead to inferences saddled with varying percentages of error. In countries like India, the organised sector of economic activity is rather insignificant compared with the unorganised, whether it be in distributive services, trade, agriculture or hand industries. In assessing income from the unorganised sector, the statistician cannot but guess, not infrequently under a rule of thumb, in some cases by intuition, by analysis in the rest. For example, in India, separate estimates are made for the gross value of the output of crops other than fodder crops, livestock, fishing and hunting, and for the various deductible costs, such as waste, seed, cattlefeed, and maintenance of farm and equipment.

Basic Source

The basic source is the yearly agricultural crop statistics which include information on area under cultivation, normal (long-run) and current yield an acre for the main crops, here and there tested by crop-cutting experiments. The output of forest products is based on official information for reported areas, extended to cover unreported areas on the basis of a percentage of the yield an acre of woodland for timber, and a higher percentage of the yield for fuel of that in the reported sections. The National Income Unit experiences the same difficulty as Dr. V. K. R. V. Rao had in estimating income from small enterprises, a substantial portion of which is carried on in the household. Coverage is not complete on the various categories of earnings, and wherever actual figures of earnings are not available, these figures in similar industries are used. The average current value of a rural house in 1950-51 was obtained from the National Sample Surveys and was applied to other years with adjustments based on wholesale food price indices. As income from rural property is almost entirely an imputed item, the rental value of rural houses is estimated on the basis of rural interest rates. The National Sample Surveys prepare data on depreciation, cost of repairs and maintenance. It is no surprise, therefore, that while Rao put the error margin at 6 percent (general), the National Income Unit placed the margin at 10 percent, 33.3 percent in small enterprises, commerce and transport, professions and liberal arts, domestic services, and house property. Mukherji and Ghosh conducted some consumption surveys which, according to them, yielded fairly comprehensive data on the average expenditures for household of the rural population. It was then multiplied by the number of such households to obtain the data.

Unreliable Statistics

Even Departmental statistics are highly unreliable because the collection of data is often not intelligent and honest, and the degree of unreliability has been in direct proportion to the difficulties of verification. Particularly in district boards and municipalities, data have sometimes been even misleading. Very recently, a municipal corporation list showed the number of street beggars at less than 800, but actual enumeration showed the strength at beyond 5,000! A rural university was proclaimed, but when the auditor insisted on inspection in spite of alleged impossibility of transport, it was found to be a small number of cattlesheds and cowherds! Not all Government Departments are equally technically qualified to collect and maintain reliable and adequate statistics (this obtains even in the U.S.A.), and sample surveys have been rare all over the world, although the slogan goes that every U.S. family on relief is tracked and plagued by at least half a dozen socio-economic investigators.

Computation, analysis and interpretation depend for their success on the degree of homogeneity and standardisation among different avenues of economic activity. But in India, while in religious and social matters, the degree of standardisation is fairly high, the economic aspect presents a mixed picture. In soils, rainfall, seed and crop, variation as between field and field and village and village is uncertain and cannot be easily determined. This is the root cause of the uncertainty of figures relating to agricultural production. It happened that two Central Ministers gave out different figures concerning foodgrains production in the country in the Lok Sabha, on the same day for the same year! There have been widely varying estimates concerning the marketable surplus of foodgrains, and stocks hoarded by profiteers.

Special Agencies

Special agencies have been developed for the task of estimating national income and expenditure, like the Brookings Institute, National Industrial Conference Board, the National Conference on Research in Income and Wealth, and the National Income Division of the Department of Commerce in the U.S.A., the Central Statistical Office in London, and the Central Statistical Organisation in New Delhi. Annual white papers are issued by the Central Statistical Organisation in London and New Delhi. *Survey of Current Business* is the journal which publishes national income data in the U.S.A. Quarterly estimates are prepared in the U.S.A., and most of the preparatory work is done by the concerned departments. A number of methods have been adopted for the purpose of meeting peculiarities in different sectors, like the income-distributed method, net output method, simplified commodity flow method, determination of the net values at factor cost, of import and export values, etcetera. Sources of information are diverse like income tax data, censuses of production, social security data and special questionnaires. Additions or subtractions are made to avoid double counting and to distinguish between the domestic supply of goods and the transactions with the rest of the world.

Principal heads of information in the U.S.A. are wages and salaries (private, military and government civilian), employers' contributions for social insurance, other labour income, proprietors' income (business, professional and farm), rental incomes, corporate profits and inventory valuation adjustment, and net interest. Items of expenditure comprise personal consumption expenditures (durable, non-durable and services), gross private domestic investment (new construction, residential, non-farm, other, producers' durable equipment), net exports of goods and services, and government purchases of goods and services (federal, national defence, other, less Government sales, Central, State and local). The gross national product is analysed into national income, disposable personal income (after allowance for personal tax and non-tax payments), personal consumption expenditures and personal saving. In the U.K., the heads are more or less similar. In the U.S.A., gross national product and personal savings are given both at current prices and at 1954 prices. In the U.K., gross national product is presented at current prices, at 1948 prices and at 1954 prices. In India, income is classified under: (1) agriculture, animal husbandry and ancillary activities, (2) mining, manufacturing and small enterprises, (3) commerce, transport and communication, (4) other services, (5) net domestic product at factor cost made up by items 1-4, (6) net earned income from abroad, and (7) national income (5+6).

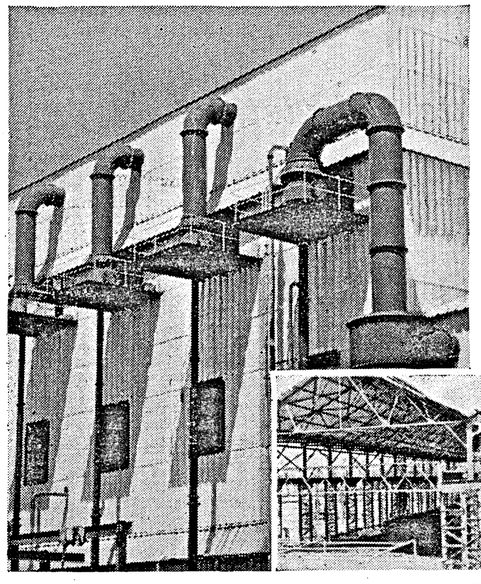
Detailed distribution of national expenditure has yet to be taken up by the recently appointed Mahalanobis Committee. *Per capita* consumption throws more light than *per capita* income, but even here, variations among different income ranges and social strata have rarely been enquired into. "The break-up of consumption expenditure would also help in the evaluation of policy for controlling inflationary pressures in the economy and also for deciding on measures for channelling savings into investment". There is the National Income Unit and the Conference on Research in National Income Studies, which are struggling hard to expand and modernise Indian national income and expenditure data.

Defective Calculations

Several calculations have been defective on account of the allotment of disproportionate weightages as well as incomplete data. In a speech in Bombay on 31st August, 1960, the Governor of the Reserve Bank pointed out how according to the Central Statistical Organisation, only ½ percent was contributed to the national income by the organised banking sector. Actually, scheduled banks received about Rs. 2,000 crores of deposits in 1959-60, and advanced about Rs. 1,100 crores. A solid contribution was made by them towards plan projects in industry, agriculture and transport. Bank accounts rose to Rs. 54 lakhs, and the number of banking offices to 1,329 in semi-urban and rural areas. The Reserve Bank of India itself contributes Rs. 40 crores a year as net profit to the Central Government and another Rs. 40 crores may be spent on working expenses, etcetera. But all this amounts to much higher than ½ percent of the national income. "There are inherent limitations in the interpretation of statistics which cannot give an idea of the qualitative aspects of sectoral components". And organised banking covers but a small fraction compared with indigenous banking, for which there are neither rules nor accounts.

Conflicting Base Years

In advanced countries generally, base years for important statistics relevant to the national income are the same. For example, in the U.S.A., 1947-49 is the base year both for the wholesale price index and the consumer index. Several international indices are worked on 1953 as the base. But here in India, for reasons not clear nor imaginable, base years differ over important information, and the lay reader is often led to inaccurate conclusions. It is not too late even now. The Mahalanobis Committee would do well to introduce some order by fixing a single base year for all national statistics. The list below shows the irrational adoption of different base years which might have been due to historical accidents, but



Sinews for Industry

B.E.W'S engineering activities embrace all types of structural steelwork, the fabrication of tanks and vessels, the manufacture of sugar and chemical machinery, light forgings and all types of ferrous and non-ferrous castings, site erection of steelwork and plant, ship repairs, the manufacture of spares for a wide range of industrial plants and an emergency breakdown service.

B.E.W'S large new establishment at Meenambakkam near Madras provides the sinews for South India's industries and is contributing to the rapid industrialisation of the country.

for the continuance of which there is no justification:

Index	Base year
Wholesale prices	1952-53
Working class cost of living	1949
Agricultural production	year ended June 1950
Industrial production	1951
National income	1948-49

Difficulties of Interpretation

Difficulties peculiar to the interpretation of Indian national income estimates deserve careful assessment, while adjudging the connotation of income figures. This is a vast country with widely varying incomes as among different regions (as for example, between Bombay and Rajasthan), among earners in different occupations (see Table I below), and among different social strata.

TABLE I

NET OUTPUT AN EMPLOYED PERSON: INDIA (1950-51)

	Net output (in crores of Rs.)	Number of persons engaged (in crores)	Net output an employed person (in Rs.)
Agriculture	4,890	10.36	500
Mining and factory establishments	620	0.37	1,700
Small enterprises	910	1.15	800
Railways and communications	220	0.14	1,600
Banking, insurance and other commerce and transport	1.470	0.97	1,500
Professions and the liberal arts	470	0.64	700
Government services (administration)	430	0.39	1,100
Domestic service	130	0.29	400
Net domestic product at factor cost	9,500	14.32	670

Lowest income ranges cover a very high percentage of families, and average *per capita* income or expenditure (including all social strata) presents a picture much brighter than real in terms of human well-being: averages are "neither fish nor fowl". There have been some sample surveys here and there indicating the trend of distribution as among different income ranges, and the national sample surveys have also given figures. But these data are valuable only as very rough indicators. In the general community socio-economic survey of Hyderabad-Secunderabad city area, 8,312 earners were found to belong to different income ranges as shown below:

TABLE II

INCOME RANGES: 1954 HYDERABAD SURVEY

Income range	Number of earners	Amount (Rs. a month)
1-25	2,022	30,098
26-50	2,615	97,528
51-100	1,924	1,36,287
101-200	1,069	1,56,054
201-500	533	1,66,309
501-1,000	102	83,733
1,001-2,500	35	60,125
2,501-5,000	6	22,302
Over 5,000	6	56,900
Grand total	8,312	8,09.336

The following table shows the precentage distribution of rural households according to N.S.S. (1951):

TABLE III

PERCENTAGE DISTRIBUTION OF RURAL HOUSEHOLDS BY SIZE OF MONTHLY EXPENDITURE (N.S.S.)

Expenditure a month (in Rs.)	Proportion of total number of households (percentage)
Up to Rs. 50	20.4
51-100	31.2
101-150	21.1
151-200	10.4
201-300	9.5
301-400	3.6
401-500	1.5
501-600	0.6
601-800	1.0
801-1,000	0.3
Over 1,000	0.4
Total	100.0

The following observations by the National Sample Survey are too sweeping to deserve acceptance, particularly in view of the fact that there are very wide variations in the standard of life, not only as among cities, towns and villages, but also as among different regions, different occupations and different income ranges: "According to the third round of the National Sample Survey, the consumption expenditure a person a month in the villages (including the imputed value of supplies obtained in kind) was Rs. 24.22 during August-November 1951; in the towns it was Rs. 31.55 and the average for Calcutta, Bombay, Madras and Delhi Rs. 54.82. The average expenditure a person for the country as a whole was Rs. 25.70 a month. The patterns of consumption in the villages, towns and cities were also different. While about 40 percent of the expenditure in the villages was on foodgrains, the proportion for the towns was 22 percent and for the cities 11 percent. The expenditure on all food items was 66 percent of the total expenditure in the villages compared with 55 percent in the towns and 46 percent in the cities. The actual expenditure on food in absolute terms was, however, higher in the cities than in the towns and villages. About 43 percent of the total consumption in rural areas was obtained in kind and 57 percent purchased in cash. The proportion of the part obtained in kind was high for articles such as foodgrains, pulses, milk and milk products and fuel and light, and varied between 61 percent and 78 percent. The proportion for all food items taken together was about 56 percent. Against this, only 11 percent of the total value of consumption in the urban areas was obtained in kind, while the remaining 89 percent was against cash. Here again, the proportion for non-cash consumption was relatively high in the case of foodgrains, pulses, milk and milk products and fuel and lighting. For the country as a whole, during August-November 1951, nearly 40 percent of the value of consumption was obtained in kind."

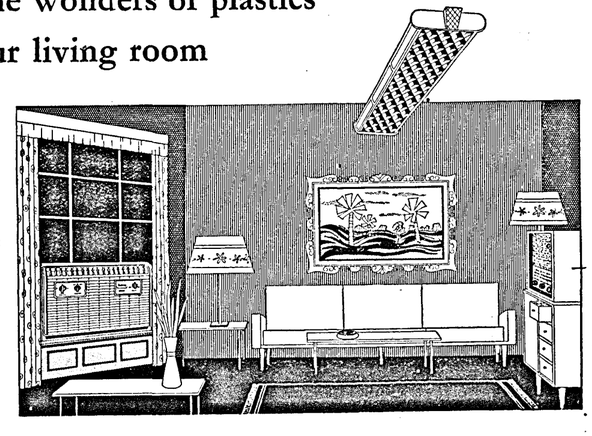
Status of India

Internationally speaking, India occupies the forty-fifth rank according to *per capita* income (in U.S. dollars) at $64, belonging to group IV, the average income of which is $94. The break-up of income is 46.2 percent (agriculture, etcetera), 37 (industry, etcetera) and 16.7 (services). According to the extracted table given below, (Table IV), *per capita* income is highest in the U.S.A. ($1,864) and lowest in Kenya ($54). Income from agriculture is highest (73.7 percent) in Haiti, and lowest in the U.S.A. (4.3 percent), and in spite of this, U.S. agricultural output commands more influence abroad than either the $19,000 million worth of gold or the 20,000 atomic bombs. On the other hand, income from industries is highest in Czechoslovakia (83.0 percent) and lowest in Haiti (16.3 percent). Income from services is highest in Israel (36.9 percent) and lowest in Nigeria (8

PLASTICS IN EVERYDAY LIFE...FOR BETTER AND MODERN LIVING

Bring the wonders of plastics into your living room

The plastics age is here. In time to come almost everything for the house will be made of plastics. Even to-day plastics hold out exciting possibilities to decorate and furnish your home. In the living room plastic radio cabinets, air-conditioner exteriors, plastic table fans, lamp shades, tray-table, photo frames, ash trays, dinner ware, colourful and decorative wall panels, and other decorative items are contributing to gracious living.



STYRON — POLYSTYRENE *the most extensively used raw material in the plastics industry*

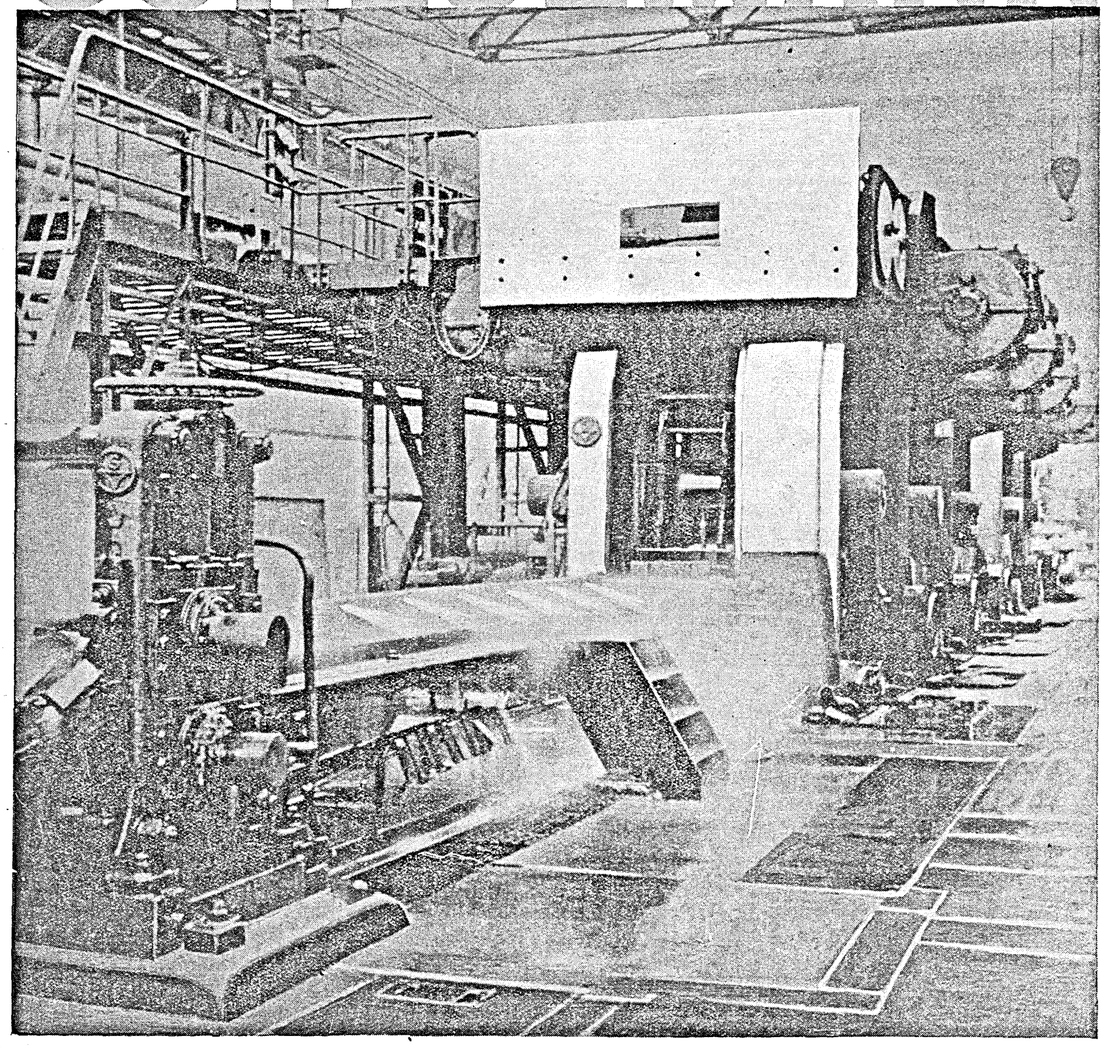
SCHLOEMANN



Finishing train of a SCHLOEMANN Strip Mill

plant for India's heavy industry

25 years ago it was that SCHLOEMANN—a German mechanical engineering company, then practically unheard of in India — received its first order from a progressive Indian company.

Since then, SCHLOEMANN have participated increasingly in India's industrial expansion...supplying the finest in plant and equipment that help produce the basic materials for a higher standard of living.

Of the many nationally important undertakings that have chosen SCHLOEMANN machinery are TISCO, Hindustan Steel at Rourkela, TELCO, the Mysore Iron & Steel Works, and the Indian Steel & Wire Products Ltd.

Today, SCHLOEMANN—a well-known and trusted name the world over—are proud to be able to offer Indian industries the very latest plant...in the very same spirit of technical co-operation existing since that first order from India 25 years ago.

- Rolling Mills for Ferrous and Non-Ferrous Metals
- Counterblow Hammers
- Hydraulic Presses
- Extrusion Presses

average annual increase	8.55	3.14	2.81		2.71	2.45

TABLE VII

NATIONAL INCOME FIGURES : U.S.A.

Year	G.N.P. at current prices 1950 base : simple	G.N.P. at 1954 prices : simple
1950	284.6	318.1
1955	397.5	392.7
1956	419.2	400.9
1957	442.8	408.6
1958	444.2	401.0
1959	482.1	428.0
Average annual increase	7.71	3.84

A close study of Tables 5, 6 and 7 must lead to the following important conclusions:

(1) In countries like the U.S.A. and the U.K., *per capita* figures are not important because population increase is very slow. National income figures are accepted as the barometer.

(2) As among current prices, constant prices with 1948 base, and at 1954 prices, the last reflects the progress in national well-being, in the best way. In the "India Project" of M.I.T., 1952 was adopted as the base.

(3) The average with yearly step presents a more correct figure than a simple average for the whole decade. For example, the respective percentage increase in gross national product at current prices is 7.71 in the U.S.A., 8.55 in the U.K., and 4.42 in India. The respective figures descend to 3.14 (U.K.) and 3.10 (India) at simple rate at 1948 prices (figures are not available for the U.S.A.). The percentages further go down to 2.71 in the U.K. and 3.84 in the U.S.A. at 1954 prices (figures are not available for India). Calculations with yearly step yield 2.45 percent in the case of the U.K. at 1954 prices (figures are not available for the U.S.A. and India).

Window-dressing by Planning Commission

On the other hand, the emphasis by the Planning Commission on national income and the simple average, appears to be due to considerations of window-dressing, and not of scientific interpretation. On account of the rapid rise in population (at more than 2 percent a year), urbanisation and the steep rise in the expectations due to fanning by the promises of political parties, national income figures lose all significance, and *per capita* figures with constant prices and with yearly step is the only relevant one. The Planning Commission has been indulging in theoretical and academic casual connection and uniform multiples as between investment and output. To put it mildly, the first two plans and the draft third plan again and again harp on figures like a 42 percent increase in national income, 25 percent increase in *per capita* income (it may not be more than 1.5 percent simple for the second plan period), stepping up savings from 8 percent to 11 percent, consumption to 16 percent and investment to 14 percent to 16 percent. In this connection, some details about 1959-60 are symbolic of the general trend. An increase only of 0.5 percent is expected in national income compared with 1958-59, but assuming the increase in the population at 2 percent during the year, *per capita* income goes down by 1.47 percent. According to the Central Statistical Organisation, *per capita* income at 1948-49 prices will go down from Rs. 293.6 in 1958-59 to Rs. 291.3 in 1959-60, and this is the tenth year of planning! This indicates a repetition of the situation in 1957-58. The main cause for a downward trend has been attributed to poorer agricultural production: in 1958-59, out of Rs. 800 crores additional national income at 1948-49 prices, Rs. 570 crores were contributed by agriculture. The prospect in 1960-61 is equally discouraging: there have been floods in Orissa, Assam and Bihar, and drought in Andhra Pradesh and Mysore. Vagaries of the Indian monsoons are a normal feature, but without any regularity, method or proportion. In such a predicament, for the third plan to aim at 28-percent increase in national income would be too optimistic: Governor Rockefeller's ambition is to raise *per capita* income in the U.S.A. to 4 percent with yearly step, and the same rate is advocated for Britain by Sir Roy Harrod.

Chinese Achievement

According to an enquiry by the Massachusetts Institute of Technology conducted by Professor Wilfred Malenbaum, the behaviour of gross national product in China and in India during 1950-58 was as shown in Table 8:

TABLE VIII

GROSS NATIONAL PRODUCT IN INDIA AND CHINA DURING 1950-58

Year	India: G.N.P. in crores of Rs. at 1952 prices	India: Ratio with 1952 as base	China: G.N.P. in crores of Rs. at 1952 prices	China: Ratio with 1952 as base
1950	10,100	93.7	11,004	81.1
1951	10,370	95.9	12,570	92.6
1952	10,810	100	13,572	100
1953	11,440	105.8	15,412	113.6
1954	11,780	109	16,384	120.7
1955	12,010	111.1	17,032	125.9
1956	12,610	116.7	19,442	143.2
1957	12,680	117.3	20,484	150.9
1958	13,000	120.3	22,500	173.2

The director of this piece of research observed that this comparative success of China was not due to the democratic or the totalitarian methods of approach in the two countries, but "a Government aspiring to economic expansion needs to define the tasks of growth realistically; moreover that Government must implement them faithfully".

Colin Clark on Economic Growth

In a recent article in the *Financial Times*, Colin Clark calculated that a doubling of the standard of living in 25 years would involve a net increase of 2.8 percent compound in real income *per capita* a year, apart from the effect of more leisure on workers' standards. He is positive that this rate of increase has not been achieved in any part of the world at any time. According to him, the annual rate of increase has been in recent years 2.3 percent in the U.S.A., 1.3 percent in Britain and between 2 percent and 2.5 percent in other industrially advanced countries. In the post-war recovery, Italy and Japan attained slightly higher levels than 2.8 percent. Clark has calculated that Britain would be able to double her standard of living in 55 years at the present annual rate of 1.3 percent. He fears that by that time, Britain would have been overtaken by other advanced countries in production a man-hour and *per capita* real income. He thinks that two prerequisites are necessary for improvement, namely, a clear realisation of the recent and present small improvement annually, and the implementation of an accelerating policy of free trade and lower taxation. In the face of these figures and observations, the Planning Commission's ambition of doubling the Indian standard of life in 20 years, is nothing more than a dream.

Sectoral Contributions

On the subject of contributions by different sectors to the national income, the following two tables give details for the 1948-49 and 1958-59 quantities and percentages. It is obvious that agriculture's contribution to national income is proportionately decreasing. It is equally obvious that the percentage increase as between 1948-49 and 1958-59 was more satisfactory in the non-agricul-

tural sector (138.4 percent) than in the agricultural sector (129.0 percent).

TABLE IX

NATIONAL INCOME BY INDUSTRIAL ORIGIN
PERCENTAGE DISTRIBUTION : INDIA

	1948-49	1958-59
Agriculture		
1. Agriculture, animal husbandry and ancillary activities	48.1	48.4
2. Forestry	0.7	0.6
3. Fishery	0.3	0.6
4. Total of agriculture	49.1	49.6
Mining, manufacturing and small enterprises		
5. Mining	0.7	1.1
6. Factory establishment	6.3	9.0
7. Small enterprises	10.1	8.1
8. Total of mining, manufacturing and small enterprises	17.1	17.2
Commerce, transport and communications		
9. Communication (post, telegraph and telephone)	0.3	0.5
10. Railways	2.0	2.6
11. Organised banking and insurance	0.6	1.0
12. Other commerce and transport	15.6	12.8
13. Total of commerce, transport and communication	18.5	16.9
Other services		
14. Professions and liberal arts	5.0	5.1
15. Government services (administration)	4.6	5.9
16. Domestic service	1.4	1.4
17. House property	4.5	4.0
18. Total of other services	15.5	16.4
19. Net domestic product at factor cost	100.2	100.1
20. Net earned income from abroad	0.2	0.1
21. Net national output at factor cost national income	100.0	100.0

TABLE X

CONTRIBUTION TO NATIONAL INCOME BY THE AGRICULTURAL AND NON-AGRICULTURAL SECTORS AS BETWEEN 1948-49 AND 1958-59 : PERCENTAGE INCREASE : INDIA

Year	Contribution of agricultural sector to national income	Contribution of non-agricultural sector to national income
1948-49	100.0	100.0
1949-50	102.6	101.4
1950-51	102.1	102.5
1951-52	104.5	105.9
1952-53	108.2	110.5
1953-54	117.2	114.8
1954-55	118.4	119.3
1955-56	118.1	124.1
1956-57	123.5	130.7
1957-58	116.0	134.1
1958-59	129.0	138.4

With each year as unit, there is little change in the proportion of contribution by primary and secondary production, and a deterioration in commerce, transport and *communications*. Compared with 1958-59, there was a reduction of 3.9 percent in agricultural outturn proper, the contribution of which accounted for 38.7 percent of the total national income in 1959-60, compared with 40.5 percent in 1958-59. Sectoral contributions (provisional) during 1958-59 and 1959-60, and a comparison as between the two years, are given in table XI:

TABLE XI

SECTORAL CONTRIBUTIONS DURING 1959-60 (PROVISIONAL), COMPARED WITH 1958-59

Sectors	Percentage contribution to total national income 1958-59	Percentage change in 1959-60 over 1958-59	Contribution to the overall increase in 1959-60 over 1958-59
Agriculture (proper)	40.5	— 3.9	—1.58
Mining and factory establishment	8.2	+ 8.1	+0.66
Communication	0.4	+ 4.0	+0.02
Railways	2.4	+ 5.7	+0.14
Organised banking and insurance	0.9	+10.8	+0.10
Other commerce and transport	15.2	+ 1.7	+0.26
Other sectors	32.4	+ 2.8	+0.91
All sectors	100.0	+ 0.5	+0.51

Different priorities for different sectors make it more difficult to assess income from the different avenues.

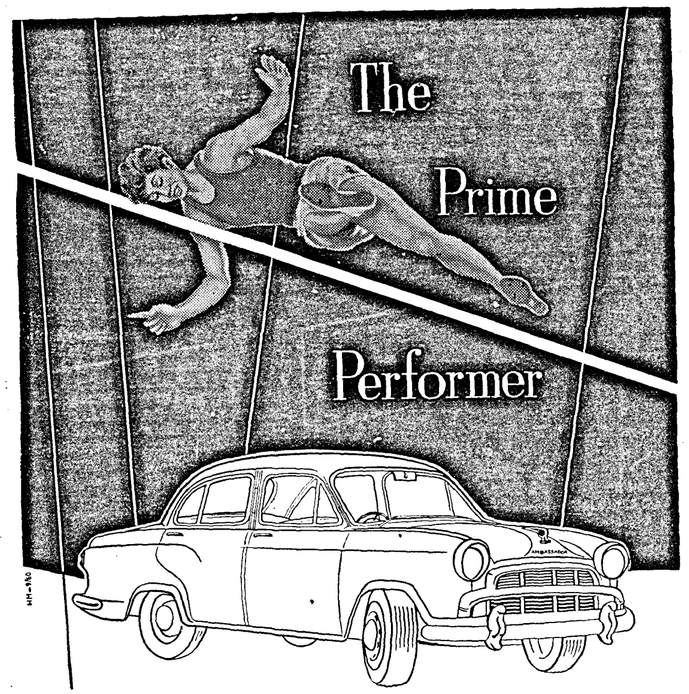
Physical Achievements

Abjas, averages and percentages apart, achievements of physical targets of production throw more light on Indian economic progress. The following statistics are encouraging because the 1960-61 target is just round the corner:

Item and Unit	1950-51	1960-61
Foodgrains (cereals and pulses) million tons	52.2	75.0
Oilseeds (million tons)	5.1	7.2
Sugarcane (gur content) million tons	5.6	7.2
Cotton (million bales)	2.9	5.4
Jute (million bales)	3.3	5.5
Community development coverage (1955-56)		
Number of blocks	1,064	3,100
Number of villages	150,000	400,000
Number of population (in million)	80	200
Co-operatives (1950-51 to 1958-59)		
Agricultural primaries (No.)	105,000	183,000
Agricultural primaries (membership in million)	4.4	12.0
Irrigated area (in million acres)	51.5	70.0
Chemical fertilisers (in tons)	55,000	360,000
Reclamation of waste lands (in million acres)		3.9
Finished steel (million tons)	1.0	2.6
Aluminium (thousand tons)	3.7	17.0
Diesel engines (thousands)	5.5	33.0
Nitrogenous fertilisers (thousand tons)	9	210
Cement (million tons)	2.7	8.3
Coal (million tons)	32	53
Cotton textiles—mill cloth (million yards)	3,720	5,000
Handloom cloth (million yards)	742	2,125
Sugar (million tons)	1.10	2.25
Paper and paper board (thousand tons)	114	320
Bicycles (organised sector only) (thousands)	101	1,050
Automobiles (number)	16,500	53,500
Railway freight traffic (million freight tons)	91	162
Railway lines (miles)		+1200
Railway tracks doubled		+1300
Electrified		+880
Locomotives (number)	8,200	10,600
Coaches (number)	19,200	28,900
Wagons (number)	199,000	354,100
Roads : surfaced (miles)	97,500	144,000
Commercial vehicles	116,000	200,000
Shipping (g.r.t.) thousand tons	396	900
Post offices	36,000	75,000
Telegraph offices	3,600	6,300
Telephone connections	168,000	475,000

Rather laborious, these figures indicate appreciable improvement in the economic sphere, in spite of serious defects in national income calculations, analyses and interpretations. But compared with the U.S.A., China and the U.K., national income has increased at a much lower pace. Reasons are not far to seek. Individual enterprise has been brushed aside unceremoniously and incentives practically deadened through doctrinaire policy-making and academic labour legislation. With land ceilings, Prohibition, the language controversy and the reorganisation of States, a psychology of doubt and uncertainty is pervading men's minds. Production has gone down as a consequence. A socialist society should be built on broad-based distribution, not on obsolete processes of production.

It is common knowledge that heavy industrialisation has been proceeding apace, with the inevitable result of not only restraining but reducing consumption and thus the national standard of life. "It will, however, be necessary to restrain consumption in order that sufficient resources become available for investment". The goal of a welfare State cannot fit in with this rather frenzied "State investmentarian" policy: if further pursued, that would result in something like killing the goose that laid golden eggs. On the contrary, the tempo of planning is bound to elevate standards of life, both actual and aspired for. The scope for importing foreign private capital, raw materials and consumer goods is very good, and if only the Government of India should pull down artificial barriers against imports and exports, and reduce stifling taxation, it should be possible to raise the annual rate of increase in *per capita* income and consumption.



Fine performance in a car depends on many factors — power, controls, balance, springing—in fact, the entire conception and construction of the car.

The Ambassador passes this test handsomely. The amazing Over-head Valve Engine gives you 25% more power and 25% more economy. The controls are responsive and easy to manipulate. It corners wonderfully, and the springs furnish a smooth ride. In fact, every component and part of the Ambassador is designed to contribute to a superb performance !

THE INFLUENCE OF MANAGEMENT ON PRODUCTIVITY

ROLE OF THE MIDDLE EXECUTIVE

FEW words have become so synonymous with progress as productivity. It is increasingly recognised that the level of productivity of industry and agriculture will determine the rate of progress in India. The purpose in this article is to identify productivity with management, and the relationship between the two can be best described by the following quotation from Peter Drucker's *The Practice of Management:* "To make an enterprise out of resources, it is not enough to put them together in logical order and then to throw the switch of capital. What is needed is a transmutation of the resources and this cannot come from an inanimate resource. It requires management."

In an industrial undertaking, there are three distinct types of management functions—direction, administration and execution. The discussion here will be limited to the executive function, and concentrated chiefly on middle management, whose status has not been very distinctly defined in management literature, but on whose leadership and judgment hinges the productivity of labour and capital. In a large or medium-sized industrial enterprise, the framework of policies is laid down by the board of directors. The managing director and his immediate associates or aides work out the methods and procedures through which the policies are to be translated into action. The associates are normally responsible for one or a group of

By

A SPECIAL CORRESPONDENT

functions, namely, production, sales, accounting, etcetera. Each of them is responsible for giving shape to the objectives of the board through their respective operating units or organisations.

The Middle Management

At the head of each of these operating units or departments, there is a manager who receives instruction from one of the associates of the managing director about his main task, his administrative jurisdiction and the policies which have to be followed while implementing the task. This executive, who may be called a departmental head, functions as the mainspring of the enterprise for activising its entire work. To the powers above, the executive is also an emissary from the members of his department, where he commands a team of supervisors and the rank-and-file employees. He is the man in the middle, subject to pressures from both directions. He has to be adaptable in making decisions and carrying them out, in functioning as a subordinate, and also in providing leadership for those under his command. He is the key man whose job is to avoid administrative bottlenecks.

Organising Departmental Production

Take the case of the superintendent of a boiler shop in a factory manufacturing locomotives. He is informed by the works manager that an order has been received for a certain number of boilers of two different types to be delivered within a specific period of time. On receiving the order, the superintendent of the boiler shop gets in touch with the drawing office to work out the details and specifications of the boilers required. On the basis of these, he prepares, in consultation with his supervisors, the list of tools and spares he will need, and his manpower budget. He then discusses the requirements of tools and spares with the production planning superintendent who, in consultation with the superintendents of the machine shop and the forging shop, prepares the list of materials which can be manufactured in these shops and also determines the dates of delivery.

The boiler shop superintendent has to bring to his aid the art of diplomacy, a show of power, patience and influence, so as to convince the superintendents of the machine and forging shops of the urgency of his needs. Next, he has to check what materials are available in the stores. Finally, he prepares the list of materials which are to be secured from outside. The purchasing officer has to be informed of the requirements, stating the priority of delivery on each item. The superintendent then confers with his supervisors, and explains to them the requirements and details of the work that has to be done by each. Finally, a time-schedule for the entire job is prepared in the department. Then follows a continuous process of follow-up, inspection and innovation. Discussions take place between the supervisors of the various departments concerned with particular items. But all these discussions and arguments are related to, and draw sustenance from, the estimates, forecasts and decisions taken by the heads of each department. In the ultimate analysis, the manufacture of boilers will depend on the knowledge which each of these departmental heads has of the respective jobs, of the men and of their capacity. On the planning and the action taken will depend the earnings of the workmen of the department in the shape of an incentive bonus (if there is any such feature in the department) and also the production cost of the boilers. The departmental heads become the pivot on whom depends not only the productivity of the boiler shop but also of the entire division.

If it is found that a particular item has not been manufactured or forged to the required specifications and has to be returned, or if the superintendent of the boiler shop forgets to sign a particular stores or purchase requisition, or if he neglects the inspection of a fabricated material, the tempo of work will slow down. Continuous delay in the supply of material will affect the morale of the workmen. Ultimately, due to the inadequacy in planning or follow-up by the superintendent, or due to shortcomings in the progress and planning department, or due to a mix-up in the purchasing department, the required number of boilers might have to be manufactured by making the men work overtime, during the last stage of the target period, thus raising the cost of production. It may also happen that, even after the completion of the job, some of the boilers will remain in the shop, crowding out other orders, because the inspecting officer from the Government, with whom the superintendent of boiler shop is not very friendly, fails to keep his appointment. During the production of the boilers, there will be occasions when workers in groups will march to the office of the superintendent, complaining against the non-availability of man-coolers and the supply of cold water, provision for which should have been made months ahead but was neglected. There may be differences of opinion between the workmen, the time-study man and the superintendent about piece-rates. In the midst of these pressures, the departmental head will have to continue to attend meetings with senior officers, sit on the works committee, production and cost meetings, supervise the preparation of returns, receive and take V.I.P.s round the shop, preside over farewell and long-service award meetings, and deal with the day-to-day problems of grievances and discipline.

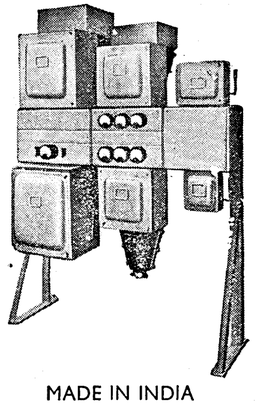
Second Part of the Job

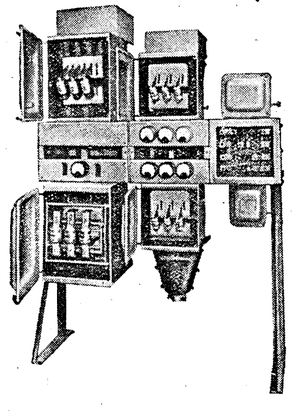
What has been stated above, although it makes the job of the boiler shop superintendent look formidable, is just one part of his function. Here he is shown as the individual who puts the means

IF IT'S SWITCHGEAR CONSULT

AEI

for True Unit Construction





MADE IN INDIA

Type MC Fuse-Switchgear

The design of type MC fuse-switchgear means greater flexibility in service because of the unit construction principle. The equipment is easier to fit, so cutting installation costs and contractors' overheads. It is easier to maintain, since all component parts are easily removed. Available in all ratings up to 500 amps and 660 volts.

of production in a logical order. In terms of the objectives of the enterprise, however, his primary function is to transform the resources placed at his disposal, and to make them fully productive. The resources cannot grow and develop by themselves. The inanimate resources need the knowledge, intelligence and drive of human resources. The second part of the job of the superintendent of the boiler shop is, therefore, to energise the human resources available in his shop for transforming the materials into boilers. It will be his task to make the individual "personality" of his supervisors and men react correctly to the resources. As a catalytic agent, he has to balance and guide the friction between these two so as to bring the impact of his personality on the men working under his command and inspire and sustain their interest in the task. The challenge for the superintendent, therefore, is not so much in the achievement of mastery over physical environment or finance. It is in the achievement of humane and satisfactory inter-personal and inter-group relationships. In other words, as far as middle managers are concerned, the ability to lead men takes precedence over the traditional problems of production. There is, however, no dichotomy between good human relations and technical efficiency. Efficiency depends on the attitude of men as well as on the technical methods of production.

Changing Needs of Management

From what has been stated above, the conclusion is that the superintendent has to possess both technical competence and a capacity for leadership. When he does a poor job, it is rarely intentional or a result of irresponsibility. More often, a lack of know-how or sheer inability to cope with the situation gives rise to his difficulties. Therefore, if good middle managers are needed, they have to be educated and trained. Significant changes have taken place in the skill and art of "being a boss" during the last 20 years. Technical changes have brought to factories a different quality of workmen needing special handling. There is now a wider realisation of the democratic concept of fair play and equality. Governmental regulations have introduced an element of rigidity and complexity in the employer-employee relationship which was undreamt of a few years ago. Further, in a planned economy, a manager, in addition to his traditional responsibilities, has a precisely defined social purpose. He has to operate within a framework of thinking and laws which give him less freedom, while calling for greater effort.

The situation is further complicated by the existence of parliamentary democracy, where those opposed to the Party in power have the freedom to criticise and act against the implementation of the plan. They thus put managers in the country at a disadvantage, in comparison with the managers in other planned economies where mobilising the people for implementing the plan is a task effectively undertaken by the Party in power. The need for organised management education and training, the need to give managers of all grades a professional concept of their jobs and help them to acquire professional ethics and discipline, has, therefore, become a very pressing need.

Developing a Middle Manager

No two enterprises consider the problem of management development in the same way. The American Management Association's exhaustive two-year survey of management development, completed in 1954, disclosed that "there is no standard procedure for developing management personnel". There are no "ten steps or rules" for management success. A prerequisite for the success of management development is the general recognition that management is a profession from the top to the very bottom. Once this is accepted, management development is for the most part adult education, which must include formal schooling in the higher theory of the profession.

Promotion to the rank of departmental head, as well as subsequent promotions to higher management positions, acquire the quality of rather appalling finality. Normally, when a promotional mistake is discovered, most managements adopt diversionary tactics to neutralise the person by such courses as circumscribing his authority, reducing his responsibilities or passing him on to unsuspecting colleagues. An enterprise should, therefore, recognise the danger inherent in selecting an individual haphazardly for a position in middle management. It is impossible to suggest a foolproof method of selection by which one can determine with accuracy the capacity of an individual for the job of a departmental head. But what is important is the attention given to minimise promotional mistakes.

Initial Selection Important

Most organisations are committed to a policy of promotion to middle management from within. A faulty first selection, therefore, inevitably leads to errors in the subsequent selections at higher levels. Care and discretion should be exercised in making the initial selection of first-line supervisors, so that selections for positions higher up the ladder are not made from second-rate material. It is important to assess the capacity of the prospective candidate to enlarge his job, and his desire and drive to develop through education and training.

One further point about picking middle management material is worth noting. In most industrial organisations—especially those which believe in promotion from within—the "locus of decision" is fairly low. The process of filling up a vacancy in the post of, say, a foreman in the shops of such an enterprise would follow the pattern of the general foreman making a recommendation to the superintendent, who in turn would relay the recommendation up the line to the chief superintendent or the works manager—who would almost invariably ratify the recommendation. The chances are that the general foreman and the superintendent will recommend a person who is perhaps the seniormost chargehand and barely fulfils the minimum academic qualification, who has been easy to handle, and whose personality meshes with theirs

man's faith

Faith that makes man aspire, strive ...
awakening him to tasks in the early-glow of dawn.
That melts rock, shapes granite; transforms
still waters to surging power.

A faith in the living future:
in a world that offers a little more—
a little less of the care, a little more of the joy.
Faith that gives meaning to life.

Today, as in the past, our products help to make homes cleaner, healthier, happier. But today we are also working for ... **Tomorrow,** when the evergrowing urge for better living will demand still greater efforts. And we shall be ready with wider service, new ideas, new products ...

Today and Tomorrow...Hindustan Lever serves the home

PR. 6-X52

—in short a good "organisation man" and not one who may "rock the boat". It is true that authority should be close to responsibility, and, further, that such decisions are approved at a relatively high level. But approval is not a true exercise of judgment, and in opening the gate of management to individuals who in due course have to discharge the responsibility of managing a department, one should be cautious and circumspect.

Appraisal System

The only alternative is to use an objective appraisal system, and to train the departmental head in appraising his subordinates. The appraisal should not, however, be confused with the filling of annual confidential reports. The experience of a large engineering firm is of interest in this context. In this firm, a confidential report is prepared for all supervisory personnel at the end of the year on the basis of an elaborate form filled in by the immediate superior of the supervisor or the manager concerned. What really happens is that these reports are prepared during the last few days of March, when the financial year closes, and reporting officers almost never give serious thought to the appraisal of their subordinates. Being humane, they do not like to put down in writing that the performance of a particular officer has been poor. At the same time, they are much too conservative in appraising the performance of anyone as "excellent". The situation is further complicated by the graded salary system, and the emphasis on seniority in promotion—which equates poor and average performances with excellent work in terms of reward. The obvious result is that the supervisors rate a large majority of the returns as just average. The contents of the confidential reports are never taken seriously by management as indices of the performance of individuals. It is, therefore, essential that the importance of appraisal should be emphasised from the top, and increases in salary should be based on it. To minimise the subjective content, more than one person should be allowed to participate in the appraisal. To avoid passengers in the management team, seniority should be considered only when there are a number of candidates who are of equal standard.

Intellectual Conditioning

Once a supervisor is promoted to the rank of a departmental head, it is important that he be emotionally and mentally capable of rising above his initial speciality. He has to grow intellectually, leaving the cell of his original speciality, leaving it behind as the butterfly leaves the cocoon. At this stage, he needs education in the higher theory of management, in the entire body of knowledge which the management profession embraces, and an orientation on his job and responsibilities. The orientation or the lack of it will have the same impact on the new manager as induction or absence of it makes on the entrant to an organisation. The first impression of the job will determine the manager's attitude and will influence his views. If the departmental head has to function as the lieutenant of the divisional head, his job has to be defined. If his job is not defined, he himself will define it and his concept may not meet with the needs of the enterprise or be conducive to a high degree of team-work. Teamwork can be attained only when each man in the team knows what his assignment is and undertakes to carry it out.

Once the initial step of orientation of the individual for the job has been completed, the process of educating the departmental head in the substance of his profession should start. This education is, however, never-ending—and his curriculum should consist of: (i) principles of organisation and administration; (ii) functional aspects of the business; (iii) related information bearing on the management profession; and (iv) company information. For this purpose, advantage should be taken by organisations which do not have in-company training facilities, of the facilities provided by the Administrative Staff College, Hyderabad, the National Productivity Council and various consultative and professional institutions.

Supervised Training

Once the young man who gives promise of management ability, and who may develop into a departmental head, has been spotted within the organisation or recruited from outside, he should be exposed to the problems of the enterprise by giving him a special assignment which will take him through almost the entire organisation and bring him in close contact with people who manage and work in the enterprise. During this period, the young man should be responsible to an executive and not left to himself—lost, bored and disillusioned. He should also not become the errand boy of an executive. This process will help size up the individual's capacity to face problems and the ability to adjust, and train him to use his

judgment and discretion. "On the job" experience is the next step of development. For this purpose, the young man should learn the know-how of the department and its objectives by undertaking specific responsibilities. Before assigning managerial responsibility to him, it will be a good practice to attach the young man as an "assistant" to the departmental head for a short period, so that he may realise the demands and responsibilities of the departmental head's job. Although there is no agreement on the "assistant to" idea, this system has helped train young executives in a large engineering enterprise in the country without creating dissatisfaction among middle supervisors who could not be promoted to a higher position.

In this firm, it was found that the assistant superintendents in some departments, who were advanced in age, were not good material for promotion to the position of superintendents. Also, there was better executive material in the organisation than many of the older senior general foremen. The firm selected a group of junior supervisors who were initially recruited and trained as graduate trainees. It then appointed them as "assistants to" the superintendents of these departments where the assistant superintendents and superintendents would retire within three or four years. These "assistants" were gradually appointed to these positions. They learnt the job of the departmental head without creating any psychological conflict of status in the department. At the same time, they used the period to make other supervisors accept and even appreciate the action of the management. Supervised training of the young executives should also include job rotation and committee assignments. Finally, the training of managers should be the responsibility of the executives and not of the subordinate staff. During the period of learning, the young men should be urged and encouraged to make decisions without fear of making mistakes. Mistakes are part of the experience which develops judgment, and judgment is necessary for good management.

Climate for Development

The development of personality depends on both heredity and environment. The development of a departmental head will depend on his inherent qualities and on the environment in which he works. Therefore, an enterprise, unless it has the climate which puts a premium on initiative, courage, discipline and team-work, on the ability to do and learn, and liquidates the man who tries to make his own way at the expense of his colleagues and the company, will find its brilliant young men reduced to cynicism and frustration or lose their services. The exercise of judgment and initiative, which is the prerequisite of leadership, cannot be developed unless the individual is allowed to act, the fear of criticism removed from his mind and responsibility delegated to him. But delegation, a much-talked-about subject in management literature, is easier to recommend than to achieve. It depends closely on the attitude of the top man.

In an organisation where a particular subject has to be referred ultimately to the highest executive—supposedly vetted by the layers of management below and the staff advisers—the chief makes it a practice to call the original initiator of the proposal to justify it. It is not surprising that the executives in the middle function as mere post offices. The chain of command in such a case is further broken by the informal direct link established between the deciding authority and the lower level of management over the heads of executives who are ultimately accountable for the fulfilment of the objectives of the enterprise. It is, therefore, essential that authority should be close to responsibility. Once the authority has been delegated, it should be a code of honour for the organisation to respect it. An example here should be set by the chief executive.

A discussion on the development of middle management is not complete without a reference to the incentives which are necessary to motivate a leader and sustain his drive. Financial incentives exert a powerful influence in creating a climate for executive effectiveness. This has, however, become a very difficult problem in India, where the steady increase in taxation is eroding the actual income of executives. Even the most ardent patriot cannot be enthusiastic about paying a commission to the State on the reward received for good performance. In such a situation, encouragement in the sphere of non-financial incentives should play an important part. The firm should also build up the status of executives in the community, trade associations and technical societies. The productivity of an enterprise in an expanding economy depends largely on the middle managers who have to become the dynamic element in industry for transmuting resources into goods.

Role of the Private Sector under the Third Plan

High Taxation and Ideological Conflicts Retard Progress

By

P. C. JAIN

THE draft outline of India's third five year plan proposes more rapid industrialisation than under the second plan, a more balanced development of different regions and a marked advance towards self-sustaining industrial growth. In this process, "the rôles of the public and private sectors are conceived as supplementary and complementary to one another". The Government's industrial policy is to give every possible help and encouragement to India's private enterprise while at the same time developing the public sector to the maximum possible extent, in order to achieve higher levels of employment and a more rapid increase in national output and income. But although theoretically these principles have been incorporated in the Government's industrial policy, there are certain contradictions in it. It is vitiated by certain ideological considerations, so it has not achieved what it set out to do.

There is as such no merit in public or private enterprise. So encouragement should be given to any enterprise which increases production, productivity and the level of employment and which fills the existing gaps in India's industrial structure. Unfortunately, these considerations seem to have been ignored in the draft outline of India's third plan. Against a share of 50 percent allowed to private enterprise in the total investment under the first five year plan, it actually ended by having a share of 53½ percent while in the second plan it is likely to end with a share of 46 percent in total investment, against a little less than 39 percent originally allowed to it. This achievement of private enterprise, coupled with the increased production more than was expected from it and the fact that it has been able to keep industrial costs and prices down—except in the case of some commodities—in spite of an enormous inflationary pressure in the economy should have entitled it to a greater share in total investment than in the second plan. This would have been consistent with the policy that the rôles of the public and private sectors are supplementary and complementary to each other. But this has not been done; in the draft outline the share of private enterprise has been reduced to a little less than 40 percent of total investment.

Serious Implications

Apart from the fact that a reduction in its scope might discourage private enterprise, it has some serious implications for the successful implementation of the third plan. An outlay of Rs. 7,250 crores, which will be necessary to sustain a total investment of Rs. 6,200 crores in the public sector in the third plan, will make it necessary to increase the level of taxation as well as deficit financing, both of which are bound to accentuate the inflationary pressures in the economy. Taxation on individuals and companies has been increased ever since the beginning of the second plan, and it has already reached its limit. Any further increase in taxation will raise industry's costs of production because of higher wages, raw material prices and overheads. The cost of living will also increase due to a rise in prices of consumer goods, including foodgrains.

All this could, to some extent, be avoided if the share of private enterprise in total investment were increased because entrepreneurs are capable of raising the necessary financial resources from their own and people's accumulated savings without creating highly inflationary conditions. Moreover, India needs a sizable foreign investment for the successful implementation of the third plan. For this, it will be necessary to create a proper climate in the country. It will not be enough to announce some concessions for private foreign investment in India as has been done by the Government. Foreign investors are not impressed by such announcements but by the conditions which obtain in India for Indian private enterprise in general. In order to attract the required amount of foreign capital to India, it is absolutely essential to give India's private enterprise a more respectable place than has been accorded to it in the draft outline of the third plan. Finally, as the latter rightly states: "Well-established firms have certain advantages in organisation and experience, better access to the capital market and to sources of foreign collaboration and availability of funds on a larger scale from businesses or industries which are within their control or influence". It would have been possible to use these resources to national advantage if private enterprise were given a greater share in total investment under the second plan. But if the share of private enterprise is reduced—as seems to be the Government's intention—the national interest will suffer.

Mental Approach

At the Raipur session of the Congress Party in October 1960, Mr. Nehru observed that the private sector has neither the capacity nor the mental approach to undertake India's industrialisation, which is a task for the public sector. Such a statement will not bear scrutiny in the light of the achievement of India's private enterprise during the past 100 years and especially during the first and second five year plans. The private sector has achieved a higher rate of annual investment and production and higher productivity than the public sector. A number of new industries of all kinds have been set up in the former. It cannot, therefore, be argued that it does not have the capacity or the mental approach necessary for the country's industrialisation.

The distrust of private enterprise by the Party in power is purely ideological. Since India is pledged to a socialist pattern of society and private enterprise is inconsistent with socialism, the official approach seems to be to discourage private enterprise and to replace it gradually by public enterprise. India's need at present, however, is not for an ideological approach but for a practical approach. She needs more production—better in quality and cheaper in price—of all goods, and if private enterprise can achieve them, it should be fully developed. It is not being argued here that the public sector is not capable of achieving the same, or even higher, efficiency as has been done

by the private. But at present, private enterprise is far better in every aspect than public enterprise. Since India is short of resources and technical skill, she should make the best possible use of her private enterprise in order to reach the stage of self-sustaining growth. Although theoretically the Planning Commission and the Government seem to have recognised the truth of these contentions, in practice they appear to ignore them too often.

Ideological Conflict

Another ideological conflict in India's industrial policy is that between large-scale and small-scale production. The draft outline of the third plan rightly points out that "it is essential to press forward with the establishment of basic capital and producer goods industries—and also with the acquisition of related skills, technical know-how and designing capacity, so that in the following plan periods the growth of the economy in the fields of power, transport, industry and mineral production will become self-sustaining and increasingly independent of outside aid'. Although this principle is recognised in theory, in actual practice undue restrictions are imposed on the production of factory goods—such as in the case of cotton textiles—in the interests of encouraging village and small-scale industries. This increases the cost of production of large-scale industry by restricting the output and dislocating their proper functioning. Small-scale and village industries have an important place in every economy, more so in India, but they have to be properly co-ordinated with large-scale industries. The pace of industrialisation will suffer a setback if they are encouraged on purely ideological grounds at the cost of large-scale units.

Another justification for encouraging small-scale industries at the cost of large-scale joint-stock enterprise, according to the draft outline, is that "the opportunities which thus arise for private enterprise should be availed of by a large number of comparatively small and middle entrepreneurs and that possible trends towards concentration of economic power should be checked in the early stages". This would be like killing the patient to cure him of the disease. There are well-known fiscal and monetary methods of preventing the concentration of economic power and of improving the distribution of wealth. In fact, with the restrictions on the managing agency system and the control on the distribution of company profits and the high level of direct taxation in India, there is hardly any possibility of further concentration of economic power and maldistribution of wealth. If, however, the Government feels that there is such a danger, it should be able to avoid it by further fiscal and monetary measures. But there can be no justification for encouraging inefficient, high cost production in small units so that the concentration of economic power might be avoided. This is especially so in view of the fact that India has to compete with other countries and has to depend on export markets for its surplus commodities. If the Government's policy of encouraging a large number of comparatively small and middle entrepreneurs succeeds, export promotion—on which the successful implementation of the third plan depends—will become still more difficult. In the modern atomic age, the emphasis all over the world is on increasing the rate of output and reducing production costs as rapidly as possible. India cannot go against the trend except at a serious risk to her economy. There is no justification for creating this confusion on ideological grounds of doubtful validity.

Balanced Regional Development

It is a matter of credit to India's private enterprise that a large number of new industrial units, big and small, have been set up during the first two five year plans, and more of these will be set up in the third plan. But in the past, a balanced regional development of the economy, which is an important feature of industrial policy, did not receive adequate attention. In spite of the industrial development of the country under the first two plans, some States, such as U.P., Punjab and Rajasthan, have remained industrially underdeveloped. The draft outline of the third plan gives special attention to the problem of balanced regional development of the country. But in order to overcome the defect, it is not enough to recognise the problem and to state that there should be a balanced regional development. It is necessary for the Government to provide facilities to industries in underdeveloped regions, irrespective of whether they are situated in a State territory or within the territory of more than one State Government. They should be assisted in procuring land for factory accommodation and housing, lower electric tariffs, cheaper transport and credit facilities and above all some concession in sales taxes and local rates for a specified period of time. The establishment of industrial estates is helping the development of underdeveloped regions in India. It should be possible to give these regions some definite preference in setting up new units in the public sector.

The reason for the ineffectiveness of the Government's industrial policy is not so much the contradictions and inconsistency in its actual implementation as the fact that it is not adequately supported by commercial, fiscal and monetary policies suitable for an expanding economy. Its taxation policy has imposed an excessive burden on industry in the shape of sales taxes, electricity duty, bonus taxes and the high rate of company taxation. Industry as well as individuals have to pay taxes to finance the Government's expenditure. True, in a planned economy, everyone should bear greater tax burdens. But taxation should not be such as to increase production costs unduly or to kill the incentive of entrepreneurs. Company taxation in India and the other taxes levied on industry by the Central and State Governments have handicapped the private sector, so it has not made as much headway as the Government's industrial policy would indicate. Besides, an important element in the development of a new industry and in the smooth functioning of an already existing industry is the availability of adequate finances for its working. Unfortunately, the dear money policy followed by the Reserve Bank of India with the object of discouraging hoarding and speculation has actually handicapped industry, which has to pay higher rates of interest for the accommodation it gets from banks and has to face avoidable difficulties in raising finances for genuine production purposes.

Finally, it is fantastic to give preference "when issuing licences under the Industries Act, to units which undertake to export a particular percentage of their production in such a manner that the foreign exchange expenditure on imports for setting up the plant would be covered by the foreign exchange earnings within a period of two or three years and the exports would be maintained later at the same level". Not all the units which need foreign exchange for importing raw materials and machinery are in a position to export part of their output in order to earn an equivalent amount of foreign exchange. Exports depend on such delicate considerations as the competitive power of rival producers, consumer tastes, organisation of markets, and the system of tariffs in the importing country. If the issuing of licences for new units were to depend on the capacity of such units to earn foreign exchange, the progress of industrialisation is bound to suffer. Besides, the Government's industrial policy in that case will prove ineffective in making the rate of industrial growth faster.

ECONOMIC PROGRESS IN PAKISTAN UNDER THE NEW REGIME

AGRICULTURE GETS TOP PRIORITY

By
A SPECIAL CORRESPONDENT

THE economic situation in Pakistan has steadily improved in the post-revolution period. Progress is evident in practically every sector of the economy. Agriculture, industry and foreign trade have all felt the impact of new policies and the Pakistan Govenment is anxious to implement them vigorously. Perhaps the most important achievement of the military administration is the successful handling of the food problem which was the major headache of the country. Although self-sufficiency still remains a goal to be achieved rather than a reality, the shortages the country had experienced in the past have now been removed, mainly because of an increase in domestic production and a regular flow of foodgrains from abroad, particularly from the United States under the Commodity Exchange Programme. Wheat supply improved to warrant its decontrol in West Pakistan and statutory rationing of rice in East Pakistan was abolished without causing any serious upset in the price structure.

Powerful Incentives

But the most striking improvement was in the industrial sector, where there was an increase of more than 11.5 percent in production over the preceding year. The output of cotton piecegoods increased from 576 million yards to 620 million yards, of cotton yarn from 345 million lbs to 387 million lbs and of jute manufactures to 2,033,000 tons. These were all solid gains which helped not so much to satisfy the internal demand as to cater for the country's export markets. Like India, the Pakistani Government wishes to increase the country's exports to pay for its increasing import requirements. The balance of payments in the pre-revolutionary period was in a precarious state. Foreign exchange earnings from raw materials declined due to two factors. One was the rise in domestic consumption, especially of raw cotton which reduced the size of exportable surplus and the other was a fall in international commodity prices which led to a decline in earnings from major export commodities.

Under the circumstances, the export of manufactured goods appeared to be the primary hope of applying a corrective to a difficult situation. Powerful incentives were, therefore, provided to the export trade in manufacture by permitting exporters to use a part of the foreign exchange earnings varying from 10 percent to 40 percent for importing machinery and spare parts as well as consumer goods. Under the stimulus of the bonus scheme, the value of exports of cotton manufactures increased to Rs. 23.04 crores and of jute to Rs. 22.33 crores, giving the country a substantial surplus in the trade account in spite of a fall in the earnings from raw jute and raw cotton. How restricted was the scope for the expansion of exports of primary produce was realised from the poor response to the reduction of export duty on cotton and the removal of minimum prices of jute cuttings. The export bonus scheme has not, however, proved to be an unmixed blessing. First, it has deprived the home market of some of the essential commodities, and secondly, it has resulted in a rise in the prices of imported commodities as the bonus vouchers are free to be sold at a premium in the open market. The scheme itself is an artificial prop to the export trade, so the expansion cannot be sustained once bonus licences which enable the traders to make profits are withdrawn. Prices of products manufactured in Pakistan are not sufficienly low to enable them to stand competition in export markets.

The upward trend of prices was the most disconcerting feature of the economic situation. In spite of the economy in non-development expenditure and the reduction of deficit financing, the inflationary trend persisted thoughout the period. Money supply rose by Rs. 29.60 crores—more than Rs. 10 crores over the increase in the previous year. The rise in Bank rate obviously did not have the desired effect in checking the expansion of bank credit, since there was a strong demand for funds from the trade which was handling a larger volume of imports. Besides, the demand for accommodation from foodgrains traders increased after the Government had relinquished its control. The rise in prices was a natural result of the domestic demand being in excess of available supplies. Greater production both in the agricultural and industrial sectors was essential for economic stability and progress, so the need for planned development of resources was acutely felt. The first five year plan had failed to justify the hopes its authors had raised. Far from effecting any improvement, it brought about a marked deterioration. The new plan had, therefore, to avoid the pitfalls of the old and at the same time provide a machinery for implementing the targets according to schedule. That it is ambitious is obvious from its outlay of Rs. 1,900 crores with a foreign exchange component of Rs. 750 crores. Since Pakistan's own resources of foreign exchange are barely adequate for her current requirements, the external expenditure will have to be met from foreign assistance and investments. Efforts are, therefore, being made not only to increase the flow of aid from the United States but also to seek assistance from friendly States like West Germany, Japan and even Saudi Arabia. To overcome the reluctance of overseas private investors, new facilities are being provided through the establishment of an Investment Bureau and fresh concessions have been offered by reducing the participation of local capital and in the matter of repatriation of capital and profits.

Agricultural Self-sufficiency

Self-sufficiency in agricultural production has been the crying need of Pakistan for many years. Large food deficits in the past had caused a serious drain on limited foreign exchange resources, and the fall in exportable surpluses of raw materials had drastically reduced her export earnings. The crucial need was, therefore, to revive agriculture by any means. Previous governments had dismally failed to recognise this fact with the result that, in spite of industrial progress, economic stability could not be achieved. By giving more priority to agriculture, the new régime has put first things first in the economic development programme. The allocation of about 30 percent of the total outlay of Rs. 1,900 crores has ensured that irrigation and land reclamation projects will get the financial support they deserve for attaining the plan targets. Land reforms have already given an incentive to agriculturists and a wide use of chemical fertilisers envisaged in the next five years will help expand production substantially.

The development of transport and communications occupies a place second only in importance to agriculture, for without free movement of goods, the economy can hardly be expected to function smoothly and efficiently. Rehabilitation of the railway lines, improvement and extension of waterways, construction of new roads and modernisation of the ports are the essential prerequisites for expanding both internal and external trade.

Raising Industrial Production

Industrial production, too, is to be raised. A 50-percent rise in consumer goods production is estimated through the full use of idle capacity and the addition of new capacity. The choice of industries has been determined with the object of saving and earning foreign exchange as well as meeting the domestic demand, especially for cloth. Accent on the development of cottage and small-scale industries is designed to create expanding avenues for employment for which scope in large enterprises is limited.

The plan is admittedly ambitious, and its success will depend on the size of the internal effort and external assistance. Additional taxation to the tune Rs. 100 crores will call for sacrifices as the country is already heavily taxed. Besides, domestic savings will have to be greatly increased to implement the borrowing programme. Deficit financing although drastically reduced cannot be altogether eliminated. Outside the plan, a huge expenditure will have to be incurred on the replacement work in relation to the Water Treaty concluded with India in September this year. The colossal expenditure envisaged in the plan will naturally perpetuate the inflationary trend. Meanwhile, no improvement in the balance of payments is possible without attaining self-sufficiency in food, since the import of large quantities of foodgrains had caused the heaviest drain on Pakistan's foreign exchange earnings and reserves. Great hopes have been raised on account of the discovery of oil. How great is the importance attached to it is shown from the negotiations now in progress with Moscow for technical assistance and aid. Pakistan imports about Rs. 28 crores worth of petroleum and products every year to meet the demands of industry and communications. In spite of many imponderables—including the level of external assistance and internal financial difficulties—planning under the military régime is likely to yield much better results than was possible in the past.

STEADY RISE IN NEW LIFE INSURANCE BUSINESS

JANATA POLICY SCHEME PROVES A COSTLY VENTURE

By

A SPECIAL CORRESPONDENT

IN entering the fifth year on 1st September, 1960, the Life Insurance Corporation of India can look back to the past with a sense of relief as well as satisfaction. The relief is because it has almost mastered the complex and intricate task of integration. The satisfaction is because it has not given way under the load it initially had to carry in replacing the old method of competitive sale and servicing by its own machinery manned by people drawn from a variety of offices. The task also involved a difficult process of making the men, with their differing allegiances and backgrounds, feel one with the huge State-owned monolith, besides acquiring sufficient staff with the requisite training, experience and competence to run the gigantic business.

The schooling is not yet complete. And the L.I.C. has still a long way to go. The problem is primarily administrative, as the elephantine machinery gets vaster and bigger with time. The proved theory in economics that after the optimum point, extra production begins to give diminishing returns, has not been heeded. For some years, knowledgeable persons suggested that the Corporation be split into competing independent units. The Government of India should consider this even now. The problem of production is not one of mere size, but of efficient administration and servicing. The Corporation seems to suffer on both counts. But the drift has to be arrested firmly if life insurance is to serve the purpose for which it is intended.

New Business

Judged from the point of view of new business secured, the Life Insurance Corporation appears to have done fairly well. The Corporation secured new business of Rs. 345 crores in 1958, which was 22 percent more than in 1957. In 1959, the new business amounted to Rs. 429 crores, recording an increase of 25 percent over the previous year. In 1960, the new business is estimated to exceed Rs. 450 crores. Foreign business which, incidentally, was one of the brightest achievements of the private companies, fell as low as Rs. 5.40 crores in 1957. In 1958, it was Rs. 5.62 crores. On account of certain measures taken by the Corporation, its foreign business went up to Rs. 9.47 crores in 1959. It expects to do still better this year. The Corporation, however, has not been permitted to do new business in the neighbouring countries of Ceylon, Pakistan and Burma, where Indian insurers had a flourishing business in the pre-nationalisation days. The reasons are presumably political. Many may not like the projection of the Government of India as a commercial entity in their countries, competing on equal terms with privately-owned commercial houses.

For the first time, the Corporation published its lapse experience to counter the doubt entertained in some quarters about the stability of its growing business. The net lapses, which amounted to 7.3 percent of the mean business in force in 1954 and 7.6 percent in 1955, came down to 6.4 percent in 1957 and 5.1 percent in 1958. The figures for 1959 are being collated. It is expected that the lapse experience for this year will be more favourable. The Corporation's business in force has also increased considerably. At the end of 1955, it was Rs. 1,220 crores. At the end of 1959, it rose to Rs. 1,964 crores, a net increase of Rs. 744 crores, or more than 60 percent. The number of policies in force on 31st December, 1959, was nearly 7 million, representing an increase of 45 percent over that at the end of 1955 during the company régime.

Renewal Expense Ratio

There has also been a remarkable fall in the renewal expense ratio. It came down to 15.89 percent in the accounting year 1956-57 from the combined renewal expense ratio of 17.3 percent for all companies in India in 1955. It decreased further to 15.46 percent in 1958. A system of budget control has been introduced with effect from 1959. The result, according to a spokesman of the Corporation, has been satisfactory since the renewal expense ratio in 1959 has come down to 12.92 percent, which compares favourably with that of some of the best companies in the past.

The life fund, which stood at Rs. 380 crores on the day of nationalisation, increased to Rs. 493 crores at the end of 1959. Similarly, total assets have increased from Rs. 414 crores to Rs. 552 crores. The annual income consisting of premiums and income from investment, it is reported, is steadily going up. The income was Rs. 105 crores in 1959. It is likely to go up further in 1960 with increasing business and investments.

The Corporation has paid Rs. 28 crores as claims, of which about 25 percent were those arising from death, the balance representing maturity benefits. Since the nationalisation of life insurance, the Corporation, it is reported, has paid about Rs. 82 crores in all on account of claims. Before nationalisation, the private companies were operating from their headquarters in big cities and the number of centres in the country where they had their offices was 97. The Corporation claims to have a widely decentralised organisation and the number of branch and sub-offices has been increased from 216 on 1st September, 1956, to 345 at the end of 1959. A further increase in the number of offices has been planned for 1960. It claims to be taking care that none of the new offices proves uneconomic.

Investments

The total book value of the Corporation's Stock Exchange investments was Rs. 338.59 crores on 31st December, 1957. The market value of these investments depreciated by Rs. 8.02 crores, of which the depreciation of the investments taken over from the former insurers was reported to be Rs. 7.28 crores. The Corporation made a contribution of Rs. 8.02 crores to the reserve for investments, which, together with the premium reserves, now stands at Rs. 13.32 crores. As at 31st December, 1959, the book value of the Corporation's Stock Exchange investments pertaining to life business was Rs. 409.82 crores, while the market value was higher by Rs. 4.68 crores.

Housebuilding Loans

Apart from these, the Corporation's working during the year is marked by certain other noteworthy features. For the first time in its history, in response to a wide demand in the country, it announced its decision to advance loans for housebuilding. Three types of loans are to be granted—to apex co-operative housing finance societies, to individual policyholders, and to housing co-operatives of workers belonging to a public limited company. Loans will be advanced only to apex co-operative housing finance societies, the repayment of principal and interest being guaranteed by State Governments. At present, only Bombay and Madras have such apex housing finance societies, but other State Governments, it is expected, will follow suit. The introduction of this type of loan will not interfere with the Corporation's policy of granting loans to State Governments for housing schemes. It will charge an interest of 5 percent a year on loans to apex societies.

Obviously, due to legal hurdles, the Corporation has abandoned, for the time being at least, its original move to advance loans to primary co-operatives. The only exception will be the co-operatives of workers of public limited companies. The companies concerned will be asked to guarantee the principal and interest. Loans will be granted on first mortgage of properties situated in India under any housing scheme of public limited companies and the maximum loan will be

70 percent of the value of the property and will carry an interest of not less than 6½ percent a year with a rebate of ½ percent for punctual repayment. The period of repayment will not exceed 20 years.

Policyholders in cities with a population of 1 million or more, namely, Bombay, Calcutta, Madras, Delhi and Hyderabad, will be given loans on the security of freehold or leasehold properties, where the unexpired term of the lease is not less than 30 years. The minimum amount of the loan will be Rs. 20,000 a policyholder and the maximum Rs. 1 lakh. Loans will be granted only on policies which have been in force for a minimum period of five years; and in case of endowment assurance policies, if such policies mature not later than the due date of repayment of the loan, subject to the face value of the policy. Such loans will carry an interest of 7 percent, reducible to 6½ percent for prompt payment. The need for fixing interest at 7 percent—rather high—was due to the fact that the interest chargeable should cover the expenses the Corporation will incur in administering these loans. The present housing loan policy is just a beginning and the L.I.C. is likely to extend it in the light of experience gained during the coming months.

Loans on Mortgages

The Corporation has also revived the practice of the former insurance companies of granting loans on mortgage of property. The new scheme will, however, be confined at present to the cities of Bombay, Madras and Calcutta. Under this scheme, loans will be granted to approved parties and on the security of approved properties (both new buildings as well as old buildings which are dilapidated) and will be for a maximum term of 15 years. Where a loan is granted for a period not exceeding five years, the interim retirement of debts will not be obligatory, but where the terms of the loans exceed five years, there will be a provision for amortisation by regular annual or more frequent payments of the principal. Loans will not be granted on the security of leasehold property with an outstanding term of less than 30 years. The amount of the loan will not exceed 50 percent of the value of the property, the minimum advanced to a borrower being Rs. 25,000 and the maximum Rs. 5 lakhs. The loans will carry an interest of 7 percent a year, reducible to 6½ percent on punctual payment. When the Life Insurance Corporation was formed, it was decided not to continue the practice followed by the former insurance companies, mainly because the mortgages inherited by the Corporation from these companies were in many cases unsatisfactory. It was thought advisable to put the whole portfolio on a satisfactory footing before fresh mortgage loans were granted. This has now been done and the Corporation has accordingly decided to grant fresh mortgage loans.

Rural Insurance

A significant departure from established practice has been made by the L.I.C. through its shift of emphasis to rural insurance. What Mr. P. K. Gopalkrishnan, chairman of the Corporation, calls the "virgin rural areas" of India, are now becoming the focal point of the L.I.C.'s efforts to achieve a target of Rs. 1,000 crores of new business by 1964, in accordance with its phased five-year plan. This is, by and large, a fascinating venture. The slow and steady shift in income from the urban middle class to skilled and semi-skilled labour, village artisans, small-scale manufacturers and agriculturists is becoming more pronounced. Rural savings, if properly harnessed, can produce significant and remarkable results for the L.I.C. As a pilot project, the Corporation undertook life insurance in intensified form in selected community development blocks in Rajasthan and Bihar, using rural *panchayats* as agents.

In a previous statement reviewing the results of 1958, Mr. Gopalkrishnan remarked that the cost of the *janata* policies has exceeded the premium income. This was considered disconcerting, and many wondered whether the L.I.C. was being run on business principles. Being aware of the cost factor, Mr. Gopalkrishnan observed that the expansion of the L.I.C.'s business in the countryside might add to costs "because of the special hazards in rural areas." Precisely because of this, he said, the insurance companies existing before nationalisation did not devote much attention to the rural areas. He felt that the simultaneous intensification of work in urban areas could offset the cost increase in rural areas. The hope that urban insurance will subsidise the heavier costs in the rural areas may not be agreeable to urban policyholders. They might feel that they are being deprived of returns from their investments because of the L.I.C.'s costly venture. Yet there is no escape if the L.I.C. is to persist in its rural insurance policy. Equity demands that it keep the two accounts separate as far as possible, and ensure over the years a separate valuation of the results of the two sectors. That will enable both urban and rural people to find out the actual returns they get from these investments.

Non-medical Insurance

To reach the "virgin rural areas," the L.I.C has decided to extend life insurance without medical examination to selected rural areas where the facilities for medical examination are poor. The new scheme will operate in compact regions where qualified doctors are not available within a radius of about ten miles. All the insurable male residents will be offered insurance on a non-medical basis. The maximum sum for which one or more policies can be taken out under the scheme will be limited to Rs. 2,000, and the policies will be issued only to persons up to 45 years of age. The maximum term of insurance will be 25 years and the maximum premium closing age or maturity will be 60 years.

Insurance without medical examination is nothing new. It has, in fact, been well established the world over in all the advanced countries. A minimum standard of living ensuring reasonable facilities for the maintenance of health is the base on which non-medical insurance thrives. There is hardly any such base in India's rural areas, and the fact that no doctor will be available within a radius of ten miles, is an argument against rather than for non-medical insurance. There is some justification for the L.I.C. extending non-medical insurance to employees in Government or quasi-Government services or in the service of reputed firms for assured sums varying between Rs. 3,000 and Rs. 5,000. Such employees can be assumed to have a fair standard of living and also facilities for medical treatment within a radius of ten miles. With these facilities, life insurance on a non-medical basis can be built up; but to offer it without such facilities at the rates applicable to medically examined urban policyholders seems to be carrying things too far. Presumably, the actuarial experts of the L.I.C. are of the view that non-medical insurance written on a mass scale, can pay for itself. Even so, it will be a gamble and not a calculated risk. Over the years, as the Corporation gains sufficient experience of non-medical insurance, it will perhaps be able to process the premium rates to be charged for such insurance on the basis of the collated data and statistics. For the present, this venture in an uncharted field can only be at the expense of the medically-examined urban policyholders.

Valuation and Bonus

The L.I.C.'s second valuation, according to the Act, was due on 31st December, 1959, but it is understood that its first valuation has not been approved by the Government of India. In an announcement on 20th June, 1959, the Corporation declared the results of the first valuation of its assets and liabilities as at 31st December, 1957. It was notified that pending the finalisation of the scheme for differential bonus, bonus at the rates declared would be payable only on policies which had become claims by death or maturity after the date of valuation and before the final scheme had been approved by the Government. The Corporation expressed the hope that it would be able to work out the final scheme of differential bonus soon and get the Government's approval for it. Only after the latter's approval had been obtained, would the bonus, according to the approved scheme, vest in the policies. Policyholders all over India should know that the approval has not been obtained so far. The scheme of allotment of bonus has thus not yet been finalised.

It appears that the Government of India wants a further refinement of the method and basis of the differential bonus. It is understood that it has instructed the L.I.C. to make a revaluation of the assets and liabilities as at 31st December, 1957, with a view finally to giving shape to the bonus which will accrue to policyholders from the surplus arising from the first valuation. The work of revaluation has already been taken on hand. The Corporation made it clear in the valuation report that a system of distributing profits among individual policyholders is good if it is equitable and practicable. The problem of classifying the policyholders according to their companies is difficult and complex. Groupings made by the Corporation, in which it has put itself in the first category, do not appear to be a satisfactory basis for the differential bonus. There appear to be objections also against the valuation base. It has been suggested that the practice of the Corporation employing its own paid actuaries to work out the valuation is neither correct nor equitable. The actuary has a semi-judicial status and should, in fairness to the policyholders, be independent of any control of or influence from the Corporation and the Central Government. It is not easy to obtain the services of experienced professionals for this difficult task. For the second valuation, the Corporation should ensure the services of an independent professional actuary to guide the intricate work, so that the status and character of the valuation is beyond question.

GENERAL INSURANCE MAKES STEADY PROGRESS

CONTROVERSY OVER CODE OF CONDUCT CONTINUES

By

A. C. GUHA RAY

THE year 1960 began for general insurance in more or less the same way as 1959. To the suggestion aired in some quarters that after four years of fruitless search for a suitable remedy against alleged malpractices, rebates and illegal inducements (whether by the device of the Code of Conduct or by the terms of the Insurance Act, or even by a reduction in fire premium rates), no better answer could be found than to appoint a sub-committee of the Executive Committee of the General Insurance Council "to take stock of the present position and recommend the future course." The sub-committee completed its labours after touring the country, and after many meetings and conferences, it submitted to the Executive Committee a report which, it now appears, has been lost in the archives of the latter. The pigeonholing of the report might give the impression that either the report is of little practical value, or its recommendations are too drastic. The Executive Committee continued to hold periodic sessions, and went on adding to rules and regulations, and clauses embodied in the Code of Conduct, or in amending or modifying a number of rules in the light of experience gained. They were, however, not deterred in this laborious task by the widespread scepticism about the value of the Code of Conduct, figuring prominently in the company chairmen's annual addresses. There was even a suggestion for a high-powered commission to go into the results of the implementation of the terms of the Code of Conduct. There can be no surer way of shelving the primary issue known to everyone, namely, the outgo of the companies' funds in excess of the terms provided in the Insurance Act, or in open disregard of sound business principles.

Pronouncements of the chairmen of various associations all over India are no less specific. The chairman of the Indian Insurance Companies Association, Calcutta, went so far as to say that some regulations under the Code of Conduct have contributed in no small measure to impeding the growth of the insurance industry. He was of the view that the remedy proved worse than the disease and he stated that the appointment of the sub-committee is an admission that remedial measures have failed in their purpose. The chairman of the Indian Insurance Companies Association, Bombay, after stating that the Executive Committee fruitlessly held prolonged discussions on the sub-committee's report, went on to suggest that the trade should accept constructive suggestions that the Government may choose to put forward, or the regulations that the latter may devise. He invited the Government to take a sympathetic and active interest in the working of the trade; at the same time, he expressed the view that if opportunity is not taken at this stage by the trade to avail itself of the "services" of the Government, a worse situation might arise in the near future. Referring in this connection to the debate on the nationalisation of general insurance in the Rajya Sabha during the year, he said that although the Government has rightly turned down the proposal, it is a matter of speculation whether a similar proposal at a later date would meet with the same resistance from the Treasury benches.

Nationalisation Move Rejected

It is now well known that the debate on nationalisation was held at the instance of the Communist Party. The approach of political Parties to such issues is doctrinaire, and not necessarily for the good of the trade. Sensing the political motive behind the move, the Minister concerned, Mr. B. Gopala Reddy, turned down the proposal and said that the Central Government had no intention at this stage of nationalising general insurance. The communist move, Mr. Reddy added, was evidently inspired by an ideology to which the Government did not subscribe. "The communists are constantly clamouring," said Mr. Reddy, "for the nationalisation of everything, but we cannot be cajoled or bullied into accepting their views." With his knowledge of the background, the chairman of an important insurance association should raise the bogey of nationalisation in the face of the known disinclination of the Government, strikes one as odd.

It has been suggested in some quarters that the chairman, being a public sector official, shares the emotional bias of the ruling Party. But the Indian Insurance Companies Association, Bombay, has not so far officially disassociated itself from the views aired by the outgoing chairman, nor has it indicated what its own views are. Nevertheless, there is no doubt that the chairman followed this line of thought because he was convinced of the failure of the Code of Conduct to improve the working of the trade.

Support for Code of Conduct

Mr. A. D. Shroff, chairman of the New India Assurance Company Ltd, has, however, advised every unit to follow rigorously the provisions of the Code of Conduct. This difference in approach probably shows that trouble lies not in the legal provisions, but in their implementation. He advised the insurance companies to develop the inherent strength and build up organisations to deal with their problems of procuration and servicing, and to get well organised through mutual understanding. Unless these steps are taken, the efforts of the Executive Committee have to be conditioned in a climate of general laxity and helplessness of the insurers to resist the demand of the insured and/or the insurance agent for excessive remuneration or rebating. As "one effective and quick solution," Mr. Shroff suggested that (a) the market which is now constituted of about 90 Indian units must be integrated into 15 or 20 units, not necessarily by amalgamation, but by group working, leading to amalgamation with a minimum of Rs. 50 lakhs portfolio, and that (b) the change-over from the present unsound conditions to a new order of absolute soundness must be bridged over by the non-diversion and amalgamation among members for a short period, so that each unit is able to readjust itself without any damage to its position.

Two well-known general insurance companies during the year decided to close down. They were the Indian Globe Insurance Company Ltd, established in 1929 and the New Asiatic Insurance Company Ltd, established in 1933. Both these companies had a considerable premium income,

particularly the New Asiatic, and it is quite obvious that the inadequacy of premium income was not the main cause of the closure. A spokesman of New Asiatic, it is reported, stated that the decision was taken because of "unhealthy practice and unfair competition which has made general insurance unremunerative." About 40 such establishments, it is reported, closed down over the past few years. The closure of the two companies gave a rude shock. The nationalisation of life assurance had denuded quite a number of private composite companies of their resources. They had to concentrate on the development of general insurance, resulting in the lowering of underwriting standards and a drive for direct business at any price which has depleted the resources of the companies.

Insurance Mergers

Mr. A. D. Shroff has drawn the attention of the insurers to what he calls a "silent revolution" in the British insurance market through the amalgamation of "giant" units. He is of the firm view that there is no alternative other than to integrate the units by group working or amalgamation. What he does not mention is that amalgamation from strength is quite another thing from working arrangements, forced or otherwise from weakness. His prescription will make the big bigger and the small smaller. It is no cure for the ills of Indian general insurance, nor is the non-diversion agreement any panacea. That will assist in maintaining the strength of the "giants" and will halt the progress and curb the initiative of the medium and small concerns. The British amalgamations are not forced mergers but are working arrangements arising from the inherent strength of each of the amalgamated units. India has neither the inherent strength, nor the capacity to enter into such mergers. It will be futile to suggest to the country that amalgamation should take place when most of the companies do not have the strength to enter into such amalgamations. In spite of amalgamations, numerous small companies work in the U.K. in healthy competition with the "giants". In India, the proposed amalgamation will eliminate competition from the market and will usher in a monopoly of a few "giants". That will be good neither for insurers nor for the insured.

Cut in Fire Rates

In spite of the unanimous opposition in the country, fire insurance rates were again reduced from 1st January, 1960. This is the second reduction within a space of a few years, the last reduction being in the year 1955. It is now well known that the Tariff Committee, at the insistence of the Controller of Insurance, had to recommend and force general insurers in the country to reduce fire rates. The Controller of Insurance was of the view that India's traditional trading surplus in fire insurance, through the stress of competition, finds its way back into the market as there is a margin available which can be conceded to the agents or the insured. He, therefore, asked the Tariff Committee to collaborate with him in depleting the surplus so that this will effectively plug the avenues through which money is conceded to agents and the insured. A firm stand against further reductions was taken by Mr. B. K Shah, chairman of the Tariff Committee, at the last annual general meeting of that body. He stated clearly that the reduction, which has been put into effect since 1st January, 1950, is likely to affect insurers so adversely that the Tariff Committee will be unable to undertake any further revision in the near future. Such a positive attitude, however, was a little belated. It should have been taken years ago. The Tariff Committee, with no adequate statistical data on which to base the correct rating, made an almost *ad hoc* reduction from June 1955. Its processing of data thereafter is also not complete. It may have premium figures and claims statistics, but in the build-up of fire insurance rates, costs, contingency reserves, profit reserves, etcetera, do enter. Without having a clear statistical compilation, the suggestion to reduce rates is unscientific and may cause permanent injury to the trade. It is to be hoped that the Tariff Committee will take a positive view about the revision of rates in future. Since its technical function is to compile rates in the country on a scientific and judicious basis, it will not be any more a tool in the hands of the Controller of Insurance to further the objectives of the Executive Committee.

Likewise, public-carrier motor-vehicles, workmen's compensation and motor-cycle rates have all been raised this year. The current ratings are based on statistical experience, so no objection can be taken to them.

Distribution of Government Business

During the year, the Central Government again revised the allocation of the business emanating from Government and semi-Government bodies. Originally, such business was distributed almost equally among Indian insurers after the temporary preferential advantage of a higher percentage enjoyed by New India was discontinued. About three years ago, the Government ruled that the business emanating from Government and semi-Government institutions should be allocated to the extent of 50 percent to Government subsidiaries and the balance of 50 percent equally divided among Indian insurers. This formula was revised during 1960 and the Indian Insurance Companies Association Pool has been directed to allocate 75 percent of the business emanating from Government and semi-Government sources, including India's aviation business, to Government subsidiaries, and to divide the balance of 25 percent equally among private insurance companies. The present agreement is current for five years and will expire in 1965. Protests have been lodged with the Central Government by insurance bodies, with no result whatsoever. It is indeed strange that the insurance business of Government and semi-Government institutions, floated and maintained at the cost of the community, should be reserved primarily for Government-maintained companies, to the detriment of private insurers.

Expense Limit

Since the law relating to management expenses has been in force, it has received the closest attention from the insurance associations, public bodies and also the Press. Its limitations are well known. That the device of measuring expenses by gross premium written direct in India must inevitably lead to a scramble for business and lowering of underwriting standards, is now public knowledge. It is also known to the Controller of Insurance and the Government of India. Nevertheless, in spite of deliberations on the subject, nobody could offer an alternative formula, which would not be exposed to criticism levelled against the present regulations. There have been suggestions ranging from deletion of the appropriate provisions from the Insurance Act altogether, to enlargement of the permissible quantum of expenses. This was the burden of a lengthy representation made to the Controller of Insurance this year by the Bombay Association and numerous individual companies. Since the Controller has discretionary authority, to alter, in consultation with the Executive Committee, the limits of permissible expenses, it was felt that pointed attention should be drawn to the inflationary climate and to the rise in prices in almost every commodity compared with the indices of prices on which, presumably, the expense regulations were based in the year 1950. Mr. A. D. Shroff, chairman of the New India Assurance Co. Ltd, was of the view that the present limits were stringent in some cases even by the standard of expenses incurred in the U.K. by the larger British offices. There is no doubt that the regulations are anomalous,

& CO. PRIVATE LTD.
Consulting Engineers to the Iron & Steel Industry

MDC-10

since some of the companies, which are well within the solvency margin and have sizable premium reserves, received warnings from the Controller of Insurance. The rather arbitrary character of the regulations for the measurement of expenses is obvious.

In Excess of Basic Limits

In the latest *Year-Book*, even the Controller of Insurance had to admit that the aggregate experience of all groups of insurers over the period, from 1956 to 1957, shows that the margin between actual expenses and the basic limit of expenses has been reduced, and in 1958, the actual expenses *have exceeded the basic limits*. There can be no better evidence of the futility of the Rule where the aggregate experience has led to the contravention of the regulations incorporated in the Insurance Act. No less significant is the position that the groups of insurers, who spend less than the basic limit of expenses in terms of Rule 17E, wrote a decreasing proportion of the gross premium income written direct in India. It only shows that expanding and progressive companies will inevitably contravene the provisions of the current regulations, exposing themselves to the punitive actions of the Controller of Insurance. The Bombay Association thought that in such circumstances, the correct course would be to liberalise the provisions under the discretionary authority of the Controller. A generous liberalisation will, however, nullify the law altogether. Sandwiched between these two positions, the Controller of Insurance has for the past few years been following the same pattern of granting a liberalisation allowance, which is rather niggardly. Perhaps the Controller is of the view that should the companies adhere strictly to the payment of commission scheduled in the Insurance Act, the expense provisions in the Act, together with the additional allowance that the Controller grants annually at his discretion, would be sufficient for all companies working in India irrespective of their size.

Steady Progress

From the figures published in the *Indian Insurance Year-Book*, it is evident that general insurance is making steady progress. Premium written direct in India in 1958 was Rs. 29.67 crores, compared with Rs. 27.83 crores in 1957, Rs. 26.07 crores in 1956 and Rs. 23.09 crores in 1955. The latest *Year-Book* records figures up to the underwriting year 1958, but it is estimated that general insurance business written direct in 1959 will exceed Rs. 30 crores, and in 1960, the figure may well be higher. The complaint that business is not evenly distributed still persists. The preferential weightage in favour of Government subsidiaries for business emanating from Government and semi-Government sources is making the Government companies too big. Knowledgeable circles apprehend that by having a very large direct insurance in their portfolio, they will have to make heavy reinsurance overseas, which will lead to the loss of foreign exchange.

Better Business by Bigger Firms

Lala Karamchand Thapar, chairman of the Indian Trade and General Insurance Company Ltd, remarked that business over which Government has any control—and the Government's finger today is practically in every pie—is fed to the Government-managed company either directly or through the Indian Insurance Companies Pool. The chairman of the Indian Insurance Companies Association, Bombay, in making a review of the distribution of business, calculated that the first ten Indian insurers increased their gross premium by over 87 percent during 1953-58, while the gross premium of all Indian insurers increased by only 60 percent during the same period. He did not consider this a healthy sign for the insurers, as it shows a substantial growth of only the larger units. The big units are thus becoming larger, while the growth of the small and medium companies is stunted.

Gross Premiums Written in India and Outside

The gross premiums written direct in India in fire, marine and miscellaneous business was Rs. 7.94 crores, Rs. 4.37 crores and Rs. 7.72 crores for Indian insurers. The figures were Rs. 4.58 crores, Rs. 2.32 crores and Rs. 2.63 crores, respectively, amounting in all to Rs. 9.63 crores, for non-Indian insurers. The total in India thus came to Rs. 29.69 crores. The gross premiums written direct outside India by Indian insurers were estimated at Rs. 2.19 crores, Rs. 1.72 crores and Rs. 2.74 crores in fire, marine and miscellaneous business, respectively, amounting in all to Rs. 6.65 crores. Therefore, gross premiums, written direct, whether in India or outside, totalled Rs. 26.68 crores for Indian insurers. The net premium income totalled over Rs. 24.97 crores. In 1957, the net premium income amounted to Rs. 22.55 crores, against a gross direct premium income of a little over Rs. 24.63 crores. Of the total gross premiums written direct in India by Indian insurers during 1958, fire insurance accounted for 40 percent, marine for 22 percent and miscellaneous for 38 percent. For non-Indian insurers, the composition was 49 percent fire, 24 percent marine and 27 percent miscellaneous. Of the total gross premiums written direct outside India by Indian insurers, 33 percent were for fire insurance, 26 percent for marine and 41 percent for miscellaneous.

As in previous years, the management expenses of non-Indian insurers in 1958 were higher than those of Indian insurers. Thus, in fire insurance, management expenses (including commission) were 45 percent of net premium income for Indian insurers, against 50.6 percent for non-Indian insurers. Similarly, in marine, the proportion was 27.8 percent, against 46.5 percent. After providing for miscellaneous outgo and an increase in reserves, the balance, as in previous years, was on the whole more favourable for non-Indian insurers. In fire insurance, the balance remaining for Indian insurers was 12 percent, against 20.5 percent of net premium income for non-Indian insurers. In marine and miscellaneous insurance business, Indian insurers had a debit balance of 6.5 percent and 1.1 percent, respectively; non-Indian insurers, on the contrary, had a credit balance of 11.8 percent and 8.2 percent. The results are significant. As in the past few years, there has been no marked variation in underwriting results, Indian insurers should examine the trends carefully. The craze for increasing premium incomes at the cost of underwriting standards has to be checked. The Controller of Insurance, on his part, should look for a solution to the dilemma whereby, without a larger direct premium income, no increase in permissible expenses is allowed for expanding the organisation.

MEASURES TO STRENGTHEN THE BANKING SYSTEM

BIGGER COVERAGE NECESSARY IN DEPOSIT INSURANCE

By

R. M. MITRA

THE growth of the Indian economy in 1959-60 broadly followed the pattern emerging earlier with the progress of the second five year plan. Rising prices and the adverse balance of payments remained among the major worries. The money supply increased by 8.1 percent (from Rs. 2,499 crores in March 1959 to Rs. 2,703 crores in March 1960). The index number of wholesale prices rose by 5.8 percent, from 112.1 to 118.6 (base year 1952-53 equals 100). In the corresponding period of 1958-59, there was a rise of 4.6 percent in money supply (from Rs. 2,389 crores to Rs. 2,499 crores) and of 5.7 percent in the wholesale price index (from 106.1 to 112.1).

National Income

The latest available estimates suggest that national income at constant prices increased by 7.3 percent (from Rs. 10,890 crores to Rs. 11,690 crores) between April 1958 and March 1959. The draft outline of the third five year plan expects that national income (at constant prices) will rise by 42 percent from Rs. 8,850 crores in March 1951 to about Rs. 12,570 crores in March 1961. The rise over the two-year period 1959-61 should, therefore, be of the order of Rs. 880 crores. If it is assumed that each year accounts for half this increase, the rise in national income works out to about 3.8 percent for the year 1959-60.

In spite of the bigger rise in money supply and the reduced growth of national income, the increase in wholesale prices in 1959-60 has been of almost the same proportions as in 1958-59. On the other hand, from March to July 1960, the wholesale price index has risen from 118.6 to 125.4, while the money supply has fallen from Rs. 2,703 crores to Rs. 2,670 crores. One cause of the different trends in money, production and prices is perhaps the money flowing outside the organised channels, which cannot be controlled by the authorities. It is well known that the ratio of money supply to national income is lower in India than in advanced countries like the U.S.A. But legal tender money represents about 68 percent of the total money supply and 16 percent of national income, against about 20 percent and 7 percent, respectively, in the U.S.A.

Enlarging the Market

Several factors are giving a new significance to the rôle of money in the Indian economy. The traditional influences of the natural economy and the barter economy have been weakening with the disappearance of isolated and self-sufficient villages. According to an authoritative estimate, about 35 percent of the national income is still accounted for by the non-monetised sector of the economy, but the increasing use of money in the changing pattern of the village economy is unmistakable. It is presumed that agricultural reforms involving co-operative farming and scientific methods of cultivation will accelerate the monetisation process. This indicates the need for closer harmony between the prices of the commodities purchased by the villager and the money income yielded by his own produce, which instead of being directly consumed or exchanged for other goods, is now being increasingly diverted to the market. The disparate movements in the prices of food, manufactured goods and industrial raw materials, which rose by 3.4 percent, 5.9 percent and 13.9 percent, respectively, from April 1959 to March 1960, underlines the importance of the change.

Again, India's schemes for economic development are based on expectations of large foreign resources. This will call for a properly disciplined use of the domestic money. The total import requirements for the five years of the second plan were originally estimated at Rs. 4,340 crores. Exports were expected to provide Rs. 2,965 crores and invisible earnings Rs. 255 crores. The plan made provision for meeting the deficit of Rs. 1,120 crores by drawing on the sterling reserves to the extent of Rs. 200 crores, and getting Rs. 800 crores of foreign aid for the public sector and about Rs. 100 crores for the private sector. The actuals for the first three years of the plan period, and the likely figures for the last two years, show that while the total outlay in the public sector will be reduced from the plan target of Rs. 4,800 crores to Rs. 4,600 crores, the contribution of external assistance for the public sector will go up from Rs. 800 crores to Rs. 1,000 crores.

Deviation from Plan Estimates

The deviation from the plan estimates has occurred mainly because imports have been much bigger. They were expected to total Rs. 4,340 crores for the full five-year period, or Rs. 3,554 crores for the first four years. The available figures show that actual imports during the first four years aggregated Rs. 4,286.4 crores. Exports and invisible earnings totalled Rs. 2,502.9 crores and Rs. 392.2 crores (or Rs. 152.9 crores and Rs. 178.2 crores, respectively, more than the plan estimates). After adjustments are made for the export of silver (Rs. 74.4 crores) in 1957-58 under lend-lease obligations and for non-monetary gold movements of Rs. 5.9 crores in 1959-60, the total gain in foreign exchange earnings over the plan estimates amounts to Rs. 251 crores for the first four years. Thus the excess imports of Rs. 732.4 crores over the plan estimate for the four years are not a temporary phenomenon. They have to be covered either by additional foreign aid or by export promotion. Yet a big rise in exports cannot be assumed, considering the changing conditions in the international market and the growth of regional trade groups such as the European Common Market and the E.F.T.A. The extent to which internal supplies can be diverted to export markets also has to be considered in an economy operating on a sub-standard level of consumption.

Servicing Foreign Debts

Foreign aid raises problems of repayment in subsequent years. By then, the need for external resources may not have fallen, either because import requirements remain large, or because exports have not risen enough, or because the surplus available for sale abroad is too small. The draft outline of the third plan assumes that exports for the five-year period will be Rs. 3,450 crores, invisible earnings Rs. 120 crores and imports Rs. 5,670 crores (including Rs. 3,570 crores of maintenance imports, Rs. 1,900 crores of machinery and equipment for projects under the plan, and Rs. 200 crores of components and intermediate products). The gap of Rs. 2,100 crores will widen to Rs. 2,600 crores as a result of payments falling due during the third plan against the obligations of earlier periods. It is further estimated that of the total foreign assistance of Rs. 2,600 crores which is required, the public sector will want Rs. 2,200 crores, against the latest estimate of Rs. 1,000 crores for the second plan period.

The problem is formidable. The public sector needs 120 percent more, and the private sector 300 percent more, of foreign assistance. Also, exports have to be raised to an annual average of Rs. 690 crores, from Rs. 607 crores during the first four years of the second plan (excluding silver exports of Rs. 74.4 crores in 1957-58). The position has become more precarious as the Reserve Bank's foreign exchange reserves have fallen to Rs. 140.83 crores (on 14th October, 1960). The present legal provisions governing the Reserve Bank's note issue require an aggregate amount of Rs. 200 crores to be held in foreign exchange and gold. As gold of the value of Rs. 117.76 crores is held in the Reserve Bank's Issue Department, the portion of the foreign exchange reserve that may be used to service external trade and other international obligations amounts to about Rs. 60 crores, and is less than 7 percent of the total imports in 1959-60 (Rs. 923.7 crores). Even if the law be changed to permit the entire reserve against the note issue to be held in internal securities, the foreign resources (including gold) available would be less than 25 percent of the estimated annual average of imports (Rs. 1,134 crores) during the third plan period.

Smooth commercial and financial relations with foreign countries depend on a certain amount of confidence in the exchange value of the rupee. It is clear, therefore, that the proper behaviour of money as a store of value and an accounting unit will acquire increasing importance with the changes in the rural sector and the growth of international transactions. Any reasonable scheme of monetary management requires that money should be capable of observation and control. A strong and broad-based banking system is thus an imperative necessity.

It is perplexing that although questions relating to prices and the purchasing power of money have been discussed in general terms in the plans, and although the first plan called for suitable institutional changes in the monetary system, the specific question of the organisation and expansion of the banking system has not been considered in detail. It is possible that the planners considered it necessary to devote their attention, in the first instance, to reforming and revitalising the co-operative credit system, and meanwhile leaving it to the Reserve Bank to deal with the so-called commercial banking system under the Banking Companies Act and the Reserve Bank of India Act. The provisions of these Acts and the machinery of supervision, inspection and guidance set up under them were perhaps considered adequate for promoting the growth and soundness of the banking system.

Credit Control

The Reserve Bank has shown commendable faithfulness in carrying out its obligations under the two Acts. The policy of selective credit controls has been pursued with vigour, and with an eye on the special requirements of trade or production. Nevertheless, the reaction of prices to changes in the quantum of bank credit has often been curious. Scheduled banks' advances against cereals, at Rs. 25.48 crores in April 1960, showed little change from those in July 1959, when they were Rs. 25.51 crores. But the wholesale price index for cereals fell from 109 to 105. The index rose to 110 in July 1960, while advances, at Rs. 25.05 crores, remained at almost the same level. Again, the rise in advances against sugar and *gur*, from Rs. 34.49 crores in July 1959 to Rs. 63.05 crores in July 1960, was accompanied by a fall in the wholesale prices for those commodities from 146 to 141.

The method of open market operations is in continuous use. The result of these operations was net sales by the Reserve Bank of Government securities worth Rs. 60 crores in 1959-60. The index number of prices for Government of India securities rose from 98.4 in March 1958 to 100.5 in March 1959 and 101.1 in March 1960. This seemed to be in consonance with the intensified demand for gilt-edged, as reflected in the Reserve Bank's net sales of Rs. 89 crores in 1958-59 and Rs. 60 crores in 1959-60, accompanied by an expansion of the scheduled banks' Government securities portfolio by Rs. 173 crores and Rs. 101 crores, respectively, during the two periods. The index number of prices for variable dividend industrial securities rose from 126.6 in March 1958 to 146.8 in March 1959 and 161.7 in March 1960. The rise of less than 3 percent in the prices of Government securities over the two years was not only of comparatively small significance from the point of view of credit control, but also had a beneficial effect on the cost of Government borrowing. But the rise in share prices of about 28 percent during the same period could not be viewed with complacency.

It is true common stock prices in the U.S.A. also showed a rise of about 27 percent over the two-year period from January 1958 to December 1959; and that this brisk stock exchange activity was possible with an increase of less than 5 percent in money supply, against an increase of about 9 percent in national income. Nevertheless, in view of the fact that the money flowing mostly outside the organised channels in India is more volatile than money in the U.S.A., the authorities considered it necessary to impose restrictions on

Refractories for all purposes...

The Kumardhubi range of refractories is now being increasingly used for boilers, coke ovens, ladles, high temperature fire furnaces and electric furnaces.

Backed by over 50 years of manufacturing experience, Kumardhubi Fireclay and Silica Works contribute a vital operational requirement in a number of industries.

bank credit against shares so that it might not add to the total of speculative finance available outside banking sources. The Reserve Bank of India issued a directive on 11th March, 1960, requiring the scheduled banks to maintain a margin of not less than 50 percent of the value of equity shares held by them as security for loans exceeding Rs. 5,000 for an individual borrower. The banks were given one month's time for adjusting the position relating to existing borrowers other than members of recognised Stock Exchanges, in whose case the time was extended to three months. An amendment to the directive, published on 17th March, exempted from the scope of these restrictions, advances to share brokers in the form of purchase of a demand bill accompanying shares delivered from one centre to another, provided that the bill was paid within seven days of purchase by the lending bank.

Clean Advances

Care was taken to ensure that the purpose of the restriction was not defeated by using clean advances for the speculative purchase of shares. A separate directive was, therefore, issued with concurrent effect asking the banks to limit their unsecured advances in any month to the average ratio of clean advances to total advances in the corresponding month of the previous year. It is noted that advances against shares to parties other than brokers showed a slight fall from Rs. 66.18 crores on 11th March to Rs. 64.21 crores on 15th April, and then rose to Rs. 68.61 crores on 24th June. But advances to brokers fell from Rs. 15.08 crores on 11th March to Rs. 13.47 crores on 24th June. So the total rose from Rs. 81.26 crores to Rs. 82.08 crores during the period from 11th March to 24th June, with a subsequent fall to Rs. 81.63 crores on 29th July. The amount of unsecured advances on 11th March, 1960, was Rs. 191.42 crores, which was about 17.6 percent of the total advances. The corresponding figure for 29th July, 1960, was Rs. 168.93 crores, giving a ratio of 15 percent. It is, therefore, significant that in spite of the negligible increase in advances against shares, the index number of prices for variable dividend industrial securities rose from 168.8 on 12th March to 181.6 on 30th July.

It may be worth noticing that the regulation of margins relating to advances against stock exchange securities introduced in the U.S.A. in 1934 (and frequently used) has not been a striking success in controlling security prices. Following a decline in the index of prices from the 1959 average of 420 to 389 on 23rd July, 1960 (base year 1939 equals 100), the margin requirements were reduced from 90 percent of market value to 70 percent with effect from 28th July, 1960, in spite of the fact that the index was still higher than in October 1958 (376), when the margin requirement was raised from the previous level of 70 percent.

Variable Reserves

Although the credit restraints for equity shares and unsecured advances marked a fresh development in monetary control in India, these measures were really a variant of the policy of selective credit controls inaugurated in May 1956. A basically new phase in monetary control, however, began with the simultaneous introduction on 11th March, 1960, of a scheme of variable reserve ratios. The notification required every scheduled bank to maintain with the Reserve Bank an "additional balance" representing 25 percent of any increase in the bank's total liabilities accruing after 11th March. The amount of "additional balance" was, however, subject to adjustment, if together with the normal balance (of 2 percent of time liabilities and 5 percent of demand liabilities), it exceeded an aggregate of 8 percent of time liabilities and 20 percent of demand liabilities (which represent the upper limits laid down in the Act). A subsequent notification issued on 5th May required the "additional balance" to be equal to 50 percent of any rise in total liabilities after 6th May, 1960, plus 25 percent of the increase arising between 11th March and 6th May. Another notification provided that if in any week the increase over the figure for 11th March was less than 50 percent of the increase between 11th March and 6th May, the additional balance would have to be equal to 50 percent of the excess of liabilities in the operative week over those on 11th March. It seems to be a question of considerable academic interest if the provision linking the "additional balance" to the increase in liabilities (over a specified date) available in a week other than the week to which the additional balance relates, is supported by the language of Section 42(1A) of the Reserve Bank of India Act.

The system of variable reserve ratios was placed on the legislative anvil in the U.S.A. as far back as 1935 and first brought into use in July 1936. It was then gradually adopted in a number of other countries. The legal provision relating to variable reserve ratios was made in India in terms of an amendment of Section 42 of the Reserve Bank of India Act passed in July 1956. The fact that a measure already familiar in other countries was pressed into service here about four years after legal sanction was obtained by the authorities, provokes an enquiry into the circumstances which compelled its use. It would be reasonable to assume that the scheme has been brought into operation not as a routine measure, but as a step taken with due caution and proper deliberation. In this connection, it may be instructive to note that Lord Keynes, in his *Treatise on Money*, recommended that a measure of variable reserves be used when an adequate volume of Government securities is not available for the successful conduct of the central bank's open market operations. Dr. Chandler, who examined a proposal for variable reserve ratios as early as 1926, considered the part they can play in immobilising additional bank reserves arising from an adventitious inflow of gold.

It seems that the situation prevailing in the U.S.A. in July 1936 fulfilled the conditions visualised by both Lord Keynes and Dr. Chandler. The member banks' reserves held with the Federal Reserve Banks amounted to more than $6 billion, and exceeded by about 100 percent the legal reserve, which was calculated at about $3 billion. This position was brought about by an unusual movement of gold following the revaluation of the U.S. dollar. Again, the Federal Reserve System's total holding of Government securities, at about $2.4 billion, was less than the amount of the excess reserve held by the member banks. But a different situation seems to confront the authorities in India. The excess reserves of the scheduled banks, aggregating Rs. 7.10 crores on 11th March, 1960, amounted to only about 11.6 percent of the statutory minimum, while borrowings from the Reserve Bank were as high as Rs. 56.33 crores. Moreover, this excess represented an insignificant fraction of the amount of Government securities held by the Reserve Bank, which totalled Rs. 1,649.60 crores on 11th March.

Low Capital Ratio

The current ratio of paid-up capital and reserves to deposits in scheduled banks is considered by the authorities to be embarrassingly low. This might have an important bearing on the present scope for using the device of variable reserves. The ratio, which represented 13 percent of deposits in 1939, went down to 6 percent in 1945 (due to the wartime increase in deposits) and then increased to 9 percent in 1949, partly as a result of new issues of shares. It remained at this figure until 1954, when it again started declining and reached the low position of 4 percent in 1959. The deterioration was caused not by an impairment of the banks' assets, but by the accelerated growth of deposits. It has been pointed out that the ratio of capital (including reserves) works out to 6.6 percent in Germany, 7.7 percent in Canada and 8.97 percent in the U.S.A. Although banks in the U.K. show a lower percentage of 3.6, they command undisclosed reserves of appreciable proportions. It has also often been argued that the availability of inner (or undisclosed) reserves is of greater consequence than the ratio of paid-up capital and disclosed reserves. While the ultimate soundness of a bank is determined by the quality

AUTHORISED CAPITAL: Rs. 10,00,00,000
ISSUED AND PAID-UP CAPITAL: Rs. 5,00,00,000
TOTAL LOANS OUTSTANDING (AS ON 30-6-60.) Rs. 39,33,38,442

AUTHORISED BUSINESS

(a) Granting of medium and long-term loans in Rupees as well as, by arrangement with the Development Loan Fund of the U.S.A. Govt., in foreign currency, to existing public limited companies or registered cooperative societies engaged in, or new ones proposing to engage in, the manufacture or processing of goods, or the generation or distribution of electricity or any other form of power, or mining, or shipping or hotel industry; also subscribing to debentures of such companies and cooperative societies;
(b) Guaranteeing of loans raised by aforesaid industrial concerns which are floated in the public market and are repayable within a period not exceeding twenty-five years;
(c) Underwriting the issue of stock, shares, bonds or debentures by aforesaid industrial concerns;
(d) Guaranteeing of deferred payments to foreign suppliers in respect of import of capital goods by aforesaid industrial concerns.

PURPOSES FOR WHICH LOANS ARE SANCTIONED

Purchase of new or second-hand machinery, renovation or modernisation or replacement of worn-out or obsolete machinery, purchase of land for factory site, and construction of factory buildings.

IMPORTANT TERMS AND CONDITIONS OF LOANS

(i) **SECURITY:** First charge of all the fixed assets such as land, buildings, plant and machinery & fixtures. Raw materials, stock-in-process and finished goods will not be mortgaged and will, therefore, be available for raising working capital from elsewhere.
(ii) **MARGIN:** Generally 50% of the value of total assets including those to be acquired with the loan. This margin may be reduced to 40% in case of industrial concerns importing plant & machinery under the U.S. Export-Import Bank Loans or other foreign currency loans (tied credits) taken by Government from foreign governments or financial institutions abroad where the cost of imported plant and machinery is 60% or above of the total capital cost of the project. The margin may be further reduced to 35% in special cases.
(iii) **INTEREST:** 7% per annum with a rebate of ½% for punctual payment of instalments of principal and interest.
(iv) **REPAYMENT:** Will be spread over up to 25 years to suit borrower's convenience.

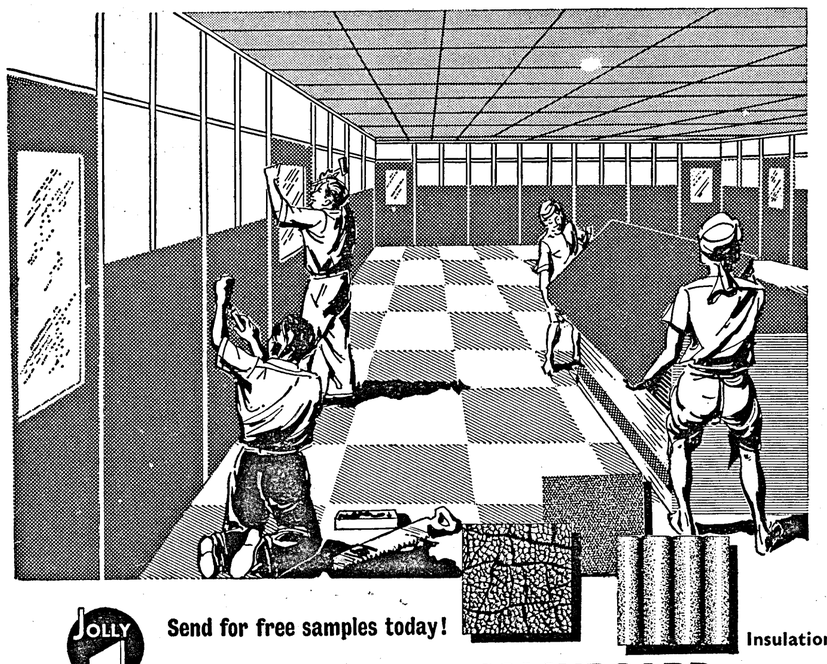
JOLLYBOARD India's finest hardboard NOW in full supply!



At surprisingly low prices

JOLLYBOARD, the top-quality Indian hardboard equal to the world's best, has a thousand uses in the factory, office and home. But it costs the same as, if not less than, inferior substitutes.

Thicknesses: 3 mm, 4.5 mm, 6 mm.
Sizes: 12'x4', 8'x4', 6'x4', 4'x4'.

JOLLYBOARD

* Very strong, light and durable; is made from wood-fibre, compressed into solid sheets—to British Standard Specifications.
* Comes in many sizes, thicknesses and attractive surfaces; a versatile building and decorating material.
* No laminations, plies or knots; won't split or crack.
* Easily sawn to any shape, easily affixed to any surface.
* Quicker to work with, finer in finish. Takes paint, varnish or polish perfectly.
* Certified by the Government Test House, Calcutta.

of its assets, the particular usefulness of inner reserves lies in their capacity to absorb current losses without harmful publicity.

The importance of inner reserves has received positive recognition in the Banking Companies (Amendment) Act, 1960. This amendment introduces a new Section (34A) which provides that any information which does not have to be disclosed in the balance-sheet or profit-and-loss account of a bank, need not be furnished to the authorities set up under the Industrial Disputes Act. Any undisclosed surplus of a bank will not, except to the extent certified by the Reserve Bank, be taken into consideration in determining the capacity of a bank to pay emoluments to its employees. (It seems strange, however, that the new provision has not been made applicable to banks having all their offices in one State.) Although the measure will serve to protect inner reserves from unreasonable demands, the question of the banks' earning capacity remains important both for the purpose of building reserves (disclosed or undisclosed) and to facilitate the successful issue of share capital, if this is considered necessary.

Open Market Operations

It appears that the existing banking situation in India is not suitable for using the instrument of variable reserve ratios. Open market operations could be undertaken on an adequate scale to sterilise the small excess reserves without causing a loss of earning to bankers, especially when the excess reserve is not the result of an ingress of superfluous and unusable funds but is a reflection of the monetary resources intended for the five year plans. It is true that, unlike in the U.S.A., provision has been made for paying interest to scheduled banks on the "additional balance" held with the Reserve Bank at a rate equal to ½ percent above the half-yearly average rate of interest paid by a scheduled bank on its total deposits during the relevant period. It is noted that, as in 1958, the average rate of interest paid in 1959 by the Indian scheduled banks on their deposits represented 2 percent, while their total expenses averaged 4.1 percent and total income 4.9 percent of deposits, against the respective percentages of 4.2 and slightly less than 5 in 1958. If, therefore, an increasing portion of the banks' resources get locked up in balances with the Reserve Bank carrying interest at ½ percent above the average rate of interest paid by the banks, the strain on their earning capacity will be accentuated without any corresponding gain in terms of the smooth operation of monetary control.

Attempts have also been made to strengthen the various measures of monetary control by moral suasion. As in previous years, a circular letter was issued to scheduled banks on 8th May, 1960, underlining the desirability of reducing their total advances by Rs. 110 crores during the 1960 slack season. It does not, however, seem to have produced substantial results. The total advances, which reached Rs. 1,011.86 crores in the last week of May 1959, went down to Rs. 920.40 crores in the last week of September 1959; but the totals for the last weeks of May and September 1960 were Rs. 1,123.55 crores and Rs. 1,127.58 crores, respectively.

Bank Rate

Since the measures so far adopted have apparently had little effect, many wonder whether Bank rate should be changed. It appears, however, that the renewed popularity which this traditional instrument of monetary control has gained during the 'fifties has not noticeably influenced the Indian authorities. Bank rate has undergone only two changes since 1951. It was raised from 3 percent to 3½ percent on 15th November, 1951, and then to 4 percent on 16th May, 1957. The Governor of the Reserve Bank, in a speech at the annual general meeting of the Indian Institute of Bankers on 18th August, 1960, discussed the various issues involved in a rise in Bank rate. He recognised the need for occasionally using Bank rate and deprecated the adoption of "rigid attitudes". But he felt that the usefulness of Bank rate in India is limited, because: (a) "the movement of international funds" is not amenable to changes in Bank rate as far as India is concerned; (b) investment in the public sector is a predetermined quantum, so the only effect of an increase in Bank rate will be a rise in the cost of servicing the public debt; and (c) investment in the private sector, whether in fixed assets or inventories, is also not materially affected by changes in Bank rate, but is largely conditioned by ideas about the future course of prices and profits. In any case, more direct methods of regulating investment in the private sector are provided by the Capital Issues Control, fiscal measures and the Industries (Development and Regulation) Act.

It is, therefore, worthy of notice that the Reserve Bank issued a circular on 21st September, 1960, advising the scheduled banks that with effect from 1st October, 1960, their borrowings from the Reserve Bank (against bills and Government securities) would be subject to interest at 1 percent above Bank rate on that portion of the borrowing which exceeds 50 percent but is not more than 100 percent of the amount represented by the prescribed average of the normal statutory reserves required to be held by a bank under Section 42(1) of the Reserve Bank of India Act (2 percent of time liabilities, plus 5 percent of demand liabilities) and at 2 percent above Bank rate on any borrowing in excess of 100 percent of the average normal statutory reserve. It might appear at first sight that this scheme of penal rates is a surreptitious method of raising Bank rate. It has also been argued in certain quarters that the introduction of penal rates on the scheduled banks' borrowings will lead either (1) to a sale of Government securities, with repercussions on their yield and a consequential rise in the cost of borrowing (thus defeating the main purpose of avoiding the direct use of Bank rate); or (ii) to restriction of the banks' advances, which will seriously hamper production and distribution during the current busy season.

Statutory Reserves

It appears that the requirement of normal statutory reserves of the scheduled banks aggregated Rs. 62.85 crores for the week ended 7th October, 1960, as against Rs. 62.56 crores, for the week ended 16th September. The banks' borrowings from the Reserve Bank declined from Rs. 40.41 crores to Rs. 30.58 crores during the period. The reduction in borrowings was accompanied by a rise in the scheduled banks' balances with the Reserve Bank to the extent of Rs. 7.76 crores, counteracted by falls in investments in Government securities of Rs. 9.43 crores and in loans and advances of Rs. 5.62 crores. If the position of scheduled banks' borrowings from the Reserve Bank continues as reflected in the figures relating to the week ended 7th October, the amount borrowed from the Reserve Bank which may bear interest at the penal rates need not cause undue concern. But the immediate Stock Exchange reaction seems to have clouded the position relating to Government securities, which may require to be watched carefully. The fact that the steps announced on 21st September are not intended to serve as a higher Bank rate in leading a general rise in interest rates is, however, evidenced by the restriction simultaneously imposed on interest on deposits subject to withdrawal on notice of not more than 21 days or on the expiry of a period of not more than 21 days from the date of deposit. A directive has been issued asking scheduled banks not to pay, with effect from 1st October, interest on such deposits at a rate higher than 2 percent below Bank rate.

Profit-earning Capacity

It might appear that the "package deal" announced on 21st September, 1960, is primarily designed to correct the over-extended position of banks' advances and to promote their profit-earning capacity. Scheduled banks' total advances on 16th September, 1960, amounted to Rs. 1,127.63 crores and represented about 58.8 percent of their total liabilities. If an adjustment is made for the position of the State Bank of India, whose custody of part of the P.L. 480 counterpart funds and whose special relationship with the monetary authorities place it in a separate category, it will appear that the total advances of other scheduled banks work out to 68.9 percent of total liabilities. It is true that banks in West Germany and Japan have had occasion to engage in lending operations on a scale involving 80 percent to 100 percent of deposits, and that their economic and banking systems have continued to grow in strength and vigour. But it should be realised that the sound and smooth working of a banking system, and for that matter of an

economic system, depends on the methods available for shifting economic and financial assets, on the one hand, and collective absorption of losses, on the other. The absence of suitable means for achieving these fundamentals, combined with the fact that credit extended by a bank is not necessarily transformed into a deposit at the same or another bank in India, makes it imperative that the traditional canons of banking liquidity should continue to be observed. At the same time, soundly formulated plans should be undertaken to bring outside money within the banking system and to introduce the process of "socialisation of financial risks" which, according to Steiner, was a characteristic of Roosevelt's New Deal.

It was in the fitness of things that the "package deal" of 21st September, 1960, included a directive requiring the scheduled banks to increase their average lending rates by ½ percent and prescribing a minimum of 5 percent for the banks' lending rates. The result of this directive will be to increase the banks' profit by more than Rs. 5 crores (on the basis of the present level of advances). On the basis of 1959 profits, this will raise the ratio of net profits to deposits from 0.8 percent to more than 1 percent. The combined effect of the three measures will, therefore, be to induce a more realistic lending policy; to prevent short-term deposits from carrying interest rates applicable to medium-term or long-term funds; and to enhance the profit-earning capacity of banks, thus facilitating an improvement in their capital position.

There is growing recognition that while the various devices of monetary control can cope with certain evils, their effects on the economy as a whole are often thwarted by the operation of many tangible and intangible factors which may not have been correctly anticipated or which are not subject to organised control. It is, therefore, being increasingly realised that while monetary control will continue to play its part in dealing with symptoms of economic disorder, the more rational and effective approach to ensure the general health and continuing prosperity of an economic system lies in the evolution of "built-in stabilisers".

Banking Reorganisation

A tentative beginning has been made in India with the introduction of a guarantee scheme for loans to small-scale industries which came into force on 1st July, 1960. Although there have been attempts previously to provide State guarantees for loans to small industries or for the rehabilitation of refugees, they have not gained momentum. Recognition of the need for social absorption of economic risks has been lacking, and the measures were intended to deal only with financial difficulties of an uncertain nature and affecting a limited section of the community. The integrity of the circulating money and of money held as a store of value is, however, a prerequisite for the success of an economic stabiliser. Again, it is necessary that bank deposits should form a preponderant part of the money supply if the behaviour of money is to be properly observed and controlled by the authorities.

The task ahead involves not only a large-scale reconstruction and expansion of the Indian banking system, but also a reorientation of the outlook. It has to be understood that equal protection will need to be extended to the holders of bank money and legal money if production and distribution are not to suffer. It also has to be appreciated that, in a welfare State, the distinction between the private and public sectors is constantly shifting, and relates to questions of enterprise and management rather than to matters of social regulation and responsibility. If a loss affecting a business unit in the private sector has serious repercussions and weakens the economy, it is no less necessary to distribute the burden of the loss than to require the community as a whole to share the consequences of failure and misadventure in the public sector.

Raymond Moley, who was associated with President Roosevelt in the formulation of economic policies but later became an opponent of the New Deal, described well the position facing the U.S. authorities on the eve of the great plan to reorganise the U.S. banking system. In his book, *After Seven Years*, he said that "if ever there was a moment when things hung in the balance, it was on 5th March, 1933." It seems that the fall in the foreign exchange reserves, the magnitude of operations contemplated under the third plan and the restricted field of banking activity in India, have combined to awaken a realisation that the great "moment" has arrived, which can be missed only at great peril to the future of the welfare State in this country.

Reorganising the System

The Banking Companies (Second Amendment) Act, 1960, which received Presidential assent on 19th September, represents a serious attempt to reorganise the banking system. It modifies Section 44A of the Banking Companies Act so as to extend to banking companies the provisions for compulsory amalgamation as contained in Section 396 of the Companies Act, 1956. It also introduces a new Section in the Act providing for an alternative method of compulsory amalgamation and/or reconstruction of a banking company (whether involving a reduction of share capital or of deposit or other liabilities, or a change in management). The recent *débâcle* following the failure of two scheduled banks has revealed the need for precautionary measures to ensure timely reorganisation so that a repetition of bank failures may not impede banking expansion or disturb the smooth working of the system. The number of banks awaiting a decision on their application for a licence under Section 22 of the Banking Companies Act was 299 (the number of licensed banks was 66) at the end of December 1959. It is true that banking resources in unlicensed banks are no more than, say, 5 percent or 6 percent of the total. But the situation arising out of the failure even of unlicensed banks will seriously harm the economy, as is emphasised by recent experience.

New Measures

It remains to be seen, however, whether the provisions of the amending Act will facilitate reorganisation without creating fresh difficulties. The new Section 45 of the Banking Companies Act provides for compulsory amalgamation in the case of only such banks as have been placed under an order of moratorium. The damage which a temporary suspension of operations may cause to the reputation of a bank may take a long time to be repaired by the benefits following from reconstruction or amalgamation. The amending legislation appears to show that the authorities will use the provisions of Section 396 of the Companies Act when the amalgamation of two fully sound banks is considered necessary "in the national interest"; and that the new Section 45 of the Banking Companies Act will be used when the reconstruction

of a sub-standard bank or its amalgamation with another bank is found necessary, whether "in the national interest," or "in the interests of the depositors", or "in order to secure the proper management of the banking company" or "in the interests of the banking system of the country as a whole".

It seems that if the objective of a sound reconstruction of the banking system is to promote its expansion on the basis of equal status being secured for bank money and legal money, the reconstruction or amalgamation of comparatively weak banks should be accompanied with suitable methods of rehabilitation, whether through the purchase and subsequent disposal of sub-standard assets by a statutory body or through subscription to share capital by State or State-sponsored agencies, or otherwise. The task need not involve any serious financial or administrative difficulty. The Reserve Bank's report on the *Trend and Progress of Banking in India* during 1959 shows that the banks' investments in unquoted shares and debentures, disproportionately high level of unsecured advances, large advances against immovable properties, high proportion of decreed and doubtful debts and irregular and dormant advances, total up to Rs. 65.32 crores. It is presumed that the several heads enumerated above duplicate substantial amounts; even if no allowance is made for this duplication, the total of sub-standard assets hardly exceeds 3 percent of total banking assets. It is evident that the position is much more favourable than it was in the U.S.A. in 1934, when the proportion of slow, doubtful and bad loans of the national banks amounted to 34.12 percent of the total loan assets.

Suspension and Closure

It is true that the operations known as "Spokane Sale" and "Waiver Plan", as carried out in the U.S.A. immediately after the banking crisis of the 'thirties, also involved the suspension and closure of banks and the reduction of deposit liabilities. But the purpose of acquiring knowledge and experience is to avoid the difficulties which arose in other countries or other times in similar situations. It is also to be noted that out of 1,417 national banks (including ten D.C. non-national banks) involved in operations of reconstruction as undertaken in the U.S.A. prior to the inauguration of the deposit insurance scheme, 292 banks were licensed after capital correction, 56 were absorbed by other banks, 518 were reopened under new constitutions, 248 were reopened under old constitutions, 13 were placed in voluntary liquidation and 290 were placed in receivership. By 30th September, 1937, 661 banks were put in a position to pay 100 percent of their deposits, and provision was made for the payment of 81.3 percent of the total deposits involved. It is presumed that there has since been a further improvement. The subsequent operations undertaken by the Federal Deposit Insurance Corporation, which have succeeded in averting bank suspension in most cases and ensuring the payment of 99.6 percent of deposits in the 439 banks that failed in the U.S.A. during the period 1934-59, may perhaps provide useful guidance.

There seems to be room for technical complications in the administration of the new Section 45 of the Banking Companies Act. Doubts exist as to whether the Section contains appropriate provisions for the vesting of assets to complete the process of compulsory amalgamation (as made in Section 44A dealing with voluntary amalgamation). Again, the legal purist may wonder whether the principles of natural justice with particular reference to the dictum *Audi alteram partem* (hear the other party), and the requirement of "interests of the general public" as prescribed in Article 19(5), or the rule of "eminent domain" as contemplated in Article 31(1) of the Constitution of India, will not cause embarrassment in implementing the Act.

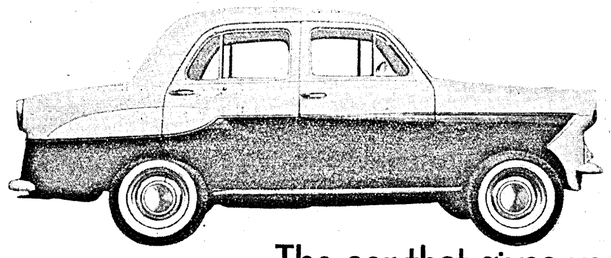
Deposit Insurance

The need for suitable "built-in stabilisers" in the banking system is receiving attention. It is reported that a deposit insurance scheme is being considered by the Reserve Bank. It is to be hoped that the question of proper rehabilitation of banks will receive further consideration when the deposit insurance scheme makes reasonable progress. Various reports are circulating in the Press about the scheme. It has been suggested that the maximum amount of deposit insured under the proposals now being examined may be set at Rs. 1,000, and that the annual premium may be fixed at 1/10 percent of the total deposits of an insured bank. Although the number of people whose deposits do not exceed Rs. 1,000 may be large, the suggested figure may not do much to allay anxiety. Experience shows that panic usually arises from the unreasonable apprehensions of depositors belonging to the middle group of between Rs. 5,000 and Rs. 10,000. Fixing a low maximum may, therefore, even occasion anxiety as to whether the banks hitherto considered sound are judged by the authorities to be sound only up to Rs. 1,000 for each depositor. A reasonable figure for a maximum amount of the deposit to be covered by insurance should, therefore, be at least the average amount of deposit an account with the major scheduled banks (say, Rs. 5,000). The extent of banking losses in India also suggests that a premium rate lower than 1/10 percent will not be actuarially unsound.

Insurance Limit

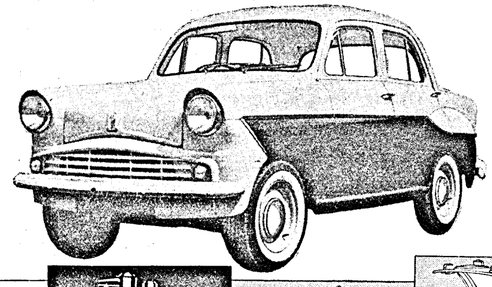
The original insurance limit of $5,000 in the U.S.A. was based on the consideration that "deposit balances not exceeding $5,000 were estimated to have accounted for" 75 percent of total banking losses, and that the premium rate of 1/12 percent was the "equivalent" of bank losses in "non-crisis years". The principle governing the administration of deposit insurance was, however, stated clearly in the "Staff Study on Assessments and Coverage for Deposit Insurance" appearing in the February 1950 issue of the U.S. *Federal Reserve Bulletin*. The study said: "It is suggested that extension of the coverage of deposit insurance might strengthen rather than weaken the adequacy of the present fund by increasing public confidence in banks. Further, it is not true as a practical matter that the insurance liabilities of the F.D.I.C. would be much, if any, increased by an increase in coverage, say, to $10,000 or even to $25,000. The Corporation now in fact tends to *protect all deposits through its merger procedure*".

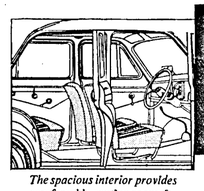
It was in the year 1912 that Mr. MacVeagh, then U.S. Secretary of the Treasury, while introducing his annual report declared that "as long as the financial system created by our federal laws remains unchanged and unreformed, the Government will be exclusively responsible for the commercial, industrial and social disasters which flow from panics." He added: "A panic is as unnecessary and as avoidable as an epidemic of smallpox", which will bring suffering to the nation "only so long as we refuse to apply the simple preventives". U.S. experience of deposit insurance shows that an optimum limit for insurance coverage, operating in conjunction with the bold and imaginative merger of banks in difficulty, may provide the "simple preventives".



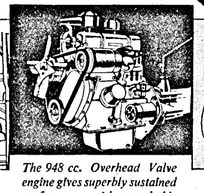
The car that gives you more !

The STANDARD TEN undoubtedly offers more value for your money. The excellent 948 cc Overhead Valve engine gives you outstanding performance with remarkable economy. The smart styling and distinctive dual tone colouring of the STANDARD, makes it stand out anywhere, while its sturdy construction is guaranteed to give you reliable service. The STANDARD also offers spacious seating accommodation, which is situated within the wheelbase, to give you maximum motoring comfort and pleasure.

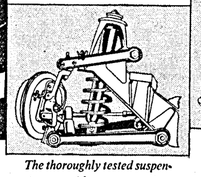




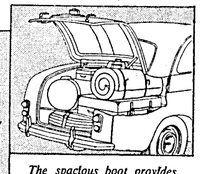
The spacious interior provides comfortable seating room for 4/5 persons, and the four wide doors which are hinged forward, make getting in and out easy.



The 948 cc. Overhead Valve engine gives superbly sustained performance with remarkable economy.



The thoroughly tested suspension, provides an exceptionally comfortable ride over the roughest surfaces.



The spacious boot provides ample room for luggage.

STANDARD
REGD. TRADE MARK

STANDARD TEN

The Sturdy Car

The Standard Ten is backed by a 6 month guarantee, and the world wide Stanpart Service.

STANDARD MOTOR PRODUCTS OF INDIA LTD., MADRAS-2.

RECESSION FOLLOWS A SEVEN-MONTH SHARE BOOM

STRONG DEMAND FOR NEW ISSUES

By GEORGE CARVELHO

AN average shareholder—if he were the owner of a widely distributed investment portfolio and neither added to, nor reduced, his holdings during the first ten months of 1960—is likely to find himself slightly better off than at the beginning of the year. But he will have had plenty of excitement in the meantime. For the first seven months of the year, he would have seen his capital appreciating almost continuously. If he had the foresight to ride the boom to its crest and then get off, he would have been considerably richer than in January. But if—as is more probable—he merely hung on, he would have been mortified and dismayed in the course of the succeeding months to see almost all his gains wiped out as share prices fell steadily. One could hardly blame him if he decided that, in the interests of his nerves, if not of his fortune, he would have been wiser to steer clear of the Stock Exchange.

Yet, more people than ever before are probably joining the ranks of stock market investors and learning, sometimes at heavy cost, how illusory is the hope of getting rich quick by dabbling in shares. This is a salutary lesson which needs to be learned, for both the boom and the slump of 1960 were predominantly speculative in character. And at least in subscriptions to new issues, which attracted much attention, the little man, no less than the big operator, showed symptoms of being infected by the speculative mania. Lord Keynes said that when the economic development of a country becomes a by-product of the activities of a casino, the job is likely to be ill-done. For several months this year, it seemed to be an apt description of conditions in India.

At the close of December 1959, the Reserve Bank's index number of variable dividend industrial securities (1952-53 equals 100) stood at 160—a level at which investors had reason to be well satisfied. Over the past seven years, their capital had increased by about 60 percent, while the index number of wholesale prices, which may be regarded as a rough indication of the value of money, had risen during the same period by only 17.6 percent. Equities seemed to be living up to their reputation as a fine hedge against inflation. It was particularly satisfying to the swelling number of investors that share prices had risen rapidly in the last two years. At the end of 1957-58, the index stood at 126.6. More than half the 60-percent rise since 1952-53 had thus taken place since 1957-58, a period in which the effects of the Krishnamachari Budget and other socialistic measures might have been expected to cloud the outlook for private investment. Investors put away their apprehensions and apparently felt that the expansionary impetus of a developing economy was powerful enough to take in its stride all such tendencies.

Growing Optimism

At the start of the year, investors looked forward optimistically to another period of rising share prices. Except for a mild fall in January, which brought the index down to 156.6, the market fully lived up to these expectations until the end of July, as the following figures show :

ALL-INDIA INDEX NUMBER OF SECURITY PRICES

(1952-53 equals 100)

December 1959	160.0
January 1960	156.6
February 1960	159.1
March 1960	161.7
April 1960	168.7
May 1960	174.8
June 1960	175.4
July 1960	181.6

Because of overoptimism, the attempts of investment analysts to assess the favourable and unfavourable factors in the market outlook seemed to be rather academic. The Chinese danger to India's northern borders no longer had any influence on market sentiment and was taken into account, if at all, only as a reason for increased defence expenditure and, therefore, possibly higher taxes. Such fears were dispelled when the 1960-61 Central Budget proposals brought no increase in direct taxes and a smaller rise in the indirect ones than market opinion had considered likely. True, the prospect of a big third five year plan loomed ahead, and with it the necessity of a much greater tax effort. But investors who had learned to adjust themselves to the Krishnamachari system of integrated direct taxation, adopted the philosophical attitude that things would probably turn out all right eventually. In any case the danger was too remote to affect present prosperity. There were other danger spots, such as inflationary pressures and the dwindling foreign exchange reserves. But investors always found it difficult to convince themselves that inflation was against their interests and goodwill towards India in the rest of the world gave ground for the belief that foreign aid would be forthcoming on an adequate scale.

Tempo of Development

While such sentiments no doubt played a part in the stock market boom, the persistent upward pressure on prices came from the sheer weight of money. The rising tempo of development as well as non-development expenditure year after year had a multiplier effect on money incomes. Some of those who received the newly generated money incomes discovered in shares something which would withstand the erosion of the value of money resulting from inflation. To this was added the perfectly natural desire to make speculative profits on a rising market. There has probably never been a Stock Exchange boom in any country in which those who would normally be genuine investors have not succumbed to the temptation to indulge in some measure of speculation. During the current year, the ordinary investor appeared to have chosen the new issue market for this purpose.

It is true that the scramble for shares could not have occurred without a substantial measure of confidence in the stability and soundness of the economy and its growth possibilities. But the picture could easily be overdrawn to the point where it became ludicrous. It was quite unrealistic to conceive of a patriotic body of investors practising severe austerity so that the savings they made through self-denial may be invested in the industrial development of the nation, to the greater glory of the five year plan. The truth was much more prosaic, and in no sense discreditable. Investors—perhaps more than other people—had an eye for the main chance. They rushed in to buy

Pardon our Presumptuousness..... but.....

The beginning and the end of a Five Year Plan are vital dates in the nation's history. Each Five Year Plan is both an assessment of the past and a call for the future. It seeks to translate into practical action the aspirations and ideals of the millions in the country and gives to each of us the opportunity of service in the common cause of eliminating poverty and raising standards of living....

Today, on the eve of the Third Five Year Plan, we of the Raza Buland Sugar Co. Ltd. believe that 25 years' useful service to the Nation is something to talk about, but we will rest contented by narrating a few facts about our "achievements" and our contribution towards raising the standard of living of our people during the past 12 months.

At the close of the last crushing season we .....

Crushed..... Over 1,13,00,000 maunds of Sugarcane
Bagged..... Over 10,93,000 maunds of Sugar
Paid to Cane-growers..... More than Rs. 1,76,00,000
Paid to Workers..... Over Rs. 17,70,000

And expect to pay to the Government and National Exchequer as Excise and Taxes Over 1,55,00,000 Rupees.

On the occasion of our Silver Jubilee celebrations recently almost a hundred of our oldest workers who had served the Raza Buland Factories for over 25 years were awarded silver medals, and cash awards.

These are our humble contributions towards the cherished targets and goals of

mainly because they thought that share prices would rise. It was incidental that private industries were thereby enabled to raise vast amounts of capital for expansion and for the establishment of new enterprises. Only those whose economic reasoning had been distorted by doctrinaire socialism, would hold this to their discredit. Economic policy should be directed to canalising such enlightened self-interest into productive expansion along the lines chalked out by India's planners. It should be said to the credit of the Government that this is precisely what the monetary authorities tried to do through credit curbs.

Supply of Floating Scrip

The growing weight of investible funds encountered a virtually constant or even diminishing supply of floating scrip. The private industrial sector of the economy was expanding and new units were being started at a faster rate than for several years past. But the rate was not fast enough to keep pace with the swelling demand. The situation was aggravated by the fact that private investors found themselves competing for the meagre supply of salable scrip with the Life Insurance Corporation, whose investments kept on rising, as its business expanded and its resources increased. More and more of the top-class equities which investors hungered for, disappeared into the maw of the L.I.C., so the shortage was accentuated and in the ensuing squeeze, prices rose to unhealthy levels.

One of the hardest questions to answer at a time of soaring share prices was whether the rise had gone too far and had resulted in a dangerously unstable situation This was a problem which perplexed experienced stock market operators and financial experts. It was too much to expect the ordinary investor, caught in the excitement of a bull market, to make a correct assessment. Looking back on events in 1960, it is now possible to assert that by end-July, the safety level was exceeded There were warnings in plenty, and those who heeded them escaped the worst of the ensuing slump. But investors were baffled by the conflicting interpretations of the pundits themselves. One set of observers had been crying themselves hoarse for months that the rise was unjustified, that it was born of speculative operations by interested parties, that real investment was almost non-existent and that the bubble would burst. But the level of prices kept moving up in spite of these dire prophecies. There were others who emulated the celebrated Doctor Pangloss by saying that everything was for the best in the best of all possible worlds. They said that India had a developing economy, with virtually unlimited growth prospects, and that while share prices were admittedly high in the light of prevailing conditions, they were more than justified in view of the bright future which lay ahead.

Narrowing Yields

Yields obtainable on different types of securities at their market prices, could perhaps be a fair index of the degree of overvaluation. But the introduction of the factor of growth prospects rendered any conclusion drawn from a study of relative yields subject to grave reservations. In the case of new issues, investors took up shares in the full knowledge that there would be no yield whatsoever on their money for some years. They considered the prospects of capital appreciation and future dividends good enough to warrant purchases even at the zero current yield. Nevertheless, the following figures of comparative yields at the end of December 1959 and July 1960 are instructive :

Yields on Securities

(Tax-free rates)

	December 1959	July 1960
	(percent a year)	
Central Government securities	2.57	2.65
Debentures	3.95	4.06
Preference shares	5.43	5.33
Ordinary shares (total)	5.22	4.70

It is advisable to disregard preference shares in the above table, because their yields were affected by a special factor—the provisions regulating preference dividends under the new system of company taxation. *The narrowing of the yield* spread between Central Government securities and ordinary shares from 2.65 percent in December 1959 to 2.05 percent in July 1960 reflected the appreciation in equity prices over the period. It is difficult to conclude from this that investors ought to have taken a narrowing of the yield differential as a red light to the overvaluation of equity prices.

The figures of yields given above are overall averages and are, therefore, less useful for the present purpose than those relating to particular groups or even to individual concerns. In July 1960, the yield on basic industrial chemical shares was 3.48 percent, on machinery, other than transport and electrical, 3.85 percent, on transport equipment 3.16 percent, and on iron and steel 3.76 percent. In individual cases, many new issues gave no yield at all, and there were instances where the yields on shares of existing concerns worked out to less than those obtainable on Government securities. But even this was not an unprecedented phenomenon in a developing economy and by itself would not justify the conclusion that share prices had reached dangerously high levels.

Any such judgment must inevitably be somewhat arbitrary. But those in close touch with the stock market have conceded that, for the most part, the business which kept the market humming with activity, came from professional speculators and genuine investment was small. It is not that the business was mainly restricted to cleared securities. It was not. Speculators were doing big business in equities on the cash list. But that does not alter the fact that the business was overwhelmingly speculative in nature. The genuine investor found himself caught up in a whirlpool of speculation. It would have needed quite extraordinary judgment and sobriety to know just when it was time to get off the bandwagon.

Credit Curbs

As early as March, the Government was perturbed over the behaviour of the stock market and the mounting inflationary pressure. The series of credit curbs introduced then had the twin objects of arresting the rise in prices and checking the unhealthy boom in the stock market. According to official thinking, both these were, in part, the consequence of a common cause—the excess liquidity of the banking system. Hence, in spite of the well-known limitations on the effectiveness of monetary policy, particularly in an undeveloped money market such as India's, a series of credit curbs were introduced. On 11th March, the Reserve Bank, for the first time, made use of the power to vary scheduled banks' reserve requirements in order to impound 25 percent of the increase in deposits accruing after that date. The proportion was increased to 50 percent for deposits accruing after 6th May. As a curb against undue expansion in bank advances against shares (other than preference shares) scheduled banks were required to impose a minimum margin of 50 percent, of the value of shares against which advances were made. In addition, they were prohibited from directly engaging in *budla* transactions. Finally, in September came the announcement that, with effect from 1st October, scheduled banks would have to pay higher rates for borrowing from the Reserve Bank in excess of specified quotas.

It is significant that the credit restrictions announced in March had only a temporary restraining influence on the upward trend in share prices. Those of May were virtually ignored by the stock market. The ineffectiveness of the measures seemed conclusive evidence that bank credit played an *insignificant part in providing funds* to support the stock market boom. But as the rise continued, there was mounting anxiety that further drastic measures to check excessive speculation were being prepared. Such fears, together with the relatively mild control measures devised by the Stock Exchange authorities, particularly in Bombay, undermined market sentiment, so from the end of July prices displayed a sagging tendency. When the latest measures of credit restraint came in September, the effect was to strengthen the downtrend which had set in much earlier. It is not, therefore, correct to say that the Reserve Bank's credit restrictions reversed the upward movement of share prices. Credit curbs might have played a part, but the more important factor was the growing conviction that the rise had gone too far and a corrective reaction was necessary to avert a collapse.

It is evident that there has been a definite shift in monetary policy during the current year. The emphasis is henceforth to be on credit restraint,

India-built PHILLIPS and HERCULES are proving the high quality of Indian manufacture abroad!

Our exports do more than earn foreign exchange; they help to foster confidence in foreign lands that India can make goods comparable to the best they're used to from the West.

Abiding Partnership: Such a favourable image is owed in no small measure to the abiding partnership between Murugappa & Sons and Tube Investments which has produced outstanding results. Our factory units producing ERW steel tubes, cycles and cycle components are being enlarged in capacity to serve both our growing internal and export needs.

There is in evidence today, as a measure of contribution to national economy, a cycle made by T. I. Cycles in every five on the road. Our TRU-WEL tubes are helping to stabilise the indigenous manufacture of cycles at a high level. These tubes are further contributing to the building up of other light engineering industries which require steel tubing combining great strength with exceptional lightness.

We look back with pardonable pride on the role we have played in developing our national economy and are happy to have a continuing opportunity to share in the unlimited task ahead of building up a free and prosperous India.

general as well as selective, instead of the earlier policy of general credit expansion, with selective controls on credit for particular purposes, such as the holding of foodgrains, sugar and oilseeds. For the genuine investor, the significance of the shift lies in its possible influence on the structure of interest rates and on the long-term return on capital. The official reluctance to raise Bank rate openly was evidently born of a desire to prevent a fall in Government security prices and a consequent rise in the rate at which new loans would have to be floated. It now appears that this hope is not likely to be realised. There have been heavy sales of Government securities, chiefly by banks who have been squeezed by the deposit impounding scheme and the rising demand for advances with the advent of the busy season. If the trend continues and yields on Government securities rise, investors will not consider equities attractive, except at a yield which will maintain the traditional spread between variable dividend and fixed-interest securities. This may lead to a fall in share prices, so the yield on them may be pushed up to attractive levels.

New Issue Mania

Perhaps the outstanding feature of the year for most investors was the unprecedented demand for new issues. More than the rising trend in the prices of existing shares, it was the orgy of speculation in new issues which convinced moderate opinion that the situation was getting out of hand and roused officials to the necessity for drastic action. The situation was unhealthy for several reasons. It was not natural or desirable that the prices of new issues should be boosted to three, five and in some cases even eight times the issue price. Not even the most optimistic assessment of growth prospects could justify high premiums when years had to elapse before the concern was likely to get to the stage of making profits and paying dividends. The existence of premia of such magnitudes at once raised the suspicion that interested speculation, rather than genuine investment demand, was the principal influence. Furthermore, it was common knowledge that the boom in new issues was encouraging stagging on an enormous scale. Probably most of those who submitted applications for such issues had no intention of locking up their capital for any length of time. All they were interested in was to get an allotment, however small a proportion of the amount applied for, which they would promptly unload at a profit, no doubt congratulating themselves on their financial acumen. Added to this was the delay in the making of allotments and refund of application money to the unsuccessful applicants, complaints of unfairness in the making of allotments and unofficial dealings in the scrip long before the despatch of allotment letters. Finally, the extent of oversubscription—over 60 times in the case of Synthetics and Chemicals—and the complete lack of discrimination on the part of investors in applying for new issues (so that any and every concern that published its prospectus and invited subscriptions to its shares was immediately swamped with applications) were clear danger signals that all was not well in the new issue market.

Sound Projects

It is certainly desirable, and a welcome change from the time when Indian capital was notoriously "shy", that investors should be ready to finance new enterprises. In many cases, but not all, the projects were intrinsically sound and well worthy of the support of enlightened, far-sighted investors. In part, the Government was to blame because the number of licences for new industrial enterprises was too small to absorb the capital seeking investment as well as to meet the estimated demand for the product which the new concern was intended to manufacture, so prospects of profitability were boosted by expectations of a large home market, protected from imports by the foreign exchange shortage, and entirely dependent on one or two producers whose projected capacity was not enough to meet more than a fraction of the demand. It is not legitimate to infer from the heavy oversubscriptions to new issues, as Mr. Nehru was reported to have done, that burden of taxation is not heavy. It would be quite wrong to make a total of the subscriptions to all the new issues and to conclude that the amount represented the sum which investors had saved and held ready to invest. The same money figured in successive new issues and probably no small part of the sums which accompanied the application forms did not represent genuine savings but loans at high interest rates which the applicants expected to recover with profit by quick sale of their allotments at high premium prices. But there is no denying that it was a senseless and unhealthy speculative mania which held the new issues market in its grip during those hectic months. All those interested in the healthy functioning of the capital market will be glad that, with the recession in share prices, this phase has ended and the share premia on new issues have fallen to levels at which they bear a truer relation to the prospects of the particular enterprises. (A list of new issues during the year appears pages 119 and 121).

Cheerful Note

The year began on a distinctly cheerful note, for share prices rose smartly in December 1959 and the equity index for the week ended 2nd January, 1960, stood at the new high of 160, against the low of 119.7 touched in January 1958. Conditions seemed favourable for a continuance of the upward trend, but Budget uncertainties acted as a restraining influence right from the beginning of the year. In addition, the diversion of funds to new issues created some weakness in existing shares. Sentiment was adversely affected by apprehensions concerning the outcome of the Congress session in Bangalore and later by reports that the Central Wage Board for the Cotton Textile Industry had recommended an increase in basic wages to textile workers. In the face of all these adverse factors, prices tended to weaken and Indian Irons were sold down to Rs. 21.85—the lowest point touched in several months. In view of the nearly prohibitive tax of 30 percent on bonus issues, one of the notable events of the month was the announcement by Katras Jherriah Coal of a bonus issue in the proportion of 13 ordinaries for every ten held. Furthermore, holders of Kalapahari Coal, also under the management of Andrew Yule and Company, were given the option of accepting Rs. 27 a share for their existing holdings or one Katras Jherriah Coal ordinary share for every one Kalapahari Coal held, on an ex-rights basis.

The defeat of the Communist Party in the Kerala elections helped boost market sentiment early in February, and there was a moderate recovery in prices. But Budget uncertainties again supervened and operators awaited 29th February with considerable trepidation. It was realised that expenditure would increase, and with it the need for additional taxation, because of the implementation of the Central Pay Commission award, the need to strengthen national defence as a consequence of the border dispute with China and the high cost of servicing the greatly increased internal and external debt. The Railway Budget, which was presented to Parliament on 17th March, was received with disappointment, because the surplus was smaller than anticipated and particularly on account of the decision to levy a supplementary charge of 5nP in the rupee on goods freight and coal transport, excluding only export ores, military, postal and the railways' own traffic.

The Central Budget

The Budget, when it finally came, turned out to be much less terrifying than was expected. The tax proposals were greeted with relief, and share prices improved along the entire list. Some disappointment was expressed at the determination of the authorities to retain the unpopular tax on bonus shares. But by and large the feeling was that things could have been much worse. Another sore point with investors was the refusal of the Central Finance Minister to acknowledge that the 45 percent rate of tax on companies' profits, under the new system of company taxation, in fact amounted to a measure of additional taxation and was not, as the Government claimed, only an administrative simplification which left the tax burden and the revenue unchanged.

The overall welcome which the market accorded to Central Budget proposals stemmed from four considerations. First, while operators expected additional taxation of the order of Rs. 30 crores to Rs. 40 crores, the tax proposals for 1960-61 were designed to bring in additional revenue of Rs. 24.23 crores (of which Rs. 23.53 crores would accrue to the Centre and Rs. 70 lakhs to the States), against Rs. 26.07 crores in 1959-60, Rs. 6.33 crores in 1958-59, Rs. 100 crores in 1957-58 and Rs. 80 crores in 1956-57. Secondly, the entire amount of additional revenue would be secured from indirect taxation. This was taken as an acknowledgment that there was no further scope for an increase in direct taxation. Particular note was taken of the Central Finance Minister's statement in presenting the tax proposals that "while direct taxation will be kept under constant and continuous review so as to make it yield the maximum resources, the bulk of the expansion in taxation will have to come from indirect taxation." It was expected that this would apply to future Budgets as well, including those during the third five year plan. Briefly, the major items on which new levies were to be imposed included pig iron, tinplate, aluminium, internal combustion engines, electric motors, essential bicycle parts, exposed cinematographic films and silk fabrics. Items on which enchancement in existing rates

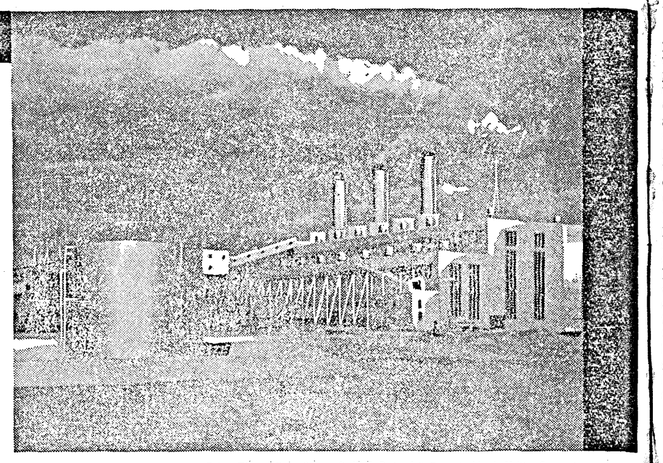
POWER FOR PROSPERITY



Bokaro Thermal Power Station, D. V. C. Designed & Constructed by the Kuljian Corporation

In the field of power engineering, Kuljian Corporation have an international reputation as designers and construction-supervisors of over a hundred steam and hydro-electric power plants and industrial power houses. Many of these projects rank among the finest in the world.

In India, the Kuljian Corporation operate a fully equipped design and engineering office offering specialised service and 'know-how' on every aspect of planning, engineering, construction and initial operation.

Between Bokaro and Bandel lies a decade during which Kuljian Corporation have been associated as consultants, designers, constructors and operation-managers with eight thermal power projects in India. And the Corporation's vast experience has been reflected on every Kuljian project.

By taming the ethereal power on earth, India is laying the foundation of her future prosperity. For, power lays the way for prosperity to go the pace.

was proposed included refined diesel oil, electric fans, bulbs and batteries.

The third welcome feature of Central Budget proposals—from the point of view of investors—was the relief in relation to taxation of intercorporate dividends and dividends paid out of profits taxed in the past. The Finance Act, 1959, had prescribed the general rate for deduction of tax at source on dividends received by Indian companies at 45 percent, while for assessees other than companies, the rate was 30 percent. It was proposed that the rate of deduction in the case of Indian companies should be reduced to 30 percent so that the effective rate of tax deduction at source would be the same for all assessees, including companies. The other proposal was that companies should be given a credit equal to 10 percent of the dividends distributed out of past taxed profits. Finally, operators were pleased that the period for which exemption was available under Section 15C of the Income Tax Act to new industrial undertakings was to be extended for a further period of five years. The consensus of opinion seemed to be that the Budget proposals were not such as to do serious damage to investment prospects which, in the circumstances, was perhaps the utmost that anyone could reasonably expect.

Preference Dividends

Within a week of the presentation of the Central Budget, the boom in shares had definitely established itself and the equity index rose to a new high of 168.8 for the week ended 12th March. It was noticed, however, that inter-market speculation, rather than genuine investment buying, provided the stimulus. Business in preference shares was brought almost to a standstill by the confusion over the legal obligations of companies towards taxable and tax-free preference shareholders under the new system of company taxation. The Finance Act, 1959, had provided that in the case of dividends paid to preference shareholders—who were entitled to a fixed rate of dividend, free of tax—the tax to be deducted at source in terms of Section 18 (3E) of the Income Tax Act, was to be computed on such an amount as would, after deduction of a sum equal to 30 percent on it, be equal to the fixed rate of dividend. It was provided in the Finance Bill, 1960, that the section should be deleted, so that companies would be free to decide the amount they should declare as dividends to preference shareholders; out of the amounts so declared by the companies, deduction at source would have to be made, as in the case of any other dividends, at the prescribed rates. There followed a wide divergence of practice by companies having preference shares. Some continued to gross up the stipulated rate of tax-free preference dividend at 30 percent, even after the end of the legal obligation to do so. Others argued that the expression "tax-free" signified simply that shareholders would not be called upon to bear the companies' income tax and that, therefore, under the new system of corporate taxation, they were entitled to the stipulated rate of dividend and no more.

The companies could not be held responsible for the fact that the Government had changed the system of taxation and deprived all shareholders, ordinary and preference, of the facility of grossing up their dividend income and claiming tax credit at the rate of 31.5 percent. This attitude overlooked the fact that the tax burden on companies had been reduced. As the Central Finance Minister said subsequently, it was the Government's intention that both types of shareholders should participate in the benefit of tax reduction on companies. The controversy continued until a definite ruling was finally provided later in the year by the Preference Shares (Regulation of Dividends) Bill, which laid down that in the case of tax-free preference shares, the stipulated rate of dividend should be increased by 25 percent, and in the case of taxable preference shares, by 7 percent. The rates do not provide full compensation to preference shareholders for the loss of grossing, but they do represent a compromise between the two extreme positions that preference shareholders should be compensated fully and that they should not be compensated at all. On average, the tax relief to companies works out to 25 percent (seeing that under the old system, the company taxation amounted to 56 percent of profits leaving 44 percent, while under the new system, companies pay 45 percent, leaving 55 percent) and, under the provisions of the Bill, companies will be paying 25 percent more to both types of preference shareholders, taxable and tax-free.

Deposit Impounding Scheme

On 10th March came the first of the series of credit curbs applied by the Reserve Bank during the year. These comprised (1) the impounding with the Reserve Bank, in the form of additional deposits, of 25 percent of any additions to the demand and time liabilities of scheduled banks after 11th March, over and above the deposits already required, namely, 5 percent of demand liabilities and 2 percent of time liabilities; (2) the imposition of a minimum margin of 50 percent on advances by scheduled banks against shares other than preference shares, above Rs. 5,000; (3) a ban on direct financing of *budla* transactions by

Important New Issues Offered to the Public During 1960

Companies	Opening Date of issue	Issue price a share		Details of issue
Premier Tyres Ltd	.. 11th January	Ordy. Rs. 25 on application	44,100	ordinary shares of Rs. 100 each and 25,000 6½ percent tax free cumulative redeemable preference shares of Rs. 100 each. Rs. 25 a share payable on allotment of both ordinary and preference shares. The balance of Rs. 50 will be called by the directors at their own discretion.
Chase Bright Steel Ltd	.. 18th January	Rs. 5 on application	150,000	ordinary shares of Rs. 10 each. Balance Rs. 5 a share was made payable on 1st August, 1960.
Associated Battery Makers (Eastern) Ltd	.. 19th January	Rs. 15	480,000	ordinary shares of Rs. 10 each, fully paid, at Rs. 15 a share.
Asian Cables Corporation Ltd	.. 5th February	Rs. 25 on application	25,000	ordinary shares of Rs. 100 each. Rs. 25 a share payable within one month from the date of allotment. Balance of Rs. 50 will be payable in such calls as may be determined by the directors, provided that no call shall exceed Rs. 25.
Hindustan Aluminium Corporation Ltd	.. 8th February	Ordy. Rs. 2.50 on application	2,156,000	ordinary shares of Rs. 10 each. Balance of Rs. 7.50 a share payable on call or calls to be made not earlier than four months after allotment.
		Pref. Rs. 25 on application	250,000	6.3 percent (free of tax) redeemable cumulative preference shares of Rs. 100 each. Balance Rs. 25 a share payable on a call to be made not earlier than six months after allotment and Rs. 50 a share on call or calls to be made not earlier than 12 months after allotment.
Automobile Products of India Ltd	.. 15th February	Rs. 2.50 on application	175,000	ordinary shares of Rs. 10 each at par, Rs. 2.50 a share payable on allotment and balance Rs. 5 as and when called.
Attikhan (Biligiri) Ltd	.. 19th February	Ordy. Rs. 2	200,000	ordinary shares of Rs. 2 each, fully paid.
		Pref. Rs. 10	20,000	9 percent (taxable) cumulative redeemable preference shares of Rs. 10 each, fully paid.
Adarsh Chemicals and Fertilizers Ltd	.. 18th April	Ordy. Rs. 25 on application	12,000	ordinary shares of Rs. 100 each. Rs. 25 a share payable on allotment and the balance Rs. 50 payable in such calls as may be determined by the directors.
		Pref. Rs. 12.50 on application	8,000	6½ percent tax-free redeemable cumulative preference shares of Rs. 100 each. Rs. 12.50 payable on allotment and the balance Rs. 75 payable in such calls as may be determined by the directors.
National Sugar Mills Ltd	.. 18th April	Rs. 50 on application	15,000	7 percent (tax-free) redeemable cumulative preference shares of Rs. 100 each. balance Rs. 50 payable in two equal calls—the time limit between each call is to be decided by the directors.
Mysore Cements Ltd	.. 21st April	Rs. 5 on application	440,000	ordinary shares of Rs. 10 each. The balance of Rs. 5 a share will be payable on call or calls as may be determined by the directors not earlier than four months after allotment.
J. K. Cotton Spinning Weaving Mills Co. Ltd (J. K. Rayon)	.. 25th April	Ordy. Rs. 10	620,000	ordinary shares of Rs. 10 each, fully paid.
		Pref. Rs. 100	39,000	6½ percent tax-free cumulative redeemable preference shares of Rs. 100 each, fully paid.
Phillips Carbon Black Ltd	.. 26th April	Rs. 5 on application	499,999	ordinary shares of Rs. 10 each. Balance Rs. 5 a share payable not earlier than four months after allotment.
East Anglia Plastics (India) Ltd	.. 27th April	Rs. 2.50 on application	200,000	ordinary shares of Rs. 10 each. Rs. 2.50 a share payable on allotment and balance Rs. 5 by two calls. The first call shall not be made earlier than one year from the date of allotment.
Pearl Cycle Industries Ltd	.. 18th May	Rs. 100	15,000	ordinary shares of Rs. 100 each, fully paid.
Synthetics and Chemicals Ltd	.. 30th May	Rs. 25 on application	165,500	ordinary shares of Rs. 100 each. Rs. 25 a share will be payable on allotment and the balance is payable in two calls.
Raymon Engineering Works Ltd	.. 27th June	Ordy. Rs. 5 on application	399,400	ordinary shares of Rs. 10 each. The balance of Rs. 5 payable on allotment.
		Pref. Rs. 50 on application	20,000	6½ percent redeemable cumulative preference shares of Rs. 100 each. The balance of Rs. 50 payable on allotment. The holders will receive a net dividend equivalent to 6½ percent on each preference shares.
Wm. Powell & Sons Ltd	.. 19th July	Rs. 5 on application	49,000	ordinary shares of Rs. 10 each. The balance Rs. 5 payable on allotment.

scheduled banks through the purchase of shares in their name for the current settlement and sale for the next settlement; and (4) fixing a ceiling on the clean advances of scheduled banks.

The immediate reaction to these measures was a sharp decline in prices. The bull market collapsed with dramatic suddenness and Indian Irons declined by Rs. 2 in a matter of minutes. Brokers were particularly concerned about the directive that banks should not purchase or discount bills relating to transactions in shares except on a minimum margin of 50 percent of the value of such shares. This meant, in effect, that brokers would henceforth have to finance 50 percent of the value of their client's purchases of ordinary shares during the period the latter were in transit. The matter was immediately taken up with the authorities by the Calcutta and Bombay Stock Exchanges. On 17th March, the Reserve Bank announced a relaxation of the conditions on advances against demand bills covering Stock Exchange securities to be despatched from one centre to another. This imparted some steadiness to the market but general nervousness prevailed. On 12th March, the Calcutta Stock Exchange held an interim clearing for squaring up outstanding transactions in an effort to avert a possible crisis. In the last week of the month, however, a moderate recovery got under way and a bullish sentiment again began to reassert itself. Operators seemed to derive encouragement from the not-too-large increase in *budla* rates, which gave rise to the feeling that the gap in *budla* finance created by the ban on the direct financing of *budla* transactions by banks would be largely bridged from outside sources. The trend was strengthened by the support of the equity market by the Life Insurance Corporation, and brokers reported some revival of investment enquiry, induced possibly by the earlier shake-out.

The recovery gathered momentum in April and by the month-end, the equity index stood at 168.7, which was close to the pre-credit-squeeze high of 168.8 reached during the week ended 12th March. Coal shares came in for keen enquiry following the increase in the selling price of 81nP a ton announced on 3rd April. With the approach of the Easter holidays, a feeling of uncertainty appeared. Market operators feared that some banks which had served their customers with notices, might be compelled to sell shares for the purpose of adjusting individual accounts in compliance with the 50-percent margin requirement for advances against shares. Relations with communist China and the ensuing meeting between Mr. Nehru and Mr. Chou En-lai also introduced an element of uncertainty on the political front.

Excellent Balance-sheets

The publication of some excellent balance-sheets of leading companies, in both Calcutta and Madras, and rumours of an imminent increase in steel retention prices put new life into the market when trading was resumed after the Easter holidays. In fact, so substantial was the recovery in the six weeks since the announcement of the credit curbs that most of those who had earlier taken advances from banks were automatically put in order and the earlier fears of forced sales by banks thus proved baseless. By the end of the month, the market was firmly in the grip of a powerful bull syndicate. It was obvious that the credit squeeze had failed to make any lasting impression on the bull market which began soon after the Central Budget.

Equities continued to forge ahead during May as the bull syndicate strengthened its grip on the stock market. The bullish enthusiasm was great, so the intensification of the credit curbs was virtually ignored. By a notification issued on 5th May, the Reserve Bank increased the additional reserves which scheduled banks were required to maintain with it to 50 percent of the rise in a bank's total liabilities effective from 6th May, 1960. For the period between 11th March and 6th May, the additional reserves required would continue at 25 percent of the increase in total liabilities. Sentiment was bullishly stimulated during the month by encouraging company news, particularly about expansion prospects. On 11th May, in order to avoid possible payments difficulties, the Calcutta Stock Exchange authorities ordered an interim clearing in three shares, namely, Indian Iron, Rohtas Industries and Hindustan Motors. The sharp price increases, particularly in the speculative counters, confounded market observers, who pointed out that on considerations of both yields and growth prospects, there was no justification for such buoyancy. The explanation was that the rise was almost entirely speculative in character, with genuine investment interest conspicuous by its absence. By the end of the month, there was a mild reaction, which reduced the index of equity prices from the peak of 175.2 during the week ended 21st May to 174.8 by 28th May. In part, the decline was to be explained by the diversion of funds to new issues, particularly to Synthetics and Chemicals which was more than 60 times oversubscribed. The fantastic over-subscription of this issue and the premium at which it was quoted compelled the authorities to consider the necessity of restraining speculation and brought about the yet more stringent credit curbs applied later in the year and the tightening up of conditions for making rights issues by insisting on a substantial premium.

The upswing in share prices which began at the end of March was arrested during June. Speculative issues declined on nervous selling and by the end of the month most brokers had empty order-books. A number of influences contributed to the levelling off and the generally more sober mood of operators. The stringent measures taken by the authorities of the Bombay Stock Exchange on 7th June to curb excessive speculation, created apprehensions of similar action by other Stock Exchanges. The high level of *budla* charges on the Bombay and Calcutta stock markets also tended to restrain activity. Fears of a possible increase in Bank rate and the reported infiltration of Chinese troops into Nepal made operators hesitant. Informed opinion discounted the possibility of an increase in Bank rate at that juncture, in spite of the increase in the British Bank rate from 5 percent to 6 percent It was agreed that the Central Government would be unlikely to acquiesce in a rise in Bank rate which would jeopardise the borrowing programme. The Reserve Bank went off the securities market on 29th June, indicating that the ground was being prepared for the new loans.

Government Loans

On 4th July, the Central Government announced two new cash-*cum*-conversion loans, namely, (1) the 3½ percent Bonds 1966 at an issue price of Rs. 99.75 a Rs. 100 (yielding to redemption 3.55 percent) and (2) the 4 percent Loan 1980 at an issue price of Rs. 99.90 a Rs. 100 (yielding to redemption 4.01 percent) for a total sum of Rs. 175 crores. The maturing issues offered for conversion into the above loans were (1) the 2¾ percent Loan 1960 at Rs. 100 a Rs. 100 (nominal), (2) the 4 percent Loan 1960-70 at Rs. 100.30 a Rs. 100 (nominal) and (3) the 2½ percent Hyderabad Loan 1955-60 at Rs. 84.75 a Rs. 85.71 or O.S. Rs. 100 (nominal). The Government reserved the right to retain subscriptions up to 10 percent in excess of the notified amount. The lists for subscriptions, which opened on 18th July, were closed on 20th July, the amount offered having been fully subscribed. Against an offer of Rs. 175 crores, total subscriptions amounted approximately to Rs. 180.30 crores, of which cash subscriptions were Rs. 106.05 crores. The 3½ percent Bonds 1966

Important New Issues Offered to the Public During 1960

(Continued from page 119, columns 2 and 3)

Andamans Timber Industries Ltd	.. 24th August		Rs. 10	86,000	ordinary shares of Rs. 10 each, fully paid.
Hindusthan Twyfords Ltd	.. 5th September	Ordy.	Rs. 2.50 on application	145,100	ordinary shares of Rs. 10 each. Rs. 2.50 payable on allotment and the balance Rs. 5 will be called not earlier than three months after allotment.
		Pref.	Rs. 25 on application	20,000	7 percent tax-free cumulative redeemable preference shares of Rs. 100 each. Rs. 25 a share payable on allotment and the balance of Rs. 50 will be called not earlier than six months after allotment.
Seshasayee Paper and Boards Ltd	.. 7th September		Rs. 5 on application	1,450,000	ordinary shares of Rs. 10 each. The balance of Rs. 5 will be called up in two equal instalments.
Zenith Steel Pipes Ltd	.. 21st September		Rs. 2.50 on application	350,000	ordinary shares of Rs. 10 each. Balance Rs. 7.50 will be called up in such calls as may be determined by the directors, but not earlier than three months of the allotment.
Citric India Ltd	.. 6th October		Rs. 25 on application	24,500	ordinary shares of Rs. 100 each. Rs. 25 a share payable on allotment and the balance Rs. 50 will be called up as may be determined by the directors, but not earlier than three months of allotment.
Anuh Pharma Ltd	.. 8th October		Rs. 2.50 on application	80,000	ordinary shares of Rs. 10 each. Rs. 2.50 payable on allotment and the balance Rs. 5 will be called in two equal instalments, at the discretion of the directors.
Hindustan Wires Ltd	.. 17th October		Rs. 5 on application	250,000	ordinary shares of Rs. 10 each. The balance of Rs. 5 a share will be payable on call or calls not earlier than four months after allotments.
Wandleside-National Conductors Ltd	.. 15th October		Rs. 25 on application	5,000	ordinary shares of Rs. 100 each. Rs. 25 payable on allotment and the balance Rs. 50 a share will be payable in two equal calls, at the discretion of the directors.
Escorts Ltd	.. 24th October	Ordy.	Rs. 7.50 on application	171,000	ordinary shares of Rs. 10 each at Rs. 15 a share. The balance of Rs. 7.50 will be payable on allotment.
		Pref.	Rs. 50 on application	17,500	9 percent (free of Company's tax) redeemable cumulative preference shares of Rs. 100 each at par. The balance of Rs. 50 a share will be payable on allotment.
Paper Mill Plant and Machinery Manufactures Ltd	.. 26th October		Rs. 100	20,000	ordinary shares of Rs. 100 each at par.
General Tyres Ltd	.. 3rd November	Ordy.	Rs. 5 on application	400,000	ordinary shares of Rs. 10 each, balance Rs. 5 will be payable on two calls.
		Pref.	Rs. 50 on application	20,000	9 percent (free of Company's tax) cumulative reedemable preference shares of Rs. 100 each. Balance Rs. 50 will be payable in two calls.
Premier Fertilisers Ltd	.. 7th November		Rs. 5 on application	350,000	ordinary shares of Rs. 10 each at par. The balance of Rs. 5 will be payable on allotment when called for.
Isaac Holdens (India) Ltd	.. 14th November		Rs. 5 on application	290,000	ordinary shares of Rs. 10 each at par. The balance of Rs. 5 will be payable on allotment when called for.
Bajaj Auto Ltd	.. 14th November		Rs. 25 on application	34,360	ordinary shares of Rs. 100 each at par. Rs. 25 payable on allotment and the balance Rs. 50 payable as and when called for.

Safe Custody and Management of Shares and Securities

To those who buy and sell securities and shares, their safe-keeping and management is often a source of worry.

For a very small cost the State Bank of India undertakes to relieve you of this burden and to provide you with (a) safe custody for your Government securities and share and debenture scrips, (b) a prompt and efficient service for the collection of interest and dividends, and (c) other services connected with the buying, selling and transfer of the scrips.

This Safe Custody service of the State Bank is one of the many banking services the Bank renders to its clients. It may be worth your while to know how the Bank can be useful to you by calling on any of the local head offices or branches of the Bank.

brought in Rs. 82.66 crores and the 4 percent Loan 1980 Rs. 97.64 crores. The terms of the loans were generally in line with market expectations. There was, in consequence, no perceptible effect on the prices of existing loans.

On 29th July, 12 State Governments announced their decision to issue, on 29th August, new 4 percent 1969 Loans for a total amount of Rs. 75 crores. The amount and the issue prices of the new loans varied from State to State. Excepting the Gujarat and Maharashtra loans, which were issued at par, the other loans were offered at a discount. The issue price was Rs. 99.75 in the case of the Andhra Pradesh, Mysore, Madras, Rajasthan, Uttar Pradesh and West Bengal loans, giving a redemption yield of 4.04 percent and Rs. 99.50 in relation to the Bihar, Kerala, Madhya Pradesh and Orissa loans, yielding 4.07 percent. The amounts of the different State loans are shown in the following table:

	(Rs. crores)
Andhra Pradesh	9
Bihar	3
Gujarat	5
Kerala	4
Madhya Pradesh	5
Madras	12
Maharashtra	10
Mysore	4
Orissa	4
Rajasthan	5
Uttar Pradesh	7
West Bengal	7

The strike of Central Government employees which began at midnight on 11th July had a sobering effect on market operators. But the collapse of the strike within five days dispelled all nervousness and brought about a strong revival of bullish fervour. There were occasional reactions, for example in the early part of the month and again towards the close caused by apprehensions of heavy additional taxation, as indicated in the draft outline of the third five year plan published on 6th July and of possible further action by the Government to curb speculation, but these proved short-lived. For most of the month, the bulls were fully in control, and operators were reminded of the conditions which prevailed during the 1946 boom. The steep and sudden rise compelled the Stock Exchange authorities to hold an interim clearing on 18th July in two shares, Indian Iron and Hindustan Motors. The peak of the boom was reached in the week ended 23rd July, when the index number for equities touched 182. It was a situation in which yields on blue chips had fallen to the point where it had become possible to obtain higher returns from even Government securities. By the month-end, operators were seriously concerned about the possibility of further credit curbs, following the Central Finance Minister's visit to Bombay, so there was a wave of panic selling. The Government's determination to hold the price line appeared to indicate that a runaway boom would not be allowed to recur. It was evident that the post-Budget bull market had ended.

Bull Market Ends

The decline that began towards the end of July gathered force during August. Fears of further measures to check speculation were strengthened by the Central Finance Minister's statement in Parliament on 18th August that the trend in share prices was being continuously watched and that every effort would be made to restrain the activities of speculators. On 9th August, the Indian Iron and Steel Company announced an ordinary dividend for the year ended 31st March, 1960, of Rs. 1.50 gross, subject to deduction of tax at source at the rate of 30 percent, leaving a net dividend of Rs. 1.05, compared with Re. 1 net for the previous year. Considerable interest attached to the announcement, as it was the first dividend to be declared by the Company under the new system of company taxation. As expected, shareholders were slightly more than compensated for the loss of the grossing facility under the old system. The scrip responded to the dividend news by recording a modest rise from Rs. 25.20 to Rs. 25.80. Other shares in the forward list did not follow the market leader, perhaps because operators were convinced that most scrip were overvalued at the prevailing level of prices. Earlier in the week, the announcement of a one for one rights issue at par by Rohtas Industries lifted the shares from Rs. 40 to Rs. 41.75. Interest shifted to the forthcoming T.I.S.C.O. ordinary dividend, and the optimists hoped that the Company would emulate I.I.S.C.O. by making a slightly higher distribution than in the previous year. Other equities tended to lose ground on stale bull liquidation. Investors had begun to mobilise funds for the spate of new issues expected from September onwards and, consequently, showed little interest in existing scrip. Towards the close of the month, the usual pre-Puja lull on the Calcutta Stock Exchange set in. Cotton textile shares were depressed following the cut in cloth prices. Jute shares attracted some interest, following the satisfactory dividend announcements by the Bird group of mills, but the Government's decision to set up a Wage Board for the Jute Industry was viewed with some concern.

September began on a weak note and widespread liquidation brought heavy losses to the bulls. An interim clearing was held on 5th September for three shares—Hindustan Motors, Rohtas Industries and Indian Cable. Activity centred chiefly on new issues. Although the State loans were fully subscribed, most of them were quoted at a substantial discount on the issue prices soon after the lists closed. Share prices moved downwards almost throughout the month and the index number of equity prices recorded a sharp fall from 178.9 during the week ended 3rd September to 169.7 for the week ended 24th September, when the Calcutta Stock Exchange closed for the Puja holidays. The heavy fall in prices caused the Calcutta stock market authorities on 15th September to apply by-law 77 of the Association and prohibit sales of clearing shares until further notice, except for squaring-up transactions. As a result, business virtually came to a standstill. Shareholders of Guest, Keen, Williams were disappointed at the terms of the rights issue, which was made at a premium of Rs. 18.50, against the expected premium of Rs. 10 a share. The shares were immediately marked down by Rs. 5 to Rs. 44. The market interpreted the increased premium as a sign that the Government would insist on high premiums on future rights issues. Before the market closed for the Puja holidays, the ban on fresh sales of clearing shares was lifted. But brokers were required to deposit, until further notice, a sum of Rs. 2 a share if their net sales exceeded their purchases in the case of six shares on the forward list—Indian Iron, Hindustan Motors, Orient Paper, Rohtas Industries, Indian Cable and Textile Machinery Corporation. Such firm and timely action by the Calcutta Stock Exchange authorities averted what might have developed into a serious crisis.

More Credit Curbs

The most significant happening in September, for the future of private investment, was the announcement by the Reserve Bank, of a further series of credit curbs, to take effect from 1st October. The borrowing of banks from the Reserve Bank was to be limited to certain quotas, above which further borrowing would be permitted only on payment of higher rates of interest. Each scheduled bank was allotted a quota for borrowing from the Reserve Bank equal to 50 percent of the reserves required to be maintained by it with the Reserve Bank, which are 5 percent of demand liabilities and 2 percent of time liabilities. Scheduled bank borrowings (against Government securities as well as bills) up to 100 percent of the quota would be at Bank rate—4 percent. Borrowings over 100 percent but not more than 200 percent of the quota would be at 1 percent above Bank rate (5 percent). Borrowings over 200 percent of the quota were to be at 2 percent above Bank rate (6 percent). In view of the new system of penalty rates, the ceiling limits of borrowing from the Reserve Bank fixed for individual banks under the bill market scheme would, for the time being, not be operative.

At the same time, a directive was issued to scheduled banks, requiring them to adhere, with effect from 1st October, to a minimum rate of 5 percent on all advances, whether existing or new, whether clear or secured, with the exception of advances to other banks, including co-operative banks. Where the minimum lending rates of banks were 5 percent or more, they were required to raise the structure of their interest rates so as to ensure an increase in their average lending rate of at least ½ percent.

In relation to some very short-term rates on deposits, the Reserve Bank directed that no scheduled bank should pay interest at more than 2 percent below Bank rate on any deposit (other than inter-bank deposits) repayable on notice or on the expiry of a period not exceeding 21 days from the date of deposit. Unlike the previous occasions during the year when credit curbs were announced, the news came at a time when the market was already weak and hesitant. It was noted that they took effect from the start of the busy season, and were therefore likely to make it particularly difficult for banks to meet the normal demand for advances.

The market reopened after the Puja holidays on 6th October on a weak note. Investor interest in existing scrip was negligible, but the appetite for new issues remained keen. By mid-October, the index number for ordinary shares was down to 65.1, which meant that the gains earlier in the year were nearly wiped out. The steep fall in prices had raised yields on first-class equities to the point where it was expected that a revival of investment might reasonably be expected. But, apart from scattered enquiry, there were no signs of any broadbased revival. Jute shares came under pressure, as the implications of the expected fibre shortage and the steps taken by the Indian Jute Mills Association to cope with the situation, were anxiously discussed. Diwali brought no cheer to the hearts of investors. When the market reopened on 22nd October, after the three-day Diwali closing, the recovery which was hoped for failed to materialise.

At the end of October, reports that the Life Insurance Corporation had bought about Rs. 1 crore worth of equities imparted a measure of steadiness to the market. But in the absence of any change in sentiment, the revival was short-lived. On 11th November, there came a relaxation of credit restrictions. Banks were no longer required, with effect from that date, to lodge with the Reserve Bank any portion of future increases in deposits. The impounding scheme with reference to earlier increases in deposits would continue, except that the proportion was reduced to 25 percent. Still, the widely held view was that no substantial recovery was likely in the next few months. Anxious thoughts were turning to the possible implications of the Budget proposals that were due at end February 1961. Some increase in taxation was admitted to be inevitable, but it was thought that if the Finance Minister relied, as he did this year, mainly on indirect taxation, the stock market would not be seriously perturbed. There was some alarm at the possibility that the Mahalanobis Committee, which was engaged in investigating the distribution of the increase in national income in the past ten years, may come to the conclusion that the principal beneficiaries had been the wealthier sections of society. In that case, the Government might feel compelled to resort to some further socialistic fiscal measures, which would react adversely on the outlook for investment. The general election due in 1962 may also lead to some strongly egalitarian measures aimed at impressing the electorate.

Operators thus did not look forward to a resumption of the uptrend in prices for some time to come. But they felt that after the bearish implications of the next Budget had been digested the expansionary effect of economic development might again make itself felt. On the long view, a degree of optimism appeared to be justified, but for the immediate future, caution was the watchword.

On towards progress . . .

India Steamship Co., Ltd., has a steady record of progress... Since Independence, its tonnage has increased from about 85,000 D.W. tons to over 200,000 D.W. tons—more tonnage being still on order.

Its services are also extending to various trade routes. After initial consolidation in the India-U.K.-Continent trade—the Company entered the Indo-Soviet service to the Russian Black Sea ports in 1956 and later to Rumanian ports. In 1959 the Company forged still another link in the overseas with South America and in 1960 it extended its service to Poland.

Their experience and reputation for fast, efficient and dependable service built on the personal care given by their experienced officers and crew to the cargo entrusted to them, have earned them the goodwill of their customers.

THE CRISIS IN THE JUTE INDUSTRY

FIBRE SHORTAGE FORCES MILLS TO CUT OUTPUT

IT has been an eventful year for the jute industry, whose fate seems to be one of recurring crises with intervals of uneasy calm in between. It is not necessary to probe deep for the root cause of these troubles, which have flared up intermittently ever since partition. Here is an extract from the address delivered by the chairman of the Indian Jute Mills Association at the annual general meeting held in February 1948: "First things must be tackled first: the Indian Dominion needs more jute and must have it if her economic position is to be sound. I am yet unconvinced that the only answer to this lies in increasing acreage: for the yield from the present areas is of the poorest. Better seeds, better methods of cultivation, better controls over all that affects an agricultural crop—apart from the weather itself—all of these demand an amount of applied research and study at levels not hitherto reached."

These words were spoken by the I.J.M.A. chairman nearly 13 years ago, and could well be reiterated topically by the present incumbent of that office: for most of the industry's ills during these years can be traced to either uncertainty about or actual shortage of raw jute supplies, and the self-same problem confronts the industry at this very moment. The following table shows how jute production in India has developed since 1947:

Season (July-June)	Acreage (000 acres)	Crop (000 bales)	Yield (bales an acre)
1947-48	652	1,658	2.54
1948-49	834	2,055	2.37
1949-50	1,163	3,089	2.66
1950-51	1,411	3,283	2.33
1951-52	1,951	4,678	2.40
1952-53	1,813	4,592	2.53
1953-54	1,196	3,129	2.62
1954-55	1,243	2,928	2.36
1955-56	1,739	4,197	2.41
1956-57	1,908	4,288	2.25
1957-58	1,742	4,052	2.33
1958-59	1,811	5,158	2.85
1959-60	1,707	4,548	2.66
1960-61		*5,800	

* estimate

These statistics indicate a general (but by no means steady) upward trend in total production, with a roughly parallel graph line for the acreage sown. Mesta, which has become an increasingly important auxiliary crop since the early 'fifties, is not included in the figures. This, however, does not vitiate the main argument, which is that the yield an acre has not yet shown the improvement it ought to have if the valuable research work carried out by the Indian Central Jute Committee had been effectively translated into actual practice throughout the jute growing areas. This is a fundamental point. Its importance cannot be over-emphasised.

Raw Material Needs

To assume that it is immaterial how the mills' raw material needs are met as long as they *are* met, is to ignore what is good for the industry and for the country as a whole. The farming community in north-east India is an essential and integral part of the industry and its interests merit a corresponding rating. At current price levels, the jute cultivators have no quarrel with their lot, but these prices cannot prevail indefinitely. For one thing, they deny the economic needs of an industry whose very existence depends on its ability to sell its products in a relentlessly competitive world market. Second, they are psychologically bad, giving the cultivators the possible impression that the industry can afford to pay these prices and still remain in business. Another reason is that, unless nature takes a hand, a continuance of the attractive prices of jute ruling at present in both India and Pakistan will encourage extensive sowings for the next season and the likelihood of bumper crops. It is of interest in this connection to refer to the jute production figures for 1951-52 (reproduced in the above table), compared with those of the previous season. This was the time of the Korean boom, and the artificially inflated values then obtaining led to a remarkable increase of 38 percent in acreage almost overnight, giving an outturn of close on 4.7 million bales, compared with 33 million bales in the preceding season. Depending on the size of this year's crops—and reliable estimates are still not available—there is, therefore, a reasonable prospect of equating world jute supply and demand in the next season, with a consequent fall in prices.

Drawing frame and automatic can tramping in a jute mill

This see-saw movement of jute prices, which is a perennial feature of the trade, is the manufacturing industry's bugbear and it is nothing short of ridiculous that, after more than a decade of "progress", one of the country's leading export industries should be rationed for its raw material, as is happening now. Basically, what is required is a lead from the Central Government in the form of a scheme for planned jute production, laying emphasis on (a) the supply or adequate quantities of fertilisers at the right time, in the right place and at the right (if necessary subsidised) price; (b) the production of improved strains of seed in the most suitable areas and the distribution of these throughout the jute growing districts; (c) the improvement of retting facilities, the adequacy of which is an important determinant of the quality of the fibres; (d) propaganda and practical demonstration work in the jute growing areas in order to educate the grower in the use of the foregoing and other modern farming methods; and (e) the need for active co-operation on the part of the State Governments concerned, making the State agricultural officers and their subordinate personnel conscious of their responsibilities and answerable for failure or neglect to carry out the duties assigned to them.

By

A SPECIAL CORRESPONDENT

These proposals are not revolutionary or unduly ambitious: they are obvious, simple, and practical and have been canvassed time and time again. Yet little has been done to carry them out. The use of chemical fertilisers finds virtually no part in jute husbandry even today, and it has been alleged that the small allocations made from time to time are diverted into other, more remunerative channels. Seed multiplication has not been placed on a proper footing: much of the seed is produced in areas which are less congenial than others, and there is no co-ordination of effort to ensure that the right types of seed are available for, and are distributed in, the right places. Progress in the digging of new tanks and the re-excavation of old ones, in order to provide better facilities for retting the fibre, has been pitifully slow. The average jute grower, in fact, has made little advance in his farming methods and has been given no opportunity or incentive to do so. If the price return is favourable in relation to paddy, he will, of course, put the maximum amount of land possible under jute, but that is no basis on which to secure the raw material requirements of such an important manufacturing industry.

Demonstration Blocks for Jute

It is good to see that the I.J.M.A.—partly, no doubt, because of the fibre shortage that has been seen in the last 12 months, and partly from a sense of frustration and disillusionment—has launched a jute development programme of its own, built generally on the lines indicated above but stressing the educative aspect. This visualises the setting up of demonstration blocks in various centres in West Bengal, to be extended later to the other jute growing States. Fertilisers will be applied in the quantities calculated to yield the best results, the best available seeds will be used, employing line sowing and other up-to-date cultural practices, and the farming communities in the surrounding areas will be encouraged to visit these model plots in order to see what can be achieved by these methods. There is no doubt that the growers are astute enough to profit from these lessons, for they are practical people. The I.J.M.A. will also undertake surveys of seed and fertiliser requirements, but, as correctly pointed out by the Association, all these activities can only be regarded as complementary to and not in substitution of the work of the Central and State Governments in this sphere. It is also worth underlining again that the Centre should not only frame the policy but should see that (a) the machinery for its implementation is there and (b) the machinery operates effectively and does not break down at the State Government and lower levels, as has happened in the past.

The immediate target to be aimed at is a crop of about 7 million bales, with an average yield of over three bales an acre, rising to 3¼ bales an acre over a period of a few years. Taking the area under jute and mesta in the season 1959-60, a yield of three bales an acre would have given a total production of over 7.2 million bales, compared with the actual production of 5.6½ million bales—which is another way of illustrating the effects of a higher yield from each acre. By this means, the cultivators will obtain a better return on the same or a smaller acreage, and jute prices will find an economic level—economic from the point of view of the growers, the manufacturing industry and the overseas buyers of the finished product. The alternative to this is what there is at present—a chaotic market which is damaging everyone's interests except those of the speculators who revel in such a situation.

Buffer Stock Scheme

At the other extreme is the fear of over-production of jute, which arose in 1958-59 when there were good crops in both India and Pakistan, and as a result, prices dropped to as low as Rs. 18 a maund, compared with the currently ruling rate of about Rs. 50 a maund. This enters into any scheme for boosting jute production, because in such an eventuality, with supplies exceeding demand, the market is depressed, the cultivators lose confidence, and this is reflected in reduced sowings and a short crop in the next season. To guard against this, the I.J.M.A., in consultation with the Central Government, has evolved a buffer stock scheme whereby the mills would carry larger stocks than normal by accelerating the pace of their purchases and at an agreed minimum rate which would be fixed according to the prevailing market conditions. Coupled with the proposed improvement in the yield from each acre, this is infinitely preferable to an arbitrary system under which the size of the jute crops is determined solely by price considerations affecting the amount of land put under jute in the sowing season. Raw jute—its cultivation and marketing—is the key to the whole situation, and it would appear reasonable to suggest that the matter be discussed as soon as possible at a top level conference attended by the Central and interested State Agricultural Ministers, the Central Commerce Minister, and representatives of the Indian Central Jute Committee and the I.J.M.A., with a

view to deciding on a planned course of action. As things stand at present, there seems to be a lack of direction and unity in the efforts of those responsible for framing and implementing what might be termed "jute policy" on behalf of an industry earning annually well over Rs. 100 crores in foreign exchange.

As the chairman of the I.J.M.A. has significantly observed, the *modus operandi* of the jute manufacturing industry in India has changed to this extent that whereas the level of the mills' production was previously determined by the state of the world demand for jute goods, the governing factor has now become the availability of the raw material. This, of course, is bound to happen in circumstances of fibre shortage. This factor has dominated the scene and motivated events in the last 12 months, which may now be conveniently reviewed.

Rumours of Shortage

By the end of the third quarter of 1959, it was becoming obvious that a squeeze in jute was being precipitated on the strength of current rumours of shortage. Fears that the low jute prices prevailing in the sowing season might have had a disincentive effect on the growers possibly influenced thinking at this stage, but there is no doubt that irresponsible speculation had a hand in it and this was borne out by the final crop figures which showed that there was just enough jute, after taking imports into account, to satisfy the industry's needs. The unfortunate aspect of the matter is that speculation was allowed to exert so much influence. As early as November, the industry foresaw the danger of an artificial rise in the market and urged the Government of India to issue licences for the import of 600,000 bales of cuttings from Pakistan, at the rate of 50,000 bales a month, in order to bridge the estimated gap between supply and demand and thus curb speculation. The Government, for reasons best known to itself, apparently did not subscribe to the view that imports to this extent would be necessary and declined to act on the industry's suggestion. With the market firming up, assisted by heavy speculation in "futures", the Government was eventually obliged to issue a Press note, which appeared on 23rd December, giving its assessment of the jute position and announcing the decision to permit immediately the import of 200,000 bales of cuttings. While this statement prevented any further rise, it did not succeed in restoring prices to realistic levels, due to the very strong speculative position which had been built up. The imposition of heavy margin deposits in the futures market likewise had only a mildly restraining influence.

Sealing of More Looms

Although in the early part of the new year prices declined slightly from the peak reached in December aided by the seasonal falling off in overseas demand, the undercurrent was still firm. By March, this firmness was receiving strong support from, first, the lack of rain in the jute-growing districts and the attendant fears concerning the new crop sowings and, second, the comparatively poor arrivals of jute in the mofussil agencies, which gave a new lease of life to the previous rumours of a deficiency of supplies. Up to this stage of the proceedings, the mills had been operating with 10 percent of their looms sealed, and early in April it was announced by the I.J.M.A. that member-mills would be permitted to open up 1 percent of their looms from 2nd May, with the possibility of a further unsealing of 1 to 1½ percent from the beginning of June if the jute supply position warranted it. The language used was meaningful: hitherto, relaxations of this kind had been notified in categorical terms, but the reservations made on this occasion suggested that there was still disquietude within the industry about the actual supply position. In the event, a few units did not take advantage of this sanction to re-commission 1 percent of their loomage from the beginning of May, and, with the vagaries of nature continuing to upset all calculations, there was a dramatic turn of events. The prolonged dry spell showed no signs of abating. This gave rise to grave concern about the next season's crop, and a Press note issued by the I.J.M.A. in May advised that, in view of the situation that was developing, not only would the proposed unsealing of looms from the beginning of June have to be deferred, but in addition, some curtailment of production would be required if the estimated available supplies of jute were to last until the new crop came on to the market in quantity. To this end, a scheme was introduced whereby, in the light of their individual stock position, I.J.M.A. members were to be allowed to seal looms voluntarily from 6th June on the understanding that the working hours so lost could be made up after the end of October. At the same time, the board of the East India Jute and Hessian Exchange, with the concurrence of the Forward Markets Commission, decided to reimpose heavy margins on all outstanding transactions in "futures", while the prohibition on fresh transactions in ready deliveries already in force was extended to new transactions in the futures market in August deliveries. Ceiling prices were also fixed, beyond which transactions were not allowed to take place.

These measures, combined with the rainfall which fortunately occurred in most of the jute growing areas in the latter part of May, had a salutary effect on conditions, and the excitement in the market subsided. June and July, relatively speaking, were quieter months—the only discordant notes being the Central Government employees' strike and the disturbances in Assam, both of which had a temporary effect on the jute market. The crop outlook seemed better, and although the prices of jute and finished goods were still higher than is good for jute as an international commodity, there were some indications of greater stability. With the start of the new season, however, interest again focussed on jute supplies. In June, the voluntary sealing of looms had been of the order of 2 percent, rising to between 3 percent and 4 percent in July. Reflecting the industry's own assessment of prospects, this voluntary sealing implied a shortage of jute at least in the immediate position, to the extent that a 9 percent restriction of production would not be sufficient to maintain a balance between supply and demand. In these circumstances, it was to be expected that the chameleon element—that comparatively small but influential section of the mercantile community which finds itself in jute business one day and a different trade the next, depending on where the prospect of immediate financial gain lies—would respond to its speculative instincts. That expectation was fulfilled and, throughout August, September and October, the jute shortage bogey was played up to the highest possible pitch, with a panicking effect not only on prices but on official thinking and official policy. The word "official" as used here covers the responsible sections of the trade and also the Government departments or agencies directly interested therein. The trouble was sparked off by an anonymous report in the Press that the Pakistani jute crop would not be more than 4.2 million to 4.5 million bales (a figure which was later refuted from a Pakistani Government source, according to which the crop would be about 5.6 million bales). Incredible as it may seem, this report, which had no official backing, started a price spiral which eventually saw jute touch Rs. 55 a maund (Assam Bottoms), with 40in. 10oz. hessian at Rs. 58.50 and B Twills at Rs. 183. One of the first steps taken was to suspend futures trading in the East India Jute and Hessian Exchange and allow only offsetting transactions. This was followed by a declaration of a state of emergency for transferable specific delivery contracts and the members of the Exchange were called upon to state their long-short position and thereafter submit weekly returns.

Regulating Production

With prices in the primary market advancing rapidly, the jute sellers more or less as a body pleaded inability to meet their commitments even under guaranteed delivery contracts, and as mill godown stocks were precariously low, the situation became critical. The I.J.M.A. had on more than one occasion made it publicly known that the industry would not be held to ransom for its raw material supplies and, in pursuance of this declaration, agreement was reached by the mills in October on a voluntary sealing of 5 percent of their looms from 17th of that month (including the percentage already voluntarily sealed as at that date) and a further voluntary sealing of another 5 percent from 24th October. The voluntary sealing scheme was also extended up to the end of the year. This brought the total restriction of production up to 19 percent—the highest at any given time for many years. Simultaneously, a scheme was introduced by the Association for the regulation of member mills' jute purchases on a quota basis, with the aim of controlling the offtake, ensuring a fair distribution of the available supplies, and offering the least stimulus to jute prices, without which no control over the prices of jute manufactures seemed possible.

Although senior officials of the Central Government were in Calcutta at the time these decisions were made, and were (it is understood) consulted, it appears that the Government took exception to the additional 10 percent sealing of looms. Following recent consultations between the industry and the Government in New Delhi, it is reported that agreement has been reached on a curtailment of production to the extent of only about 17 percent for the present, subject to review according to later assessments of the crop position. There is evidence of a division of opinion here. One imagines that the industry has based its attitude largely on (a) the trade estimates of the Indian crop, averaging about perhaps 5.8 million bales, plus likely imports, (b) the relationship between this and the rate of production of finished goods and (c) the desirability of erring on the side of under-assessment rather than over-assessment in order to restrain speculation and avert a possibly disastrous situation later in the season. The Government, on the other hand, taking a more optimistic view and with an eye to the export trade, would no doubt prefer to maintain goods production at the highest possible level and rely on measures such as, for example, requisitioning of jute should strong-arm tactics become necessary. What it really boils down to is that, for a

good part of the season, both the Government and the industry are themselves obliged to indulge in crop speculation, which is farcical only to the extent that it is not tragic. After making every allowance for the fragmented nature of jute farming in India, one would have thought that it would have been possible by this time to devise some sort of machinery which would spare the industry the indignity of having to rely on "trade" or other estimates of its raw material resources.

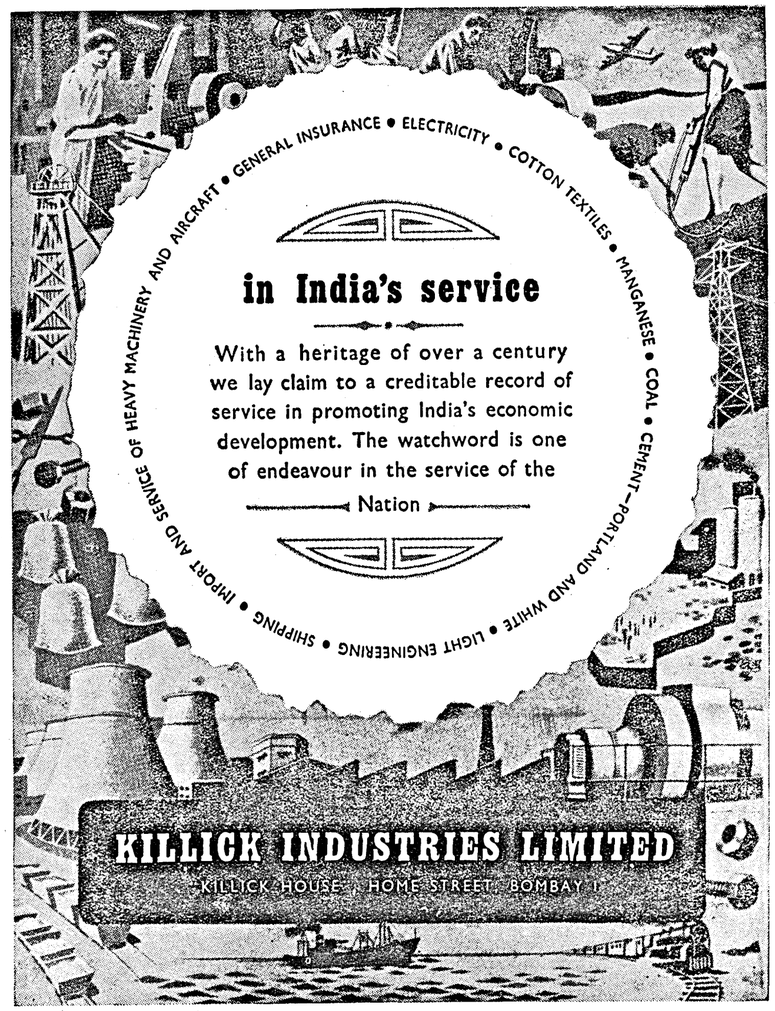
Unfair Charge against Mills

In all fairness to the manufacturing mills, who have a stake in the trade second to none, one gets the impression that they are expected to "take the rap" when times are difficult: if the market is unduly depressed, they are accused of victimising the growers, and when prices show signs of an abnormal rise they are censured for manipulating the market against the overseas consumers. The fact of the matter is that—and this can be demonstrably proved by reference to the industry's results compared with those of other industries in this country—normal profit margins have been a thing of rare occurrence in the industry for years, except for short-lived spells, and the manufacturers have been forced against their inclinations to take a view of the market in the hope of breaking even or at least cutting their losses.

At the time of writing, events are again moving swiftly and everything points to the fact that the Government is convinced that the abnormal conditions prevailing are due more to irresponsible speculation than to straightforward economic considerations. The Forward Markets Commission has on its own initiative introduced a number of sweeping regulations affecting trading on transferable specific delivery contracts for raw jute and jute goods and thereby, in fact if not in intent, virtually superseded the authority of the board of the Exchange. These regulations confer powers which may be exercised by the board with the prior concurrence of the Commission or by the Commission itself and cover the registration of T.S.D. contracts and delivery orders, the restriction of transfers of contracts and delivery orders, the prohibition of trading on T.S.D. contracts for specified varieties of jute and jute goods, the levying of margins on T.S.D. contracts, the prohibition of trading on such contracts at rates above a maximum or below a minimum to be fixed by the board, and, in extreme need, the closing out of such contracts at prices fixed by the Commission. The immediate reaction of the trade was one of uncertainty and confusion, and business was temporarily brought to a standstill. Without in any way challenging the propriety of these measures —indeed, from the way in which the market has fallen, there would seem to be considerable merit in them—it is unfortunate that the policy was carried through in such indecent haste without full consultation with the responsible section of the trade. The registration of contracts and the levying of margins have both been given effect to, but there are obvious defects in the details of the regulations and some adjustments will be necessary if genuine trade is not to be frustrated along with purely speculative activities.

Long-term Interests of Export Trade

On the export front, which has been overshadowed by domestic developments, the main problem is, of course, the repercussions which the abnormal price rise will have on the long-term interests of the trade. Reasonably so, overseas buyers are not consoled by explanations of how this or that has come about: their only concern is to obtain their regular requirements of jute goods at competitive and stable rates, and if by events here they are forced to the conclusion that the jute industry cannot be relied on to cater adequately to their needs, they will look elsewhere and possibly turn to substitutes such as paper or to the use of bulk handling methods. One can sympathise with the strenuous efforts of the industry and the Government to redress the present unbalance, and it is to be hoped that consumers' patience will not be exhausted in the meantime. During the first six months of this year, when conditions were comparatively settled, the pattern of the export trade remained fairly stable, with only a few notable exceptions. There were encouraging increases in exports to the Continent of Europe and Argentina—both predominantly hessian markets—while the offtake of sacking by Far East countries also recorded a substantial improvement, mainly because of large shipments to China. On the other hand, the rate of exports of hessian to the U.S.A., although higher than in the first half of 1958, dropped compared with the same period in 1959, and Australia's offtake of sacking was also less. Seasonal and temporary factors, of course, have to be taken into account, and in view of the consumer resistance which has grown in the second half of the year, it is quite possible that a different export picture may emerge when the performance for the year as a whole is reviewed. On balance, with the relatively high prices which have been prevailing, it is probable that the industry's foreign exchange earnings, which rose to Rs. 58 crores in the first six months of the year, compared with Rs. 41 crores in the first half of 1959, will be higher for the year as a whole, compared with 1959. Although satisfactory from the short-term point of view, because India's need of foreign exchange earnings is desperate, no pleasure can be derived from the fact that this has been achieved mainly at the expense of the industry's customers who are unlikely to continue to pay high prices indefinitely.



SELF-SUFFICIENCY IN JUTE PROVES AN EPHEMERAL ACHIEVEMENT

CROP DELAYS ACCENTUATE SHORTAGE AND SPECULATION

OVER the past few years, the jute markets and industry have been through a series of difficulties. In 1959, the attainment of self-sufficiency in raw jute created exceptional problems. Although the year generally was good, it was felt that "the future prospects were not bright." How true this prophecy has turned out to be is obvious to those who follow the fortunes of the trade. During 1960, many hopes have not been realised. There have been gains and setbacks, and numerous schemes have failed. It has been practically impossible to plan ahead properly. Violent fluctuations in the jute and gunny markets have undermined the confidence of the industry. They have also led overseas buyers, particularly in the United States and Europe, to curtail purchases and search for substitutes.

Supply of Raw Jute

When India was striving for self-sufficiency in raw jute, one *pundit* was laughed to scorn because he said that when success was achieved, it might embarrass the country. His fears proved true sooner than had been expected, although not in exactly the same sense, as originally stated. In 1959, great emphasis was placed on India's ability to export raw jute in fairly large quantities. The State Trading Corporation entered into commitments with such countries as Russia, China, Belgium, Poland and Yugoslavia. Now, a year later, the Indian industry could well do with the jute which was shipped overseas, since an acute shortage has developed. The export of raw jute was rushed too soon.

Towards the end of 1959, the large demand for sacking reduced the mills' gunny stocks, so much so that in the last three months of 1959, the sacking stocks held by mills dropped below the monthly production figure. The I.J.M.A. decided to postpone sealing 2½ percent of the mills' loomage, which was due to revert to the position prevailing before 24th August, 1959, when 12½ percent of the industry's loomage lay sealed. The *status quo* was to be maintained "at least until 1st February, 1960". This was later extended to the end of February 1960. Towards the end of 1959, meanwhile, there was a rapid rise in fibre prices. Although it was difficult to pinpoint any particular reason for it, the improved prospects for the goods market contributed to the rise. At the turn of the year, however, in spite of all the earlier talk about a bumper crop, the popular belief was that the final outturn would not be so large. Much jute was held back by farmers since agency prices were higher than Calcutta rates. In spite of the latter rising to Rs. 87.10 a 100 kilos (Rs. 32.50 a maund) early in January for Assam Bottoms, on very few occasions were the levels at par. The rise worried the Government, which said in a Press note that it was due to undesirable speculative activity based on apprehensions about the size of the 1959-60 crop. Official circles saw no justification for such fears; there were adequate supplies in sight and in stock to meet all requirements, leaving a comfortable balance for normal carryover into the next season. In an attempt to relieve the position, immediate permission was given to import 200,000 bales of cuttings from Pakistan.

Official Statements

The Government's statements at that stage reassured the industry. If more positive action had been taken, the crisis later in the year might have been averted. But by the time the Government woke up to the fact that something was wrong, it was too late. Although it resorted to drastic measures, the damage had been done. At the time, mills in general considered the price of raw jute and jute goods too high. It was reported that the chairman of the I.J.M.A. made an unofficial appeal to member-mills not to purchase any jute for a specified period, in an attempt to reduce fibre prices. The "gentlemen's agreement", as it was termed, was to be a salient feature of the year, but not until the end did it become effective. Certain mills were prepared to pay much more in the agencies for the same jute which they could buy in Calcutta. This raised upcountry rates, and later Calcutta indications also. Some groups bought freely in the open market in defiance of the gentlemen's agreement. In these transactions, they faced strong resistance from sellers against any attempt to cut prices.

A little later, talk of a fibre shortage began to die down. Imports improved in the upcountry agencies and also in Cossipore. Over the next few weeks, fibre prices dropped by over Rs. 3 a maund. Mesta, however, was in short supply as it had gained popularity over the years because of its cheapness. At this stage, mesta rates were only Rs. 1.50 a maund below Assam white indications, whereas in 1959 the difference was about Rs. 5.

Fresh Margin Deposits Introduced

The upsurge in speculative activity in the Calcutta markets had been worrying the East India Jute and Hessian Exchange and the Forward Markets Commission for some time. Margin deposits were first introduced in September 1958, but for an entirely different purpose. The emergency then was due to jute and gunny rates being too low, and mills were anxious to dispose of their gunny stocks. Now the trade considered prices too high, and fresh margin deposits were imposed on all classes of hedge contracts in raw jute, sacking and hessians. This was the second time within a few weeks that margin deposits had been increased. At the time, they appeared to have little

By

A SPECIAL CORRESPONDENT

chance of success as operators were determined to force up prices. Margin deposits were to be with the trade for the rest of the year, and speculative activity reached alarming proportions later in spite of further restrictions. Eventually, the futures market was closed entirely.

It had long been agreed that a well-regulated futures market, such as the one for cotton in the U.K., would be an asset. But the form of trading favoured by Indian operators proved a hindrance rather than a help. Some years ago, the West Bengal Government brought experts from the U.K. to investigate the possibilities of setting up a futures market in Calcutta. Their private view has now been confirmed. This was to the effect that a futures market in India would not work well, as long as it was used mainly for making money instead of as a legitimate hedge to check undue price fluctuations.

Fibre Arrivals Increase

Arrivals of raw jute in the agencies and in Cossipore continued to improve. The supply increased to such an extent that a prominent local daily newspaper carried an advertisement offering 50,000 maunds of raw jute for sale under a New Delhi box number. The advertisement was repeated a few days later for a different quantity under a Calcutta box number. Whether these were genuine offers, or attempts to depress the market, was never really proved. But some thought that the advertiser was the State Trading Corporation, and the jute offered probably that which was bought earlier under the price support scheme when rates were very low. The liberalisation of imports of Pakistani cuttings helped ease the raw jute position. Although a fair amount of cuttings were purchased, many mills preferred to wait for a fall in prices before covering their requirements. Cuttings prices did fall later in the year, but much of the business conducted at low prices was to embarrass the mills before the year was out, when cuttings rates were more than doubled.

Many mills began to complain about the quality and moisture content of the jute arriving at their gates. Much of the poorer quality fibre was now coming forward, having been held back in order to allow good quality jute to be shipped as a bait for repeat orders. This was true of only areas which had experienced bad floods during the growing period. Jute from districts unaffected by the floods was reported to be satisfactory. The amount of fibre offered by sellers continued to increase, as most of them were holding large stocks. Heavy purchases in the Cossipore market by mills and sellers caused an appreciable change in stocks which dropped to about 600,000 maunds, as against 900,000 maunds a year earlier. Upcountry stockists also appeared to have less on hand, so the movement of jute began to slow down and the fall in prices was arrested.

New Crop Prospects

Much now depended on the situation in the jute fields. Jute was quite a remunerative crop at the rates prevailing at the time. It was hoped that this would encourage heavy sowings. Some early showers in the Northern and Assam districts, as well as a few in Calcutta, gave rise to hopes that an early start could be made with the new crop. The rainfall was only spasmodic, however, and the market reaction was slight. The movement of jute upcountry continued to be slow and stocks in Cossipore fell to new low levels. Although there was no increase in raw jute rates, sellers held bullish ideas. In spite of the improved weather conditions in the growing areas, activity was very restricted, and although normal preparations were well in hand, there was no new wave of enthusiasm for which many were on the look-out. The mills claimed that they had adequate stocks, but there was a general increase in buying and prices began to rise. The surprising thing was that the mills followed the rise, and in a very short time prices advanced by about Rs. 6 a maund. In an attempt to stem the rise, the Jute Commissioner announced that sanction had been given for importing a further 200,000 bales of Pakistani cuttings. Unfortunately, this did not help much and prices continued to rise.

The bullish tendency, encouraged by speculative activity, continued to dominate the raw jute and jute goods markets. New high levels were recorded, with Assam Bottom rates rising to Rs. 37 by the end of April. Stocks of jute goods were very low at this stage and this was no doubt one reason why the I.J.M.A. recommended that the mills unseal more looms. Immediately the availability of jute became suspect to meet even the small increase in production, so the Government sanctioned the import of a further quota of Pakistani cuttings. Worries in this connection were increased by reports of adverse weather conditions in the growing areas, and in general the crop was already a month late. Hot and dry weather in nearly all districts caused an almost total suspension of field work, and created much concern. As a result, raw jute prices rose steadily, and by the middle of May, Assam jute was quoted at Rs. 52—an increase of nearly 70 percent since the beginning of the year.

Speculative Activity

Throughout this period, speculative activity continued and the various associations connected with the jute trade showed serious concern. To curb the inflationary tendencies, trading in all classes of futures contracts was suspended and ceiling prices were imposed on operations for September delivery. This drastic action proved effective, and prices of both jute and gunnies began to fall, Assam Bottoms being quoted at Rs. 46. Anxiety about the jute crop continued, however, but stricter enforcement of the gentlemen's agreement (that only mills with low stocks should buy fibre) had the desired effect. Reports from the jute fields indicated that where sowing had taken place, the plants were now withered, and a second sowing appeared inevitable. But most of the sowing was held up due to the parched state of the ground. Towards the end of May, however, conditions showed an improvement, and the protracted drought, which had been the main cause of the bullishness, was over. Good rain in nearly all districts allowed farmers to resume sowing. In the areas where sowing had already taken place, it was thought that the rains had come in time to prevent a total failure.

Standing Crop

Reports on the standing crop indicated that the plants were about half as high as the previous

VISADEX
THE DASHBOARD OF BUSINESS

Work the VISADEX way to get the best out of your men, machines and materials.

VISADEX can tell you what you need to know at a glance. VISADEX offers you a fluent indexing system by which records are kept on cards, while colour signals spotlight what things are in stock or needed, whether production is ahead of or behind schedule, sales are increasing or decreasing, where to intensify advertising, which department requires more personnel, who owes you and how much... VISADEX, in short, affords greater control at less cost, besides keeping records secure.

Our VISADEX Representative will be happy to show you, without obligation, how simple VISADEX is to operate—either with Card Pockets or Brass Card-holders—and how easily it can meet your specific requirements.

Stockists all over India & abroad

year at the same time. It was obvious from this, and from the late sowing in many districts, that the crop would be at least a month late in arriving at the mills. In order to conserve raw jute stocks for the longer interim period between seasons, the I.J.M.A. recommended to its members a system of voluntary loom sealing with effect from 6th June. The number of looms to be sealed was left entirely to the discretion of the mills, and changes could be made as and when it was considered advisable, according to the individual mills' jute stock position. Mills which had adequate stocks were under no obligation to seal any looms.

The immediate reaction was a fall in both fibre and jute goods prices. This continued over the next few weeks as new crop prospects improved and sales of new crop jute were heavy, with sellers eager for business. By the middle of July, Assam jute had dropped from Rs. 52 to Rs. 34.50 a maund, or Rs. 472 a ton. At the same time, sacking dropped by Rs. 210 a ton, and hessians by Rs. 350 a ton. The business in new crop jute done over this period was eventually to prove a headache to sellers, brokers and mills alike, as by the time the delivery period came, raw jute prices had almost doubled. In spite of the fact that new crop prospects continued to be excellent, prices showed a steady advance over the next month due mainly to speculative activity in the goods market, where overseas and Indian Government enquiries helped to establish a bullish feeling. In the meantime, arrivals of new crop jute at all the receiving centres continued to be very encouraging. But the demand was so great that no stocks could be built up, and there were ready buyers for everything that arrived.

Arrivals Fall

By early September, the situation was entirely different. It was generally acknowledged that the crucial time for the jute industry, in relation to the supply of fibre, would be September. With the approach of this period, the supply position began to cause serious misgivings. Arrivals at the receiving centres showed a drastic fall, and the reasons were varied and often contradictory. Many areas reported a lack of steeping water, which may have accounted for the delay in bringing jute forward. The majority, however, favoured the view that growers were holding back supplies. Until recent times, most growers were compelled to market their crop soon after harvesting because they needed the money. With the growth of co-operative societies and other allied institutions, however, the pressure to sell this year was not so marked, as the growers were now more independent than they had ever been before.

At this stage, the I.J.M.A. reviewed the raw jute position in the light of the latest stock returns and the estimates of the 1960-61 crop. It decided that the voluntary loom sealing scheme would have to be extended for a further two months at least, i.e., up to the end of December. An increase in the percentage of looms compulsorily sealed appeared inevitable from 1st January, 1961. Over the next few weeks, the situation deteriorated rapidly. Prices shot up to Rs. 53 a maund for Assam Bottoms, and raw jute was practically off the market. Mills again agreed to refrain from buying fibre, but their stock position was such that this meant a further curtailment in production. From 17th October, mills were advised that they could voluntarily seal a further 5 percent of their looms; the sealing of yet another 5 percent was envisaged and carried out a week later. This move brought a storm of protest from the trade unions. Protracted negotiations were conducted between the industry, the unions and the Government. Eventually, the I.J.M.A. agreed to a slight increase in production by the unsealing of some of the looms already sealed, but working hours were to be cut from 48 hours to 45 hours a week. This in effect was a sealing of about 17 percent of the total loomage on the basis of the working hours previously in force.

Quota System for Raw Jute

Throughout October, mills belonging to the I.J.M.A. refrained from buying jute under a gentlemen's agreement. This, combined with the series of steps taken by the East India Jute and Hessian Exchange, succeeded in bringing down the price of fibre. Meanwhile, to ensure equitable distribution of the stocks available, the I.J.M.A. introduced a quota system for the purchase of raw jute among member-mills, based on their actual physical stocks. At first, prices tended to harden as operators withdrew in order to judge the market reactions. But gradually rates declined, and by the beginning of December had fallen back to Rs. 50 a maund for Assam Bottoms. There was no immediate rush by mills to buy jute and indeed many did not take up their full quota, which gave the impression that the shortage was not as serious as was made out. Mills with agencies used their quotas upcountry, which reduced the volume of business done in Calcutta.

The main problem for mills in the last quarter of the year centred on low-priced contracts due for delivery in September, October and November. Pakistani cuttings also created a problem, as most contracts were made at prices between Rs. 98 and Rs. 160, but by the time the delivery period arrived, prices had shot up to Rs. 240 or even Rs. 260. Most of these contracts were also fulfilled but sellers in all cases incurred heavy losses. The initial reasons for issuing licences for importing cuttings from Pakistan no longer held good with prices as inflated as they were towards the end of the year. At Rs. 100 a bale, cuttings were an attractive proposition, but at Rs. 220 a bale, mills lost interest as they could buy low-class Indian jute or mesta at very nearly the same price. Thus licences for the full quantity promised by the Government were not issued. Towards the end of the year, the committee of the East India Jute and Hessian Exchange became very active. It was determined to stamp out illegal speculative activity, so it promulgated orders almost daily. Daily and weekly returns were called for from mills, sellers, brokers and others connected with the trade. All contracts had to be registered with the Exchange, and heavy penalties were threatened for defaulters.

Conversion to Metric System

In accordance with the laws passed by the Central Government in 1958, the industry was compelled to convert to the metric system for raw jute with effect from 1st July, 1960. Although nearly two years' notice had thus been given, the trade was totally unprepared for the changeover. Many important aspects came up for discussion only after the introductory date had passed, and it was some weeks before the conversion took full effect. It was doubtful whether the system would work efficiently on its own, as even six months after its introduction, the old and new systems were being worked side by side. For finished goods, the "compulsory" introduction of the metric system had not yet taken place.

As the year draws to a close, it is extremely difficult to prophesy the future. Although general trends point to lower prices for both jute and gunnies, it is doubtful whether rates will show any appreciable decline. The industry is not yet out of the woods, but there is a glimmer of hope ahead. Although this report again finishes up with the view that "future prospects are not bright", they are perhaps brighter than they were a year ago.

RAISING COAL OUTPUT IN THE THIRD PLAN

NEED FOR BETTER TRANSPORT FACILITIES

By

A SPECIAL CORRESPONDENT

THE year 1960 will be remembered by the coal industry as the year in which the Government began to appreciate that the warnings sounded by the industry from time to time were not only accurate forecasts but contained many constructive suggestions of value. It is unfortunate that it took a crisis over the supply of coal to the steel plants to show the inadequacy of the official advice given to Ministers and the Cabinet. Much time and effort has been spent in endeavouring to apportion the blame for the crisis developing, and this will not be entirely pointless, provided the information obtained is used to prevent the recurrence of similar unfortunate situations in future. It is apparent that both the Ministry of Steel, Mines and Fuel and the railway authorities failed to assess with sufficient accuracy the steel plants' rapidly increasing need for coking coal of the higher qualities. A simple statistical exercise would have warned them of the danger, but this seems to have been overlooked, although it was well known that superior quality coking coal was in short supply. Unfortunately, little or no attention was paid to the industry's advice concerning the measures which would be necessary to increase output.

Coal Washing and Blending

The shortage of high grade coking coal stems from a number of fundamental causes, one of which is the Government's failure to expedite the construction of coal washeries and blending plants. The Planning Commission's report for the second five year plan noted that washeries for the private sector were being considered. Certain companies which were keen to install washing plants at their collieries put forward tentative schemes, but ultimately their proposals were turned down in favour of Government washeries. Results have shown that the private sector was fortunate in not being permitted to proceed with these plans, if the experience of an existing washery in the private sector is any guide. This washery has only just been granted a price increase for washed coal, although the public sector washery in Kargali had, by "private arrangement," been permitted such an increase from the outset.

As for the Government central washeries, the sense of urgency which at one time attached to their construction appeared to have been lost during the second plan period, and this remains true in spite of the coking coal crisis. Only the washeries in Kargali and Durgapur have been completed, but even they are not able to work to full capacity. The washery in Dugda, it was once expected, would be completed in March 1961; but this now looks like an unrealisable dream. A year ago, tenders for Bhojudih were being examined; the order has only recently been placed. Last year, invitations to tender for the Patherdih washery were issued; this year, the tenders have been received and are still being examined. The country cannot afford such slow progress in the implementation of a scheme which is aimed at making available for the steel industry adequate supplies of high grade coal and which will reduce the burden of coal movement.

Coupled with the question of washing is that of blending coals of different qualities. Apart from Durgapur, no steel plant in the public sector has apparently made any arrangements for blending. This is unfortunate as blending can result in the conservation of about 20 percent of coking coal of the best quality, which is vitally necessary, if variations in the quality of the coke produced for steel manufacture are to be avoided. With adequate washing and blending arrangements, the sources of supply can be considerably widened and exclusive dependence on raw coal of higher grades obviated. Speedy action is essential to improve the position.

Increases in Production

The shortage is by no means confined to coking coal. Many consumers have experienced serious shortages, including the railways which are the largest consumers in the country. It is necessary, therefore, to review the industry's difficulties not from the point of view of ending one crisis but rather to indicate how another may be avoided in the third plan period. The output since 1955 has been as follows (in million tons):

	Private Sector	Public Sector	Total
1955	33.8	4.4	38.2
1956	34.7	4.7	39.4
1957	38.2	5.3	43.5
1958	39.5	5.8	45.3
1959	40.3	6.7	47.0
1960 (Estimate based on nine months' production)	42.7	7.9	50.6

The percentage increases over the past few years are as follows:

Period	Private Sector	Public Sector	Total
Increase in 1957 over 1956	10.90	12.77	10.41
Increase in 1958 over 1957	3.40	9.43	4.14
Increase in 1959 over 1958	2.03	15.52	3.75
Increase in 1960 over 1959	5.96	17.91	7.66

Both sectors have achieved substantial increases in production in the face of the many difficulties. By the end of 1960, private collieries will be producing at the level of an additional 9 million tons, compared with a planned increase of 10 million tons, while the public sector will be producing at the rate of an additional 4 million tons, as against a target of 12 million tons. It is possible that the rate of production in the private sector will, in the early months of 1961, be in line with the target set for attainment by the end of the second five year plan, which will be a very creditable performance.

Subsidies for Stowing

The considerable delay over the preparation and submission of the report of the Coal Prices Revision Committee had the effect of denying funds to the industry which could have been used to increase production. Nevertheless, credit is due to this Committee for its appreciation of the need for an increased level of assistance for sandstowing operations and for the introduction of a subsidy scheme for collieries handicapped by adverse factors. While the ceiling of assistance for stowing has been revised upwards on two occasions in the last 18 months, and the relief granted to the industry as a result of this is most welcome, there are still many instances in which the present ceiling of assistance is inadequate and further consideration requires to be given to modifying the sand-stowing assistance scheme to cover such cases.

The scheme to subsidise collieries handicapped by adverse factors has only recently been notified in a practicable form, although the necessary cess has been levied since February 1960. While the industry is grateful to the Minister for having personally taken steps to ensure that a workable scheme has been prepared and issued, it is unfortunate, to say the least, that assistance under the scheme will only begin with effect from September 1960 and that the funds to be made available by way of this assistance will not be disbursed until after the completion of the initial period of seven months. It is obvious that an appreciation of the difficulties of the industry is not lacking at the highest levels of the Government, but the time taken to grant much-needed relief to this basic industry is still deplorably long.

New Areas

An incorrect and harsh interpretation of the Industrial Policy Resolution, which amounted to a complete ban on expansion of the private sector into new coal-bearing areas, even though such expansion amounted to replacement of exhausting seams, resulted in the private sector being "imprisoned in its existing workings", which for the coal industry meant a prospect of certain extinction. Happily no such shackles are imposed in the draft outline for the third plan and the Minister of Steel, Mines and Fuel has recently indicated that the private sector will be given the opportunity to share in the gigantic task set for the next five years. The Government should also show a co-operative spirit by refraining from exercising on behalf of the National Coal Development Corporation its powers under the Coal Bearing Areas Acquisition Act to the detriment of private sector undertakings. There are vast virgin fields where the extensive capital available to the Corporation can be fruitfully used, without it becoming necessary for this organisation to encroach on the areas where private industry has worked for so many years.

Third Plan Targets

One favourable result of the coal shortage is that the planning for the next five years has been done with greater thoroughness, keeping in view the real capacity of collieries as opposed to the mere need for coal. Collieries were invited to indicate their various expansion plans. These were collated and commented upon by the joint working committee of the industry's four producer associations, and then submitted to the working group set up by the Government. These plans and comments give details of individual producers' difficulties as well as the basic problems of the industry, both of which require to be resolved to enable the companies to attain their targets. Only the major difficulties are discussed in this article. Unless the Government appreciates their serious import and also heeds the very detailed suggestions for increasing production, very little will be achieved. At the time of writing, the working group's report has not been published, but it is understood to have been accepted generally. The third plan target will, therefore, be fixed at an additional production in the private sector of 17 million tons over the second plan target of 45 million tons, the public sector's share being 20 million tons; in other words, an increase of 46 million tons over the existing production of 51 million tons. These challenging targets can definitely be attained, but regular consultation with and co-operation from the Government and swift remedial action wherever necessary will be absolutely necessary.

Selected Grade Coal

In considering the overall targets, it is necessary not to overlook the need for greater quantities of higher grade coal to be produced. As much use as possible must, however, be made of the lower grades. The Chief Combustion Engineer in the Coal Controller's organisation has a most important function in this matter, in that it is his responsibility to bring to the attention of industrialists the various ways and means of reducing their consumption of the higher grades of coal. The following production figures for the Bengal and Bihar fields indicate that the output of selected grades of coal has not increased. Since the bulk of the better grades of coking coal are now reserved for the steel plants, industries, and the railways in particular, are now having to use far larger proportions of inferior grades.

	Selected A	Selected B
	(In million tons)	
1957	7.60	10.97
1958	7.44	11.18
1959	7.33	10.83
1960 (Estimates based on six months) ...	7.41	10.29

In fact, the falling off in production is accounted for by the downgrading of a not inconsiderable number of collieries, particularly of selected B

grade. The present basis for the grading of non-coking coal mines in the Bengal and Bihar coalfields is as follows:

Grade	High volatile ash and moisture content	Difference between the grades
	Percent	Percent
Selected A ... Selected B	... 17.5 ... 19	1.5
Selected B ... Grade I	... 19 ... 24	5
Grade I ... Grade II	... 24 ... 28	4

While it has been established that the ash/moisture content of coals can be scientifically related to its value to consumers, it cannot be claimed that the present grading system is based on such scientific principles since the maximum ash/moisture content for each grade of coal is a purely arbitrary figure. The fact that there is no uniform percentage difference between the grades is also the result of an arbitrary decision. It does not take into account the true value to consumers of coals with varied ash/moisture content. It is obvious that a more scientific basis of grading should be introduced, but as it may take time to prepare a suitable scheme, there is one obvious defect in the existing basis of grading which should be removed immediately. As will be observed, the ash/moisture content range of selected B grade is very limited, compared with the lower grades. The result of this is that very few coals qualify for this grading, while many coals with an ash/moisture up to 21 percent of the content are included in grade I along with coals of inferior quality, having an ash/moisture content of up to 24 percent. Consumers and producers would benefit from a revision of the maximum ash-moisture content of selected B grade coal to 21 percent and the existing system of grading would become more realistic as a result of this modification.

Rail Movement

One of the industry's basic requirements is a sufficiency and regularity of transport for coal movement. No effort should be spared to put the railways in the position of being able to move the coal produced in suitable wagons. Inadequate wagon offerings have become such a chronic problem that producers are obliged to base their production capacity on anticipated offtake. The result of the wagon shortage is that movement from the coal face is restricted and impeded, particularly when the limited stacking facilities have been fully used. This enforced restriction of production increases colliery raising costs which have already been adversely affected by having to double-handle huge quantities of coal, due to inadequate and irregular offtake of production. The limited five hours' loading period allowed to collieries renders it almost impossible to ensure proper picking of impurities from the coal with the result that the quality deteriorates, industry suffers and the railways themselves complain of slow and delayed trains.

Wagon Shortage

The railways are attempting to overcome the wagon shortage by providing larger B.O.X. type wagons, but it is by no means certain that this innovation will provide a solution to the problem in view of the small number of collieries and consumers who will be in a position to accept such wagons. It has even been suggested that the railways should cease to manufacture 22-ton wagons for coal movement. Such a drastic step should not be considered unless and until it is proved that the railways can provide adequate transport facilities for coal movement without additional 22-ton wagons being available. Why is it that India, which has ample resources of timber, must import steel to build steel wagons, at a time when foreign exchange is critically short, when other countries which experience no steel shortage, can still use timber-sided wagons?

Another factor in the railway development programme which augurs ill for the success of the coal plan is that the authorities propose to build only the same number of additional wagons as were visualised in the second plan, although the plan for additional coal is 37 million tons, as against 22 million tons. Admittedly, the railway plan is based on the total increase in traffic, 6 percent of which, it is hoped, will be moved in empty coal wagons returning to the coalfields, but it is feared that the industry's needs, particularly for open wagons for collieries with mechanical loading plants, will again be overlooked. The railways must amend these unsatisfactory proposals and plan realistically to achieve normal conditions, not merely to avoid a wholesale crisis.

While appreciating the adverse effect of the Central Government employees' strike, it appears that the railways were completely unprepared for the additional commitment arising out of the commissioning of the new steel plants. The result of this was that while coal piled at collieries, the Rourkela and Bhilai steel plants were compelled to postpone firing furnaces for lack of coal. A comparison of the stocks held by collieries on 31st July, 1959, with the position on 31st July, 1960, shows that there was an increase of half a million tons, or 16 percent. The crisis did produce results in that the railways woke up to the fact that they could reduce the standards which decided whether a wagon was in need of repair, and a number of usable wagons were pressed into service. They were also permitted, in the excitment, to import steel for new wagons.

After the crisis, the railways decided that they could improve their operational efficiency by taking over from distribution section of the Coal Controller's Office the day-to-day allocation of wagons, on the basis of a ten-day bulk allotment programme drawn up by it. This new departure has met with strong opposition from producers and consumers because of the chaos which has followed. The shortcomings of this latest railway venture have become apparent at a time when wagons are more readily available for coal movement than at any previous time during 1960, and the disastrous results which may be expected should the wagon position deteriorate, are a matter for concern and apprehension.

Coal Movement

As yet no convincing evidence is available that coal movement will improve to any appreciable extent in the coming years. The railways still do not appear to appreciate that the long-established seasonal pattern of coal movement can no longer effectively meet the needs of producers or of consumers, and that a new realistic approach is required to ensure that the coal industry will be able to operate at optimum capacity all the year round and no loss of momentum will result from considerable fluctuations in wagon supplies, either between seasons or from day to day.

There will soon be functioning a new sub-committee to consider what revision in pilot and depôt capacities is necessary in the light of the expansion plans accepted by the Government. It is to be hoped that the railways will have ample resources to implement the recommendations of this committee in good time, so that their capacity to handle traffic will be put to the best possible use and they will not be faced with the problem of having at one and the same time, spare capacity in some sections while being unable, due to pilot and depôt limitations, to increase their offerings in other sections where these are urgently required. If it has done nothing else, the recent coal crisis has proved conclusively that planning for increased coal production calls for a more detailed and realistic assessment of many problems which have been overlooked in the past. There are definite indications that the Government is now fully alive to the necessity for taking steps to assist the industry to achieve the tremendous task which it faces in the third five year plan.

DROUGHT AFFECTS THE NORTH INDIAN TEA CROP

VIGOROUS PROPAGANDA NEEDED TO PROMOTE EXPORTS

TEA prices fetched at the Calcutta auctions have been reasonably good so far this season. The average price at the export sales has been Rs. 5.81 a kilogram, against Rs. 5.29 during the same period of the last season. Prices at the internal sales have been even more gratifying: Rs. 5.33 a kilogram, against Rs. 4.41 last year. The selling season in north-east India is, at the time of writing, about two-thirds of the way through. Production has, however, declined sharply this year because of a severe drought in Assam and Cachar as the following table shows:

NORTH INDIAN TEA CROP ESTIMATE UP TO END OF OCTOBER 1960, COMPARED WITH LAST YEAR

District	Estimated this year	Crop last year	Kilograms Up	Kilograms Down	Difference in Percent Up	Difference in Percent Down
Assam valley	123,071,459	133,802,696	—	10,731,237	—	8.02
Cachar	11,545,587	16,399,915	—	4,854,328	—	29.60
Darjeeling	8,569,394	7,462,131	1,107,263	—	14.84	—
Dooars	55,275,414	55,684,501	—	409,087	—	0.73
Terai	7,094,377	7,323,890	—	229,513	—	3.13
Bihar	36,002	50,136	—	14,134	—	28.19
All others	2,834,074	3,042,654	—	208,580	—	6.86
Total	208,426,307	223,765,923	—	15,339,616	—	6.86

Although the fall in production is sufficient to cause a further rise in prices later this season, many tea gardens will incur losses in a year of good prices. It is not likely that the shortage occurring in north-east India alone will make for a further rise in world prices. North India's share in the world tea market is not as great as it was

By
A SPECIAL CORRESPONDENT

in the past, although it is still over 30 percent. South India should do well on this season's working, as should Ceylon, for they will get the benefit of the rise in prices because of the shortage of crop in north India without having to suffer any similar losses themselves. The drought has been especially severe in Cachar, where the crop is 35 percent down on last year. Practically, all gardens will suffer losses on the year's working and if, as is threatened, this is accompanied by a rise in the wage rates, many companies will have to go out of business.

Comparative Prosperity

However, droughts do not last for ever and if there is a good crop next year, it may be one of comparative prosperity as markets will certainly start short of tea. There will not, however, be as long an end-of-season hiatus as had been expected between the final sales of this season and the first sales of the next in May. In spite of the shortage of crop, adverse physical conditions in the navigation of the Brahmaputra and breaches in the Assam rail link due to floods in Bihar have held up delivery in Calcutta and will probably result in the later sales being carried forward to normal dates. Moreover, since drought has been severe in Cachar and certain other parts of Assam, the injury to the tea bushes caused by withering on the ground will result in further loss of crop in the subsequent season.

When considering the prospects for 1961 and future years, one naturally thinks of the third five year plan. It is rumoured that the Working Group for Tea is prepared even to consider an all-India production target of 900 million lbs or over 41,000 tons. This ambitious target will represent a 25 percent increase in crop over the five-year period of the plan, against the 16-percent or 17-percent increase during the last five years (excluding 1960 as a year of drought). Newly planted tea does not come into bearing for three years or into full bearing for about five years. Extensions must, therefore, take place in this cold weather or the next if a rapid extension of the area under cropable tea is to be achieved by 1965.

It is to be noted, however, that what the Working Group was considering as a target was the maximum that might be produced within the geographical limits of the present estates, given favourable weather conditions and all the incentives the industry has asked for in order to encourage it to expand, to widen its markets, and to earn foreign exchange for India. But this will only be possible if the Government gives it the required incentives.

The Foremost Requirement

The foremost requirement of the industry is fertiliser in the shape of sulphate of ammonia. This is a Government controlled monopoly. The Government of India has persistently failed over the last ten years to allocate a sufficient quantity to the tea industry to meet its needs. Frequently, only 50 percent or 60 percent of its requirements have been met. To achieve an all-India production target of 41,000 metric tons of made tea, over 100,000 tons of fertilisers a year are needed, against 50,000 tons or 60,000 tons given now. Although at the earnest request of the industry, the Central Government recently sanctioned foreign exchange to obtain fertilisers from abroad to supplement the production of Sindri and other home factories, the imports have been mainly utilised for increasing food production.

The tea industry should be given its fertilisers at a fair cost price covering the actual cost of production as well as transport costs. At present, a high price for fertilisers is imposed on the tea industry with a view to subsidising other consumers. If more production of tea is wanted, then the industry should get its fertilisers on the same terms as other agriculturists. Secondly, vigorous propaganda is required to expand the market for tea. The industry pays a cess to the Tea Board which, as a successor to the late Tea Marketing Expansion Board, has the responsibility for organising market propaganda. Although the industry provides the money—by way of cess—it has little control over the way it is spent. Producers' representatives are not in a majority on the Tea Board. But even if the latter could be persuaded to alter its view, the Government of India frequently interferes with propaganda activities. The industry has not the choice in the selection of the propaganda staff who tend to have the outlook of Government servants rather than that of the ambitious salesmen or advertising agents. The industry has been urging for years the necessity of propaganda in Britain, but little is being done. It has also stressed the necessity for continuous and effective propaganda to increase the internal consumption in India, knowing that a widespread and secure home demand rather than the uneven geographical picture that exists today (Saurashtra consumes ten times as much tea a head as does Andhra), will act as a base or cushion on which the industry could rely when planning for more adventurous expansion programmes abroad. Thirdly, the industry needs financial assistance or rather abstention from financial oppression. Of all industries in India, it is the most heavily taxed. Excise, carriage taxes, octrois, export duties—in addition to sales and income taxes—have been imposed on it. In south India, there are heavy rates of agricultural income tax and land revenue levies on plantations. The present export duty of 53nP a kilogram or Rs. 530 a ton acts in reverse as a protective duty for the teas of Africa and other competitors, and falls particularly hard on plain common teas, *e.g.*, from Cachar or from the Dooars, which have to meet with competition from those already more advantageously placed geographically to reach the London market.

Assam Carriage Tax

The Assam Carriage of Goods Tax Act has been declared void by the Supreme Court. This and the Calcutta entry tax have—apart from their fiscal burden—interfered with the freedom of trade and commercial intercourse visualised in Article 301 of the Constitution. To avoid the Assam tax, half the exports from the Dooars district were diverted from their natural outlet through the river port of Dhubri, and many gardens in Assam—lucky enough to have private sidings—were driven to use the all-rail route, which avoided the tax if no public road was used, instead of the more economical steamer route to Calcutta. To avoid entering Calcutta, many tea consignments are now diverted across India to Bombay, or sold direct to dealers in north India, to the detriment of the Calcutta auctions.

It is to be hoped that the Assam Government will not seek other means to impoverish the tea industry to replace the revenues it obtained from its carriage tax. The latter was made specifically payable by the producer and not the carrier of the tea, so in its incidence it was an excise under another name and an encroachment on the Central Government's field of taxation. It is not unreasonable that the States in which the tea industry is situated should wish to have a substantial share in the taxation revenue accruing from it. But the fair way to ensure this is not to impose fresh taxes, and the Government of India should consider this factor when distributing its grants-in-aid between individual States.

Housing for Labour

The industry is compelled by law to build a certain proportion of new permanent houses every year to very generous specifications to rehouse its labour force. In spite of this being a recurring expenditure, it is not allowed to treat it as a charge when being assessed for income tax, but must pay for the whole out of taxed profits. There is a strong case in equity for allowing the industry to treat such expenditure as a revenue charge in view of its compulsory and recurrent nature. The compulsion under the Plantations Labour Act to build new houses for as many as 8 percent of its workers every year is a heavy burden imposed on the industry. The programme has the effect of forcing the postponement of expenditure on new tea machinery and other measures of rehabilitation, and thus curbing the expansion both of production and exports. The industry has asked the Government to reduce the pace of the programme to 4 percent, *i.e.*, more of the labour force should be asked to be content with their present houses for some time longer in order to help implement the programme under the third five year plan.

The plantation industry is the only one not allowed the benefits of the Government of India's scheme for subsidising industrial housing, which is grossly unfair, according to planters. If the industry were permitted to obtain the 25-percent subsidy and 50-percent loan like others, its efforts to reach the housing target set under the Planta-

Here are the Reasons why:

Architects, Builders and Engineers agree that there is no material as Versatile as "SPRAYED 'LIMPET' ASBESTOS"

"Sprayed 'Limpet' Asbestos" coatings consist of specially prepared Asbestos Fibres which can be sprayed on to any surface and to any pre-determined thickness.

"Sprayed 'Limpet' Asbestos" provides a continuous coating of *low thermal conductivity* which is unaffected by shock and prolonged vibrational stress.

"Sprayed 'Limpet' Asbestos" *prevents corrosion.* A single coating will protect iron and steel against the corrosive effects of water vapour and chemicals.

"Sprayed 'Limpet' Asbestos" possesses a high degree of sound absorption. It reduces the reflection of sound from walls and ceilings and damps down reverberation, which is a great asset in the treatment of ducting, fan and blower chambers, and similar plant.

"Sprayed 'Limpet' Asbestos" is similarly ideal for acoustical correction and is undoubtedly the most adaptable acoustic material yet discovered. It can be employed satisfactorily to obtain good acoustics and the optimum reverberation period.

"Sprayed 'Limpet' Asbestos" is more efficient than any other fireproofing material, and enhances, in large measure, the fire resistance of the structure to which it is applied.

"Sprayed 'Limpet' Asbestos" eliminates dust and dirt, by providing an unbroken, and reasonably flexible lining, which effectively seals all laps and joints.

"Sprayed 'Limpet' Asbestos" prevents condensation which is a practical problem wherever humid conditions prevail, as in textile mills etc. and has long since proved its worth for the insulation of accommodation spaces etc., aboard ships.

"Sprayed 'Limpet' Asbestos" is rot-proof and vermin-proof and will last indefinitely, unless deliberately removed.

The finished appearance of *"Sprayed 'Limpet' Asbestos"* coatings can be suited to the particular needs of each application.

tions Labour Act would have been more successful. Besides, there would *not* have been so great an encroachment into the funds required for new machinery and extensions.

Need for Co-operative Attitude

Another direction in which the Government could benefit the industry is by adopting a more co-operative attitude in its supply of controlled commodities required for the maintenance of the estates and the manufacture of tea. The attitude of the Central Food Ministry has generally been exemplary, as has been that of the Food Department of the West Bengal Government. The Assam Government has not always been much co-operative, and in times of shortage there has been a tendency to put tea garden labour last in the queue to be fed, and to tell the managements to keep off the market till everyone else has had a prior share. But the food situation in Assam is at present favourable, so there is not likely to be much trouble for at least the next 12 months.

As for coal, the standard grade for the industry has recently been reduced from Grade Selected B to Grade I. Wagons are frequently in short supply, and the railway administration considers itself at liberty to divert and purloin consignments paid for and despatched to gardens when it suits its purposes, and not to replace or pay compensation for thefts for years on end. In Assam, although much good coal comes to the industry from the Ledo and other mines, the control over the quality of coal from the Khasi hills quarries by the Coal Control authorities is slipshod, and tea gardens—particularly in Cachar—are forced to accept quantities of very inferior stuff which will not burn steadily in their prime-movers, and the resultant inability to control temperatures makes the maintenance of quality manufacture well-nigh impossible. If enhanced targets are to be reached under the third five year plan, the attitude of many Government servants that "the tea industry will pay" or "this is good enough for the tea industry, and they cannot but accept what they are given" must be drastically corrected.

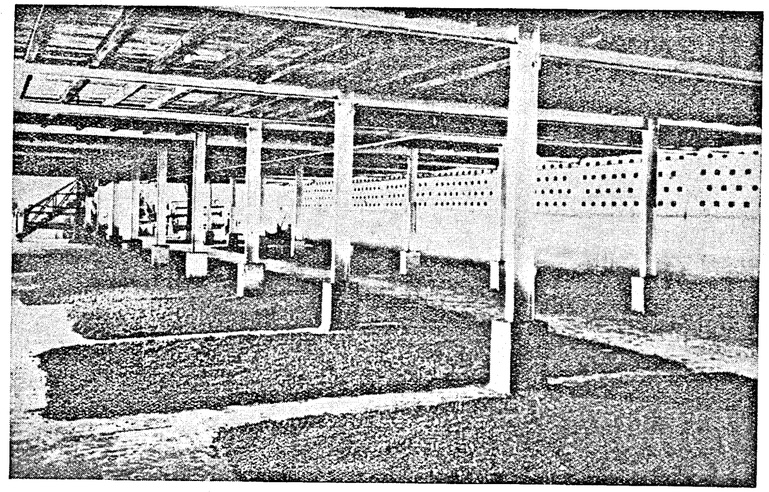
European Common Market

A wide field for the expansion of India's tea market lies in the Continent of Europe. This field was somewhat neglected by the Indo-British tea trade in prewar years, partly from a tendency to leave it to the Dutch, who had their own sources of supply in Indonesia and their own auctions in Amsterdam from which they supplied most of northern Europe, and partly because of high revenue and sumptuary duties imposed on tea by European Governments, who still regarded the article as a luxury. These duties remain as high as ever today, rising in the case of the Federal Republic of Germany to 97 percent *ad valorem*. The situation has not improved under the European Common Market Agreement. One of the first steps taken by the Government of West Germany to meet the new situation arising under the agreement was to raise the consumer tax on coffee and tea from 1st January, 1959, thus compensating for the loss of revenue which would otherwise have been caused by the reduction of tariffs under it and maintaining high retail prices in West Germany.

When negotiating trade treaties with European countries, the Government of India should make special efforts to prevail upon these countries to reduce the duties. When sending heavy industrial machinery and know-how to India, surely one of the easiest methods of repayment, and one giving mutual advantage to both parties in terms of international trade, is for these countries to welcome the import of Indian tea. If and when Britain enters the European Common Market, India should ensure that there should be no question of a U.K. tariff being placed on tea (Britain herself is not likely to want one), but that the European tariffs are abolished and the internal duties gradually reduced.

Promoting Tea Exports

Has the industry reason to hope that the Government of India will adopt a go-ahead policy over tea exports, instead of the restrictive and step-motherly attitude it has hitherto shown? It is an astonishing fact that up to now the industry—the greatest earner of foreign exchange for India—has earned it in spite of the hindrances put in its way. Much more could have been earned if the attitude of the Government was favourable. It is doubtful how far the Government would be prepared to give up its comparatively secure revenue from export duties for the sake of future gain from foreign exchange and from income tax (for every rupee of direct duty remitted, the Government gains at least 50nP in income tax). The benefit by way of security of employment to many thousands of workers engaged in the industry would be immense. But at least duties could be adjusted and more carefully spread in order to encourage exports and to ensure that export teas do not bear a heavier burden than internal ones.



Tea leaves spread out in a cool, humid place for fermentation

This could be easily done by abolishing the export duty and slightly raising the excise. It should be a flat increase and *not* one designed to fall more heavily on the better quality teas which are more valuable as exports. Besides, the total amount of taxation should be lessened and not raised. As excise duty is at present paid before tea leaves the garden, the financial payment should be mitigated by administrative arrangements to pay excise duties in arrears. At the same time, all attempts by State Governments to levy carriage taxes or octroi duties (the Calcutta entry tax, on the Supreme Court's reasoning, appears to be equally illegal as the Assam carriage tax) should be abandoned. The wastage of national effort involved in such a multiplicity of taxes and tax authorities must be very high indeed.

Labour Welfare

As for housing, a more rational policy could well be enforced. In spite of the natural reluctance of the Government to take any step which might appear to lessen the pace of advance in labour welfare, one may say that the individual worker might prefer to wait longer before changing to a more up-to-date dwelling, if he were confident that this will help improve his prospects for the future because of the greater prosperity of his company and the greater confidence that his children would be able to succeed him in the same employment. The revision of the incidence of taxation on house-building and the granting of subsidies as in other industries, will not unduly tax the Government's resources, particularly as there is complaint that other industries are not taking sufficient advantage of the subsidies. There is no indication as yet, however, that the Government is anxious to take action. The target is high, far higher than the industry can hope to achieve in terms of natural expansion if present circumstances continue, but the need for foreign exchange is great. The optimist may hope that the Government will take action in time to provide the essential support, as indicated in this article, to the tea industry which is keen to realise the allotted targets. The pessimist—and perhaps the man of experience—will conclude that the Government will never take action in time, and that any target in the nature of 40,000 tons of made tea a year by 1965 is a mirage so dim and distant that it will never be hit in the magpie, let alone the bull.

BACKGROUND TO THE RISE IN CLOTH PRICES

RAW MATERIAL AND LABOUR COSTS INCREASE

By
KRISHNARAJ M. D. THACKERSEY
Chairman, Indian Cotton Mills Federation

THE current year began well for the Indian cotton mill industry, promising to yield good returns. There was a steadily widening demand for cloth and yarn and many units which had suffered heavily during the crisis of 1957-58 looked forward to a period of reasonable prosperity so that they could recover at least part of the losses sustained by them. The need for their financial rehabilitation is indeed great, as the crisis did not only lead to an abnormal accumulation of cloth and to a drastic curtailment of production, but so seriously strained their resources that they have yet to recover from its effect completely. Many factors contributed to the crisis. First, an unbalanced assignment of production targets between the organised and the decentralised sectors of the industry led to the uncertainty whether there would be adequate supplies of cloth during the second plan period. Great hopes were entertained about the capacity of the handlooms to increase their output on an impressive scale. Expansion of the loomage in the organised sector was accordingly not allowed. It is unfortunate that there should have been fears of cloth shortage so soon after the inauguration of the second plan which, it was claimed, was to take the country a big step further in the direction of a higher standard of living.

In order to avert an apprehended cloth shortage and at the same time discourage higher consumption, the Government loaded mill cloth with an additional excise duty of staggering proportions. The duty was raised on 1st September, 1956, in order to yield the exchequer as much as Rs. 72 crores a year from this single source. Within a period of only seven months, the impost was enhanced by Rs. 34 crores. The effects of this measure were far-reaching. Yet the damage caused to the industry would not have been so great if it had been adopted as a mere expediency. Apart from the fact that no serious attempts were made to afford facilities for increasing mill production through an appropriate expansion of the equipment, the excise was not reduced in good time, even when the need for curbing consumption had no longer been felt. The worsening of the food problem and the consequent sharp increase in food prices compelled the consumer to divert a larger part of his income towards food, so even his normal expenditure on cloth was reduced.

Problem of Mounting Stocks

This state of affairs persisted throughout 1957 and 1958, when the industry was confronted with the problem of mounting stocks. The cloth held by mills, including unsold and sold but not lifted, in October 1956, was 480,827 bales (one bale contains 1,500 yards); the accumulations rose to 605,526 bales in October 1957, and in the same month of 1958, they stood at 601,800 bales. The financial implications of these accumulations can be easily understood when it is recalled that the value of two months' production at prewar prices was Rs. 10 crores; it was more than six times that amount at 1958 prices.

The industry was thus faced with an impossible situation. In spite of its intentions to persevere for maintaining a high level of production in response to the Government's appeal, it could not do so indefinitely when the demand for its products persistently remained low. In these circumstances, it was forced to adjust its output to demand, and this inevitably meant a curtailment of production. The following figures show how production was affected by the crisis: 1956, it was 5,306 million yards, it fell to 5,317 million yards in 1957; to 4,927 million yards in 1958, and stood at 4,925 million yards in 1959.

There was, however, a perceptible improvement in the demand for cloth from the beginning of last year. The change in the situation was largely due to the effect produced on the economy by the increased investments under the current plan. The mills were no longer burdened with heavy stocks of cloth which began to move into the market rather rapidly. For instance, while the stocks held by the mills in the categories of sold but delivery not taken and unsold at the end of January 1959, were 535,300 bales, the figures for the subsequent months were: February, 494,900 bales, April, 439,200 bales, June, 399,000 bales, and December, 273,700 bales. This tendency continued into the current year, the first two months of which saw the mills holding only 268,900 bales and 259,800 bales, respectively.

Such a rapid depletion of cloth stocks was, however, not desirable, and it was recognised both by the Government and the industry that a 10-percent increase in production was vitally necessary in order to prevent a cloth shortage in the country. But this goal could not be realised unless the mills were assured of a plentiful supply of cotton. The production of home-grown cotton has been unsatisfactory for some years past. It amounted to 4.8 million bales in 1956-57; 5.1 million bales in 1957-58; 4.7 million bales in 1958-59 and 3.8 million bales in 1959-60. The following table shows the quantities of cotton consumed by the mills during the same period:

(In thousand bales of 392 lbs)

Year	Indian cotton	Foreign cotton	Total
1956-57	4,666	567	5,233
1957-58	4,433	566	4,999
1958-59	4,616	455	5,071
1959-60	4,419	686	5,105

In the light of the poor record of Indian cotton output, the second plan target of 6.5 million bales appears to be over-ambitious. It is against this background that the reasonableness or otherwise of the rise in cloth prices since the beginning of this year should be judged. Cotton constitutes more than 50 percent of production costs. Both on account of bad crops and delayed supplies from abroad, cotton has been both scarce and costly during this year. Due to their short supply, Indian growths, which are normally cheaper than imported cottons, cost the producer much more than the scheduled prices, often involving payment in excess of world parity for similar varieties.

The leaders of the industry clearly saw the danger of such a development and pleaded with the Government not only to liberalise imports but also to expedite them. Writing to the appropriate authorities on 15th October, 1959, the Indian Cotton Mills Federation drew their attention to the critical supply position and urged the need for importing "a minimum of 1 million bales, if not more, if we are to avoid a crisis in the cotton supply situation". The Government certainly realised its gravity, but the action taken to meet it was unfortunately not prompt. Belated announcements of import quotas compelled the mills to buy their requirements from abroad at exorbitant prices, some of the purchases being Rs. 400 a candy more than the normal prices. Inevitably, dearer cotton entailed a higher cost of production.

Purchase of Foreign Cottons

Besides, mills producing coarse and medium varieties of cloth were forced to make extensive purchases of foreign cotton as domestic varieties were not available. Since imported cottons are mostly of longer staple, the mills were forced to have recourse to the uneconomical practice of spinning them down in order to produce the types of cloth for which they were equipped and in which they specialised. Apart from these factors which led to a distortion of the industry's cost structure, the mills were called upon to shoulder a heavier wage bill, following the implementation of the Central Wage Board's recommendation for an increase in the basic wage of the workers at the rate of Rs. 8 and Rs. 6 a month a worker in different textile centres, with effect from 1st January, 1960. The workers will be given a further flat increase of Rs. 2 from January 1962 in their basic wage. Moreover, due to the high food prices, the industry is forced to give them a rising dearness allowance. For instance, Bombay city cotton mills paid a dearness allowance of Rs. 64.75 a month a worker in 1955, the average payment in the subsequent years being Rs. 68.75 a month a worker in 1956, Rs. 74 in 1957, Rs. 81.58 in 1958 and Rs. 86.42 in 1959. This sharp increase in the dearness allowance has been maintained in the current year, the average up to October 1960 being as much as Rs. 89.15 a month a worker. The wage bill of these cotton mills has been thus inflated by about Rs. 6 crores a year since 1955 on account of dearness allowance alone. The share of wages in the cost of production ranges from 25 percent to 32 percent.

In these circumstances, the prices of cloth and yarn cannot remain at a level appropriate to a lower cost of production. Apart from the fact that the industry had suffered grievously for two years, the operation of the law of supply and demand also contributed to the price increase. Three factors have, therefore, to be taken into account when assessing the reasonableness or otherwise of the prices which ruled from the beginning of the current year. First, it was the big increase in the cost of production; secondly, it had become necessary for the mills which had suffered during the crisis to avail themselves of

FRESH FIELDS AND PASTURES NEW FOR INDIAN MANUFACTURERS

opportunities to make up their losses by taking an honest advantage of the widening demand for their products. Thirdly, the rise in prices was only temporary. The industry was, however, asked to reduce the prices of its products as part of the general drive to "hold the price line". In order to co-operate with the Government, the industry agreed to bring them down to the level which obtained in October 1959, adding only certain percentages to cover the additional cost of production. Unfortunately, the gesture failed to win the approbation of the authorities who insisted that the prices should be reduced to the August 1959 level. There could not be any justification for taking August 1959 as the base period since in that month many mills had made distress sales. The demand for a drastic reduction of prices was based on the untenable assumption that they had risen by 40 percent over those of August 1959. In fact, only a small proportion of the total volume of cloth output and that, too, confined to one or two categories, namely, coarse and medium, was affected by high prices.

Rise in Cloth Prices

This point was made clear by the Indian Cotton Mills Federation by a Press note on 11th August. "This Committee of the Federation regrets to note how the figure of a rise of 40 percent in cloth prices has been freely tossed about, with the result that many people have begun to regard that there has been a general rise of 40 percent. In fact, not more than 5 percent of the total cloth produced by mills would be selling at this rate, whereas in all other varieties the rise has been much less". Having, however, agreed to reduce cloth and yarn prices to the August 1959 level, the industry has been making earnest efforts to offer its products to the consumer at the revised rates through a network of approved retail cloth shops and by direct sales of yarn to the handloom co-operative bodies. Taking August 1959 as the basis, the ex-mill cloth prices are to bear the following additional percentages: coarse 25; lower medium 22; higher medium 18; fine 11½ and superfine 9. The prices of yarn have also been suitably revised. Apprehending serious financial consequences to many mills following the second cut in prices, the Federation in a Press note on 3rd September said: "The industry and in particular those units which had become financially weak due to the continuing crisis from 1957 were still making distress sales in August 1959 and if the industry was required to take that month as the basis and charge only the increase in costs that had occurred since then, the mills would again have to incur losses, which they could ill afford to do. The industry had suggested the month of October 1959 as the basic period as it was only since that month that the upcountry mills had begun to sell at a price, which, on an average, did not result in losses."

Financial Position of Industry

The ban on the expansion of mill production, the restriction on the manufacture of certain lines by the mills, the heavy call upon their resources through taxes and levies, low profitability and the official intervention during the short spells of its prosperity, have all combined to undermine the financial soundness of the cotton textile industry. Indeed, its low earning capacity is at the root of all its troubles. Poor profits make it impossible for the mills to acquire the necessary finances for modernisation which has fallen into heavy arrears. The place of cotton textiles in the scale of industrial profits is best indicated by the figures below taken from the *Reserve Bank of India Bulletin* for September 1960.

These figures explain not only the true position of the industry, but also its plight. All right-thinking persons will readily endorse the Government's move for stabilising prices, but the campaign against rising prices cannot have a good augury by merely singling out cotton textiles, especially when their prices have not shown any flagrant disparity with the cost of production. A judicious allocation of production targets to the three sectors of the industry with facilities for the mills to increase their spinning and weaving capacity, ample supplies of cotton at reasonable prices and facilities for the modernisation of mill machinery are vitally necessary for the attainment of higher levels of production and for offering the products of the industry at attractive prices to both domestic and foreign consumers.

GROSS PROFITS AS PERCENTAGE OF GROSS SALES

SUGAR PRODUCTION INCREASES

OFFICIAL INCENTIVES ENCOURAGE FACTORIES TO WORK LONGER

By

J. S. MEHTA

THE Indian sugar industry achieved an all-time production record of 2.4 million tons in the 1959-60 season. In one year, it increased output by over 26 percent, or a total of 500,000 tons. It also exceeded the second plan target of 2.25 million tons by 170,000 tons, and that too, a year ahead of schedule. Following the decline in output in the previous two years, this achievement is remarkable. The increase in output has been shared by all the sugar producing States with U.P., the largest among them, recording the highest increase. The following table gives the increase in output achieved by the various States:

State	Production in thousand tons		Increase	
	1958-59	1959-60	In thousand tons	Percentage
Uttar Pradesh	888	1,323	335	37.72
Bihar	311	325	14	4.60
Maharashtra and Gujarat	321	394	73	22.74
Madras	73	75	2	2.74
Andhra Pradesh	120	138	18	15.00
Rest of India	205	263	58	28.29
All-India	1,918	2,418	500	26.06

The recovery of sugar improved too, although slightly, from 9.84 percent to 9.89 percent; and the crushing period of the factories also recorded an increase from 120 days to 147 days.

The increased sugarcane supplies as also the additional production capacity brought into service during the year contributed to this increase. But by far the most important single factor responsible was the new sugar policy of incentives initiated by the Government. Unless the latter had made it possible for the factories facing controls on prices and distribution to incur extra costs for drawing larger cane supplies, production could not have risen substantially. Besides, the increase in cane supplies and in the industry's capacity was only about 5 percent, which cannot explain an increase of 26 percent in sugar output.

New Sugar Policy

The sugar policy announced by the Government at the beginning of the last season was a bold step forward. It provided for incentives to the growers as well as to the industry. To the growers was given the incentive of a higher cane price—it was raised from Rs. 1.44 to Rs. 1.62 a maund. To the industry, a rebate of 50 percent in the basic excise duty was granted on all sugar produced in excess of the average production of the previous two years. Besides, in order to enable the factories in U.P. and Bihar to start crushing earlier than normal, concessions in cane price were given. The factories in west U.P. which started crushing on or before 4th November, 1959, were given a concession of 31nP a maund of cane crushed by them from the date of start up to 21st November. A similar concession was given to the factories in east U.P. and north Bihar which started crushing on or before 10th November on all cane crushed by them up to 21st November. While the former step enabled the factories to attract larger cane supplies by either paying higher prices in competition with *khandsaris* and power crushers or by drawing cane from longer distances at considerably higher costs, or by continuing late crushing when the recovery of sugar falls to an uneconomic level, the latter made it possible to start early crushing, even though recovery in the beginning is lower than the normal for the season. But for this policy of incentives, the diversion of cane to *khandsaris* witnessed during the previous two years would have continued. It was the large-scale diversion of cane to *khandsaris* in 1957-58 and 1958-59 that resulted in the fall in production in spite of the increase in the industry's capacity. Had this position continued in 1959-60 also, it would not only have prevented any increase in sugar output, but would also have resulted in a net loss of sugar. If the cane used by sugar factories for producing the additional 500,000 tons of sugar had been used by *khandsaris*, only 325,000 tons of *khandsari* would have been produced; recovery in the latter process is only 6 percent to 7 percent, compared with nearly 10 percent recovery obtained by sugar factories. This would have meant a net loss of 175,000 tons of sugar to the country. In terms of money value, the loss would have been of the order of Rs. 19 crores. The loss to the exchequer in terms of excise duty and cane cess, etcetera, resulting from lower sugar production, would have amounted to about Rs. 14 crores.

Increase in Consumption

The consumption of sugar over the years has shown a steady rise. It rose from 1.72 million tons in 1954-55 to 2,066,000 tons in 1958-59. During last year, however, it showed a slight fall, and the total for the year is expected to be 2,050,000 tons, showing a decrease of about 16,000 tons from the previous year. The fall is largely due to the restricted monthly releases which became necessary in the early part of the season because of low stocks. This policy was started in 1958-59 itself when, because of the lower available domestic supplies, the Government was compelled to keep monthly releases at a lower figure, and in many areas, rationing of sugar was introduced. For the first five months of last year, the Government continued this policy and limited the monthly releases to 175,000 tons. Although the monthly releases were increased to 185,000 tons for the next two months and to 200,000 tons thereafter, transport bottlenecks kept the consumption rate low. The three-fold increase in *khandsari* production over the last three years and the consequent larger supplies of *khandsari* in certain areas also affected sugar consumption.

With better production prospects and free releases, the consumption rate, it is expected, will rise again with the increase in population and improvement in the standard of living, the overall demand for the sweetening agents is bound to increase steadily, and in normal circumstances, this is expected to be reflected mostly in the higher consumption of factory sugar.

Sugar Exports

The substantial increase in sugar production unaccompanied by a corresponding rise in consumption has at present resulted in a large surplus of supplies. The current sugar season has opened with a stock of about 520,000 tons, compared with last year's carry-forward of only 153,000 tons. With even better prospects of production in the current season, stocks at the close of the season are expected to be still higher, after allowing for some increase in consumption during the year. This has prompted the Government to revive plans for resuming sugar exports. An export quota of 50,000 tons has been announced already. The Government is also exploring the possibilities of exporting a substantial quantity to the U.S.A. That country is a substantial sugar importer and was so far importing a major portion of its requirements from Cuba. In case the Government of India is able to strike a deal with the U.S.A., a major portion of the country's surplus sugar could be exported to that country, and the loss involved would be much lower as the U.S.A. pays an appreciable premium over the world prices for sugar purchased by it.

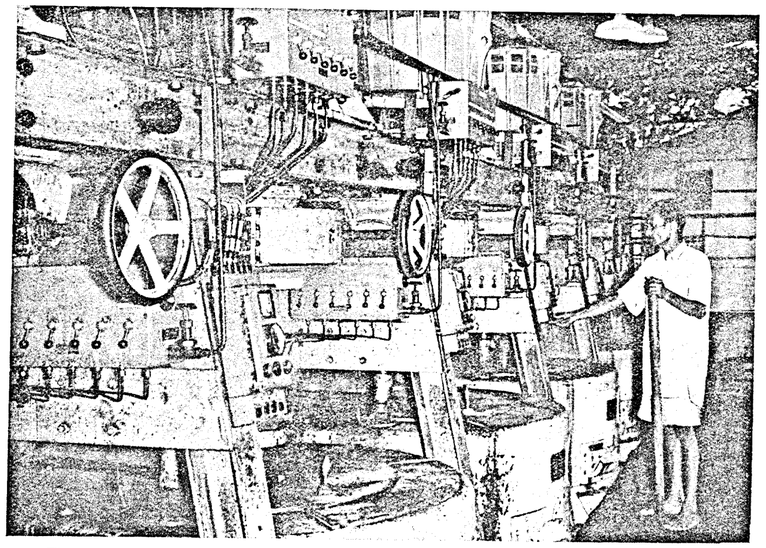
There has been good progress in installing additional capacity during the year. Five new factories with an annual production capacity of 60,000 tons went into production during 1959-60. Besides, a number of factories increased their existing capacities by a total of 40,000 tons. The total production capacity at the beginning of the current season has thus reached 2.28 million tons, against 1.7 million tons at the beginning of the second plan. The following table shows the yearly increase in installed capacity since 1954-55:

(Figures in '00,000 tons)

Year	Capacity	Additional capacity installed during the year		
		From existing units	From new units	Total
1954-55	15.1	...	...	...
1955-56	15.9	0.4	0.4	0.8
1956-57	17.0	0.5	0.6	1.1
1957-58	18.4	0.2	1.2	1.4
1958-59	19.9	0.4	1.1	1.5
1959-60	20.9	0.4	0.6	1.0
1960-61	22.8	0.8	1.1	1.9

Machinery Manufacture

In the field of sugar machinery manufacture also, considerable progress has been made. In 1956, sugar machinery produced was worth Rs. 32 lakhs, while the production in the current year is expected to exceed Rs. 3.5 crores. When the two consortia of sugar machinery manufacturers bring their



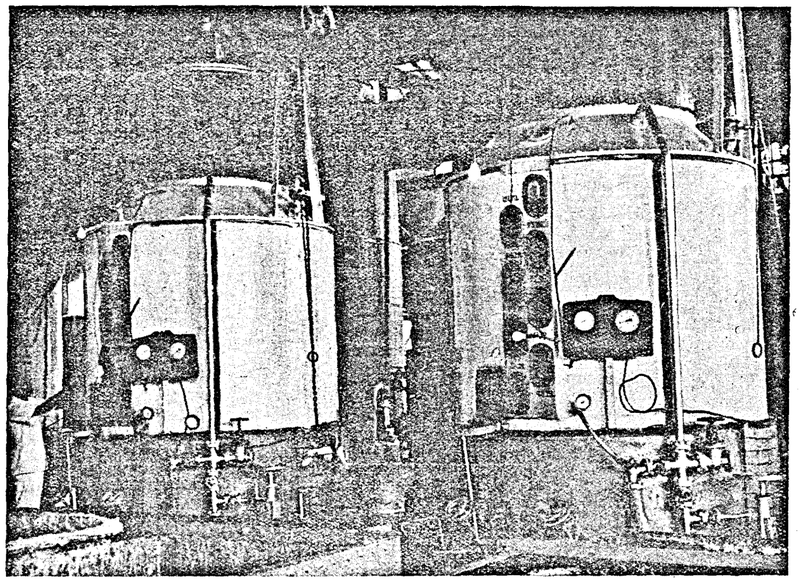
The centrifugal where the massecuite is rotated, and the liquid sugar is separated and dried

plants to full working by 1963, it would be possible to manufacture within the country, every year, 12 complete sugar plants of the capacity of 1,000 tons to 1,250 tons, and the equivalent of about nine complete plants by way of expansion and replacement requirements of the sugar industry. From that year, almost the entire requirements will be met within the country.

Tariff Enquiry Report

During the year, the Tariff Commission submitted its report on the sugar industry to the Government. The Commission was required to report on (1) the cost structure of sugar; (2) fair price of sugar payable to the industry and (3) claims of the sugar industry for rehabilitation charges and profit. It selected 48 factories in the principal manufacturing regions for examination and prepared four separate schedules of cost of production for (1) the northern region comprising the States of Uttar Pradesh, Bihar and Punjab, (2) Bombay State, (3) Madhya Pradesh and (4) the southern region comprising the States of Andhra Pradesh, Mysore and Madras. The main recommendation concerning the cost structure is that from year to year, the price for each region should be determined according to duration and recovery with the help of the regional schedules prepared by the Commission, and thereafter, a fair price for the industry should be fixed at a level which would cover the fair prices of the four regions. The Commission recommended a gross return to the industry of 12 percent on capital employed. As for the industry's claim for rehabilitation charges, the Commission did not agree to include it as an item of cost.

The industry has been greatly disappointed at these recommendations. The Commission seems to have approached the subject with a view to checking the inflationary trends in the price structure of sugar on the ground that it enters directly into the cost of living of all classes of population. The units selected by the Commission for costing did not represent the average conditions obtaining in the industry, as is admitted by the Commission itself, although the disparity was not rectified as claimed by it. The industry is not also happy with the Commission's departure from the established practice of computing an all-India schedule of costs and having resorted to regionwise computation on the ground of disparity in the working conditions in different regions. As a matter of



The vacuum pans in a sugar mill

fact, the disparities between different units in the same region are at least as prominent as they are between one region and another. Moreover, in working out the cost schedules, the Commission assumed ideal working conditions and excluded costs where these were high, whereas in cases where the figures were abnormally low, these have been included.

Rehabilitation Allowance

The industry is particularly aggrieved at the Commission's refusal to allow rehabilitation charge as an item of cost. It may be pointed out here that it was largely as a result of the industry's representation to the Government for an appropriate allowance for rehabilitation and modernisation that a reference was made to the Tariff Commission. In 1953-54, when the Kidwai formula was evolved, recognition was given to the necessity of a rehabilitation allowance. The Gopalakrishnan (Expert) Committee also accepted the industry's demand for rehabilitation and made an allowance, although inadequate, in the costs. The principle was followed by the Government when it instituted price control in 1958, but the industry had represented that the amount of the rehabilitation allowance given in price was too low.

When the matter was referred to the Tariff Commission, the industry expected that the principle having already been accepted, only the quantum would be the subject matter of study. It was, therefore, greatly disappointed when the Commission did not make any allowance for rehabilitation in the cost schedule. The industry's stand has been that following a several-fold increase in the cost of sugar machinery, the amount of depreciation actually allowed is quite insufficient for the replacement of the assets on expiry of their useful life. Rehabilitation allowance comes into the picture only to make up the difference in the amount allowed as depreciation and the amount actually required for the restoration of assets. It is, therefore, necessary to include it as an item of cost to enable replacement when it is due.

One of the reasons given by the Commission for disallowing rehabilitation as an item of cost is that the industry has employed all available funds in expanding capacity to earn more profits, and, therefore, it should meet the rehabilitation cost from its own resources. It has overlooked the fact that any reduction in cost due to expansion has already been taken into account while working the cost schedules, which are based on actual costs during 1957-58. As against the argument that it is socially unjust for the consumer to foot the rehabilitation bill when the industry has used its resources for expansion, the industry contends that any benefits in the matter of reduced costs resulting from expansion have already gone to the consumer too. The Tariff Commission has not followed a uniform policy in this matter. The cement and steel industries also used a considerable portion of their reserves for expansion purposes, and yet their rehabilitation needs have been admitted.

The necessity for making adequate provision for rehabilitation has been always recognised by the Supreme Court of India. While considering the award of bonus to workmen in the A.C.C. case, the Court held that rehabilitation should be considered as a prior charge. It is rather surprising to find that the Tariff Commission has not followed the judgment of the highest judicial authority in the country, enunciating the principle of provision of rehabilitation requirements.

Return on Capital

In allowing a return of 12 percent on capital employed, the Tariff Commission has observed that this rate of 12 percent will "in our view, provide sufficient funds for each unit to meet its commitments under bonus and gratuity, interest on borrowed capital and debentures, dividend on preference shares, managing agents' commission and income tax, and finally leave a residue to a large majority of the units in all the regions to declare reasonable dividends". But in actual practice, the 12 percent return on capital employed allowed to the industry, will, after meeting various charges, leave a net return of less than 4 percent free of tax to equity shareholders. Against this, it is significant to note that on the basis of the Supreme Court judgments, an industry like textiles is entitled to a return of 6 percent on paid-up capital and 4 percent on reserves. In 1931, which was a period of depression, the then Tariff Board had allowed the sugar industry a return of 10 percent on gross block which included 2 percent for taxation and 2 percent for reserves, leaving 6 percent for dividends. The Tariff Commission, instead of allowing a higher return in view of the present market conditions, has recommended a basis which reduces the return to less than 4 percent. This is obviously a very inadequate return, particularly when, for an industry like sugar whose working is rendered uncertain because of its dependence on the vagaries of nature, it is difficult to raise capital at less than 8 percent free of tax.

It may not be out of place to mention here that the World Bank mission which visited India early this year, has in its report referred to the "price-fixing activities" of the Tariff Commission of India and has expressed concern about the arbitrary methods employed in deciding what the limits to profits should be as these are liable to discourage investment. As the World Bank mission observes, out of the maximum of 12 percent on capital employed, after dividends have been paid, there is very little left for expansion. In the case of the sugar industry, the basis followed by the Commission does not only not leave anything as finance for expansion which the Bank mission thinks is necessary for future growth of an industry, it does not leave adequate residue for servicing even the existing capital.

It may be mentioned here that the policy followed by the Tariff Commission in determining the costs of various industries like sugar, cement and steel is completely different from the liberal price policy followed in the case of Governmental industrial agencies. Unless the price policy followed for these major industries is made more positive, the object of economic development may be thwarted. This is particularly so in a developing economy like India's, where every encouragement is necessary for enabling the industries not only to maintain their current production but also to grow and develop at a reasonably quick pace.

Price-linking Formula

Under the price-linking formula introduced by the Government in 1958, sugarcane growers supplying cane to a sugar factory share with the factory owner the net sugar price realised by the latter during the year, in the same ratio as the cost of cane bears to the factory's cost of sugar production during that year, excluding taxes. The industry, while not opposed to the principle of price linking as such, has, besides suggesting various minor modifications, stressed the need for allowing rehabilitation cost as a prior charge before deciding the growers' share. Further, in the controlled regions, where ex-factory prices of sugar have been determined by the Government, there should be no question of sharing the sugar price with the growers, as in these regions, the industry does not earn any extra price.

In response to this, the Government has recently asked the Tariff Commission to (a) examine the issue of price linking in all its aspects and suggest modifications in the existing formula with a view to improving it or to suggest a revised all-India formula or regional formula, (b) to examine whether the claim of the industry for a rehabilitation allowance in the matter of sharing sugar price is justified, and if so, the rate at which the allowance should be given in the price-linking formula, (c) examine whether the formula should be made applicable to regions where ex-factory prices have been fixed, and in case the formula is not applied, how the advantage of special incentives given to factories in years of control should be shared and (d) examine the effect of price-linking formula on the establishment of new factories with heavy capital outlay and whether any concession should be allowed to them. It is hoped that the Tariff Commission will take all relevant factors into consideration and evolve an equitable and simple formula, after allowing for the just needs of the industry.

Third Plan Target

The draft outline of the third plan published some time ago visualises a sugar target of 3 million tons to be produced in 1965-66 on the basis of an estimated consumption of the same figure. This compares with the second plan target of 2.25 million tons and the estimated capacity of 2.28 million tons in 1960-61. The estimates of the requirements at the end of the third plan have been arrived at on the following basis:

(a) Quantity required at the existing rate of consumption for an estimated population of 480 million	2,506,000 tons
(b) Quantity required to cover the increase due to changes in dietetic habits	214,000 tons
(c) Quantity required to cover the increase due to increase in purchasing power	251,000 tons
Total	2,971,000 tons
	or 3 million tons

The industry's existing and licensed capacity has been estimated at 2.6 million tons; which means that an additional capacity of 400,000 tons will be licensed during the plan period. The average duration of the season for estimating the capacity has been taken at 120 days, which is a conservative estimate keeping in view the fact that the average duration for the last five years was 136 days. The estimate of 140 days' crushing period at the end of the third plan period by the industry appears to be more realistic. The actual production capacity is, therefore, likely to be more than 3 million tons, just as last year the production was 2.4 million tons, compared with the estimated capacity of only 2.1 million tons.

Cane Supplies

The sugarcane output last season increased to 75 million tons, showing an increase of 4.1 million tons, or 5 percent from the 1958-59 figures. The first estimate for the current season shows an increase of 3.7 percent in the acreage, and cane output is also likely to show a proportionate rise. But it is a matter for concern to find that there is hardly any improvement in the yield from each acre. Unfortunately, in spite of the progress made in model farms and research stations, the yield in the country as a whole has not shown any improvement. The same is the position concerning the quality of cane. The following figures pertaining to some leading sugar producing countries are illustrative:

Country	Tons of cane recovered an acre	Recovery percent of cane	Tons of sugar recovered an acre
Cuba	17.12	12.25	2.095
Puerto Rico	24.16	12.23	2.056
Hawaii	62.05	10.46	6.489
Peru	41.14	12.33	5.076
Egypt	30.42	9.97	3.032
Java	56.20	11.49	6.440
Philippines	27.08	8.45	2.287
Japan and Formosa	28.27	12.93	3.657
Australia	21.34	14.33	3.060
India	14.49	9.89	1.433

The draft outline of the third plan has visualised a target of 92 million tons of sugarcane. This will necessitate an increase of 30 percent in the present yield of cane. Judging from the past achievements in cane development, this requires a tremendous effort on the part of all concerned. Care has also to be taken to see that in an anxiety to increase the cane yield, the need for increasing sugar content in cane is not ignored. Ultimately, it is the sugar an acre, depending both on yield and quality of cane, which matters.

Prospects for the New Season

The favourable turn that sugar production took last year after the decline in the two previous years, has given new hope and confidence about future prospects. The Government has continued its policy of incentives for the current season also. The increased cane price introduced last year has been continued. The factories have been given the incentive of the 50 percent rebate in excise duty on production achieved in excess of the average of the last two years. Further, the State Governments of U.P. and Bihar have announced a remission in cane cess at the rate of 6nP a maund of cane crushed in excess of last season's crush, provided the factories start their operations for the season by a particular date. The cane supply position is also likely to be favourable. The general expectations, therefore, are that sugar output in the current season may exceed 2.6 million tons.

With a large stock of over 500,000 tons carried forward from the last season and production prospects this year still better, the stocks at the end of the current season, even after allowing for some increase in consumption, will be considerable. If an outlet is not found to the surplus stocks, the industry will be faced with problems of storage and finance. Besides, the prospects of production in the next year may also be adversely affected. The position can be helped if the Government tries to remove the bottlenecks of transport to facilitate a freer flow of sugar within the country. This may improve to some extent the domestic offtake of sugar. Besides, the possibilities of exporting the surplus should be fully explored.

K C P

- UNDER LICENCES FROM MESSRS. FIVES-LILLE-CAIL, FRANCE, WE MANUFACTURE MACHINERY AND EQUIP COMPLETE SUGAR AND CEMENT PLANTS.
- MESSRS. FIVES-LILLE-CAIL HAVE BUILT THE LARGEST SUGAR AND CEMENT PLANTS IN THE WORLD AND HAVE SUPPLIED SOVIET RUSSIA IN 1959 A FIVE THOUSAND TON DAILY CAPACITY CEMENT PLANT.
- IN ARGENTINA THEY ARE SUPPLYING 10,000 TONS SUGARCANE DAILY CRUSHING CAPACITY PLANT.
- WE ALSO MANUFACTURE AND SUPPLY COMPLETE SULPHURIC ACID AND SUPERPHOSPHATE PLANTS.

We have secured orders for Six complete sugar plants of one thousand tons daily sugarcane crushing capacity each from the following Sugar Factories :—

The Amadalavalasa Co-operative Agricultural and Industrial Society Ltd., Amadalavalasa; The Chodavaram Co-operative Agricultural and Industrial Society Limited, Chodavaram; Nizamabad Co-operative Sugar Factory Ltd., Nizamabad (Andhra Pradesh); Co-operative Sugars Ltd., Chittore (Kerala State); Namakkal Co-operative Sugar Mills Ltd., Salem Dist. and Champaka Sugar Plantations Ltd., Mannargudi, Tanjore Dist. (Madras State).

DEPRESSION CONTINUES IN FREIGHT MARKETS

By

A SPECIAL CORRESPONDENT

THE depression in the shipping industry continued throughout 1960, although slight gains were made by owners in the overall exchanges. Higher rates have been paid for grain from the U.S.A. to India, but the announcement of this country's 4 million tons annual import programme did not cause as much strengthening in rates as owners had expected. The probable reasons are the increase in tanker tonnage now used in the grain trade and the 50 percent flag reservation on which the U.S. Government has insisted.

In recent months, there has been a significant increase in long-term time chartering, and prices of second-hand vessels have risen sharply. Whether this is due to international tension or is chiefly speculative is difficult to tell. However, it does give some hope of improved conditions in the industry next year.

In India, there has been an encouraging increase in tonnage. The progress of some of the newcomers to the shipping field will be watched with interest. In its efforts to increase the country's export trade, the Government has formed various committees to negotiate with shipowners and Conferences on freight rates and some weaknesses in the Conference structure have been revealed. One general complaint has been the delay occasioned by most Conferences in making decisions. The deferred rebate system has come under fire, and it is understood that a legal case is now pending in Pakistan, challenging the validity of the system.

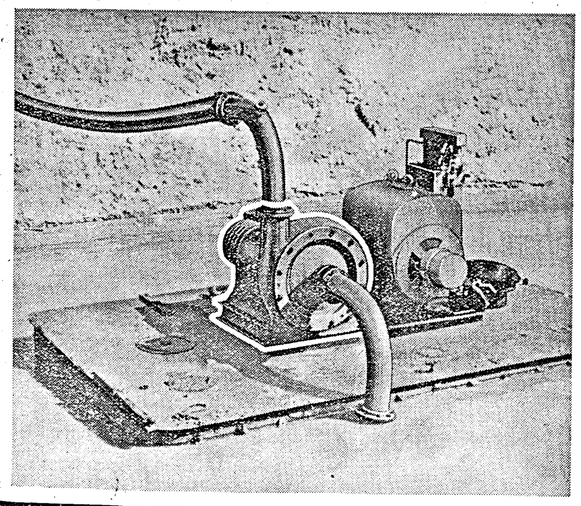
In Calcutta, conditions in the river have greatly improved, but the standard of work on board ship is still far from satisfactory. The introduction of the piece-rate scheme, which would be of great benefit to all port users, is as far away as ever. The conduct of a minority of the stevedores in the port has been most reprehensible. The use of Haldia as a lightening anchorage for grain ships has been prevented, very largely as a result of the machinations of one or two stevedores. A recent strike of baggers and stitchers can be attributed to the same source. It may be significant that the larger, well-established stevedores have had no part in these manoeuvres, but they will suffer equally if governmental action is taken against all of them. It is a sorry state of affairs to have the country's largest port continually in a state of labour unrest, and the Government cannot have failed to observe the effects of nationalisation of stevedoring labour in Burma and Ceylon.

Serious Complaints

In neighbouring East Pakistan, serious complaints are being made concerning the lack of navigational aids in the river Pussur and the shortage of pilots. Some vessels, to avoid serious delays at Chalna, are following the vessel fortunate enough to secure the services of a pilot, but this is a dangerous procedure. Urgent action is required by the Government if jute exports are to be maintained and the growing industrial potential afforded a safe and convenient outlet.

The hue and cry raised by the nascent shipowning countries against flag discrimination has died away, but foreign owners are now closely watching the position concerning berthing, pilotage, etcetera, where it is possible for true flag discrimination to flourish. A glaring example of flag discrimination is the Indian Government's refusal to allow foreign flag vessels to carry cargo from Indian ports to Pakistan, although the latter country is a foreign State.

Silt disposal with VACSEAL pumps



From settling pits silt and water are drawn off to disposal areas by Vacseal Pumps of various capacities through steel pipes. The method ensures supplies of clean circulating water for the washing plant itself.

This is one of many applications of Vacseal Pumps for handling liquids containing abrasive solids. The pumps require no sealing water and are available in Ferloy metal and rubber-lined, in various sizes from 1½ in. to 8 in., both vertical and horizontal types.

ABMTM

Products of a group founded over 40 years ago, ABMTM machine tools rate high in the estimation of industry. So much so that their accuracy, performance and general efficiency are often regarded as the required standards for machine tool manufacture. Such an index of quality is significant It is brought about by skill and experience in the production of individual types of machines, as represented by six specialist but independent companies operating through a single organisation—ABMTM.

This, while minimising the costs of selling and distribution, leaves the individual members of the association free to concentrate upon *design and manufacture*, thus raising the standards of accuracy, productivity and ease of operation to the highest levels.

No organisation or business whose need is for efficient machine tools of undoubted quality and durability can afford to disregard the assistance of such a unique service.
